Darry, (2002) mentioned that, cancer patients who continue to work are as productive on the job as other workers. Most cancer patients who are physically able to work do go back to their jobs. Returning to work can help them feel they are getting back to the life they had before being diagnosed with cancer<sup>(169)</sup>. This is in line with the study findings regarded to the relation between occupation and all the side effects of chemotherapy, it was found that there is no significant difference among the three assessments of the study while for the control group there was a significant difference among the three assessments. This result was opposite to Ashing, (2004) findings who documented that breast cancer and it's treatment have varying effects on women employment, several women choose to change jobs or stop working, others lost their function and experience serious job disruptions<sup>(170)</sup>.

Recent studies revealed that herbal components, the subject of the current study, have anti inflammatory, anti oxidant and immunomodulator effects, which support the present findings in decreasing and minimizing the side effects of conventional chemotherapy. Robbson, (2006) stated

that, oncology nurses are engaged in a collaborative practice with all members of the care team to provide optimal management of patients with cancer. Their professional practice requires detailed knowledge of the biologic and psychosocial dimensions of the cancer problem. They have key roles not only as caregivers but in patient and family education and clinical cancer research. Oncology nurses also are continuously involved in the enhancement of nursing practice through research, continuing education, and advanced education<sup>(171)</sup>.

Also it was concluded that, when patients integrate these complementary therapies as herbals into their medical and surgical care, they are creating a more comprehensive treatment plan and helping their own bodies to regain health and vitality<sup>(22)</sup>. Therefore, minimizing of the chemotherapeutic side effects requires skillful nursing interventions as well as collaborative work between oncologist, pharmacologist, nutritional therapy, laboratory technicians, and oncology

This study aims at declaring the effect of the herbal combination of herbal mixture to conventional chemotherapy on minimizing the incidence of chemotherapeutic side effects for 2<sup>nd</sup> stage breast cancer patients. Based on the results of this study, it can be concluded that:

The risk of breast cancer was found to be highly among women with age group (49 – 65) years, and common among breastfeeding women who lactated for three times and more through their life.

Patients with herbal and conventional therapies experienced less chemotherapeutic side effects of all body systems than patients with only conventional therapy. It was also concluded that, liver functions and endocrine studies, renal functions, reproductive system, urinary system, and weight changes were the least affected systems with chemotherapeutic side effects and were also the most affected systems when combined herbal to conventional therapy

Gastro intestinal, respiratory, musclo skeletal systems and hematological studies, as well as eye, ear, mucous membranes were moderately affected systems with the side effects of chemotherapy, and also with combining herbal to conventional chemotherapy. While Psychological status, nervous system, and skin, hair, and nails were the most affected systems with the side effects of chemotherapy, and they were the least affected systems with combining herbal to conventional chemotherapy.

Patients with combining herbal and conventional therapy group have good and very good degrees of health grades and life style, after three months of treatment by herbal and conventional therapy combination. While patients with only conventional therapy, have bad and moderate degrees.

Patients with herbal and conventional therapy have increased body mass index, after three months of treating with herbal and conventional therapy. While patients with only conventional therapy, have decreased their body mass index.

It was found that, there was no relation between chemotherapeutic side effects with age, occupation, type and frequency of breast feeding.

The present findings declare that herbal combination of the study has a great action on attenuating, decreasing, minimizing and protecting the body from the usual side effects appears during conventional chemotherapy.

### **Recommendations**

Based on the findings of the present study, the following recommendations are derived and suggested:-

#### **A- Recommendations for oncology team:**

1. Herbal education should be introduced in nursing and medical curriculum as well as health awareness about herbals with proven efficacy, and its health effects should be increased.
2. It is essential to increase the level of awareness among public, patients and health care providers regarding the efficacy and toxicity of these medicinal herbals, through mass media.

#### **B- Recommendations for further researchers:**

1. Further researches are needed for these herbal components to measure its efficacy on minimizing the side effects of chemotherapy for breast cancer and / or other types of cancer.
2. Clinical studies to identify the effect of these herbals on different cancer therapies, different chemotherapeutic protocols, as well as specifically pre or post mastectomy.
3. Further research also needed for larger number of sample, as well as long period of study time to confirm the effect of these herbals on minimizing the chemotherapeutic side effects.

4. Investigate the relation between awareness of educated patients towards herbal medicine and their compliance.
5. Collaboration, guidance and support for relevant research in herbal medicines to test its safety and efficacy for managing other diseases.

## Women's Awareness of Danger Signs of Obstetrics Complications

Wafaa A. Rashad \*, Rasha M. Essa \*\*

\* Assistant Professor of Obstetric and Gynecologic Nursing, Faculty of Nursing, University of Alexandria, Alexandria, Egypt

\*\* Lecturer of Obstetric and Gynecologic Nursing, Faculty of Nursing, University of Alexandria, Damnhour Branch, Alexandria, Egypt

[wafaa.rashad@alex-nursing.edu.eg](mailto:wafaa.rashad@alex-nursing.edu.eg); [wafaara@yahoo.com](mailto:wafaara@yahoo.com); [rashaessa111@yahoo.com](mailto:rashaessa111@yahoo.com)

**Abstract:** An exploratory descriptive study was conducted at two Maternal and Child Health Centers (MCH) selected randomly in Albeheira Governorate to assess women's awareness of danger signs of obstetric complications. The study subjects consisted of 200 pregnant women attending the previously mentioned setting for tetanus toxoid immunization during pregnancy was enrolled in the study. (100 from each) A structured interview schedule was developed by the researcher after reviewing of the relevant literature and used to collect the necessary data. It comprised the following parts: Part I: Socio-demographic data such as age, level of education, occupation and number of family members...etc Part II: Obstetric characteristics such as gravidity, parity, abortions, antenatal follow up and presence of any complications. etc. Part III: questions related to knowledge about signs of obstetric complications, complaining of any obstetric complication, what to do if the woman has any of these signs. The study revealed that slightly more than one quarter of the study subjects (26.5 %) were unaware of obstetric danger signs compared to almost the same proportion (26.0 %) that had good awareness about such signs, while 47.5 % of the study subjects exhibited fair awareness. Lack of awareness about obstetric danger signs was related younger age, low level of education, gravidity and parity, previous experiences with any obstetric complications and lack of antenatal care. This study reflects the need for strategic plane to increase the awareness to shape health seeking behavior of the public related to signs of obstetric complications.

[**Wafaa A. Rashad**, Rasha M. Essa, Women's Awareness of Danger Signs of Obstetrics Complications. Journal of American Science 2010;6(11):802-]. (ISSN: 1545-1003).

**Keywords:** obstetric danger signs, awareness, signs of obstetric complications

### Introduction

Pregnancy is a normal process that results in a series of both physiological and psychological changes in expectant mothers. However, normal pregnancy may be accompanied by some problems and complications which are potentially life threatening to the mother and / or the fetus. (Fraser et al, 2003).

Globally, every minute, at least one woman dies from complications related to pregnancy or childbirth – that means 529 000 women a year. In addition, for every woman who dies in childbirth, around 20 more suffer injury, infection or disease – approximately 10 million women each year. (WHO, 2005).

In Egypt, maternal mortality ratio has declined dramatically from 174 / 100 000 live births in 1992-1993 to 67.6 / 100 000 live births in 2005, a further decline to 44.6 / 100 000 was also reported by 2009. (GHC, 2010; WHO, 2010)

Five direct complications account for more than 70% of maternal deaths: hemorrhage (25%), infection (15%), unsafe abortion (13%), eclampsia (very high blood pressure leading to seizures – 12%), and obstructed labor (8%). A total of 99 % of all maternal deaths occur in developing countries, where 85 % of population lives. While these are the main causes of maternal death, unavailable, inaccessible, unaffordable, or poor quality care is fundamentally responsible. (WHO, 2010).

Most maternal deaths are avoidable as the health care solutions to prevent or manage the complications are well known. This includes well functioning health system that provides accessible and high quality care from household to hospital level. Egyptian health officials have long been concerned about the country's preventable maternal deaths, with good reason. According to Egypt Demography and health Survey, slightly more than one quarter of Egyptian pregnant women do not receive antenatal care. However, among those who receive antenatal care only one third of them received advised about signs of obstetric complications and

where and when to seek medical assistance. (El-Zanaty et al, 2008).

Obstetric danger signs include persistent vomiting, severe persistent abdominal pain, vaginal bleeding during pregnancy and delivery, severe vaginal bleeding after delivery, swelling of face , fingers and feet, blurring of vision, fits of pregnancy, severe recurrent frontal headache, high grade fever, marked change in fetal movement , awareness of heart beats, high blood pressure, sudden escape of fluid from the vagina, dysuria, oliguria or anuria, prolonged labor, loss of consciousness and retained placenta. Awareness about the significance of symptoms and signs of obstetrics complications may lead to timely access to appropriate emergency obstetric care. (WHO, 2010) Obstetric nurse/ midwife plays a crucial role in promoting an awareness of the public health issues for the pregnant woman and her family, as well as helping the pregnant woman to recognize complications of pregnancy and where to seek medical assistance.

### **Significance of the study**

Women need not to die in childbirth. Women die from a wide range of complications in pregnancy, childbirth or the postpartum period. These life threatening complications are treatable, and thus most of these deaths are avoidable if women with the complications are able to identify and seek appropriate emergency obstetric care which makes a difference between life and death.<sup>(3)</sup> Lack of awareness of the significance of symptoms of obstetric complications is one of the reasons of failure of women to identify and seek appropriate emergency care. Accordingly, assessment of women's awareness of obstetric danger signs and associated factors contributes to their awareness.

### **Aim of the study**

The aim of this study was to assess women's awareness of danger signs of obstetric complications.

### **Research question**

Are women aware of danger signs of obstetric complications?

### **Material and Methods**

#### **Research design**

This is an exploratory descriptive study.

### **Setting**

The study was conducted at two Maternal and Child Health Centers (MCH) selected randomly in Albeheira Governorate namely Mahmodya and Abu-Matameer.

### **Subjects**

A convenient sample of 200 pregnant women attending the previously mentioned setting for tetanus toxoid immunization during pregnancy was enrolled in the study. (100 from each)

### **Tool of data collection**

A structured interview schedule was developed by the researcher after reviewing of the relevant literature to collect the necessary data. It comprised the following parts: Part I: Socio-demographic data such as age, level of education, occupation and number of family members.....etc Part II: Obstetric characteristics such as gravidity, parity, abortions, antenatal follow up and presence of any complications . etc. Part III: questions related to knowledge about signs of obstetric complications, complaining of any obstetric complication, what to do if the woman has any of these signs.

### **Methods**

1. An official permission was obtained from the administration of the previously mentioned settings.
2. The tool was developed after reviewing of relevant literature and content validity was tested by a jury from 3 experts in the field.
3. A pilot study was carried out to ascertain the clarity and applicability of the tool.
4. The researcher met the participants and explained the purpose of the study, and then an individual interview was carried out with the participants who accepted to participate in the study to collect the necessary data.
5. A list of medically recognized life threatening obstetric signs was obtained from the women's responses.
6. After data collection, responses were categorized, coded and analyzed by computer.

### **Ethical considerations**

An individual interview was carried out with the participants who voluntarily accepted to participate in the study to ascertain privacy and confidentiality.

### **Statistical analysis:**

The collected data was categorized, coded computerized, tabulated and analyzed using SPSS/version 17. Chi square test was used to

demonstrate the difference between study subjects' characteristics and level of awareness about obstetric danger signs. The level of significant selected for this study was p equal to or less than 0.05.

Good awareness about obstetric danger signs is defined as the ability to mention >75.0% recognized danger signs, fair awareness is the ability to mention 50-75% and the ability to mention up to 50% of obstetric danger signs was considered poor awareness.

## Results

Table I shows the general characteristics of the study subjects. It is observed that, 23.5% of the subjects were aged 20 to less than 25 years old, 34.5% aged 25 to less than 30 years old and 30.5% aged 30 to less than 35 years old, while only 11.5% were aged 35 years old and more.

Regarding level of education, only 13.5% of the study subjects had university education, 33.0% finished secondary school, 19.5% finished primary or preparatory school, 14.5% were just able to read and write and 19.5 % were illiterate.

As to their occupation, it is observed that, the majority of the study subjects (83.5%) were housewives and 16.5 % were workers.

As regards number of family member, it is found that, only 8.5% of the study subjects live within large family size and less than one half live within family consists of 4 to five members.

Table II shows that, 38.0 % and 34.5 % of the study subjects were pregnant two and three times respectively, 45.0 % and 29.5 % delivered two and three times respectively, 64.5% of them delivered by cesarean section, only 4.0 % had normal spontaneous vaginal delivery and the majority (81.0%) had no abortion. Places of delivery were home (5.5%), governmental hospital (23.0%), private hospital/ clinic (38.0 %) and health/ maternal and child health centers (32.5).

Regarding their babies' health, it is found that only 9.0 % of the study subjects having babies with health problems. These problems are congenital malformations (5.0%), small for date babies (1.5%) macrosomic babies (1.0%) and mental retardation (1.0 %).

Table III: shows the distribution of the study subjects according to attendance of antenatal care. It is observed that the majority of the study subjects (90.0 %) attended antenatal clinics, 49.4 % seek antenatal care at private hospital / doctor, 45.0 % at health / maternal and child health centers and only 5.0 % attended governmental hospital for antenatal care. Only 20.6 % of the study subjects had more than four antenatal visits, followed by 9.4 % had only

four visits, and 36.7 % had three visits and 22.2 % had only two visits.

Table IV presents the distribution of the study subjects according to presence of complications with last pregnancy. It is observed that, about half of the study subjects (46.5%) had complications with the last pregnancy. During pregnancy 17.2 % had threatened abortion or preeclampsia, and 15.1 % had placenta previa. During labor, 6.5 % had difficult labor and intrapartum bleeding, while during postpartum period 4.3 % had breast problems.

Table V presents the distribution of the study subjects according to their awareness of obstetric danger signs. It is found that, slightly more than one quarter of the study subjects (26.5%) were unaware of obstetric danger signs compared to almost the same proportion (26.0%) that had good awareness about the obstetric danger signs, while 47.5% of the study subjects exhibited fair awareness.

Table VI shows the relation between level of awareness of the study subjects and their general characteristics. It is observed that 68.1 % of the study subjects aged 20 to less than 24 years old had good awareness about obstetric danger signs, compared to 21.7 % of those aged 25 to less than 30 years old. It is also observed that 29.5 % of the study subjects aged 30 to less than 35 and 78.3 % aged 35 or more years old exhibit poor awareness regarding such signs. A statistical significant difference was observed between level of awareness and study subjects' age. ( $p = 0.001$ )

The table also shows that the level of education played a positive role in relation to awareness of obstetric danger signs. Therefore, only 11.1 % of the university graduate unaware of obstetric danger signs compared to more than two thirds (69.2%) of illiterate and the difference was statistically significant between level of awareness and level of education. ( $p = 0.001$ )

Regarding occupation, it is observed that, about one third of housewives (31.7 %) exhibited poor awareness about obstetric danger signs, and the majority (90.9 %) of working women exhibited good awareness and the difference was statistically significant regarding level of awareness about obstetric danger signs and occupation. ( $p = 0.0031$ )

As regards number of family member it is observed that the 8.3% and 5.9% of those who had 6 and 8 or more family members respectively exhibited lack of awareness about obstetric danger signs, compared to 45.8 % and 35.3 % of the same group who exhibit good awareness regarding such signs. A statistically significant difference was observed between awareness of women about obstetric danger signs and number of family members. ( $p = 0.015$ ).

Table VII presents the relation between level of awareness of the study subjects and their clinical characteristics. It is observed that 61.5 % of those who were pregnant for the first time and 40.6 % those who were pregnant for three times exhibited good awareness about obstetric danger signs and 78.9 % of those who was pregnant for the second time had fair awareness about such signs. A statistically significant difference was found between awareness of obstetric danger signs and number of pregnancies. (**p = 0.014**)

Regarding parity it is observed that, 41.7 % of those who had no deliveries had either good or poor awareness about obstetric danger signs, the majority (66.7 %) of those who delivered once exhibited fair awareness about such signs. Almost the same proportions (42.4 % and 40.7 %) of those who delivered twice had either fair or poor awareness about such signs, and 57.1 % and 50.0 % of those who delivered for three and more times exhibited good awareness. The difference was statistically significant between awareness about obstetric danger signs and number of deliveries. (**p = 0.028**)

As regards to place of previous delivery, it is observed that, near one half (43.5 %) who delivered at governmental hospital had poor awareness about obstetric danger signs compared to one half of those who delivered at private hospital/private clinics and 61.5 % of those who delivered at Health centers/MCH centers. The difference was statistically significant between awareness of women about obstetric dnger signs and place of delivery. (**p = 0.001**).

Presence of complications during the last pregnancy did not influence the awareness of women about obstetric danger signs as 50.5 % of those who had complications exhibited poor awareness compared to 5.6 % of those who had no complications, while 32.3 % of those with complications had fair knowledge compared to 60.7 % of those who had no complications. The difference was statistically significant between occurrence of complications and the awareness about obstetric danger signs. (**p = 0.0031**)

Attendance of antenatal care positively affected the awareness of women about obstetric danger signs. The majority of those who attended the antenatal care had more awareness than those who did not. And the difference was statistically significant between the level of the study subjects about obstetric danger signs and attendance of antenatal care. (**p = 0.001**).

## Discussion

The current challenge worldwide is to decrease maternal mortality rate. Reproductive health is closely related to maternal mortality. McCarthy & Main (1992) mentioned that health status and reproduction status of women belong to intermediate variables determine maternal mortality. Health status of women concerning nutritional status; history of pregnancy morbidity such as infectious or chronic diseases; it is clear that women's health status plays a significant role in their reproductive function. Reproductive status consists of maternal age, parity and marital status which is directly related to maternal mortality.

The vast majority of maternal deaths could be prevented if women know when and where to seek medical care because if the pregnant women do not have appropriate information about pregnancy and childbirth they would be unable to make a choice that will contribute to their own well-being, the question is are women aware of the warning signs of obstetric complications?

The present study aimed to answer the research question whether women in a certain rural area in Egypt are aware of obstetric danger signs? This is important because in rural areas in Egypt it is generally believed that pregnancy is a natural phenomenon and a part of women's reproductive functions, and problems or complications during pregnancy are being viewed by some women as natural to pregnancy. Such beliefs contribute to lack of utilization of medical services which in turn leads to undetected and untreated complications consequently increased maternal mortality rate.

In the current study only about one-quarter of the study subjects exhibited good awareness about obstetric danger signs. This awareness indicates the existence of knowledge which can be in turn transferred into action. The importance of knowledge to shape health seeking behaviors which contribute to save women's live from preventable causes of maternal deaths is stressed by many authors (Myer &

Hariisson 2003; Smith et al 2004; Stekelenburg et al 2004; Sugiarto 2007)

Unfortunately, almost the same proportion of the study subjects was unaware of obstetric danger signs which reflect lack of knowledge regarding such signs even though such knowledge is very important. This could be explained by poor counseling of pregnancy danger signs among those who attended antenatal clinics as the majority of the study subjects attended antenatal clinics, among them about two-thirds had three visits. This emphasizes the needs to ensure that nurse/midwives inform all antenatal clients about obstetric danger signs

Women's awareness of potential obstetric danger signs is expected to influence their decisions regarding when to decide to seek medical care. Accordingly, awareness of obstetric danger signs is expected to help women to early recognize signs when the complications occur and limit the time to make a faster decision to seek medical care which makes a difference between life and death if all such signs are well known. . This makes it very important to women to be aware of all obstetric danger signs. However, the results of the present study revealed that nearly one half of the study subjects had fair awareness of obstetric danger signs; it means they were able to identify 50-75% of such signs. This could be explained by the fact that 26.4 % of Egyptian women does not receive antenatal care, among them 34.1 % told about signs obstetric complications and 31.4 % told where to go if had any of complications (EDHS 2008). Therefore, this study reflects the needs for strategic plan to increase the awareness to shape health seeking behaviors of the public related to obstetric complications.

The present study revealed that age, education, occupation, gravidity, parity, presence of complication and attendance of antenatal care are associated with awareness of women about obstetric complications. Increased awareness among older and multigravida and multiparous women may be related to their own experiences of pregnancy and delivery which is an important source of their information specially those who had complications associated with their pregnancy. This is in line with Pembe et al (2009) who stated that young women in their first pregnancy may need more consideration when providing counseling and health education.

In the current study education seems to play a positive role in increasing the awareness of women about signs of complications. This is in agreement with Anya et al (2008) who stated that, educated women have better pregnancy outcome compared with uneducated women; this may be partly because they are better informed and make better choices. Moreover, occupation seems to influence the level of

women awareness about signs of obstetric complications. This could be explained by the fact that, working women have better opportunity to share experiences with others than housewives. Furthermore, in rural areas sources of information are limited unlike urban areas in addition to the prevalence of illiteracy which may contribute to this result.

The findings of the present study revealed that attendance of antenatal had positive effects on increasing the awareness of women about the signs of obstetric danger signs. This is online with Anya (2008) who stated that high antenatal coverage and relatively high frequency of visits provides an excellent opportunity for information, education and communication. However, this finding is incongruent with Pembe et al (2010) who reported deficiencies in the counseling of pregnancy danger signs in his study and a significant proportion of the clients were not informed about pregnancy danger signs. Similar results are documented by NBS (2004/5), Nikiema et al (2009), von Both et al (2006) and Boller et al (2003)

#### **Limitation of the study:**

Women were not asked about the source of their information and to whom they should report if they experience any complication in addition to the immediate intervention they should receive.

#### **Conclusion**

Based on the findings of the present study, it can be concluded that lack of awareness about obstetric danger signs was related younger age, low level of education, gravidity and parity, previous experiences with any obstetric complications and lack of antenatal care. These factors stressed the need for a plan to increase the awareness of the public about such signs. This information will help the services providers for improving the quality of antenatal care services.

From this study the need for strategic plan to increase the awareness of women about signs of obstetric complications is highly recommended.

Food Toxins and contaminants Department<sup>1</sup>, Dairy Department<sup>2</sup>, Food Technology Department<sup>3</sup>, National Research Centre, Cairo, Egypt.  
[shaabanmostafa@yahoo.com](mailto:shaabanmostafa@yahoo.com)

**ABSTRACT:** The following study was conducted to investigate the antifungal and food additive potential of medicinal plants. herbal decoction and essential oil (EO) extracts of *Cymbopogon flexuosus* (lemongrass) leaves and stems were tested for their inhibitory action against spoilage organisms and mycotoxins formation in two separated experiments. In the first experiment, yeast- extract sucrose medium (YES) was used as a basal medium to examine the mold growth and mycotoxin production by three pathogenic fungi: *Aspergillus flavus* (*A. flavus*), *Aspergillus parasiticus* (*A. parasiticus*) and *Aspergillus ochraceus* (*A. ochraceus*). The YES medium was supplemented with four different concentrations of Lemongrass oil, inoculated with 1-mL of a spore suspension containing  $10^5$ - $10^6$  conidia of each test mold and then incubated at 28° C for 14 days. After incubation period, cultures were analyzed for mycelial dry weight and mycotoxin accumulation. In the second experiment, yoghurt medium was used as a basal medium and the same system of study was applied in two different degrees of temperature (5°C and 28°C) for 4 weeks. Evaluation of the Lemongrass oil activity in yoghurt samples focused on the microbial stability of yoghurt, sensory evaluation as well as mold growth and mycotoxin formation. In the 1<sup>st</sup> experiment, the level of 0.1% of the EO extract was effective in inhibition both mold growth and mycotoxin production for all tested molds, and 0.3 % extract completely prevented the growth and toxin production. whereas, 1% of the decoction extract was effective. So, the EO extract was the suitable agent in the second experiment. It is of interest to note that while reduction in mold growth due to increasing extract concentrations was observed, the most striking effect was the reduction of mycotoxin production. The obtained data from the second experiment showed that the EO extract (0.1% concentration) inhibited viable yeasts and preserved yoghurt for over 28 days at 5°C. Also, the inhibitory action of the EO extract against yeasts was concentration dependent. The maximum inhibitory effect of was found when the extract level increased above 0.1%. Incubation temperature had an important role in growth and mycotoxin production in yoghurt medium. During cold storage for 28 days at 5°C, the different concentrations of the EO extract added to the yoghurt samples displayed different titratable acidity and total bacterial cells and pH than the control yoghurt ( $p < 0.05$ ). Overall sensory acceptability of yoghurt supplemented with the EO extract was higher than that of the control yoghurt prepared without the EO extract. Total sensory evaluation of experimental yoghurt used as a control was up to 4.3 scores lower compared to yoghurt samples treated with the EO extract. The results indicate that the addition of the appropriate the EO concentrations (0.1%, w/v) improved the physicochemical properties as well as sensory characteristics of yoghurt, could be used for decontamination of dairy products such as yoghurt from mycotoxicogenic fungi and mycotoxins formation, beside its beneficial properties as a functional food.

**Key words:** Yoghurt, lemongrass, molds, yeasts, mycotoxins, aflatoxins, ochratoxin A, food additives.

### INTRODUCTION

Yoghurt in addition to its high nutritional value, it possesses antagonistic and therapeutic values. The valuable sensory characteristics of yoghurt are due to its content of carbonyls, mainly acetaldehyde, acetone, diacetyl and ethanol, produced by yoghurt bacteria. Yoghurt provides higher levels of protein, carbohydrate, calcium and certain B vitamins than milk (Gurr, 1987; Deeth and Tamime, 1981). The shelf life of yoghurt is short, i.e., 1 day under ambient condition (25–30°C) and

around 5 days at 7°C, which hinders its commercialization (Salji, 1987). Yoghurt defects due to microbial contamination are widely reported in literature; the most frequent contaminants are yeasts and moulds (Spolaor *et al*, 1988; Foschino and Ottogalli, 1988; and Abdel-Fattah and Abdel-Salam 2004) usually causing the swelling of packs, the presence of superficial coloured spots and abnormal tastes (Ottogalli, 1991). The low pH of yoghurt offers a selective environment for the growth of acid tolerant yeasts and molds (Banaquio *et al*, 1981, Spillmann and Geiges, 1983). Therefore, it is

not surprising that various investigators have found that yeasts are the primary spoilage microorganisms for yoghurt and that fruits, flavors, and coloring agents are frequent contamination sources (**Main, 1984; Weber and Broich, 1986**). The spoilage of yoghurt by yeasts has been generally characterized by yeasty offflavors, loss of textural quality due to gas production, and swelling and occasional rupturing of the product containers (**Davis, 1974**). As a result, there is an apparent need for an effective preservation method to control acid-tolerant spoilage yeasts and molds in yoghurt.

Micotoxicogenic Fungi and Pathogenic bacteria can grow at refrigeration temperature to numbers, which can result in an infection. For this reason dairy products should be kept well covered to prevent contamination, should ideally be consumed within two days of opening, or used in cooked foods after that two-day period (**Potter and Hotchkiss, 1995**). Mycotoxins may be found in milk products, originating from three possible sources: raw milk (such as aflatoxin M1 which present as a consequence of aflatoxin B1 metabolism by the animal); growth of a toxicogenic fungal strain on product and mycotoxins synthesis, and production of these toxins in dried milk used to make milk product (**Jose et al., 1988**).

Hence, it is highly desirable to prevent mould growth or to prevent mycotoxins formation in contaminated food. Several chemicals have been used to detoxify mycotoxins but these chemicals can not be added to foods to prevent mycotoxins formation because of their hazardous effect on human health. In recent years, studies on the natural antifungal agents, herbs and spices, have been reported by numerous investigators (**Afrodit, 1995; Hiroshi and Jun Sato, 2002; and Abd-EL Fattah and Abdel-Salam, 2004**). They found that some herbs and spices had antifungal effect against some kinds of mycotoxicogenic fungi, such as *A. flavus*, *A. ochraceous* and *A. parasiticus*, in synthetic medium. Among herbs and spices used, were sage, thyme, rosemary, mint, and Lemongrass.

*Cymbopogon flexuosus* (Lemongrass) is an economically important plant that has been used for centuries, as a medicine because of its wide-ranging therapeutic properties included relief of rheumatic and other pain and healing effect on ulcers (**Fenwick et al., 1990**). Flavonoids extracted from Lemongrass are of considerable interest as natural plant components with antioxidant and antifungal activity (**Pratt and Hudson, 1990; Nieto et al., 1993; and Abu-Seif, et al., 2009**). Of the flavonoids present in Lemongrass, licochalcone A and licochalcone B which have equal antioxidant activity of vitamin E, and

glabrene which is 3 times as active when compared with vitamin E (**Okuda et al., 1989**).

One objective of the present study was to investigate the inhibitory action of Lemongrass oil against spoilage organisms and mycotoxins formation in yoghurt under laboratory conditions. The use of Lemongrass herb in this study was due that Lemongrass is naturally occurring material, widely cultivated, cheap, had a medical functions and safe. These properties and the antifungal activity, if possible, make lemongrass oil may be potential multi-functional food additives. The physico-chemical properties, color characteristics, total phenol content, microorganisms, sensory evaluation and the effect of storage time at 5°C for 2 months of yoghurt were also studied.

## 2- MATERIALS AND METHODS

### 2.1- Experimental design.

Depending on our previous results (**Abdel-Fattah, 2002; Abdel-Fattah and Abdel-Salam, 2004 and Abu-Seif, et al., 2009**), concerning the antimicrobial effects of herbal extracts, this study was achieved. Two separated experiments were carried out during this study. The first experiment was to examine the best of the tow different extracts of Lemongrass, essential oil (EO) extract and decoction extract as antifungal agents. In the second experiment, the best extract selected from the first study was used on yoghurt medium, to test its antifungal effects and to study the physico-chemical properties, color characteristics, total phenol content, as well as microbial stability and sensory evaluation of yoghurt during storage time at 5°C for 4 weeks.

### 2.2- Organisms.

**a- Fungal strains:** *Aspergillus flavus* (A. *flavus*), aflatoxigenic local strain; *Aspergillus parasiticus* (A.*parasiticus*) NRRL 2999 and *Aspergillus ochraceus* (A.*ochraceus*) NRRL 3174, were obtained as lyophilized preparation from the Mycotoxin lab. , National Research Center, Dokki, Giza , Egypt.

**b- Bacterial strains:** Starter culture of Yoghurt *Streptococcus salivarius* subsp. *thermophilus* and *Lactobacillus delbrueckii* subsp. *bulgaricus* (1:1) was obtained from HACCP certified and ISO22000: 2005 Dairy Company, and used as a source of the starter culture.

### 2.3- Milk used for making of lab. Yoghurt:

Raw buffalo's milk used for making yoghurt, the milk was obtained from a dairy farm at Agriculture

faculty, Cairo University Governorate. Starter cultures used for making plain yoghurt Old plain yoghurt obtained from HACCP certified & ISO22000: 2005 Dairy Company was used as a source of the starter culture.

#### **2.4- Plant material:**

Lemongrass powder (leaves and stems) was purchased from an Egyptian local market (Harraz Co., Cairo, Egypt).

#### **2.5- Mycotoxins standards:**

All standards of Mycotoxins (Aflatoxins, B1, B1, G1, G2, and ochratoxin A) were purchased from sigma company, USA.

#### **2.6- Analytical methods:**

##### ***2.6.1- Extract preparations of Plant material:***

Lemongrass powder was purchased from a local market and the samples were extracted as follow:

**a- Preparation of herbal decoction:** Decoctions of lemongrass leaves were prepared by boiling the powder material at solid : liquid ratio 1:10 with distilled water for 5 minutes. The vessel containing the decoction and herb was then covered and removed from the heat and allowed to cool for 5 minutes. The herbal material and liquid was then strained through cheese cloth and the resulting decoction placed into 100 mL reagent bottles which had been kept for use as the test decoction (**Abdel-Fattah and Abdel-Salam, 2004**).

**b- Preparation of herbal Oil:** Briefly, 250 g fresh plant material (leaves and stems) of lemongrass plant was put in a round bottom flask and 1000 mL distilled water was added before subjecting to hydro-distillation (**Bankole and Joda, 2004**) for 6 hours. The oil was recovered and dried over anhydrous sodium sulphate.

##### ***2.6.2- Spore suspension of fungal strains:***

These culture strains were grown on (PDA) slants for 10 days at 25 °C Until will sporulated . the spores were washed from the slants with a sterile 0.01% solution of tween 80 as a spore dispersal agent. The final spore preparations were resuspended in the appropriate volume of sterile saline to yield a direct microscopic count of approximately  $10^5$ - $10^6$  spores /mL, of each tested fungus.

##### ***2.6.3- Preparation of yoghurt containing Lemongrass oil:***

Raw buffalo's milk was subjected to a heat treatment at 72°C for 2 seconds to kill microorganisms followed by cooling to 40 – 45°C.

Oil extract of Lemongrass was added to milk before processing with different concentrations. As starter culture yoghurt (*L.bulgaricus* and *S. thermophilus*) was added (1.5%) to the milk, followed by mixing, and packed in sterilized glass capped cups 100 mL capacity, followed by incubation at 40°C for 3 hours till gel forms (pH 4.5). Freshly yoghurt was cooled and stored at refrigeration at 5°C till examination to slow down the physical, chemical and microbiological analysis.

#### ***2.6.4- Antifungal assay:***

**2.6.4.1- With yeast extract sucrose medium (YES):** Yeast extract- sucrose (YES) broth (2% yeast extract, 15% sucrose) was used in the 1st experiment as a basal medium for mould growth and mycotoxin production in stationary cultures (**Davis et al., 1966**). Each medium (50 mL) in 250 mL Erlenmeyer flasks was sterilized at 121°C for 15 min. For each organism used, the appropriate amounts of lemongrass essential oil and lemongrass decoctions were added into sterile YES to obtain the concentrations of 0.05, 0.1, 0.3, 0.5 and 1.0 %. YES without any herbal extract added served as control. Each flask with or without appropriate extract was inoculated with 0.1 mL spore suspension, then cultures were incubated at 28°C in the dark for 14 days. Each concentration of tested extracts was tested twice, sometimes three times.

**2.6.4.2- With yoghurt medium:** The same antifungal assay on YES, was applied on yoghurt medium except that extract used was the EO extract, added to milk before processing and the culture media were incubated at two different temperature, 5 and 28 °C for 35 days. Yoghurt medium were inoculated with mycotoxicogenic fungi and stored for 35 days at 5 and 28 °C. Semi quantitative assay of the tested oil extract was conducted according to **Harboure (1973)**.

#### ***2.6.4.3- Evaluation of antifungal properties of lemongrass extracts.***

**a- With YES broth media:** Contents of flasks, with and without (serve as the control) lemongrass extracts, were analyzed in triplicates for dry weight of mycelium and mycotoxin accumulation. Dry weight of mycelium was determined according the method of **Davis et al., (1966)**. Aflatoxins were extracted according to the modified procedure of **Eleghede, (1978)**. After extraction, aflatoxins (B<sub>1</sub>+G<sub>1</sub>) were determined according to the **AOAC methods, (1980)**. Ochratoxin A (OA) was extracted and determined

according to the method of Scott *et al.*, (1971). Percent reduction or accumulation over control, in growth or mycotoxin production was calculated by the following equation:

$$\text{Percent reduction} = 100 - \{(A_1 / A_0) * 100\}$$

$$\text{Accumulation over control} = \{(A_1 / A_0) * 100\} - 100$$

Were:  $A_1$  = The amount obtained by treatment.

$A_0$  = The amount obtained by control.

**b- With yoghurt medium:** Fungal growth of all tested molds were visually assessed using a semi-quantitative scale, Viz.(0) no growth; (1) very little growth covered the surface of the plate; (2) 25 % of the plate surface covered; (3) 50% of the plate surface covered; (4) 75 % of the plate surface covered and (5) 100% of the plate surface covered. Yoghurt medium were examined for the presence of aflatoxin production as described by the **AOAC methods, (1980)**. For ochratoxin A, cultures were extracted, and OA levels were determined as described by **Valenta and Michael, (1996)**.

#### **2.6.5- Microbiological stability of yoghurt:**

The microbial stability of yoghurt containing the EO extract of lemongrass during storage at refrigerator ( $5^{\circ}\text{C}$ ) for 28 days were investigated. The populations of total bacteria, yeast and molds were determined by the method of **Sadler, et al., (1992)**. The counts of total bacteria (TPC), yeast and molds (Y&M) calculated per one gram of all yoghurt slices using plate count agar and malt extract agar (Merck KGaA, Darmstadt, Germany). The number of colonies (TPC or Y&M) that appeared on the plates was counted and expressed as Colony Forming Unit (CFU/g).

#### **2.6.6- Determination of pH:**

The pH of fruit sample was measured using a combination pH electrode with a digital pH meter (HANNA, HI 902 meter, Germany) standardized with stirring as described in (AOAC, 2000).

#### **2.6.7- Determination of total soluble solids (TSS):**

The percent total soluble solids, expressed as oBrix, were determined with a refractometer (ATAGO, Japan).

#### **2.6.8- Determination of Titratable acidity (TA):**

Titratable acidity were determined as described by (Tung Sung Chung, et al., 1995) by using approximately 10 g portion of yoghurt sample

blended with 100 mL distilled water for 30 sec in blender and was titrated to pH 8.0 with a 0.1N NaOH solution. The end point was determined with a pH-meter. Titratable acids in the sample were calculated as percent of lactic acid or malic acid.

### **2.6.9- Viscosity measurements:**

The viscosity measurements were carried out using a HAAKE viscometers (HAAKE, Mess-Technik Gmbhu. Co., Germany) with thermostatic bath to control the working temperature within the temperature of 25°C. Results of viscosity were expressed in centipoise (cP) according to the method of Ibarz *et al.*, (1994).

#### **2.6.10- Total phenol determination:**

Total phenol content of the untreated and treated samples was measured by the method of **Amerine and Ough (1980)**, the absorbance was measured at 765nm using Spectrophotometer, UVD-3500, Labomed, USA and the results were expressed as milligram of garlic acid as standard equivalent per gram.

#### **2.6.11- Color characteristics determinations:**

Color is one of the more important quality parameters in processed products. Undoubtedly, possible color changes would influence the Organolytic properties of samples and would limit their potential applications.

Hunter  $a^*$ ,  $b^*$  and  $L^*$  parameters were measured with a color difference meter using a spectrophotometer (Tristimulus Color Machine) with the CIE lab color scale (Hunter, Lab Scan XE - Reston VA, USA) in the reflection mode. The instrument was standardized each time with white tile of Hunter Lab Color Standard (LX No.16379):  $X=72.26$ ,  $Y=81.94$  and  $Z=88.14$  ( $L^*=92.46$ ;  $a^*=-0.86$ ;  $b^*=-0.16$ ) (**Sapers and Douglas, 1987**). Color difference, Delta E, was calculated from  $a^*$ ,  $b^*$  and  $L^*$  parameters, using Hunter-Scotfield's equation (**Hunter, 1975**) as follows.

Delta E = (delta a<sup>2</sup> + delta b<sup>2</sup> + delta L<sup>2</sup>) 1/2 ----- (1)  
 where: a - a<sub>o</sub>, b - b<sub>o</sub> and L - L<sub>o</sub>; subscript "o" indicates color of control or untreated sample.

The Hue-Angle ( $H$ )\*, Chroma ( $C$ )\* and Browning Index ( $B_I$ ) was calculated according to the method of **Palou et al.**, (1999) as follows:

$$C^* = \text{square root of } [a^{2*} + b^{2*}] \quad (3)$$

Where:  $X = (a^* + 1.75L^*) / (5.645L^* + a^* - 3.012b^*)$

#### **2.6.12- Sensory Evaluation:**

Sensory evaluation of the studied was carried out included 20 experienced panelists. The attributes such as: flavour intensity, body, texture and color were organolaptically assessed at stated by (Crandall, et al., 1990). The all tested samples subjected to sensory evaluation after 28 days in yoghurt samples.

#### **2.7- Statistical Analysis:**

Analyses for experiments were performed in duplicated, and results were averaged. A Duncan Multiple Range Test was carried out by means of the “shortest significant ranges SSR” (Larmond, 1974) to determine the differences between the treatments using HDSS statistical analysis program.

### **3- RESULTS AND DISCUSSION**

#### **3.1- Antifungal effect of the two different extracts of lemongrass on YES borth medium:**

Data presented in Table (1) clearly indicate that mould growth by all tested strains, were suppressed by lemongrass oil extract or decoctionextract. The inhibitory effect of these extracts was proportional with their concentrations. Slightly effect on fungal growth was observed when low concentration (0.05% and 0.1%, respectively) of the EO extract and decoction extract were applied, whereas high concentrations of these extracts inhibited fungal growth and, consequently, mycotoxin formation. The maximum inhibitory effect of these extracts were recorded at the level 1 % and 0.3% for decoction extract and EO extract, respectively (Table, 1).

In regard to Table (2), *A. ochraceus* was more sensitive one for the two lemongrass extracts than the two other molds. The EO extract was more effective agent on mycelial growth than decoction extract. The inhibitory effect of the two different extracts on mycelial growth according to the mold type, may be rankled as follow: *A. ochraceus* > *A. flavus* > *A. parasiticus*, for the EO extract. However, for decoction extract were: *A. ochraceus* > *A. parasiticus* > *A. flavus*. These differences in the inhibitory effect may be mainly due to interfering some factors: the mold type, incubation temperature and type of extract and subsequently the differences in the chemical composition for each extract. In this respect, many publications indicated that the compositions and concentrations of compounds within the distinct types of herbal extract

preparations would differ and play an important role in its antifungal activity action (Buchanan and Shepard, 1981; Lienert et al., and Nass-Reinhold et al., 1998; and Abdel-Fattah and Abdel-Salsm, 2004). Also, El GendY and Marth, 1980, reported that temperature is one factor affects mold growth and mycotoxin production by toxigenic aspergilli and penecillus and in the presence of lactic acid bacteria. Abdel-Fattah, (2002), found that mold type and incubation temperature were important factors affecting mold growth and aflatoxin production by *A. flavus* and *A. parasiticus* in media contained solvent extracts of licorice.

Data represented in Table (2) clearly indicate that increasing levels of the extract, in YES broth media, resulted in detection of decreasing levels of mycotoxin production. At the lowest level (0.05% extract), reduction in mycotoxin production was slightly decreased in the media supplemented with decoction extract compared to those supplemented with oil extract. Increasing extract concentrations caused a linear depression in mycotoxin formation by the all tested molds, but the maximum inhibitory effect was differ, and this may be referred that organism was more variable in its reaction to the extract. This trend indicates that extract inhibited mycotoxin formation by inhibiting the mould growth. In a similar study, Masood and Ranjan (1991) reported that extracts of *Argemone mexicana* and *cyperus rotundus* inhibited aflatoxin production by inhibiting the growth of *A. flavus*. Also, Mahmoud et al., (1994), found that extracts of lupinus and xanthium punens inhibited aflatoxin production by inhibiting the growth of *A. flavus*.

Reduction of fungal growth and mycotoxin production by the EO extract in our study was due to interference by active principles of these extracts. Such interference may be at the biosynthetic levels. In this respect, Kumar and Prasad (1992) suggested that growth and aflatoxin production by *A. flavus* are proportionate processes. However, Bhatnagar and McCromick (1987) reported that the growth and aflatoxin production by *A. parasiticus* are independent phenomena. On the other hand, Abu-Seif, et al., (2009) reported that oil extract of lemongrass leaves and stems, completely inhibited mycelial growth and mycotoxin production of *A. flavus*, *A. parasiticus* and *A. ochraceus* at level (0.3 %) of YES broth medium.

Data represented in Table (1) showed that there were a considerable differences in mold or mycotoxin inhibition in YES medium supplemented with the EO extract or the decoction extract, in trend to EO extract. Therefore, the EO extract of Lemongrass leaves and stems was selected, as the best, to examine its antimicrobial effect on yoghurt medium.

### 3.2- Antifungal effect of lemongrass oil on yoghurt medium:

Results obtained from Table (3) showed that increasing levels of EO extract added to yoghurt

either incubated at 5 or 28 °C for 28 days, an inhibitory effect was noted on the growth of the all tested molds. At the lowest concentrations of extract (0.05%), the mold growth by the tested molds, were comparatively no changed over control. However,

increasing concentration level up to 0.1% completely prevented the mold growth, either when the media incubated at 5 or 28 °C. These results also indicate that growth was influenced by both mold type and incubation temperature. Also, these results revealed that 28 °C was the optimum incubation temperature for growth and consequently, mycotoxin formation occurred in this study. The mold growth was higher by *A. flavus* and *A. ochraceus* than *A. parasiticus*. Also, growth was influenced by mold type and temperature degree of incubation. Temperature is one factor which affects mold growth and mycotoxin production. Other publications supported our results (**EL-GENDY and MARTH, 1980; MASHALY and EL-DEEB, 1982, and ABDEL-FATTAH, 2002, Abdel-Fattah and Abdel-Salam, 2004**).

When mycotoxin production was determined in the media incubated at 5 and 28°C, the effect of EO extract was even more striking (Tables 4 and 5). Increasing concentration of extract resulted in detection of decreasing levels of mycotoxin production. At the lowest level of extract (0.05%), a great reduction mycotoxin production were found, and the reduction was especially pronounced with aflatoxins and ochratoxin A. No toxin was detected when the extract level increased to 0.1%.

Regarding results represented in Tables 3, 4 and 5, The lack of mycotoxin production on yoghurt raises questions concerning the reasons for this phenomenon. The possibility that ingredients contained in yoghurt, but not in YES, might be inhibitory to growth and toxin production was considered.

It is possible that antifungal activity of the used lemongrass essential oil in this study is due to an unidentified component of the antioxidants extracted (perhaps phenols, flavonoids, flavones,..etc) . In this respect, **Rosenthal et al., 1997**, reported that phenols play an important role as antifungal agents. They found that ferulic acid, p-coumaric acid and other plant cell wall phenols, had antifungal actions in microorganisms isolated from dairy products. Also, **Abu-seif et al., 2009**, found that phenolic compounds extracted from Lemongrass leaves had antifungal effects on *A. flavus* and *A. parasiticus*. **Hiroshi and Sato (2002)**, reported that lemongrass extract with 80% methanol was found to have high fungicidal effect against *Arthrinium sacchari* M001, and its active compound was identified as glabridin. Strong antioxidant activity has been observed in flavonols such as quercetin, flvonones such as luteolin, and chalcones such as butin (**Hudson and Lwiss, 1983**).

**3.2- The effect of essential oil of lemongrass on the log (CFU/gm) of growth yeast and molds (Y&M) and bacteria in yoghurt during storage at refrigerator for 4 weeks.**

The microbial stability of yoghurt supplemented with extracts of lemongrass during storage at refrigerator (5°C) for 4 weeks were investigated. Tropical spices (lemongrass) may prove useful in preservation of yoghurt by hurdle technology (**Ejichi, et al., 1998**). Total microbial count of different yoghurt treatments with 0.0, 0.05, 0.1, and 0.3 % of lemongrass EO extract, and of untreated yoghurt were followed up through 4 weeks at 5°C. The effect of treating yoghurts with the studied various volatile or essential oil extract and stored at 5°C for 4 weeks on inhibiting the microbial counts are seen in Table (6). It can be observed that the yoghurt treated with low concentration of lemongrass extract have the highest inhibition of yeast and molds (Y&M) and bacteria (B) followed by those treated with high concentration of lemongrass extract after 4 weeks at 5°C. Untreated yoghurt was 6.75 log (CFU/gm) of B compared to 0.00 log (CFU/gm) in case of those Y&M. Whereas, the yoghurt treated with 0.5% lemongrass was 0.00 log (CFU/gm) of Y&M and 6.10 log (CFU/gm) of B.

The results from Table 6 showed that the yoghurt treated with high concentration of lemongrass has also the highest reduction of Y&M and B followed by low concentration of lemongrass, but untreated samples were the lowest reduction of Y&M and B for 4 weeks stored at 5°C.

These results are partially confirmed by those of **Kanako et al., (1998)**. They found that Limon grass and clove exhibiting strong anti-fungal activity for 30 days. Whereas no colonies were seen for 30 days and fungal growth was inhibited for more than 30 days. On the other hand, **Sebti and Tantaoui, (1994)** showed that cinnamon powder although very efficient at inhibiting the fungi, imported a dark color

to the papers and therefore is not recommended. While, cinnamon water extract did not inhibit fungal growth up to concentration of 80 g/kg (8%). Also, results from Table (6) showed that refrigeration temperature 4 oC of yoghurt could enhance the inhibitory effect of volatile or essential oil lemongrass extract. These results nearly in consistent with results given by **Eissa et al., (2003a, b), Eissa et al., (2008)** and **Ting and Deibel, (1992)** who appeared that refrigeration temperature (5°C) could enhance the inhibitory effect of some spices extracts but not others. When 0.5 or 1.0 % cloves were tested, the organism died more rapidly in tryptic soy broth at 24°C than at 5°C. Whereas, > 5 log reduction in CFU was observed after 7 days of incubation at 5°C and after 3 h incubation at 24°C in tryptic soy broth.

In general, the refrigeration of yoghurt effects increased the inhibition of bacteria, yeast and mold counts. Also, the results showed that the yoghurt treated with different concentrations of lemongrass extract were observed no browning and lowest microbial count (T and M and B) during storage at 5°C for 5 weeks. Lemongrass extract as preservatives may be due to it contain aldehydes and volatile compounds that have efficient on inhibition of browning and inhibition of growth microorganisms. **Nakatani, (1994)** proposed inhibitory mechanism that the anti-fungal action of the aldehydes that was due to the ability to form charge transfer complexes with electron donors and reactivity with SH group in cystein or glutathione moieties.

**Zaika, (1988)** reported that food product safety and shelf life depend in some part on the type, quantity, and character of volatile oil spices extracts added to the products. Then, our results showed that refrigerating at 5°C and 0.05% volatile or essential oil extracts treatments caused a marked reduction in yeast and bacteria populations with acceptable taste and extension shelf life of yoghurt up to 5 weeks.

**Table 6. Effect of essential oil extracts on the number of colonies (TPC or Y&M) that appeared on the plates and expressed as the log (CFU/gm) in yoghurt during storage at refrigerator (5 °C) for 4 weeks.**

### **3.3- Effect of lemongrass essential oil on physico-chemical content in yoghurt during storage time:**

#### **Quality evaluation of yoghurt products.**

The following discussion of the chemical characteristics for fresh, products and lemongrass extract pre-treated yoghurt is based on the data given in table (7). The pH of fresh and treated yoghurt ranged from 4.04 to 4.49 showing a increase in pH values. The increase in pH was directly related to increase lemongrass extract concentrations in yoghurt. TSS (g/Kg) of yoghurt products after 28 days storage was lower than the fresh yoghurts. Whereas, the increase of TSS was obvious with increasing of lemongrass extract concentration. This increase of TSS was attributed to the greater degree of tissue breakdown, releasing more components that contribute to soluble solids (**Tung-Sun, et al., 1995**). The TSS / acid ratio is the major analytical measurement for quality in fresh and treated yoghurt. The TSS / acid ratio of fresh, and treated yoghurt was increased by increasing of lemongrass extract concentration. TSS / acid ratio was shown to be correlated with sweetness but not so closely with flavour (**Guyer, et al., 1993**).

Titratable acidity of yoghurt products was lower than fresh yoghurt (Table 7), which may due to enzymatic desertification and degradation of pectin resulting in an increased of total acid.

The viscosity (cP) was selected as a measure of yoghurt quality. However, the viscosity between fresh and treated yoghurt samples were decreased from 2.92 cP to 2.64 by increasing the lemongrass extract concentration in yoghurt than fresh sample (2.86 cP), respectively as seen in Table (7). Total phenol content were decreased also by increasing of lemongrass extract concentration in all yoghurt samples, as seen in table (7).

**Table (7): Effect of Concentrations on physico-chemical properties in yoghurt at zero time and after 21 days.**

Extract level,%	TSS		pH		% acidity		TSS/acidity		Viscosity (cP)		Total Phenols	
	at zero time	after 28 days	at zero time	after 28 days	at zero time	after 28 days						
0.0	7.50	6.00	4.04	4.39	0.94	0.94	7.8	6.38	2.86	2.60	1342.85	1342.85
0.05	7.00	6.00	4.00	4.30	0.96	0.92	7.4	6.51	2.92	2.80	1345.97	1345.97
0.1	7.50	7.00	4.08	4.39	0.97	0.94	7.7	7.44	2.75	2.60	1338.17	1338.17
0.3	8.00	7.00	4.11	4.49	0.98	0.95	8.17	7.36	2.64	2.52	1317.87	1317.87

### **3.4- Effect of lemongrass essential oil concentrations and storage on Color characteristics of yoghurt:**

#### **a- Color parameters during storage time of yoghurt:**

Tristimulus Reflectance Colorimetry (TRC) measuring the reflectance L\*, a\* and b\* values) was used to follow the extent of browning in yoghurt and change of color in foods (**Sapers and Douglas., 1987**). The results in Table (8) showed change of color in yoghurt during storage time up to 28 days at 5°C. These results illustrated the changes in color of yoghurt in terms of redness a\*, yellowness b\* and lightness L\* during 28 days of storage at 5°C. In addition to determination of the lightness L\*, redness a\* and yellowness b\*, for experimented yoghurt. Hue angle (H\*) as well as the chromaticity (C\*) were determined. Hue is the aspect of color that we describe by words such as green, blue, yellow or red. The chroma refers to reflection at given wavelength and indicates how much a color differs from gray (**Eissa and Moharam, 2001**). The equations No. 1, 2, 3 and 4 are showed the DE, B<sub>1</sub>, H\* and C\*.

The H\* values were closely stable in all samples with increasing of storage time up to 28 days at 5°C. The chromaticity (C\*) increased by the increasing of stoarge time in yoghurt up to 28 days. Thereafter, no relation was

noticed. It can be observed that the  $a^*$ -value of the fresh yoghurt was -2.22 compared to -2.27 after 7 days, -2.39 after 14 days and increased -2.18 after 28 days, as seen in Table (8).

Regarding the lightness  $L^*$  and the yellowness  $b^*$ . It is clear that the lightness  $L^*$  as well as the yellowness  $b^*$  were decreased as a result of increasing the time of storage up to 28 days. The effect of storage time on increasing the  $a^*$ -value from -2.22 at zero time days to -2.18 after 28 days was noticed. The change in color may be referred to chemical changes occurred during storage (**Kumar et al., 2006**).

The analysis of variance identified the significant ( $p<0.05$ ) effect of storage time on Hunter values of yoghurt. Although the  $a$ -value showed a definite increased trend throughout storage, the  $L$ -value decreased and the  $b$ -value increased as the yoghurt storage aged, as seen in Table (8).

It can be concluded that the storage of yoghurt slightly inhibited the changes in color yoghurt. The total color differences (DE) increased by the increasing of storage time in yoghurt up to 28 days as presented in Table 1, total colour differences of yoghurt were small, which almost correspond to the sensory difference threshold (**Rohm and Jaros, 1996b**). However, greatly different values of DE were found for yoghurts at 7, 14 and 28 days of storage and at different concentrations lemongrass extract treated samples. The almost identical colour values found in yoghurt could be attributed to their similar structure. The browning index ( $B_1$ ) increased by the increasing of storage time in yoghurt up to 28 days, especially in high concentration treated yoghurt (0.3%). Thereafter, no relation was noticed.

#### ***b- Non-enzymatic browning of yoghurt samples:***

Non-enzymatic browning in yoghurt is only one component that determines overall color and might not be a problem at low levels. The effects of heat treatment of milk and yoghurt products in the inhibition of the browning reaction are listed in Tables (8). It is obvious that the yoghurt product treated and untreated yoghurt samples inhibits the development of A 420 nm and red colour  $a^*$ . For example, the A420 nm and  $a^*$ -value of fresh yoghurt was 64.34 compared to 64.11, 64.36 and 61.56 in case of the different concentrations of lemongrass extract yoghurt samples, respectively. **Crandall et al., (1986)** concluded that two measures of browning were used, color  $a^*$  or  $L^*$  and absorbance at 420nm where the higher numbers indicate increased absorbance due to the formation of brown pigments. Browning is also indicated by a decrease in the color  $L^*$  toward black and an increase in the color  $a^*$  toward brown or red.

**Table (8): Effect of on colour characteristics in yoghurt during storage at 5 oC for 35 days.**

	$L^*$	$a^*$	$b^*$	Delta E	$C^*$	$H^*$	$B_1$	OD 420nm

#### **3.5- Sensory evaluation of Yoghurt:**

The results of sensory evaluation of the products based on colour, odour, taste, texture and appearance are shown in Table (9). Sensory evaluation of the yoghurt samples was carried out during 4 weeks of samples at 5°C by

20 experienced panels using 10 points scales. Difference in sensory properties of yoghurt samples due to the effect of different concentrations of lemongrass extract was determined by analysis of variance (ANOVA). Sensory attributes are of great importance to measure consumer attitudes and their influence on food choice and acceptability. The colour of yoghurt is the first quality attribute used to judge acceptability of yoghurt products.

The change in color may be referred to chemical changes occurred during storage of yoghurt samples (**Young-Hee, and Song Sun, 2009**). The mean value of flavor or odour scores for all treatments of yoghurt stored was 8.13, 7.75, 7.00 and 7.38 at 0.0, 0.05, 0.1 and 0.3 % concentration of lemongrass extract, respectively. The texture of the tested samples was affected by refrigeration. The over all mean score for the texture of yoghurt was only 8.13, 7.63, 8.13 and 8.25 at 0.0, 0.05, 0.1 and 0.3 % concentration of lemongrass EO extract, respectively (Table 9). These levels of score indicate the importance of the lemongrass extract in keeping a texture for the tested yoghurt. However, there were significant differences between the individual ripening. Samples pre-treated for 0.3% lemongrass EO extract showed the highest score (8.25) in texture stored at 5°C.

In general, the lemongrass extract pretreated yoghurt samples received higher sensory scores than untreated sample. For example, color values were 8.0 – 8.63 the EO extract pretreated yoghurt samples but were 8.13 – 8.75 in untreated samples, these differences were nonsignificant ( $P<0.05$ ) for all samples. Samples treated with 0.05 and 0.1 % EO extract generally had better score for all sensory characteristics at all samples. On the contrary, the sample treated with 0.3% EO extract had lower score for all sensory characteristics at all samples especially in taste characteristics. However, concentration of lemongrass extract had a positive influence on acceptability of colour and flavor of yoghurt samples. Increased concentration of lemongrass extract also showed that the same odour, colour texture and acceptability characteristics in hoghurt samples. However, all sensory scores were in the acceptable range, which greater than 5 scores.

It is clear that the the lemongrass EO extract pretreated yoghurt gave higher mean panel scores (8.0- 8.5) than the untreated yoghurt sample, which were the most preferred in all the studied characteristics. The lemongrass EO extract pretreated yoghurt samples with different concentrations had a non-significant difference ( $P<0.05$ ) between these samples.

**Table (9): effect of lemongrass concentrations on sensory evaluation of youghurt stored at 5°C for 4 weeks.**

Extract level, %	Appearance	Texture	Colour	Taste	Odour
0.0	8.13 <sup>A</sup>	8.13 <sup>A</sup>	8.75 <sup>A</sup>	8.50 <sup>A</sup>	8.13 <sup>A</sup>
0.05	8.0 <sup>A</sup>	7.63 <sup>A</sup>	8.50 <sup>A</sup>	7.13 <sup>B</sup>	7.75 <sup>A</sup>
0.1	8.50 <sup>A</sup>	8.13 <sup>A</sup>	8.50 <sup>A</sup>	7.13 <sup>B</sup>	7.00 <sup>A</sup>
0.3	8.63 <sup>A</sup>	8.25 <sup>A</sup>	8.38 <sup>A</sup>	6.88 <sup>B</sup>	7.38 <sup>A</sup>
LSD	NS	NS	NS	S	NS

LSD = least significant difference at 0.05 level.

#### 4- CONCLUSION

While the primary function of Lemongrass may not be preservative in nature, it has preservative properties, which may useful in built-in safety systems in food. In addition, Lemongrass herb is cheep, safe, and had a medical functions. Our results show that water extract from Lemongrass, at level 0.1% was effective agent to inactivate mold growth and mycotoxin formation and increasing level to 0.3% completely prevented growth and mycotoxin production , for the all tested molds, in YES broth medium. However, in yoghurt medium its inhibitory effect was different according to mold type, supplemented concentration and constituents of the used medium. Its evident from our data that, if possible, a sufficient amount of lemongrass oil to prevent mold growth needs to be used if one wishes to prevent mycotoxin production. It can be concluded from the results of this work that of lemongrass

volatile oil extract treatments with refrigeration at 5oC may serve as alternative to conventional chemical preservatives in the preservation of yoghurt by hurdle technology.

**Abstract:** This study was carried out on 360 freshwater fishes (240 *Oreochromis* species and 120 *Clarias gariepinus*). They were collected from different governorates and during different seasons. Naturally infected fishes showed clinical abnormalities such as skin darkening, exophthalmia, corneal opacity, abdominal distention, ulceration of the skin and cotton wool like growths on various parts of the body. Fishes were then subjected to post mortem examination which revealed many abnormalities. Mycological examination revealed the isolation of 2081 fungal isolates from 150 diseased and 210 apparently healthy fish samples (1658 mould and 423 yeast isolates), of which 1334 were isolated from *Oreochromis* species and 747 isolates from *Clarias gariepinus*. Isolated moulds belonged to the following genera: *Saprolegnia* (4.2%), *Aspergillus* (43.0%), *Fusarium* (14.1%), *Mucor* (14), *Penicillium* (17.2), *Rhizopus* (4.8%), *Scopulariopsis* (1.2%), *Paecilomyces* (1%) and *Curvularia* (0.4%). Yeasts isolated also from both fish species had the following incidence: *Candida albicans* (35.9 %), other *Candida* species (19.1%), *Rhodotorula* species (31.4%) and *Torulopsis* species (13.5%). Experimental infection with the most predominant fungi (*Aspergillus flavus*, *Fusarium* species and *Candida albicans*) was conducted to evaluate the pathogenicity of these isolates. Clinical pictures of experimentally infected fish were similar to those of natural infection. Inoculated fungi were re-isolated from different organs. Results were confirmed with histopathological examination, which revealed the presence of fungal hyphae and spores in different organs.

**Keywords:** Mycotic infection, *Oreochromis* species, *Clarias gariepinus*, Moulds, Yeasts, *Aspergillus*, *Fusarium*, *Candida*, *Penicillium*.

## 1. Introduction

Many of the fungi that affect fishes are considered opportunists, attacking the fishes when they are stressed or immunocompromised because of unfavorable environmental conditions, or secondary to bacterial or viral infections, or when they have lost their mucus protection because of trauma or excessive handling (Roberts 1989 and Quiniou *et al.*, 1998). Mycotic infections of fishes by Oomycetes are wide spread in freshwater and represent the most important fungal group affecting wild and cultured fishes. The *Saprolegniaceae*, in particular members of the genus *Saprolegnia*, are responsible for significant infections involving both living, dead fishes and eggs. Oomycetes are classical saprophytic opportunities, multiplying on fishes that are physically injured, stressed or infected (Pickering and Willoughby, 1982). Members of this group are generally considered agents of secondary infection arising from conditions such as bacterial infections, poor husbandry, and infestation by parasite and social interaction. However, there are several reports of Oomycetes as primary infectious agents of fishes (Pickering and Christie, 1980) and their eggs (Walser

and Phelps, 1993). Moreover, there are other fungi that have been implicated in fish diseases. Some of the genera involved include *Aspergillus* (Salem *et al.*, 1989b), *Fusarium* (Bisht *et al.*, 2000), *Ichthyophonus* (Faisal *et al.*, 1985), *Branchiomyces* (Easa 1984), *Phoma* (Hatai *et al.*, 1986), *Paecilomyces* (Lightner *et al.*, 1988), *Exophialia* (Langdon and MacDonald 1987), *Phialophora* (Ellis *et al.*, 1983), *Rhizomucor* (Wolf and Smith 1999) and *Candida* (Neish and Hughes 1980). Most of these are multiple case reports or single, and causing systemic disease with high mortality rates in fishes. The objective of this study was to determine the types of fungal pathogens affecting freshwater fishes specially those causing high mortality rates, elucidation of the incidence and distribution of such pathogens in *Oreochromis* species and *Clarias gariepinus*, studying the seasonal variations enhancing fungal diseases of fishes and determination of the pathogenicity of the most prevalent isolated fungi.

## 2. Material and Methods

A total number of 360 fish were observed for their behavior, external lesions prior to autopsy. Then they were killed and examined. The examination included external changes as well as examination of internal organs. Wet mount preparation of fish samples were commonly made in 10% KOH. A simple stain such as lactophenol cotton blue was used. The preparation was examined microscopically after about 30 minutes for fungal elements. Mycological examination was done according to and (1993 Noga). Identification of moulds was carried out according to Refai (1987). Identification of yeasts: Plates were examined microscopically for the presence of chlamydospores, arthrospores and blastospores (Refai, 1987) and the scheme of identification of yeasts given by Terrence (1971). Urease test (Cruickshank *et al.*, 1975). Suspected *Candida* species were scratched onto rice or corn meal agar for pseudohyphae and chlamydospores production (Larone, 1987) and a confirmatory identification was carried out by germ tube test (Martin, 1979).

#### Histopathological examination:

Tissue samples were prepared according to Roberts 1989. and stained by periodic acid Schiff's (PAS) and GMS (Sheehan and Hrapchak 1980).

#### Experimental infection:

A total of 120 *Oreochromis* species with 30-40 g average body weight were used. They were divided into four equal groups (each one contained 30 fish). Each group were subdivided into three sub-groups, each contained 10 fish.

**Preparation of spores suspension for experimental infection:** Inocula were prepared by spreading 5 ml of sterile phosphate buffer saline over the plates containing 7- 10 day old pure cultures of *Aspergillus flavus* and *Fusarium* sp. The spores were harvested by gentle washing of the surface of the colonies with sterile loop, then transferred aseptically to sterile flasks. Two drops of tween 80 were added to avoid clumping of spores in case of *Aspergillus flavus* group. Spores were counted by aid of haemocytometer and suspension was diluted to reach  $9 \times 10^4$  spores/ml for both *Aspergillus flavus* and *Fusarium* sp.

**Preparation of yeast suspension for experimental infection:** A loopfull of one day old pure yeast culture of *Candida albicans* was added to test tube containing 5 ml of sterile phosphate buffer saline and mixed gently to reach equal distribution. Spores were counted by using haemocytometer then suspension was adjusted to reach  $2 \times 10^3$  *Candida* spores per ml.

### 3. Results and Discussion

Mycological examination revealed the isolation of 2081 fungal isolates from 150 diseased and 210 apparently healthy fish samples, of which 1334 were isolated from *Oreochromis* species and 747 isolates from *Clarias gariepinus*. Identification of fungi into yeasts and moulds revealed that the percentage of moulds was slightly higher in *Oreochromis* species (80.5%) in comparison to that in *Clarias gariepinus* (78.2 %). On other hand, the rate of yeast isolates per fish was slightly higher in *Clarias gariepinus*. Isolated moulds belonged to the following genera: *Saprolegnia*, *Aspergillus*, *Fusarium*, *Mucor*, *Penicillium*, *Rhizopus*, *Scopulariopsis*, *Paeciliomyces* and *Curvularia*. The same fungal isolates were reported by Abdel Alim (1992) and Khalil (1993).

The Incidence of moulds in diseased and apparently healthy fishes were recorded in (Fig.1&2), also the incidences of isolated moulds from different organs of *Oreochromis* species (Fig.3) and *Clarias gariepinus* (Fig.4) were detected. Seasonal incidences were seen in (Fig. 5). As these isolates were recovered from apparently healthy and clinically diseased *Oreochromis* species and *Clarias gariepinus* This was expected, as almost all these fungi were categorized by Shaheen (1986) as normal mycoflora. This does not mean that they cannot produce disease. They can better be considered as opportunistic fungi (Refai, 1987) as many of them possess virulence factors, which enable them to cause diseases (Refai *et al.*, 2004), particularly under favourable predisposing condition. Regarding to seasonal incidence *Saprolegnia* species were isolated with high incidence in Winter, followed by early Spring and late Autumn. This result agrees with Naguib (1994), who stated that the seasonal variations play an important role in spreading of the *Saprolegnia* infection among freshwater fishes especially during late Autumn, Winter and early Spring, where the water temperature was low.

The Incidence of moulds in diseased and apparently healthy fishes were recorded in (Fig.1&2), also the incidences of isolated moulds from different organs of *Oreochromis* species (Fig.3) and *Clarias gariepinus* (Fig.4) were detected. Seasonal incidences were seen in (Fig. 5). As these isolates were recovered from apparently healthy and clinically diseased *Oreochromis* species and *Clarias gariepinus* This was expected, as almost all these fungi were categorized by Shaheen (1986) as normal mycoflora. This does not mean that they cannot produce disease. They can better be considered as opportunistic fungi

(Refaï, 1987) as many of them possess virulence factors, which enable them to cause diseases (Refaï *et al.*, 2004), particularly under favourable predisposing condition. Regarding to seasonal incidence *Saprolegnia* species were isolated with high incidence in Winter, followed by early Spring and late Autumn. This result agrees with Naguib (1994), who stated that the seasonal variations play an important role in spreading of the *Saprolegnia* infection among freshwater fishes especially during late Autumn, Winter and early Spring, where the water temperature was low.

Clinical findings of *Oreochromis* species inoculated with *Aspergillus flavus*, *Fusarium* species and *Candida albicans* revealed that exophthalmia (Photo.21), skin darkening (Photo.22), cotton wool-like growth on various parts of the body (Photo.23&24), moderate abdominal distention (Photo.25) and corneal opacity and haemorrhages all over the body surface (Photo.26). These results are supported by Marzouk *et al.*(2003).

Postmortem finding revealed congestion and ulceration of gills (Photo.27), haemorrhagic abdominal fluids, necrotic foci within liver and distention of gall bladder (Photo.28), multiple

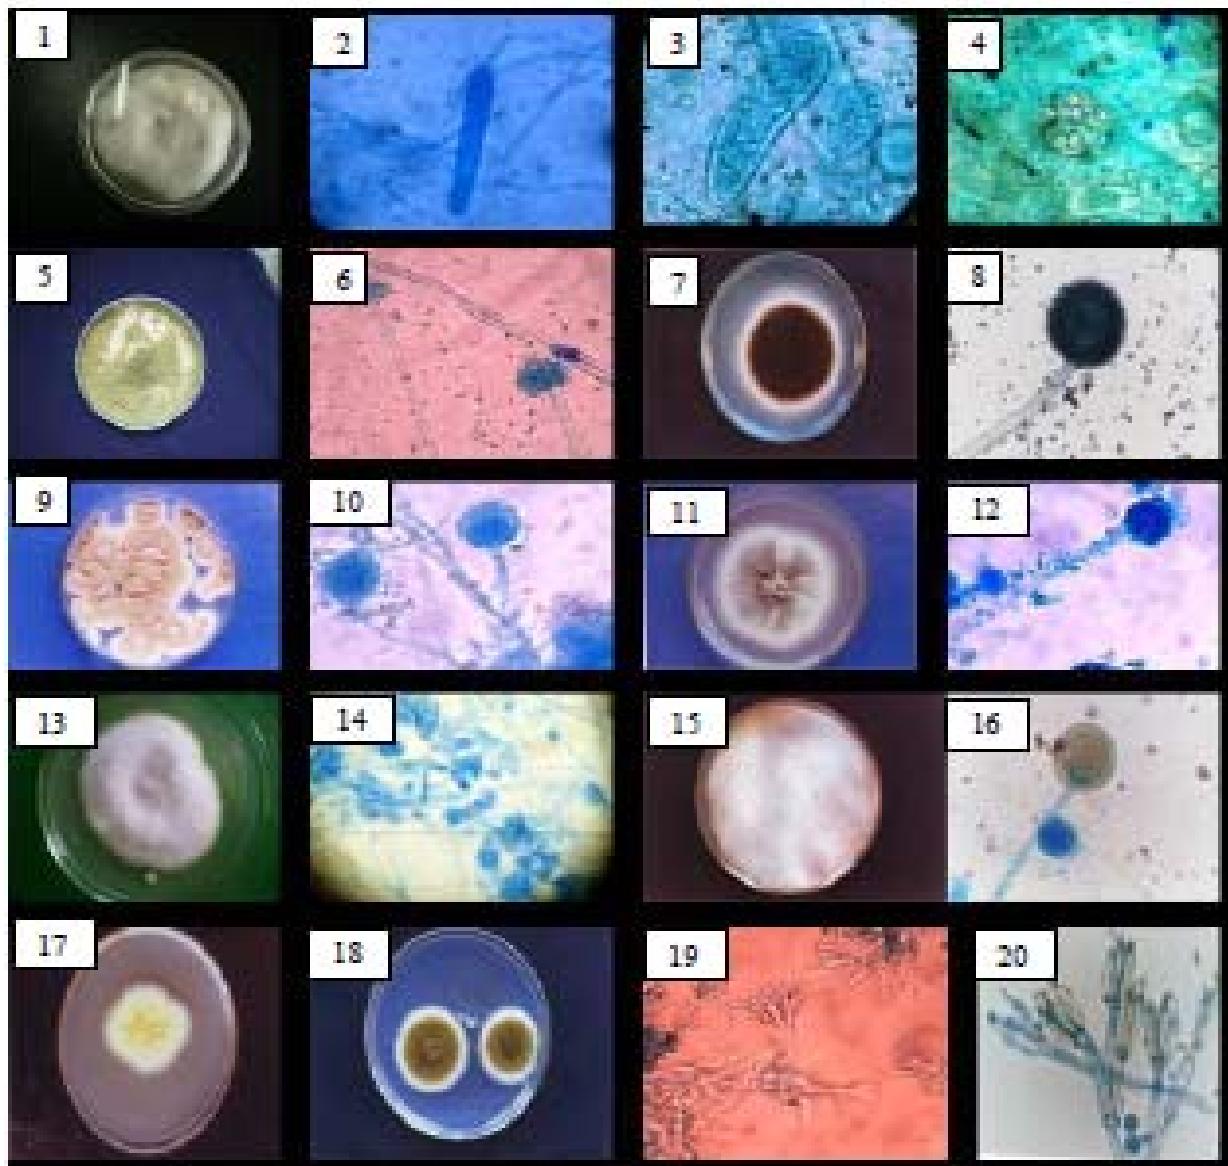

nodules within spleen (Photo.29) and severe intestinal congestion (Photo.30) were also observed. On the other hand, no clinical or postmortem changes were detected on fish groups maintained at 18°C. These findings are in agreement with those of Refai *et al.* (1987).

It can be concluded from the results obtained in the present work that, though most fungi isolated from fishes are considered by several authors as normal mycoflora, yet we could prove in the present study that many fungi can cause natural infections. This was confirmed by histopathological reactions characteristic of fungal infection in naturally infected fishes, and the presence of fungal elements in the lesions. This was substantiated also by experimental infection of fish that induced similar findings as the natural infection, i.e. a clear application of Koch's postulate. This conclusion should direct our attention to the possible role of fungi in affecting fishes industry.

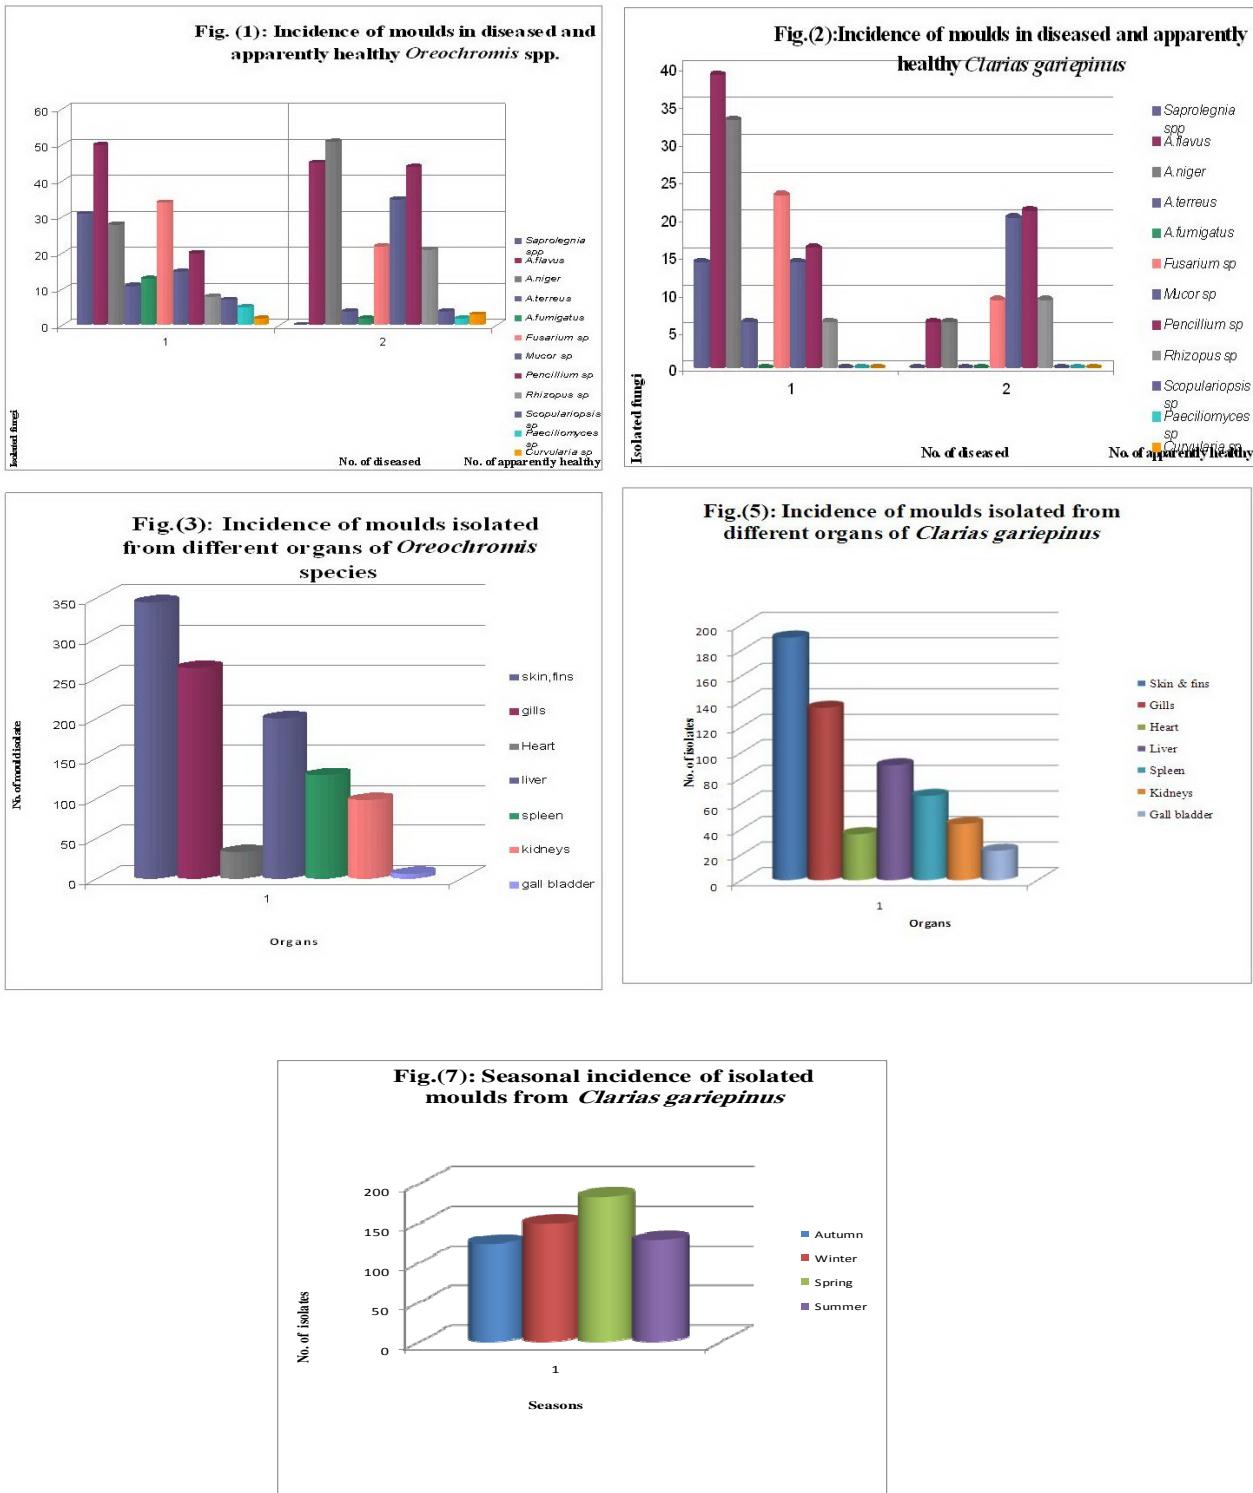

The pathological changes and the fungal elements in tissue sections in naturally infected fishes of various organs are described under each of the following photos (31-39), stained by either PAS or GMS stains.

**Abstract:** **Objective:** The aim of this study was to evaluate the effects of 6 months of balanced caloric moderately deficit diet program combined with individualized moderate Physical exercise on the body weight, body composition and fat distribution of adolescent girls. **Subjects & methods:** It was a longitudinal survey comprised 1244 adolescent girls, aged from 14 to 18 years. Their body weight and height were measured, and the BMI was calculated. Of the total sample, only one hundred and eleven girls (8.9%), with mean age was  $15.82 \pm 0.75$  years, were suffering from obesity based on their body mass index; which is greater than the 95<sup>th</sup> percentile for age and gender based Egyptian Growth Reference Charts. These obese girls were undergoing nutritional intervention (specific dietary program, nutritional education and exercise) for 6 months. At the start of this program, the obese girls were assessed for their anthropometric measures: the body weight, body height (or stature), body mass index (BMI), waist and hip circumferences, waist/hip ratio, skin folds thickness at 5 sites and, according to BIA, their body composition. This assessment was repeated after 6 months. Only thirty eight girls completely finished the program till the end. **Results:** The current study showed that after following the dietary program and physical activity, there were highly significant reduction in waist circumference, the skin fold thickness at the 5 sites (triceps, biceps, sub scapular, suprailiac and abdominal), peripheral and central adiposity, and fat mass, and significant reduction in body weight, hip circumference and fat%. The change in BMI was not significant. On the other hand, there was a highly significant increase of the total body water and Basal metabolic rate after following the dietary program and physical activity. **Conclusion:** The nutritional intervention program was succeeded in 38 obese adolescent girls. These girls show highly significant reduction in body composition and body fat distribution. This revealed that the combined program of diet restriction and exercise is necessary.

## Introduction

The prevalence of obesity has reached alarming levels. Obesity is affecting virtually both developed and developing countries of all socioeconomic groups including all age groups thereby posing an alarming problem, described by the World Health Organization (WHO) as an “escalating global epidemic”<sup>(1)</sup>.

Worldwide, over 22 million children under the age of 5 are severely overweight, as are 155 million children of school age. This implies that one in 10 children worldwide is overweight<sup>(2)</sup>. The dramatic increase in the prevalence of obesity in the

past few decades can only be due to significant changes in lifestyle influencing children and adults<sup>(3)</sup>. These obesity-promoting environmental factors are usually referred to under the general term of “obesogenic” or “obesigenic”<sup>(4)</sup>. The current changing nature of this obesogenic environment has been well described in a WHO Technical Report as Changes in the world food economy have contributed to shifting dietary patterns, for example, increased consumption of energy-dense diets high in fat, particularly saturated fat, and low in unrefined carbohydrates. These patterns are combined with a decline in energy expenditure that is associated with a sedentary lifestyle<sup>(5)</sup>.

With changing food habits and increasingly sedentary lifestyles, a potential deluge is evident across the globe with obesity rates increasing more than two fold over the past 25 years in the U.S., almost threefold in the past 10 years in England, and almost fourfold over a similar time frame in Egypt<sup>(6)</sup>. Recently, in Egypt research of National Survey for Diet, nutrition and non-communicable diseases "DNPCNCD" by National Nutrition Institute (2008)<sup>(7)</sup> stated that the prevalence of overweight and obesity among adolescents aged 10-18 years was 20.5 %.

Obesity in children and adolescents is associated with several metabolic and hemodynamic abnormalities: dyslipidemia, high blood pressure (BP), impaired glucose tolerance, insulin resistance and assorted cardiovascular risk factors<sup>(8)</sup>. In addition, atherosclerosis reportedly begins in childhood<sup>(9)</sup>.

So, the need for evidence-based treatment recommendations is a critical health care issue, because obese children and adolescents are at risk for developing many of the co-morbidities seen in obese adults. Studies demonstrated that fasting serum glucose, insulin, and triglyceride levels and the prevalence of impaired glucose tolerance and systolic hypertension increase significantly as children become obese (BMI of ≥95th percentile)<sup>(10)</sup>. Even children and adolescents who are overweight (BMI of 85th to 94th percentile) are at risk for co-morbidities. Therefore, interventions using dietary modifications, increased physical activity, and behavioral therapy may be beneficial for overweight children and adolescents, with more-aggressive intervention directed toward obese children and adolescents<sup>(11)</sup>.

Health care professionals, however, may find it difficult to determine which interventions will be most efficacious for their patients. Clinical trials have failed to determine whether specific dietary modifications alone without behavioral interventions and increased physical activity are effective in reducing childhood overweight and obesity rates. Comprehensive interventions that include behavioral therapy along with changes in nutrition and physical activity are the most closely studied and seem to be the most successful approaches to improve long-term weight and health status<sup>(12)</sup>. However, the clinical trials testing these interventions often are limited in their ability to determine the relative efficacy of individual strategies. Ultimately, children and adolescents (and adults, for that matter) become

overweight or obese because of an imbalance between energy intake and expenditure. Dietary patterns, television viewing and other sedentary activities, and an overall lack of physical activity play key roles in creating this imbalance and therefore represent opportunities for intervention.

**The aim of this study** was to evaluate the effects of 6 -month of balanced caloric moderately deficit diet program combined with individualized moderate physical exercise on the weight, body composition and fat distribution of adolescent girls.

### Subjects and methods:

This study was conducted by the National Research Centre, Egypt, to estimate the prevalence of obesity among secondary school adolescent girls. It was a longitudinal survey, comprised 1244 adolescent girls, with age ranged from 14 to 18 years. They were recruited from "Gamal Abd-El-Naser Secondary Public School", in Giza governorate, for a whole studying year from October, 2008 to April 2009. Girls were excluded if they had a prior major illness, including type 1 or 2 diabetes, took medications or had a condition known to influence body composition, insulin action or insulin secretion (e.g. glucocorticoid therapy, hypothyroidism and Cushing's disease).

Permission to perform the study was granted by the Ministry of Education, and the director of the school included in the research. Parents were informed about the purpose of the study and their permission in the form of written consent was obtained. Another assent from the student's involved in the research was obtained. The protocol was approved by the "Ethical Committee" of the "National Research Centre".

Each girl underwent a complete physical examination, including anthropometric measures which are following the recommendations of the International Biological program<sup>(13)</sup>. The body height was measured to the nearest 0.1 cm on a Holtain portable anthropometer, and the body weight was determined to the nearest 0.01 kg on a Seca scale Balance with the subject wearing minimal clothing and no shoes. Body mass index (BMI) was calculated as body weight (in kilograms) divided by body height (in meters) squared.

Of the total sample, only one hundred and eleven girls or 8.9% with mean age 15.82± 0.75 years, were suffering from obesity based on their

body mass index; which is greater than the 95<sup>th</sup> percentile for age and gender based on the Egyptian Growth Reference Charts<sup>(14)</sup>. These obese girls were undergoing nutritional intervention (specific dietary program, nutritional education and exercise) for 6 months. At the start of this program, the obese girls were assessed for following anthropometric measures and calculated parameters: the body weight and body height; waist and hip circumferences; five skin fold thickness; BMI; waist/hip ratio; and body composition according to BIA. This assessment was repeated after 6 months.

**Anthropometric measures:** Body weight was measured as previously mentioned. Waist circumference was measured at the level of the umbilicus with the subject standing and breathing normally, hip circumference at the level of the iliac crest, using non-stretchable plastic tape to the nearest 0.1 cm. Skin fold thickness were taken at five sites: triceps, biceps, sub scapular, suprailiac and abdominal. Each skin fold was measured three times on the left side of the body with Holtain skinfold caliper to the nearest 0.2 mm, and the mean was recorded. The following indices were calculated:

- Body mass index (Kg/m<sup>2</sup>)
- Waist/ Hip ratio (cm/ cm).
- Peripheral adiposity: as the sum of triceps and biceps skin fold thickness.
- Central adiposity: as the sum of subscapular, suprailiac and abdominal skin fold thickness.

**Body Composition:** Whole body resistance and reactance (capacitance) were measured using a Bioelectrical Impedance Analyzer (HOLTAIN LIMITED). As specified by the manufacturer, the unit was calibrated before testing using 400-ohm resistor, and electrodes were placed on right wrist and ankle. By using girl's sex, age, body weight and body height approximated to the nearest unit, the percentage body fat (Fat %), fat mass (FM), fat free mass (FFM), total body water and basal metabolic rate (kcal) were derived.

**Nutritional intervention** (specific dietary program, nutritional education and exercise): A balanced caloric moderate deficit diet (BCDD), is a reduced-energy diet (- 500 kcal/day) was established by a dietician. The diet was selected from the usual 4 food groups in quantities thought to meet basic requirements of all macronutrients and micronutrients in a healthy proportion: ( 25-30% of total calories from fats, 8-10% from saturated fats, up

to 15% of total calories from monounsaturated fatty acids, up to 10% from polyunsaturated fats ,< 300mg/d cholesterol , approximately 15% of total calories from protein, 55% from CHO. , 20—30gm/d fiber ,no more than 1. 5 gm /d Na , water not less than 2.5 liter /d, 1000—15000 mg/d calcium). These diet regimen supplies enough calories to enable the patients to proceed normally in their life & not feel hungry nor lacking energy .Also, it can be adherent to and safe in long and short time, the diet design was individualized, flexible allowing the patients to exchange items, so as not to be boring, and produce 1 Ib or 0.5 kg loss per week .We spread the food through the day to meet the energy needs, avoiding long periods of no food or hunger. The foods were selected according to the girl's dietary habits. PowerPoint presentations and role-play scripts were designed for trainers to be used during the educational program.

**Exercise:** moderate Physical activity in the form of unsupervised walking for an hour daily or at least 5 times /week, starting by half an hour then gradually increase the duration to an hour after 3 days. This was encouraged and motivated by grouping teams of students.

The anthropometric measurements and body composition were remeasured after 6 months from the start of the dietary program to assess the effect of the nutritional modifications.

**Statistical Analysis:** Graphic presentation of the % of girls with different effect of the program, according to the reduction of the % body fat was drawn. Evaluation of the statistical distribution of the variables was done using Kolmogorov - Smirnov Goodness of Fit Test. Most the variables have asymmetric distribution ( $p<0.05$ );except skin fold thickness at the triceps and suprailiac crest, fat free mass and total body water; where they have normal distribution ( $p>0.05$ ). All values are reported as the mean  $\pm$  SD (the range). The changes in the used parameters before and after the dietary program were calculated. WILCOXSON non parametric t- test was used to examine the differences before and after the dietary program for the variables which had asymmetric distribution, while Paired sample t test (d-statistics) was used for the variables which had normal statistic distribution. The level of significance was set at a probability of less than 5% ( $p<0.05$ ). Statistical evaluation of the results was performed with the SPSS 9.05 computer program.

## Results:

The nutritional intervention program started with 111 girls; but unfortunately; 38 girls only continued strictly with the program for the 6 months. All of them undergo weight reduction, except 3 girls showed very minimal changes in weight but significant changes in body fat distribution and body composition. Their ages ranged between 15 to 16 years (with mean age  $15.45 \pm 0.50$ ).

Percentage of the girls with different effect of the program; according to the reduction in % body fat; are presented in figure (1). It was noticed that 38.6% (14 girls) had no effect on the % body fat; in spite of the reduction in their weight; 26.3% (10 girls) had reduction less than 5%, 18.4% (7 girls) had reduction between 5 - 10%, and 18.4% (7 girls) had reduction between 10 - 20%.,

Anthropometric measurements at the beginning and the end of the nutritional intervention were summarized in table (1) and figure (2). The main baseline of BMI was  $32.39 \pm 3.13$  Kg/m<sup>2</sup>, which indicates that; on average; these girls were obese at the beginning of the nutritional intervention.

After the 6 months nutritional intervention, highly significant reduction in body weight and waist circumference, and significant reduction in hip circumference were recorded after following the dietary program, nutritional education and physical activity. However, the change in BMI was insignificant. Body fat distribution at the beginning and the end of the nutritional intervention program were summarized in table (2) and figure (3). Highly significant reduction in all the skin fold thickness at the 5 sites (triceps, biceps, sub scapular, suprailiac and abdominal), peripheral and central adiposity, waist circumference and waist-hip ratio was recorded.

Body composition at the beginning and the end of the nutritional intervention program were summarized in table (3). It was observed that there were highly significant reduction in fat % and fat mass, while, total body water and basal metabolic rate showed highly significant increase. However, the fat free mass was not significantly increased or even not changed. The nutritional intervention program was succeeded in 38 obese adolescent girls. These girls show highly significant reduction in body composition and body fat distribution.

## Discussion

Adolescents who are overweight or obese are more likely to remain so in adulthood than pre-adolescents aged 10–14<sup>(15)</sup>, unless the latter obtain treatment.

Treatment for children and adolescents who are overweight or obese seems easy, that is, just counsel children, adolescents and their families to eat less and to exercise more. In practice, however, treatment of childhood obesity is time-consuming, frustrating, difficult, and expensive. In fact, choosing the most effective methods for treating overweight and obesity in children is complex at best. This is especially true for primary care providers, who have limited resources to offer interventions within their offices or programs. The paucity of providers to whom they can refer patients adds to the problem.

A multi-factorial approach has been in use for the treatment of obesity, including dietary modification, exercise, psychotherapy and medication. There are several reports in the literature about exercise programs for adolescents with obesity<sup>(16, 17)</sup>. However, the focus of most programs is on long-lasting endurance activities, which in our opinion are boring for the pediatric population. Furthermore, most programs are not easily reproducible due to lack of detail or requirement of special equipment. Therefore, our aim was to encourage adolescents to do a simple, cheap, cost effective activity which is accessible to everyone and motivates adolescents by walking with their colleagues.

Low physical activity levels may be as important as excess energy intake<sup>(18)</sup>. Although data from previous studies were equivocal, Swinburn et al. (2006)<sup>(19)</sup> found energy intake was a more important determinant of high body weight than low physical activity. TES, 2008<sup>(20)</sup> stated that in the absence of caloric restriction, moderate exercise does not generally cause weight loss. However, in combination with decreased caloric intake, exercise can achieve significant weight loss. This matches our results as with both caloric restriction and regular physical activity over a period of 6 months our patients achieved weight reduction. Wittmeier et al., 2008<sup>(21)</sup>, also, reported that lower durations of both moderate physical activity (MPA) and vigorous physical activity (VPA) are associated with increased odds of overweight and adiposity. They concluded that forty-five minutes of MPA and fifteen minutes of VPA were associated with reduced body fat and

BMI. A total of one hour per day of moderate-intensity activity, such as walking on most days of the week, is probably needed to maintain a healthy body weight<sup>(22)</sup>.

In general, to lose weight, you either have to decrease the amount of calories you are eating and drinking, exercise to burn more calories, or even better, do a combination of both. To lose 1 pound in 1 week, you can decrease your calories by 500 a day or burn 500 extra calories a day. The American Diabetic Association<sup>(23)</sup> stated that: Use of a reduced-energy diet (not less than 1200 kcal/day) in the acute treatment phase for adolescent overweight is generally effective for short-term improvement in weight status; and this is agreed with our data which showed significant reduction in weight of the studied group.

The BMI can be easily assessed at low cost, and has a strong association with body fatness and health risks<sup>(24)</sup>. The subcutaneous skin fold thicknesses have been widely used to estimate body fat. The main advantages are simplicity of use and suitability for epidemiological studies<sup>(25)</sup>. It is used as a measure of nutritional status in children on assumption that increased subcutaneous fat reflects a greater caloric reserve<sup>(26)</sup>. It has been shown to correlate with estimates of total body fat and with lean body mass<sup>(27)</sup>.

In this study, BMI and sum of skin fold thickness were used as indicators of overall adiposity. The sum of skin fold is reported as a reliable estimate of obesity and regional fat distribution<sup>(28)</sup>. WC was considered as an appropriate predictor of abdominal fat in children<sup>(29)</sup> and adolescents<sup>(30)</sup>. Another indicator of abdominal adiposity is WHR, which was reported as a better indicator of adiposity independent of age and sex<sup>(31)</sup>. But in this study the changes of WHR were discrete and not significant, so the future investigations are needed about the sensitivity of WHR in detection of obesity, in the population of Egyptian girls.

Highly significant reduction in waist circumference was also, noticed after following the dietary program and physical activity. However, the change in BMI was not significant. Skin fold thickness at 5 sites (triceps, biceps, sub scapular, suprailiac and abdominal) were significantly decreased. Highly significant reduction in fat mass, peripheral and central adiposity; significant reduction in fat %; and highly significant increase in total body

water were found. There was a highly significant increase of the basal metabolic rate, but the increase of fat free mass was not significant. The BMI didn't show a reduction, and probably one of the possible reasons for this is a highly significant increase of total body water in our investigated girls.

Decrease in the fat percent with preservation of the FFM and increase of the resting metabolic rate (RMR) of the girls was also observed. The weight reduction and maintenance appears to be antagonized by a reduction in the resting metabolic rate (RMR) which comes in agree with our results. As the largest component of daily energy expenditure, RMR comprises approximately 60–70%, Fat-free mass (FFM) is the main factor that accounts for the magnitude of resting metabolism<sup>(32)</sup>. As a heterogeneous compartment, FFM consists of highly metabolically active muscle and organs and low-metabolic rate tissues such as bone and connective tissue<sup>(33)</sup>. Therefore, any diet or exercise interventions, which are capable of maintaining FFM or at least attenuating its decline following weight loss, could have significant effects on total energy balance. The foremost objective of a weight-loss trial has to be the reduction in fat mass leading to a decrease in risk factors for a metabolic syndrome. Both with regard to a reduction in risk factors and long-term weight maintenance the content of adipose tissue in the weight lost has to be maximized, thus preserving FFM<sup>(34)</sup>. A decline in body weight can be achieved while favorably modifying body composition with the maintenance of FFM is through physical activity<sup>(35)</sup>.

Wells and Victoria<sup>(36)</sup>, 2005, also, stated that changes in body composition indicators may have important health implications, as it has been demonstrated that the health risks associated with obesity derive primarily from fat rather than body weight. Moreover, it is not only the total amount of fat that is important, but also the distribution of fat in the body<sup>(37)</sup>, with central fatness being most related to health risks<sup>(38)</sup>. Teixeira et al. (2001)<sup>(39)</sup> showed that measures of central adiposity such as WC and WHR significantly correlated with serum lipid levels in obese children and adolescents but not in leaner individuals. Kelishadi et al. (2007)<sup>(40)</sup> concluded that BMI, WC and WSR were the most appropriate indices in predicting CVD risk factors. Many studies confirming the predictive value of BMI for CVD risk factors<sup>(41, 42)</sup>.

Finally the current research also, revealed that after the 6 months nutritional intervention, reduction in body weight, hip, and waist circumference were significant after following the dietary program. However, the change in BMI was minimal. The reduction in all the measured skin fold thickness at the 5 sites (triceps, biceps, sub scapular, suprailiac and abdominal), reflects a reduction in peripheral and central adiposity. However, the change in waist-hip ratio was minimal.

In summary, it can be concluded from this research that dietary composition can modify the physiological adaptations to energy restriction. A balanced diet with moderate energy restriction together with moderate physical activity and behavioral modification result in body weight loss with preservation of the FFM and a decrease in the fat percentage. This study may contribute in establishing evidence based Egyptian program for obesity and overweight management.

# Morphological and Molecular Evidences Among Four Heteroforms of *Avicennia marina* (Forssk) Vierh.

Wafaa M. Said and Nahla O. M. Ehsan\*

Botany Department, Women's College for Arts, Science, and Education, Ain Shams University.

[dr.nahla.osman@gmail.com](mailto:dr.nahla.osman@gmail.com)\*

**Abstract:** Morphological characteristics and random amplified polymorphic DNA (RAPD) marker were used to assess inter-specific relationships among four heteroforms of gray mangrove (*Avicennia marina* (Forssk) Vierh.) grown in Al-Sharm Al-Bahari site, 33Km south Al-Qussier, Red Sea Coast, Egypt. The four heteroforms viz. I, II, III and IV were detected in two distinct habitats (marine and desert). The morphological and molecular data indicated high variation between form I&III and II&IV. On the other hand, low variation between form I&II and III&IV. Dendrogram based on morphological, anatomical and genetic data supported the segregation of the four heteroforms of *Avicennia marina* into two groups; one includes form I & III and the second include form II & IV. The study concluded that the four heteroforms can be classified as two subspecies, *A. marina* subsp. *eucalyptifolia* (form I) and the *A. marina* subsp. *marina* (form II). In addition, forms III and IV considered as phenotypes from I and II, respectively.

[Wafaa M. Said and Nahla O. M. Ehsan. Morphological and Molecular Evidences Among Four Heteroforms of *Avicennia marina* (Forssk) Vierh. Journal of American Science 2010;6(11):843-856]. (ISSN: 1545-1003).

**Keywords:** Mangrove; *Avicennia marina*; Morphology, RAPD; Red Sea

## 1. Introduction:

*Avicennia* L. (F: Avicenneaceae) is a genus of mangrove woody trees or shrubs that grow in coastal habitats. It has the largest longitudinal and latitudinal distribution of all mangrove species, ranging from the east coast Africa from the Red Sea to South Africa to the west pacific from Japan to New Zealand (Le *et al.*, 2003).

Moldenke (1975) and Tomlinson (1986) recorded that the genus *Avicennia* L. shows considerable morphological variation especially in leaves and flowers, and classified based on these attributes. *Avicennia* represents the largest polymorphic genus of the mangrove, where it well known ecologically, systematically, morphologically and genetically in comparison with other taxa (Duke, 1995).

Mabberly (1981) classified the genus *Avicennia* to 14 species according to morphological characters of leaves and flowers. While Tomlinson (1986) and Duke (1991, 1992) classified the *Avicennia* species to four major groups according to their morphological criteria; *A. marina* & *A. alba*, *A. officinalis* & *A. integra*, *A. rhumphiana*, and *A. germinans*, *A. schaueriana* & *A. bicolor*.

*A. marina* (Forssk.) Vierh is an important true mangrove species; it is a halophytic plant, grows as a shrub or tree to a height of three to ten meters. In addition, it has three subspecies; *A. marina australasica*, *A. marina*

*eucalyptifolia* and *A. marina marina* (Schwarzbach and Mc Dade, 2002).

*A. marina* (Forssk.) Vierh represents the dominant mangrove species in Egypt, found along Red Sea Coast ling from Ras-Mohamed to Mersa-Halaib (Zahran, 1993).

Tomlinson (1986) recorded that *A. marina* species characterized by different heteroforms. Four heteroforms of *A. marina* were recorded in Al-Sharm Al-Bahary site, 33 km south Al-Qussier region in two different habitats. Two forms growing in the inundation area, while the other two are found in the desert closed to Red Sea shores. The two habitats have different physico-chemical properties as recorded by khalafallah (2002). Are those four heteroforms, subspecies of *A. marina* oreotypes/phenotypes? These four heteroforms need taxonomical study.

The previous taxonomical studies of genus *Avicennia* L. of *A. marina* species were achieved based on the morphological variations of the vegetative and reproductive organs. The advent of technology that directly examines genes and gene products, it has been found that the morphological characteristics not be completely reliable indicators for genetic variation or taxonomic differences, owing to their tendency to be highly influenced by environmental factors (Brown *et al.*, 1997; Duke *et al.*, 1998 and Bryars & Adam, 1999).

Recently, several studies have been carried out on mangrove species in order to assess genetic diversity using genetic markers, as studies the worldwide genetic diversity of *A. marina* using Allozyme and ALFP & microsatellite markers, RAPD, RLFP, ALFP DNA (Mguire *et al.*, 2000 & 2002 and Le *et al.*, 2003). Gallios & Burrus (1998) and Gauer & Cavalli-Molina (2000) reported that molecular genetic markers can provide a relatively unbiased method of quantifying genetic diversity in plants and their populations.

Said (2008) concluded that DNA based genetic markers have been recently integrated into the important of several plant systems and are expected to play a very important role in the future of molecular genetic and plant taxonomy.

The objectives of this study are: (1) investigation the morphological and anatomical characteristics of the four heteroforms, (b) study the genetic variation of the four heteroforms by application of the RAPD technology and (c) study the taxonomic relationship between the four heteroforms of *A. marina* in Al-Sharm Al-Bahari, Al-Qussier region, Red Sea Coast, Egypt.

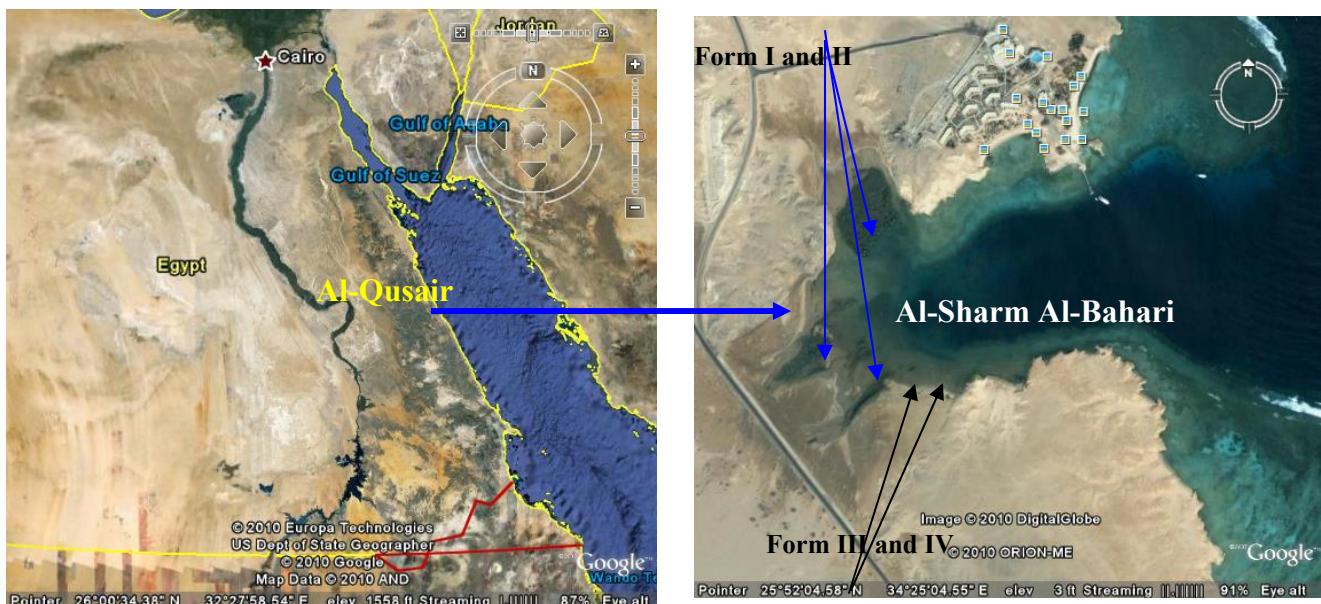

## 2. Materials and methods

### Study Site

Al-Sharm A-Bahari site was chosen as it contains the four heteroforms of *A. marina* plants in two different habitats. Forms I and II are growing in the inundation area, while Forms III and IV are found in the desert closed to Red Sea shores. The site is located at 33km south Al-Qussier city ( $25^{\circ}52'04.58''$  N and  $34^{\circ}25'04.55''$  E, Fig. 1). Physico-chemical properties of the two habitats were analyzed by khallafallh (2002) and recorded in table (1&2). The four forms are photographed and showed in Fig. (2).

### Plant samples collection

Thirteen healthy samples (third internodes, third leaves, flowers and fruits) of the four forms of *A. marina* were collected at May 2008 from Al-Sharm Al-Bahari site, Al-Qusseir Red Sea Coast for the morphological, anatomical and molecular investigations. Voucher specimens are deposited in the herbarium of Botany Department, Women's College for Art, Science and Education, Ain Shams University

NaCl (g / L)	35.7				

### Botanical investigation

Plant heights of the four heteroforms were measured in the field. The macro-morphology of the investigated forms was described directly from fresh specimens. Measurements included both numeric attributes (internode length, leaf length, flower length and number of flowers/inflorescence) and coefficient attributes (leaf narrowness and leaf area) as modified from Duke (1990). The micromorphology of stems, petioles and leaves of each form was carried out through hand-microtome cross sections at 10-15 $\mu$ m, stained with safranin and light green according to the methods described by Johanson (1940). The sections were photographed by using light microscope (Olympus) with digital camera (Canon Power Shot S80) connected to computer; the photographs were taken by Zoom Browser Ex program. The dimensions of sections were measured by using Corel Draw program ver. 11.

### Molecular investigation

Total genomic DNA was extracted from 0.5g fresh young leaves of the four *A. marina* heteroforms according to the Dellaporta *et al.* (1983). The extraction examined by RAPD-PCR marker at Genetic Engineering and Biotechnology Center, Ain Shams University to determine inter and intra specific variations.

Based on RAPD markers for amplification of unknown DNA sequences; single and short random oligonucleotide primers were used. Ten-mer random DNA oligonucleotide primers (UBC) were obtained from Operon kit (Operon Tech. Inc., USA). Their code and sequences were listed in table (3). After electrophoresis of the RAPD pattern, amplification was carried out according to Williams *et al.* (1990). Amplification products were size-fractionated on a 1% w/v agarose gel containing 10mg ml<sup>-1</sup> of ethidium bromide. They were visualized under UV light and photographed. The gels were documented using gel documentation advanced software UVP-England Program.

### Data analysis

Standard deviations of the morphological and anatomical characters were calculated. The data were treated statistically using the one-way analysis of variance (ANOVA) as described by Snedecor and Cochran (1969), the means were compared by LSD using SPSS program version 15. The morphological, anatomical and genetic evidences were scored for presence (1) or absent (0) to the computation analysis under a program using similarity and dissimilarity assessment percentage method ver. 2.02 Rohlf (1998).

### 3. Results

#### Macromorphological investigations

Macromorphological characters of the four heteroforms *Avicennia marina* described or measured and recorded in tables 4&5. The recorded data

indicated that from 59 studied characters, the four heteroforms shared in 51 (86%) characters but differed in 8 (14%) characters (habitat, stem surface, node shape, pneumatophores presence, leaf base, leaf shape, leaf apex, upper surface colour of leaf). Form I&II growing in aquatic and have pneumatophores, while forms III and IV growing in desert without pneumatophors. The main difference focused between I&III as a group and II&IV as other group (table 4).

There is no significant difference between heights of forms I and II also forms III and IV, while it significantly differed between forms I&II as a group and forms III&IV as other group (Table 5). The other measured dimensions; internode length, petiole length, leaf length, leaf width, leaf narrowness, leaf area and no. of flowers/inflorescence significantly differed between forms I&III as a group and forms II&IV as other group.

#### Micromorphological investigations

From thirty one anatomical characters, the four heteroforms of *Avicennia marina* differed in six characters (table 6 and figs. 3, 4&5). The main differed character is focused on stem outline. Forms I and III have circular outline while forms II and IV have angular outline. The other differed characters are thickness of cuticle layer of stem, petiole and leaf,

The anatomical data of the four heteroforms of *Avicennia marina*; stems, petioles, leaves, showed a significant difference between forms I&II as a group and Forms III&IV as other group in more than 44% of the studied characters (Table 7).

#### Genetic characters based on RAPD analysis

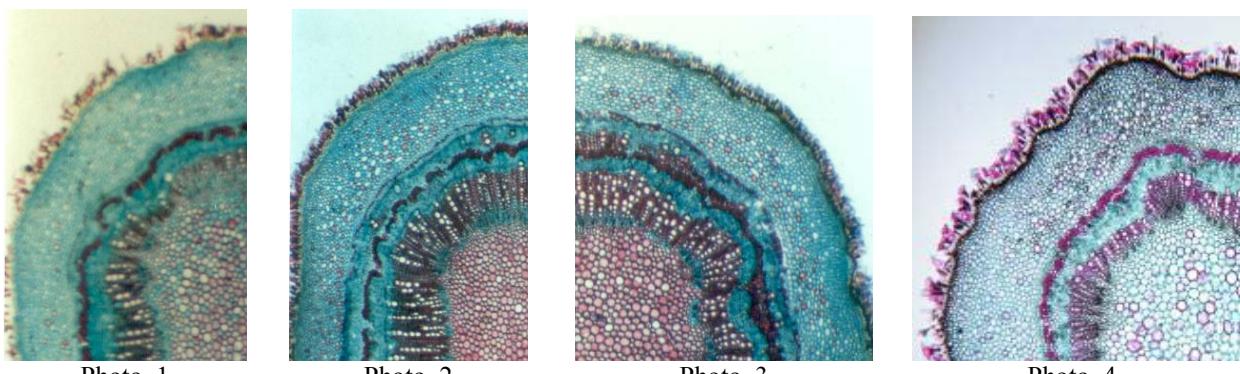

Ten-mer arbitrary oligonucleotide primers were initially used to establish RAPD- PCR fingerprints of the four forms *A. marina* plants, the results were demonstrated in table (8) and Fig (6).

A total number of 95 fragments were visualized across the four heteroforms. The number of bands was variable in each form as present or absent with a particular length in the RAPD patterns and change in the intensity of amplification of fragments with the same length. The primers produced band numbers ranging from 5 (primer OP-CO5) to 17 (primer OP-D-3) with size ranges between 100-1000 bp.

DNA polymorphism recorded 59 polymorphic bands with an average 5.9 polymorphic

fragments per primer, and the polymorphism percentage ranged from 42.857% (primer OPA-18) to 81.818% (primer OPB-17) with an average 61.73 %. On the other hand the highest monomorphic bands were 8 bands at primer OPD-3.

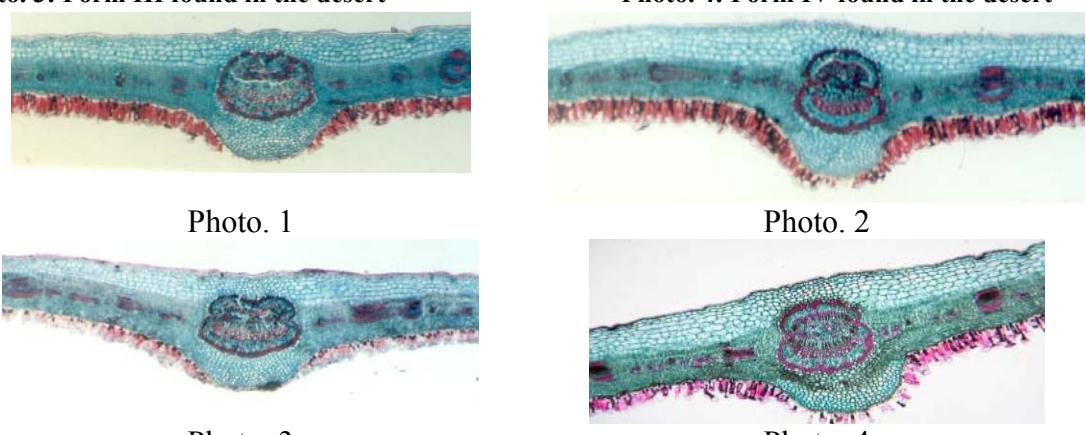

Table (9) and Fig (6) represent the distribution of molecular weight of unique bands. The maximum no. of the unique bands was observed in primer OP-A-7 and OP-Z-7 (6 and 7, respectively). The maximum no. of unique bands were revealed in form I (13 bands) and form III (10 bands) at primers OP-A3, OP A-7, OPA-18, OPA-19, OPB-15, OP B-17, OPCO-5, OP-D-3 and OP-Z-7. On the other hand, the minimum no. was revealed in forms II and IV (1 band for each form) at primers OP-D-3 and OP-Z-7, respectively.

Clustering technique analysis based on morphological, anatomical and genetic evidences resulted a dendrogram, classified the four heteroforms of *Avicennia marina* to two groups. The first group contains form I and from III separated at

distance 37, while the second group contain form II and form IV separated at distance 15 (fig. 7).

#### 4. Discussion

Morphological, anatomical and genetic evidences of *Avicennia marina* four heteroforms in two different habitats at Al-Sharm Al-Bahari site, Al-Qussier region, Red Sea Coast, Egypt, were studied to reveal the taxonomic inter-specific relationships among them. Two forms of *Avicennia marina* (named form I and form II) are grown in marine aquatic habitat in the inundation area. The other two forms (named form III and form IV) are grown in the desert habitat. Significant difference recorded between the physico-chemical properties of the habitat's soil (texture, pH, EC, salt content and minerals content). The main difference between the two habitats focused on soil water content, the first habitat is waterlogged, while the second one have low water content and high aeration. The environmental differences in the two habitats according to many studies (Tomlinson, 1986; Duke, 1990; lakshmi *et al.*, 2000; Melville and Burchett, 2002; Melville, *et al.*, 2004; Chen, *et al.*, 2008; Deng *et al.*, 2009; Salas-Leiva *et al.*, 2009) have effects on the morphological, anatomical and genetic evidences of the four heteroforms.

Present study recorded high variations in the morphological characters between forms I & II (growing in aquatic habitat) and between forms III & IV (growing in the desert habitat). On the other hand, low variations between forms I & III and also between forms II & IV were recorded. Negative correlation has been recorded between habitat properties and morphological characters of stem, leaf and petiole. These results indicated that form I and form II in spite of they are growing in the same habitat, but they have low similarity index. On the other hand form I and form III while they are growing in two different habitats, but they have high similarity index.

Tomlinson (1979) reported that some morphological characters are stable in different habitats and they are genetically controlled as leaf apex, leaf shape, and stem surface.

Duke (1990) and Duke *et al.* (1998) found negative correlation between morphological criteria of *Avicennia marina* leaves and environmental conditions. In this respect, Melville and Burchett (2002) reported that, leaf morphology may be used as a genetic marker of population differentiation. The measurements included leaf area, length, average width, apex, thickness and succulence or water content.

According to Tomlinson (1986) and Melville and Burchett (2002), the morphological characters separated the four heteroforms to two grouped, the first group contains form I and form III, while the 2<sup>nd</sup> group contains form II and form IV.

The anatomical features of *Avicennia marina* four heteroforms in the present study are in agreement with description of Fahn and Shimony (1977), Metcalfe and Chalk (1979) and Tomlinson (1986). Anatomical sections of the four heteroforms have the same structure but with differed in the section layers thickness (cuticle, cortex, phloem, xylem, etc). The difference in layers thickness can be attributed to the environmental variations. This hypothesis is supported by the present findings, where as form I and form II found in the same environmental conditions (waterlogged habitat) and have significant differences in the morphological characters, but they differed in their stem, petiole and leaf dimensions. Stem outline of form I and III is circular while that of forms II and IV is angular. Tomlinson (1986) concluded that the inundated plants are more frequently by the saline tidal water than those of the ridge plants, the former group has to maintain large number of narrow vessels overcoming cultivation problem, density and diameter of vessels are influenced by environmental fluctuation. Recent anatomical data of the four heteroforms of *Avicennia marina* didn't show clear trend in forms classification.

Genetic diversity has been recorded in populations of mangrove species. Nettel and Dodd (2007) and Nettel *et al.* (2008) observed genetic diversity for *A. germinans* population along the Pacific coast of Central America. Results of Melville and Burchett (2002) indicate that the genetic differences among three estuaries populated by Australian *Avicennia marina* were not greatly influenced by sediment characteristics, but rather by geographic distance.

Random amplified polymorphic DNA (RAPD) marker was used to assess genetic diversity and inter-specific relationships among the four heteroforms of Egyptian *Avicennia marina*. The present results obtained from RAPD analysis revealed that low genetic variation between forms I & III and forms II & IV but high genetic variation were detected between forms I&II and forms III&IV. These results beside it can used as indicators in species taxonomy, Allphin *et al.* (1998), Hartl (1988) and Mitton, (1989) considered that the greater levels of genetic variation within species and populations are an advantage in the face of the environmental and anthropogenic challenges.

The data obtained from morphological, anatomical criteria and RAPD analysis suggested segregation of the four heteroforms of *Avicennia marina* into two groups, the first group contains Form I and form III, while form II and form IV represent the 2<sup>nd</sup> group.

Results of the present study on the four heteroforms provide evidence for one species, *A.*

*marina*, comprising two subspecies. According to Tomlinson (1986), Duke (1990), Duke *et al.* (1998) and Moldenke (1960 and 1967), forms I & III are *A. marina* (Forsk.) Vierh. variety *eucalyptifolia* and forms II & IV are *A. marina* (Forsk.)Vierh. variety *marina*.

According to the familiar formula of Stace (1980); Genotype + Environment → phenotype, it can be considered form III is a phenotype to form I and form IV is a phenotype to form II.

In summary, from the morphological, anatomical and molecular evidences, *Avicennia marina* population in Al-Sharm Al-Bahari site, Al-Qussier region, Red Sea Coast, Egypt, contain two subspecies; *A. marina* (Forsk.) Vierh. variety *eucalyptifolia* and *A. marina* (Forsk.)Vierh. variety *marina*. The two subspecies have distinct morphological characters and they grow in aquatic habitat. The environmental factors play a part in modifying the genotype to produce the phenotype. Both subspecies has phenotype grows in desert habitat.

# A High Temperature Sensitive Micro-Planes Damage Model for Plane Concrete

Mojtaba Labibzadeh<sup>1</sup>, Hamid Reza Ghafouri<sup>1</sup>, Ali Edalatbehbahani<sup>1</sup>

<sup>1</sup>Department of Civil Engineering, Faculty of Engineering, Shahid Chamran University, Ahvaz, Iran  
[Labibzadeh\\_m@scu.ac.ir](mailto:Labibzadeh_m@scu.ac.ir)

**Abstract:** A computational model simulating the behavior of the concrete subjected to the high temperature environment has been presented here by means of micro-planes framework. The constitutive equations using damage formulations developed earlier by (Labibzadeh and Sadrnejad, 2006) have been adapted here to account for the effects of elevated temperatures. These damage formulations have been founded upon five fundamental damage functions which are directly related to the loading history of each micro-plane. The characteristic features of the proposed model have been verified through making comparison with published experimental results for uniaxial compression and tension tests in the literatures. This suggested model could be easily implemented into a 3D finite elements code to detect damages of concrete structures subjected to fire events.

[Mojtaba Labibzadeh, Hamid Reza Ghafouri, Ali Edalatbehbahani,. A High Temperature Sensitive Micro-Planes Damage Model for Plane Concrete. Journal of American Science 2010;6(11):857-864]. (ISSN: 1545-1003).

**Keywords:** Constitutive equations, Micro-planes, Damage, High temperatures, Plane concrete

## 1. Introduction

Generally, most of concrete structures exposed to fire could be retrieved and returned to service even after severe fires. In this process the damaged structural members must reach to a minimum strength, ductility and stiffness which they have possessed before the fire. After heating concrete to the high temperatures, a series of physical and chemical reactions lead it to exhibit changes such as loss of moisture, decomposition of aggregate particles and dehydration of cement past. These changes could strongly affect the structure of concrete members by reducing mechanical properties of concrete, namely the decrease in both strength and stiffness of the concrete. Also variation of brittleness of the softening behavior is going to show more ductility with raising the temperature. To investigate and rehabilitate the mentioned structural members this point is crucial to have a good estimation on the effects of temperature on mechanical properties of concrete. This necessity rises when stress-strain relationships are required to predict the entire behavior for a further earthquake.

Many studies have been made to evaluate influence of the high temperature on physical properties of concrete (Malhotra, 1956; Abrams, 1971; Harda, et al., 1972). Consequently numerous models have been proposed to account high temperatures for concrete. Simo and Ju (1987) proposed continuous elasto-plastic damage models with considering strain and stress based dual framework. To propose a unified theory, Carol et al., (1994) merged elastic

degradation and damage theory. Another model based on viscosity plastic theory has been conducted by Faria et al., (1998) for massive concrete structures. Wu et al., (1999) tested 44 specimen exposed to the temperatures up to the 600 °C and extracted a stress-strain relation which is applicable for heated and unheated concrete. Thermo-chemo constitutive equations based on plasticity could be utilized to consider decohesion and the thermal damage (Ulm, et al., 1999). Also Hydro-thermo-mechanical analysis along with further development to account the damage at high temperatures has been considered for concrete (respectively Bagio et al., 1995 and Gawin, et al., 1999). Nechnech et al., (2002), proposed an elasto-plastic damage model for plane concrete subjected to the elevated temperature in which thermal damage has been defined via the variation of elastic modulus with the temperature.

Researches alluded above have been regarded concrete on the basis of plasticity, damage or a combination between both of them. Generally, continuous models are categorized into two main classes: **macroscopic models** which are presented by damage and plasticity theory or a combination between both and **mesoscopic models** such as multi-laminate or micro-plane models.

Through the mesoscopic notion a model presented a damage model for concrete on the basis of "micro-plane theory" which has employed experimentally damage functions for only mechanical loadings (Labibzadeh and Sadrnejad, 2006). In the present paper the previous model (Labibzadeh and Sadrnejad,

2006) is further developed to consider the effect of elevated temperatures. The new model has combined the mechanical damage with the thermal one which is defined with variation of elastic modulus.

## 2. Material and Methods

### 2.1 Micro-plane formulation based on kinematic constraint approach

At first, the slip theory developed based on the idea that constitutive behavior of material could be presented by the behavior of specified planes within the material. By applying this theory to account for continuum damage mechanics and cohesive frictional material, for the first time "slip or multi-laminate theory" changed its name to the "micro-plane theory".

Now we are presenting the applied formulation at the model which is a combination of micro-plane theory with assumption of kinematic constraint approach and damage theory. Models constrained with this approach are capable to depict softening behavior of plane concrete in a stable manner.

The unite sphere of micro-plane models includes 26 planes tangent to the sphere's surface (Figure 1). The position and orientation of each plane is specified with the unite normal to the plane with components of  $n_i, i = 1, 2, 3$  (any subscript refers to the components in Cartesian coordinate axis  $x_i$ ). Also to extract shear components on the micro-planes, we are required to define two extra coordinate directions  $M, L$  which represent two orthogonal unite coordinate vectors  $m_i, l_i$  respectively.

According to the kinematic constraint, at first macroscopic strain tensor is projected on the planes. This projection yields three components of micro-strains along the plane's triplet local directions which one is normal ( $\varepsilon_N$ ) and two of them are tangential ( $\varepsilon_M, \varepsilon_L$ ) (Figure 2). The following relations depict the projection process in mathematical form:

$$\varepsilon_N = N_{ij} \varepsilon_{ij}, N_{ij} = n_i n_j \quad (1)$$

$$\varepsilon_M = M_{ij} \varepsilon_{ij}, M_{ij} = (m_i n_j + m_j n_i) / 2 \quad (2)$$

$$\varepsilon_L = L_{ij} \varepsilon_{ij}, L_{ij} = (l_i n_j + l_j n_i) / 2 \quad (3)$$

Where repeated indices imply summation over  $i = 1, 2, 3$ .

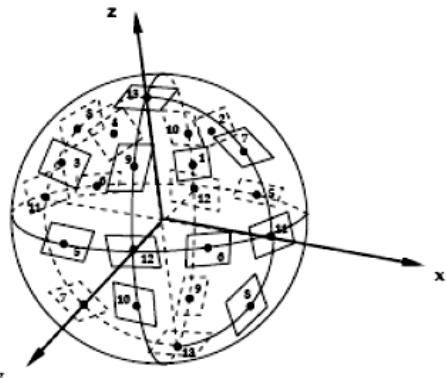

Figure 1. Position of integration points on the unite sphere surface.

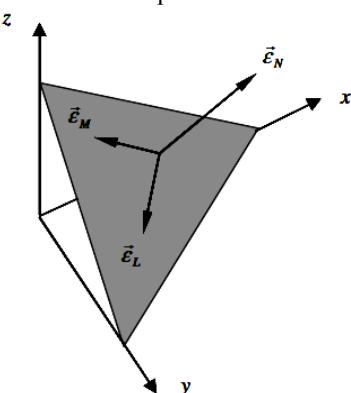

Figure 2. Strain components on a micro-plane.

Now with employing the appropriate constitutive laws at micro-plane level, micro-stresses are updatable through the executed strain components on the planes.

Totally, kinematic constraint models indefeasibly oblige the macroscopic stress tensor to have identical projection on the micro-planes with the stress components at the same planes. Thus these models are credible if and only if the constitutive laws at micro-level are particularly invented in a way that this condition could be satisfied. Due to the desired satisfaction through the analysis procedure is generally scared, the kinematically constrained models have been proceeded to fabricate a static equilibrium between plan's stress components and macro-level stress tensor. This equivalence could be supplied by means of the virtual work method. The equation (4) has equated the virtual work inside the unit sphere and on its surface:

$$\sigma_{ij} = \sigma_v \delta_{ij} + \frac{3}{2\pi} \int_{\Omega} [\sigma_D (N_{ij} - \frac{\delta_{ij}}{3}) + \sigma_L L_{ij} + \sigma_M M_{ij}] d\Omega \quad (4)$$

Where  $\Omega$  is the unit hemi-sphere surface,  $\sigma_L$  and  $\sigma_M$  are tangential stress components on each

plane,  $\sigma_v$  and  $\sigma_d$  are volumetric and deviatoric parts of normal micro-stress components which will be discussed later.

The introduced integration at equation (4) can be carried out by any numerical integration technique such as Gaussian integration. Here, an approximate formula with 26 integration points with a finite number of micro-planes for each point has been taken into account. The final portrait of the numerically performed equation (4) is:

$$D_{ijkl} = \frac{3}{4\pi} \int_{\Omega} \left( \frac{E}{1+v} \right) \left[ \left( N_y \frac{\delta_y}{3} \right) \left( N_u \frac{\delta_u}{3} \right) + M_y M_u + L_y L_u \right] d\Omega + \frac{E}{1-2v} \frac{\delta_u}{3} \delta_y \quad (5)$$

## 2.2 Elastic modulus at various temperatures

Generally with increasing temperature, concrete structures will be accompanied by changes such as reducing compressive (tensile) strength and increasing peak strain which means concrete is softening with raising temperature. For the same thermal condition, the reduction in compressive (tensile) strength is smaller than its counterpart in the elastic modulus. As shown in figures 4 and 5 the elastic modulus decreases with increasing temperature. Therefore to assess concrete structures damaged during severe fires, it is crucial to have precise visualize on the thermal effects over the concrete elastic modulus. For practical purposes at compressive state, the elastic modulus of heated concrete could be considered as secant modulus at 40% of experimental peak strain of compressive stress-strain curve. This percentage for the temperatures 200,400,600 is respectively reported as 80%, 40% and 6%.

## 2.3 Anisotropic damage model

Total deviatoric part of constitutive matrices is computed from superposition of its counterparts on the micro-planes which such counterparts in turn, are calculated based on the damage occurred on each plane depending on each specific loading condition (Labibzadeh and Sadrnejad, 2006). The prime skeleton of damage mechanism at the proposed model is based on five separate damage functions which one by one are constructed to cover one of the alluded loading situations. The five loading states are related as:

1. Hydrostatic compression
2. Hydrostatic extension
3. Pure shear

## 4. Shear + compression

## 5. Shear + extension

The damage evolution functions proposed by Labibzadeh and Sadrnejad, (2006) and here is adapted for thermal considerations are acquired through the authoritative laboratory tests which are carried on the concrete specimens under diverse compression and tension states of loading. Generally speaking, each function that is formulated for one of the five force conditions has been constructed upon two series of parameter. The first kind (parameter a to k) consists of 11 experimental parameter in a way that each of them has been allotted with considering both proportion of applied macro-level forces at loading directions and thermal condition. These parameters remain constant during loading procedure. Then, they only depend on the ratio of loading at applied directions while in the other hand should be allocated at different temperature ranges. The calibration process for them is a crucial step to satisfy both loading and thermal condition by implementing optimum values. The second type only consists of average strain parameters that are separately concluded from operative micro-strains on the planes. The proposed damage evolution functions are:

$$\omega_{HC} = 0.0 \quad (6)$$

$$\begin{cases} \omega_T = 0 & \text{if } \varepsilon_{eq} \leq a \\ \omega_T = 1 - \left( \frac{a}{\varepsilon_{eq}} \right) \times \exp\left[-\left(\frac{\varepsilon_{eq} - a}{c - a}\right)\right] & \text{if } \varepsilon_{eq} > a \end{cases} \quad (7)$$

$$\begin{cases} \omega_{ur} = 0 & \text{if } \varepsilon_{eq} \leq \sqrt{3}a \\ \omega_{ur} = 1.0 - \left( \frac{\sqrt{3}a}{\varepsilon_{eq}} \right) \times \exp\left[-\left(\frac{\varepsilon_{eq} - \sqrt{3}a}{b - \sqrt{3}a}\right)\right] & \text{if } \varepsilon_{eq} > \sqrt{3}a \end{cases} \quad (8)$$

$$\begin{cases} \omega_C = d \times \varepsilon_{eq} & \text{if } \varepsilon_{eq} \leq e \\ \omega_C = f(\varepsilon_{eq} - e)^2 + g(\varepsilon_{eq} - e) + h & \text{if } e < \varepsilon_{eq} < i \\ \omega_C = 1 - \left( \frac{j}{\varepsilon_{eq}} \right) \times \exp\left[-\left(\frac{\varepsilon_{eq} - j}{k - j}\right)\right] & \text{if } \varepsilon_{eq} > i \end{cases} \quad (9)$$

$$\omega_{sh} = 0.5 \times (\omega_C + \omega_T) \quad (10)$$

## 2.4 Damage evolution

In our formulation the thermal damage is defined by means of the variation of elastic modulus with temperature. The anisotropic damage model takes advantages of a total damage function ranging between zeros to one. Covering the mechanical and thermal effects, the value of zero expresses a micro-

plane surface with no crack or any crack initiation and the one is related to a totally damaged surface. The proposed Total Damage Function (TDF) is assembled for each plane through the aforementioned five damage function and also five new variables ( $HT, T, SH, C, HC$ ). These new ones are referred to the updated micro-stress components from projected strains on the micro-planes. This could be formulated as:

$$TDF(P) = HT(P) \times \omega_{HT}(P) + T(P) \times \omega_T(P) + SH(P) \times \omega_{SH}(P) + C(P) \times \omega_C(P) + HC(P) \times \omega_{HC}(P) \quad (11)$$

Where  $P$  indicates the micro-planes number 1 to 13. Planning procedure for micro-plane stress components employs macroscopic parameters,  $v, E$  in which contains thermal effects. Thus the Total Damage Formula is separately computed for each micro-plane on the basis of the variables affected by thermal and mechanical circumstances.

## 2.5 Model flowchart

Analysis procedure sequence followed by the model has been portrayed at figure 3.

## 3. Results

In this section validity of the proposed model has been examined by focusing on its capability to simulate constitutive responses of specimens submitted to the uniaxial compression and tension tests. The applied values for mechanical properties of concrete at different temperatures have been summarized through the Table 1 and Figure 4(a,b).

Table 1(Mechanical properties of concrete)

		At room temperature	Variation with temperature
Compression	$E_0$	29600 Mpa	Fig.4(a)
	$v$	0.2	constant
Tension	$E_0$	50000 Mpa	Fig.4(b)
	$v$	0.2	constant

|  
|

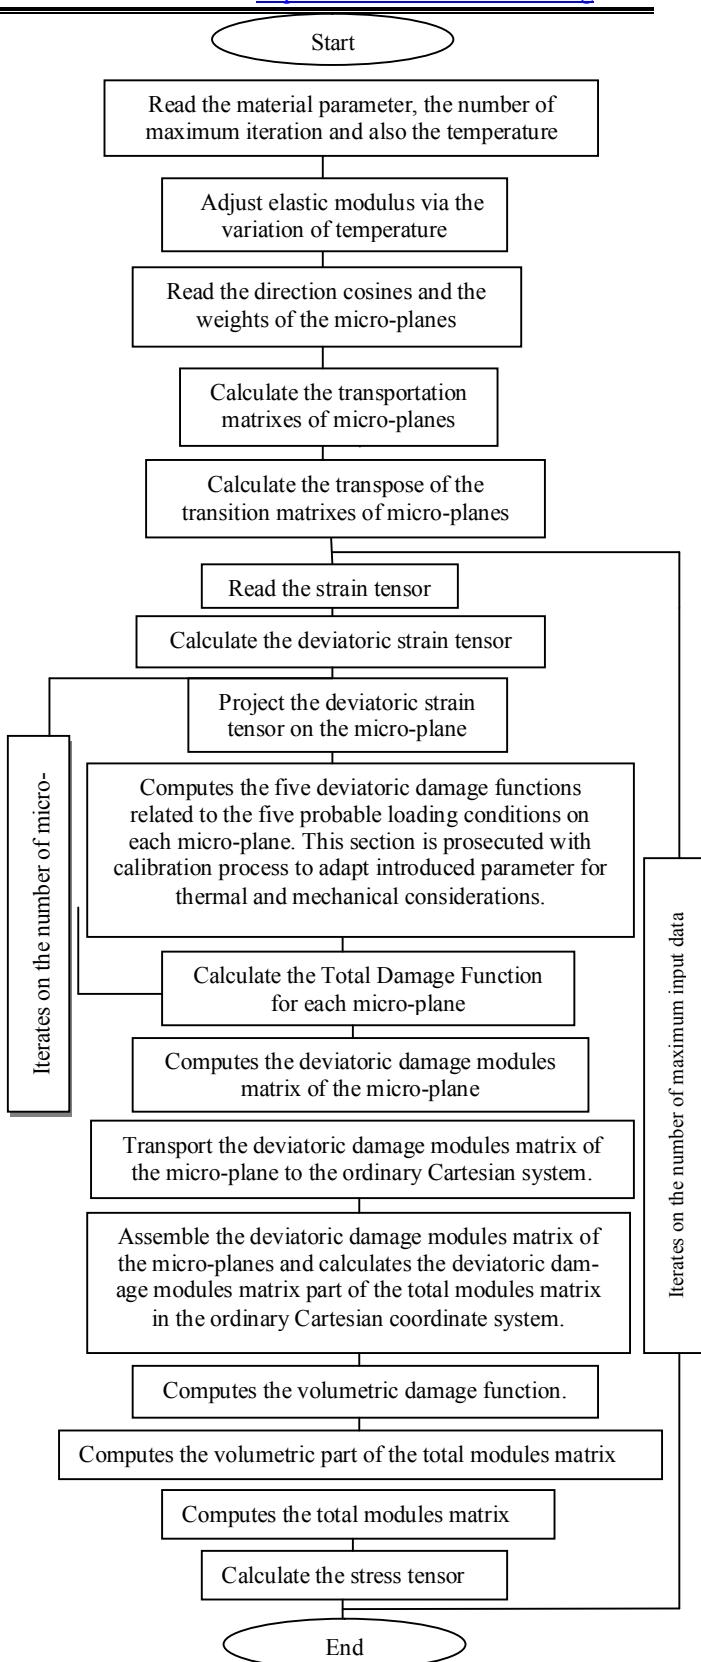

Figure 3. Corresponding model flowchart

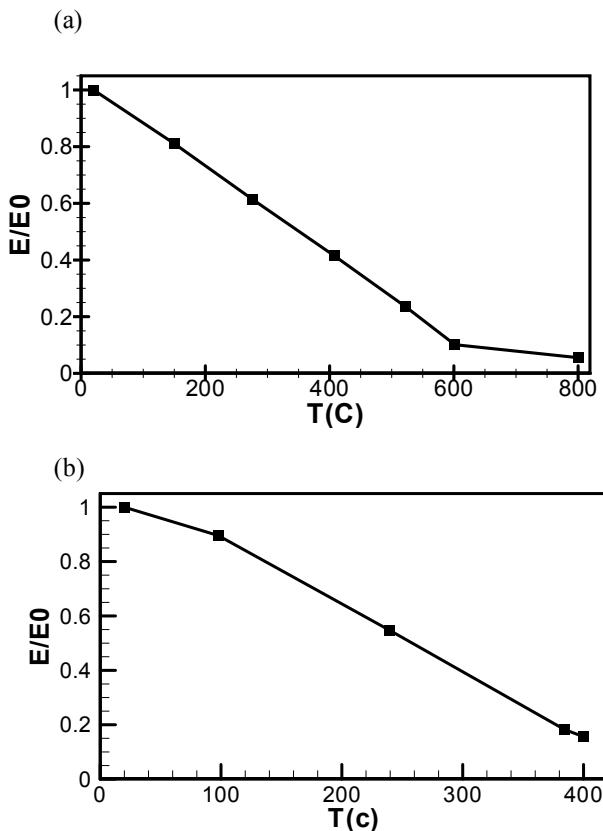

Figure 4(a,b). Variation of elastic modulus, (a) Compressive state (b) tensile state, with temperature.

### 3.1 Uniaxial compression (UC) test

The uniaxial compression tests on concrete performed by Chang et al., (2006) are conducted here, to assess coincidence between simulated responses of the proposed model and experimental stress-strain curves. The test instruction exposes concrete specimen to progressive temperature increase up to the desired level and then this is followed by natural cooling down. Afterward the specimen is conducted to the desired loading to get the stress-strain responses. Figure 5(a,b) shows a reasonable agreement between the results fulfilled by the proposed model and experimental stress-strain curves. These results declare that as temperature increases, both strength and material stiffness decline, concrete is softening and stress-strain curves become flatter. That's why the shape of the curves varies from unheated to the heated states and also between the ones at different temperatures.

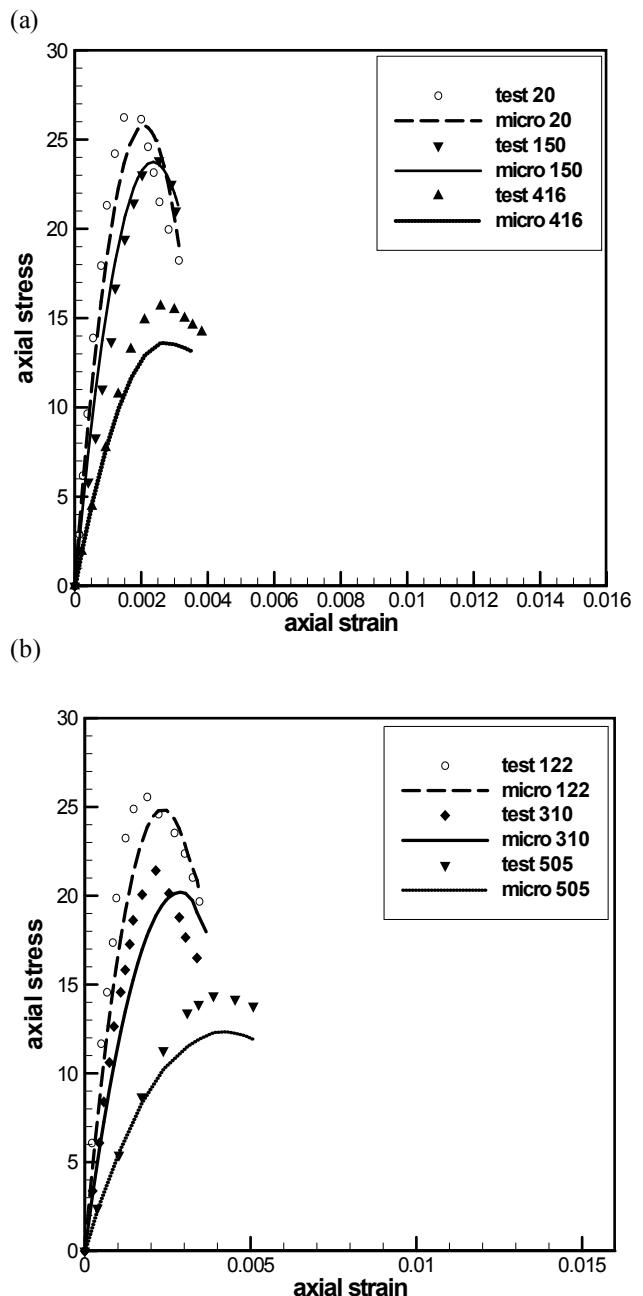

Figure 5(a,b). Comparison of proposed stress-strain curves with experimental results at UC test.

Now with applying the uniaxial compression load along the X-axis, the micro-plane 11 on the unite sphere is just loaded by compressive stress. Only tensile stress affects the planes number 9,10,11,12 situated normal to the loading direction and on the other eight micro-planes compression together with shear stresses operate with different ratios depending on geometric location of the plane. Figure 6 is

depicted damage evolution on the planes 5,6,7,8 during the test at different temperatures.

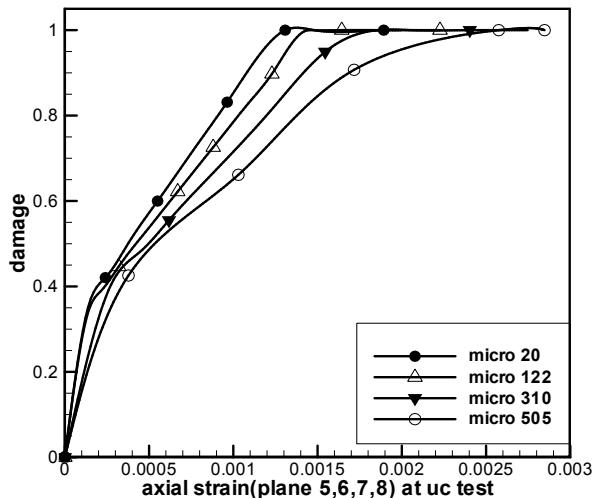

Figure 6. Damage evolution during uniaxial compression test

### 3.2 Uniaxial tension (UT) test

The tests performed by Felecitti and Gambarova , (1998) are considered here. The experimental stress strain responses of concrete specimen under uniaxial tensile loading at different temperatures (reported by the mentioned authors) in compare with simulated results of the proposed model are depicted at Figure 7.

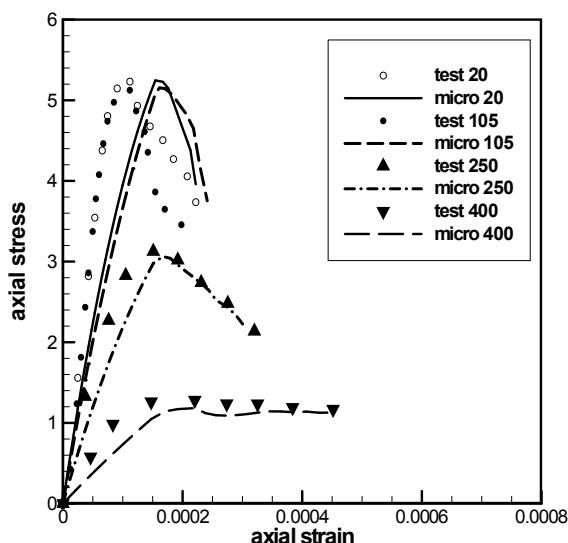

Figure 7. Comparison of proposed stress-strain curves with experimental results at UT test.

The damage values during the test are presented at Fig. 8. As we can see at the stress-strain curves, together with the raising temperature, the concrete softening behavior conveys the peak location in that its value increases in the strain axis. This event is clearly observable through the gradient of the damage-strain curves (Fig. 6, 8) in a way that with raising temperature the curves become less inclined to absorb higher strains.

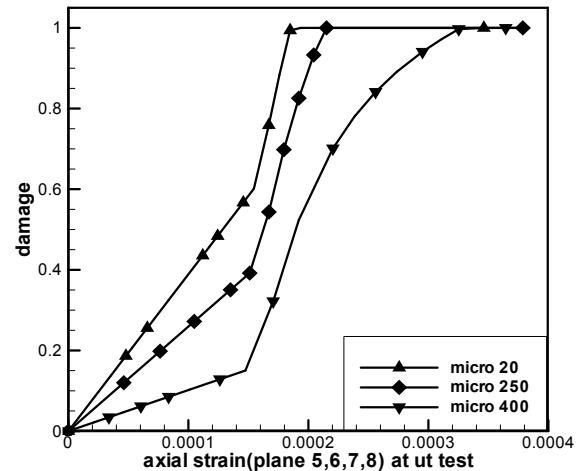

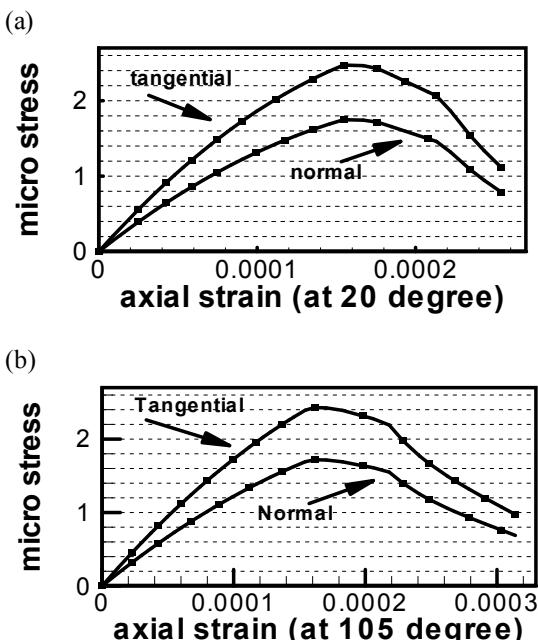

Figure 8. Damage evolution during uniaxial tensile test

Furthermore the micro-stress components fulfilled by the projection of macroscopic stress tensor, versus the axial strain are depicted at Figure 9 for the micro-planes number 1 to 4.

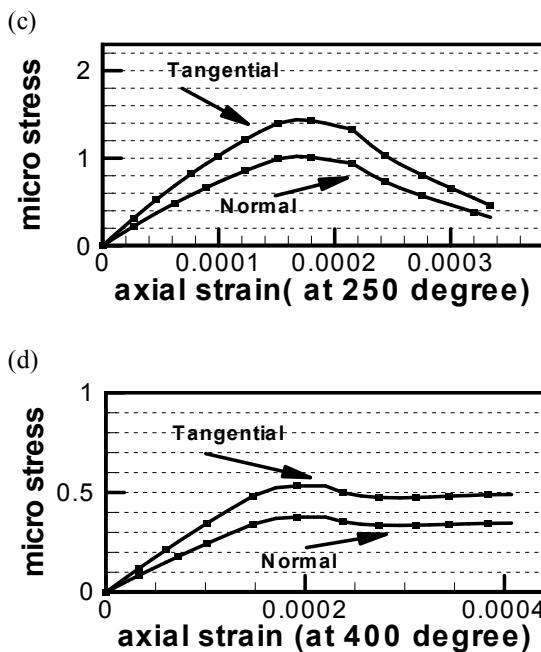

Figure 9. (a to d). Micro-stress-strain curves at various temperatures during UT test.

#### 4. Discussions

Because of demoting the mechanical properties of concrete such as elastic modulus and compressive (tensile) strength with elevating temperature, the proposed model has been defined the thermal damage via the variation of elastic modulus with temperature. The model implemented five separate damage functions to cover up the total damage included mechanical and thermal ones. The damage functions act via the projected strain components on the micro-planes and the parameters have been calibrated for thermal and mechanical effects by the published experimental results.

Raising temperature profoundly affects softening behavior and peak location of the stress-strain curves of plane concrete which the ascending part is turning to the linear state while descending curve becomes flatter.

Macroscopic strain tensor allocates three strain components, projected along the local coordinate axis, to each micro-plane (N- normal direction and M, L- tangential directions). This proficiency would capable the model to predict the direction of crack growth around a point.

# Toxic Impact of Titanium Dioxide (TiO<sub>2</sub>) In Male Albino Rats with Special Reference to its Effect on Reproductive System

Nabela, I., EL- Sharkawy\*, Salah, M. Hamza and Ehsan, H., Abou-Zeid

Dept. of Forensic Medicine & Toxicology. Fac. of Vet. Med. Zagazig University, Zagazig, Egypt.  
[\\*nabelaimam@hotmail.com](mailto:nabelaimam@hotmail.com)

**Abstract:** The present study was directed to explore the toxic effects of orally administered TiO<sub>2</sub> in mature male albino rats. Eighteen mature male albino rats were classified into three equal groups. The first group was used as control and fed on TiO<sub>2</sub> free ration (C), the second and the third groups (T1) and (T2) were fed on ration containing 1% and 2% TiO<sub>2</sub> respectively for 65 days. The body weight of male albino rats fed 1% and 2% TiO<sub>2</sub> showed a significant decrease along the experimental period. Animals were scarified after termination of the experimental period. The sera were separated for estimation of nitric oxide and testosterone levels. Liver samples were preserved for antioxidants enzyme activities determination. Liver, testes and seminal vesicle samples were preserved in formalin for histopathological study. The results indicated that TiO<sub>2</sub> resulted in a significant decrease in body weight gain, sperm motility %, sperm cell concentration, sperm viability and serum testosterone level. While, a significant increase in sperm abnormalities, serum nitric oxide (NO), hepatic superoxide dismutase (SOD), glutathione reductase (GR) enzyme activities and malondialdehyde (MDA) concentration were recorded. Histopathological findings revealed reduction in the number and size of the epithelial lining of the tubuloalveolar gland and hyperplastic glandular epithelium of seminal vesicle. Testes showed mild spermatogenesis besides congested testicular blood vessels. Liver showing vacuolar, hydropic degeneration and cell death of some hepatic cells and steatosis. The present study concluded that, TiO<sub>2</sub> elicited a marked ruinous effect on male fertility and biochemical parameters as well as histopathological picture.

## 1. Introduction:

Colors have been used to make food more attractive and appetizing for centuries. In Egyptian Tombs dating as far back as 1500 B. C depict the making of colored candy (Marmion, 1987). Several synthetic food colors used in food industry proved numerous side effects such as urticaria (Chafee and Settipane, 1967), genotoxic effects (Combes and Haveland-Smith, 1982), endocrinial disturbances (Jennings et al., 1990), behavioral disorders (Pollock and Warner, 1990), and neurological effects (Tanaka, 2001).

Titanium is one of the eight most abundant in the earth's crust and consequently enters the food chain to some degree. Human are estimated to consume approximately 300g/titanium/day in food (Dunford et al., 1997). Moreover, TiO<sub>2</sub> accounts for about 70% of the total volume of pigment production world wide (Bann et al., 2006).

The Federal Regulations of US Government limit usage of TiO<sub>2</sub> in food products to 1% by weight (Wang et al., 2007). Oral route is a potential exposure route for general population due to TiO<sub>2</sub> used as white pigment on tooth paste, drug capsule (Baan et

al., 2006), in tableted drug products (Ghoropade et al., 1995), in dairy based products as a whitener in manufacture of different types of cheese (Leone, 1973), dairy based drinks, chocolate, milk, coca, soybean products, milk powder, margarine, processed meat, table and soda water, sausage casing (JECFA, 2006), in bread flour and in the confectionary (Lorenz and Maga, 1973). Also, TiO<sub>2</sub> therapeutically used in sunscreens and cosmetic creams (Gelis et al., 2003). There have been a relatively few systematic studies that have employed pigmentary TiO<sub>2</sub> (Bermudez et al., 2002). Most studies on TiO<sub>2</sub> toxicity in mammals were focused on the pulmonary impact of inhaled or dermal exposure (Wang et al., 2007). Mahrousa (2004) reported that 4mg/kg body weight of TiO<sub>2</sub> for 90 days in rats resulted in non significant change in DNA, and RNA content in liver and testis. Schapiro et al., (1995) reported that there were numerous studies shown that TiO<sub>2</sub> significant increase the production of hydroxyl radicals. Guo et al. (2009) studied the effect of nanosized TiO<sub>2</sub> (200 and 500 mg/kg) in male ICR mice aged 6 weeks injected intraperitoneally ever other day for five times. One week after drug cessation, low dose group

showed non significant changes, while high dose group exhibited a significant increase in serum ALT, ALT/AST ration and BUN. Furthermore, reduction in sperm density, motility and increased sperm abnormalities with germ cell apoptosis concomitant with no obvious pathological changes in liver, kidney, spleen, testis and epididymis.

It is pertinent to record that paucity of information concerning the reproductive study on TiO<sub>2</sub>. Thus this study was carried out to investigation the oral toxic impact of titanium dioxide in male albino rats with special reference to its effect on fertility.

## 2. Materials and methods

### Experimental Animals

Eighteen mature male albino rats weighing 180- 200g were used. The animals were obtained from Faculty of Veterinary Medicine, Zagazig University (laboratory animal's housing unit). Animals were clinically healthy, kept under hygienic condition, housed in metal cages with hard wood shavings as bedding. They were maintained on basal ration and given water *ad-libitum* for two weeks of acclimatization before use.

### Chemical

Titanium dioxide (TiO<sub>2</sub>): It is manufactured by Riedel- deHaen and was obtained by Sigma-Aldrich Laborchemikalien GmbH. TiO<sub>2</sub> was added to the ration at level of 1% and 2% according to *Ghoropade et al.*, (1995).

### Description

It is a white odorless powder with molecular weight 79.88 g/mole

Solubility:-It is insoluble in water and other solvents. It is dissolved slowly in hydrofluoric acid and in hot concentrated sulphuric acid. Water soluble matter not more than 0.5%, some preparations can be made hydrophilic by suitable surface treatment.

### Synonyms

Titanium dioxide, titanium peroxide, Titania, anatase, cosmetic white, Tipaque, titanium oxide, pigment white 6, titanium white, E 171, Tania.

### Methods

Rats were randomly distributed into three groups each of six. The first group control group (C) fed on TiO<sub>2</sub> free ration. The second and third groups fed on ration containing 1% and 2% TiO<sub>2</sub> (T1&T2) respectively for 65 days according to (Wang et al., 2007). All rats were weighed before the start of the experiment (preliminary weights). Rats were scarified at the end of the experimental period. Serum samples

were collected and kept at -20°C for biochemical studies. For seminal picture; The cauda epididymis were minced in normal saline and a drop of this epididymal suspension was picked up for seminal analysis and recording the epididymal spermatozoal characters (Hafez, 1970), sperm motility (Slott et al., 1991), sperm cell concentration per ml of semen (Robb et al., 1987), sperm abnormalities and live % of spermatozoa (Filler, 1993). Serum testosterone was determined according to Wilson and Foster, (1992) using testosterone kit (Egyptian Co. of chemicals) which depend on the method of enzyme immunoassay. Serum concentrations of nitrite according to Torre et al., (1996) by Griess reaction, superoxide dismutase (SOD) activity was assayed by Niskikimi et al., (1972), glutathione reductase (GR) activity was determined by Beutler, (1975) and Malondialdehyde (MDA) concentration according to Draper and Hardly, (1990), using Shimadzu type spectrophotometer manufactured by Incorporation Kyoto, Japan. Testis, seminal vesicle and liver were fixed in 10% formalin for histopathological examination according to Bancroft et al., (1996). Statistical analysis of data was assessed according to SPSS, (1997).

## 3. Results

### Clinical signs

Clinical signs showed depression, anorexia and white feces among the different dose levels of TiO<sub>2</sub> treated male rats along the experimental period. Moreover, addition of TiO<sub>2</sub> either 1% or 2% for 65 days of feeding, significantly decrease ( $P < 0.05$ ) the body weight compared to the control (Table 1).

### Effects of TiO<sub>2</sub> on male fertility

Concerning the sperm motility; there was non significant decrease in sperm motility percentage of male albino rats fed on low level of TiO<sub>2</sub>, while a significant decrease ( $P < 0.05$ ) was recorded in high level fed group compared with the control. The mean values of sperm cell concentration recorded a significant decrease ( $P < 0.05$ ) in both treated groups comparing with the control. There was a significant increase in percentage of sperm abnormalities which was dose dependent and compared to the control one. Results are depicted in Table 2 (Fig 1-II, Fig 1-III A, B, C, D). Regarding sperm viability showed that 1% and 2% TiO<sub>2</sub> caused a significant decrease ( $P < 0.05$ ) comparing with the control group .The testosterone level recorded a significant decrease ( $P < 0.05$ ) in both TiO<sub>2</sub> treated groups compared to control (Table 2).

### Biochemical parameters

TiO<sub>2</sub> 1% and 2% resulted in a significant increase ( $P < 0.05$ ) in NO production, SOD and GR

enzyme activities compared with control. MDA showed non significant increase in TiO<sub>2</sub> treated groups (Table 3).

#### Post mortem changes

Macroscopically; seminal vesicles of TiO<sub>2</sub> treated male rats showed hypertrophy in low dose level, while atrophy in high level (Fig 2-A).

#### Histopathological findings

The epithelial lining of the seminal vesicle showed hyperplastic changes with little or absence of secretion beside edema of trabiculae observed in all rats fed 1% TiO<sub>2</sub> (Fig. 2-C), while there was

reduction in number and size of the epithelial cell lining of the tubuloalveolar glands in rats fed 2% TiO<sub>2</sub> (Fig 2-D).The seminiferous tubules revealed mild spermatogenesis with congested interstitial blood vessel with endotheliosis in T1 (Fig. 3-B). Thickened tunica albuginea with degenerated spermatogonial cell layers and spermatocytes with absence of spermatogenesis were also seen particularly in rats fed 2% TiO<sub>2</sub>. The hepatocytes suffered from various degenerative changes varied from vacuolar and hydropic degenerations to cell death in rats fed low dose of 1% TiO<sub>2</sub> (Fig 3-D). TiO<sub>2</sub> 2% resulted in more intense lesions mainly steatosis of the hepatic cells (Fig. 3-E).

**Table (1): Changes in mean body weight (g) of male albino rats fed on 1% and 2%TiO<sub>2</sub> containing rations for 65 days (Mean± S.E.).**

Group	Treatment	Mean of body weight at the beginning	65 days post- administration
C	Free diet	181.00±5.56 <sup>a</sup>	275.16±2.6 <sup>a</sup>
T 1	TiO <sub>2</sub> 1%	179.42±5.2 <sup>a</sup>	237.83±1.92 <sup>b</sup>

#### 4. Discussion

In the past, some food additives had been considered acceptable in the absence of adequate information. Safety data about TiO<sub>2</sub> is still limited and it has been needed to be evaluated repeatedly and determined its safety by Regulatory Agency in the country of use.

Regarding to the effect of TiO<sub>2</sub> on body weights, our results revealed that male albino rats fed on TiO<sub>2</sub> 1% and 2% had lowered mean value of body weights if compared with that of the control group. These results are consistent with those observed by Wang et al., (2007) who found that after acute oral administration of a single dose of TiO<sub>2</sub> (5g/kg body weight) decreased body weight of all treated mice , Mahrousa , (2004) who recorded that oral treatment of male rats with 4mg/kg body weight TiO<sub>2</sub> for 90 days resulted in a significant decrease in their body weight and Bermudez et al., (2002) who exposed six week old female mice, rats, and hamsters to 10, 50, or 250 mg/m<sup>3</sup> pigmentary TiO<sub>2</sub> for 6 hours per day and 5 days per week for 13 weeks. TiO<sub>2</sub> produced depression in the body weight in all species and in all groups.. The weight loss is paralleled with anorexia which was observed on the exposed animals in the present study and may be attributed to the disturbance in different metabolic systems which resulted from

feeding synthetic food colorants (Abdel- Rahim et al., 1989).

Regarding the effect of TiO<sub>2</sub> feeding on male fertility, the present study revealed that TiO<sub>2</sub> 1% and 2% feeding for 65 days demonstrated a significant dose dependent increase in sperm abnormalities % and significant decrease in sperm cell concentration. Sperm motility % was significantly decreased in TiO<sub>2</sub> 2% and non significantly decreased at 1% compared with the control group. Our results were in the same context with those previously reported (Guo et al., 2009). Changes in epididymal sperm characters obtained in our result may be postulated to the generated NO following TiO<sub>2</sub> which plays a role in sperm motility (Herrero et al., 1997). By the same way, excessive NO production in response to a variety of stressors, possibly reducing the survival rate and motility of sperm cells (Ozokutan et al., 2000). Serum testosterone level was lowered. The high level of NO may be responsible for reduction in testosterone secretion (Adams et al., 1994), which leads to hypospermatogenesis, testicular inflammation and disturbance of GnRH secretion (Ferrini et al., 2001) and supported our histopathological evidence in the present study. Degenerated spermatogonial cell layers may be attributed to decreased testosterone synthesis and disruption of normal androgen status (Xing-

Shou, 1983) or may be due to reduced serum cholesterol level which is the precursor of all the steroid hormones (Bush,1991). TiO<sub>2</sub> is one of ROS generators (Sayes,et al.,2006 and Gurr et al.,2005) and confirmed by elevated antioxidant enzyme activities , SOD and GR.The present study revealed that there was a significant increase in SOD and GR enzyme activities in male rats fed on 1% and 2% TiO<sub>2</sub>.Similar results obtained after ultra-fine TiO<sub>2</sub> intra tracheal exposure in alveolar macrophage and peripheral RBCs of treated rats (Afaaq et al., 1998) to face the high level of generated ROS mentioned .The present study showed a non significant increase MDA concentration in liver homogenate of TiO<sub>2</sub> treated rats. Our results are concordant with Maness et al., (1999) who mentioned that TiO<sub>2</sub> caused an exponential increase in the MDA production who explained an increase of lipids peroxidation due to excessive ROS generation. These results are in agreement with Gurr et al., (2005) and Olmedo et al., (2005) in human and rats bronchial epithelial cells. The pathological alterations induced by TiO<sub>2</sub> may be associated with the generation of ROS. Furthermore, hepatic lesions as a sequellae of accumulated TiO<sub>2</sub> particles which is difficultly cleared *in vivo* after oral ingestion (Wang et al., 2007).

**Acknowledgment** to Prof .Dr. Abd EL- Monem Ali Professor of Pathology Faculty of Veterinary Medicine for his help in histopathological examination.

# Protective Effect of *Lepidium sativum L.* Seeds Powder and Extract on Hypercholesterolemic Rats

**Wafeka Abdulah Al Hamedan**

Department of Nutrition and Food Science, Home Economic, Collage, Princess Nora Bent abdul – rahman - University, Riyadh, Saud Arabia

**Abstract:** The present study was designed to investigate the effects of *Lepidium sativum L* (LS) on the nutritional status and some biochemical analyses of serum and liver in hypercholesterolemic rats. Forty-two adult albino male rats Sprague Dawley strain were classified into six groups. One was fed on standard diet and kept as control (-ve) group. The other five hypercholesterolemic rat groups were control (+ve), drug, LS extract, 5 % or 10 % LS powder rat groups. In comparison to control (- ve) group, the control (+ve) group showed a significant higher value of weight gain , feed efficiency ratio (FER), serum cholesterol, triglycerides , LDL-c ,VLDL-c, cholesterol/ HDL-c and LDL-c/ HDL-c, serum (AST& ALT) ,creatinine ,urea, liver cholesterol and total lipids but significant decrease in HDL-c, globulin and liver triglycerides .Also, LS extract and 5% LS powder rat groups showed a significant increase in weight gain, cholesterol/ HDL-c and LDL-c/ HDL-c, serum (AST& ALT) however, drug and 10% LS powder rat groups showed a significant increase in cholesterol/ HDL-c. On the other hand, The drug, LS extract , 5% and 10% LS powder rat groups showed a significant increase in serum cholesterol ,triglycerides VLDL-c , LDL-c ,serum creatinine and urea level when compared to control (- ve) group. In comparing with control (+ ve) group, The drug, LS extract , 5% and 10% LS powder rat groups showed a significant lower value of weight gain , feed efficiency ratio, serum cholesterol ,triglycerides VLDL-c , LDL-c level, cholesterol/ HDL-c , LDL-c/ HDL-c , serum (AST& ALT) ,serum creatinine, urea, liver cholesterol and total lipids with a significant increase in both serum globulin and liver triglycerides.

[Wafeka Abdulah Al Hamedan. Protective Effect of *Lepidium sativum L.* Seeds Powder and Extract on Hypercholesterolemic Rats. Journal of American Science 2010;6(11):873-879]. (ISSN: 1545-1003).

Key wards : *Lepidium sativum* – aqua extract- cholesterol and rats

## 1. Introduction:

Hypercholesterolemia refers to elevated serum LDL cholesterol or a combination of high levels of LDL cholesterol and triglycerides. Hypercholesterolemia, a significant cardiovascular risk factor, is one of the major oxidative stresses that generate excess of highly reactive free radicals. This exacerbates the development and progression of atherogenesis Hypercholesterolemia increased the risk of increased LDL-c or more accurately LDL-c/ HDL-c ratio. The atherogenic index decreased as a result of the reduction in LDL-c and increment in HDL-c (Durrington, 1995 and Abd El-Ghanny et al., 2007).

Plants still remain a major source for drug discovery in spite of the great development of synthetic molecules. Consequently, the uses of traditional plant extract in the treatment of various diseases have been flourished (Jouad et al., 2001).The garden cress seed oil, *Lepidium sativum L.*,(LS) is a fast growing annual herb belonging to the Brassicaceae family that is native to Egypt and west Asia The seeds are wildly consumed as salad and spice (Gokavi et al .,2004). Previous studies have demonstrated the protective action of LS against

carcinogenic compounds and growth inhibition of *Pseudomonas aeruginosa*, a bacteria strain with a potent antibiotic resistance (Abuja et al., 2001 and Kassie et al., 2003). LS recommended in the treatment of hypertension, diabetes and renal disease (Kirtkar and Basu 2005 and Tahraoui et al., 2007).

The present study was designed to investigate the effect of powder or aqua extract from *Lepidium sativum L.* seeds (LS) either on the nutritional status and some biochemical analyses of serum and liver in hypercholesterolemic rats.

## 2. Materials and methods

### I – Materials:

#### 1- Garden cress (*Lepidium sativum L.*) seeds:

*Lepidium sativum L.* seeds (LS) were purchased from Agricultural Research Center. Garden cress seeds were dried with hot air (40–60 °C) and grinded to powder. Garden cress seeds powder was used in preparation of aquatic extract and also added to the diet as 5 % and 10% of the constituent of fiber.

#### 2- Gemfibrozil capsules:

It was obtained from Amoun Pharmaceutical Industries Company. Each tablet contains 100 mg. It is lipid regulating agent which decrease lipid elevated serum lipids by lowering serum triglycerides and total cholesterol. Human therapeutic dose was 100 mg which converted to rat dose that was 9 mg/kg body weight daily which dissolved in distilled water and given to rats by oral intubations according to Paget and Barnes (1964).

### 3-Biochemical kits:

BioMerieux Kits were purchased from Alkan Co. for Chemicals and Biodiagnostics, Dokki,, Egypt.

### 4-Experimental animals:

A total of forty-two Sprague -Dawley adult male rats were purchased from the Agricultural Research Center, Giza, Egypt. The average weight was  $205 \pm 5$  g. The animals were kept under observation for five days before experiment and supplied with standard diet and water *ad libitum*. The standard diet comprised of casein (200g/kg), corn starch (497g/kg), sucrose (100g/kg) , cellulose (30 g/kg) ,corn oil (50g/kg), mineral mixture (100g/kg) , vitamin mixture (20g/kg) and DL-methionine (3g/kg).The standard diet was performed according to NRC (1995).

## II. -Methods:

### 1. Preparation of the garden cress aqueous extract:

The aqueous extract was prepared in a standardized manner by boiling 1 g of dried powdered seeds of LS in 100 ml of distilled water for 10 min and left for 15 min to infuse then cooled and filtered. The filtrate was lyophilized and the desired dose was then prepared and reconstituted in 10 ml of distilled water per kilogram body weight just before oral administration. The aqueous extract dose was 20 mg/kg body weight daily by oral intubations (Eddouks et al., 2005).

### 2- Grouping of rats and experimental design:

The experimental rats were divided into six groups (n= 7 rats). The first group which kept as normal control (-ve) group which fed on standard diet only. The rest of rats were fed on standard diet with 2 % cholesterol for 3 weeks to be hypercholesterolemic, then classified into 5 groups and remained fed on hypercholeslerolemic diet during the experimental period (8 weeks). One of them acted as control (+ve) and the other groups were drug, LS seeds extract, 5% and 10% LS powder.

### 3 –Calculation of some parameters:

Feeding and growth performance were carried out by determination of daily feed intake, body weight gain and feed efficiency ratio (FER) according to Chapman et al., (1950) using the following Formula

$$\text{FER} = \text{Body weight gain} / \text{Feed intake.}$$

### 5 –Collection of samples:

The rats were sacrificed at the end of the experiment (8 weeks). The collected blood samples were centrifuged at 3000 rpm/ 10 minutes to obtain serum. Livers of rats were also collected for some biochemical analysis.

### 5 -Biochemical analysis:

#### A- Serum analysis

Serum cholesterol, triglycerides (TG) and high density lipoprotein cholesterol (HDL-c) were determined by using enzymatic colorimetric methods (Allain et al., 1974, Buccolo and David (1973) and Kostener, 1977, respectively). Very low density lipoprotein cholesterol (VLDL-c) was calculated as TG/5 while low density lipoprotein cholesterol (LDL-c) was calculated as following [LDL-c= Total cholesterol -HDL-c -VLDL-c] according to Fruchart, (1982). Serum aspartate and alanine amino transferase (AST&ALT) enzymes, total protein, and albumin were estimated according to Reitman and Frankel (1957), Weichselbaum (1946) and Bartholomev and Delany (1966), respectively. Serum globulin (G) value was determined by subtracting the albumin from the total proteins according to Coles (1974). In addition, creatinine and urea were estimated according to Bonsens and Taussky, (1984), and Patton and Crouch, (1977) respectively. Atherogenic indexes (cholesterol/ HDL-c & LDL-c/ HDL-c) were calculated according to Castelli and levitar, (1977).

#### B- Liver analysis:

Livers of rats were rapidly removed and parts of them perfuse with 50 to 100 of ice cold 0.9%NaCL solution for estimation of cholesterol, triglycerides , and total lipids, according to Abell et al., (1952) , Seheletter and Nussel, (1975), Folch et al., (1957), respectively.

## III.- Statistical analysis:

Collected data were subjected to analysis according to SPSS Program Differences were considered significant at  $p < 0.05$  (Artimage and Berry, 1987).

## 3. Results:

Data recorded in table (1) showed that the control (+ve) group showed a significant higher value of weight gain and feed efficiency ratio (PER) at  $p<0.01$  while the LS extract, 5% and 10% LS powder rat groups showed a significant higher value of weight gain at  $p<0.05$  compared to control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant lower value of weight gain and feed efficiency ratio compared to control (+ ve) group.

Table (2) showed that the control (+ve) group showed a significant increase in serum cholesterol, triglycerides, LDL-c and VLDL-c ( $p<0.001$ ) but significant decrease in HDL-c ( $p<0.001$ ) in comparison with control (-ve). On the other hand, the drug, LS extract , 5% and 10% LS powder rat groups showed a significant increase in serum cholesterol ,triglycerides LDL-c and VLDL-c level ( $p<0.05\&0.01$ ) compared to control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant decrease in serum cholesterol ,triglycerides LDL-c and VLDL-c level in comparison with control (+ve).

Table (3) showed that, control (+ve), LS extract and 5% LS powder rat groups showed a significant increase in cholesterol/ HDL-c and LDL-c/ HDL-c ( $p<0.01\&0.05$ ) while drug and 10% LS powder rat groups showed a significant increase in cholesterol/ HDL-c ( $p<0.05$ ) compared to control (-ve) group. The drug, LS extract, 5% and 10% LS powder rat groups showed a significant decrease in value of cholesterol/ HDL-c and LDL-c/ HDL-c in comparison with control (+ve).

Mean values in each row having different superscript (a, b &c,) are significant.

From data presented in table (4), it could be noticed that control (+ve) ,drug, LS extract , and 5% LS powder rat groups showed a significant increase in serum alanine and aspartate aminotransferase (ALT &AST) at  $p<0.01$  compared to control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant decrease in serum alanine and aspartate aminotransferase enzymes in comparison with control (+ ve) group .

As shown in table (5), the control (+ve) showed a significant decrease in globuline ( $p<0.05$ ) but a significant increase in creatinine and urea ( $p<0.01$ ) compared to control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant increase in serum creatinine and urea ( $p<0.05$ ) compared to control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant increase in serum globulin and a significant decrease in serum creatinine and urea compared to control (+ ve) group.

As recorded in table (6) showed that control (+ve) group showed a significant increase in liver cholesterol and total lipids ( $p<0.01$ ) but significant decrease in liver triglycerides ( $p<0.05$ ) in comparison with control (- ve).The drug, LS extract, 5% and 10% LS powder rat groups showed a non significant difference in liver cholesterol, triglycerides and total lipids in comparison with control (- ve) group. The drug, LS extract , 5% and 10% LS powder rat groups showed a significant decrease in liver cholesterol and total lipids but significant increase in liver triglycerides in comparison with control (+ ve) group.

#### 4. Discussion:

Our investigation revealed that, consumption of *Lepidium sativum* L.(LS) seeds increase weight gain as LS seeds are found to contain 18–24% of fat which 34% of total fatty acids is alpha linolenic acid. It contains good amount of lignans and antioxidants, which can stabilize the n-3 polyunsaturated fatty acids in its seed oil. LS oil has alpha linoleic acid which could give it nutritional advantages (Gunstone, 2004 and Diwakara et al., 2008). The primary fatty acids in LS oil were oleic (30.6 wt %) and linolenic acids (29.3 wt %). LS seeds oil contained high concentrations of tocopherols. The primary phytosterols in L S were sitosterol and campesterol, with avenasterol (Bryan et al., 2009).

The results of lipid profile were agreed with results obtained by Das et al., (1997) who reported that the lipid profile of hypercholesterolemic animals were significantly higher than control rats for total lipid, total cholesterol , triglyceride, LDL-c and VLDL-c while only HDL-c was significantly lower in hypercholesterolemic rats than in control rats.

The increased plasma cholesterol, particularly LDL-c is one of the most important risk factor for coronary vascular disease. LDL-c particle are taken up by macrophage cells after oxidized or modified and then deposited in the arterial intima leading to formation of atheroma (Durrington, 1995). Low HDL-c levels are considered as a strong risk factor for coronary heart disease as HDL-c act as antioxidant and protect LDL-c from oxidation so that

reduce LDL-c from circulation (Boden and Pearson, 2000 and Glass and Witztum, 2001). Lepidium sativum L. seeds have revealed presence of glycoside, alkaloids, tannin (Phenolic compound), flavonoids, and amino acids like glutamine, cysteine, and glycine. The tannin and flavonoids may have antioxidant activity whenever glutamate, cysteine, glycine are intermediates for synthesis of the endogenous antioxidant glutathione. Diets rich in alpha linolenic acid have been associated with a reduced risk of fatal ischemic heart disease, a reduction in heart attacks and mortality from chronic vascular disease. Feeding alpha linolenic acid has also been shown to decrease platelet aggregation, total cholesterol, LDL cholesterol and triglycerides in humans and rats (Olsson, and Yuan 1996, Kirtkar and Basu 2005 and Hamer and Steptoe, 2006).

Protective and curative treatment of ethanolic extract of Lepidium sativum seeds L. in renal failure of rats significantly reduced the level of urea and creatinine that indicates increase glomerular filtration rate. Extract of Lepidium sativum L. seeds may be having nephroprotective and curative activity. Daily oral administration of aqueous LS extract for 3 weeks exhibited antihypertensive and diuretic activities. ALT and AST are closely correlated in most cases of liver diseases. Excessive storage of fat in the liver effects on liver functions and increases the susceptibility to free radical attack in hypcholesterolemic rats resulting in liver damage as described by Tahri et al .,(2000), Mhamed et al .,(2005) and Yadav et al .,(2009). Feeding rats with 10% Garden cress seed oil lowered hepatic cholesterol by 12.3% and serum triglycerides by 40.4% compared to SFO fed group. Very low density lipoprotein cholesterol (VLDL-C) and low density lipoprotein cholesterol (LDL-C) levels decreased by 9.45% in serum of 10% LS oil fed rats, while HDL remained unchanged among LS oil fed rats (Diwakar et al .,2008)

<sup>\*</sup>[Sata186@hotmail.com](mailto:Sata186@hotmail.com)

**Abstract:** A total of 335 antibiotic-resistant coagulase-negative staphylococci (CNS) were isolated from face of 53 Egyptian acne patients, 13 dermatology staff and 36 controls. Prevalence of tetracycline resistant CNS was the most common with a rate of 87.3% of total population sampled. Acne patients treated with antibiotics were found to have significant higher risk of carrying erythromycin and clindamycin resistant CNS than patients not under treatment. Staff group was the most common cohort to carry multi-resistant CNS strains with a prevalence of 81.2%. Four erythromycin-resistance genes were screened for 43 CNS strains from patients. The most widely distributed determinants were *msr(A)* alone (48.8%), followed by *erm(C)* alone (39.6% strains) while both determinants together were accounted in 11.6% of the isolates. In addition, 48 non-duplicate tetracycline resistant CNS strains from patients were screened for the presence of four tetracycline resistance genes. Forty-seven of the isolates (97.9%) had *tet(K)* gene. *Tet(L)* gene was only found in four isolates (8.3%), from which three isolates were found to carry also *tet(K)* gene. This study revealed that the high carriage rate of *msr(A)* in our isolates suggests the effective therapy with clindamycin for most of erythromycin resistant CNS infections. In addition, the mechanism of tetracycline resistance in our isolates is mainly by active efflux and we might expect the success of treatment with minocycline in most of tetracycline resistant CNS from Egypt.

[El-Mahdy, T.S.; Abdalla, S.; El-Domany, R. and Snelling, A.M. Investigation of MLS<sub>B</sub> and tetracycline resistance in coagulase-negative staphylococci isolated from the skin of Egyptian acne patients and controls. Journal of American Science 2010;6(11):880-888]. (ISSN: 1545-1003).

**Key words:** acne, coagulase-negative staphylococci, MLS<sub>B</sub>, resistance, tetracycline. *Running title:* Antibiotic resistance of Egyptian CNS.

## 1. Introduction:

Antibiotics remain the cornerstone of acne treatment. Whilst *Propionibacterium acnes* is being targeted, selective pressure is also exerted on other members of the commensal skin flora, including CNS. These bacteria may then act as reservoirs of resistance genes for more pathogenic strains or species. Several species of CNS are recognized as potential opportunistic pathogens, mainly causing nosocomial infections (Righter, 1987). CNS especially methicillin-resistant is one of the main causes of nosocomial blood stream infection in ICUs in Assiut University hospitals, Upper Egypt (Ahmed *et al.*, 2009)

Macrolide, lincosamide and streptogramin B (MLS<sub>B</sub>) antibiotics are chemically distinct but share a similar mode of action. Three mechanisms have been involved in staphylococcal resistance to macrolides; target-site modification [encoded by *erm* genes] (Skinner *et al.*, 1983), active efflux [encoded by *msr(A)*] (Ross *et al.*, 1989), and rarely by drug inactivation (Weisblum, 1998). CNS strains carrying *erm* genes are cross-resistant to all MLS<sub>B</sub>. However,

strains carrying *msr(A)* gene are only resistant to MS<sub>B</sub> antibiotics (Ross *et al.*, 1990).

Bacterial resistance to tetracycline was mediated by: efflux proteins [encoded by *tet(K)* and *tet(L)* genes], ribosomal protection proteins [encoded by *tet(M)* and *tet(O)* genes], enzymatic inactivation of tetracyclines and target modification (Roberts, 2005). *Tet(K)* and *tet(L)* genes confer high level resistance to tetracycline but not minocycline. In contrast, *tet(M)* and *tet(O)* genes confer resistance to minocycline (Chopra & Roberts, 2001).

Erythromycin, clindamycin and tetracycline are widely used in Egypt to treat acne, and available over the counter, but it is not known how this is affecting the commensal flora. This study sought to determine the prevalence of resistant CNS, and genes responsible, isolated from Egyptian acne patients attending dermatology clinics and controls.

## 2. Materials and methods

### Subjects

A total of 53 patients (23 male and 30 female) aged 15-29 years (average 20 years) attending two dermatology clinics in Cairo at:

Dermatology Clinic, Ain-Shams University Hospital and Cairo Dermatology Hospital, participated in this study. Thirteen dermatology staff (nurses and doctors) from the same dermatology clinics were also sampled. Patients were whether currently on or off treatment. Also 36 age-matched controls from the community were not suffering acne and no antibiotics taken in past six months. All patients, controls and dermatology staff were informed and gave their verbal and written informed consent to take part in this study. All participants in the study were asked to fill a questionnaire. The study was approved by the local Ethics Committees.

#### Sampling method

Cutaneous CNS isolates were collected from the face of Egyptian acne patients and controls according to the method applied by Ross *et al.* (2003). Applying firm pressure, the surface of the entire face was rubbed with a transport swab (Copan Italia, Brescia, Italy) moistened in sterile wash fluid (0.075 mol/L sodium phosphate buffer, pH 7.9) containing 0.1% Triton-X 100. Swabs were placed into tubes of Amies medium prior to transfer in the same day of sampling at 4°C to Bradford University, UK and arrived after two days by experienced courier on two shipments.

#### Isolation and identification of resistant CNS

Swabs were used to inoculate Muller-Hinton (MH) agar plates containing breakpoint concentrations according to CLSI guidelines of 4 mg/L erythromycin, 2 mg/L clindamycin or 8 mg/L tetracycline as well as antibiotic-free control plates, which were always inoculated last. After 48 hours aerobic incubation at 37°C, plates were inspected for growth. One representative isolate in colonies morphologically resembling staphylococci was chosen per plate but if more than one colony morphology was evident, a representative of each was selected for further study using Gram staining, coagulase test (Staphaurex, Remel, USA) and carbohydrate fermentation (method adopted from Kloos & Schleifer, 1975).

Selected coagulase-negative strains were also further identified using MASTRING *Staphylococcus* ID kit for identification of CNS (Mast, UK) as per manufacturer's protocol and PCR-ribotyping of staphylococci protocol. Eleven CNS reference strains were used, included *S. hominis* NCTC 11320; *S. warnari* NCTC 11044; *S. capitis* NCTC 11045; *S. epidermidis* NCTC 11047; *S. cohnii* NCTC 11041; *S. haemolyticus* NCTC 11042; *S. epidermidis* NCTC 2749; *S. aureus* NCTC 6571 (Oxford); *S. simulans* NCTC 11046; *S. xylosus*

NCTC 11043 and *S. hyicus* sub. *chromogenes* NCTC 11530.

#### Antibiotics

Antibiotics were purchased from Sigma (Poole, U.K.) and were dissolved in water with the exception of erythromycin, which was dissolved in absolute ethanol.

#### Determination of MICs

MICs for the three antibiotics were determined by agar dilution on MH agar as described by CLSI using multipoint inoculator (Denley, Tech Ltd, Bolney Sussex, U.K). Type strain *S. aureus* NCTC 6571 (Oxford) was included as a susceptible control.

#### DNA preparation

A. For PCR detection of tetracycline and erythromycin resistance genes in CNS

Lysostaphin (50µl at 2 mg/mL cells suspended in 1X TE buffer) was used to weaken the cell walls and incubating at 37°C for up to 1 h. Genomic DNA was extracted twice with phenol/chloroform and precipitated by absolute ethanol as described by Eady *et al.* (1993).

#### B. For PCR-ribotyping of CNS

Using NET (10 mM Tris, 1mM EDTA, 10 mM NaCl)/Achromopeptidase (stock solution 10 units/µl, Sigma, code A3547) solution as described by Kobayashi *et al.* (1994).

#### PCR-ribotyping for species identification of CNS

The PCR reaction was performed as mentioned before by Jensen *et al.* (1993). A pair of primers was used within the 16S-23S rRNA spacer region. The PCR-ribotyping amplification patterns of CNS isolates were visually compared with those obtained for the reference strains.

The electrophoresis of PCR-ribotyping of CNS was carried out using 1X TBE buffer (89 mM Tris, 89 mM borate, 2mM EDTA, pH 8.3) and the gel was run at 100V for three hours in a large gel tank. All obtained fragments were visualized by ethidium bromide (Sigma) staining after gel electrophoresis using 2% agarose gels. The sizes of the PCR products were determined by comparing them with the migration of 100-bp DNA ladder (Fermentas).

#### PCR to investigate tetracycline and erythromycin resistance genes in CNS

Table 1 gives the primer sequences and PCR reaction conditions for each target gene. The PCR reaction was performed in a 20 µl volume; containing 1 µl DNA extract, 2 µl of 10x thermopol buffer

containing 2mM MgSO<sub>4</sub> (New England Biolabs, Ipswich, UK), 2µl of PCR nucleotide mix including 2 mM each of dNTP (New England Biolabs, UK), 0.25 µl of 0.1nm/µl each primer (Sigma Genosys, Ltd, London, UK) and 0.1 µl of Taq DNA polymerase (New England Biolabs, NEB), the volume for each PCR reaction was completed to 20 µl by molecular

biology grade water (Eppendorf, Hamburg, Germany). All PCR reactions were started by an initial denaturation step at 94°C for 4 min, and ended by a final elongation step at 72°C for 5 min. All obtained fragments were visualized as mentioned before.

## Assay for resistance phenotype pattern in erythromycin resistant CNS

Selected CNS strains demonstrating erythromycin resistance were screened for the MLS<sub>B</sub> and MS<sub>B</sub> phenotype as described by CLSI guidelines, 2007. Flattening of the zone around the clindamycin disc indicated an inducible MLS<sub>B</sub> phenotype while constitutive MLS<sub>B</sub> phenotype shows no inhibition zone around both discs. In contrast, the MS<sub>B</sub> resistant isolates do not show flattening of the clindamycin zone next to the erythromycin disc.

### 3. Results and Discussion:

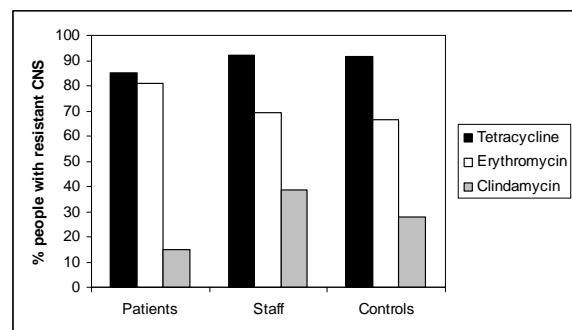

#### Demographics of study participants

More than half of the patients (62.2%) had acne from a period of 1-3 years. Twelve (22.6%) patients sampled had never used any specific acne treatment prior to the study. However, only 26.4% of patients were currently on any kind of acne therapy at the time of sampling. There was no significant difference between patient sex and severity of acne ( $P > 0.05$ ).

#### Prevalence of skin colonization with antibiotic resistant CNS

Figure 1 shows the % of people in each cohort carrying antibiotic resistant CNS amongst their skin flora, as determined from the primary selective plates. The prevalence of tetracycline resistance was the most common amongst antibiotics tested with a rate of 87.3% of all cohorts sampled. The difference in prevalence of tetracycline resistance between patients, clinic staff, and controls was not significant ( $P>0.05$ ). Patients on current or very recent antibiotic treatment were no more likely to carry tetracycline resistant strains (24 people of 45) than those using other or no medication (21 people of 45) ( $P>0.05$ ).

In keeping with the observations of Miller *et al.* (1996) where they studied the staphylococcal resistance on the skin of acne contacts and controls, a majority of our controls carried staphylococcal strains resistant to tetracycline (95.1% of their controls *vs* 91.4% of controls in the current study), erythromycin (70.7% *vs* 66.7%) and clindamycin (24.4% *vs* 27.8%). In addition, prevalence of bacterial resistance to erythromycin was 95% for *S. epidermidis* strains isolated from acne patients in a French study (Dreno *et al.*, 2001). These results are higher than those reported by Nishijima *et al.* (1994) in Japan and by Bouchami *et al.* (2007) in Tunisia with a percentage of 61% and 62%, respectively, but nearly similar to our current study (81.1%) in Egypt and to Forssman (1995) in Switzerland with a percentage of 100%.

**Figure 1: Prevalence of antibiotic resistant CNS amongst the cohorts tested**

Egyptian acne patients treated with antibiotics were found to have a higher risk of carrying erythromycin and clindamycin resistant CNS ( $P= 0.023$  and  $0.036$ , respectively) than patients not under treatment. On the contrary, Dreno *et al.* (2001) showed that the use of previous or current treatment with erythromycin does not influence the frequency of resistant strains of *S. epidermidis*. This contradiction may be explained by the extensive use of both antibiotics in treatment of acne in Egypt.

#### Phenotypic and MIC profiles of antibiotic-resistant CNS

The susceptibilities of the 335 resistant isolates to the three antibiotics were determined by agar dilution. Table 2 illustrates the number of antibiotic-resistant CNS within the different cohorts.

Forty-seven strains of 117 (40.2%) carrying erythromycin resistance in patients had high-level resistance ( $MIC > 1024$  mg/L). Eight CNS strains of 116 (6.9%) from patients were found to have high-level resistance to tetracycline ( $MIC \geq 256$  mg/L). Staff group was the most common cohort to carry multi-resistant CNS strains with a prevalence of 81.2% of total strains from staff having resistance to two or three antibiotics. The incidence of multi-resistant CNS amongst isolates retained from patients and controls were 75.5% and 71%, respectively. All clindamycin resistant strains were also resistant to erythromycin.

#### Genetic diversity of erythromycin -resistant CNS

A total of 43 erythromycin resistant strains were retained from the 43 patients who were colonized with erythromycin resistant-CNS and identified to the species level. The PCR-ribotyping amplification patterns of CNS isolates were visually compared with those obtained for the reference strains.

**Table 2: Number of antibiotic-resistant CNS strains and cross-resistance obtained from different cohorts**

Antibiotic	No. of CNS strains resistant to antibiotic(s) / %			
	All cohorts (Total=335)	Patients (Total=163)	Controls (Total=124)	Staff (Total=48)
Tet	238 / 71	116 / 71.2	82 / 66.1	40 / 83.3
Ery	221 / 66	117 / 71.8	71 / 57.2	33 / 68.8
Clin	59 / 17.6	21 / 12.9	28 / 22.6	10 / 20.8
Cross-resistance to two Abs	151 / 45.1	70 / 42.9	60 / 48.4	21 / 43.8
Cross-resistance to three Abs	99 / 29.6	53 / 32.5	28 / 22.6	18 / 37.5

High level resistance to erythromycin was seen in 51.2% of the tested isolates ( $MIC > 1024$  mg/L) and all of these isolates harbor *erm(C)* gene (Table 3). The most widely-distributed erythromycin resistance determinants was *msr(A)*. The expression of *erm(C)* was either inducible or constitutive. All CNS carrying only *msr(A)* were clindamycin susceptible and have low level resistance to

erythromycin ( $MIC \leq 128$  mg/L). All strains carrying both *erm(C)* and *msr(A)* genes phenotypically express the inducible or constitutive  $MLS_B$  pattern. *S. simulans* and *S. epidermidis* were the major CNS species with *erm* mechanism (81.8%, 18 of 22 strains), in contrast, *S. haemolyticus* and *S. hominis* were the predominant *msr(A)* carrying species (61.5%; 16 of 26 strains) (Table 3).

**Table 3: Genotypic and phenotypic distribution of erythromycin resistant CNS**

Ery resistance gene(s)	No. of strains (%) (n=43)	Ery MIC range mg/L (mode)	Phenotype	CNS species
<i>erm(A)</i>	0	0	0	0
<i>erm(B)</i>	0	0	0	0
<i>erm(C)</i>	17 (39.6)	>1024 (>1024)	13 i $MLS_B$ 4 c $MLS_B$	<sup>a</sup>
<i>msr(A)</i>	21 (48.8)	16-128 (32)	21 non-inducible MS <sub>B</sub>	<sup>b</sup>
<i>erm(C)/ msr(A)</i>	5 (11.6)	>1024 (>1024)	4 i $MLS_B$ 1 c $MLS_B$	<sup>c</sup>

i $MLS_B$ : inducible  $MLS_B$

c $MLS_B$ : constitutive  $MLS_B$

<sup>a</sup>7 *S. simulans*, 6 *S. epidermidis*, 2 *S. haemolyticus*, 1 *S. hominis*, and 1 *S. saprophyticus*.

<sup>b</sup>9 *S. haemolyticus*, 7 *S. hominis*, 2 *S. cohnii*, 1 *S. epidermidis*, 1 *S. saprophyticus*, and 1 *S. simulans*.

<sup>c</sup>3 *S. epidermidis*, and 2 *S. simulans*

The available data corresponding to this study was compared in Table 4. Lina *et al.* (1999) found that macrolide resistance due to *msr(A)* was more prevalent in CNS (14.6%) than in *S. aureus* (2.1%). This *msr(A)* ratio in CNS is much lower than our finding that 60.5% of selected erythromycin resistant strains of CNS from Egypt have *msr(A)* gene alone or in combination with *erm(C)*. Similarly to the current study, Bouchami *et al.* (2007) reported that the MIC of erythromycin varied between 32 and >1024 mg/L for isolates harboring *erm* genes and between 16 and 32 mg/L for those harboring *msr(A)*.

The present study extends the data from previous studies that  $MLS_B$  resistance in CNS was caused most often by *erm(C)*. Carriage of *msr(A)* is rarely seen in *S. aureus*, but seems to be more frequent in CNS (Lina *et al.*, 1999). However, one study from USA (Fiebelkorn *et al.*, 2003) reported that *msr(A)* gene was present in a high proportion of *S. aureus* isolates (36%), indicating that geographical differences may exist. It can be concluded from the present study that in our Egyptian CNS tested strains, clindamycin treatment should be considered as effective therapy due to the high carriage rate of the *msr(A)* gene by our isolates.

#### Genetic diversity of tetracycline-resistant CNS

A total of 48 non-duplicate tetracycline resistant CNS strains were chosen from patients and identified to the species level. Breakpoint of doxycycline and minocycline was 8 mg/L as set by CLSI. Forty-two strains (87.5%) had cross-resistance to doxycycline. The majority of isolates had doxycycline MICs in the range of 8-16 mg/L. None of the strains tested had resistance to minocycline.

All strains were screened for the presence of four tetracycline resistance genes; *tet(K)*, *tet(L)*, *tet(M)*, and *tet(O)*. Forty-seven of the isolates (97.9%) had *tet(K)* gene. *Tet(L)* gene was only found

in four isolates (8.3%), from which three isolates were found to also carry *tet(K)* gene (Table 5). Similarly, Bismuth *et al.* (1990) from France reported that 97.6% of tetracycline resistant CNS carry *tet(K)*, using DNA-DNA hybridization, which was detected in all of the species studied. Ardic *et al.* (2005) in Turkey reported that *tet(K)* genes were detected widely (42.9%) in CNS, whilst *tet(M)* genes were mainly seen in MRSA (50.0%). The frequency of *tet(K)* was much lower in Turkey than our study, but it is important to acknowledge that Ardic *et al.* (2005) had not selected the isolates on the basis of tetracycline resistance.

**Table 5: Distribution of *tet* gene classes among CNS**

<i>tet</i> resistance gene(s)	No. of strains (%) (n=48)	MIC range mg/L (mode)			CNS species
		Tetracycline	Doxycycline	Minocycline	
<i>tet(K)</i>	44 (91.7)	16->256 (64)	2-64 (8)	0.125-2 (0.25)	All <sup>a</sup>
<i>tet(L)</i>	1 (2.1)	64	16	0.25	<i>S. haemolyticus</i>
<i>tet(K) / tet(L)</i>	3 (6.2)	64-128 (128)	16	0.25-1 (0.5)	<i>S. haemolyticus</i> <i>S. epidermidis</i> <i>S. saprophyticus</i>
<i>tet(M)</i>	0	0	0	0	0
<i>tet(O)</i>	0	0	0	0	0

<sup>a</sup>13 *S. haemolyticus*, 11 *S. epidermidis*, 6 *S. hominis*, 4 *S. caprae*, 3 *S. cohnii*, 2 *S. saccharolyticus*, 2 *S. simulans*, 1 *S. saprophyticus*, 1 *S. lantus*, and 1 *S. capitis*.

The finding that 47 of our 48 isolates (97.9%) had *tet(K)* gene and all isolates were minocycline susceptible comes in agreement with the documented phenomenon that the efflux proteins don't confer resistance to minocycline. This might be because minocycline is a lipophilic tetracycline derivative, which readily crosses the cytoplasmic membrane of the bacteria, possibly at quicker rate than the efflux pumps encoded by *tet(K)* or *tet(L)* can remove it (Speer *et al.*, 1992).

In this study we illustrated that our CNS isolates from Egypt are resistant to tetracycline via the tetracycline efflux mechanism, and this is mainly due to the acquisition of the *tet(K)* gene and to a lower extent by *tet(L)*. The *tet(K)* determinant appears to be widespread amongst CNS isolates in a broad range of countries, regardless of whether antibiotics can be purchased over the counter or not. Fortunately, the efflux mechanism of resistance to tetracycline does not confer resistance to minocycline. Consequently we might expect the efficient treatment with minocycline for the most tetracycline-resistant CNS from Egypt.

#### **4. Conclusions and future work**

The almost universal carriage of tetracycline resistant strains by controls may reflect the extensive use of the tetracyclines in dermatology and general medicine. Also our observations confirm that CNS isolates show an important reservoir of multi-resistance to the standard antimicrobials used for acne therapy likely due to prolonged use of antibiotics for acne therapy (Eady, 1998). The hospital dermatology staff can be an important source of transmission of resistant CNS from patient to patient. Strategies for reducing antibiotic use remain the major means of controlling resistance.

Cross-resistance between erythromycin and tetracycline was common amongst the skin isolates. Further investigations for the mobile genetic elements carrying erythromycin and tetracycline resistance genes were needed. These will elucidate if the high carriage rate of CNS isolates having both erythromycin- and tetracycline-resistance from Egypt is due to that these resistance genes were carried on the same transposons or plasmids or not.

#### **Acknowledgements**

We thank the Egyptian Ministry of Higher Education for funding a channel scholarship for El-Mahdy, T.S.M. to study in the UK. We are indebted to Prof. Mahira El-Sayed, and to Dr. Mohamed Abd El-Aziz, for their dermatological professional guidance during skin swabs sampling.

## Evaluation of Rural Development in Guilan Province, Iran

Hamidreza Alipour<sup>1</sup> and Mohammad Sadegh Allahyari<sup>2</sup>

<sup>1,2</sup> Department of Agricultural Management, College of Agriculture, Islamic Azad University, Rasht Branch, Iran  
[Allahyari@iaurasht.ac.ir](mailto>Allahyari@iaurasht.ac.ir)

**Abstract:** The main purpose of this study was to measure the development level of Guilan rural districts based on Morris Inequality Index. The study employed a descriptive survey design. The statistical population of this study was all Guilan rural districts consisting of 109 rural districts in 2006. In order to investigate and to determine the key indexes of development or backwardness in each region, some variables in five groups (agricultural, health, infrastructure and social) had been used. For data analysis and assessment of development level, Morris Inequality Index was used. Findings revealed that out of the total Guilan rural districts in developmental situation, six rural districts were underdeveloped and more percent of villages were in less developed situation.

### 1. Introduction

Development and Growth as an economic and social context, in one hand by economists and then by socialist and other researchers of some sciences such as geography had been paid attention and became as the base of planning. Permanent problems in study the economic development literature and social changes is to recognize the concept of development and growth (Ghadir Masoum and Habibi, 2004)

Development word has different definition and interpretation in view of development economists and researchers which including the increasing of production efficiency, promotion of life quality and quantity level, remove poverty and privation, promotion the health and therapy service level, removing unemployment problems and inflation and providing socio-economic requirements. In fact, development is a thing which influences our living. The ideal meaning of development is to improve all living quality (Khakpour, 2006). In other definition of development, we can consider it as an economic, social and political process which resulted from living standard and cause to improve the living level of increasing population. Development process has so importance that it must be observed parallel to population growth. The most important subject in definition of development is its attitude to humankind. One that is considering about development is its popularity, participation and endogenous. As we can say that, in fact, development is for human and about human and its final end is to reach human to satisfaction stage from his/her life (Eanali and Taherkhani, 2005).

During past decades, Iran, either before the revolution or after it had been had the witness of performing various development programs.

Development quality and its infrastructure had been created major problems in developmental trend of the country areas because of undesirable past national and focused planning. So, the subject of government investment between the economic area, sections and sub-sections always had been considered in order to justice distribution and to reduce unbalancing.

Various dimension and structure complexity of this subject is considering as one of the main constrain in provide suitable model to distribute the credits. In order to solve the problems result from regional unbalancing, the first step is to identify and determine the level of regions in fitness rate in socio-culture and etc area (Rezvani and Sahneh, 2005). Therefore, the study of socio-economic and regional-province unbalancing is one of the basic and necessary actions to planning and reform in order to provide economic growth along with social justice which can influence the resources allocation with the aim of remove the regional unbalancing (Ahanghari and Saadat Mehr, 2007)

Although it is possible to simply state that there is no rural district which is higher developed or higher back warded than the other rural district, but measuring development level is not a simple work. As we said, development word has very meaning. Whether the meaning of development is economic development, social, educational, cultural and health development or a combination of them? Even we define development in a more exact concept; its measurement is problematic (Khakpour, 2006) The main purpose of this study was to measure the development level of Guilan rural districts based on Morris Inequality Index.

### 2. Material and Methods

Guilan province has been located in the north of Iran in the area of  $36^{\circ}34'$  -  $38^{\circ}27'$  northern latitude and  $48^{\circ}53'$  -  $50^{\circ}34'$  eastern longitude from meridian as it is neighboring with Caspian sea and Azerbaijan by the north, and from the west by Ardabil province, and from the south by Qazvin and Zanjan province and from the east by Mazandaran province (figure 1).

The type of this study is applied and the research method is second analyzing attributive study of the existence information and documentary. Concerned indexes for each of the rural districts had been collected and dealing with ranking and leveling Guilan rural districts through suitable number taxonomy statistical methods. The indexes in this study had been collected by some organizations such as Iran Statistical Center, Health and Therapy centers, Education Department and Agricultural Organization by the separating of villages and rural districts. The statistical population of this study was all Guilan rural districts consisting of 109 rural districts in 2006. Rasht Township with the number of 18 rural districts and Bandar Anzali Township had been enjoyed from the most and least frequency, respectively. Data analyzing method was use of the indexes. Correlation rate, reducing the number of indexes into some general indexes and finally, grouping and ranking the rural districts in developing or deprivation point of view which performed using statistical software. In this research, in order to investigate and to determine the key indexes of development or backwardness in each region, some variables in five groups (agricultural, health, infrastructure and social) had been used.

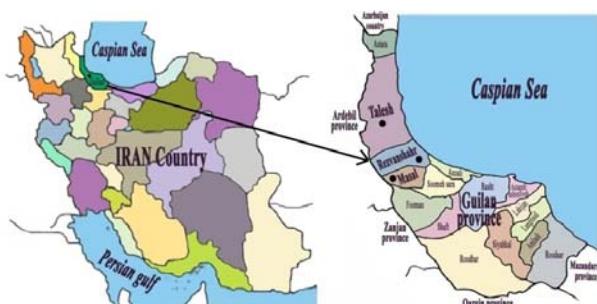

Figure 1, site of study

### The structure of Morris Inequality Index

United Nations Development Program (UNDP) had been applied a model to rank the areas in development point of view which it was both the most recent formal model used in global level and their extending and replacing capacity in the planned places are performable with various scales. This model is known as Morris Inequality Index. This model is important to determine establishing model

of settlement network, to determine rural system or rural development area. Morris Inequality Index identified the developmental place of each unit based on each one of selected indexes using accessing information for every settlement unit and finally, it had been determined the average of indexes using development index analyze simply but with great attention and then it deal with the ranking of settlements. Calculation way of this index is as follow:

$$Y_{ij} = \frac{X_{ij} - X_{ij}(\min)}{X_{ij}(\max) - X_{ij}(\min)} \times 100$$

$Y_{ij}$ : Inequality index to  $i_{th}$  variable in  $j_{th}$  unit

$X_{ij}$ :  $i_{th}$  variable in  $j_{th}$  unit

$X_{ij(\min)}$ : minimum rate of  $i_{th}$  variable

$X_{ij(\max)}$  : maximum rate of  $i_{th}$  variable

The most important point in this method is that the applied indexes must be monotonic or homo direction. In order to study the subject, all concerned indexes in the mentioned formula had been applied and finally, in order to find the main concerned development index for each unit, below equation was used.

$$D.I = \frac{\sum Y_{ij}}{n}$$

In this relation, n and D.I are consider as the number of studied indexes and the development main index of each unit, respectively. Morris development index coefficient is range between 0-100 where the closer to 100 the greater the development level (Allahyari, 2010).

In order to measure what extends of an index had been distributed imbalance among the rural district; Coefficient of Variation method (CV) was used. Coefficient of Variation is calculated using the following formula (Kalantary, 2001).

$$C.V = \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{\sum_{i=1}^n X_i}}$$

In this method, the high number of (CV) indicating more inequality in the concerned index distribution.

C.V = Coefficient of Variation rate of an index

$X_1$  = an index rate in one region

$\bar{X}$  = The average of the same index

N = Number of regions (sector, rural district and village).

### 3. Results

Developmental coefficient of each one of Guilan rural districts had been calculated using the collected data in the form of health and therapy, agriculture, social and service indexes (18 indexes) and based on Morris Inequality Index. The results indicated that the developmental coefficient of rural districts was ranging between minimum of 4.51% to maximum of 75.2% as rural areas of *Yaylaghi* district in *Rezvanshahr* Township is enjoying the least developmental coefficient and at the other hand, rural area of *Licharegi* in *Bandar Anzali* Township is enjoying the highest development coefficient by 75.2% among the Guilan rural districts. In order to grouping rural area in Guilan province four categories were considered:

Under developed: 0- 24.99  
 Less developed: 25-49.99  
 Semi-developed: 50-74.99  
 Developed: 75-100

According to table 1, 53.2% (8 rural districts) from the studied rural districts are located in the less developed group and 40.4% (44 rural districts) are located in semi-developed group and only one rural district is in developed condition.

Table 1, grouping Guilan rural districts based on Morris Inequality Index

	Frequency	Percent	cumulative percent
Underdeveloped	6	5.5	5.5
Less developed	58	53.2	58.7
Semi developed	44	40.4	99.1
Developed	1	0.9	100

The results from the ranking of Guilan rural districts based on developmental coefficient and separate of each studied indexes indicated that in production indexes area (agriculture), this coefficient is ranging between 1.39% to 79.82% as *Lat Lil* rural district of *Langroud* Township and *Shirjou Posht* rural district of *Lahijan* Township had been enjoyed from the least agriculture developmental coefficient by 79.82% respectively.

Table 2, is indicating the grouping of Guilan rural districts based on agricultural development index. As you can see, more than half of Guilan rural districts (51.4%) are in underdeveloped level in agricultural development. Generally 94.5% of rural districts are in underdeveloped to less developed level.

Table 2, grouping of Guilan rural districts based on agricultural index

	Frequency	Percent	cumulative percent
Underdeveloped	56	51.4	51.4
Less developed	47	43.1	94.5
Semi developed	5	4.6	99.1
Developed	1	0.9	100

Also, in the health and therapy indexes area, developmental coefficient was ranging between 1.07% to 70.18%. The *Yaylaghi* district in *Rezvanshahr* Township and *Licharegi* rural district of *Bandar Anzali* are enjoying the least and the highest health and therapy developmental coefficient, respectively. According to performed grouping, it can see that none of the Guilan rural districts is located in developed health and therapy area as their 62 rural districts (%56.9) are in deprived level and also 36.7 are in less developed level.

Table 3, Grouping Guilan rural districts based on health and therapy index

	Frequency	Percent	cumulative percent
Underdeveloped	62	56.9	56.9
Less developed	40	36.7	93.6
Semi developed	7	6.4	100
Developed	0	0	-

In service and infrastructure indexes area, developmental coefficient is ranging between 5.36% to 64.27%. Out of this, The *Yaylaghi* district in *Rezvanshahr* Township is enjoying the least developmental coefficient of service and infrastructure and at the other hand *Saravan* rural district of *Rasht* Township is enjoying the highest developmental coefficient in service and infrastructure indexes. About 10 percent of Guilan townships are in less developed in services and infrastructure indexes and also 12.8% of Guilan rural districts are in semi-developed indexes.

Table 4, Grouping Guilan rural districts based of service and infra-structure index

	Frequency	Percent	cumulative percent
Underdeveloped	19	17.4	17.4
Less developed	76	69.7	87.2
Semi developed	14	12.8	100
Developed	0	0	-

In social indexes, developmental coefficient is ranging between 3.06% to 85.73%. out of Guilan rural district , the country- seat *Sayar Setagh* rural district of *Roudsar* Township and *Licharegi* rural district of *Bandar Anzali* Township were enjoy the least and highest developmental coefficient, respectively. 61.5% of Guilan rural district are in semi-developed level index and also 30 rural districts (27.5%) are in less developed condition (table 5)

Table 5, grouping Guilan rural district based on social index

	Frequency	Percent	cumulative percent
Underdeveloped	6	5.5	5.5
Less developed	30	27.5	33
Semi developed	67	61.5	94.5
Developed	6	5.5	100

In order to measure what extent of an index had been distributed among the rural districts, inbalance, coefficient of variation (CV) method was used.

In this method, the high rate of CV indicating more inequality in the concerned index distribution. As you can see in table 6, the highest rate of coefficient of variation is related to production and agricultural indexes (57%) which in distribution of this index among the Guilan rural districts.

The least coefficient of variation rate is finding among the social indexes (30%). With regard to this in measuring this index, women and man literacy variables had been investigated, it is indicating that most rural district have the same condition relatively low coefficient of variation is expectable (table 6).

Table 6, Investigation of variance coefficient about the studied indexes

	Social	Service	Health	Agriculture
Standard deviation	16.6	11.82	13.52	14.63
Mean	53.98	35.42	25.76	25.66
CV	0.3	0.33	0.52	0.57

#### 4. Discussions

Finding efficient and right method to measure development and then to provide service supply in rural area is very difficult. This is result from more frequency of rural, population dispersion, rural diversity and their distribution manner in the area, their communication situation, rural special characteristics, budget and developmental credit deficiency, expert personal deficiency and rural administrative management system deficiency and ignoring rural settlements in several past decades

(Rezvani and Sahneh, 2005). With regard to this issue that no program can without objective, so in planning stage, balancing developmental situation of rural districts and balancing in enjoying rate of various possibilities and services and to improve this indexes in order to provide community health are considered the key goals, goal which cause to social justice and provide sustainable development area (Khakpour, 2006).

The results indicate that out of the total Guilan rural districts in developmental situation, six rural districts were underdeveloped and more percent of villages were in less developed situation. One of the regional planning goals, is to balance develop of region and to prevent from generating under developed area. Use the results of this study to reach to above goals. As in allocation of improvement credits, allocation credits to each region can determine according to developmental degree and distance rate of each rural districts from ideal condition. So, developed rural district will receive less budget and underdeveloped rural districts will receive more budget.

**Abstract:** This investigation was performed on 131 animals (cattle and buffaloes) from farms located in different places in kaliobia aged from 1.5-5 years the samples were collected from clinically infected animals that suffer from "surra" disease and animals apparently healthy in contact with infected animals (subacute or chronic) Infected animals .This investigation reported that 51animals showed the Clinical signs of illness as pyrexia, parasitaemia,progressive emaciation, generalized edema and recurrent episodes of fever occur during course of disease .The microscopic examination of blood film revealed (*Trypanosoma evansi*) in 5 out of 80 apparently healthy animals (7.8%) while PCR examination found that 35 out of 75animals positive (46.7) so PCR is the most suitable diagnosis for early diagnosis and consequently controlling programs and consider the confirmatory test.

**Keywords:** **Diagnosis; Epidemiological; Bovine Trypanosomiasis; Kaliobia Governorate**

## 1. Introduction:

Trypanosomiasis is a disease complex caused by several species of Flagellate protozoan parasites (Trypanosomes) that live in body fluids. It occurs through the tropical and subtropical regions of Africa. It affects cattle, buffalos and human. , the fact that the disease is transmitted mechanically as well as cyclinically has certainly expanded the disease distribution out of the tsetse belt area. Trypanosomiasis,also known as (surra ) is caused by *T.evansi* and is quite common among horse, cattle, buffaloes, and camels (Sehgal et. al.2006) in this study, trypanosomosis was examined in suspected to infected using PCRs confirmatory test for early diagnosis andconsequently controlling programs .The disease has economic important due to loss of condation,reduction in milk yield (Reghu Ravindran et.al.2008) decrease capacity of work and may affect on quality of semen in bulls and cause irregular estrus, abortion and stillbirth in cows ( El Sawlhy 1999). PCR is high sensitivety method that could detect *T.evasi* infection bovine three day earlier than miroscopically (Wasana et al. 2000). Prevalence of disease depends on rate of exposure, availability of infected animals, the insect reservoir and seasons (Mottib et al. 2005). The conventional parasitological methods lack sensitivity and serological techniques ,which detect antibodies or antigen lack specificity or sensitivity, respectively .Therefore molecular technique, especially (PCR) has been developed in order to overcome the problems faced with conventional and serological technique

.In addition ,it was reported that PCR is a reliable method for diagnosis and epidemiological studies (El-Metanawey et. al.2009)

## 2. Materials and methods

### Animals

Total number of animals\_131aged from 1.5-5years old from different location in Kalubaia was clinically examined with special attention to signs related to trypansoma evansi infection .Samples also collected from apparently healthy animals in contact to infective animals

### Samples

The blood samples were collected from jugular vein by sterile sharp needle with wide pore samples\_were collected in clean and dry test tube containing EDTA as anticoagulant for blood smear and PCR analysis

### Blood film:

Three thin blood film were prepared and left in air to dry and fixed in absolute methyl alcohol for 1-2min. Staining with freshly filtrated and diluted Giemsa stain for 30-45 min then washed with distal water to remove excess of stain after that the slides were left to dry, then put one drop of cider oil examined under oil immersion lens according to(Coles,1986) .

Examination of blood film for trypanosome:

1/4-1/2 inch from end of the film and transferred from one slide of film to other (cross-section method) to give constant and representative examination according to (Barrent 1965) animals be considered negative if the three slides were negative.

#### DNA extraction:

Two hundred and fifty microlitres of EDTA blood was mixed with 250 µl lysis buffer (0.32 M Sucrose, 0.01 M Tris, 5 mM MgCl<sub>2</sub>, 1% Triton X-100, pH 7.5). The mixture was centrifuged at 13,000 g for 25 sec. The supernatant was removed and the pellet washed with 500 µl lysis buffer. The centrifugation and washing were repeated twice. The final pellet was resuspended in 250 µl 1 x PCR buffer (10 mM Tris-HCl (pH 8.3), 50 mM KCl, 0.1 % Triton X- 100). 1.5 µl of proteinase-K (10 mg/ml) was added and vortexed. The samples were incubated at 56 °C for 1 hour and at 95°C for 10 min. (to inactivate the proteinase-K) and stored at -20°C until use. DNA was extracted as described by Higuchi (1989).

#### DNA amplification:

PCR were carried out in 25 µl reaction volumes containing 10 mM Tris-HCl (pH8.3)Polymerase chain reaction (PCR) assays were further performed to confirm the Trypanosomiasis in buffaloes were *T. evansi*. Forward 5-ACA TTC CAG CAG GAG TTG GAG-3 primer and reverse 5-CAC GTG AAT CCT CAA TTT TGT-3 primer, which are

trypanosome specific (Holland et al., 2001), were used for amplification of the 239-base pair (bp) fragment from *T. evansi* genomic DNA. Amplification was carried out in a thermal cycle .

The final reaction volume was 25 µl. For detection of amplified product, 5 µl of the PCR product was electrophoresed on a 1.5% agarose gel with Tris borate-EDTA as the running buffer (30 min at 50 V) and a 100-bp DNA. The gels were stained with ethidium bromide (5 µl/100 ml of gel) and analyzed on a UV transilluminator to visualize the expected size (239- bp) product.

### 3. Results

From table (1)showed that total number of 131 animals from cattle and buffaloes 1.5:5 years old were clinically examined with special attention to signs related to *T.evansi* infection as pyrexia, parasitaemia, progressive emaciated „, and recurrent episodes of fever occur during course of disease as shown in figure (2) , microscopic examination of blood film revealed that *T.evansi* is an extra cellular motile (rapid twisting motion)that stain bluish with red nucleus by Giemsa or leishman stain in 5 animals only as in figure(1) and the remains samples are negative in other hand when perform PCR for this animals found that 35 animals positive (infective) confirmed to be infected with *T.evansi* as in figure (3) where they lacking the clinical signs of Trypanosomiasis and microscopically negative .

**Table(1)Comparative study of techniques between infected animals with *T.evansi***

Total number of examined animals(cattle and buffaloes	Infected animals with clinical signs appearance		Animals apparently healthy in contact with infective animals (suspected infection)			
			Microscopic examination		PCR examination	
Examined animals	No.of +ve	Rate	No.of +ve	Rate	No.of +ve	Rate
131	51	38.9%	5	6.3%	35	46.7%

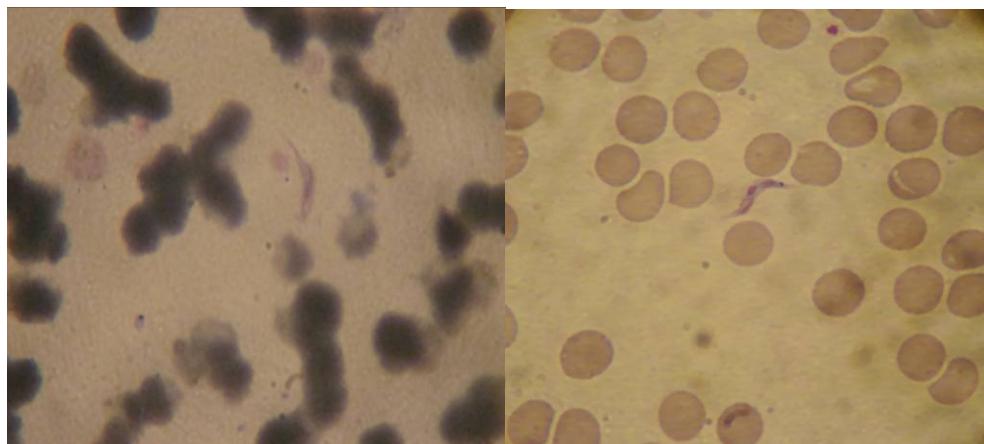

Figure (1) Giemsa stained blood film showed trypanosome bluish with red nucleus

Figure(2) showed clinical signs of trypanosomiasis :

1-emaciated ,pyrexia and anemia                  2-off food weakness and edema in different places

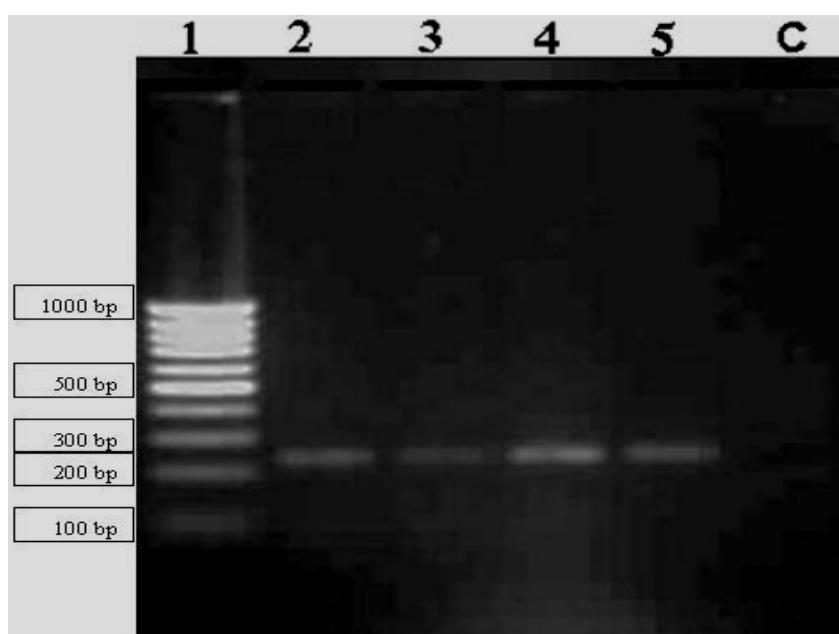

Figure (3) Electrophoresis gel(1.5% agarose,stained with ethidium bromide showing lanes from left to right 1.100-bp DNA ladder ; (2-5),Natural T.evansi infected blood of cattle(C), negative control .

#### **4. Discussion:**

Bovine trypanosomiasis is blood parasite disease that imposes large economic losses such as drop in milk yield, meat production, irregular estrous, abortion, stillbirth in cow and low quality semen in bulls (Wasana et.al.2000 and Reghu Ravindran et.al 2008)

Concerning the clinical signs, the affected cattle and buffaloes with *T.evansi* were suffered from pyrexia, parasitaemia, emaciation, generalized edema and recurrent episodes of fever occur during course of disease these results came agreement with (Ahmed El Sawalhy 1999)

The method of choice to detect *T.evansi* in blood of infected animals especially in acute cases was blood film examination In the present work, examination of Giemsa stained blood film revealed *T.evansi* belong to the subgenus trypanozoon, the organism is an extra cellular motile (rapid twisting motion)that stain bluish with red nucleus by Giemsa or leishman stain (Imadeldin E Aradaib and Ali A Majid )

Blood smear examination proved to be of limited value in diagnosis of subacute or chronic cases. In this study only 5 animals were positively identified by microscopic examination out of 80 samples were apparently healthy in contact with infected animals this result in agreement with Herbart W.J. and lumsden H.R.(1976) who found that when parasites number less than 2,500,000 parasites per ml present in blood samples ,microscopic detection is not feasible

The PCR technique as used in this study detected the low parasitaemia and suspected Trypanosomiasis infection using specific trypanosome primer (*T.evansi*) . PCR has some major advantages over the parasitological techniques; sample processing does not have to be done within minimum time after collection but can be delayed for some time after preservation at -20 °C. The PCR technique has been verified on blood samples of infected cattle, confirming its higher sensitivity and specificity when compared to parasitological techniques (Clausen, 1998). The PCR technique is accurate, more sensitive and specific method in diagnosis of trypanosomes infected cattle than other parasitological methods and overcome the problem of non specific reaction in case of serological tests; it can detect low parasitic cattle in the chronic cases. The strength of PCR was shown in detection of infection in a parasitaemic cattle showing clinical signs of diseases and was negative using parasitological tests.

The PCR test showed the best sensitivity compared with parasitological methods using classic investigation methods. Use of PCR as accurate and specific diagnostic technique, so treatment has to be carried out immediately in the field (Holland et.al.2004) facilitate control programming. PCR assays for diagnosis of trypanosome infection in cattle were evaluated for their ability to detect trypanosome DNA in blood spots samples collected from cattle in four different provinces from the Bolivian lowlands and the results compared with those obtained with standard parasitological Micro Haematocrit Centrifugation Technique (MHCT) and stained smears and serological methods (Card Agglutination Test for *T. evansi* and Antibody ELISAs for *T. vivax* and *T. congolense*). Kappa agreement analysis showed a significant agreement between PCR assays and results from parasitological methods. Results from PCR assays for *T. vivax* and *T. evansi* were combined with results from parasitological and serological assays to provide information on prevalence rates for the four provinces from where the samples were obtained. (Gonzales et al, 2003).

In this study out of 75 samples, PCR revealed that 35 individuals were confirmed to be infected with *T. evansi*, where they were lacking the clinical signs of Trypanosomiasis and negative by microscopic examination so this animal may be in early stage of subclinical and chronic infection.

#### **5. Conclusion:**

Early detection of *T.evansi* play an important role in epidemiology, control program of disease and treatment

# Noise Prediction for Outdoor Cooling Systems; Case Study

Ahmed A. Medhat A.Fahim<sup>1</sup> and Hoda S. Seddeq<sup>\*\*</sup>

<sup>1</sup>HVAC Consultant & Fire Engineering Auditor in Electro-Mechanical Research Institute at Housing and Building National Research Center, HBRC, Cairo, Egypt, P.O.Box 1770 Giza,

<sup>2</sup> Acoustic laboratories in Building Physics research Institute at Housing and Building National Research Center, HBRC, Cairo, Egypt, P.O.Box 1770 Giza

[luukki@live.com](mailto:luukki@live.com) [hodasoliman@yahoo.com](mailto:hodasoliman@yahoo.com)

**Abstract:** Outdoor noise analyses are commonly required to estimate the sound levels at the property line of adjacent buildings. Outdoor cooling units, such as cooling towers, air-cooled chillers and rooftop units, all create noises at different levels that can disturb neighbors or occupants inside the building itself. Creating a comfortable acoustic environment in most of Heating, Ventilating and Air-Conditioning, HVAC, applications falls on the mechanical engineering disciplines because most background noise sources are generated by the mechanical apparatuses and cooling devices. This paper investigates the prediction of sound pressure levels emitted from outdoor HVAC systems. The sound level of outdoor units in various applications is dependent upon several significant factors. These factors include equipment location, directivity of the source, barrier shielding, sound path, and attenuation due to distance, atmospheric sound absorption and ground attenuation. A developed simplified model called "Outdoor Modeling Acoustic Code, OMAC" has been utilized taking into consideration the influences of previously mentioned parameters. This OMAC code has been used to analyze and predict the noise level emitted from roof-top air-cooled chillers located on office building as a case study. Predicted noise regimes were compared with the collected field measurements for the validation and verification purposes. Detailed analyses and comparisons between predicted and measured noise spectrums were carried out based on the local and international standards. These comparisons show a good agreement among predicted noise criterions, measured data and dedicated standard thresholds. It was concluded that it is mandatory to utilize such prediction "modeling" tool during the early stages of HVAC design process to allow the authority having jurisdictions to predict the impact outdoor noises within the new development urban.

[Ahmed A. Medhat A.Fahim and Hoda S. Seddeq. Noise Prediction for Outdoor Cooling Systems; Case Study. Journal of American Science 2010;6(11):898-905]. (ISSN: 1545-1003).

Key words: outdoor sound propagation, HVAC, sound power, directivity, barrier, atmospheric sound absorption, ground attenuation

## 1. Introduction

Noise is usually regarded as one of the factors threatening our living environments. Occupants are surrounded by numerous sources of noise that create pervasive environmental pollution and insufferable noise to the neighboring community. The major problem of the noise is not only that it is unwanted, but also that it negatively affects health and well-being<sup>1</sup>. Problems related to noise include hearing loss, stress, sleep loss, distraction, lost productivity, masking speeches and a general reduction in the quality of life and opportunities for tranquility. Humans can be both the cause and the victim of noise.

HVAC equipments are the dominating source of noise in buildings and it can even disturb people in the nearby surrounding, therefore it is importance to consider acoustic criterion and actions at the early stage of the design process. Accurate predictions for the sound pressure level emitted from HVAC equipments are needed to evaluate the noise reductions values required to meet local regulations; then the determination of each unit noise limits shall be obtained to select suitable noise controls method; and finally to confirm that the

plant will comply with applicable noise threshold as stated by Frank H. Brittain, Marlund E<sup>2</sup>.

Two quantities are needed to describe the strength of noise source, its sound power level and its directivity. The sound power level is a measure of total sound power radiated by the source in all directions. The directivity of a source is measure of the variation in its sound radiation with direction. Directivity is usually stated as a function of angular position around the acoustical center of the source and also as a function of frequency. Some sources radiate sound energy nearly uniformly in all directions. These are called nondirectional sources. Generally, such sources are small in size compared to the wave length of the sound radiated. Most practical sources are somewhat directional that is they radiate more sound in some directions than in others<sup>3,4</sup>.

Propagation of outdoors sound shall consider meteorological effects, the attenuation effects of ground coverings, atmospheric sound absorption, and the sound attenuation associated with barriers, and the effects of reflecting surfaces. Precious acoustical analyses associated with all of these can be rather complicated. However, the

accuracy is not often justified because the acoustical effects of the above factors are extremely fluctuated. Acoustical analysis presented herein will be simplified to give an estimate of outdoor sound pressure regimes and levels associated with HVAC equipment that are affected by spherical spreading, reflecting surfaces and barriers<sup>5</sup>.

The successful outdoor noise consultant needs five things:

- Measurement equipment (octave band sound level meter, perhaps a long term monitor)
- Noise control techniques (such as barriers, damping materials, enclosures, mufflers and silencers)
- A goal – what is a “good” level (from regulations, resident opinions, etc.)
- A good understanding of the physical mechanisms and a basic prediction model

## 2. Sound Propagation Outdoors

Normally if the equipment sound power level spectrum and ambient sound pressure level spectrum are known, the contribution of the equipment to the sound level at any location can be estimated by analyzing the sound transmission paths involved. When there are no intervening barriers, the principal factors outdoors are reflections from buildings near the equipment and the distance to the specific location. The following equation may be used to estimate the sound pressure level of the equipment at a distance from it and at any frequency when given the sound power level<sup>6</sup>

$$L_P = L_W + 10\log_{10} Q - 20\log d - 11 \quad (1)$$

where

$L_P$  = sound pressure level at distance  $d$  (m) from the acoustic center of the sound source, dB

$L_W$  = sound power level of sound source, dB

$Q$  = directivity factor associated with the way sound radiates from sound source (refer to figure 1)

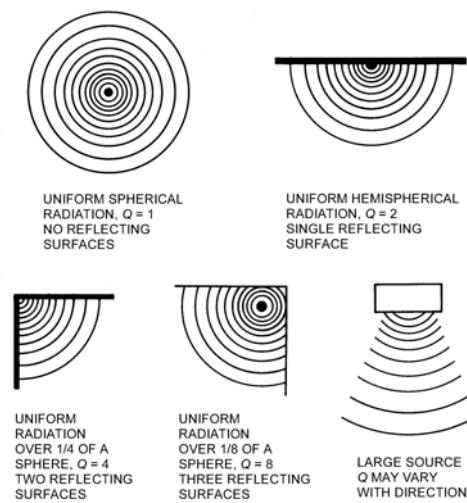

This equation does not apply where  $d$  is less than twice the maximum dimension of the sound source.  $L_P$ , may be low by up to 5 dB where  $d$  is between two and five times the maximum sound source dimension<sup>6</sup>.

If the source is directional, an additional term, the Directivity Index DI, is needed to account for the uneven distribution of the sound intensity as a function of direction. The Directivity Index is the difference between the actual sound pressure, and the sound pressure from a non-directional point source with the same total acoustic power. It can be determined experimentally, or calculated for a limited number of analytical cases, such as a piston in a baffle (a decent approximation of a loudspeaker), a piston in the end of a long tube (engine exhaust)<sup>4</sup>

$$D_I = 10\log_{10} Q \quad (2)$$

For an omni-directional source radiating into free space, DI = 0 dB. If that same source is

situated directly on a perfectly reflecting surface (hemispherical radiation), DI = 3 dB.

**Figure 1** Directivity factors for various radiation patterns

## 3. Excess Attenuation Model

Including absorption of sound in air, non-uniformity of the propagation medium due to meteorological conditions (refraction and turbulence), and interaction with an absorbing ground and solid obstacles (such as barriers). Equation 1 will be extended to account for atmospheric absorption and all other effects by introducing the concept of excess attenuation,  $A_E$  is defined as: - the total attenuation in addition to that due to spherical divergence and atmospheric absorption<sup>5,7</sup>, [ISO 9613 PART 2]. So equation (1) will be as follows:

$$L_P = L_W + 10\log_{10} Q - 20\log d - 11 - A_{abs} - A_E \text{ (dB)} \quad (3)$$

Where  $A_{abs}$  = atmospheric absorption,

$A_E$  = excess attenuation (dB)

The total excess attenuation  $A_E$  (dB) is a combination of all effects:

$$A_E = A_{Weather} + A_{ground} + A_{turbulence} + A_{barrier} + A_{vegetation} + \text{any other effects...} \quad (4)$$

where

Meteorological conditions attenuation –  $A_{weather}$

Attenuation due to ground interaction –  $A_{ground}$

Atmospheric turbulence attenuation –  $A_{turbulence}$

Attenuation due to vegetation –  $A_{vegetation}$

Attenuation due to barrier

Attenuation due to meteorological conditions  $A_{weather}$  such as wind, that can all bend sound waves and influence sound levels at large distances. Their effects are short term and generally not included in acoustic evaluations<sup>6,8</sup>.

Sound energy is dissipated in air by two major mechanisms<sup>9, 10</sup>

- Viscous losses due to friction between air molecules which results in heat generation (called “classical absorption”)
- Relaxation processes – sound energy is momentarily absorbed in the air molecules and causes the molecules to vibrate and rotate. These molecules can then re-radiate sound at a later instant (like small echo chambers) which can partially interfere with the incoming sound.

These mechanisms have been extensively studied, empirically quantified, and codified into an international standard for calculation: ANSI Standard S1-26:1995, or ISO 9613-1:1996. For a standard pressure of one atmosphere, the absorption coefficient  $\alpha$  (in dB/100m) can be calculated as a function of frequency  $f$ (Hz), temperature  $T$  (degrees Kelvin) and molar concentration of water vapor  $h$  (%) by:

$$\alpha = 869 \cdot f^2 \left\{ 1.84 \cdot 10^{11} \left[ \frac{T}{T_0} \right]^{1/2} + \left[ \frac{T}{T_0} \right]^{-5/2} \right. \\ \left. 0.01275 \frac{e^{-2239.1}}{F_{r,0} + f^2 / F_{r,0}} + 0.1068 \frac{e^{-3352/T}}{F_{r,N} + f^2 / F_{r,N}} \right\} \quad (5)$$

where

$$F_{r,0} = 24 + 4.04 \cdot 10^4 h \frac{0.02 + h}{0.391 + h} \text{ Oxygen relaxation frequency (Hz)} \quad (6)$$

$$F_{r,N} = \left[ \frac{T}{T_0} \right]^{-1/2} \left[ 9 + 280 h e^{\left\{ -417 \left[ \frac{T}{T_0} \right]^{-1/2} - 1 \right\}} \right] \text{ Nitrogen relaxation frequency (Hz)} \quad (7)$$

$$T_0 = 293.15^\circ K (20^\circ C) \quad (8)$$

To calculate the actual attenuation due to atmospheric absorption  $A_{abs}$  (dB) for a given propagation range for use in equation 3:

$$A_{abs} = \alpha r / 100 \quad (\text{dB}) \quad (9)$$

where :

$\alpha$  = absorption coefficients (dB/100m)

$r$  = range (meters)

#### 4. Estimation of Sound Pressure Levels

When investigating the propagation of sound outdoors, it is necessary to take into account the attenuation effects of ground coverings, atmospheric sound absorption, and the sound attenuation associated with barriers, and the effects of reflecting surfaces. Accurate acoustical analyses associated with all of these can be rather complicated. However, this accuracy often is not justified because the acoustical effects of the above factors are extremely variable.

The acoustical analysis presented in this section will be simplified to give an estimate of outdoor sound pressure levels associated with HVAC equipment that are affected by the directivity of a source , reflecting surfaces, barriers and air absorption. Air absorption is likely to be quite small, except for very high frequencies, Thus, for the case of construction projects in urban environments air absorption can be considered<sup>11</sup>. The simplified outdoor sound pressure levels can be estimate as follows:

$$L_P = L_W + 10 \log_{10} Q - 20 \log d - 11 - A_{ground} - A_{abs} \quad (\text{dB}) \quad (10)$$

Calculation of attenuation due to ground absorption<sup>1</sup>

$$A_{ground} = 4.8 - \left( \frac{2h_m}{r_2} \right) \left( 17 + \frac{300}{r_2} \right) \quad (11)$$

where

$A_{ground}$  - attenuation due to ground absorption

$h_m$  - mean height of the propagation path (meters)

$r_2$  - distance between the source and the receiving node (meters)

If the sound source is near a vertical reflecting surface, the sound pressure level at a distance  $r$  from the sound source is given by:

$$L_P = L_W + 10 \log_{10} Q - 20 \log d - 11 - A_{ground} - A_{abs} + \Delta L \quad (\text{dB}) \quad (12)$$

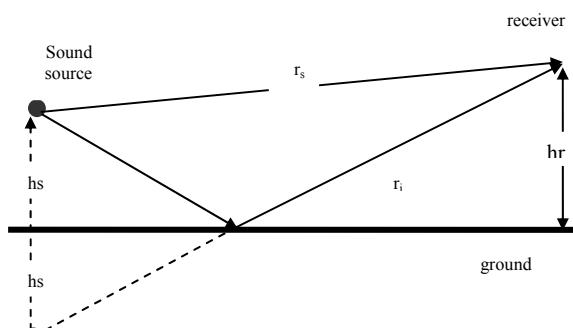

where

$\Delta L$  is the correction term associated with the vertical reflecting surface<sup>1</sup>.

Figure 2 shows a sound source near a hard reflecting surface. The effect of the reflecting surface can be modeled by placing an image sound source on the side of the reflecting surface opposite the sound source. As the figure indicates, these are two paths between the sound source and the receiver. One is the path of the directly radiated sound wave between the source and receiver. The distance of this path is  $r_s$ . The other is the path of the reflected sound wave between the sound source and the receiver. The distance of this path is  $r_i$  also is the distance between the image sound source and the receiver. If the reflecting surface is a vertical surface, the effects of this surface and the corresponding values of  $\Delta L$  are a function of the distance between the sound source and the reflecting surface and the distance between the sound source and the receiver. This relation is expressed by<sup>12</sup>

$$\Delta L = 3.00 - 9.29 \log_{10} \left[ \frac{r_i}{r_s} \right] + 10.13 \left[ \log_{10} \left[ \frac{r_i}{r_s} \right] \right]^2 - 3.84 \left[ \log_{10} \left[ \frac{r_i}{r_s} \right] \right]^3 \quad (13)$$

$$\Delta L = 0 \quad \text{for} \quad \frac{r_i}{r_s} > 10$$

**Figure 2 Sound paths between the sound source and the receiver**

### 5. Influence of Obstructions and Barriers

When the line of sight between a source and receiver is obstructed by a rigid, non-porous wall or building, appreciable noise reductions can occur. Sound waves must diffract around the obstacle in order to reach the receiver. This phenomena is used to great advantage in the attenuation of highway noise by barriers in congested urban areas. An observer in the vicinity of a rigid, infinitely long barrier (Figure 2), for sound from a point source, will experience an excess attenuation<sup>13</sup> of:

$$\Delta A = 20 \log \frac{\sqrt{2\pi N}}{\tan ch \sqrt{2\pi N}} + 5 \text{ (dB)} \quad \text{for } N \geq -0.2 \quad (14)$$

$$\Delta A = (0) \text{ otherwise}$$

$$\nabla A_{Total} = -10 \log \left[ \sum 10^{\nabla A_i / 10} \right] \quad (15)$$

$$N = \pm \frac{2}{\lambda} \partial \quad (16)$$

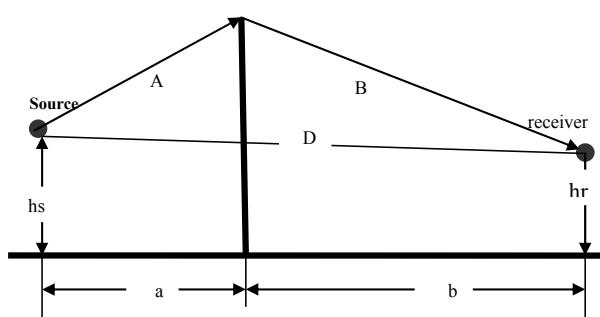

where

$\lambda$  is the wave length (m) that corresponds to the center of the frequency band being analyzed.  $\partial$  is called the path length difference (m) and is given by

$$\partial = A + B - D \quad (17)$$

where

A, B, C as shown in figure 3

**Figure 3 geometry of sound propagation path over or around a barrier**

Equation (16) is based on optical diffraction theory and was developed by Z. Maekawa<sup>14</sup>. The dimensionless quantity  $N$  is called

the Fresnel number and is a measure of how far below the line of sight (relative to a wavelength) the receiver lies. A negative sign for  $N$  indicates that the receiver can see the source, while a positive sign denotes that the receiver is in the shadow zone<sup>15</sup>. More complex models are needed to account for line sources, finite length and absorptive barriers. The barrier should be as tall as possible. The effectiveness of a barrier depends on how far below the line of sight the receiver lies.

When the excess attenuation for a barrier is taken into account equation (12) becomes

$$L_P = L_W + 10 \log_{10} Q - 20 \log d - 11 - A_{ground} - A_{abs} - \Delta A \text{ (dB)} \quad (18)$$

Many practical situations exist where barriers are of finite length. If the sound source is a point source, the sound level at the receiver location is obtained by first calculating the individual sound pressure levels for sound traveling over the barrier and around each end of the barrier. After the individual sound pressure levels at the receiver location have been calculated, the overall sound pressure level is obtained by adding the three individual sound pressure levels. For most situations where a barrier is used to attenuate noise from HVAC equipment, the barrier will enclose the equipment on three sides. When this is the case the barrier can be considered an infinite barrier with respect to barrier design, the following usually applies. Excess barrier attenuations of 10 dBA or less are easily attainable. Excess barrier attenuations up to 15 dBA are difficult to obtain. Excess barrier attenuations over 20 dBA are nearly impossible to obtain<sup>11,16</sup>.

### 6. Experimental Work

Outdoor Modeling Acoustic Code, OMAC has been created to estimate the sound pressure level emitted from outdoor HVAC equipments. This program based on the mathematical equation (3). Figure (4) shows the flow chart of OMAC to predict the outdoor sound pressure level at the receiver. Outdoor Modeling Acoustic Code, OMAC includes the following steps:

- Define the sound power from the catalogue of the equipment (measured by standard method)
- Calculate the directivity of the equipments.
- Calculate the attenuation factors.
- Calculate the effect of vertical surface.
- Calculate the effect of barrier.
- Calculate the combined sound pressure level from multiple sources.

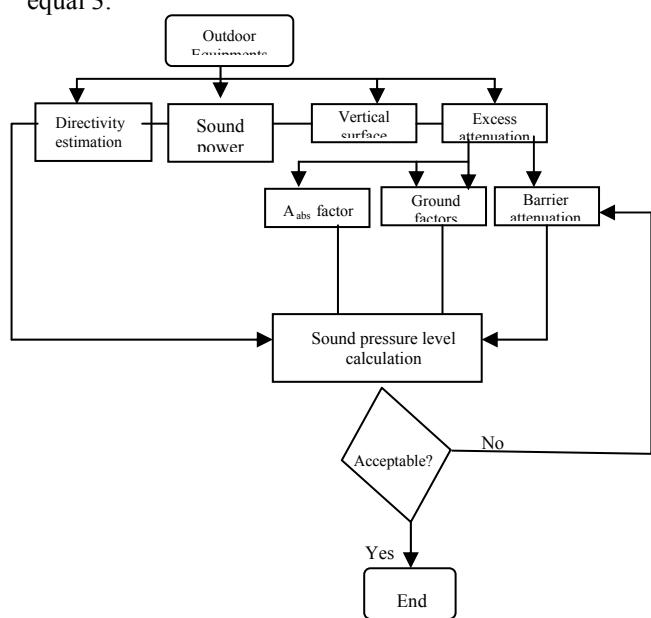

OMAC has been used to predict the sound pressure level emitted from 2 air-cooled scroll chillers that is installed on a roof at residential areas in which commercial building are located. The predicted sound pressure level has been compared to the field measured sound pressure levels at octave

band frequencies. The installed air-cooled scroll chillers have the specification as given in table (1):

**Table 1 - Specification of Outdoor Chiller**

Type	Capacity	Power	No of comp.	No of fans
Air-cooled scroll	60 Ton/ref	110 KW	2/each	6/each
<b>Sound power in dB</b>				
63		103		
125		103		
250		102		
500		99		
1000		99		
2000		97		
4000		90		
8000		84		

Outdoor sound analysis is closest to a free field analysis. The sound pressure level will depend on equipment location, directivity and the attenuation factors. For instance, an air-cooled chiller sends a significant amount of sound vertically from the condenser fans. The air-cooled scroll chiller is on the roof of a 4-story building. The horizontal distance from the chiller to the receiver was 10 m. The receiver measurement at point is 1.5 meter above grade. The source is directional and situated directly on a reflecting surface (hemispherical radiation) so the directivity index DI equal 3.

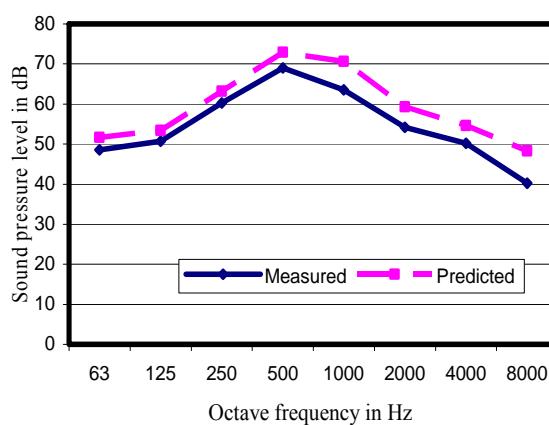

**Figure 4. Flow chart of OMAC Acoustic Code**

Figure 5 shows the comparison between the measured sound pressure levels with predicted sound pressure level at octave band without consider the absorption of the air.

It can be noticed that the difference between the measured and the predicted value increase at the high frequencies this may be due to fluctuation of atmospheric absorption of sound and its effect on sound propagation especially at high frequencies greater than 1000 Hz. The new ISO-DIS 9613 (parts 1 and 2) standard contains a detailed method for computing the sound propagation outdoors, taking into account the effects caused by the air absorption. So the absorption coefficient  $\alpha$  (in dB/100m) calculated again as a function of frequency  $f$  (Hz), temperature  $T$  (degrees Kelvin) and molar concentration of water vapor  $h$  (%) by equation 5, 6, 7, 8 and recalculated the outdoor sound pressure.

Figure 6 shows the comparison between the measured and predicted sound pressure level adding correction for atmospheric absorption.

It can be noticed that the predicted sound pressure level is higher than the permissible sound pressure limit according to the environmental low (table 3). So sound barriers can be installed to reduce the sound levels and hide equipment from view. The barrier creates an "acoustic shadow" that reduces sound pressure levels on the opposite side of the source. The reduction in sound level, or *Insertion Loss*, is based on the path length difference. The path length difference equals the path around the barrier minus direct path from the source to the receiver in feet (or meters). If nonporous barriers placed between the sound source and the receiver can result in significant excess attenuation of sound pressure level.

**Figure 5. Measured and Predicted Outdoor Chiller Sound Pressure Level**

**Table 2 - Measured and Predicted Outdoor Chiller Sound Pressure Level**

Octave frequency	Measured SPL (dB)	Predicted SPL (dB)
63	48.5	51.7
125	50.7	53.4
250	60.2	63.2
500	69	72.9
1000	63.5	70.6
2000	54.2	59.3
4000	50.2	54.6
8000	40.2	48.3
dBA	70.7	75.4

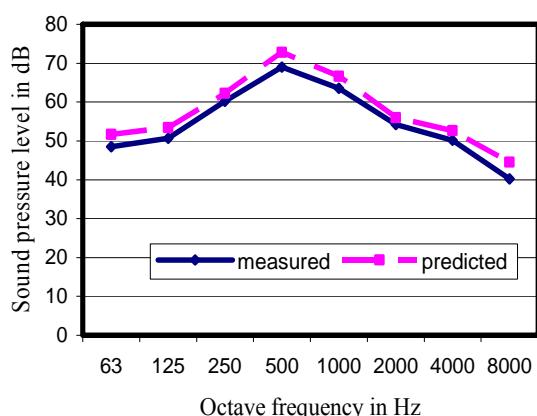

Figure 6. Measured and Predicted Outdoor Chiller Sound Pressure

**Table 4 predicted attenuation;  $\Delta A$  sound pressure level**

Octave frequency	Predicted $\Delta A$	Predicted SPL In dB
63	12.5	39.2
125	15.2	38.2
250	19.6	42.6
500	22.3	50.5
1000	21.5	45.1
2000	20.6	35.4
4000	23.1	29.5
8000	19.6	24.9
dB		52.6

The barrier TL (Transmission Loss) must be at least 10 dB greater than the insertion loss in each band<sup>6</sup>. Therefore the predicted transmission loss of the barrier must be at least as shown in the figure (6).

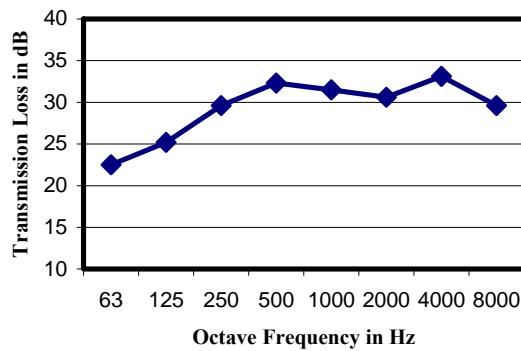

Figure 6. Transmission Loss of the Barrier

**Table 3 Comparing the measured SPL with Predicted SPL**

Octave frequency	Measured SPL	Predicted SPL
63	48.5	51.7
125	50.7	53.4
250	60.2	62.2
500	69	72.8
1000	63.5	66.6
2000	54.2	56
4000	50.2	52.6
8000	40.2	44.5
dBA	70.7	74

OMAC has been used to predict the sound pressure level for the same building. A barrier has been added at three sides around the chiller. It was 5 m from the chiller and 2 m taller than the chiller. The new sound pressure level in dBA has been predicted at point 1.5 meter above grade. Where the excess attenuation (*Insertion Loss*);  $\Delta A$ , is determined. Table (4) shows the predicted attenuation;  $\Delta A$

## 7. Conclusions

A developed simplified model called “Outdoor Modeling Acoustic Code, OMAC” has been utilized based on the measured sound power and taking into consideration the influences of equipment location, directivity of the source, barrier shielding, and attenuation due to distance, atmospheric sound absorption and ground attenuation. The OMAC code has been used to analyze and predict the noise level emitted from roof-top air-cooled chillers located on office building as a case study. The predicted sound pressure level has been compared to the field measured sound pressure levels at octave band frequencies. These comparisons show a good agreement among predicted noise criteria, measured data and dedicated standard thresholds. It was concluded that it is mandatory to utilize such prediction “modeling” tool during the early stages of HVAC design process to allow the authority having jurisdictions to predict the impact outdoor noises within the new development urban.

## Seed Exomorphic Characters of some Taxa from Saudi Arabia

**Soliman, M.S.A.<sup>\*1</sup>, El-Tarras. A.S.<sup>2</sup> and El-Awady, M.A.<sup>2</sup>**

Biotech. & Genet. Eng. Res. Unit, Taif University, Taif, KSA

(Permanent address: Botany & Microbiology Dept., Fac. Sci., Helwan Uni.<sup>1</sup>and Genetics Dept., Fac. Agr., Cairo Uni.<sup>2</sup>, EGYPT.)

<sup>\*</sup>[prof.msoliman@yahoo.com](mailto:prof.msoliman@yahoo.com)

**Abstract:** Seed exomorphic characters of seven species collected from Taif province, Saudi Arabia, were investigated by the aid of Scanning Electron microscopy (SEM). The seed exomorphic characters that are diagnostic at the generic and specific level are seed shape, dimensions, epidermal cells, seed surface sculpture and aspects of anticlinal and periclinal walls. The seed coat of the studied taxa exhibit a wide range of morphological characters. Seed shapes varied from globoid, elliptic, oblong and kidney shaped. They showed either smooth or papilate surface. SEM investigation at higher magnifications revealed different types of seed surface pattern viz, is tuberculate, reticulate, scalariform and tenicostate. Seeds of *Cloeme droserifolia* and *Fagonia schweinfurthia* showed a deposition of wax on their surface. The present study is a modest contribution to previous studies on the flora of Saudi Arabia.

[Soliman, M.S.A. Al-Tarras. A. and Al-Awady, M. Seed Exomorphic Characters of some Taxa from Saudi Arabia. Journal of American Science 2010;6(11):906-910]. (ISSN: 1545-1003).

**Key words:** SEM, seed coat, exomorphic characters, *Cloeme droserifolia*, *Fagonia schweinfurthia*, flora, Saudi Arabia.

### 1. Introduction:

During the present decade, nature reserves were established in Arabia and Saudi Arabia becomes among the countries that are concerned with protection of nature and conservation of biodiversity. Saudi Arabia, has a diversified higher plant flora in its varied landscapes, with about 2243 species in 837 genera and 142 families (Collenette 1998 and 1999). The variety of wild plant species has a valuable economic importance due to its usage as pharmaceuticals, nutritional, fire wood suppliers for urban and rural populations as well as its use in popular remedy.

Aspects of the plant diversity of Saudi Arabia have been documented on phytogeographical bases by Mandaville (1990), Al-Farhan (1999), Chaudhary (1999), Chaudhary & Al-Jowaid (1999) and BaZaid and Mossallam (2000).

The importance of ultra-structural pattern analysis of the seed coat observed under the SEM; as a reliable approach for identifying the species and assessing taxonomic relationships; has been well recognized (Barthlott 1981, Koul *et al.* 2000 and Gamarra *et al.* 2007). Until now, the morphology of the seed coat sculpture under the SEM for the concerned taxa in the present study has not been studied except for *Aizone carsriense* L., by Kanwal, *et al.* (2009).

The aim of the present study is to illustrate the utility of seed coat micro-and macro-morphological characters of seven species using SEM in an attempt to provide some basic data for nature conservation and other applied programs as well as for wild plants taxonomy in Al-Taif province, Kingdom of Saudi Arabia. These taxa are: *Aizone carsriense* L., *Cloeme droserifolia* (Forssk.) Delile, *Fagonia schweinfurthia*, *Fosskaolea tenacissima*, *Peganum harmala*, *Resida lutea*, and *Zygophyllum simplex* L.

### 2. Materials and methods

The investigated taxa were collected during May-August 2009 from different localities (table1). Voucher herbarium specimens of the studied taxa are kept in BGERU (Biotechnology and Genetic Engineering Research Unit, Taif University, K.S.A.). The external macro-morphological aspects of the seeds of the studied taxa were investigated with the aid of scanning electron microscope (SEM). For SEM observations, dried mature seeds were mounted on brass stubs and coated with a thin layer of gold. Coated seeds were examined and photographed on a Joel JSM 6390LA, at the Electron Microscope Unit in Taif University. The terminology of Barthlott (1981 and 1984) and Stearn (1983) was adopted to describe the SEM aspects of seed coat.

**Table (1): List of the examined taxa and their position of collection.**

### 3. Results and Discussion:

Ornamentation of seeds provide important characters to distinguish some taxa (Koul *et al.*, 2000), where, the microstructure details of the seed

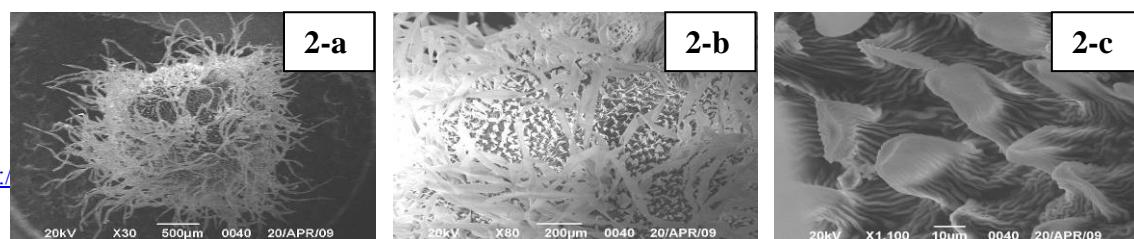

coat surface are strikingly constant from one sample to another in each species (Akbari and Azizian, 2006).

**Figure 1: SEM image for *Aizone carsriense* L. seed.**

As regards to the scanning electron microscopy for *Aizone carsriense* L., the seed shape as indicated in Figure (1), is kidney shaped with striated raised longitudinal and transverse striae, tenuicostate overall seed coat surface. Seed

dimensions (LxW) is (0.68x0.51 mm). The anticlinal cell wall level is raised with smooth texture, thin cell wall and Anticlinal cell wall relief is straight. Periclinal cell wall is flat and it's sculpture is nearly smooth.

**Figure 2: Different magnified SEM images for *Cloeme droserifolia* (Forssk.) Delile.**

Seed shape of *Cloeme droserifolia* (Forssk.) Delile is globular and covered with dense hairs, seed coat pattern is tuberculate, tubercles. Seed size (LxW) is (1.85x1.85). The seed surface shows

rugose-striate surface. Anticlinical walls sunken, straight while periclinical wall is convex, tuberculated and tubercles surface are striate-regate with striated strips, Figure 2 (a, b & c).

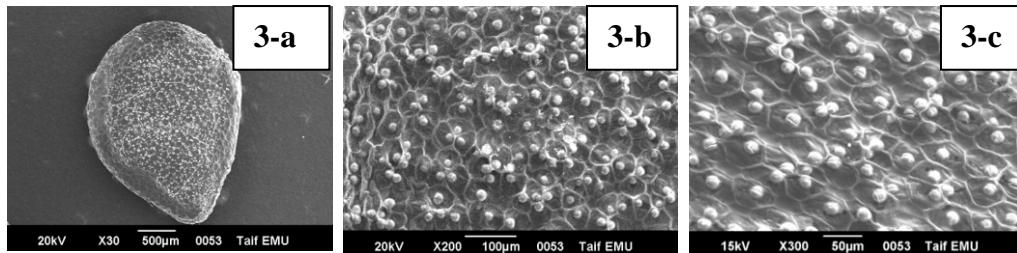

**Figure 3: Different magnified SEM images for *Fagonia schweinfurthia*.**

Figure 3 (a, b & c) shows that, *Fagonia schweinfurthia* seed is ovate has dimentions (LxW) of 2.66 x 2.51 mm and it's overall seed coat pattern is reticulate. The Anticlinal cell wall thickness is thin with smooth texture, has raised cell wall level and it's

relief is straight. The Periclinal cell wall sculpture is smooth to striated with flat cell wall level. Epicuticular wax depositions are noticed over the seed surface as globular particles.

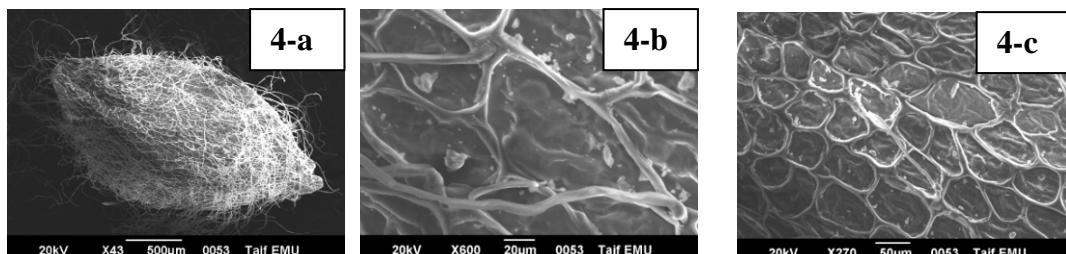

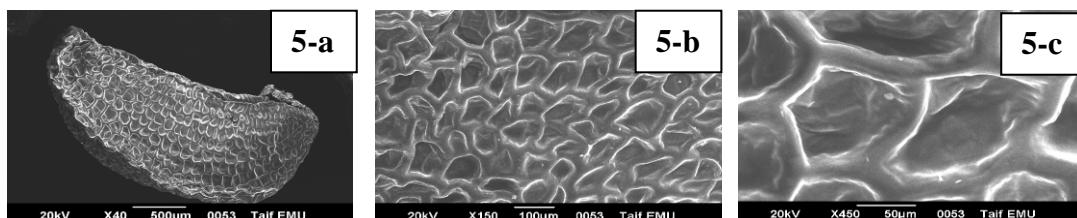

**Figure 4: Different magnified SEM images for *Fosskaolea tenacissima* L**

Figure 4 (a, b & c) shows that, seeds of *Fosskaolea tenacissima* L are elliptic in shape, covered with dense, long fine unicellular and uniseriate hairs. Their dimentions (LxW) is 2.61 x 1.33 mm. SEM investigation indicated that the seed surface sculpture

is typically reticulate. The anticlinal cell walls thickness are thin, straight, raised with smooth surface, whereas the periclinal walls are flat with ruminante surface. Epicuticular wax deposition is observed over the seed surface as irregular particles.

**Figure 5: Different magnified SEM image for *Peganum harmala L.***

Figure 5 (a, b & c) shows that, seeds of *Peganum harmala L.* are elliptic in shape, seed dimensions (LxW) is 2.622x1.786 mm. SEM investigation indicated that the seed surface sculpture is typically regular reticulate. The anticlinal cell walls

thickness are thick, straight, raised with finely striated texture, whereas the periclinal walls are concave with ruminate surface. Epicuticular wax deposition is absent.

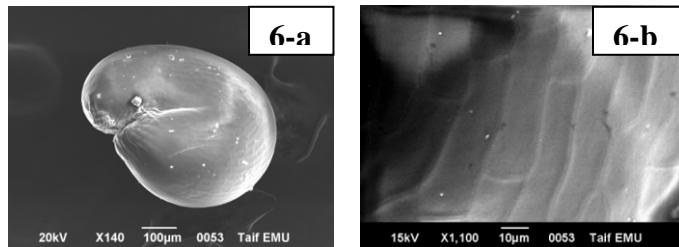

**Figure 6 (A & B): Different magnified SEM image for *Resida lutea L.***

Figure 6 (a & b) shows that, seeds of *Resida lutea L.* is kidney shaped with scalariform pattern. The seed dimensions (LxW) is 0.579 x 0.442 mm.

Anticlinical cell wall is raised and periclinical cell wall is flat with smooth texture.

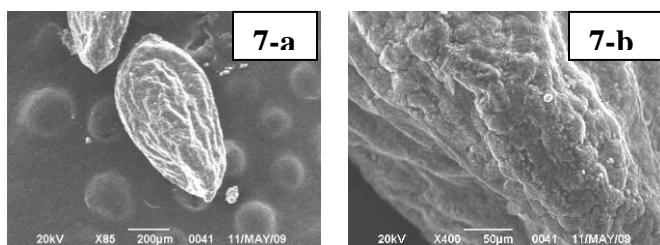

**Figure 7: Different magnified SEM images for *Zygophyllum simplex L.***

Figure 7 (a & b) shows that, seeds of *Zygophyllum simplex L.* is elliptic in shaped with irregularly granulated islands pattern. The seed dimensions (LxW) is 0.833 x 0.450 mm.

## Biomarkers Characteristics of Crude Oils from some Oilfields in the Gulf of Suez, Egypt.

**M. I. Roushdy, M. M. El Nady, Y. M. Mostafa, N.Sh. El Gendy and \*H. R. Ali**

Egyptian Petroleum Research Institute, Nasr City, Cairo, Egypt.

[\\*hugochem@yahoo.com](mailto:hugochem@yahoo.com)

**Abstract:** Seven representative crude oil samples from the Gulf of Suez were chosen for this study. The studied crude oils are Ras Badran, Belayim marine, Belayim Land, Rahmi, West Bakr, Esh El Mellaha and Geisum. The oils were fractionated by medium pressure liquid chromatography into saturated hydrocarbons, aromatic hydrocarbons and polar compounds. The saturated hydrocarbons were determined by gas chromatography and gas chromatography/mass spectrometry (GC/MS). Ratios of certain biomarkers, (Pristane/phytane, isoprenoids/n-alkanes, CPI, Homohopane, Diasteranes, Gammacerane index, C<sub>29</sub> 20S/20S+20R, C<sub>29</sub>/C<sub>30</sub> hopanes and Ts/Tm) referred to as source correlation indices, are sensitive to the geological source of oil. The results of evaluation suggest that two types of oils could be recognized as marine oils. These oils are characterized by high level of maturation and sourced mainly from source rocks rich in marine organic matters with few inputs from terrestrial origin.

**Key words:** Egypt, Gulf of Suez, Homohopanes, Diasteranes, Gammacerane index, C<sub>29</sub> 20S/20S+20R, C<sub>29</sub>/C<sub>30</sub> hopanes and Ts/Tm, Crude oils.

### 1. Introduction:

The biological marker patterns of crude oils are commonly used for oil/oil and oil/source rock correlations and to assess such source rock attributes as lithology, depositional environment, kerogen type and maturity (Waples and Machihara, 1991; Peters and Moldowan, 1993). Exploration applications of biomarkers rest on the pattern of the oil imprinted by the source rock. For example, bulk geochemical evidence and biological markers distributions enable the characterization and distinction of ancient marine and non marine petroleum source rocks (Peters et al., 1986). However, the source-related biomarkers pattern of an oil may have been altered by a number of processes after generation and primary migration (expulsion) from the source rock.

The Gulf of Suez province is highly faulted and corresponds to a continental rift, which started in evolution at the beginning of the Miocene times, consisting of an elongated graben about 300 km long and 30 km wide between the Sinai Peninsula and the Eastern Desert of Egypt (Fig. 1). Various putative source rocks deposited in distinct, well-defined environments exist within the Gulf of Suez basin (Fig. 2).

Source rocks and sandy reservoirs are abundant in both the pre-rift and the post rift sedimentary rocks (Nagaty, 1992 and Shahin and Shehab, 1984). Most accumulations of crude oils in Gulf of Suez are found in different reservoirs and pay zones, ranging in age from Paleozoic to Middle

Miocene (Fig. 2). These accumulations were occurred in structural fault blocks formed at the time of rifting (Chowdhary and Taha, 1987). Since the beginning of this century, the Gulf of Suez has been highly prospective and has drawn the attention of many explorationists.

### Previous Work

The geochemical characteristics of crude oils discussed by Abdel Azim (1970) showed, through statistical comparison of specific gravities of the Gulf of Suez crud oils, that the API gravity and paraffinic content increase with the depth. Zein El Din et al. (1981) reported that the oils produced from some fields in the central Gulf of Suez are derived from similar marine source rocks. Roharback (1983) suggested that the oil samples of the major horizon in the Gulf of Suez have the same genetic family, highly similar in their source rocks, as they reflect a marine origin and show no biodegradation. Shaltut et al. (1985) divided the oils of the central Gulf of Suez into two groups based on porphyrins distribution; the first group is characterized by the increase in vanadyl porphyrins distribution with the depth, while the second group shows inverse relation. Mostafa and Khaled (1988) concluded that the reservoir depth of the oils in the Gulf of Suez is not correlated with the oil maturity, based on sulfur percent, specific gravity, NSO compounds, asphaltenes and carbon isotope ratios. Mostafa and Ganze (1990) revealed that the crude oils of the Rudeis oil field are similar in their

origin; also they concluded that the Eocene Thebes Formation and the Upper Senonian Brown limestone may act as source for the Abu Rudeis oil. Barakat et al. (1996) divided the oils of the southern part of the Gulf of Suez into three types. Type I is sourced from carbonate source rocks (mainly of marine origin), type II appears to be originated from Tertiary source rocks with contribution from high land plants, and type III is a mixture of type I and type II. Sharaf (1998) recognized two oil groups for the oils from October and Abu Rudeis fields. Group "1" heavy oil, is derived mainly from hypersaline reducing environment and group "2" moderate to light oils, is formed under low salinity environment with minor contribution from terrigenous organic matter. Hammad and Barakat (2000) concluded that the oils from some oil fields in the Gulf of Suez were generated from mixed and algal organic matter deposited in transitional and reducing environments. El Nady (2001) recognized that the crude oils of the Gulf of Suez are sourced mainly from marine organic matters. Barakat et al. (2002) stated that there is a close genetic relation between the oils in the southern part of Gulf of Suez. El Nady and Harb (2005) recognized that the crude oils in the north Gulf of Suez are mature and derived mainly from mixed organic sources (mainly terrestrial with marine input) under transitional environments. El Nady (2006) reported that the crude oils in the south Gulf of Suez are mature, originated mainly from marine sources and show good correlation with the Lower Miocene source rocks in the southern part of Gulf of Suez. El Nady et al., (2007) divided the crude oils in the central part of Gulf of Suez into tow groups: The first group includes moderately mature oil from the N. October, Belayim marine, Belayim Land and July fields which are typical of crude oils generated in a strongly reducing (marine). The second group comprises mature oils generated from source rocks deposited in lacustrine palaeoenvironmental conditions and includes oils from Issaran, E. Kareem, El-Khaligue and El Ayun fields. Harb and El Nady (2010) divided crude oils in the Gulf of Suez into 1. Heavy oils characterized by low maturation and originated mainly from terrestrial organic sources. 2. Light oils of high maturity level originated mainly from marine organic sources. Faramawy et al., (2010) classified the crudes in central Gulf of Suez, as aromatic intermediate oils heavy oils of low wax content characterized by high maturity level and derived from mixed organic sources (mainly marine with few inputs from terrestrial origin) belong to the carbonate type, deposited in transitional environments under reducing-oxidizing conditions.

### Aim of the Study

The present work attempts to evaluate the geochemical relationships between the oils recovered from some oil fields within the Gulf of Suez to assess and investigate oil characterization, maturation, source depositional environments and oil families. This target was achieved through analytical results of gas chromatography and gas chromatography-mass spectrometry analysis (GC-MS) for "7" crude oil samples collected from seven oilfields namely: Ras Badran, Belayim marine, Belayim Land, Rahmi, West Bakr, Esh El Mellaha and Geisum distributed within the Gulf of Suez (Fig. 1). These samples are representative for the producing horizon zones (Belayim, Rudies and Nuhkul formations.) of Upper-Lower Miocene age (Figure 2) characterized by limestone facies with depths ranging from 2250 to 8286 ft (Table 1). The oil samples were kindly supplied by (EGPC) from Gulf of Suez and Belayim.

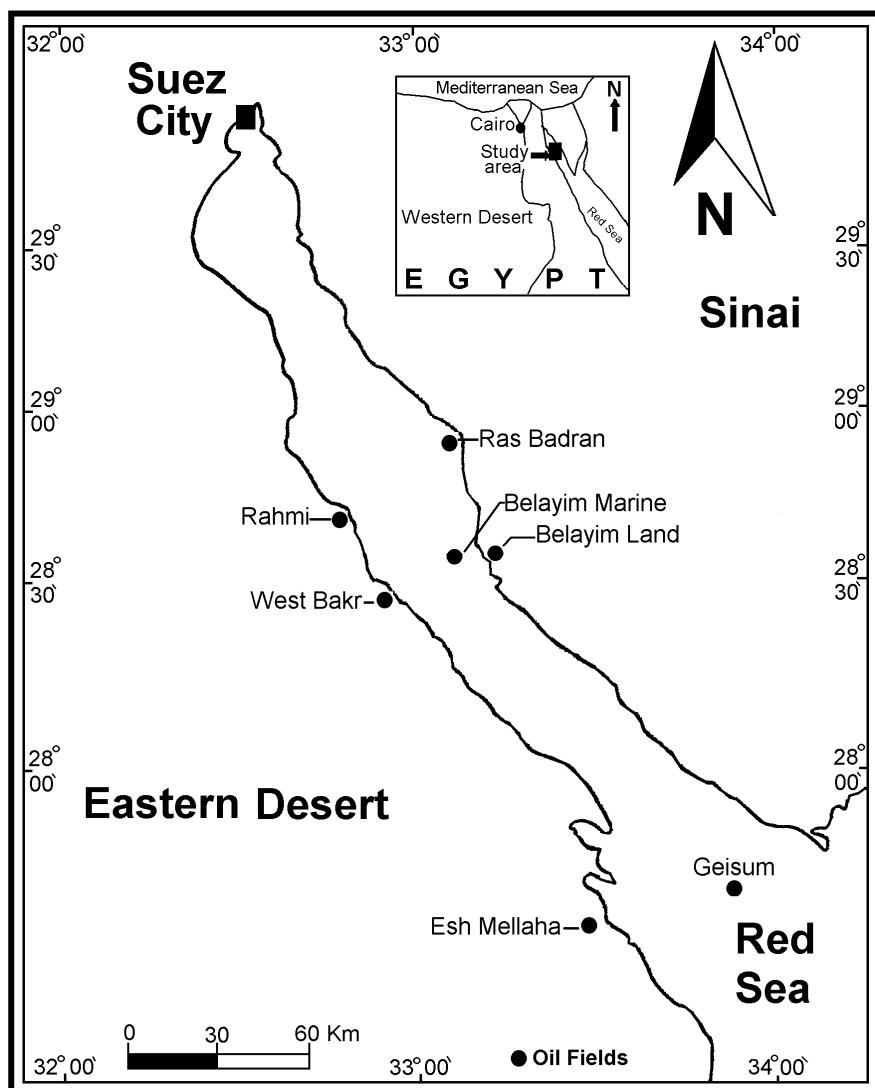

### 2.Experimental

1. The crude oil samples were fractionated by medium pressure liquid chromatography into saturated hydrocarbons, aromatic hydrocarbons and polar compounds. The saturated hydrocarbons were analyzed by gas chromatography (GC) and gas chromatography/mass spectrometry (GC/MS).
2. Gas chromatographic analysis of the saturated hydrocarbon fractions was achieved by Perkin Elmer Instrument Model 8700, provided with a flame ionization detector (FID). Oven temperature programmed for 100 to 320°C at 3°C/min. and final time 20 min. SPB-1 capillary column of 60 m. in length and 0.53 i.d. Nitrogen was used as carrier gas, the optimum flow rate was 6 ml min.
3. Gas chromatography-mass spectrometry used a 50m x 0.25mm fused silica capillary column of bonded SE 54 installed with a finnigan MAT TSQ-70 combined gas chromatography/quadrupol mass spectrometer. The column oven was programmed from 100 to 310°C at 4°C/min. These analyses were done in the laboratories of the Egyptian Petroleum Research Institute (EPRI).

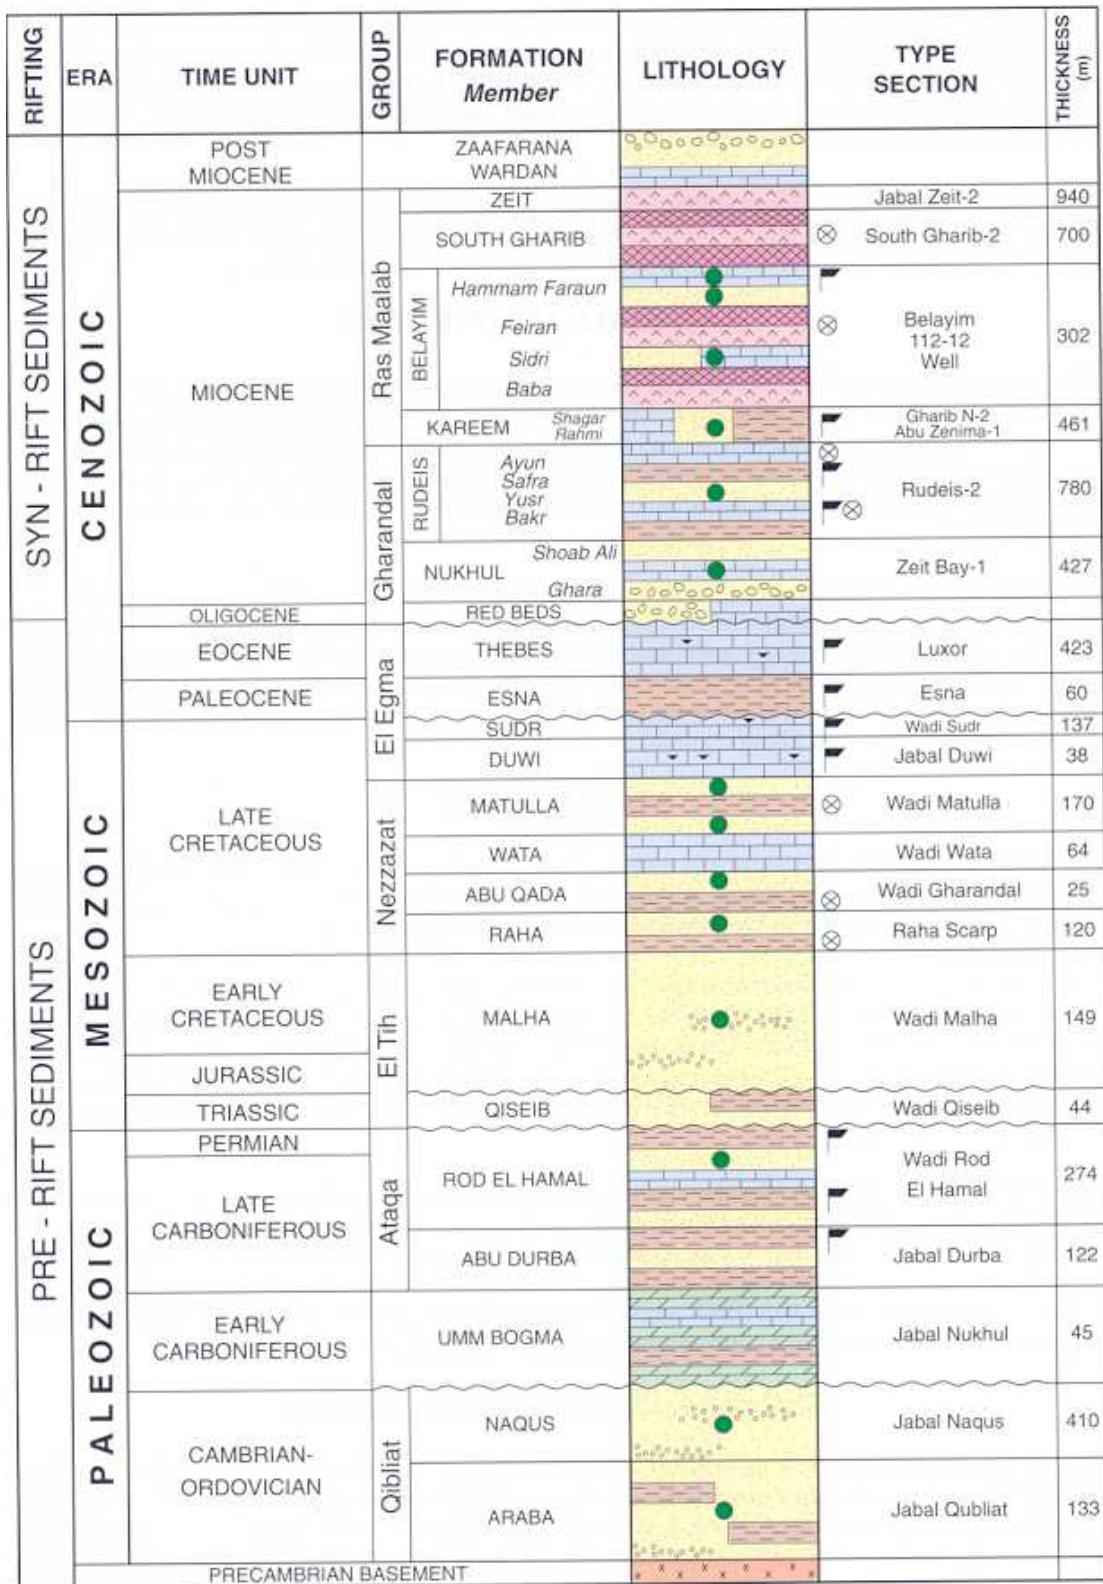

### 3. Results and Discussion

#### Normal -alkanes Characteristics

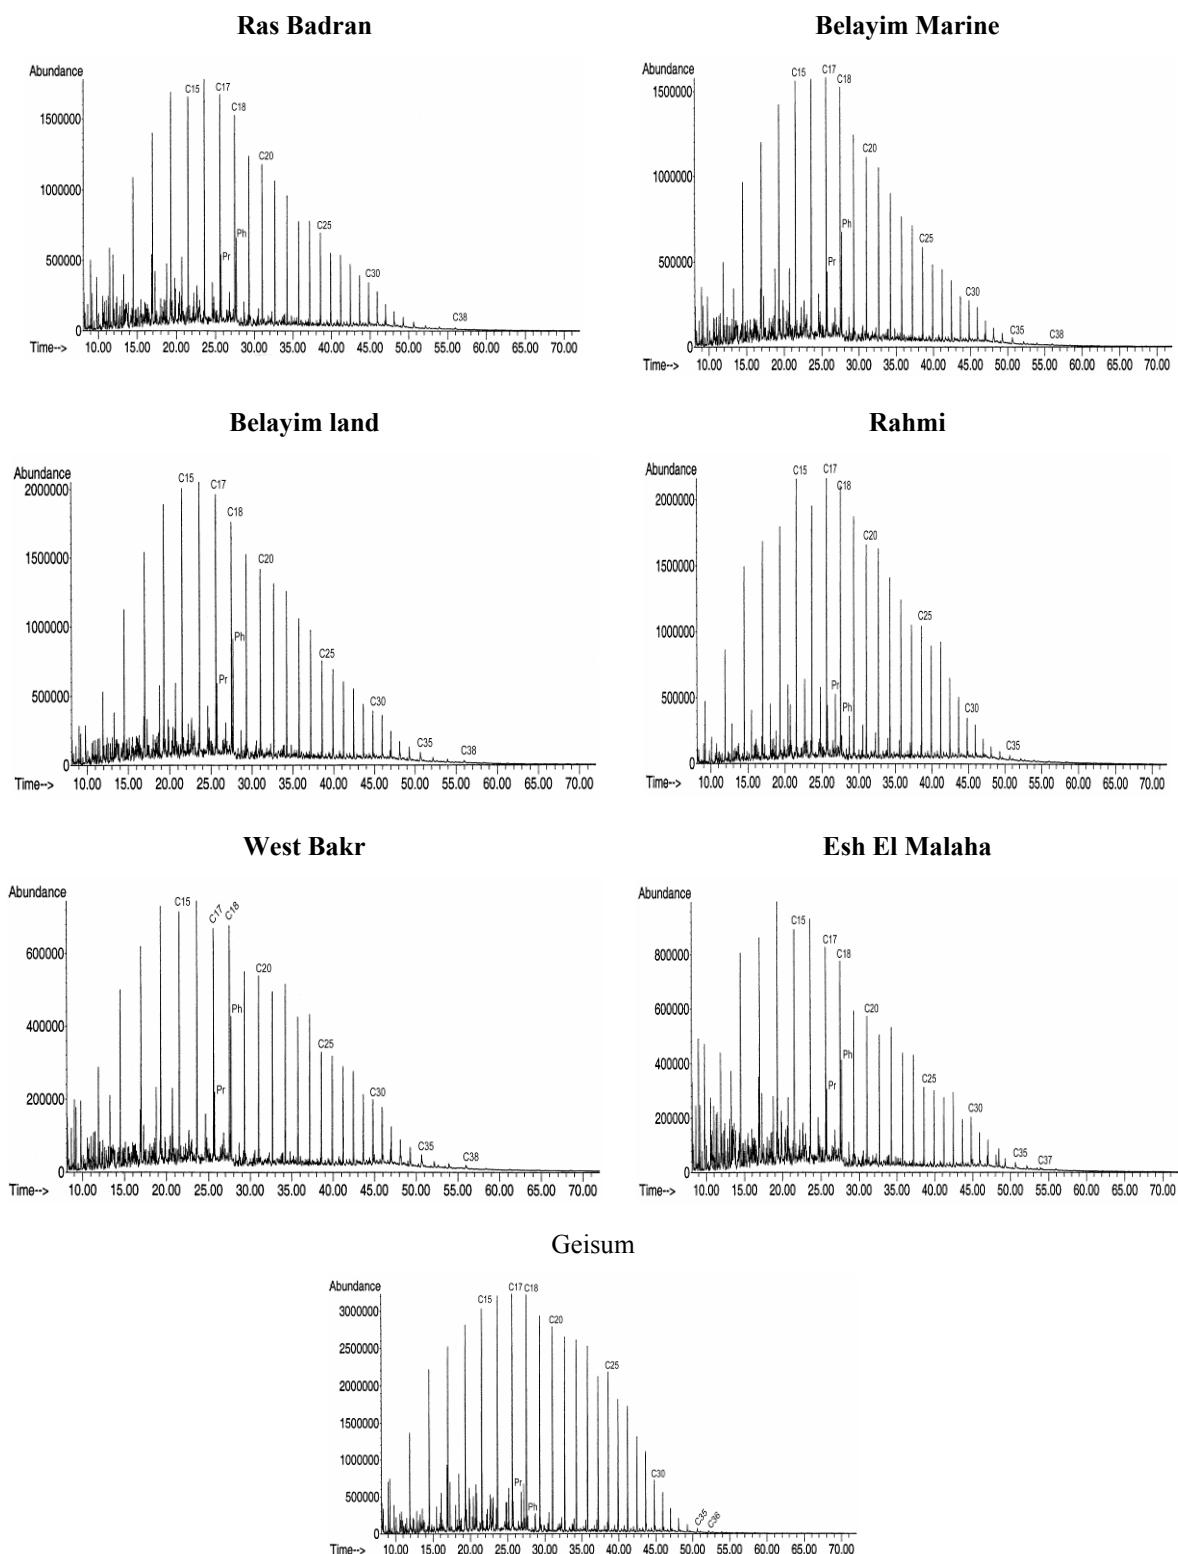

The distribution of n-alkanes in crude oils can be used to indicate the organic matter source (Duan and Ma, 2001). Figure 3 shows the fingerprints of gas chromatography for the saturated hydrocarbons of the

**Fig.1. Location map of the studied oilfields in the Gulf of Suez, Egypt.**

**Fig. 2: Stratigraphic column of the Gulf of Suez (Alsharhan and Salah, 1997). Oil reservoirs are indicated by green circles (●), source rocks as flags (■) and seals (⊗)**

**Fig. 3. Gas chromatograms of saturated hydrocarbons of the studied oil samples in the Gulf of Suez, Egypt**

studied crude oil samples. These fingerprints show that the studied oils appear to be mature, based on the abundance of n-alkanes in the range n-C<sub>15</sub> to n-C<sub>20</sub>, slightly even carbon preference and moderately to low concentration of heavy normal alkanes. The increase in the n-C<sub>15</sub> to n-C<sub>20</sub>, suggests marine organic matters with contribution to the biomass from algae and plankton (Peters and Moldowan, 1993). The striking molecular feature of oils is that all are characterized by uniformity in n-alkanes distribution patterns, suggesting that they are related and have undergone similar histories, with no signs of water washing or biodegradation ( Ficken et al. 2000 and Duan and Ma, 2001). The carbon preference index (CPI) of the studied oils ranging from 1.00 to 1.1 (Table 1) generally shows no even or odd carbon preference, indicate mature samples (Tissot and Welte, 1984).

#### Degree of Waxiness

**Table 1 Geochemical parameters derived from GC and GC-MS analyses of studied oilfields in the central Gulf of Suez, Egypt**

	Oilfields

g: Ts/Tm: Trisnorhopanes/Trisnorhopanes ratios.

#### Isoprenoids

#### Pristane/Phytane

The pristane/phytane (Pr/Ph) ratio is one of the most commonly used geochemical parameters and

The standard method of categorizing the amount of land-derived organic material in an oil is to determine its degree of waxiness. This method assumes that terrigenous material contributes a high molecular-weight normal paraffin components to the oil (Köket al., 1997). Thus, recent studies about oil classification by source input have relied heavily on waxiness as an environmental source input parameter (Connan and Cassou, 1980). The degree of waxiness in this study is expressed by the ΣC<sub>21</sub>-C<sub>31</sub>/ΣC<sub>15</sub>-C<sub>20</sub>, ratios (Table 1).

The studied oils are characterized by high abundance of of n-C<sub>15</sub>to n-C<sub>20</sub> n-alkanes in the saturate fractions reflecting low waxy (Moldowan et al., 1994). The dege of waxness (ΣC<sub>21</sub>-C<sub>31</sub>/ΣC<sub>15</sub>-C<sub>20</sub> ratios)ranging from 0.68 to 0.94 (Table 1) confirms low waxy nature and suggests marine organic sources (Peters and Moldowan, 1993).mainly of higher plants, deposited under reducing condition.

has been used as an indicator of depositional environment with low specificity due to the interferences by thermal maturity and source inputs (Didyk et al., 1978, Peters et al., 2005). ten Haven et

al. (1987) stressed that high Pr/Ph (>3.0) indicates terrigenous input under oxic conditions and low Pr/Ph (<0.8) indicates anoxic/hypersaline or carbonate environments. According to Lijmbach (1975) low values (Pr/Ph<2) indicate aquatic depositional environments including marine, fresh and brackish water (reducing conditions), intermediate values (2–4) indicate fluviomarine and coastal swamp environments, whereas high values (up to 10) are related to peat swamp depositional environments (oxidizing conditions).

The studied oil samples are characterized by pristane/phytane ratios (0.14 to 0.36) and waxiness values (0.68 to 0.94, Table 1), confirming that these oils have been originated from marine organic source deposited under suboxic conditions. Figure 4 exhibiting the relationship between Pr/Ph and waxiness confirms this conclusion. Furthermore, the cross plot of Pr/Ph versus CPI (Figure 5) shows that, the oils fall in the field of more reducing zone of thermal maturation level.

#### Isoprenoides/n-alkanes ratios

In crude oil studies, the ratios of isoprenoids to n-alkanes are widely used since they provide informations on maturation and biodegradation as well as source (Ficken et al., 2002). Consequently, a plot of Pr/n-C<sub>17</sub> versus Ph/n-C<sub>18</sub> in Figure 6 as originally proposed by Lijmbach (1975). The isoprenoids/n-alkanes ratios (pr/n-C<sub>17</sub> and ph/n-C<sub>18</sub>, shown in Table 1), suggest marine organic matters source (mainly algae) deposited under reducing environment. It also indicates a genetic close relation between the studied oils.

#### Steranes (m/z 217) Distribution

The distribution of steranes is best studied on GC/MS by monitoring the ion m/z=217 which is a characteristic fragment in the sterane series. The resulting mass chromatograms for the representative samples are shown in Fig. (7) and the labeled peaks are summarized in Table (2). The compounds were identified in their key fragmentograms based on the relative retention times and by comparison of their mass spectra with the published data. It is agreed that the relative amounts of C<sub>27</sub>-C<sub>29</sub> steranes can be used to give indication of source differences (Lijmbach, 1975)

The studied crude oils of Ras Badran, Belayim, West Bakr and Esh Elmalaha are characterized by predominance of C<sub>28</sub>, C<sub>29</sub> and C<sub>30</sub> steranes (20S and 20R, Fig. 7, see peak identifications in Table 2)

which indicate an origin of the oils derived mainly from mixed terrestrial and marine organic sources. While oil samples from Rahmi and Geisum (Fig. 7) show slightly low abundance of C<sub>28</sub> and C<sub>29</sub>, and relatively higher concentrations of C<sub>27</sub>steranes (20S and 20R, see peak identifications in Table 2) which indicate more input of marine organic source. The steranes diagram (Fig. 8) confirms these assumptions.

The amount of C<sub>27</sub> diasteranes, diasteranes index and concentration of (20S) and (20R) isomers influences the maturity level of crude oils. Peters and Moldowan (1993); Petersen et al., (2000) and Andrew et al. (2001) recognized that the maturity level of oils increases with the increase of these parameters (i.e. high concentration of C<sub>27</sub> diasteranes, > 0.1 diasteranes index, and > 0.5 C<sub>29</sub> 20S/20S+20R). Thus, it is obvious that the studied oils have slightly high concentration of C<sub>27</sub> diasteranes (20S and 20R) peaks A, B and C with diasteranes index range from 0.10 to 0.11 and C<sub>29</sub> 20S/20S+20R from 0.1 to 0.12 (Table 1). These data reveal that the studied oils are characterized by high maturity level.

#### Triterpanes (m/z 191) Distribution

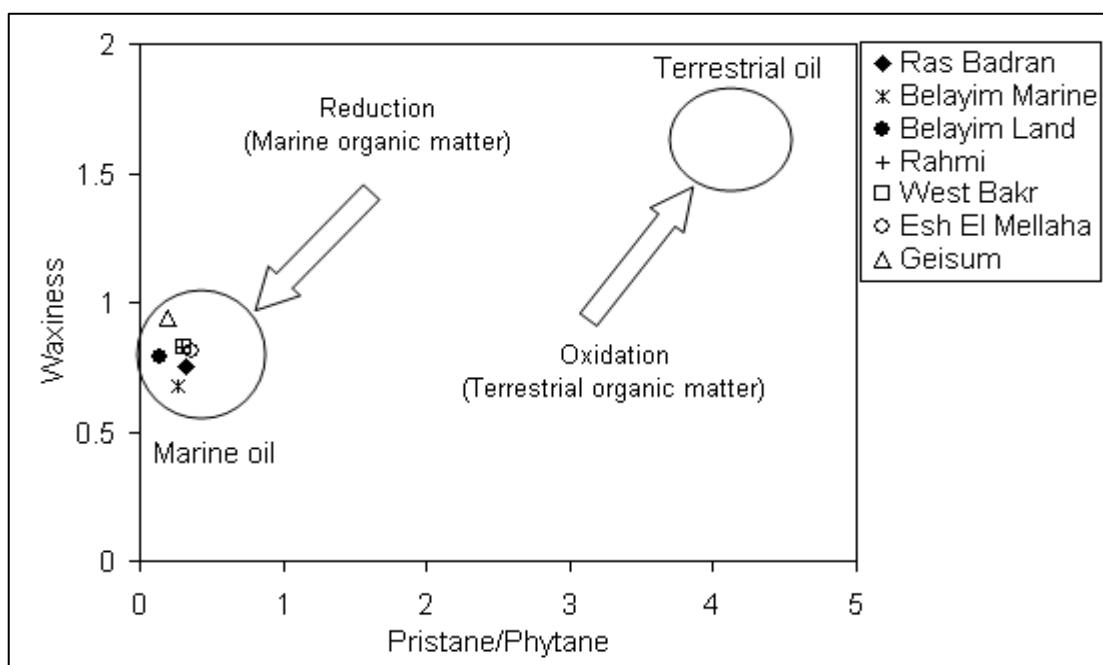

Together with steranes, triterpanes belong to the most important petroleum hydrocarbons that retain the characteristic structure of the original biological compounds. Tricyclic, tetracyclics, hopanes, and other compounds contribute to the terpane fingerprint mass chromatogram (m/z=191) are commonly used to relate oils and source rocks Hunt, 1996). Mass fragmentogram at m/z=191 was used to detect the presence of triterpanes in the saturate hydrocarbon fraction of the studied oils (Fig. 9). The assignment of the peaks labeled in fig. (9) are listed in Table (2). the most distinct features are Tricyclic Terpanes, Ts/Tm and C<sub>29</sub>/C<sub>30</sub> hopane ratios

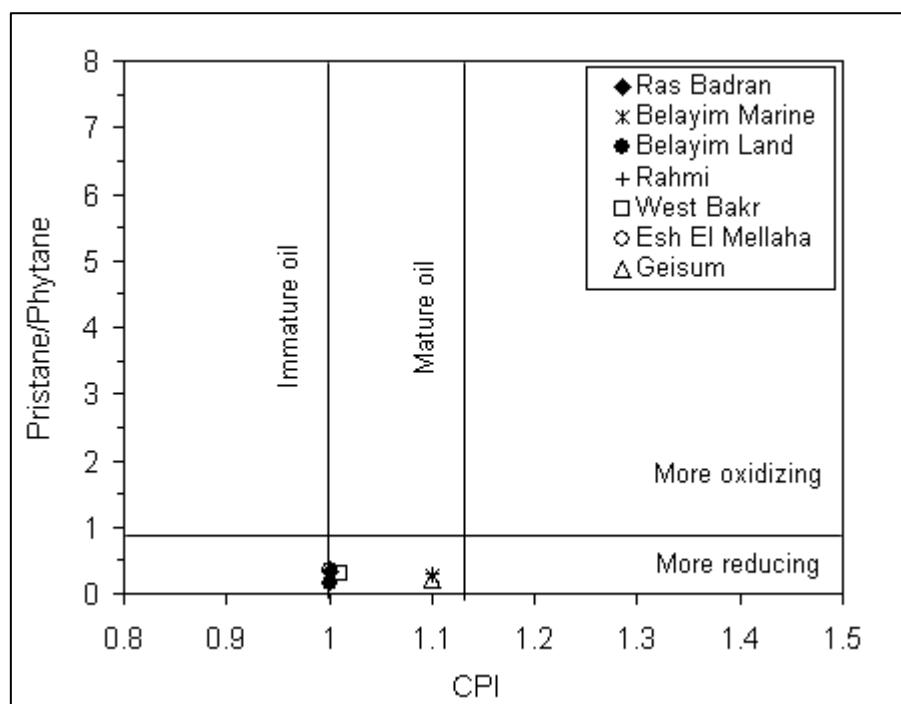

#### Tricyclic Terpanes

The concentration of tricyclic terpanes in crude oils is more sensitive to the specific paleoenvironments (Waples and Machihara, 1992 and Andrew et al., 2001). In addition it has been used as a qualitative indicator of maturity (Van Grass, 1990). In high mature oils, the tricyclic terpanes is dominated more than in low mature oils (Hunt, 1996). Aquino et al. (1983) indicated that tricyclic terpanes are normally associated with marine source. Our study reveals that the concentration of C<sub>22</sub> tricyclic terpanes peak B in the studied oil samples (Fig. 9, see peaks identifications in Table 2) is higher which support the idea that the oils are more

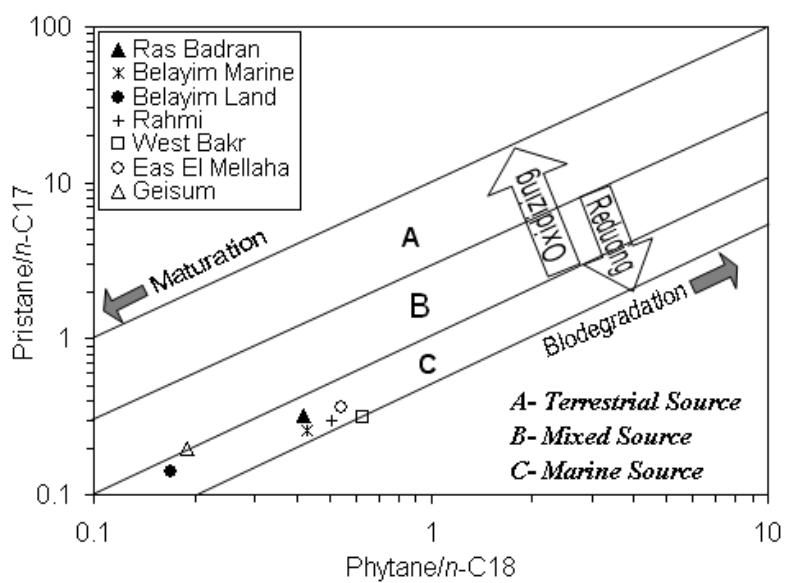

Table 2. Identification of peaks in triterpanes ( $m/z$  191) and steranes ( $m/z$  217) mass fragmentograms.

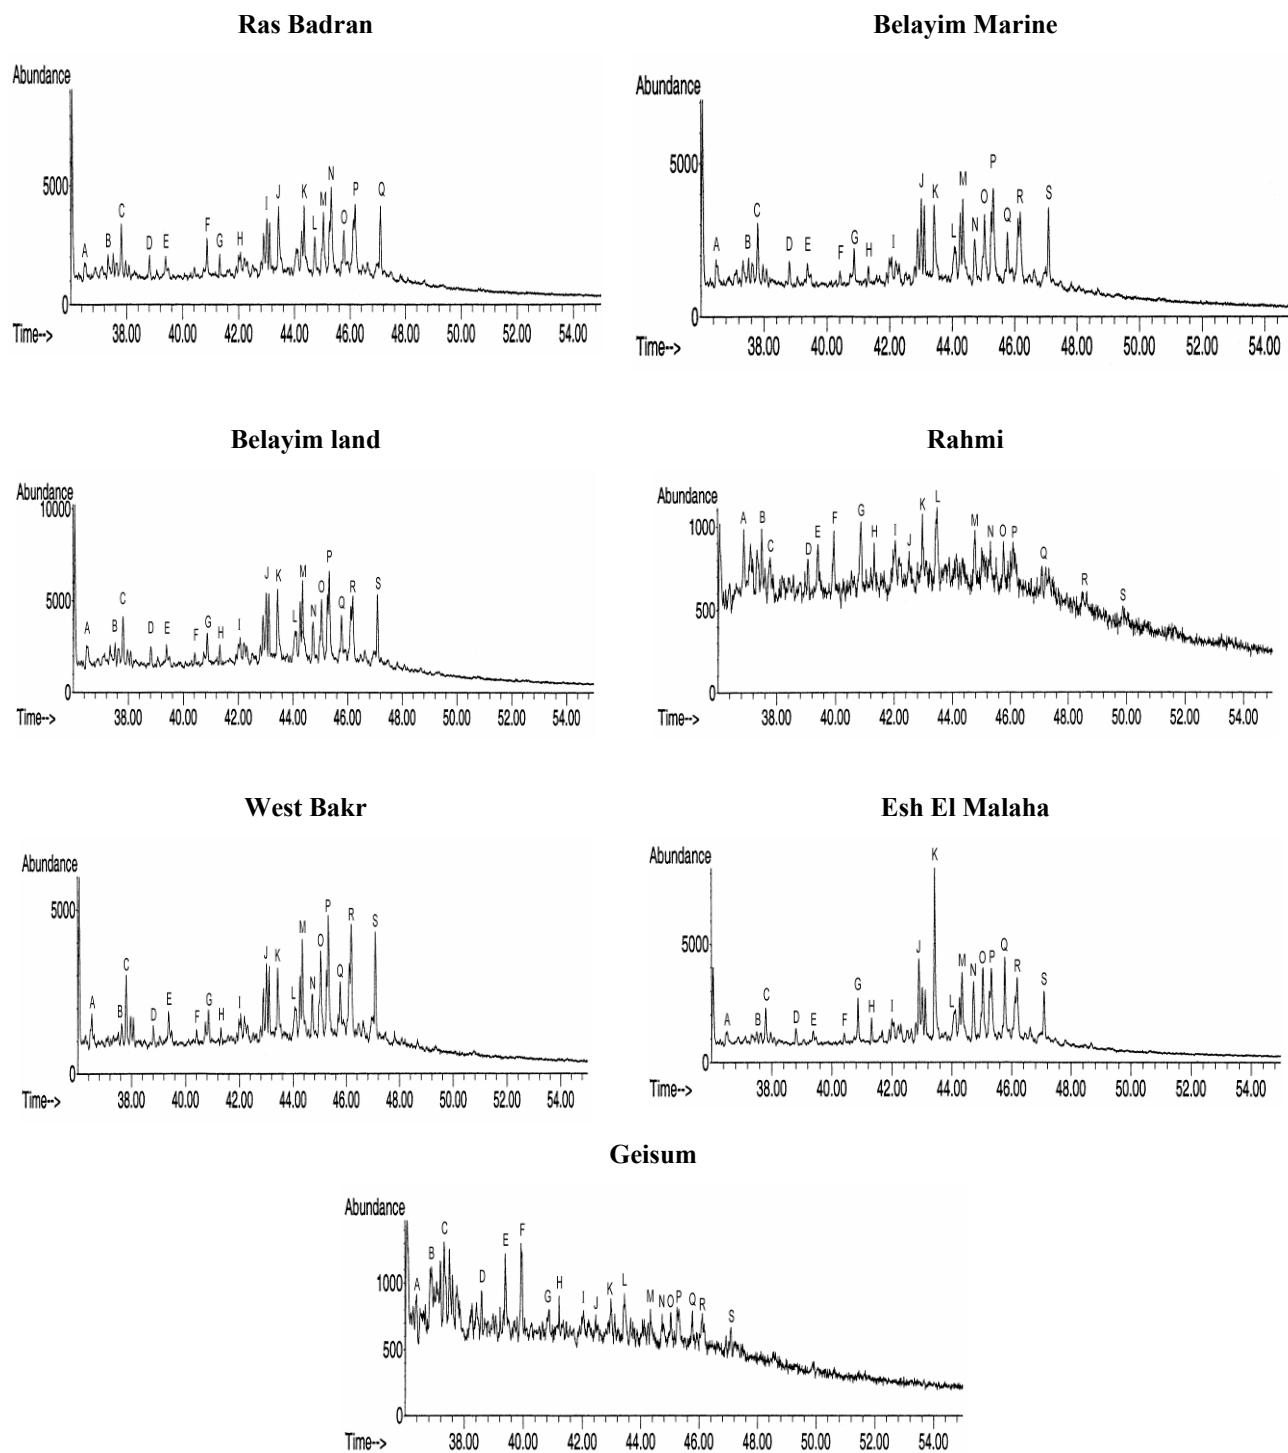

Fig. 4: Cross plots of Pr/Ph versus waxiness  $\sum(n\text{-C}21\text{-n-C}31)/\sum(n\text{-C}15\text{-C}21)$  for the studied samples.

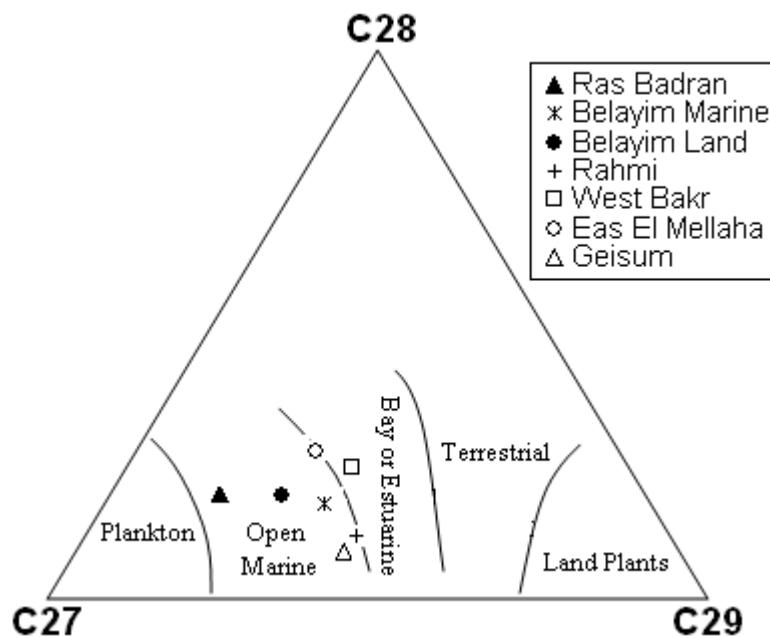

**Fig. 5: Pristane/Phytane versus CPI showing the sources of studied crude oils (Akinula et al., 2007).**

**Fig. 6. Plot of pristane/n-C<sub>17</sub> versus phytane/n-C<sub>18</sub> (Shanmugam, 1985), showing the organic sources and maturation of studied oil samples.**

**Fig. 7. Ion fragmentgrams ( $m/z$  217) steranes of saturated hydrocarbons of the studied oil samples in the Gulf of Suez, Egypt**

**Fig. 8. Distribution of C<sub>27</sub>, C<sub>28</sub>, and C<sub>29</sub> regular steranes (Huang and Meinschein, 1979), showing organic facies of the crude oils in the Gulf of Suez, Egypt.**

mature and sourced mainly from carbonate source rocks. On the other hand, C<sub>21</sub>, C<sub>23</sub> to C<sub>28</sub> tricyclic terpanes peaks A, C to I are generally of low detection levels in the studied oils indicating that these oils have some inputs derived from terrestrial organic material (Hunt, 1996). This confirms with the conclusion of steranes biomarkers.

#### Homohopanes

The homohopanes (C<sub>31</sub> to C<sub>34</sub>) are believed to be derived from bacteriopolyhopanol of prokaryotic cell membrane. C<sub>35</sub> homohopane may be related to extensive bacterial activity in the depositional environment (Ourisson et al., 1984). The distribution of 17 $\alpha$ ,21 $\beta$ (H)-29-homohopanes 22R+22S C<sub>35</sub>/(C<sub>31</sub>-C<sub>35</sub>) (or simply homohopane index) in crude oils can be used as an indicator of the associated organic matter type, as it can also be used to evaluate the oxic/anoxic conditions of source during and immediately after deposition of the source sediments (Peters and Moldowan, 1991). Low C<sub>35</sub> homohopanes is an indicator of highly reducing marine conditions during deposition, whereas high C<sub>35</sub> homohopane concentrations are generally observed in oxidizing water conditions during deposition, consistent with the oxic conditions as suggested by high pristane/phytane ratios (Peters and Moldowan, 1991).

The studied crude oils have low concentrations of C<sub>31</sub>-C<sub>35</sub> homohopanes (20S and 20R) (peaks S to V Fig. 8, Table 2) which are more significant to hypersaline marine oils. The homohopane indices

values 0.21 to 0.98 (Table 1) confirms the above conclusion.

#### Gammacerane

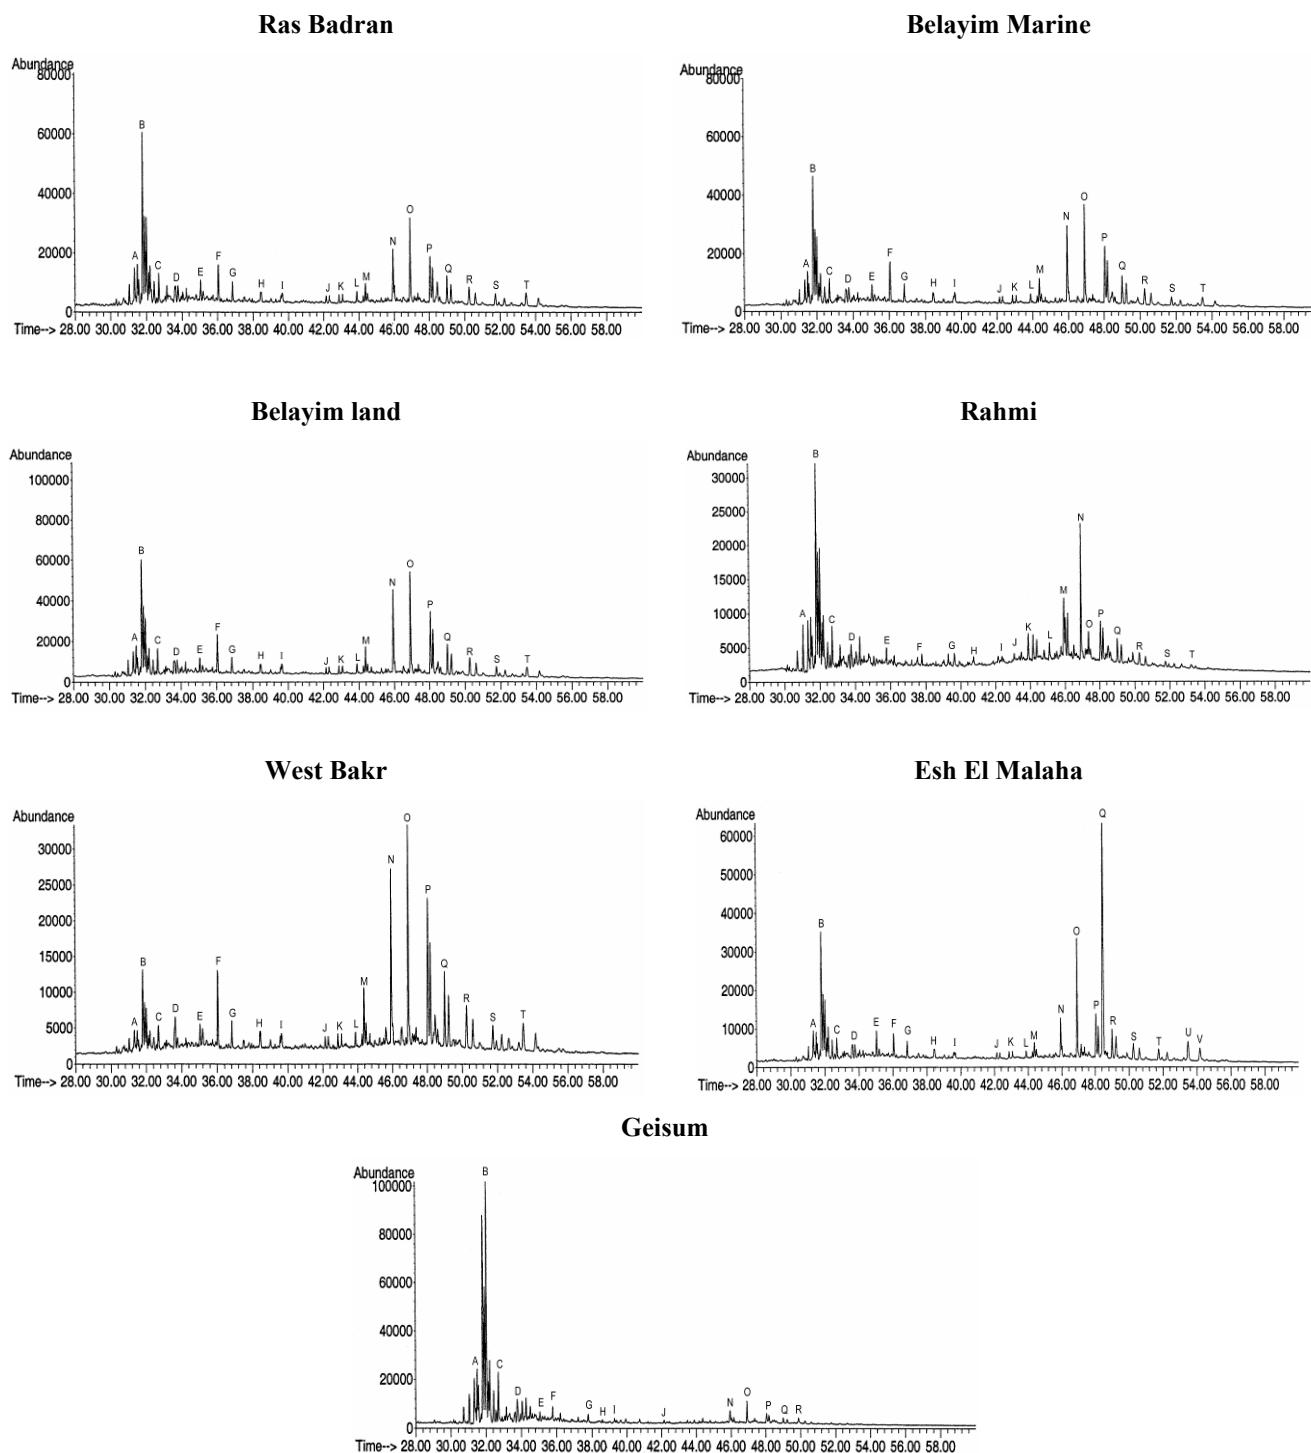

Gammacerane, is associated with environments of increasing salinity, both marine and lacustrine (Waples and Machihara, 1991; and Peters and Moldowan, 1993). Gammacerane (peak R, see peaks identifications in Table 2, Fig. 8) is only detected in relatively low amount in the studied oils indicating input of marine organic matter in different saline environments, e.g. lakes, lacustrine, ponds, ... etc .

#### Ts/Tm

The ratio of Ts (trisnorneohopane) to Tm (trisnorhopane) more than (0.5) increases as the portion of shale in calcareous facies increases (Hunt, 1996). Also, this ratio was proved to be useful in paleofacies predictions, though not as decisive as maturity parameters. Van Grass (1990) stated that Ts/Tm ratios begin to decrease quite late during maturation, but Waples and Machihara, (1991) reported that Ts/Tm ratio does not appear to be appropriate for quantitative estimation of maturity. In the present study we show that the Ts/Tm ratios range from 0.53 to 0.65 for the studied oils (Table 1). These relatively high ratios suggest that the studied oils were generated mainly from calcareous facies.

#### C<sub>29</sub>/C<sub>30</sub> hopanes ratios

C<sub>29</sub>/C<sub>30</sub> hopanes ratios are generally high (>1) in oils generated from organic rich carbonates and evaporates (Connan et al., 1986). The majority

**Fig. 9. Ion fragmentgrams ( $m/z$  191) triterpanes of saturated hydrocarbons of the studied oil samples in the Gulf of Suez, Egypt**

studied oil samples, having higher concentrations of C<sub>29</sub> than C<sub>30</sub> hopane, peaks O and Q respectively with high C<sub>29</sub>/C<sub>30</sub> hopane ratios range from 1.01 to 1.40 (Table 1), except oils from wells Esh El Mellaha and Geisum which have lower concentrations of C<sub>29</sub> than C<sub>30</sub> hopane (Fig. 8), with low values of C<sub>29</sub>/C<sub>30</sub> hopanes (0.04 to 0.07, Table 1). These data illustrate that the oil samples might be sourced from source rocks rich in carbonaceous organic matters. This assumption is confirmed by the low abundance of C<sub>29</sub> moretane (peak P), gammacerane (peak R) and slightly higher concentration of C<sub>28</sub> bisnorhopanes (peak L), Philp (1985); Riediger et al. (1990) and Waples and Machihara, (1991).

#### Steranes/17 $\alpha$ (H)-hopanes ratio

The regular steranes /17 $\alpha$ (H)-hopanes ratio reflects input of eukaryotic (mainly algae and higher plants) versus prokaryotic (bacteria) organisms to the source rock (Noriyuki et al,1996). The sterane/hopane ratio is relatively high in marine organic matter, with values generally approaching unity or even higher. In contrast, low steranes and sterane/hopane ratios are more indicative of terrigenous and/or microbially reworked organic matter (Noriyuki et al,1996). From steranes/hopanes ratio of the studied crude oils range 1.25 to 2.00 of wells Ras Badran, Belayim marine, Belayim Land, Rahmi, and West Bakr and 0.57 and 0.82 Esh El Mellaha and Geisum crude oils (Table 1). This indicates that the majority of the studied crude oils can be considered generated from high marine organic matter source (marine and lacustrine algae). These results show an agreement with the data obtained from the relationship of Pr/nC<sub>17</sub> versus Ph/nC<sub>18</sub> (Fig. 6).

#### 4. Conclusions

Utilizing the GC and GC/MS technique made it possible to arrive at a clear characterization and classification of crude oils according to their sources. This has been achieved from the acyclic isoprenoids, steranes and terpanes biomarkers. Geochemical parameters based upon these components coupled with bulk geochemical parameters did indicate whether the crude oils are of marine, terrestrial or mixed marine-terrestrial origin.

Biomarkers analyses of crude oils from the Gulf of Suez, suggest the following: oils are more mature and derived mainly from mixed organic sources from terrestrial and marine inputs contribution to the biomass from algae and plankton in different saline environments.

The few discrepancies that appear between the results obtained by using the different parameters can be related to the alteration caused by the number

of processes (physical, chemical and/or biological) affecting part of the source related biomarkers pattern of the oil after generation and/or primary migration from the source rock.

\* [amatalmatary@yahoo.com](mailto:amatalmatary@yahoo.com)

**Abstract:** Fascioliasis is a widely distributed disease affecting herbivorous animals. As a result of drug resistance a mixture of two antifasciola drugs (Triclobendazole and Superivomec) was used in trial to overcome this drug resistance. Twenty eight newly weaned white Boskat rabbit aging 1.5 month were divided into 7 groups, six of them were experimentally infected with metacercaria of *Fasciola gigantica* and one kept as -ve control group. Faecal egg count during the clinical course of the disease, counting the worm and its morphological studies and lesion score after postmortem examination were the parameters used to evaluate the effect of different drug mixtures. It had been concluded that the mixture of triclabendazole and superivomec was the mixture of choice.

[A. Z. Mahmoud; Mokhtar M. Taha; Salah M. H. Afifi; Khaled M. A. Hassanein and Amal Mohamed Abdo. Drug resistance and recent therapeutic measures in controlling of fascioliasis. Journal of American Science 2010;6(11):926-933]. (ISSN: 1545-1003).

**Key words:** Fascioliasis, Metacercaria, Triclabendazole, Rabbit and Superivomec.

### 1. Introduction:

Fascioliasis or liver flukes is a disease affecting herbivorous animal and caused by *Fasciola hepatica* and *Fasciola gigantica*. It has a worldwide distribution in a large variety of grass-grazing animals as sheep, goats, cattle, buffaloes, horses and rabbits. In Egypt, donkeys and camels as well, are hosts for *Fasciola gigantica*. Fascioliasis may occasionally affect man (Haseeb et al., 2002; Sanad and Al-Megrin, 2005).

Fascioliasis gives rise to important economic losses such as great expenses with anthelmintics, liver condemnation, production loss due to mortality, lower production of meat, milk and wool; reduced weight gain, and impaired fertility (Parr and Gray, 2000; Marques and Scroferneker, 2003).

Two clinical stages are recognized in fascioliasis. An acute stage coincides with the larval migration and worm maturation in the hepatic tissue, and a chronic stage coincides with the persistence of *Fasciola* worms in the bile ducts (Haseeb et al., 2002).

Fascioliasis is controlled by a combination of anthelmintic therapy and management measures. These methods are costly and may lead not only to anthelmintic resistance, but also to undesirable residues in food or the environment (Pérez et al., 2002). Consequently, the control of fascioliasis is one of important aims in our work.

These studies were designed to select an effective treatment against different stages of *Fasciola gigantica* were including immature worm, adult worm, and eggs using mixture of drugs to avoid development of drug resistance.

### 2. Materials and methods

#### I. Materials

##### Experimental animals:

A total number of 28 newly weaned white Boskat rabbit aging 1.5 months (obtained from faculty of agriculture farm, Assiut University) were divided into 7 groups (4 rabbits each).

Group (1): (Control +ve group): Rabbits were infected with 30 metacercaria/ rabbit orally by stomach tube. Rabbit were slaughtered 11 weeks post infection (PI).

Group (2): Flubendazole treated group: Rabbits were infected with 30 metacercaria/ rabbit orally and treated orally with flubendazole at 6 weeks (PI) (100 mg/kg b.wt).

Group (3): Flubendazole and superivomec treated group: Rabbits were infected with 30 metacercaria/ rabbit and treated orally with flubendazole (50 mg/kg b.wt.) plus superivomec (ivermectin 100 µg and clorsulon 1 mg/ kg b.wt).

Group (4): Superivomec treated group: Rabbits were infected with 30 metacercaria/ rabbit orally and treated S/C with superivomec at 6 weeks (PI) (ivermectin 200 µg and clorsulon 2 mg /kg b.wt).

Group (5): Triclabendazole treated group: Rabbits were infected with 30 metacercaria/ rabbit orally and treated orally with triclabendazole (10 mg/kg b.wt).

Group (6): Triclabendazole and superivomec treated group: Rabbits were infected with 30 metacercaria/ rabbit orally and treated orally with triclabendazole (5 mg/kg b.wt) plus superivomec (ivermectin 100 µg and clorsulon 1 mg per kg b.wt).

Group (7): (Control -ve group): Rabbits were slaughtered 11 weeks (PI).

## II. Methods

### A) Parasitological examination:

#### Faecal samples:

A piece of faecal sample was dispersed and thoroughly mixed with about 10 parts by volume of saline solution. Examination of faecal samples was carried out according to Melvin and Brooke, (1982)

#### Fluke samples:

Samples of flukes were taken to study changes in morphology by carmine stain and scanning electron microscopy.

Methods used to study the effect of the drug on the worm:

- Egg count at different periods of infection during the experiment.
- The number of worms were counted and measuring the length of the flukes.
- The morphology of adult flukes was studied by carmine stain and Scanning Electron Microscope (S.E.M).

### B) Pathological examination:

Tissue samples: Samples from liver were taken for histopathological examination.

Gross pathology: Rabbits were dissected for the presence/absence of any gross lesions in the liver.

Histopathological examination: Routine review histopathological picture were carried on formalin fixed paraffin embedded sections from the liver and stained by H & E (Bancroft et al., 1994).

### C) Statistical analysis:

The data were statistically analyzed using general linear model (G. L. M) procedure of SAS (1996). The significance differences between treatment means were tested by Duncan multiple range test (Steel and Torrie, 1982).

## 3. Results

The clinical signs were observed 4 weeks post infection with *Fasciola gigantica*. The signs in the form of dullness, rough hair coat. At 9 weeks (PI), loss of hair coat, anorexia, paleness of the mucous membranes and emaciation were observed

especially in control +ve group and flubendazole treated group when compared with normal rabbits (Figs. 1A,B).

Faecal examination revealed the presence of eggs of *Fasciola gigantica* as early as 40 days (PI) in all infected groups. The eggs appeared oval, operculated, delicate light yellow in color (Fig. 1C).

Statistical analysis of the egg counts from 7 to 11 weeks (PI) revealed significant increase in eggs in group 1 and 2 when compared with other groups. In group 3 and 4, highly significant decrease of egg count was observed when compared with group 1 and 2. Statistical investigation of egg count in the group of rabbits treated with triclabendazole either alone or in combination with superivomec revealed highly significant decrease in the egg count during the 7<sup>th</sup> week (PI) when compared with group 1. Complete cessation of the eggs was observed in both groups during the 8<sup>th</sup> weeks (PI) (Table 1).

Gross examination of the liver in group 1,2 and 3 showed enlargement, congestion and multiple necrotic foci on the liver surface. In addition, multiple migratory tracts were observed. Perihepatitis was observed. Normalization of the liver with no migratory tracts and liver flukes were seen in group 4, 5 and 6.

Histopathological examination of the liver in group 1 and 2 showed congestion, thrombosis, vasculitis and perivasculitis of hepatic vasculatures. Bile duct proliferation, hyperplasia, cholangitis and pericholangitis were observed. The bile duct changes in group 2 were more severe than group 1. The histopathological changes of the hepatic cells were ranged from degenerative changes (vacuolar degeneration and glycogen infiltration), necrosis (coagulative and lytic) and hepatitis either focal or diffuse (Figs. 1D-G).

The histopathology of the liver in group 3 showed the same pathological changes as group 2 but less severe. The histopathological changes of liver in group 4 were quite similar to those observed in the previous groups. While triclabendazole treated group revealed normal appearance of the different hepatic structures except a minor changes expressed by congestion and thrombosis of some hepatic vasculatures. The bile ducts showed bile duct proliferation and hyperplasia, cholangitis and pericholangitis. The hepatic parenchyma showed focal granular degeneration. In superivomec + triclabendazole treated group, most of the hepatic tissues appeared more or less normal except minor pathological alterations.

As shown in Table (2) the lesion scores of histopathological results of group 1 revealed significant increase in the bile duct lesions, portal lesions, migratory tracts and focal liver lesions in

group 1 when compared with other groups except group 2. In group 3, the lesion score demonstrated that the bile duct lesion and portal lesion were significantly decreased when compared with group 1 and 2. In group 4, minimal lesion scores were observed. In group 5, the lesion scores revealed absence of migratory tracts and diffuse liver lesion. The lesion scores of bile duct and portal lesions were significantly decreased. In group 6, lesion scores obtained after treatment with the mixture revealed significant decrease in all parameter when compared with other groups.

Careful counting of the liver flukes and statistical analysis revealed significant increased of flukes numbers in group 1 when compared with other groups (Table. 3). *Fasciola gigantica* stained with carmine revealed maturity of the worm while in flubendazole treated group it was decreased than control +ve group. The flukes stained with carmine showed that the mixture of flubendazole and superivomec had a prominent effect on the maturation of the fluke especially those of the sexual organs. Significant decrease in the number and the length of flukes in superivomec treated group when

compared with other groups was seen. Also, it has a prominent effect on maturation of sexual organs and to lesser extend on the digestive organs (Table. 3) & (Figs.2A-D).

Scanning electron microscopy of the liver flukes in control +ve group revealed rough tegumental surface of the adult *Fasciola gigantica*. The surface covered with posterior directed spines and transverse folds. The anterior ventral portion showed oral and ventral suckers and gonoopore between them (Fig. 3). In flubendazole treated group minor changes in the form of shrunken oral sucker and dilated ventral sucker. The spines surrounded the oral sucker and mid-lateral aspect of the ventral surface of the flukes showed shortening of the scale-like spines. The ventral surface of the flukes showed large area of sloughed tegument which filled with debris while the dorsal surface showed disruption in the form of furrowing of the tegumental surface (Fig. 4). Scanning electron microscopy to the liver flukes of flubendazole + superivomec treated group showed more prominent changes especially in the anterior half of the fluke (Figs. 5).

#### 4. Discussion:

*Fasciola hepatica* remains one of the single most important helminth parasites of many countries in the world. Its tropical counterpart is *Fasciola gigantica*. There are effective strategies for the control of fascioliasis, based largely on drug (fasciolicide) use but allied to epidemiological data (Boray, 1997 and Malone, 1997). While most of the experimental work has been conducted with *Fasciola hepatica*, the problems associated with fascioliasis and its control is similar in large parts of the world where only *Fasciola gigantica* is present. All drugs effective against one of the species are equally effective against the other (Boray, 1986).

In the present study, the histopathological changes in the form of vascular changes, bile duct lesions, portal lesions, migratory tracts and hepatocellular changes were reported by many authors (Farha, 1993; Yoshida et al., 1996; Pérez et al., 1999 and Adedokun and Fagbemi, 2001).

The eggs of *Fasciola gigantica* were appeared in the faeces at 40 days post infection as oval, operculated and delicate yellow in color. This finding was in agreement with the studies of many authors (Haseeb et al., 2002; Lotfy and Hillyer, 2003). Statistical analysis of the egg counts from 7 to 11 weeks (PI) revealed significant increase in eggs in control +ve group when compared with other groups.

The egg counts increased gradually from 7 to 11 weeks. These results are in harmony with the studies of Sherif et al., (2001) who reported that the egg counts increased gradually from 10 weeks to 16 weeks (PI). Also, Sewell, (1966) mentioned that egg counts of *Fasciola* increased gradually up to a peak 108 days (PI).

In the present work, counting of the liver flukes and statistical analysis revealed significant increase of fluke's numbers in control +ve group ( $13.90 \pm 1.38$ ) when compared with other groups. These results were obtained by Schillhorn Van Veen et al., (1980) and Adedokun and Fagbemi, (2001) who reported that the pathological findings were related to the number of the flukes recovered at post mortem.

*Fasciola gigantica* stained with carmine revealed maturity of the worm with eggs in the uterus and well developed intestinal ceca and testes at 9 and 11 weeks post infection. Similarly, Olaechea et al., (1991) found that there was individual variation in numbers of flukes per animal and the mean percentage of mature worm with eggs in uterus at 10 weeks post infection. Kolodziejczyk et al., (2006) said that the juvenile form of the flukes in the liver tissue and mature forms in the bile ducts of rats were seen at 7 weeks (PI).

Scanning electron microscopy to the liver flukes in control +ve group revealed rough tegumental surface of the adult *Fasciola gigantica*. The surface covered with posterior directed spines and transverse folds. These results obtained by many investigators (Meany et al., 2006 and Mahmoud and Hegazi, 2007). This can be explained by the increasing efficacy of absorption and exchange of materials by the tegument, such features are also observed in other trematodes (Jinxin and Yixun, 1981). The anterior and middle regions tend to have more developed spines or folds than the posterior region. These results were agreed with the studies of Mahmoud and Hegazi, (2007) who suggested different capabilities of absorption in various regions of tegument. The presence of numerous spines, covering the body surface may facilitate movement of *Fasciola* in the bile ducts of the liver. In the flubendazole treated group, minor changes of the flukes in the form of shrunken oral sucker and dilated ventral sucker, shortening of the scale-like spines and sloughed tegument which filled with debris. These findings coincide with those described by Omran et al., (2006) who studied the effect of flubendazole on *Schistosoma mansoni*.

In superivomec treated group, there was significant decrease in the number and the length of flukes when compared with other groups. Also, it has a prominent effect on maturation of sexual organs

and to lesser extend on the digestive organs. These results were in agreement with the findings of Vera-Montenegro et al., (2003) who reported that clorsulon causing stunted growth of the fluke and egg production was markedly decreased and the findings of Fetterer et al., (1985) and Sundlof et al., (1991) who reported that clorsulon was highly effective in reducing worm burden.

It had been concluded that experimental fascioliasis in rabbits resulted in severe deleterious effect on the liver tissue. The flubendazole was not effective against fascioliasis. The uses of triclabendazole in the treatment of fascioliasis eliminate the gross lesions and liver fluke and minimize the histopathological alterations. The results produced by the mixture of triclabendazole and superivomec may be due to its effectiveness in overcoming the eggs as early as one week of treatment and its effectiveness against the fluke. So we advise using this mixture in the treatment of *Fasciola gigantica* in the field (mixture of choice).

**Abstract:** Aim of the work: Assessing the Effect of green, roasted and decaffeinated coffee on serum glucose, insulin and serum lipid profile in diabetic rat models. Methods: Design of the Study: Thirty female wistar rats weighing  $124.5 \pm 5.41$ g (mean  $\pm$ S.D) were divided into 5 groups. The first group served as a control and consumed a standard diet according to (AIN – 93). The other 4 groups were injected intraperitoneally with 105 mg / kg body weight of alloxan . One group was kept without further treatment and served as a positive diabetic control. Groups 3, 4, 5 consumed 5% green, roasted and decaffeinated coffee in drinking water, respectively. The feeding trial continued for four weeks. At the end of the experiments, the animals were sacrificed, blood samples were collected, and the liver, kidney ,spleen and heart were separated, washed ,dried and weighed. Laboratory investigations Consisted of serum glucose, insulin, calcium, phosphorus and complete lipid profile was determined to test the magnitude of antioxidant potential green, roasted and decaffeinated coffee. Results: The present study show a significant difference ( $p < 0.05$ ) in body weight gain and food intake between all treatment groups , with non significant difference in water intake , relative weight of organs including liver , kidney , spleen and heart . the study also shows significant elevation ( $p < 0.05$ ) in serum glucose and insulin in diabetic control group as compared to normal control group. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ( $p < 0.05$ ) .There is a significant decrease ( $p < 0.05$ ) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green, roasted and decaffeinated coffee respectively indicating an association between coffee consumption and bone health. our results also shows that alloxan injection produced a significant increase( $p < 0.05$ ) in serum total- cholesterol(TC); triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio however a significant decrease ( $p < 0.05$ ) in serum HDL-C is observed ; In diabetic rats compared to normal control .green, roasted and decaffeinated coffee resulted in a significant decrease ( $p < 0.05$ ) in triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ( $p < 0.05$ ) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study . Conclusion: The observed improvement in glucose, insulin profile, triacylglycerol and HDL-C confirm the potent biological action of green, roasted and decaffeinated coffee and suggest that chlorogenic acid (a component in coffee) might have an antagonistic effect on glucose transport. Suggesting a novel function of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

**Key words:** Green, roasted, decaffeinated coffee, glucose, insulin and lipid profile.

## 1. Introduction:

Type 2 diabetes is a chronic disease associated with high rates of morbidity and premature mortality(Nathan , 1993)1 An alarming increase in the prevalence of type 2 diabetes is expected,( Wild et al ., 2004 ) and the need for preventive action is widely acknowledged. While increased physical activity and restriction of energy intake can

substantially reduce the incidence of type 2 diabetes (Tuomilehto et al., 2001 Knowler et al., 2002) , insight into the role of other lifestyle factors may contribute to additional prevention strategies for type 2 diabetes.

Coffee is considered one of the most popular beverages consumed in the world due to its pleasant flavor and pharmacological properties(DÓREA and

COSTA ., 2005). Prospective and epidemiologic studies of green and especially of roasted coffee consumption has been carried out to investigate its biological effects on lipids, blood pressure and glycaemia(CORTI et al ., 2002 ; DAGLIA et al ., 2000 and ROBINSON et al .,2004) . Scientific evidences have demonstrated that green and regular coffee beverages present high antioxidant properties in vivo and in vitro (KARAKAWA, 2004 and SOMOZA et al ., 2003). Few recent studies have indicated that soluble extracts of green coffee were effective against the high blood pressure in mice(SUZUKI, A. et al .,2000) and in human(KOZUM. et al ., 2005 and OCHIAI, . et al. 2004). It is possible that its antihypertensive action be related to vasoreactive factors produced and released from the vascular endothelium (OCHIAI, R. et al . 2004).

The roasting process causes a loss of water from the green bean and degradation of many of the compounds including the antioxidant polyphenols; however, there is very little difference in total antioxidants between the different roasts of a bean (Daglia et al., 2000).

There are three main methods of coffee preparation; boiled unfiltered coffee, filtered coffee, and decaffeinated coffee, the latter primarily consumed as instant coffee.

There are over a thousand compounds, many formed during the roasting process, which produce the unique taste and smell of coffee(Parliament et al ., 2005). However, from the point of view of concentration in coffee, prior detection of the parent compound or metabolites in the body, and physiological effects, there are essentially only three ingredients that are important; caffeine, the diterpene alcohols cafestol and kahweol, and chlorogenic acid and other polyphenols. In specialty coffees consumed outside the home the range is 18–80 mg/cup and decaffeinated coffees averaged 5 mg/cup(McCusker et al ., 2003). Coffee is an important source of caffeine; it provides 71% of the caffeine in the US diet (Frary et al., 2005). The diterpenoid alcohols are the oils in coffee and their concentration depends on the how the coffee is prepared. Filtered coffee has less than 0.1 mg/100 ml, i.e. essentially none, and unfiltered coffee can have between 0.2 and 18 mg/100 ml depending on the method.

High consumption of unfiltered types of coffee, such as French press and boiled coffee has been shown to increase low-density-lipoprotein-cholesterol concentrations. In addition, limiting caffeinated coffee intake during pregnancy seems a prudent choice. However, evidence has been accumulating that frequent consumption of coffee

may reduce risk of type 2 diabetes and liver cancer(van Dam ., 2008).

Higher habitual coffee consumption was associated with higher insulin sensitivity (Arnlöv et al ., 2004) and a lower risk for type 2 diabetes(van Dam et al ., 2002 ; Rosengren et al ., 2004 ; Salazar-Martinez et al ., 2004 ; Tuomilehto et al ., 2004 and Carlsson et al ., 2004) in diverse populations. In contrast, short-term metabolic studies showed that caffeine intake can acutely lower insulin sensitivity (Keijzers et al ., 2002 and Thong et al ., 2002 ) and increase glucose concentrations(Mougiakos et al ., 2003 and Lane et al ., 2004 )

Tunnicliffe and Shearer, 2008 found that Coffee consumption may also mediate levels of gut peptides (glucose-dependent insulinotropic polypeptide and glucagon-like peptide-1), hormones intimately involved in the regulation of satiety and insulin secretion. Finally, coffee may have prebiotic-like properties, altering gut flora and ultimately digestion.

It has been reported that Coffee intake might have an antiatherogenic property by increasing of ATP-binding cassette transporter (ABC)G1 and scavenger receptor class B type I (SR-BI) expression and enhancing HDL-mediated cholesterol efflux from the macrophages via its plasma phenolic acids(Uto-Kondo et al ., 2010).

## 2. Materials and methods

Materials :

Chemicals:

All chemicals including alloxan were fine grade, chemicals purchased from local distributor (Sigma chemical) Cairo.Egypt.

Green, roasted and decaffeinated coffee where purchased from a local market ,Cairo, Egypt and was added to drinking water at a concentration of 5 g% after following preparation : 5g of green ,roasted and decaffeinated coffee dissolved in 100 ml boiled water for 10 minutes .

The basal standard diet was prepared in accordance with AIN-93 formulation (Reeves et al., 1993).

Composition of diet (g/100g)

Corn starch 62.07;casein 14 ;sucrose 10 ;cellulose 5 ;corn oil 4 ;salt mixture 3.5 ; vitamin mixture 1;L-cystine0.18; choline bitartrate 0.25 and tert.butylhydroxy quinine 0.008.

Animals

In the present study 30 female rats of wistar strain weighing ( 124.50 ±5.41 g) obtained from Institute of Ophthalmology(Cairo, Egypt) were used in this study . The rats were maintained under

standard laboratory conditions in an air conditioned room and housed in stainless steel cages one per cage at temperature  $22\pm3$  °C and relative humidity 30-70 %. The animal diet was given ad libitum . Animals were acclimatized for one week prior to experiment. Thirty rats were divided into 6 groups each of 6 rats. Group 1(G1): Served as normal control and received standard diet.

Group 2(G2): Diabetic control group. Green, roasted and decaffeinated coffee

Group 3(G3): Diabetic group which received 5 % green coffee in drinking water.

Group 4(G4): Diabetic group which received 5 % roasted coffee in drinking water.

Group 5(G5) Diabetic group which received 5 % decaffeinated coffee in drinking water.

The experiment lasted for 4 weeks.

#### Assays:

At the end of experimental period, all rats were fasted overnight and then anesthetized by ether and sacrificed. Blood was collected and allowed to clot; serum was separated by centrifugation at 3000 rpm for 15 minutes serum was then transferred into properly labeled sterile vials and stored at -20° C till the performance of Laboratory analysis.

liver , kidney and spleen and heart were excised, rinsed in chilled saline solution and then blotted on filter paper ,weighed separately to calculate the relative weight.

$$\text{The relative weight of organ} = \frac{\text{absolute weight of organ}}{\text{Final body weight of rat}} \times 100$$

Serum was used for determination of serum glucose according to Barham and Trinder , (1972) . Serum insulin was determined according to Vuppugalla et al., (2003). Serum total cholesterol was assayed by the method of Richmond , (1973) , serum triacylglycerol according to Fossati and Prencipe , (1982) , serum HDL by the method of Steele et al ., (1976 ) while serum LDL-cholesterol by the use of the equation of Friedewald et al ., (1972) .

#### Statistical analysis:

Statistical analysis: were performed using SPSS for Windows 10.0(SPSS Inc,Chicago.IL.USA). Data were expressed as mean  $\pm$  S.D. One way analysis of variance (ANOVA) at (  $p < 0.05$  ) was used to compare mean values of continuous variable in cases and control.

### 3. Results

The present study show a significant difference ( $p <0.05$ ) in body weight gain and food intake between all treatment groups, with non significant difference in water intake, relative weight

of organs including liver , kidney , spleen and heart .these data suggesting that green, roasted and decaffeinated coffee did not influence the relative organ weight and caused the reduction in food intake and gain weight in diabetic rats as compared to normal control group.(Table 1).

Table 2 shows significant elevation ( $p < 0.05$ ) in serum glucose and insulin in diabetic control group as compared to normal control group at the end of experiment. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ( $p <0.05$ ) with the lowest glucose value observed with green coffee and with decaffeinated coffee for insulin.

There is a significant decrease ( $p < 0.05$ ) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green and roasted coffee respectively indicating an association between caffeine consumption and bone health.(Table 3)

Table (4) shows that alloxan injection produced a significant increase( $p < 0.05$ ) in serum total- cholesterol(TC);triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\HDL ratio and TC \ HDL ratio however a significant decrease ( $p < 0.05$ ) in serum HDL-C is observed ; In diabetic rats compared to normal control .

Green, roasted and decaffeinated coffee resulted in a significant decrease ( $p <0.05$ ) in triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ( $p < 0.05$ ) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study .

### 4. Discussion:

In this study the observed decrease in body weight is in agreement with animal studies and the prospective epidemiologic studies on weight loss (Muroyama et al ., 2003 and van Dam et al., 2006 ) suggest that long-term caffeine and coffee consumption could decrease body weight in humans.

Shimod et al., (2006) showed that consumption of green coffee bean extract (GCBE) for 14 days caused a suppressive effect on weight gain and visceral fat accumulation in mice. GCBE contains 10% caffeine and 27% chlorogenic acid as the principal constituents, and these constituents showed a tendency to suppress body weight gain and visceral fat accumulation. Thus, these constituents are suggested to be partially involved in the suppressive effect of GCBE on body weight gain and visceral fat

accumulation. Caffeine is known to be a lipolytic

compound. On the other hand, the effect of

chlorogenic acid on body weight gain has not yet been established.

Elevated serum glucose and insulin in diabetic control group as compared to normal control group confirm uncontrolled hyperglycemia, whereas green, roasted and decaffeinated coffee decreased serum glucose and insulin ( $p < 0.05$ ) with the lowest glucose value observed with green coffee and with decaffeinated coffee for insulin.

These results are with the line of van Dam., (2008) who found that frequent consumption of coffee may reduce risk of type 2 diabetes and liver cancer.

Several plausible mechanisms for a beneficial effect of coffee on glucose metabolism exist. Coffee has been shown to be a major contributor to the total in vitro antioxidant capacity of the diet (Pulido et al ., 2003) which may be relevant as oxidative stress can contribute to the development of type 2 diabetes. Coffee is the major source of the phenol chlorogenic acid.( Clifford 2000) Intake of chlorogenic acid has been shown to reduce glucose concentrations in rats(Andrade-Cetto and Wiedenfeld ., 2001 and Rodriguez de Sotillo and Hadley 2002 and intake of quinides, degradation products of chlorogenic acids, increased insulin sensitivity in rats.( Shearer et al ., 2003) Chlorogenic

acid contributes to the antioxidant effects of coffee, (Clifford 2000) may reduce hepatic glucose output through inhibition of glucose-6-phosphatase, (Arion et al ., 1997 )and may improve tissue mineral distribution through its action as a metal chelator. (Rodriguez de Sotillo and Hadley 2002). In addition, chlorogenic acid acts as a competitive inhibitor of glucose absorption in the intestine. ( Clifford 2000)Indeed, decaffeinated coffee seemed to delay intestinal absorption of glucose and increased glucagon-like peptide-1 concentrations in an intervention study in humans.( Johnston et al ., 2003) Glucagon-like peptide-1 is well known for its beneficial effects on glucose-induced insulin secretion and insulin action.( Drucker 1998) This effect may explain the observation that higher coffee consumption was associated with lower postload, rather than fasting, glucose concentrations.( Yamaji et al ., 2004 and )

Caffeine ingestion can acutely reduce glucose storage, but beneficial effects of caffeine on lipid oxidation and uncoupling protein-3 expression have also been suggested.( Yoshioka et al ., 2004) In US studies, decaffeinated coffee consumption was inversely associated with risk of type 2 diabetes.( Salazar-Martinez et al ., 2004) In addition, in a Japanese study, the inverse association with hyperglycemia was stronger for coffee than for

caffeine.( Isogawa et al ., 2003) These observations suggest that coffee components other than caffeine may have beneficial effects on risk of type 2 diabetes. Coffee also contains substantial amounts of magnesium, which has been linked to better insulin sensitivity and insulin secretion.( de Valk 1999) However, adjustment for magnesium intake did not explain the association between coffee consumption and risk of type 2 diabetes(Salazar-Martinez et al., 2004)

As the beneficial effects of coffee consumption exist for both decaffeinated and caffeinated coffee, a component of coffee other than caffeine must be responsible. Tunnicliffe and Shearer2008 reported that, being plant-derived; coffee contains many beneficial compounds found in fruits and vegetables, including antioxidants. In fact, coffee is the largest source of dietary antioxidants in industrialized nations. When green coffee is roasted at high temperatures, Maillard reactions create a number of unique compounds. Roasting causes a portion of the antioxidant, chlorogenic acid, to be transformed into quinides.

Decreased serum insulin in this study is in agreement with The decreased insulin secretion reported by Tianying et al., (2005) is consistent with the increased insulin sensitivity observed by Arnlov et al.,(2004). In contrast, Arnlov et al., 2004 did not observe a decrease in insulin secretion as assessed by early insulin response under glucose stimulation. However, C-peptide has a longer half-life than insulin and thus may better represent insulin secretion than insulin levels do (Chen et al., 1999).The independent association between decaffeinated coffee and C-peptide indicates active ingredients other than caffeine. Antioxidants may improve insulin sensitivity Bruce et al., 2003 (in type 2 diabetes and decrease insulin levels in rats (Thirunavukkarasu., 2004).

Tianying et al., (2005) concluded caffeinated and decaffeinated coffee consumption might prove to be an effective strategy for reducing insulin resistance, especially in overweight women. Oka, 2007 demonstrated that the prophylactic effects of coffee on diabetes involve pleiotropy of plural components in accordance to the degree of the roasting. A new concept of nutritional blended coffee may be important to optimize the prophylactic effects of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

On the other hand Contrary to our study Kempf et al., 2010 demonstrated that coffee consumption led to an increase in coffee-derived compounds, mainly serum caffeine, chlorogenic acid, and cafffeic acid metabolites. , Whereas no changes

were seen for markers of glucose metabolism in an oral-glucose-tolerance test.

On the other hand Robinson et al ., 2004 found evidence of a non significant caffeine-induced increase in insulin secretion in men with type 2 diabetes, and Petrie et al ., 2004 found no increase in such insulin secretion in obese men.

In this study the significant decrease in serum calcium and serum phosphorus in groups 3, 4 and 5 fed green, roasted coffee respectively is in agreement with the finding of Barrett-Connor et al., (1994) who reported that caffeinated coffee intake equivalent to two cups per day is associated with decreased bone density in older women who do not drink milk on a daily basis.

Also are in agreement with those of Rapuri, et al ., (2001) who reported that Intakes of caffeine in amounts >300 mg/d ( $\approx$ 514 g, or 18 oz, brewed coffee) accelerate bone loss at the spine in elderly postmenopausal women. They found a significant negative correlation between caffeine intake and calcium intake and suggested that high caffeine consumption per se has a negative effect on bone mineral density (BMD), which may be further accentuated by low calcium intakes. However, they could not gain insight into the mechanism of how caffeine exerts its negative effect because we found no significant changes in any of the biochemical indexes measured.

The decrease in serum calcium may be due to the effect of coffee consumption which caused an increase in endogenous fecal calcium and urinary calcium excretion.

our results on the other hand disagree with those of Sakamoto et al ., (2001) reported that strongly indicates that coffee does not stimulate bone loss in rats. They clarify the relationship between coffee consumption and bone metabolism using male Wistar rats. assigned to three treatment groups including a control-diet group , a 0.62% coffee-diet group, and a 1.36% coffee-diet group. They indicated no significant differences in body weight change, serum and urinary biochemical markers of bone metabolism, and bone histomorphometry were found between the coffee-diet groups and the control-diet group, except that urinary phosphorus excretion after 140 days of both coffee diets was significantly increased compared with controls ( $p < 0.05$ ). In addition, the coffee diets were not associated with differences in tumor necrosis factor- $\alpha$  and interleukin-6, which have been implicated in the pathogenesis of bone loss together with interleukin-1 $\beta$ .

Green, roasted and decaffeinated coffee resulted in a significant decrease ( $p < 0.05$ ) in triacylglycerol (TAG); LDL-C; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio. on the other hand a significant increase ( $p < 0.05$ ) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee ,with non significant effect on serum total- cholesterol(TC) reported in this study .

Our results are in agreement with those of Kempf et al., 2010 who reported that coffee consumption led to an increase in coffee-derived compounds, mainly serum caffeine, chlorogenic acid, and cafffeic acid metabolites. Significant changes were also observed for serum concentrations of interleukin-18, 8-isoprostanate, and adiponectin (8 compared with 0 cups coffee/d). Serum concentrations of total cholesterol, HDL cholesterol, and apolipoprotein A-I increased significantly by 1, whereas the ratios of LDL to HDL cholesterol and of apolipoprotein B to apolipoprotein A-I decreased significantly by 8% and 9%, respectively (8 compared with 0 cups coffee/d), this indicate that coffee consumption appears to have beneficial effects on subclinical inflammation and HDL cholesterol.

In accordance to our study Shimod et al.,(2006) reported that serum and hepatic TG levels were lowered with intravenous administration of chlorogenic acid in Zucker fa/fa rats. However, the TG level in the adipose tissue was not lowered. Therefore, chlorogenic acid is suspected to be effective on hepatic TG, and not adipose TG. Chlorogenic acid is also a dietary polyphenolic compound with antioxidative activity. Thus, it is suggested that caffeine, chlorogenic acid and other polyphenolic compounds in GCBE act synergistically to suppress body weight gain and visceral fat accumulation in mice.

Uto-Kondo et al. ( 2010) hypothesized that coffee may enhance reverse cholesterol transport (RCT) as the antiatherogenic properties of high-density lipoprotein (HDL). Caffeic acid and ferulic acid, the major phenolic acids of coffee, enhanced cholesterol efflux from THP-1 macrophages mediated by HDL, but not apoA-I. Furthermore, they concluded that Coffee intake might have an antiatherogenic property by increasing of ATP-binding cassette transporter (ABC)G1 and scavenger receptor class B type I (SR-BI) expression and enhancing HDL-mediated cholesterol efflux from the macrophages via its plasma phenolic acids.

Lee ., 2009 demonstrated that coffee may guard against Alzheimer's disease and other forms of dementia and somehow soften the blow of a heart attack.

Ozercana et al. ( 2006) found that lipid peroxidation products that increased in the plasma and liver tissue of the CCl4 group decreased by (instant coffee) IC administration. There was an increase in the measured antioxidant parameters, which were total antioxidant capacity (TAOC), sulphhydryl (SH) and ceruloplasmin levels. They concluded that IC had a protective role in acute liver injury induced by CCl4, but did not affect steatosis.Lopez-Garcia et al., (2006) reported that there is no evidence that coffee consumption increases the risk of CHD.

Our results on the other hand disagree with the fnding of Rodrigues and Klein. (2006) who found that Caffeine is the most widely consumed psychostimulant drug in the world that mostly is consumed in the form of coffee. They examined the effects of caffeine intake, both alone and via coffee consumption, on key blood markers of CVD risk: lipoproteins (cholesterol, triglycerides), fibrinogen (a biomarker of blood clotting) and C-reactive protein (CRP; a biomarker of inflammation). They indicated a strong relationship between boiled, unfiltered coffee consumption and elevated cholesterol levels. Also disagree with those of Ricketts et al. (1993) who suggest that caffeine consumption is associated with increased serum cholesterol and/or low density lipoprotein cholesterol. They confirmed that when consumption of caffeine reaches 200 mg or more total cholesterol significantly increased in males. Low density lipoprotein cholesterol concentrations were somewhat increased in males who consumed 200 mg or more. In women, triglyceride levels significantly increased when dietary caffeine intake was 200 mg or higher. Dietary caffeine intake may be a factor to consider when evaluating serum lipid levels.

## 5. Conclusion

The observed improvement in glucose, insulin profile, triacylglycerol and HDL-C confirm the potent biological action of green, roasted and decaffeinated coffee and suggest that chlorogenic acid (a component in coffee) might have an antagonistic effect on glucose transport. Suggesting a novel function of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

# The Impact of Obesity and Weight Reduction Program with Xenical Drug Treatment on Health Status of Obese Adolescent Girls in Saudi Arabia

**Hend Hassan Ali Ganbi**

Nutrition and Food Science Dept., Faculty of Education for Home Economics and Art Education , King Abd – Elaziz University, Jeddah , Saudi Arabia  
Dr.gamal rawayshed@yahoo.com

**Abstract:** The present investigation aimed to assess the health problems and diseases associated with obesity in Saudi Arabian adolescent girls, and to evaluate the impact of obesity and weight reduction program with xenical (Orlistat) drug treatment on health status of tested obese adolescent patients. This study was performed on a group of 160 obese adolescent girls, aged 15 – 20 years, attending Physical Rehabilitation and Obesity Treatment Centers at Jeddah, Saudi Arabia. The obese patients group, under investigation, was selected from the adolescent girls who want in the treatment of obesity after obtaining their consent to participate in this study. The present results revealed that most tested obese adolescent girls suffered with a lot of health problems and diseases. The obesity was associated with deterioration of health status for obese subjects. Also, the weight reduction program with xenical (Orlistat) drug treatment caused a significant loss ( $\leq 0.01$ ) in body weight of obese adolescent girls by 7.42 and 11.35 % after 30 and 60 days respectively. In addition that tested weight reduction program with orlistat treatment exhibited a significant enhancing impact ( $\leq 0.01$ ) on all tested health status parameters of obese patients ; especially when obese patients engaged with tested weight – reduction program based upon being on a nutritionally balanced , reduced – calorie dietary regimen and practicing the physical activities regularly at least 6 hours a day , as showing by its enhancing effect on liver functions, serum lipid profile , liver and renal functions and by its lowering effect on blood glucose , insulin and LDL - cholesterol levels ; within the reference reported range of all health status items for health individual adolescent girls. Therefore, it is recommended that the obese adolescent girls and women should be orally treated with xenical drug capsules with their obligation by being on a dietary regimen ; a nutritionally balanced , reduced – calorie diet (800 – 1200 calorie) , and practicing the physical activities regularly at least 6 hours a day.

**Key words :** Obesity ; Weight reduction program ; Obese adolescent girls ; Liver functions ; lipid profile ; Renal functions ; Health status ; Xenical drug ; Physical activity ; Dietary regimen.

## Introduction :

Obesity is defined as the accumulation of fatty tissue to such a level that overall health might be adversely affected and it reflects an imbalance between energy uptake and expenditure that is mediated by behavior (Neeley and Gonzales , 2007 and Knecht *et al.*, 2008). The corpulence is not only a disease itself , but the harbinger of others , recognizing that obesity is a medical disorder that leads to many comorbidities (Lavie and Milani , 2003). Obesity is associated with physical and endocrine changes of the body. Adipose tissue synthesizes and releases into the bloodstream peptides and nonpeptide compounds. Like in other organs with endocrine function , disequilibrium o the released hormones affects the homeostasis of other systems throughout the body (Schindler *et al.*, 2006 ; Knecht *et al.*, 2008 and Nejat *et al.*, 2010). Environmental factors including sedentary lifestyle and the

consumption of high-energy foods and drinks are thought to play key roles in the development of obesity ( Baur & O'Connor , 2004 and Neeley & Gonzales , 2007). Television viewing has been particularly implicated (Robinson , 2001). Dietary intake is also important. High-fat foods and sugar-containing soft drinks have been associated with increases in obesity (Astrup , 2001 and Ludwig *et al.*, 2001) , as well as more high fructose corn syrup foods and drinks (Bray *et al.*, 2004 and Elliott *et al.*, 2002). Lack of physical activity was shown to be associated with obesity is a risk factor (Whitaker *et al.*, 1997 and Neeley & Gonzales , 2007).

Overweight and obesity in children and adolescents are a serious issue with many health and social consequences that often continuo into adulthood (Foxhall , 2006 and Rimmer *et al.*, 2007). The world wide epidemic of obesity that has emerged with the dawning of the 21<sup>st</sup> century are a major public health problem , having struck developed

countries as well as those still developing (Wang *et al.*, 2005). Globally , at the turn of the century more than 300 million persons were considered obese. This increased prevalence of obesity , in part driven by over-nutrition and physical inactivity , leads to many public health problems (WHO , 2005 and Engelgau *et al.*, 2007). The global obesity epidemic is advancing at an ever-accelerating pace with the United States taking an embarrassing lead (NCHS., 2006). Currently , 32% of U.S. adults are obese as defined by a body mass index (BMI) of greater than 30 Kg/m<sup>2</sup> , according to the latest National Health and Nutrition Examination Survey (Ogden *et al.*, 2006). It is estimated that by 2015 , 75% of U.S. adults will be overweight or obese (BMI) of greater than 25 Kg/m<sup>2</sup> and 41% will be obese (Wang and Beydoun , 2007). Excess weight has emerged as one of the leading factors in predicting chronic disease and even death in later life (Strauss & Pollack , 2001 and Dietz & Robinson , 2005). Accruing data identify detrimental consequences of early obesity on life time health ; BMI greater than 25 Kg/m<sup>2</sup> at age 18 was associated with an increased risk of premature death in a large cohort from the Nurses' Health Study (Van-Dam *et al.*, 2006). National Health and Nutrition Examination Survey (NHANES) studies have been undertaken in the United States since the early 1960s and evaluate many parameters of health and growth. In these studies , children aged 6 to 11 had a prevalence of overweight of only 4.2 % in 1965 compared with 15.8 % in 2002. Those aged 12 to 19 experienced a similar change in prevalence. The prevalence of obesity in adults increased from 13.3 % to 31.3 % , and the prevalence of overweight increased from 45 % to 65.2 % in that same time period (Wang and Beydoun , 2007). In the last two decades , an alarming increase in the prevalence of overweight and obesity has been reported and become a serious public health problem affecting different social and economic classes as well as different age-groups in Saudi Arabia and other Asian countries (Abahussain *et al.*, 1999 ; Al-Mousa and Parkash , 2000 ; Sakamoto *et al.*, 2001 ; Ramachandran *et al.*, 2002 ; Al-Almaie , 2005 and Khalid , 2008)

The primary concern with obesity is the health risks that it imparts on the afflicted person. It has been reported that obesity and overweight have been associated with an increased risk of many diseases and complications include non-insulin-dependent diabetes mellitus (Wang *et al.*, 2002 ; Foxhall , 2006 and Brennan *et al.*, 2009) , gastro – intestinal problems ( Kaats *et al.*, 1996 and Knecht *et al.*, 2008) , hypertension and hyperlipidemia ( Anon , 1998 ; Sanchez – Castillo *et al.*, 2005 ; Poirier *et al.*, 2006 and Knecht *et al.*, 2008) , stroke disease ( Suk *et al.*, 2003 and Thomas *et al.*, 2005) , cerebro – and

cardiovascular diseases (Berenson , 2001 and Wilson *et al.*, 2002 ) , dementia ( Yaffe *et al.*, 2004 and Whitmer *et al.*, 2005) , sleep disorders ( O'Donnell *et al.*, 2000 and Knecht *et al.*, 2008) , depression (Faith *et al.*, 2002 and Knecht *et al.*, 2008) ; cholelithiasis , particularly in women ( Bellentani *et al.*, 2000 and Knecht *et al.*, 2008) , pulmonary and renal diseases ( Bray , 2004 and Nejat *et al.*, 2010) , psychosocial problems (Everson *et al.*, 2002 , Knecht *et al.*, 2008 and Brennan *et al.*, 2009) , musculoskeletal disorders (Cicuttini *et al.*, 2002 and Brennan *et al.*, 2009) ; alteration of the endocrine and immune systems ( Heber *et al.*, 2000 and Knecht *et al.*, 2008) , and various cancers including breast , cervical , ovarian , gall bladder , prostate , stomach and colon cancer (Must *et al.*, 1999 ; Van den – Brandt *et al.*, 2002 ; Call *et al.*, 2003 ; Schouten *et al.*, 2004 ; Olsen *et al.*, 2007 ; Renehan *et al.*, 2008 ; Fader *et al.*, 2009 and Nejat *et al.*, 2010).

Orlistat is approved for weight reduction. It is a hydrogenated derivative of a bacterial lipase inhibitor that blocks pancreatic lipase , thus decreasing intestinal digestion of fat and increasing fecal fat loss. Its efficiency in weight reduction depends on the dietary fat content. It can reduce digestion of up to 30 % of orally ingested triglyceride from a diet containing 30 % fat. The drug was reported to produce a weight loss of about 9 – 10% (Bray and Tartaglia , 2000 and Knecht *et al.*, 2008). In secondary prevention studies for weight maintenance , orlistat also attenuated the regain of weight. (Li *et al.*, 2005)

The immobile life style and consumption of high – calorie food are the most remarkable risk – factors of the obesity. It is well known that moderate weight loss (5 – 10 %) in overweight and obesity is clinically beneficial in reduction the risk of obesity – related diseases and health hazards , as well as in improving quality of life (Toplak *et al.*, 2005 and Knecht *et al.*, 2008).

Therefore , this work was performed to assess the obesity – associated diseases and health problems , as well as to determine the impact of obesity and tested weight – reduction program with orally treatment of xenical drug on body weight loss and health status of obese adolescent girls in Saudi Arabia.

## **Material and Methods :**

### **Xenical drug capsules:**

Xenical capsules contained 120 mg of the active ingredient ; orlistat , for each produced on August 2009 by Roch Pharmaceutical Industries Co., Jeddah , Saudi Arabia.

## **Subjects :**

This study was performed on 160 obese adolescent girls , aged 15 – 20 years , which were chosen from whom attending the physical rehabilitation and obesity treatment centers at Jeddah , Saudi Arabia on August 2009. The obese patients , under investigation , were selected from the adolescent girls having a desire to treatment of obesity after obtained their consent to participate in this study. The body mass index (BMI) of selected obese patients was ranged from  $\geq 30$  to  $< 40$  Kg / m<sup>2</sup>. At the beginning of study , the selected obese patients were kept to weight – reduction program based upon there obligation with being on a dietary regimen ; feeding on a nutritionally balanced , low – calorie diet (800 – 1200 calorie) , and in practicing the physical activities regularly at least 6 hours per day. Whereas , the selected obese patients were divided randomly into two equal main groups composed of 80 obese female patients for each. The first group was not treated with xenical drug capsules , while all individual subjects of the second were orally given one xenical capsule 3 times a day with each main meal ; during the 60 days of studying period. Each main group of the selected obese adolescent girls was divided into 4 unequal subgroups according to their obligation and regularity on the tested weight – reduction program throughout the two experiment periods (30 and 60 days) as follows:

**Group 1 :** The obese individual patients group was neither being on the tested dietary regimen program nor practicing the physical activities regularly at least 6 hours a day.

**Group 2 :** The obese individual patients group was being obligation on the tested dietary regimen with no practicing the physical activities regularly at least 6 hours a day.

**Group 3 :** The obese individual patients group was not being obligation on the tested dietary regimen with practicing the physical activities regularly at least 6 hours a day.

**Group 4 :** The obese individual patients group was being obligation on the tested dietary regimen with practicing the physical activities regularly at least 6 hours a day.

## **Lifestyle exposures :**

All measures of dietary intake were self – reported using a validated food – frequency questionnaire (Cancer Council of Victoria , 2005 and Brennan *et al.*, 2009). The nutritive value and the energy value (calories) of the daily consumed food were calculated by using food composition tables of WHO (1992). The obligation of individuals obese patients was self – reported using a special lifestyle questionnaire which was included information about

Leisure – Time Physical Activity (LTPA) , Occupational activity (OA), afternoon siesta, sleeping hours, means of transportation are used for even short – distance, availability of domestic help, and thereupon practicing hours of the physical activities a day were calculated (Cancer Council of Victoria , 2005).

## **Assessment of health problems and diseases associated with obesity :**

The information about health problems and diseases associated with obesity for each patient was collected from the records of the Physical Rehabilitation and Obesity Treatment Centers depending upon the clinical examination and from interviewing the obese patient and his parents about what are the health problems and diseases which is he suffering from?.

## **Anthropometric measurements :**

Body weight of obese girls was measured and recorded using an Avery Beam weighing scale (SECA , Hamburg , Germany) to the nearest 0.1 kg. Standing height of patients was measured and recorded to the nearest 0.1 cm with a stadiometer (SECA , Hamburg , Germany) without shoes. The body mass index (BMI) of obese patients was calculated as weight / height squared (kg / m<sup>2</sup>) and categorized as being normal  $< 25$  (kg / m<sup>2</sup>) , overweight 25.0 – 29.9 (kg / m<sup>2</sup>) or obese  $\geq 30$  (kg / m<sup>2</sup>) ; as reported by NHMRC. (2003).

## **Biochemical analysis :**

Biochemical analysis methods were carried out on all selected obese adolescent girls orally treated or not with xenical drug capsules at the beginning of experiment and after 30 and 60 days (the half and the end of this study period).

Serum total lipids , triglyceride (TG) , total cholesterol and high density lipoprotein cholesterol (HDL) levels by using enzymatic colorimetric methods of Knight *et al.* (1972) ; Foster and Dunn (1973) ; Hewitt and Pardue (1973) and Lopes – Virella *et al.* (1997) , respectively. Serum low density lipoprotein cholesterol (LDL) and very low density lipoprotein cholesterol (VLDL) levels were calculated by using the following equations of Lee and Nieman (1996) as follows:

$$\text{VLDL} = \text{Triglycerides (TG) level} / 5$$

$$\text{LDL} = \text{Total cholesterol} - (\text{HDL} + \text{VLDL})$$

Atherogenic indices were calculated as reported by Aviram & Fuhrman (1998) and Hollander *et al.* (1998) as : (1). Total cholesterol / HDL. (2). LDL / HDL. (3). (LDL + VLDL) / HDL.

Serum aspartate and alanine aminotransaminase (AST; ALT) and alkaline phosphatase (ALP)

activities were determined by using enzymatic colorimetric methods of Reitman and Frankel (1957) and Haussement (1977) , Respectively.

Serum creatinine , urea , uric acid and glucose levels were estimated by enzymatic colorimetric methods reported by Schirmeister (1964) ; Patton and Crouch (1977) ; While *et al.* (1970) and Trinder (1969) , respectively. Serum insulin level was determined by radioimmunoassay reported by Wilson and Miles (1977).

#### **Statistical analysis:**

Statistical analysis for the obtained data was carried out using IBM-PC computer and SAS program as the procedure of ANOVA and Duncan's Multiple Range according to Helwing (1983).

#### **Results and Discussion :**

##### **Distribution of the subjects among obesity associated health problems and diseases :-**

Obesity is a serious health hazard. It puts extra strain on heart , lungs , muscles , bones and joints , and it increases the susceptibility to diabetes mellitus and hypertension. It increases surgical risks , shortens the life-span , causes psychosocial problems , and is associated with a lot of health problems and diseases.

The obtained data (Table 1) illustrated that the most evident health problem among the obese adolescent girls was osteoarthritis ; bone and joint diseases , which represented 48.1 % of obese subjects , this is possibly as the result of the excess weight on the joints. As also shown in Table (1) , the second predominant health compliant , linked to obesity was pulmonary problems which found in 39.4 % of obese subjects. The present results ( Table 1) also showed that the third order of obesity – associated health complaints was gastrointestinal problems , which were exhibited in 31.9 % of selected obese adolescent girls , including gallbladder disease , gallstones , constipation , flatulence , irritable colon , sensation of bloating , anorexia , heart burn , nausea , vomiting , dyspepsia and gastric , and peptic ulcers. In addition , the obtained results ( Table 1 ) also showed that neuropsychiatric problems , cardiovascular disease , hypercholesterolemia , hypertension , dyslipidemia , diabetes , reproductive problems and cancer disease were present in 22.5 , 20 , 18.8 , 16.9 , 21.3 , 17.5 , 14.4 and 10.6 % of the selected obese adolescent girls, respectively. These results are in accordance with those reported by Knecht *et al.* (2008) ; Brennan *et al.* (2009) and Nejat *et al.* (2010).

**Table (1) : Distribution of the subjects among obesity - associated health problems and diseases**

Health problem and disease	Distribution of obese subjects	
	Number	%
Osteoarthritis	77	48.1
Pulmonary problems	63	39.4
Gastro - Intestinal problems	51	31.9
Neuropsychiatric problems	36	22.5
Cardiovascular (CV) disease	32	20.0
Hypercholesterolemia	30	18.8
Dyslipidemia	27	16.9
Hypertension	34	21.3
Diabetes	28	17.5
Reproductive problems	23	14.4
Cancer diseases	17	10.6

##### **Impact of obesity and weight – reduction program on tested anthropometric measurements of obese subjects :**

As shown in Table (2) , the body weight and body mass index (BMI) of untreated obese adolescent girls with xenical drug were increased significantly (at  $\leq 0.01$ ) throughout the experiment period ( 60 days) at different rates affecting by their obligation on tested weight – reduction program based upon being on a dietary regimen and practicing the physical activities regularly at least 6 hours a day. The increment rate was significantly decreased (at  $\leq 0.01$ ) with the engagement by the tested former weight reduction program.

The obtained results ( Table 2) also illustrated that the body weight and the BMI of obese subjects orally treated with xenical drug ; as a source of orlistat , were significantly decreased ( at  $\leq 0.01$  ) during the experiment period ; especially in obese subjects group which engaged with weight – reduction program (G4). Whereas , the body weight of the fourth group (G4) of treated subjects with orlistat were decreased by 7.42 ; 11.35 % and its BMI was reduced from 35.1 kg/m<sup>2</sup> at the beginning of experiment to 31.7 and 29.6 kg/m<sup>2</sup> ; after 30 and 60 days , respectively.

On the other hand , the height ( 161.9 – 165.5 m) of all tested obese adolescent girls treated or not with orlistat was not , somewhat , significantly changed during the experiment period. In this respect , Carolynn *et al.* (2000) and Knecht *et al.* (2008) noted that there is no magic way of losing weight and maintaining the reduced weight , but there is a key to it. That key is changing eating habits and doing physical activities regularly at least 3 to 5 times a week for 30 minutes. These results are in accordance with those obtained by Bray and Tartaglia (2000) ;

Toplak *et al.* (2005) ; Garcia *et al.* (2006) ; Totoian *et al.* (2006) and Knecht *et al.* (2008) whom reported that orlistat is an anti – obesity agent , especially for treatment of obese woman. It blocks pancreatic lipase , thus decreasing intestinal digestion and absorption of dietary fat by approximately 30 % and increasing fecal fat loss , and thereupon promotes weight loss. Furthermore, Li *et al.* (2005) and Zanella *et al.* (2006)

that orlistat treatment of obese subjects attenuated the regain of body weight and long – term orlistat therapy helped to reduce and maintain a lower body weight. Furthermore , Hutton and Fergusson (2004) suggested that the orally ingestion of 120 mg orlistat 3 times a day is effective for improving the weight loss , health status and quality of life , as well as maintaining the body weight in obese patient.

**Table (2): The most important anthropometric measurements of different tested obese adolescent girls.**

Variables	Anthropometric Measurement ( $M \pm SE^*$ )

**$M \pm SE^*$ :** Mean ± Standard error of each anthropometric measurement of obese patients' group throughout experiment period ( in the same row ) having different superscripts are significantly varied.      **G1:** Patients group was neither being on the tested dietary regimen nor practicing physical activities regularly at least 6 hours a day.    **G2:** Patients group was being on the tested dietary regimen with no practicing physical activities regularly at least 6 hours a day.    **G3:** Patients group was not being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.    **G4:** Patients group was being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.

#### **Impact of obesity and tested weight – reduction program with Xenical drug treatment on serum lipid profile fractions of obese subjects :**

From the obtained results (Table 3) , it could be noticed that serum lipids profile fractions for untreated obese adolescent girls with xenical drug treatment were increased significantly ( $\leq 0.01$ ) during the experimental period (60 days) , with the exception of high density lipoprotein cholesterol (HDL) which was exhibited a significant reduction ( $\leq 0.05$ ) throughout the same periods. The engagement

with both being on tested dietary regimen and values of serum lipids profile fractions of obese subjects were much higher than the normal ranges of practicing physical activity regularly caused a marked improvement in serum lipids profile of obese subjects as illustrated in subgroups No.4 (G4). The mean these fractions for health individual adolescent girls reported by Murray *et al.* (1993) and Anon (1998) , except the high density lipoprotein cholesterol (HDL) values which were within the normal values (70 – 170 mg/dL).

**M±SE\*:** Mean ± Standard error of each biological parameter in serum of obese patients' group throughout experiment period ( in the same row ) having different superscripts are significantly varied.

**G1:** Patients group was neither being on the tested dietary regimen nor practicing physical activities regularly at least 6 hours a day.

**G2:** Patients group was being on the tested dietary regimen with no practicing physical activities regularly at least 6 hours a day.

**G3:** Patients group was not being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.

**G4:** Patients group was being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.

**NR •:** Normal Range (mg/dL) for health adolescent girls reported by Murray et al. (1991) and Anon (1998).

With regards orally treated obese adolescent girls with orlistat, as a source of orlistat , as shown in Table (3) , serum lipid profile of treated – obese subjects with orlistat was improved significantly ( $\leq 0.01$ ) ; especially in subgroup No.4 (G4) which obligated with the tested weight – reduction program based on being a dietary regimen and practicing the physical activities regularly. As illustrated in Table (3) , serum total lipids , triglyceride , total cholesterol , low density lipoprotein cholesterol (LDL) , very low density lipoprotein cholesterol (VLDL) values of the

obese adolescent girls were decreased significantly ( $\leq 0.01$ ) during the experiment period (60 days) , compared to the corresponding untreated – obese subjects. On the contrary , the HDL – cholesterol values of obese patients were increased significantly ( $\leq 0.05$ ). The alteration rates in serum lipid fractions of obese subjects treated with orlistat were varied depending upon their engagement with the tested weight – reduction program , lipid fraction itself and the period of experiment. It is worth to note that the mean values of serum lipid fractions for treated –

obese subjects with orlistat after 30 and 60 days of treatment were within the normal values reported for health individual adolescent girls. These finding are in agreement with those found by Sanchez – Castillo *et al.* (2005) and Knecht *et al.* (2008) who reported that overweight and obesity are associated with elevation the serum total lipids , triglyceride and the LDL concentrations values , as well as with lowering the HDL ; especially in adolescent girls. Also , these results are in a quite accordance with those obtained by Bray and Tartagila (2000) ; Bettina *et al.* (2001) ; Mulls *et al.* (2001) and Knecht *et al.* (2008) who

reported that orlistat is a bacterial lipase inhibitor that blocks pancreatic lipase , thus decreased intestinal digestion and absorption of fat and increasing fecal fat derivatives from a diet containing 30 % fat. Therefore, orlistat therapy is associated with improving lipid loss. It can decrease the digestion and absorption of up to 30 of orally ingested triglyceride and cholesterol metabolism processes and serum lipid profile in obese patients as shown by a greater decline in serum total lipids and cholesterol, triglyceride and LDL levels.

**M±SE\*:** Mean ± Standard error of each atherogenic index of obese patients' group throughout experiment period ( in the same row ) having different superscripts are significantly varied.

**G1:** Patients group was neither being on the tested

dietary regimen nor practicing physical activities regularly at least 6 hours a day. **G2:** Patients group was being on the tested dietary regimen with no practicing physical activities regularly at least 6 hours a day. **G3:** Patients group was not being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.

**G4:** Patients group was being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day. **Risk ratio •:** Risk ratio of atherogenic index for obesity associated diseases and health problems reported by Vazquez – Freire *et al.* (1996) and Hollander *et al.* (1998)

From the results represented in Table (4), it could be showed that all determined atherogenic indices; including total cholesterol / HDL, LDL / HDL and (LDL + VLDL) / HDL , for untreated obese adolescent girls with orlistat were increased significantly ( $\leq 0.01$ ) with prolonging the tested period of experiment. The atherogenic indices' values were within the risk ratios for obesity – associated diseases and health hazards. The increment rates of atherogenic indices in untreated patients by orlistat

were decreased with their obligation and attendance by the tested weight – reduction program as shown in subjects' subgroups No.4 (G4).

Therefore , the risk of obesity – associated decreases and health hazards were elevated during the span – life of obese subjects ; especially with no obligation by being on tested dietary regimen and practicing physical activities regularly ( Lavie and Milani , 2003 ; Knecht *et al.*, 2008 and Brennan *et al.*, 2009).

Concerning orlistat – treated obese patients as illustrated in Table (4) , the orally orlistat treatment caused a significant reduction and improvement ( $\leq 0.01$ ) in the values of all atherogenic indices for the risk factors of obesity – associated diseases and health problems in obese adolescent girls. The highest reduction rates in the values of atherogenic indices were observed in the individuals obese patients engaged by the tested weight – reduction program as evident in obese patients' subgroup No.4 (G4). Whereas , all atherogenic indices of different orlistat – treated obese patients' groups were much lower than those causing the increased risk of obesity – associated diseases and health problems. Therefore , the orally treatment of obese patients with orlistat (120 mg – capsule 3 times a day with the main diets) with attendance by their being on tested weight – reduction program caused a greater reduction in the risk of many diseases and health problems associated with obesity in adolescent girls and therefore improved their health status , and the quality of life in obese patients. These results are in agreement with those found by Vazquez – Freire *et al.* (1996) ; Hollander *et al.* (1998) ; Bray (2004) ; Hutton and Fergusson (2004) ; Shaheen (2007) and Knecht *et al.* (2008) who reported that orlistat treatment for overweight and obese patients caused a significant reduction ( $\leq 0.01$ ) in atherogenic indices and therefore a greater improvement in the risk factors' numbers of coronary heart disease (CHD) and other diseases , and health problems associated with overweight and obesity.

#### **Impact of obesity and tested weight – reduction program with Xenical drug treatment on liver and renal functions in the serum of obese subjects :**

The liver functional enzymes (AST , ALT and ALP) activity in serum are most frequently measure for diagnosis of liver diseases particularly infective hepatitis , alcoholic cirrhosis , biliary obstruction , toxic hepatitis and liver cancer. The former liver functional enzymes are not secreted into the blood , therefore any elevation in their values in blood is resulted from leakage of liver damage cells and from the disturbance and dysfunctions in liver functional enzymes activity. In addition, the liver functional enzymes (AST, ALT and ALP) activity in human and experimental animals are considered the excellent markers of liver dysfunctions and damages that probably associated with overweight and obesity or caused by exposure to the toxic substances or some drugs and therapeutic substances. Therefore, they are considered the good successful criterion for health status of obese adolescent girls (Murray *et al.*, 1993 and Sabuncu *et al.*, 2003).

As shown in Table (5), the obesity was associated with hyper activity of liver functional enzymes; aspartate and alanine amino transferases (AST; ALT) and alkaline phosphatase (ALP), during the tested experimental period (60 days), as illustrated in untreated obese adolescent girls with orlistat. The hyperactivity extent of liver functional enzymes in the serum of untreated subjects with orlistat was less with their obligation by tested weight – reduction program based upon being on tested dietary regimen and practicing physical activities regularly at least 6 hours a day. Whereas , the liver functional enzymes' activities in obese patients' serum were much higher throughout the period of experiment than the normal ranges for healthy individuals adolescent human females. This finding is in accordance with those reported by Hickman *et al.* (2004) and Knecht *et al.* (2008) who mentioned that overweight and obesity were associated with an exceptional elevation of liver functional enzymes activity in serum of adult women.

The obtained results (Table 5) also exhibited that the orally orlistat drug treatment caused a high significant improvement ( $\leq 0.01$ ) in liver functional enzymes (AST , ALT and ALP) activity in serum of obese patients ; especially with their engagement by attending the tested weight – reduction program , as shown in the fourth group of obese adolescent subjects. Where ; AST , ALT and ALP activities were reduced from 42.8 , 36.2 and 97.7 Unit / L at the beginning of experiment period to 21.6 , 17.8 and 51.2 Unit / L at the end of experiment period (after 60 days) for the orlistat – treated subgroup (G4) which engaged by the attendance with the tested weight – reduction program ; respectively. The functional liver enzymes ' activities for orlistat – treated obese patients , which engaged with the tested weight – reduction program , were within the normal values range for health individuals adolescent human females reported by Murray *et al.* (1993) and Anon (1998). The improvement effect of orlistat drug treatment on liver functions of obese subjects may be due to the protection effect of orlistat against the oxidation of lipids ; especially the LDL – cholesterol in liver and plasma , and to its reduction effect on the heart disease risk by improving blood profile of lipid constituents with decreasing the LDL – cholesterol level and lowering the blood pressure (Gacob , 1994 ; Sabuncu *et al.*, 2003 ; Hickman *et al.*, 2004 and Knecht *et al.*, 2008) , as well as to its enhancement effect on metabolic processes (Demidova *et al.*, 2006).

With regards the renal functions in the serum of obese patients as affected by obesity and tested weight – reduction program , it worth to mention that the normal levels' range of kidney functions in the serum of health individuals adolescent girls are 2.6 –

6.0, 10 – 50 and 0.6 – 1.1 mg / dL for uric acid , urea and creatinine , respectively (Murray *et al.*, 1993 and Anon , 1998). The exceptional elevation of the former levels into two times or more in mammalian blood is resulted from kidney damage cells, disturbance and dysfunctions (Murray *et al.*, 1993 and Jacob, 1994).

From the data presented in Table (6), it could be observed that the renal functions; serum uric acid, urea and creatinine values of untreated obese patients with orlistat were elevated exceptionally during the experiment period ( 60 days ). The highest

elevation rate was observed in the individual obese patients of subgroup No.1 (G1) whom was neither being on the tested dietary regimen nor practicing the physical activity regularly at least for 6 hours a day. The renal function values for all untreated obese subjects with orlistat drug were much higher than the normal values for health adolescent human female. These data are in accordance with those found by Vasanthi *et al.* (2003) ; Shaheen (2007) and Knecht *et al.* (2008).

G4: Patients group was being on tested dietary regimen with practicing physical activities regularly at least 6 hours a day.  
N R •: Normal Range (Unit / L Serum) for health adolescent girls reported by Murray *et al.* (1991) and Anon (1998).

Concerning orlistat – treated obese subjects , as evident from the results recorded in Table (6) , the tested renal functions for orlistat – treated adolescent girls were improved significantly ( $\leq 0.01$ ) as shown from a high decrement of the values of these functions , when compared with those of the corresponding subgroups of untreated obese patients with orlistat. The highest improvement in renal functions was found in the individuals obese subjects 'subgroup No.4 (G4) which engaged by their attendance with being on the tested weight – reduction program. Whereas , serum uric acid , urea

and creatinine levels for orlistat – treated obese patients were decreased from 7.23 , 61.6 and 1.32 mg / dL at the beginning of experiment to 4.83 , 27.5 and 0.73 mg / dL at the end of experiment (after 60 days) , within the normal levels of the health individuals adolescent girls , respectively.

These results are in agreement with those reported by Demidova *et al.* (2006) and Shaheen (2007) whom reported that xenical ; orlistat , treatment was beneficial for patients to correct obesity because it improved metabolic processes and therefore kidney and liver functions.

**M±SE\*:** Mean ± Standard error of each renal function in serum of obese patients' group throughout experiment period (in the same row ) having different superscripts are significantly varied. **G1:** Patients group was neither being on the tested dietary regimen nor practicing physical activities regularly at least 6 hours a day. **G2:** Patients group was being on the tested dietary regimen with no practicing physical activities regularly at least 6 hours a day. **G3:** Patients group was not being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day. **G4:** Patients group was being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day. **NR •:** Normal Range (mg / dL) for health adolescent girls reported by Murray *et al.* (1991) and Anon (1998).

#### Impact of obesity and tested weight – reduction program with Xenical drug treatment on serum glucose and insulin levels of obese subjects :

As shown in Table (7) , there was a significant increase ( $\leq 0.01$ ) in serum glucose level of obese adolescent girls throughout the experiment period (60 days) at different rates affecting by their obligation with tested weight – reduction program based upon being on the tested dietary regimen and practicing the physical activities regularly at least 6 hours a day. The lowest increment rate in serum glucose level was observed in subgroup of obese individual patients No.4 (G4) which engaged by their attendance with selected weight – reduction program. Serum glucose level for untreated obese patients with orlistat ranged from 154.2 to 194.5 mg / dL ; that much higher than the normal levels for healthy obese individuals adolescent girls which ranged from 70 to 140 mg / dL ( Murray *et al.*, 1993 and Anon , 1998). These results are well in line with those obtained by Foxhall (2006) and Knecht *et al.* (2008) whom reported that obesity is associated with much elevation in serum glucose level in obese adult human

as well as with non – insulin dependent diabetes mellitus disease.

The obtained data (Table 7) also illustrated that orlistat orally treatment of obese adolescent girls caused a significant reduction ( $\leq 0.01$ ) in their serum glucose level during the experiment period (60 days) when compared to patients no treated with orlistat , especially in those engaged by tested weight – reduction program as shown in subgroup No.4 (G4). The serum glucose level for orlistat – treated obese subjects was ranged from 86.1 to 124.5 mg / dL throughout the experiment period (60 days) ; within the normal value (70 – 140 mg / dL) for health individuals adolescent girls reported by Murray *et al.* (1993) and Anon (1998). This observation is in agreement with those of Hollander *et al.* (1998) ; Demidova *et al.* (2006) and Shaheen (2007).

With regards serum insulin level of obese subjects , as illustrated in Table (7) , the insulin level in serum of untreated obese patients with orlistat was increased significantly ( $\leq 0.01$ ) during the experiment period (60 days) from 11.8 mg / dL at the beginning of experiment to 12.7 – 17.8 mg / dL , affecting by

**M±SE\*:** Mean ± Standard error of either glucose level or insulin level in serum of obese patients' group throughout experiment period ( in the same row ) having different superscripts are significantly varied.

**G1:** Patients group was neither being on the tested dietary regimen nor practicing physical activities regularly at least 6 hours a day.   **G2:** Patients group was being on the tested dietary regimen with no practicing physical activities regularly at least 6 hours a day.

**G3:** Patients group was not being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.   **G4:** Patients group was being on the tested dietary regimen with practicing physical activities regularly at least 6 hours a day.   **N R •:** Normal Range (mg / dL) for health adolescent girls reported by Murray et al. (1991) and Anon (1998).

the experimental period and the obligation of patients with their being on tested weight – reduction program. Serum insulin levels for obese patients were much higher than the normal values for health individuals adolescent girls (9 – 12 mg / dL) reported by Murray *et al.* (1993) and Anon (1998). These results are in accordance with those reported by Hickman *et al.* (2004) and Heilbronn *et al.* (2006).

The results presented in Table (7) also showed that serum insulin levels for orlistat – treated obese patients were reduced significantly ( $\leq 0.05$ ) during the experiment period , on the contrary to untreated ones. The highest reduction in or controlling on insulin secretion into the blood of obese subjects was observed throughout tested experimental period in obese patients' subgroups No.4 (G4) which engaged by their obligation and attendance with the tested weight – reduction program. Whereas , the serum insulin level for orlistat – treated subjects was ranged from 8.3 to 11.2 mg / dL ; within the normal values (9 – 12 mg / dL) reported for health individuals adolescent girls. These observations are in agreement with those noticed by Hickman *et al.* (2004) and Heilbronn *et al.* (2006) who reported that weight – reduction program with orlistat treatment caused a significant decrease in serum insulin of obese patients and other benefits included improvement in quality of life , amelioration of dyspnea and chest pain , and

reduction in number of risk leave days. While , these results are in a disagreement with those obtained by Shaheen (2007) who reported that the serum insulin levels in obese experimental animals did not significantly affected by orlistat treatment.

### Conclusion and Recommendation :

It can be concluded that over consumption of high calorie – foods and the lack of practicing the physical activity regularly at least 6 hours a day were the two important factors in the development of obesity among the adolescent girls. Furthermore , the attendance of obese patients by the tested weight – reduction program with the orally treatment of xenical drug (orlistat) for 60 days caused the loss of body weight of obese adolescent girls by about 11.35 % with high enhancement the health status parameters such as serum lipid profile , renal and liver functions and glucose , and insulin levels.

Therefore , it is recommended that : (1) – Women whom are mothers of today need to be targeted for health education programs related to an awareness of appropriate body weight , healthy life style and obesity control. (2) – Adequate facilities for healthy foods teaching , and physical activity programs must be introduced by the different specific institutions. (3) – The obese adolescent girls and women should be orally treated with xenical drug capsules with their obligation and attendance by being

on a dietary regimen ; a nutritionally balanced , reduced – calorie diet (800 – 1200 calorie) , and practicing the physical activities regularly at least 6 hours a day.

<sup>4</sup>Microbiology Dept., College of Pharmacy, Misr University for Science and Technology, Cairo, Egypt

**Abstract:** Strains of *Lactobacillus* and *Bifidobacterium* were isolated from processed milk collected in Cairo, Egypt. *Lactobacilli* was isolated on Acetate media (SL) of Rogosa and Mitchell-Weisman. While *Bifidobacterium* was isolated on DSM medium (Difco Sporulation Medium). The isolates were characterized microscopically, morphologically and by some biochemical tests. DNA was extracted from the specified isolates using (Qiagen, Germany. Cat #51306) and species-specific primers for *Lactobacillus* and *Bifidobacterium* were designed to amplify the 16s rDNA gene as a conserved region in the bacterial DNA. Elution of the target band from the gel was performed efficiently and the 16S rDNA region was subjected to sequencing using Sequencer ABI PRISM 3730XL Analyzer. The sequencing data obtained suggested that the two studied isolates were (at the genus level) designated as *Lactobacillus* and uncultured *Bifidobacterium*. When the sequencing data was aligned on <http://www.ncbi.nlm.nih.gov>, it shows 88% homology and expected value of 7e-164 to *Lactobacillus kiranofaceins* but dendogram tree shows more homology to *Lactobacillus plantarum* family. While the other sample showed 91% homology and expected value of 3e-113 with Uncultured *Bifidobacterium* Clone R333 16S rRNA gene. [Hashem S.; H. H. Sabit; M. Amin; W. Tawakkol; and A. F. Shamseldin. Molecular Characterization of Egyptian Isolates of Lactobacillus and Bifidobacterium. Journal of American Science 2010;6(11):959-964]. (ISSN: 1545-1003).

Keywords: Molecular Characterization of Egyptian Isolates of *Lactobacillus* and *Bifidobacterium*

## 1. Introduction:

Probiotics are defined as live microbial food ingredients that have a beneficial effect on human health. The concept of probiotics evolved at the turn of the 20th century from a hypothesis first proposed by Nobel Prize winning Russian scientist Elie Metchnikoff (Bibl, 1988). He suggested that the long, healthy life of Bulgarian peasants resulted from their consumption of fermented milk products. He believed that when consumed, the fermenting bacillus (*Lactobacillus*) positively influenced the microflora of the colon, decreasing toxic microbial activities. For human adult use, this includes fermented milk products as well as over-the-counter preparations that contain lyophilized bacteria. The microorganisms involved are usually lactic acid producers such as *lactobacilli* and *bifidobacteria*. An effective probiotic should exert a beneficial effect on the host, be nonpathogenic and nontoxic, contain a large number of viable cells, it should be capable of surviving and metabolizing in the gut, also remain viable during storage and use, having good sensory properties, and finally be isolated from the same species as its intended host (Gonzalez *et al.*, 1995).

Much attention has focused on decreasing colon cancer risk through increasing intake of dietary fiber; recently, this has included interest in the consumption of prebiotics and probiotics (Brady *et al*, 2000). Furthermore, (Balish *et al*, 1997) reported that the probiotic bacteria manifested different capacities to adhere to epithelial surfaces, disseminate to internal organs, affect the body weight of adult mice and the growth of neonatal mice, and stimulate immune responses. Although the probiotic species were innocuous for adults, his results suggest that caution and further studies to assess the safety of probiotic bacteria for immunodeficient hosts, especially neonates, are required.

## 2. Materials and methods

### 2.1 Isolation

Milk samples were collected from Cows at Six October governorate, Egypt. Serial dilution for the samples was carried out under aseptic conditions, 100 µl of 10<sup>-7</sup> dilution from each sample was transferred to a Petri dish. Warm Acetate media (SL) of Rogosa and Mitchell-Weisman agar medium and DSM agar medium were poured on each plate for *Lactobacillus* and *Bifidobacterium* respectively. The

plates were then incubated under anaerobic conditions at 37 °C for 24 hours. Single colonies were examined morphologically and microscopically using gram stain. The *Lactobacillus* colonies appeared as white small colonies around 2 mm in diameter with entire margin, while the *Bifidobacterium* were punctiform cream colonies with 0.5 mm in diameter. Both isolates were able to ferment lactose, glucose and sucrose but not mannitol. Furthermore, *Bifidobacterium* was able to ferment hexose by fructose-6-phosphate phosphoketolase (F6PPK) shunt. In addition, both isolates were subjected for catalase and indol test, and negative reaction were appeared in both samples.

## 2.2 DNA Extraction

MRS and DSM broth media were inoculated with *Lactobacillus* and *Bifidobacterium* respectively. 1.5 ml of the overnight culture was transferred to each eppendorf tube and were centrifuged at 8000 rpm for 1 min at 4 °C. Supernatant was discarded and 1 ml of washing buffer SET (20% sucrose, 50 mM Tris-HCL and 50 mM EDTA, pH 7.6) was added to each eppendorf. Cells were re-suspended and centrifuged and the supernatant was discarded again. 100 µl of SL (SET + 25 mg/ml Lysosyme) and 10 µl of Proteinase K (10 mg/ml) was added to the cells which is then was re-suspended by the aid of vortex. Cells were incubated in water bath at 37 °C for 2 hours. 70 µl of 10% SDS was added and re-incubated in the water bath for 10 minutes. 500 µl of TE buffer (10 mM Tris HCl and 0.2 mM EDTA) was added to each eppendorf, followed by the addition of 600 µl of Phenol:Chloroform:Isoamly mixture (25:24:1 respectively). The tubes were mixed gently, and then centrifuged at 12000 rpm for 15 minutes at 4 °C. The upper aqueous phase was transferred to a clean eppendorf tube, and equal volume of cooled Isopropanol was added and re-centrifuged for 10 minutes at 12000 rpm. Supernatant was discarded and purification was applied by addition of double volume of 70% cooled Ethanol, samples were centrifuged for more 10 minutes, and then pellet was re-suspended in 100 µl of water after removing the supernatant.

## 2.3 Polymerase Chain Reaction (PCR)

Extracted DNA was electrophoresed in a 1.5% agarose gel (Fisher Scientific) and was subsequently visualized with UV illumination after staining with ethidium bromide. DNA concentration was measured using Spectrophotometer apparatus Biometra then DNA was diluted to 50 ng/ml. The oligonucleotide primers used in this study were purchased from LabTechnology (Promega Corp.). Primer PAF [5' AGA GTT TGA TCC TGG CTC AG 3'] position 8-27 (using the *Escherichia coli* numbering system) and 536R [5' GTA TTA CCG CGG CTG CTG 3'] position 519- 536 were used to amplify the 5' region of the 16S rDNA gene (Yeung *et al.*, 2002). PCR was performed in Biometra PCR System. For each reaction, a 50-µl reaction mixture was prepared. The reaction mixture contained 1× buffer without MgCl<sub>2</sub> (Promega Corp., Madison WI), 1.5 mM MgCl<sub>2</sub>, 20 µM dNTP, 0.1 µM primers PAF and 536R, 1.5 U Taq Polymerase (Promega Corp.), and 3 µl of DNA template. The amplification program was as follows: preheating at 94°C for 2 min, followed by 40 cycles at: 94°C for 45 s, 55°C for 45 s, and 72°C for 60 s. After these cycles, the reaction was maintained at 72°C for 7 min and then cooled to 4°C. Five microliters of the PCR products were electrophoresed in a 1.5% agarose gel and were subsequently visualized by UV illumination after ethidium bromide staining.

3' position 8-27 (using the *Escherichia coli* numbering system) and 536R [5' GTA TTA CCG CGG CTG CTG 3'] position 519- 536 were used to amplify the 5' region of the 16S rDNA gene (Yeung *et al.*, 2002). PCR was performed in Biometra PCR System. For each reaction, a 50-µl reaction mixture was prepared. The reaction mixture contained 1× buffer without MgCl<sub>2</sub> (Promega Corp., Madison WI), 1.5 mM MgCl<sub>2</sub>, 20 µM dNTP, 0.1 µM primers PAF and 536R, 1.5 U Taq Polymerase (Promega Corp.), and 3 µl of DNA template. The amplification program was as follows: preheating at 94°C for 2 min, followed by 40 cycles at: 94°C for 45 s, 55°C for 45 s, and 72°C for 60 s. After these cycles, the reaction was maintained at 72°C for 7 min and then cooled to 4°C. Five microliters of the PCR products were electrophoresed in a 1.5% agarose gel and were subsequently visualized by UV illumination after ethidium bromide staining.

## 2.4 Sequencing of 16S rDNA gene

Sequencing reactions were performed in a MJ Research PTC-225 Peltier Thermal Cycler using a ABI PRISM BigDyeTM Terminator Cycle Sequencing Kits with AmpliTaq DNA polymerase (FS enzyme) (Applied Biosystems), following the protocols supplied by the manufacturer. Single-pass sequencing was performed on each template using PAF Primer [5' AGA GTT TGA TCC TGG CTC AG 3'] position 8-27 and 536R [5' GTA TTA CCG CGG CTG CTG 3'] primer. The fluorescent-labeled fragments were purified from the unincorporated terminators with an ethanol precipitation protocol. The samples were resuspended in distilled water and subjected to electrophoresis in an ABI 3730xl sequencer (Applied Biosystems).

## 3. Results and Discussion:

In the present study, molecular identification of the isolates under study (*Bifidobacterium* and *Lactobacillus*) was performed. Significant value of these strains as an immunomodulator and stimulator of immune responses and also for the fact that they are opportunistic pathogens, especially in immunodeficient hosts as Probiotics appear to be innocuous for immunocompetent hosts and bacteria closely related to probiotic species have been associated with infections in patients. For example, *Streptococcus* spp. and *Lactobacillus* spp. have been isolated from patients with heart valve replacements who have endocarditis (Balish *et al.*, 1997). Lactic acid bacteria and bifidobacteria are increasingly being administered to pregnant women and infants with the intention of improving health. Although these organisms have a long record of safe use (Morgan *et al.*, 2010).

Amplification of conserved region 16S rDNA using PAF and 536-R primers is shown in figure (1), both the target bands for *Bifidobacterium* and *Lactobacillus* were appeared around 500 bp which was in agreement with data indicated by (Yeung *et al.*, 2002) who used the same primers with 26 different strain of *Lactobacillus* and *Bifidobacterium*. On the other hand, The PCR sequencing of a 470-bp fragment of the 16S rRNA gene, using primers plb16 and mlb16 (positions 8 to 27 and 507 to 526 in the 16S rRNA gene sequence of *Escherichia coli*, respectively) was used to identify the bifidobacteria at the species level (Rodríguez *et al.*, 2009).

Sequencing result in Figure (2) of the 518 bp DNA segment shows a high GC content in the *bifidobacterium* sample which might be studied in future for possible immune-regulation activity in mammals through out the CpG island of the foreign bacterial DNA. This might be the case as many studies (Koo and Rao, 1991) examined the effects of administration of both *bifidobacteria* (*B. pseudolongum*) and 5% neosugar [fructooligosaccharide (FOS)] to female mice given DMH resulted in 50% as many AC as in control animals at 18 and 38 weeks.

Furthermore, Figure 4 shows alignment of the base sequence “FASTA format” using the blasting tool on <http://www.ncbi.nlm.nih.gov> shows 91% homology, a high score of 407 and expected value 3e-113 with Uncultured *Bifidobacterium* sp. Clone R333 16S ribosomal DNA gene. Figure 5 demonstrates the genetic relationship between the Egyptian *Bifidobacterium* isolate with other control

samples in a dendrogram which relies on the results of the partial 16S rDNA analysis.

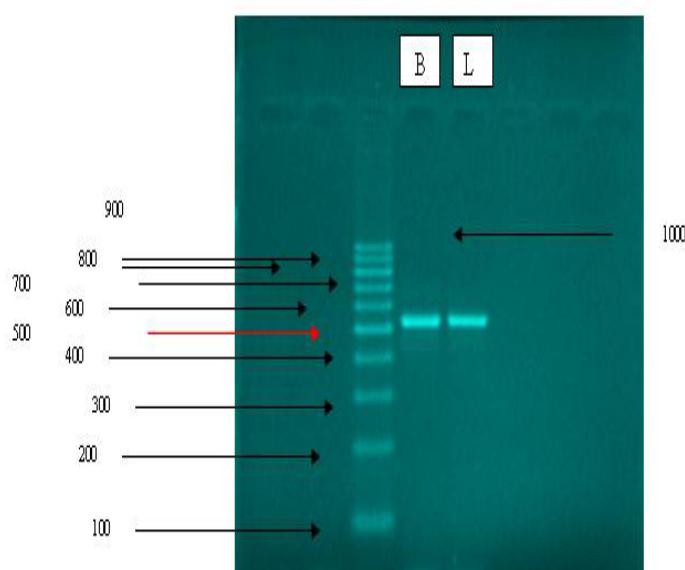

On the other hand, the sequence of the partial 16S rDNA gene 673 bp for the isolated *Lactobacillus* is illustrated in Figure 3. *Lactobacillus* sequence results were aligned using BLAST tool which is illustrated in Figure 5, result shows homology of 88%, 577 score and expected value 7e-164 with *Lactobacillus kefiransaceins* and is illustrated by a dendrogram in Figure 6.

#### 4. Conclusion

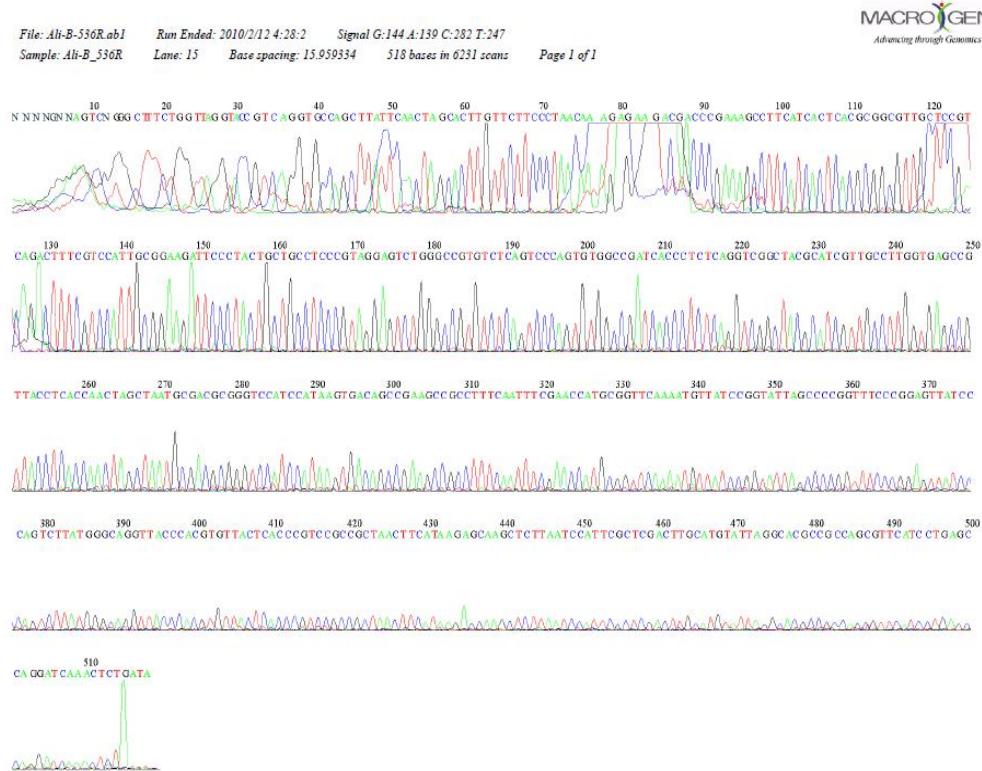

The study describes the molecular identification of two Egyptian isolates *Bifidobacterium* and *Lactobacillus* using species specific primers for amplification of 16S rDNA and comparing them with standard strains after alignment using blast tool on <http://www.ncbi.nlm.nih.gov>, bioinformatics analysis and dendrogram study of partial 16S rDNA gene showed a homology of 91% for the *Bifidobacterium* samle with Uncultured *Bifidobacterium* sp. Clone R333 and 88% homology with *Lactobacillus kiransaceins* for the *Lactobacillus* isolate.

#### Acknowledgment

The research was supported by the College of Biotechnology, College of Pharmacy, Misr University for Science and Technology (MUST) together with Faculty of Medicine, Assiut University, Egypt. Moreover, the bioinformatics analysis was carried out by the help of Mohammed Ezz, research assistant at College of Biotechnology, MUST.

## Maturation and Histological characteristics of ovaries in Mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria.

LAWSON, Emmanuel Olugbenga

Department of Fisheries, Faculty of Science, Lagos State University, Ojo.  
P.O. Box 001, LASU Post Office Box, Lagos, Nigeria.  
[ollulawson@yahoo.com](mailto:ollulawson@yahoo.com).

**Abstract:** Maturation and histological characteristics of female gonads in mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria were investigated between July 2004 and July 2006. This species is found in abundance in the mud flats of the mangrove swamps of Lagos lagoon where it forms part of its fisheries. Its importance lies on its availability as food for man and as baits for both artisanal and offshore fisheries. Diurnal collections were made with non return valve traps. Biometric data were recorded and sexes separated. Ovaries were carefully removed from 1390 individual specimens that were with no abnormalities or pathological changes. The histological structure of the ovaries was based on a temporal scale after intensive sampling. The ovaries were observed macroscopically and processed by standard histological technique. ICES, BITS and IBTS scales and Bucholtz manuals were employed in the classifications of its maturity and gonadal stages. Seven stages of maturity which included: immature (stage I), immature and developing (stage II), ripening (stage III), ripe (stage IV), ripe running (Stage V), spent (stage VI) and recovering-spent (stage VII) were observed among the specimens. These constituted 1.15, 47.99, 15.32, 9.86, 19.50, 4.68 and 1.51% of the specimens examined in the study respectively. The pre-spawning phase was represented by stages I, II and III; the spawning by IV and V; and post-spawning by VI and VII. Histological development of the species indicated six (6) developmental stages of oocytes development viz: oogonium, primary oocyte, primary, secondary, and tertiary vitellogenic and hyaline oocytes. Specimens were found with oocytes which had developed over the migratory nucleus stage, indicating maturation can still proceed in the fish on the mudflats before migrating to spawning nests in the burrows. Stages V and VI ovaries contained all stages of oocyte. The GSI of the species increased at initial phase and then became stable at the later period. The species was a multiple and synchronous spawner, spawning in February, March, and October. The mean GSI varied from  $1.03 \pm 0.09\%$  in May to  $8.40 \pm 1.67\%$  in February 2006. Less than  $8.40 \pm 1.67\%$  % of the body biomass was converted by the species to development of ovaries. The minimum size of spawning females was 110 mm TL. Therefore, this study provides the necessary information on maturation and histological development of oocytes as an appropriate strategy for optimum utilization and conservation of this commercially valued fish species in Lagos lagoon, Nigeria.

[LAWSON, Emmanuel Olugbenga. Maturation and Histological characteristics of ovaries in Mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria. Journal of American Science 2010;6(11):965-976]. (ISSN: 1545-1003).

**Key words:** Chromatin, zona radiata interna, externa, maturation, nucleolar, vitellogenic.

### 1. Introduction

Mudskipper, *Periophthalmus papilio* (Bloch and Schneider 1801) is a member of the family Periophthalmidae. It is the only reported species of the family in the Gulf of Guinea, which includes Lagos lagoon in Nigeria (FAO, 1990; Lawson, 1998), where it has been reported in large number (Etim *et al.* 1996; King and Udo, 1996; Udo 2002). Irvine (1947) grouped *Periophthalmus* into indigenous or permanent element of the brackish waters of estuaries and lagoons. Other related species found in other parts of the world include: *P. chrysospilos* in Singapore (Ip *et. al.* 1990), and *P. koelreuteri* in East Africa. *Boleophthalmus boddaerti* and *B. woberi* are found inhabiting estuary of Pasir Ris in Singapore. Importance of this fish lies on its commercial value as food especially in Niger Delta region and as bait in

artisanal and offshore fisheries. It is reported to cost as high as \$20/kg in Taiwan and Japan (Khaironizam and Norma-Rashid (2002). Reviews on the *P. papilio* include that of King and Udo (1996) on its length-weight relationships; Etim *et al* (1996) gave a report on its population dynamics in Eastern Nigeria; and Lawson (1998) documented the aspects of its bioecology; its distribution, age determination, and growth patterns (Lawson, 2004a); its salinity tolerance and preference (Lawson, 2004b); and its blood osmolality contents (Lawson, 2004c). Aspects of its food and feeding habits (Lawson, 2004d); length-weight relationships and fecundity estimates (Lawson, 2011) were also investigated in Lagos lagoon, Nigeria. Several reviews on the maturation, histological and ultrastructural characteristics of non related species include that of Marcus (1982) on

Clupeid, *Ilisha africana*; and Ugwumba (1984) on the ten pounder, *Elops lacerta* off Nigerian coasts. Reviews from other parts of the world include that of Washio *et al* (1993) on Mudskipper, *Boleophthalmus pectinirostris*; Assem (2000) on Carangid, *Caranx cryos*; Grier (2000) on Common snook, *Centropomus undecimalis*; Srijuungam and Wattanasirmkit (2001) on Nile tilapia, *Oreochromis niloticus*; Assem (2003) on *Pagellus erythrinus*, Okuthe *et al.* (2004) on freshwater shrimp, *Caridina nilotica*; Valdés (2004) on Common pandora, *Pagellus erythrinus*, Ito (2005) on Pejerrey, *Odontesthes bonariensis*; Garcia-Diaz *et al* (2006) on Black comber, *Serranus atricauda*; Ortiz-Ordóñez (2006) on the butterfly goodeid, *America splendens*; Honji *et al* (2006) on Argentine hak, *Merluccius hubbsi*, Koç (2007) on Chub, *Leuciscus cephalus*; Bucholtz *et al* (2008) on Baltic herring, *Clupea harengus*; Lawson and Jimoh (2010) on Grey mullet, *Mugil cephalus*, Mohamed (2010) on Gadidae fish, *Merluccius merluccius*, and Saeed (2010) on Kutum, *Rutilus frisii kutum*. Guraya (2000) reported biology of gonad development, sex differentiation and maturation, and sex reversal in fish at cellular, molecular and endocrinological levels. Several studies from other teleosts showed that histological analysis of gonadal development is the most accurate methodology to determine the individual stage of sexual maturation, exhibiting more consistent results than visual staging of reproductive organs (Murua and Motos, 1998; Saborido-Rey and Junquera, 1998; Kjesbu *et al.*, 2003; Tomkiewicz *et al.*, 2003).

Histological study of this species though very strenuous is very essential especially in reproductive system. It is the most accurate method to determine the reproductive state of female fish (West, 1990). Therefore, the study on histology of ovaries of fish will provide a basic knowledge of reproductive system of fish and will be a useful tool for further applications in other species. This study has sought to investigate maturation and characterize the histology and ultrastructure of the ovary in mudskipper, *P. papilio* from the mangrove swamps of Lagos Lagoon, Nigeria.

## 2.0 Materials and Methods

### 2.1 Collection of specimens:

1390 female individuals of mudskipper, *Periophthalmus papilio* were caught from the mudflats of Lagos lagoon (longitude: 3°20'-3°50'W and latitude: 6°24'-6°36'N) between July 2004 and July 2006. The diurnal collections were carried out with non return valve traps. Services of artisanal fishermen were employed.

### 2.2. Laboratory procedures and data collections:

In the laboratory, collections of biometric data such as sex, total length (TL) and body weight (BW) measurements were carried out, TL to the nearest 1 mm and BW to the nearest 0.1 g. The specimens were examined for abnormality or pathological changes and were cut opened through the ventral position. Sexes and gonad maturity stages were ascertained by naked eye examination of the gonads and were confirmed under the light microscope. Ovaries were removed from the specimens considered to be females, the paired ovaries were weighed (GW) to the nearest 0.1 g. The ovaries were fixed in Bouin's fluid. Sections were taken from the middle part of each ovarian lobe, dehydrated in alcohol, cleared in xylene, and impregnated in paraffin wax between 52-60 °C melting points. They were embedded in paraffin wax and sectioned at 6 µm thick. The sections were stained in Ehrlich haematoxylin and Eosin (H&E) following Belelander and Ramaley (1979). Microscopic observations of the ovaries were done under binocular microscope that was mounted with camera and photographs taken.

To determine the individual stage of sexual maturation, visual staging of reproductive organs was applied. The description of macroscopic criteria was developed by comparing the histological results with the photographic records of the ovaries. Maturity stages were evaluated using scales from which each gonad was judged by visual analysis of external features. Sexual maturity of each specimen was classified according to macroscopic scales used in the IBTS (International Bottom Trawl Survey), BITS (Baltic International Trawl Survey), ICES (International Council for Exploration of the Sea of 1963, 1999) and recently, Bucholtz *et al* (2008) manual, and as well using a microscopic scale, based on histological analysis (Vitale *et al.*, 2005). The microscopic criteria applied in the classification of ovarian development were based on oocyte characteristics such as the formation of cortical alveoli, degree of yolk accumulation and nuclear migration. This microscopic classification underlines the importance of the passage from endogenous to exogenous vitellogenesis, which coincides with the beginning of yolk production in the oocytes.

The gonadosomatic index (GSI) of the fish was calculated by dividing the ovaries weight by the whole body weight and multiply by 100. Thus:

$$\text{GSI} = \frac{\text{GW} \times 100\%}{\text{BW}}$$

### 3.0 Results

#### 3.1 The structure of ovary in *P. papilio*.

The morphology of ovaries in different developmental stages is presented in Figure 1. Ovary of *P. papilio* was observed to be a paired, elongated bodies situated in the posterior half of the body cavity and suspended from the body wall by the mesovarium. Anteriorly, the two lobes were free but posteriorly they bent downwards and inwardly to form a short oviduct leading to the genital pore. The length, width, and colour of ovaries were seen changing as maturity progressed due heavy vascularization. The colour turned yellow on

maturity and reddish when the fish were ready to spawn (in stages IV and V). Stage I ovaries were not represented because they were not discernible enough to be classified as males or females

#### 3.2. Macroscopic characteristics of ovaries.

Macroscopically ovaries in *P. papilio* were classified into seven (7) developmental stages (Table 1). The stages were classified as Immature (Stage I), Immature and Developing (Stage II), Ripening (Stage III), Ripe (Stage IV), Ripe running (Stage V), Spent (Stage VI), and Recovering-spent (Stage VII).

Table 1: Macroscopic characteristics of ovaries in *P. papilio*

Maturity stage	Degree of maturation	External or macroscopic appearance of females
Stage I	Immature	The external examination did not show sexual differentiation, the gonads were rudimentarily developed and could not be differentiated as males or females. Hence the specimens were classified as immature. 16 specimens were observed as immature.
Stage II	Immature and developing	The ovaries were small, rounded with a rough surface and soft texture. They were pinkish in colour, translucent with blood vessels forming internally, and occupying between 1/8 <sup>th</sup> (12.5%) and 1/4 <sup>th</sup> (25.0%) of the length of the abdominal cavity. None of the oocytes were visible.
Stage III	Ripening	The ovaries were swollen and lobed. A heavy network of vessels appeared externally on the surface of the ovarian wall. Yellowish oocytes were visible to naked eye through the ovarian wall. The gonad extended for about 60 – 70% of the abdominal cavity.
Stage IV	Ripe	Ovaries at this stage were almost filling the body cavity occupying 80 – 90% of abdominal cavity. They were orange yellowish in colour. The shedding of eggs has not commenced and otherwise soft. The eggs were rounded with a rough granular surface given a hollow sac like appearance. Blood vessels coalesced to form larger ones on the external surface of the ovary wall. Yellowish colour was possible due to the large yellow oocytes that were visible through ovary wall.
Stage V	Ripe running	The eggs flowed from the vent on slight pressure and the ovary occupied 99% of the abdominal cavity and rendered alimentary canal and gut almost inconspicuous.
Stage VI	Spent	The red ovaries were flaccid and vascularized with reduced size, the ovarian wall was tough and smooth with no granulation. The residual eggs were visible through the flabby wall. The ovary length: width ratio was 4.5 and the gonads occupied 50% of the abdominal cavity. There were large numbers of surface blood vessels.
Stage VII	Recovering-spent	Externally, ovaries were firmer than spent stage but mainly red in colour. It occupied 60% of the body cavity and none of the residual oocytes were visible through the ovary wall.

#### 3.3. Comparison of present study with other maturity scales.

Table 2 describes the conversion of the scale developed in this study to the scales of Bucholtz et al (2008), and ICES (1963) and as well as the scales used for the BITS and IBTS surveys. The ICES scale is commonly used in most laboratories, the BITS and IBTS scales were similar. Also similar were Bucholtz et al (2008) and ICES (1963) scales except the addition

of abnormal stage in former covering a stage of reproductive malfunction (stage VII). However, these scales were modified and simplified in this study for better understanding of the histology of this species and other teleosts. Common to all these scales were a recovering-spent stage which encompassed the final recovery of the spent gonad as well as the beginning of a new maturation cycle.

**Figure 1:** Morphology and gonadal stages (II-VII) in female *P. papilio* from Lagos lagoon, Nigeria.

II, immature and developing; III, ripening; IV, ripe;  
V, ripe running; VI, spent; VII, recovering-spent.

### 3.4. Histological characteristics of Ovaries in *P. Papilio*.

The histological characteristics of the ovaries of this species in their different developmental stages are represented with photomicrographs in Figure 2A-F.

#### 3.4.1 Immature and developing stage:

Histological appearance (Figure 2A) of the ovary was characterized by the presence of many oocytes between 0.025 and 0.05 mm. The larger oocytes were seen with cytoplasm vacuoles and were irregularly shaped but few were rounded. The thickness of the ovarian wall was 50 µm and folded. Empty follicles and space were visible.

667 specimens belong to this category.

#### 3.4.2 Ripening:

The histological observation of the ovaries at this stage showed that many oocytes between 0.1 and 0.2 mm were present. Larger oocytes with cytoplasmic vacuoles were very few and had small yolk droplets (Figure 2B). The primary and secondary vitellogenic oocytes dominated while tertiary vitellogenic oocytes were represented in the gonad. The cytoplasm of larger oocytes was filled with densely staining yolk granules.

The ovarian wall was 70 µm thick. N=213.

#### 3.4.3. Ripe:

The histological observation of the gonads showed that the secondary and tertiary vitellogenic oocytes dominated the gonad with very few primary oocytes (Figure 2C). The *theca externa* were prominent. The hyaline oocytes were present but

usually collapsed by histological processing. Ovary wall was 90  $\mu\text{m}$  thick; many oocytes were between 0.2 to 0.5 mm in diameter and usually 0.35 mm in size. Many oocytes were at stages II and III. There were blood vessels internally but some of the yolk oocytes were atretic. N=137.

#### 3.4.4. Ripe running:

Oocytes looked exactly like those in the ripe stage and were laid singly with space (septa) in between as shown in Figure 2D; most of the oocytes were in their tertiary vitellogenic stage. N=271.

#### 3.4.5. Spent:

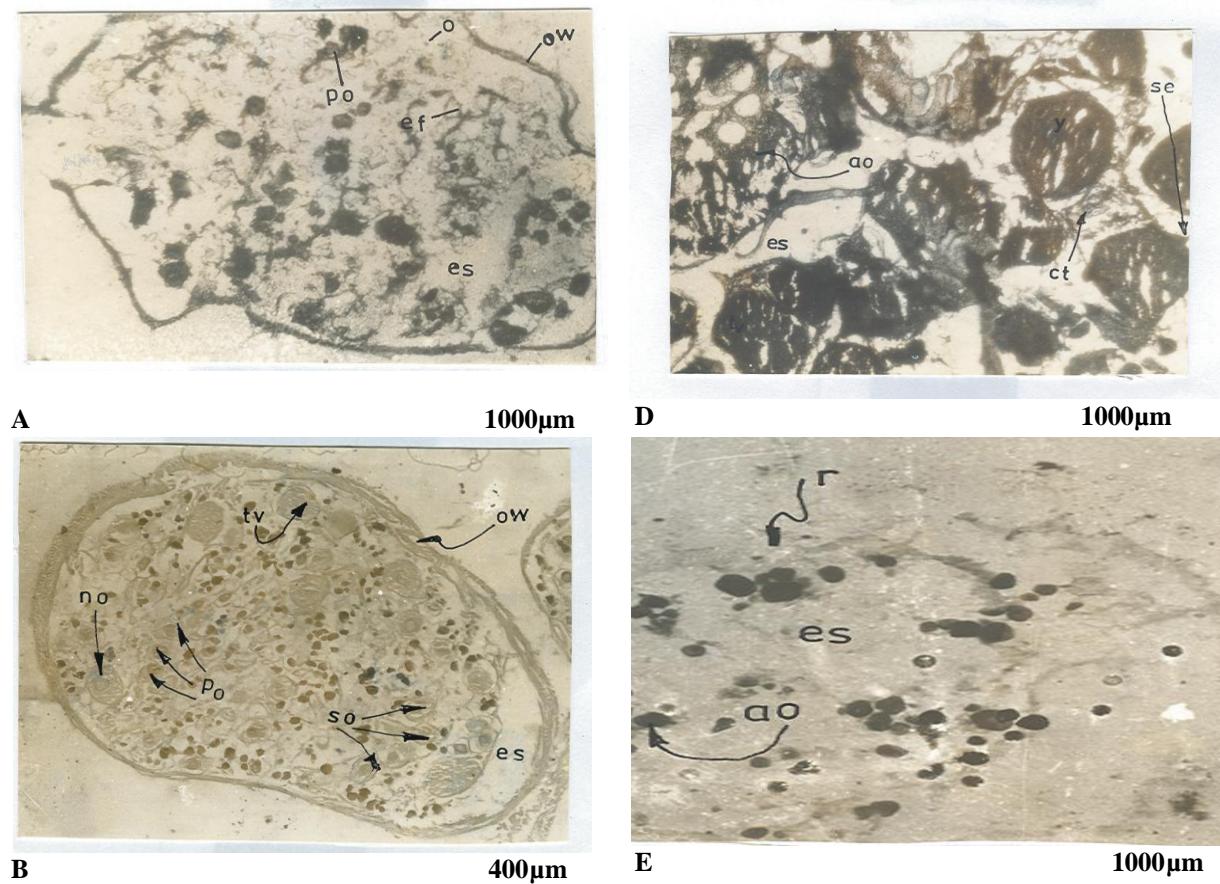

A few atretic residual oocytes were seen, the invasion of oocytes by follicular cells was noted (Figure 2E). High level of oocyte atresia was noted.

There was disorganization of septum, no empty follicular coat. The ovarian wall was 300  $\mu\text{m}$  thick while the lumen contained debris of the residual cells N=65.

#### 3.4.6. Recovering and resting:

The residual atretic oocytes were present but the septum was not very organized (Figure 2F). Reorganization of ovigerous lamellae started. A few reabsorbing oocytes were also present. N=21.

The vascularized and ripe stage oocytes showing different developmental characteristics are present in Figure 3. The six (6) oocyte developmental stages in this study included: oogonium, primary oocyte, primary, secondary, tertiary vitellogenic and hyaline oocytes.

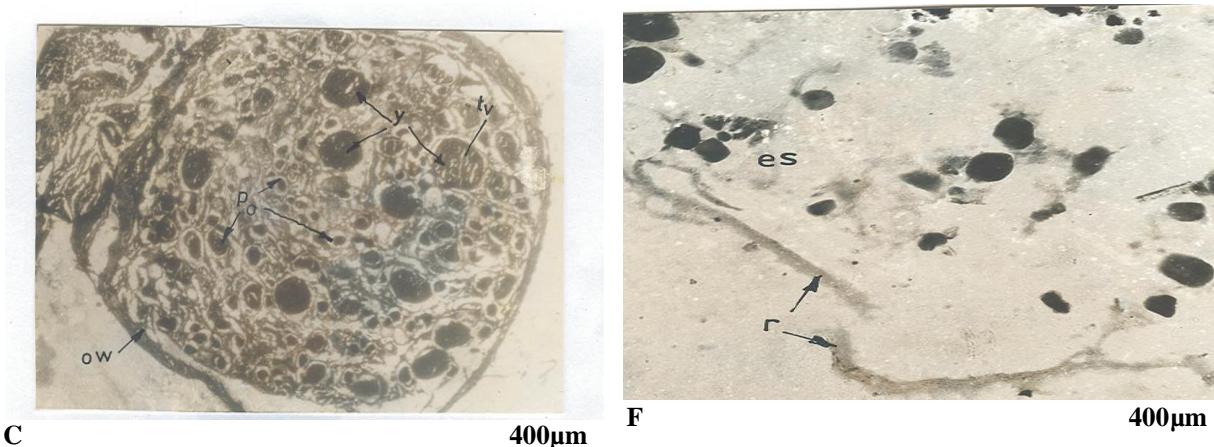

Figure 2. Photomicrographs of ovaries in their various maturation stages in *P. papilio* from Lagos lagoon, Nigeria. A: A section through an ovary in immature and developing; B: An ovary in ripening stage; C: A section through a ripe stage ovary; D: An ovary showing tertiary vitellogenic or ripe oocytes in ripe running stage; E: A section through an ovary in spent stage; F: An ovary in recovering-spent stage.

o, oogonium; po, primary oocyte; es, empty space; ef, empty follicle; ow, thick ovarian wall; s<sup>o</sup>, secondary oocyte; no, nucleolus; y, yolk; pv, primary vitellogenic oocyte; tv, tertiary vitellogenic oocyte; ga, gap between ovigerous fold; of, ovigerous fold; bv, blood vessel; ha, haline oocyte; ct, connective tissue; se, septum; ao, atretic oocyte; r, rupture ovarian wall.

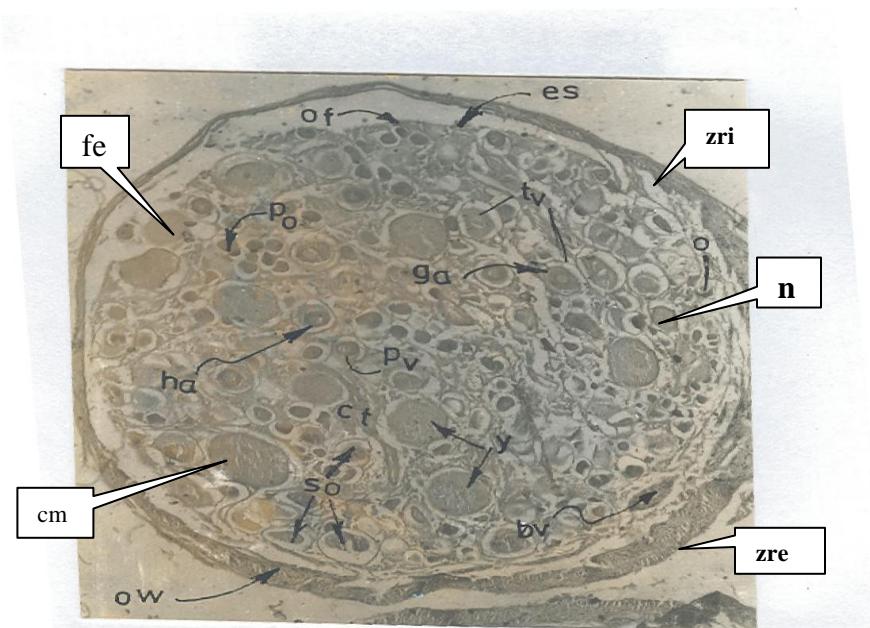

Figure 3. The vascularized and ripe stage oocytes showing different developmental characteristics. s<sup>o</sup>, secondary oocyte; po, primary oocyte; pv, primary vitellogenic oocyte; es, empty space; ow, thick ovarian wall; tv, tertiary vitellogenic oocyte; ga, gap between ovigerous fold; o, oogonium; of, ovigerous fold; bv, blood vessel; ha, haline oocyte; y, yolk; ct, connective tissue; cm, chromatin; fe, follicular epithelium layer; zri, zona radiata interna; zre, zonal radiata externa; n, nucleus.

### 3.5. Reproductive cycle and maturity stages

In the present study seven stages of maturity were developed and validated (Figure 4). These stages were grouped into three phases as presented in Figure 4. The phases were (a) Pre-spawning phase which included stages I-III ovaries; (b) Spawning phase, the stages IV

and V; and (c) post-spawning phase which were stages VI and VII. The reproductive cycle of *P. papilio* in Lagos lagoon started from stage I and ended at stage VII then back to stage II, or from the pre-spawning through spawning to post spawning, back to pre-spawning phase in cyclic manner.

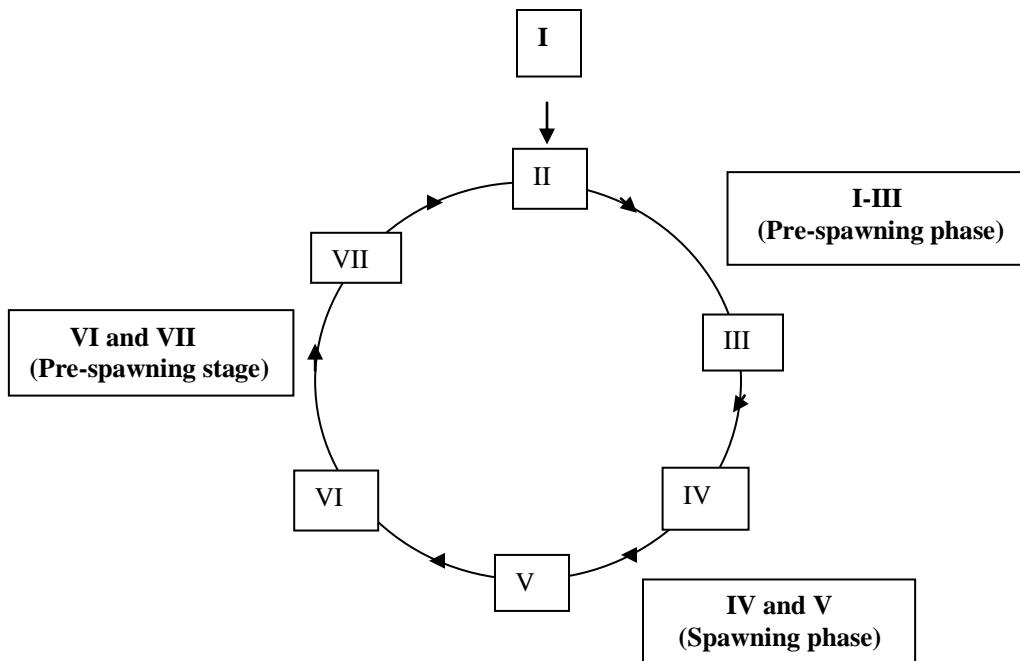

Figure 4. Reproductive cycle and maturity stage in *P. papilio* from Lagos lagoon, Nigeria.

### 3.6. Distributions of maturity stages and phases in *P. papilio*.

Of the seven (7) maturity stages and three (3) maturation phases (Figure 5) encountered in the study, The least dominant group was stage I and stage II fish were the most abundant constituting 1.15 and 47.99% of the population respectively. The pre-spawning, spawning and post spawning phases were 64.46, 29.36 and 6.19% respectively. The pre-spawners were more in number than the spawning or post-spawning fish.

### 3.7. Gonadosomatic index of *P. papilio*

Monthly changes in GSI of the fish were presented in Figure 6. GSI were high in August and October 2004. The lowest GSI value of  $1.03 \pm 0.09\%$  was recorded in May and was at the peak ( $8.4 \pm 1.67\%$ ) in February, 2005. In 2005, GSI began increasing from January ( $6.36 \pm 1.23\%$ ), and these values represented the changes similar to those of 2006, although the GSI value in February 2005 that was high was significantly lower in 2004 and 2006 than those in 2005 (t-test,  $P < 0.05$ ).

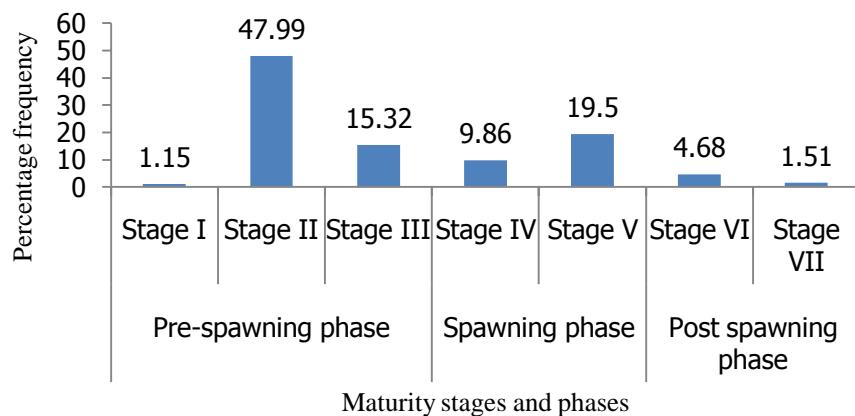

Figure 5. Histograms of percentage frequency distributions of maturity stages and phases in females *P. papilio* from Lagos lagoon, Nigeria.

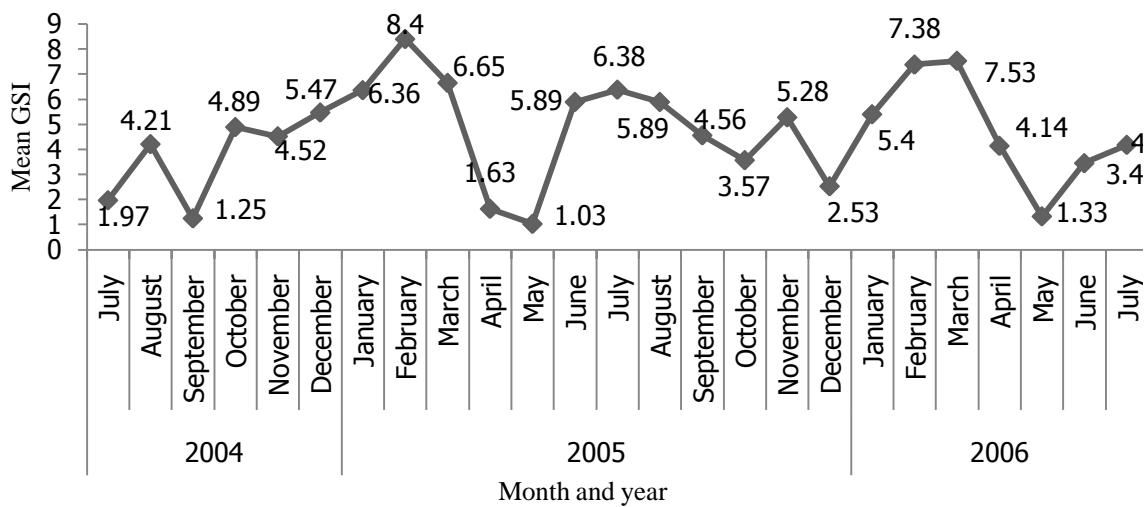

Figure 6. Monthly mean GSI in females *P. papilio* from Lagos lagoon, Nigeria.

#### 4. Discussion

In this study, seven stages of gonadal development were observed in mudskipper, *Periophthalmus papilio* (Table 1). The stages were immature, immature and developing, ripening, ripe, ripe running, spent and recovering-spent. Immature fish were those that were unable to be differentiated both micro and macroscopically as males or females. Most of the specimens were at pre-spawning phase. Fewer fish populations at the spawning and post spawning phases was an indication that the fish had

not migrated away from their spawning nests in their burrows.

The macroscopic characters and gonad differentiations occurred as maturation progress from a stage to next. Vascularisation and identification also increased with progression in size and maturity. Immature, immature and developing and ripening stage were categorized as pre spawning period, i.e a period when the fish were virgin, or maturing or were in their early or mid or late maturation phase. A scale

generated from the present study was a modification of the ICES, BIT, and IBTS scales that were used in the current study (Table 2). The general pattern of histological development of the ovaries of the present study conforms to that of the most teleosts (El-Gharabawy, 19996; Assem, 2000 and 2003). A 4-stage maturity scale was generated by IBTS, 5 by BITS, 7 by ICES and 8 by Bucholts et al 2008 for Herring and Cod. These scales were reportedly applied in histological study of many teleosts. The maturity stages are hardly discernible by the naked eye and consequently the most susceptible to misclassification.

The six (6) developmental stages (Figure 3): oogonium, primary oocyte, primary, secondary, tertiary vitellogenic and hyaline oocytes were represented the various stages of the oocyte growth and development in *P. papilio*. This also confirmed progressive process in stages of formation, growth or development of eggs (oogenesis). These developmental stages were well documented by Gardner and Snustad (1984). Oocyte is the mother cell, the cell that undergoes two meiotic divisions to form the egg cell. The primary oocyte occurs before the completion of the first meiotic division; second oocyte, after the completion of the first meiotic division. Oogonium is a germ cell of the female before meiosis begins. Oogenesis in fish according to Jackson and Sullivan (1995) is accompanied by conspicuous cellular, biochemical, molecular and endocrinological changes.

The present study confirmed that the maturation period in *P. papilio* was characterized by appearance of isolated follicular epithelial cell around the oocyte and formation of yolk nuclei. The yolk nuclei appear first as a small spherical corpuscle in close adherence to one side of the nucleus and then migrate to the periphery of the cytoplasm, where it finally disintegrates and disappears. This was in agreement with reports of Mohamed (2010) on *M. merluccius*. Herrera et al (1988) pointed out that the follicular epithelial cells are considered as a good proof for synthesis of sexual steroids in fish.

The vacuolization period may be characterized by the presence of marginal vacuoles and by the fact that the oocyte wall consisted of *zona radiata* coated with follicular epithelial layer (Mohamed, 2010). Grant (1990) characterized the vacuolization stage by cortical alveoli formation.

The yolk deposition as presented in Figure 3 was a period characterized by the presence of yolk granules in the periphery of the oocyte cytoplasm. The yolk deposition in the oocytes in *P. papilio* showed the same picture described by many authors for some fishes (El-Gharabawy, 1996; Assem, 2000

and 2003) most of cytoplasm is filled with yolk granules of various sizes.

Examination of the ovaries of this species in this study showed presence of oocytes at different stages of development. This is an indication that the fish has prolonged and fractional spawning season. Therefore, the fish may spawn more than once along the spawning period. This was supported by Salem et al (1994) for *Mugil seheili*, El-Greisy (2000) for *Diplodus sargu*, Honji et al (2006) for *Merluccius hubbi*; Garcia Diaz et al (2006) for *Serranus atricauda*; and Mohamed (2010) for *Merluccius merluccius*.

Teleosts attain sexual maturity at various ages depending on the species, latitude, water temperature, salinity. The age, at which fish living in a water body under natural environmental conditions (in regard to age and season) attain maturity depends on the latitude, the more south a water body in the northern hemisphere is found, the earlier the fish mature. The environmental factors such as temperature, photoperiod, nutrient supply, dissolved oxygen, diseases or parasites) are well known to influence reproductive maturity and oogenesis in fish (Cambray, 1994; Joy et al 1999). But the mechanism of action of various environmental factors as well as the sites of their action remains to be determined at the cellular and molecular levels.

The fish burrowed and spawned in the mud flats, this was responsible for fewer populations of the spawners and post spawning fish. Fish close to spawning phase enter the spawning nests and stayed there for some while even at spent stage. This may be reason for large number of pre-spawners than either spawning or post-spawning fish as reported in the present study. Nest spawning behavior was reported in *B. pectinirostris*, *P. cantonensis* and *P. modestus* by Uchida (1932); and Dotsu and Matoba (1977) in Ariake sound and Washio et al (1991) in Midori River, Kumamoto prefecture in Japan. The maturation following their migration to the spawning nest could also responsible for their inability to be collected with traps.

GSI values were higher in 2005 than in 2004 or 2006 (Figure 5), the difference according to Washio et al (1991) reports on mudskipper species, *B. pectinirostris* is closely related to the annual changes in reproduction. The GSI had been used to describe the development of gonads in Pike, *Esox lucius* by Danilenko (1983). However, determination of reproductive maturity using only the GSI is not enough because the structures within the ovary, such as oocytes at different stages, interstitial tissues with accumulation of yolk materials, can not be interpreted by weight (Srijunngam and Wattanasirmkit, 2001). GSI increases progressively

with increases in the percentages of ripe individuals towards the spawning seasons (Mohamed, 2010). The most common practice for determination of a species spawning season is the establishment of its GSI and the histological examination of the gonads (El-Greisy, 2000; Assem, 2000 and 2003; Honji *et al.*, 2006). High values of GSI for the months of October 2004 ( $4.89 \pm 1.06\%$ ); February 2005 ( $8.4 \pm 1.67\%$ ); and March 2005 ( $7.53 \pm 2.56\%$ ) demonstrated that the species was a multiple spawner and spawned several times within a spawning period. Less than  $8.40 \pm 1.67\%$  of the body mass was converted to gonad development in the fish. GSI varied with species, sex, seasons and availability of food and these were in conformity with reports from other teleosts (Lawson, and Aguda 2010; Lawson and Jimoh, 2010; Lawson *et al.*, 2010; Lawson, 2011) in some Nigerian waters.

Therefore, the study provides information on the maturation process and histological characteristics in a species of mudskipper, *P. papilio*, an economically valued fish from Lagos lagoon, Nigeria. There is an on going research work of the ultrastructural characteristics of the gonads in this species using a transmission electron microscope. The reports of the study will be reported in the next paper.

## Residual Available Copper and Boron in Soil as Affected by Zinc sulfate and Boric acid in a Zinc and Boron Deficient Soil

Farshid Aref

Department of Soil Science, Firouzabad Branch, Islamic Azad University, Iran

Tel: +989173383896, [farshidaref@yahoo.com](mailto:farshidaref@yahoo.com)

**Abstract:** Micronutrients such as copper (Cu) and boron (B) are needed in small amounts, and there are also likely to be residual effects for some years after their application. A field experiment with maize plant grown on Zn and B deficient soil was conducted to evaluate the effect of Zn and B interaction on the residual available Cu and B content in the soil during 2009 at Fars Province, Iran. Treatments including five levels of Zn (0, 8, 16 and 24 kg ha<sup>-1</sup> and Zn foliar spray) and four levels of B (0, 3, and 6 kg ha<sup>-1</sup> and B foliar spray) in a completely randomized block design were set up. The findings showed that the in all treatments, the residual available Cu and B in the soil increased compared to its initial levels (before culture). The main effect of Zn and B on the residual Cu was insignificant relative to the no Zn and B level. No treatments, showed a significant difference on the residual Cu in the soil as compared with the control and also the effect of Zn-B interaction on the residual Cu was insignificant. In most treatments, the residual B in the soil decreased compared to its initial level levels (before culture). The Zn-B interaction was significant on the residual available B content in the soil. The presence of Zn prevented from increase of the available B remaining in the soil by B use relative to the soil B content before culture. Application of a high amount of Zn in the soil decreased residual available B in the soil relative to the no Zn level.

[Farshid Aref. Residual Available Copper and Boron in Soil as Affected by Zinc sulfate and Boric acid in a Zinc and Boron Deficient Soil. Journal of American Science 2010;6(11):977-984]. (ISSN: 1545-1003).

Keywords: Interaction, Zinc, Boron, Copper, Residual available nutrients

### Introduction

Zinc (Zn) deficiency is a very important nutrient problem in the world's soils. Total Zn concentration is in sufficient level in many agricultural areas, but available Zn concentration is in deficient level because of different soil and climatic conditions. Soil pH, lime content, organic matter amount, clay type and amount and the amount of applied phosphorus fertilizer affect the available Zn concentration in soil (Adiloglu, 2006). Zinc is an essential nutrient for all plant crops. Chemically, Zn has some similarities with Fe and Mn, and in plant uptake there can be competition between these elements (Neue et al., 1998). Furthermore, high levels of phosphate in soils can strongly reduce Zn availability (Marschner, 1995). As regards agriculture, according to Cakmak (2002) Zn deficiency is the most widespread soil micronutrient deficiency in the world. Availability of Zn for plants is particularly low in calcareous and alkaline soils, while absolute Zn contents tend to be low in highly weathered acid tropical soils. Almost half of the agricultural soils from India, one third of the agricultural soils in China, and 50 per cent of cultivated land in Turkey are considered Zn-deficient for plants (Frossard et al., 2000; Gupta, 2005). Other more location specific studies report on low soil Zn contents in, for example, Iran (Aref, 2010). In spite of

the fact that the total amount of Zn in the soil is relatively high, but a small fraction of it is available to the plant. Numerous factors affect Zn availability, including the soil calcium carbonate content, which reduces the Zn availability in the soil (Mandal et al., 1992). Among the micronutrients, Zn deficiency is perhaps most extensive in the world. Zinc deficiency is most common in low- and high pH soils, low- and high organic matter, sandy, sodic, calcareous soils and waterlogged without ventilation (Takkar and Walker, 1993). Corn is among the plants most sensitive to Zn deficiency (Tandon, 1995).

Boron regulates transport of sugars through membranes, cell division, cell development, and auxin metabolism. Without adequate levels of B, plants may continue to grow and add new leaves but fail to produce fruits or seeds. A continuous supply of boron is important for adequate plant growth and optimum yields (Mahler, 2010). The total boron content of most agricultural soils ranges from 1 to 467 mg kg<sup>-1</sup>, with an average content of 9 to 85 mg kg<sup>-1</sup>. Available boron, measured by various extraction methods, in agricultural soils varies from 0.5 to 5 mg kg<sup>-1</sup>. (Gupta, 2007). It appeared that the percentage of soils deficient in B varied from 0 to 69 percent, thus suggesting that multiple micronutrient deficiencies at more localized level might be much more common

than based on only Zn, Fe, Cu and Mn (Nube, 2006). Boron deficiency is common in sandy and highly calcareous rich soils since there is an interaction between the Ca ion and the available B and high Ca levels at high pH reduces B uptake (Marschner, 1995). Soil texture, soil organic matter content, and soil moisture (annual precipitation, irrigation) are the three most important factors affecting boron availability in soils. Coarse textured soils (sands, loamy sands, sandy loams) that are low in organic matter are often low in plant-available boron. Boron deficiencies are especially pronounced in high rainfall areas (greater than 25 inches) where boron may have been leached from the soil profile. Over-irrigation may cause the same results. The availability of boron in the soil is also influenced by pH. Maximum boron availability occurs between soil pH 5 and 7 (Mahler, 2010). Copper is an essential element for plant growth. However, its presence in the soil in quantities lower or greater than the optimal amount could adversely affect plant growth (Tucker et al., 1995).

Soil fertility is an important factor, which determines the growth of plant. Soil fertility is determined by the presence or absence of nutrients i.e. macro and micronutrients. The availability of micronutrients is particularly sensitive to changes in soil environment. The factors that affect the contents of such micronutrients are organic matter, soil pH, lime content, sand, silt, and clay contents revealed from different research experiments. There is also correlation among the micronutrients contents and above-mentioned properties (Nazif et al. 2006). Iron, aluminum, and manganese oxides; organic matter; and phosphates, carbonates, and sulfides are important sinks for trace elements in soil–residual systems. The pH of the soil–residual system is often the most important chemical property governing trace element sorption, precipitation, solubility, and availability (Basta, 2005). In agriculture, micronutrients are an issue of increasing interest and concern. Many research activities are being undertaken which address the relationships between micronutrient provision to plants and associated crop growth, and trace elements such as Zn, Mn and Cu are increasingly recognized as essential when aiming for better yields (Mann et al., 2002; Bhadoria et al., 2003; Rashid and Ryan, 2004; Welch and Graham, 2004; Gupta, 2005; He et al., 2005).

The interaction among nutrient elements is very important for plant nutrition. Boron x Zn interaction among these interactions has been curcial in the Zn

deficient soils, in recent years (Alkan et al., 1998). Copper, Zn, Mn and P are Fe antagonists, and high levels of these elements in soils (or in fertilizer) can reduce Fe uptake by plants. Thus, information on extractable Fe, for example using DTPA4, is generally of much more relevance than information on the absolute levels of Fe contents in soils (Nube, 2006). The negative effect of high phosphorus suggest an induced deficiency of another element, possibly Zn, Cu, Fe or Mn (or a combination of these micronutrients), as P is known to have an antagonistic effect on these micronutrients. (Nube, 2006).

In a study in the China the residual effect of 1.1 kg B/ha remained fully effective in correcting B deficiency in oilseed rape for 2 years in the Inceptisols, whereas the residual effect of 1.65 kg B/ha continued to correct B deficiency for at least 3 years in both the Inceptisols and the Ultisol (Yang et al., 2000). Aref (2007) by studying the effect of Zn and B on the residual nutrients in the soil observed that P, Fe, Mn and Zn increased relative to its initial levels. Yang et al., (2000) reported that foliar application of B fertilizer generally corrected B deficiency for oilseed rape but showed limited residual effect in the following years after application.

In agriculture, very little research considers the entire range of micronutrients that are essential for plants (Nube, 2006). The critical level of Zn in the soil in  $\text{mg kg}^{-1}$  by DTPA extraction, has been reported by Darajeh et al. (1991) for corn to be 0.8, by Agrawala (1992), 0.8, Sharma and Lai (1993), 0.6, Terhan and Gerval (1995), 0.75. Lindsay and Norwell (1978), using DTPA extraction introduced critical limits of the soil Zn content as low if less than  $0.5 \text{ mg kg}^{-1}$ , medium if between  $0.5$  to  $1 \text{ mg kg}^{-1}$  and sufficient if more than  $1 \text{ mg kg}^{-1}$ . Nijjar (1990) has reported the critical B level by the hot water method in calcareous soils as  $0.5 \text{ mg kg}^{-1}$ . The critical level of Zn in the soil by DTPA extraction, has been reported by Agrawala (1992), 0.78, and Sims and Johnson (1991), 0.1-2.5  $\text{mg kg}^{-1}$ .

By measuring the residual nutrients in the soil after harvesting the crop, we can use many desired relations for better management in the culture. If the amount of the residual available element in the soil is at a high level, this represents less uptake by the plant or less fixation by soil particles and if it is at a low level, this represents more uptake by the plant or more fixation by soil particles. Of course, in addition to uptake and fixation, other factors such as uptake of

elements from unavailable form to available form or vice versa as well contribute to the amount of residual available element in the soil. Therefore, the objective of the study was examination of the effect of Zn and B on the residual available Cu and B in the soil after harvesting corn so that we are able to plan for Cu and B use in the next cultures.

### Materials and Methods

The field study was conducted at the research farm of Firouzabad University in Fars province of Iran, on the corn (*Zea mays L.*), cultivar "Single Cross 401" during 2009 cropping season. Composite surface soil samples (0-30 cm) were taken from the site before the experiment was initiated. This soil had a loam texture, pH of 8.4, 0.78 % organic matter, 210 mg kg<sup>-1</sup> exchangeable potassium (K), 9.9 mg kg<sup>-1</sup> available P, DTPA extractable Fe, Mn, Zn and Cu concentration were 1.4, 6, 0.38 and 1 mg kg<sup>-1</sup> and available B with hot water extractable was 0.9 mg kg<sup>-1</sup>. This experiment consisted of 20 treatments and 3 replications in the form of completely randomized block design and factorial that combinations of five levels Zn (0, 8, 16 and 24 kg ha<sup>-1</sup> Zn and Zn foliar spray) and four levels of B (0, 3, and 6 kg ha<sup>-1</sup> and B, and B foliar spray). Nitrogen: P: K used at 350, 200 and 200 kg ha<sup>-1</sup> according to the recommendation, from sources of urea, triple super phosphate and potassium sulfate, respectively, were added to all treatments (plots). Moreover, 50% of the urea was used when planting and the remainder two times: At vegetative growth (35 days after planting) and when the corn ears were formed. Potassium and P used before planting. Zinc and B, from zinc sulfate and boric acid sources, respectively, were used by two methods, adding to the soil and spraying. Addition to the soil was made at the time of plantation and the sprayings were made at 5 per thousand (0.5%) Zn sulfate and 3 per thousand (0.3%) B two times: one at vegetative growth stage and the other after corn ears formation. The Zn and B were both applied to the leaves with uniform coverage at a volume solution of 2500 L ha using a knapsack sprayer. Each experimental plot was 8m length and 3m width, had 5 beds and 4 rows, equally spaced, and seeds 20 cm apart on the rows. At the end of the growth stage (4.5 months after planting) the grain yield, dry matter and the residual available P and Zn in the soil after corn harvest were measured.

The soil samples were air-dried and ground to pass through a 2-mm sieve before analysis. Selected soil chemical and physical characteristics for the two

sites are presented in Table 1. Analysis of the soil was carried out using common lab procedures (Soil and Plant Analysis Council, 2004). Soil particle size distribution was determined by the hydrometer method (Gee and Bauder, 1986), organic matter (OM) content by the Walkley-Black method (Walkley, 1947), and pH was determined at a 1:1 soil/water ratio. Soil available K was determined by 1 M NH<sub>4</sub>OAc extraction and K assessment in the extract by flame photometer (Thomas, 1982). Soil P available was measured by Olsen method. Available Fe, Zn, Mn and Cu in the soil were first extracted by DTPA and then were read by atomic absorption (Shimatzu Model AA-670). The soil's available B was extracted by hot water and then was measured by spectrophotometer by curcumin method, considering the intensity of the color produced. Each variable was subjected to ANOVA using the Statistical Analysis System (SAS version 8.2, SAS Institute, 2001) for each soil. Treatment (fraction) means were separated by Duncun's multiple range test ( $P < 0.05$  level). Multiple regression analyses (stepwise procedure) (SAS Institute, 2001) was conducted to evaluate the relationships between residual available Cu and B in the soil and other factors.

### Result and Discussion

#### Soil analysis result before culture

Physicochemical characteristics of soils taken before the experiment was initiated in the spring of 2009 are presented in Table 1. While table 1 indicates the soil had high clay content. The soil P and K available in the soil is lower than the critical level suggested in scientific sources (Karimian and Yasrebi, 1995). Karimian and Ghanbari (1990) have reported the critical P level by the Olsen method in calcareous soils as 18 mg kg<sup>-1</sup>. The soil Zn and B content was lower than the critical level. High soil pH and CaCO<sub>3</sub> content induce B deficiency in the surveyed area. Similar results were found by Borax (1996) and Rashid et al. (1997). In soil, the B concentration of  $<0.65$  mg kh<sup>-1</sup> and  $>3.5$  mg kh<sup>-1</sup> are deficient and toxic levels for cotton crop, respectively (Anonymous, 1985). For many crops, a DTPA-extractable Zn level of 0.5-0.8 mg kg<sup>-1</sup> has been regarded as a soil critical level below which crop production would be limited by Zn deficiency (Martins and Lindsay, 1990). The soil Mn, Cu and Fe content was above the critical level. Sims and Johnson (1991) have reported the critical levels of Fe, Zn, Mn and Cu by the DTPA extraction method and

B by the hot water in the soil method to be 2.5-5, 0.2-2, 1-5, 0.1-2.5 and 0.1-2 mg kg<sup>-1</sup>, respectively.

Table 1. Soil mechanical and chemical analysis

B	0.9

#### Residual available copper in the soil

The soil Cu content before planting was 0.5 mg kg<sup>-1</sup> and increased after harvesting in all treatments (Table 2). Considering that Cu fertilizer was not applied to the soil, the increase in soil Cu content after harvesting was due to availability of a part of the total Cu in the form of available Cu. Root secretions and reactions was carried out in the soil by activities such as irrigation and climate changes during the growing season leads into availability of a part of the total Cu in the form of available Cu. Also, by adding zinc sulfate fertilizer can increase available Cu content in the soil by replacement of Zn instead of Cu. Therefore, in addition to the presence of total Cu in the soil can meet the plant needs, also, some amount of the total soil Cu content be available to the plant after culture and operations on the soil. Of course, with the elapse of time the total available Cu content in the soil decrease to the unavailable form.

The use of different Zn levels and Zn-B interaction on the residual available Cu in the soil was insignificant at 5% level. No treatments showed significant difference from the control. Yang et al., (2000) reported that the decline in residual values of B from a single fertilizer addition was closely related to the soil and leaf B concentration. There was a relation between the leaf Cu content and the residual Cu content, so that Zn and B application had no significant effect on the leaf Cu content; that is the amount of Cu removal from the soil by plant did not change by Zn and B application and consequently residual Cu in the soil did not change as affected by Zn and B application. Considering that Zn and B application at all levels had no significant effect on

the residual Cu content in the soil relative to the Zn and B levels and also, almost all treatments showed no significant difference from the control, therefore increasing the residual Cu content in the soil depend on the many factors such as soil tillage, irrigation, root secretions and NPK fertilizers.

Several soil properties such as pH, redox potential (Eh), cation exchange capacity, organic matter, texture, oxide content, and clay mineralogy influence the relative distribution of Cu in different chemical forms (McLaren et al., 1983; Sims, 1986). Soil properties, metal characteristics, and environmental factors influence Cu and Zn concentrations and loads in surface soil (Zhang et al., 2003; He et al., 2004).

Table 2. The effect of Zn and B on residual available Cu in the soil after corn harvest (mg kg<sup>-1</sup>)\*

B (kg ha <sup>-1</sup> )	Zn (kg ha <sup>-1</sup> )					Mean
	0	8	16	24	Foliar Spray

#### Residual available boron in the soil

The B amount before harvesting was 0.81 mg kg<sup>-1</sup> and decreased after harvesting in all treatments except the three treatments of 3 kg ha<sup>-1</sup> B (with a residual B content of 1.3 mg kg<sup>-1</sup>), 6 kg ha<sup>-1</sup> B (with a residual B content of 0.83 mg kg<sup>-1</sup>), and joint use of 6 kg ha<sup>-1</sup> B and 8 kg ha<sup>-1</sup> Zn (with a residual B content of 0.83 mg kg<sup>-1</sup>) relative to the its initial level (Table 3). In fact, at no Zn level, the use of B increased residual B in the soil as compared with the its level before culture; but at presence of Zn, B application had no significant effect on the residual B in the soil relative to the its initial level. Reduction of residual B in the soil relative to the initial B has various causes: or B removal by plant has been more than the amount of B in the soil (initial soil B + B fertilizer), or large amount of boric acid was added to the soil, to become unavailable, or small amount of total soil B has been available. Due to high soil pH (calcareous soil) the

amount of boron added to the soil as B fertilizer comes unavailable.

Gupta (1993) reported that after the crop was harvested, lower quantities of hot-water-soluble boron were found in the soil. When boron is released from soil minerals, mineralized from organic matter, or added to soils by means of irrigation or fertilization, part of the boron remains in solution, and part is adsorbed (fixed) by soil particles. An equilibrium exists between the solution and adsorbed boron (Gupta, 2007). Usually more boron is adsorbed by soils than is present in solution at any one time, and fixation seems to increase with time (Jame et al., 1982). Soil factors affecting availability of B to plants are: pH, texture, moisture, temperature, organic matter and clay mineralogy (Goldberg, 1997). Soil reaction or soil pH is an important factor affecting availability of boron in soils. The availability of boron to plants decreases sharply at higher pH levels, but the relationship between soil pH and plant boron at soil pH values below 6.5 does not show a definite trend (Barker and Pilbeam, 2007). Boron retention in soil depends upon many factors such as the boron concentration of the soil, soil pH, texture, organic matter, cation exchange capacity, exchangeable ion composition, and the type of clay and mineral coatings on clays (Gupta, 2007).

Table 2. The effect of Zn and B on residual available B in the soil after corn harvest ( $\text{mg kg}^{-1}$ )\*

B ( $\text{kg ha}^{-1}$ )	Zn ( $\text{kg ha}^{-1}$ )					Mean
	0	8	16	24	Foliar Spray	
0	0.42	0.33	0.45	0.30	0.33	0.37
	b	b	b	b	b	b
3	1.30	0.63	0.78	0.35	0.39	0.69
	a	b	b	b	b	a
6	0.83	0.83	0.71	0.43	0.45	0.65
	b	b	b	b	b	a
Foliar	0.36	0.40	0.38	0.37	0.37	0.38
Spray	b	b	b	b	b	b
Mean	0.73	0.55	0.58	0.36	0.38	
	a	ab	ab	b	b	

\*Means with same letters lack a significant difference at 5% level by Duncan's test

The effect of different Zn levels on the residual B in the soil was significant at 5% level. The highest mean residual B in the soil,  $0.73 \text{ mg kg}^{-1}$ , was seen at no Zn level. The use of 16 and  $24 \text{ kg ha}^{-1}$  Zn, showed no significant difference from the no Zn level, but application of  $24 \text{ kg ha}^{-1}$  Zn and Zn solution spray decreased residual B in the soil from 0.73 at no Zn level to 0.36 and  $0.38 \text{ mg kg}^{-1}$ , respectively (50.7 and

48 percent decrease as compared with the no Zn level). There was no significant difference between the Zn spraying and applying Zn to the soil. No Zn content in the soil helped increasing residual B in the soil relative to levels of Zn applied to the soil.

The main effect of B on the residual B in the soil was significant at 5% level. At no B and spraying B levels where B fertilizer was not applied to the soil, the soil B content after harvesting ( $0.37$  and  $0.38 \text{ mg kg}^{-1}$ , respectively) was less than that of other levels. The use of 3 and  $6 \text{ kg ha}^{-1}$  B increased residual B in the soil from  $0.37$  at no B level to  $0.69$  and  $0.65 \text{ mg kg}^{-1}$ , respectively (86.5 and 75.7 percent increase relative to the no B level), but no significant difference was seen between these two B levels. The minimum residual B in the soil at  $0.37 \text{ mg kg}^{-1}$ , was seen at no B level.

At no Zn level, only application of  $3 \text{ kg ha}^{-1}$  B increased residual B in the soil from  $0.42$  to  $1.3 \text{ mg kg}^{-1}$  (209% increased relative to the no B use at this Zn level), but other B levels had no significant effect. At other Zn levels, B use had no significant effect on the residual B in the soil as compared with no B use at these Zn levels.

At  $3 \text{ kg ha}^{-1}$  B level, Zn application at all levels (to the soil and spraying), significantly decreased residual B in the soil, but at other B levels, Zn application had no significant effect on the soil B content relative to the no Zn use at these B levels. At  $3 \text{ kg ha}^{-1}$  level, the use of 8, 16 and  $24 \text{ kg ha}^{-1}$  Zn decreased residual B in the soil from  $1.3$  to  $0.63$ ,  $0.78$  and  $0.35 \text{ mg kg}^{-1}$ , respectively (51.5, 40 and 73 percent decrease relative to the no Zn use at this B level). Also Zn spraying at  $3 \text{ kg ha}^{-1}$  B level, decreased residual B in the soil from  $1.3$  to  $0.39 \text{ mg kg}^{-1}$  (70% decrease relative to no Zn use), but showed no significant difference when Zn was applied to the soil.

No treatments, except the treatment with the highest residual B in the soil (application of  $3 \text{ kg ha}^{-1}$  B) had no significant difference on the residual B in the soil from the control. Application of  $3 \text{ kg ha}^{-1}$  B, with a residual B in the soil of  $1.3 \text{ mg kg}^{-1}$ , showed 209 percent increase relative to the control, with a residual B in the soil of  $0.42 \text{ mg kg}^{-1}$ . In the control which did not use Zn and B, residual B in the soil decreased 48 percent relative to the initial soil B amount ( $0.81 \text{ mg kg}^{-1}$  B).

#### The correlation between the residual available Cu and B in the soil with other variables

The correlation coefficients ( $r$ ) between different variables by the Pearson method and the relevant equations were obtained by the step by step method using the SPSS software. One can use each of the following equations depending on what are the variables measured and  $r$  and  $r^2$ , but the last equation derived, is the most complete equation containing dependent and independent variables and we must measure more variables to derive that equation. The symbols \* and \*\* in equations and correlation coefficients ( $r$  or  $r^2$ ), are significance at 5% ( $\alpha = 0.05$ ) and 1% ( $\alpha = 0.01$ ) levels.

#### **The residual available Cu content in the soil**

There was a positive correlation between residual Cu in the soil and residual P ( $r = 0.43$ ) and Fe ( $r = 0.84^{**}$ ) in the soil, leaf Zn content ( $r = 0.33$ ), grain Zn content ( $r = 0.37$ ), the percentage of grain in the ear ( $r = 0.69^{**}$ ), and grain protein content ( $R = 0.37$ ), and a negative correlation with leaf Mn content ( $r = -0.36$ ), grain Cu content ( $r = -0.58^{**}$ ) and Cu uptake by the grain ( $r = -0.47^*$ ). The relevant equations were:

$$\begin{aligned} 1) \text{CuS} &= 0.174 + 0.157 \text{FeS} \quad r = 0.84^{**} \\ 2) \text{CuS} &= 0.253 + 0.155 \text{FeS} - 0.14 \text{BS} \\ &\quad r^2 = 0.78^{**} \end{aligned}$$

CuS, FeS and BS are residual Cu, Fe and B in the soil ( $\text{mg kg}^{-1}$ ), respectively.

#### **The residual available B content in the soil**

The residual B in the soil showed a positive correlation with the residual Mn in the soil ( $r = 0.37$ ) and leaf B content ( $r = 0.36$ ) and a negative correlation with leaf N content ( $r = -0.54^*$ ) and P content ( $r = -0.35$ ). The equation was:

$$\text{BS} = 3.232 - 1.136 \text{NL} \quad r = 0.54^{**}$$

BS and NL are residual B in the soil ( $\text{mg kg}^{-1}$ ) and N concentration in the leaf (%), respectively.

#### **Conclusion**

The residual Cu in the soil increased in all treatments relative to its initial level. The effect of Zn and B on the residual Cu in the soil was insignificant relative to the no Zn and B level. Also the Zn and B interaction on the residual Cu in the soil and the effect of all treatments relative to the control was insignificant. The residual B in the soil in all treatments decreased relative to the soil B content before planting. At no Zn level, B application to the soil increased residual B in the soil as compared with its initial level. Therefore, the presence of Zn in the soil prevented from increase of the residual B in the soil, by B application. The main effect of Zn and B

on the residual B in the soil was significant relative to the no Zn and no B levels. The highest and the lowest residual B in the soil were seen at no Zn and B levels, respectively. Application of Zn at a high amount decreased residual B in the soil relative to the no Zn level. Boron application to the soil at all levels, increased residual B in the soil relative to the no Zn level. many factors such as soil tillage, irrigation, root secretions and NPK, Zn and B fertilizers affected on the residual available Cu and B content in the soil relative to the its initial.

# Preparation of spherical silica nanoparticles: Stober silica

**Ismail A.M. Ibrahim\*, A.A.F. Zikry, Mohamed A. Sharaf**  
**Chemistry Department, Faculty of science, Helwan University, 11795 Egypt**  
 \* [ismailscience@gmail.com](mailto:ismailscience@gmail.com)

**Abstract:** The diameter of silica nanoparticles is mainly affected by the relative contribution from nucleation and growth. Once the total number of nuclei is fixed, the resultant particle size is then determined via the growth process by the total quantity of TEOS. In this work, we will demonstrate the effect of TEOS and NH<sub>3</sub> concentrations on particle size of silica nanoparticles. Experimental results indicate that the size of silica colloids decreases with increasing with TEOS and ammonia concentrations where both the rate of hydrolysis and condensation become faster and influence the solubility of intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-x</sub>(OH)<sub>x</sub>] and hence the supersaturation for the nucleation process. With higher catalyst concentration, the number of nuclei is increased and therefore smaller silica colloids are obtained. Also surface modification of the silica nanoparticles by hexamethyldisilazane was studied to prevent the particles aggregation and to give good dispersion of silica nanoparticles in hydrophobic mediums.  
 [Ismail A.M. Ibrahim, Amina Zikry, Mohamed A. Sharaf, Chemistry Department, Faculty of science, Helwan University, Egypt. Journal of American Science 2010;6(11):985:989]. (ISSN: 1545-1003).

**Keywords:** Stober silica; nucleation; hydrolysis; condensation; nanoparticles; surface modification

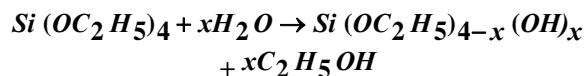

## 1. Introduction

Silicon is present in environment in different forms. Although it is not found in nascent form but it is always present in combination with oxygen (as in silica) or hydroxides (As in silicic acid). 78% of earth's crust consists of silicon and oxygen compounds, both amorphous and crystalline compounds for example quartz, flint, opal, silicates etc. Silicon is also present in dissolved form in the oceans as silicic acid. Also silica is found in living organisms like sponges, grasses, algae (for example, diatoms) (C.G. S. Phillips and R. J. P. Williams, 1965; T. L. Simpson and B. E. Volcani, 1981; R. K. Iler, 1979; S. V. Patwardhan, 2003).

The Stober process used for the preparation of monodispersed silica colloids 'white carbon black' by means of hydrolysis of alkyl silicates and subsequent condensation of silicic acid in alcoholic solutions using ammonia as catalyst was first published in 1968 (W. Stober et al., 1968). Ever since, there have been many research groups who applied those monodispersed silica colloids as model material in various applications. Sacks and Tseng utilized those colloids to pack ordered structure membrane and investigated its sintering behavior (M.D. Sacks and T.Y. Tseng, 1984). Unger et al. on the other hand applied these submicron silica colloids as packing material for capillary chromatography (S. Ludtke et al. 1997; K. K. Unger et al., 2000). In addition, there are a lot of recent investigations on using those monodispersed silica colloids to fabricate photonic crystals of 3D periodic structure (V. N. Stratov et al. 1996; H. Miguez et al., 1997). For all

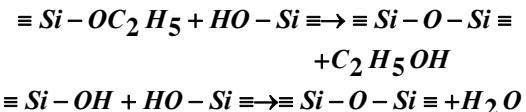

these different applications, it would always be desirable to use silica particles with a specified particle size and extremely narrow distribution.

Like any other synthesis of colloids, the diameter of silica particles from the Stober process are mainly controlled by the relative contribution from nucleation and growth. The hydrolysis and condensation reactions provide precursor species and the necessary supersaturation for the formation of particles will be briefly described as follows. During the hydrolysis reaction, the ethoxy group of TEOS reacts with the water molecule to form intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-x</sub> (OH)<sub>x</sub>] with hydroxyl group substituting ethoxy groups. Moreover, ammonia works as a basic catalyst to this reaction; the hydrolysis reaction is probably initiated by the attacks of hydroxyl anions on TEOS molecules (C. J. Brinker and G. W. Scherer, 1990). The chemical reaction is expressed as follows:

Following the hydrolysis reaction, the condensation reaction occurs immediately. The hydroxyl group of intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-x</sub> (OH)<sub>x</sub>] reacts with either the ethoxy group of other TEOS (alcohol condensation) or the hydroxyl group of another hydrolysis intermediate (water condensation) to form Si-O-Si bridges. Furthermore, it was also claimed (K. S. Kim et al., 2002) that the rate of water condensation is thousands times faster

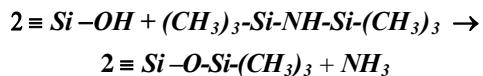

than the alcohol condensation. Both condensation reactions can be expressed as follows:

The overall reaction can then be depicted as follows:

The reactions of organosilicon compounds in acid-base reactions at oxides with surface OH groups are of technological importance in diverse fields (Leyden D. E., 1985). Because of its high reactivity with silica surface silanols, a system which has been widely used is silica reacted with hexamethyldisilazane (HMDS) to form trimethylsilylgroups and the particles become hydrophobic (Vasant E. F. et al., 1995):

Even though this system is widely employed for the synthesis of industrially useful materials, the structural element in HMDS most influential in determining its reactivity with silica surface silanols is the basic nitrogen (Dabrowski A. and Tertykh V. A., 1996).

The effect of various parameters on particle size had been reported in a previous paper (K.S. Chou and C.C. Chen, 2003). Here we discuss the effect of TEOS and catalyst concentrations on the particle size and also the effect of surface modification on the dispersion of the particles was discussed.

## 2. Material and Methods

### 2.1 Materials

The materials required for the synthesis of silica nanoparticles are described as follows. Tetraethyl orthosilicate (TEOS 98%) was obtained from the Fischer Company, Ammonium hydroxide solution 31.5% (NH<sub>3</sub>) was used as received from the Aldrich Company, Absolute ethanol 99 % from ADWIC Company. The materials required for Preparation of organically modified silica are described as follows. Silane coupling agent (hexamethyldisilazane) was obtained from fluka and used without further purification. Toluene was obtained from ADWIC Company.

### 2.2 preparations of Silica nanoparticles

Silica nanoparticles were prepared by hydrolysis and condensation of TEOS in ethanol, and in presence of ammonia as catalyst (W. Stober et al., 1968). First, solution containing appropriate quantities of absolute ethanol, ammonia and deionized water were stirred for 5 minutes to ensure complete mixing. Then a proper amount of TEOS in absolute ethanol was added to the above solution and the reaction proceeded at ambient temperature for 24 hours according to reactants concentrations. Thereafter the colloidal solution was separated by high-speed centrifuge, and the silica particles were washed by absolute ethanol for three times to remove undesirable particles, Followed by drying in oven at 100 °C for 2 hrs to prevent continuous reaction.

### 2.3 Preparation of organically modified silica

After a thermal treatment at 150°C for 2 h to remove physisorbed water, a given amount of silica is put in a glass flask equipped with an amount of toluene then the liquid reagent (10% hexamethyldisilazane in toluene) is added and the mixture is stirred and refluxed at 110°C for 3h. After treatment, the solid is filtered and repeatedly washed with toluene and acetone in order to remove any unreacted silane coupling agent, and finally dried at 150°C for 2h.

### 2.4 Transmission electron microscope analysis

TEM analyses of silica particles were carried out using JEOL JEM 2010 on silica particles to investigate the diameter of silica particles. To prepare samples for TEM analysis, silica powder is dispersed in absolute ethanol and a drop of silica colloid solution was placed on a copper grid coated with carbon. The solvent was evaporated at room temperature, leaving the silica particles on the grid.

## 3. Results and Discussions

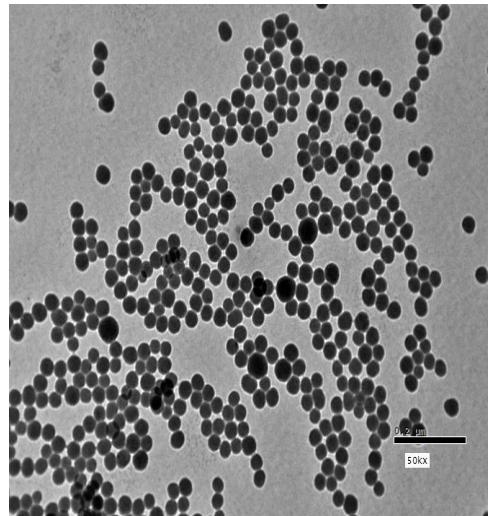

### 3.1. Mechanism of particles formation

Based on the particle formation mechanism in the sol - precipitation process (G.H. Bogush and C. F. Zukoski, 1991), a huge number of primary particles is first nucleated in the initial high supersaturated solution "induction period". Then, the primary particles are rapidly aggregated to form stable particles, which grow with the further aggregation of primary particles. After this particle induction period, any further primary particles generated under supersaturation are consumed for the growth of stable particles. As such, the resulting particles in the product suspension were highly monodispersed in size and spherical in shape,

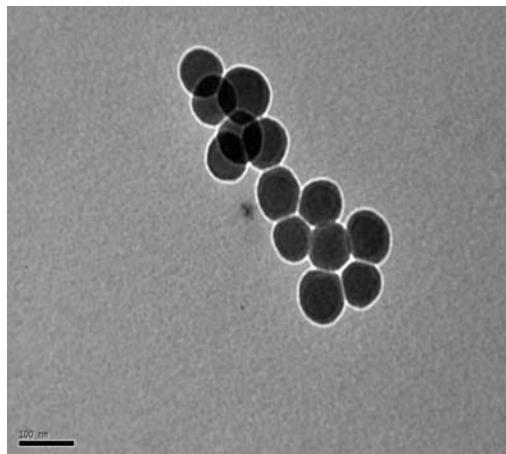

However, if the generation of primary particles by supersaturation exceeds the consumption of primary particles for the growth of stable particles during sol - precipitation, new stable particles are spontaneously formed by the self -aggregation of the extra primary particles, resulting in a multi -modal distribution of particle sizes in the product suspension (S.L. Chen et al., 1997). Yet, in the present study, the monodispersity of the particle size was maintained even over a wide range of TEOS, H<sub>2</sub>O, and NH<sub>3</sub> concentrations, implying that the population of stable particles formed during the induction period was sufficient to consume the primary particles nucleated after the induction period. Furthermore, the initial supersaturation level (supersaturation level during induction period) was critical in determining the particle size of the product suspension in the sol - precipitation, as the higher particle formation with a higher initial supersaturation resulted in a smaller particle size in the product suspension.

### **3.2. Effect of TEOS concentration on size of particles**

In Figures 1and 2 they show that the silica particles are spherical and there is no wide distribution in the particles sizes. The particle size increases with TEOS concentration, ranging from 0.2 to 0.4M while ammonia and water concentrations are fixed at 0.2M and 1.0 M respectively. When TEOS concentration is increased; both the rate of hydrolysis and condensation become faster (G.H. Bogush and C. F. Zukoski, 1991). As a result, the intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-X</sub> (OH)<sub>X</sub>] will be increased rapidly due to the high hydrolysis reaction; however, as it reaches the supersaturation region, the consumption rate of intermediate through condensation reaction is also relatively fast (S.L. Chen et al., 1997), which probably shortens the nucleation period. Thus, the total number of nuclei formed will be less in numbers, and the final particle size of synthetic silica colloids will be relatively larger as exhibited in Figures 1 and 2 under the constraint of the same total ammonia and water concentrations in these cases.

**Figure 1** TEM of Silica nanoparticles ~50nm  
(experimental conditions: TEOS: 0.2M; NH<sub>3</sub>: 0.2M; H<sub>2</sub>O: 1M)

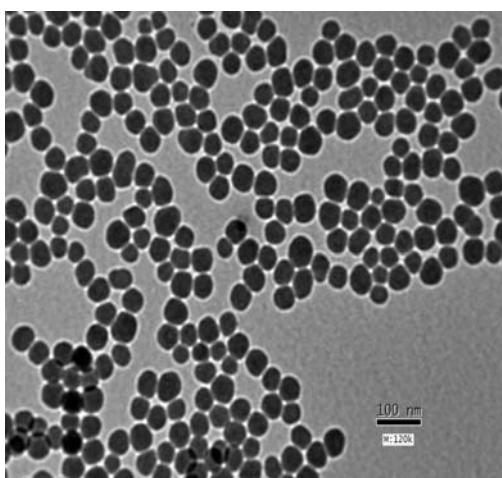

**Figure 2** TEM of Silica nanoparticles ~65nm  
(experimental conditions: TEOS: 0.4M; NH<sub>3</sub>: 0.2M; H<sub>2</sub>O: 1M)

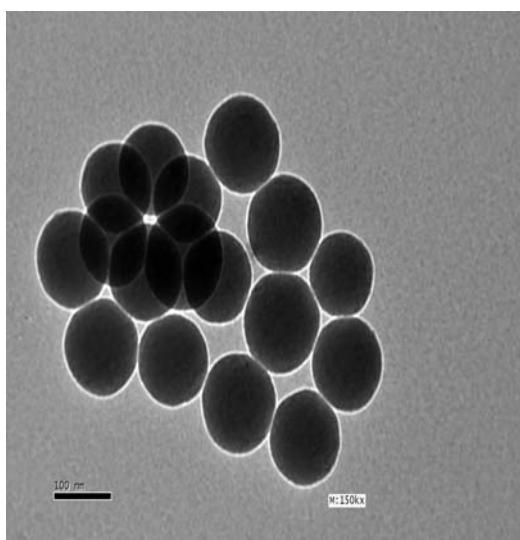

### **3.3. Effect of catalyst concentration on size of particles**

In Figures 3 and 4 they show also that the silica particles are spherical and there is a distribution in the particles sizes at low ammonia concentration. The particle size increases with ammonia concentration, ranging from 0.11 to 0.3 M while TEOS and water concentrations are fixed at 0.28M and 1.0 M respectively. When ammonia is increased, also both the rate of hydrolysis and condensation become faster. And the intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-X</sub> (OH)<sub>X</sub>] will be increased rapidly due to the high hydrolysis reaction; however, as it reaches the supersaturation region, the consumption rate of

intermediate through condensation reaction is also relatively fast, which probably shortens the nucleation period. Thus, the total number of nuclei formed will be less in numbers, and the final particle size of synthetic silica colloids will be relatively larger as exhibited in Figures 3 and 4 under the constraint of the same total TEOS and water concentrations in these cases.

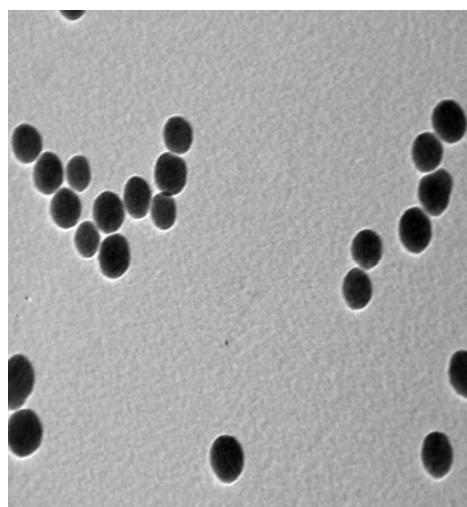

**Figure 3** TEM of Silica nanoparticles ~55nm  
(experimental conditions: NH<sub>3</sub>: 0.11M; TEOS: 0.28M; H<sub>2</sub>O: 1M)

**Figure 4** TEM of Silica nanoparticles ~130nm  
(experimental conditions: NH<sub>3</sub>: 0.3M; TEOS: 0.28M; H<sub>2</sub>O: 1M)

### 3.3. Effect of surface modification on dispersion of silica particles

Figure 5 shows the TEM image of silica nanoparticles modified with hexamethyldisilazane. The figure shows the good dispersion of the particles. This is attributed to that, the particles posses some organophilic characters after treatment with hexamethyldisilazane where the surface OH groups will convert to [-CH<sub>3</sub>)<sub>3</sub>] groups that results in the segregation of the particles.

**Figure 5** TEM of Modified Silica (experimental conditions: TEOS: 0.18M; NH<sub>3</sub>: 0.2M; H<sub>2</sub>O: 1M, 10% HMDS in toluene)

### 4. Conclusion

Herein, we have studied the effects of TEOS and catalyst (NH<sub>3</sub>) concentrations on the resulting particle size of synthetic silica colloids. Our results are discussed in terms of relative contribution from nucleation and growth processes. Any parameters, which increase the rate of hydrolysis, tend to produce fewer nuclei during the nucleation process and therefore a larger particle size in the end. The surface modification by silane coupling agent gives hydrophobic character to the silica nanoparticles.

**Abstract:** This work aimed to study the early postpartum dietary practices among a group of Saudi women. A retrospective study was carried out on a convenient sample of 300 women during their post-partum period who attended seven primary health centers in Riyadh and Taif, KSA. The subjects were interviewed individually throughout a period of four months from September 2009 to January 2010. An interview questionnaire and a dietary scale of King and Jakobson were used for data collection. The results showed that 73.3% of the study subjects had incomplete knowledge about post-partum nutrition and an equal proportion of them (28.3%) had either excellent or borderline dietary practices during their early post-partum period and about one-fifth of them (19.3%) had dangerous dietary practices. The study concluded that Saudi women's post-partum dietary practices were significantly associated with their general characteristics such as age, education, employment and number of family member as well as with their obstetrical characteristics including their gravidity and parity.

**Keywords:** postpartum; dietary; Saudi; women

### **1. Introduction:**

The postpartum period, or puerperium, starts about an hour after the delivery of the placenta and includes the following six week (Nian et al., 2006). By six weeks after delivery, most of the changes of pregnancy, labor, and delivery have resolved and the body has reverted to the non-pregnant state (Cunningham et al., 1997).

A good postpartum care and well balanced diet during puerperal period can influence her health for rest of her life (Pillitteri, 2007). After vaginal birth, there are no dietary restrictions for woman without underlying medical conditions or pregnancy-induced complications. Woman should be encouraged to drink 3.000ml of water and other liquids every 24 hours to restore the fluid balance altered by fluid loss during labor and birth process. Healthy food choices are encouraged with respect for ethnic and cultural preferences, while after cesarean birth, woman usually receives clear liquids until bowel sounds are present and then advance to solid foods. For each 20 calories of breast milk produced, the woman must consume an additional 30 calories. This results in a dietary increase of 500 to 1.000 calories each day for woman who is maintaining body weight (Kathleen and Patricia, 2001).

Unfortunately, many women consume less than the recommended amounts of calcium, magnesium, zinc, vitamins B<sub>6</sub>, and folate (Institute of Medicine, 1992). New mothers are likely to stop

taking prenatal vitamins which result in nutritional deficiency during their postpartum period and necessitate a restitution of prenatal nutritional supplementation. Prenatal supplements generally do not include a significant amount of calcium, in addition during lactation; 250 – 350 mg of calcium is transferred daily from the mother to the neonate through breast feeding. Woman should be apprised of the need for additional supplementation to meet requirement for this key mineral (Olson et al., 2003). Postpartum nutritional counseling can be tailored to the individual woman based on risk factors for poor nutrition such as extremes of maternal age, excessive weight gain during pregnancy, deviation from ideal body weight, multiple gestation, and history of eating disorders, close interconceptional period and highly restrictive diet due to traditional and religious practices(Olson et al., 2003).

The postpartum dietary and lifestyle habits vary greatly among different countries and cultures (Yeoun, 2003). In western countries, instead of restrictions, women are encouraged to eat a well-balanced diet from all food categories and start physical exercises during this period (Artal et al., 2003 &WHO, 1998). In Asia, postpartum maternal food restrictions (food avoidances) are common practices, which may have important health consequences in reducing the nutritional content of breast milk, inadequate breastfeeding and weaning

practices contribute to high rates of malnutrition and infant and child mortality (Barennes et al.,2007).

In gulf region, the nutritional assessment studies revealed that there are many nutritional problems. In Saudi Arabia, in spite of the vast economic advancement and availability of all types of food in the market, the general observation among the Kingdome communities surveyed was the low intake of various nutrients. On the other hand, several researchers in the Kingdome of Saudi Arabia recommended that the nationwide studies should be conducted to assess the magnitude of nutritional problems, the causative and related socio-cultural factors (Salma et al., 1990). So, this study aimed to identify the early post-partum dietary practices among a group of Saudi women.

## **2. Subjects & Methods:**

### Research design:

A retrospective study was carried out on women who interviewed individually in their post-partum period and asked to report their post-partum dietary practices within 24 hours.

### Setting:

The study was conducted at seven primary health care centers representing the different sectors of urban areas in Riyadh and Taif cities, KSA, namely, West-Naseem, East Naseem and El Rabwa health centers at Riyadh and Oudh, West El-Madina, El- Hawia and Ganoub El-Shohada El-Ganoubia health centers at Taif.

### Subjects:

A convenient sample of three hundred women attending the previously mentioned setting during their post-partum period was included in the study throughout a period of four months from September 2009 to January 2010.

### Tools of data collection:

#### Tool I:

An interview questionnaire sheet was designed for data collection and included the following parts:

Part I: Comprised the socio-demographic and obstetric characteristics of the study subjects such as age, level of education, occupation, type of the family, family income, food budget. Also, obstetrical characteristics of the study subjects such as their gravidity, parity and history of abortion were included in that part.

Part II: It included questions related to women's dietary knowledge and practices during the post-partum period with 24 hours diet recall sheet.

Tool II: A dietary scale of King and Jakobson (Zackler&Brandstadi, 1975) was translated to Arabic, modified and used to assess the dietary practices of the study subjects and to analyze the diet consumed throughout 24 hours by the puerperal women. The scale contained data related to four food groups as follows:

Group one, milk or choice from the milk food list; the amount required daily is four servings (the score was four points per serving, with a total score of 16 points).

Group two, meat or choice from the meat food list; amount required daily is three servings. (the score was 2.7 points per serving, with a total score of 8 points).

Group three, vegetables and fruits" dark green or yellow" the amount required daily is one serving scored with 3 points. Cooked or raw vegetables, the amount required daily are 2 serving (The score was 2 points for each serving with a total score of 4 points). Citrus fruits, the amount required daily are one serving scored with three points. Others fruits" fresh or canned", the amount required daily is one serving with one point score.

Group four, bread and cereals; the amount required daily is four serving (one point per serving with a total of 4 points. A total score of 60 means excellent dietary practices, 54-59 means good dietary practices, 48-53 means borderline and below 48 means danger dietary practices.

### Methods:

- 1- Official permission to carry out this study was obtained from the previously mentioned settings.
- 2- The dietary scale was translated into Arabic language by the researchers and verified by bilingual assessors specialized in the field.
- 3- A pilot study was carried out on 30 women selected from primary health care centers and was not included in the study subjects, to ascertain the relevance of the questions and to detect any further problems peculiar to the sequence and clarity of the tool. Based on the results of the pilot study, the questionnaire sheet was reconstructed and made ready for use.
- 4- Each woman was interviewed individually to collect the necessary data and asked to recall her food intake in the last 24 hours.
- 5- Women's knowledge about post-partum nutrition was scored. The correct answers were predetermined according to literature. A score of one was given to each correct answer and score of zero to the wrong answers. The score ranged from zero to two and the total score was classified according to the following: a score of 50 or above denotes good knowledge, while a

- score of 30 to less than 50 considered fair and less than 30 was scored as poor knowledge.
- 6- The dietary practices were determined by comparing the food eaten during their last 24 hours with the four food groups and the total score of the dietary practices was compared with that of King and Jacobson, 1975 scale.
  - 7- The collected data were categorized, tabulated and made ready for analysis.

#### Statistical analysis:

The collected data were coded and analyzed using SPSS version 10 for windows. Women's early post-partum dietary practices were examined for association with a variety of demographic and obstetrical characteristics of the study subjects using Chi-squared test with significance when  $p \leq 0.05$ .

### 3. Results

The general characteristics of the study subjects showed that 30% of them aged from 30 to less than 35 years old, about one-half of them (48.3%) were illiterate or just read and write, most of them (90.3%) were housewives and about three-quarters of them (75.3%) lived in extended family and more than one-half of them (55%) their family members ranged from 4 to 10 persons. Less than one-third (31.7%) of the study subjects had history of three gravida with slightly more than one-third (34%) of them had 3 deliveries and 91.7 % of them had no history of abortion (table I).

On assessing food budget and responsibility about food, it was observed that more than two-thirds (68.3%) of the study subjects had enough food budget while, less than one-third (31.7%) of them didn't have enough budget. Responsibility regarding food budget fall on father in law among 71.7 % of the study subjects while, mother in law was responsible about food choice among 45% of the study and about three-fifth (59.3%) of them were responsible about food preparation (table II).

Concerning knowledge of Saudi women about post-partum nutrition, the results of the present study revealed that more than one-half (54%) and less than one-third of them (30.7%) either had correct but incomplete knowledge or wrong answer regarding the definition of well-balanced diet respectively. Correct but incomplete answer was found among 73.3% of the study subjects regarding the importance of well-balanced diet and among more than four-fifth (83.7%) of them regarding the different food groups (table III).

It was noted that an equal proportion of the study subjects (28.3%) had either excellent or borderline dietary practices during their early post-partum period and about one-fifth of them (19.3%) had dangerous dietary practices (table IV).

The distribution of the study subjects according to food groups consumed within 24 hours showed that milk or milk group was not taken by more than two-thirds (68%). 84.7% and 76.7% had incomplete intake of meat group and vegetable group respectively (table V).

As regards food which are increased during early post-partum period, it was found that one-half (50%) of the study subjects increase chicken, slightly more than one-third of them (34%) increase honey with dates, more than one-quarter (26.7%) increases intake of vegetables and fruits, while an equal proportion of them (24%) increase intake of fish and meat. The most given reason for increased food was to replace blood loss (48%). Carbohydrates were among food to be decreased during that period by 30 % of the study subjects and more than one-half of them (53%) relate this to traditional reasons. About three-fifth of the study subjects (59%) didn't eliminate special types of food during their early puerperal period (table VI).

It was observed that only 15 % of the study subjects were more likely to drink 8 to 10 cups of fluid daily. Arabic coffee was mentioned by most of them (99%) among the different types of fluid to be taken during their early post-partum period followed by herbal tea (50%) and black dotes (46%), (table VII).

A significant association was observed between Saudi women's dietary practices during their early post-partum period with their general characteristics such as age, education, employment and number of family member as well as with their obstetrical characteristics including their gravidity and parity ( $p \leq 0.05$ ), (table VIII).

### 4. Discussion:

The postpartum period is a very special phase in the life of a woman. Her body needs to heal and recover from pregnancy and childbirth, a good postpartum care and well balanced diet during the puerperal period is very important for her health. Several studies indicated that the incidences of postpartum health problems are high and these problems maybe have relation to traditional and unscientific dietary and behavior practices in the postpartum period (Nian et al., 2009).

The results of the study denoted that considerable percent (around three-quarters) of the study subjects had correct but incomplete knowledge about post-partum nutrition, while the score of the dietary practice of about one-half of them tends to be at the borderline or dangerous. These results are congruent with (Nian et al., 2009) who found that increased nutrition and health care knowledge did not lead to parallel dietary and health behavior changes, this apparent incongruence may be related to the fact that in Saudi Arabia, the tradition to support a newly delivered woman and her baby for the first month after childbirth at home is still common, where more than three-quarters of the women in the study lived in extended family and they may had an elder female of the family such as her mother or mother-in-law as the support person. The elder female who takes care of the women may have hindrance the change due to traditional believes (Nian et al., 2009).

Incomplete intake of the daily requirement of the different food groups was observed among Saudi women in this study where, milk and milk products were not taken at all by more than two-thirds of the study subjects during their early post-partum period. Such harmful practices should be negated as mothers during the post-partum period are in need for more calcium as essential component in milk production (Abraham et al., 2001 and Olds et al., 2004).

Meat group was inadequately taken by more than four-fifths of Saudi women in the study, one-half of them increase chicken intake during the post-partum period and only 24% of them increase intake of red meat and fish prepared in a unique Saudi Arabian way such as Mazby and Mandy. These results are supported by Juliana et al., (2008) who reported that, according to women in his study, some meats are problem causing for health, especially pork, fish and beef. It is not advisable to consume these animals' meat if they are neutered, nor their guts. One of the permitted meats is poultry, mainly used to prepare chicken soup and considered to be substantial light food.

The daily intake of vegetables and fruits was inadequate among more than three-quarters of the study subjects. Congruent with this, a study performed in Egypt by Wafa et al., (2004) who found that the majority of the Egyptian women in her study subjects had harmful dietary practices where, 66.3% & 82 % did not take their daily requirement of meat and vegetables group respectively. These results may attributed to the fact that mother in law was responsible about food preparation among 59.3% of the study subjects. Puerperal diet arranged by mother or mother-in-law was the negative influencing factor of vegetable intake (Nian et al., 2009).

Carbohydrates, salty and spicy food were among the food restricted or avoided by Saudi women in the study either for traditional reasons or to avoid infection and weight gain. In agreement with this Yeoun (2003), who stressed that culturally specific dietary prescriptions are common in the postpartum period among non-Western countries, the choice of certain cultural foods by non-Western women should be respected, if there are no dietary restrictions for health reasons.

A minority of Saudi women in the study had adequate daily fluid intake during their puerperium. Arabic coffee, herbal tea and nigella sativa (black seeds) were the mostly fluid taken during that period. This is a pleasant way for many women to increase fluid intake but the nurse should alert the women that excessive intake of coffee interferes with the absorption of supplemental iron and may have important health consequences in reducing the nutritional content of breast milk (Barennes et al., 2007).

A significant association was observed between the Saudi women's dietary practice and their general characteristics such as their age, education, occupation, number of family members as well as their gravidity and parity. These results are supported by Nian et al., (2009) who observed that although the traditional postpartum beliefs and practices abound, the level of adherence differs according to the socio-economic structure of the women and their families.

## 5. Conclusion:

It can be concluded that considerable percent of the Saudi women had incomplete knowledge about post-partum nutrition with an observable borderline and dangerous post-partum dietary practices that significantly related to their socio-demographic as well as their obstetric characteristics.

## Recommendations:

Antenatal clinic should develop education programs on postpartum nutrition and health care for pregnant women and their family members. Some of the antenatal visits should be extended to early postnatal visits to follow up and guide the women on contemporary postpartum practices, which will enable women to practice them. Moreover, further prospective studies are needed to explore the relationship between post-partum dietary practices and women's health outcomes.

**Abstract:** In recent years data mining has become a very popular technique for extracting information from the database in different areas due to its flexibility of working on any kind of databases and also due to the surprising results. This paper is an attempt to introduce application of data mining techniques in the manufacturing industry to which least importance has been given. A taste of implementable areas in manufacturing enterprises is discussed with a proposed architecture, which can be applied to an individual enterprise as well as to an extended enterprise to get benefit of data mining technique and to share the discovered knowledge among enterprises. The paper proposes conceptual methods for better use of different data mining techniques in product manufacturing life cycle. These techniques include statistical techniques, neural networks, decision trees and genetic algorithms. An integrated and unified data mining platform is anticipated then to improve overall manufacturing process.

**Keywords:** Data Mining, Manufacturing, Industrial application, Data Mining methodologies, Data Warehousing

## 1. Introduction

The progress in data acquisition and successful development of storage technology at cheaper rates, along with limited human capabilities in analyzing and understanding big databases have tempted scientists and researchers to move forward towards the specific field of knowledge discovery in databases (KDD). This recently emerged discipline, lies at the intersection of data management, artificial intelligence, machine learning and statistics. Data Mining is the search for valuable information in large volumes of data. It is a cooperative effort between humans and computers. Humans design databases, describe problems and set goals; computers sift through data, looking for relationships and patterns that match these goals. The central step within the overall KDD process is data mining, the application of computational techniques in the task of finding patterns and models in data. The major areas enjoying the benefits of KDD include banking, finance, business and medical sciences. Many companies including manufacturing enterprises all over the world, are now giving attention to the utilization of KDD technology for the improvement in their current status.

KDD has not commonly been used in manufacturing enterprises. The reasons for this are not certain, but it may be because of the long time scales and expenses involved in introducing new techniques in this area and also because of lack of awareness of

the benefits offered by this new data mining technology. An alternative possible reason might be the complexity and diversity of different manufacturing processes as these make it very difficult to devise a generic data mining process that can be used for all kinds of manufacturing processes and can handle all types of manufacturing problems. Data is stored in most manufacturing enterprises for quality control and traceability reasons or sometimes for simple statistical analysis to provide information on where the enterprise is currently standing against its past performance or its competitors. These databases may also be consulted if any problem occurs in the manufacturing process but the operational knowledge that exists within these databases is generally not exploited beyond these types of activities.

Competitive improvement can be achieved in many ways, for example by improving the quality of products or by reducing the material waste, production or overhead costs, or by decreasing the time to launch a new or improved product. Data Mining can support these improvements, through the extraction of knowledge from either existing data warehouses, or from current production data. Applying this knowledge can help to improve the quality of products by better controlling the manufacturing processes and methodologies, and by keeping product and production parameters in range.

Computer integrated manufacturing systems as well as more simply controlled enterprises, gener-

ate huge amounts of data daily but even when companies appreciate the importance and value of this information, people seldom try to explore their databases thoroughly, because of other 'urgent' commitments towards their engineering and technical duties. The usual approaches for addressing and controlling problems that arise in manufacturing areas is through the application of engineering knowledge and experience. Yet these problems may also be tackled and solved by analysing the available operational information directly. This involves sifting through past data that exists in the enterprise's databases to see if any trends exist, or are emerging that may be causing specific defects or faults. Therefore, data mining techniques could be applied to improve exploitation of valuable information and knowledge sources, to better control the system and also to check the strategic gains and losses during the manufacturing.

Competitiveness increasingly depends on the quality of decision making and improving the quality of decision making from past information and decisions [1]. Improved knowledge of manufacturing capabilities and products enables engineers to better target their future production strategies. Searching through data may identify unknown or hidden patterns and relationships in existing databases. This knowledge may then be utilised to improve the production process and hence the quality of product as well as the whole manufacturing system.

Basically data mining is concerned with the analysis of data and the use of software techniques for finding patterns and regularities in sets of data. It is the computer, which is responsible for finding patterns by identifying the underlying rules and features in the data. The idea is that it is possible to strike gold in unexpected places as the data mining software extracts patterns not previously discernable or so obvious that no one has noticed them before.

Data mining analysis tends to work from the data up and the best techniques are those developed with an orientation towards large volumes of data, making use of as much of the collected data sets as possible to arrive at reliable conclusions and decisions. The analysis process starts with a set of data and uses a methodology to develop an optimal representation of the structure of the data, during which time knowledge is acquired. Once knowledge has been acquired the process can be extended to larger sets of data working on the assumption that the larger data set has a structure similar to the sample data. Again this is analogous to a mining operation where large amounts of low-grade materials are sifted through in order to find something of value.

In the section two we will describe, at a high level, areas in manufacturing enterprises where benefit can be gained from data mining technology. We

shall also provide some details of design constraints and discuss how product life cycle data can be used to explore and discover knowledge by using data mining techniques. Section three covers data warehousing, as this plays an important part in implementing data mining and saves time spent on the initial steps required for data pre-processing. The fourth section is about the real technology of data mining, a brief background and description of some of its popular tools are given, in the perspective of manufacturing enterprises. In the last section an integrated data mining model is proposed, keeping in mind the requirements of manufacturing enterprises and how a generic data mining system can fit within a manufacturing system.

## **2. Manufacturing System Design and Performance Improvement:**

The importance of data oriented knowledge discovery techniques cannot be denied in any industry. Manufacturing enterprises in particular normally generate quantities of data at every step of the manufacturing processes from design through to the disposal of the product, and generally, most of this data is not fully exploited. Currently there is very little research being carried out in the manufacturing sector into the application of data-oriented knowledge discovery techniques.

Efforts have been made in the recent past to utilize the databases from manufacturing enterprises for design and quality control processes for example the factory data model [2][3] and data warehouses. The factory data model proposed in [2] promotes better exploitation of the information residing in the databases. It is however very difficult to design a data supported manufacturing enterprise which can gain the benefits of their historical as well as their current databases.

In manufacturing systems involving small sized products in very large volumes, for example in the semiconductor industry, quality checking has always been a problem and detecting any process abnormality as early as possible becomes more crucial than ever. Similarly in the production of very large sized products with small volumes it is desirable to maintain the non-conformities level to a minimum. The aim of current manufacturing systems is to decrease the time from occurrence of a fault to its detection. The shorter the identification time the more controlled the manufacturing system is. It is therefore important to learn from both past problems and successes, and to use this existing knowledge to improve product designs.

### ***Design and Re-usability of knowledge:***

Design can be defined as “effective allocation of resources”[4]. Alternatively, Pahl and Beitz [5] describe it as “a process of synthesis and integration”. The most comprehensive definition is given in [6] which states, “Systematic, intelligent generation and evaluation of specifications for artefacts whose form and function achieve stated objectives and satisfy specified constraints.” In their opinion, an engineering design does not directly result in a physical product compared with other design domains but rather, it provides a set of specifications to construct or fabricate the products.

Conceptual design, layout design, drafting and design analysis all create data, (which in turn may be used as the basic raw material for a data mining process). Product and process faults may occur at any stage of the product’s life cycle, hence, it is possible that certain faults can be traced back, using the data from the design and the design process. Earlier computer aided designs or old design drafts can be reused and be very helpful in the redesign of the product providing they can be analysed in a sensible way. A potential difficulty exists when attempting to re-use previous design knowledge that exists in the form of archival design documents, testing and analysis reports [7]. The difficulties lie in the forms in which the data has been archived, as some paper-based or hard forms are difficult and slow (and therefore expensive) to search and reuse. Therefore when designers or managers want to consult (and learn) from these designs or previous results the costs may be substantial in terms of time and overheads. Designers spend 20-30% of their time looking for information and same amount of time in handling information. Therefore any design system should incorporate all the designers’ own files, to make information easy to find and easy to use [7].

Data searching and retrieval become less of a problem when information is computer based. However substantially more efforts than are commonly used at present are needed to reuse such knowledge effectively. Data Mining could provide a solution to these problems by finding relationships between design problems and production problems or other aspects relating to the product life cycle. Manufacturing system design requires considerable amounts of information to be collected, and processed in order to improve the design and performance of the processes. Several information modelling techniques, and processing methodologies are already in use as described in detail within [2][3].

The popularity of computer aided design (CAD) and computer integrated manufacturing (CIM) have increased the amount of available digital data. This is easy to store and recover or search,

helping the modern manufacturing enterprise to make better use of computing power in the analysis of its valuable data. Many researchers believe that computational approaches to design should enhance, not replace, human practice [8] [9]. With the help of knowledge discovery in databases, the causes and contributory factors to faults may be more clearly identified, enabling human designers to focus and concentrate their efforts on important problem areas and thus the time to design or redesign a product can be reduced.

It is generally important to consider how a product will be produced in parallel with the design of the product. Improvements to the manufacturing system can also result in improvements to the product. The manufacturing system, modelling and design, will therefore now be considered in the context of data mining.

#### ***Advanced Manufacturing Systems:***

A primary challenge, which must be faced by manufacturing enterprises in their response to changes in world markets, is the speed at which changes need to be made. Information modelling is one approach to support changes to enterprise design and more information on enterprise modelling can be traced back from [10] [11] [12]. Successful manufacturing system designs are often created iteratively, initially from small amounts of information, which progressively gain detail as the design for the enterprise progresses. Modelling the whole enterprise is a long and complex task, and a model may not be completed in time to meet whatever challenge triggered the need for change i.e. the model may be overtaken by events [2].

Advanced manufacturing enterprises are more flexible and proactive than ever before but gaining absolute flexibility is impossible. Bartezzaghi and Turco [13] remark on the fact that the various types of flexibility may trade-off with each other (for example: a manufacturing system which is flexible in relation to volume of product may not be so in relation to the mix or the introduction of a new product). Achieving absolute flexibility requires substantial quantities of information about the current processes and related activities, which directly or indirectly, link the whole manufacturing system. Information about the product life cycle also plays an important role in designing the flexible manufacturing process. The details of the product life cycle and employment of data mining on it are discussed at the end of this section.

Flexible manufacturing can be achieved by having tools, machining programmes and parts all quickly changeable and being able to respond rapidly by minimizing the part lead times. Machine

utilization should be maximised together with an almost instantaneous response both to customers and to any problems that may occur. The philosophy behind this arrangement simultaneously aims for minimisation of lead times for the parts to be processed along with the maximisation of the utilisation of the machines doing the processing [14]. But how can this be achieved successfully?

Since it is difficult to measure manufacturing flexibility, it is often hard to financially justify investments aimed at increasing the flexibility of a manufacturing system [15]. Manufacturing enterprises are struggling to make all the steps in their operation as flexible as possible, but often without proper knowledge and information sharing between the various stages of the manufacturing processes. The hurdles in making the flexible manufacturing systems can be analysed using data that has been recorded during individual processes within the whole system. Keeping in mind the problems data mining will give the solutions to the problems that are actually indirectly involved in the brittleness of the system. Once the information about the system's brittleness is discovered the system can be made more elastic by removing the obstructions in achieving the goal.

The first step towards applying data mining techniques for achieving the maximum flexibility in the manufacturing system is to make a system to archive the data recorded during different operational stages of the manufacturing organizations. Most advanced manufacturing enterprises record such data but it is often in the form of simple database files that are not well organized. A well designed database or model is required, otherwise substantial pre-processing of the data may be necessary before it can be mined and this will consume considerable resources. The first step towards achieving this goal is to develop a data warehouse, and this will be discussed further in section three.

If a data warehouse is utilized properly it can not only help in developing the new strategies but it can also be used for repairing the strategies of an enterprise in crisis. For ongoing fault detection, it will sometimes be necessary to have an on-line data mining system, which does not have to rely on the data warehouse. The on-line systems will work on fresh data direct from the manufacturing system to find out any developing trends towards bad quality or to help better scheduling of resources. In an advanced manufacturing system there are advantages to automating the data mining system to help directly in controlling the process.

### **Manufacturing Strategies and Data Models:**

An enterprise needs to redesign if its aims are not being achieved or if its aims or strategies change. Good strategy and a well structured enterprise result in profit whereas bad strategy or a business that does not meet the competitors' challenges, damages the company in the marketplace. Therefore management decisions should be based on accurate and reliable information that is structured within a data warehouse and a factory data model [2]. A factory model focuses on operation and infrastructure in contrast to a data warehouse provides information about the behaviour of the existing enterprise. Both these sources of information are vital for the design and redesign of an enterprise and for performance evaluation.

However, the existence of this useful information is only part of the solution. How it can be utilized effectively to produce the required results is equally important. Simple statistics normally work well to give a very good picture of the current overall manufacturing process but there may be much more hidden knowledge waiting to be discovered. Machine learning and artificial intelligence tools can be used to gain insight into the data and to discover hidden patterns and trends.

The above analysis regarding the ways of extracting information may not appear to provide adequate solutions as the results of the mining process cannot be predicted. Hence, we cannot be sure that the value of the knowledge that may be discovered in the data will be greater than the time and resources that need to be spent in the mining process. However implementations of the same technology in other areas of human sciences like banking, finance, marketing, insurance, telecommunication, health care etc. have given very good results [16] [17] and people are now benefiting from the knowledge they have gained in their respective fields – so why should manufacturing enterprise not also benefit?

### **Product Life Cycle and Data Mining:**

The product's life cycle is based on the design of the product and is important for a data collection point of view and for the analysis for the mining perspective. Information collected during a product's life cycle provides feedback on a product's performance that can be used to assess the quality of the design [18]. Nahmias [19] divided the product life cycle into the following four phases: start-up, rapid growth, maturation and decline. Hazelrigg [4] made a further in-depth division and split the whole process into seven stages: engineering and design; test and evaluation; manufacturing; distribution and sales; operations, maintenance & repair and disposal. All these stages produce data, which should be more or

less easily available for analysis to gain insight into the whole life cycle of the product. Knowledge gained through this analysis can be used for redesign or for the introduction of new products.

Once the production process is completed there are many reasons why it is difficult to collect information relating to the costs. This information is very important regarding the design or redesign of the products. Prasad [20] concluded from different studies that indirect costs could be as much as 4-5 times the amount of direct labour and material costs. In this situation if all the relevant data from the product life cycle is available then it is far easier to analyse the data and to target the areas for improvement in the design and the manufacturing process. This is the point where data mining comes into play. Figure1 shows a very high level architecture of collecting the data during the product life cycle and storing it in a data warehouse, which is actually coupled with a data-mining engine. The engine would use either one or a combination of the many available data mining techniques depending on the type of the data and the type of problem to be solved. A brief introduction and relevant details of a few of these techniques and their applicability can be

found in the fourth section of this paper. A design improvement that takes into consideration all the aspects of the product life cycle gives a much more controlled and efficient design compared with a design based on market demand and production capabilities. The advantages of mining data relating to the product life cycle are that it can improve the design or redesign of the product and also that it provides more information that is helpful for design of the production process, marketing strategy, environment effects, quality and reliability of the product. This information collected during a product's life cycle provides feedback on product's performance that can be used to assess the quality of the design [18].

Data for mining can be structured so that the overall data from all the major stages of the life cycle can be examined together. In addition, analysis should also be carried out on sections of the data relating to individual stages in the life cycle. This is necessary to detect any hidden relations and effects on subsequent life cycle stages so that corrective actions can be taken to improve the design of the product or the manufacturing process.

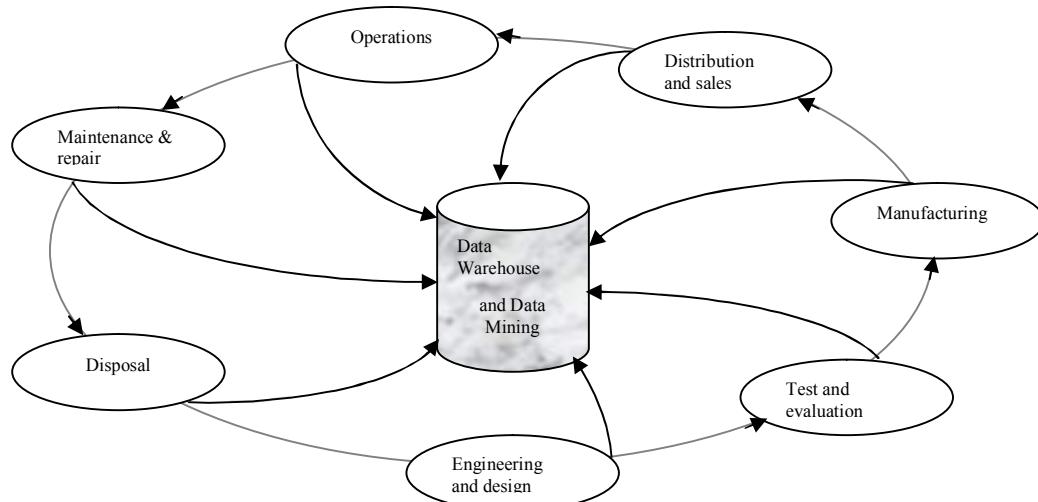

Figure1: Product Life Cycle's Data Collection Architecture.

### 3. Data Warehousing

Data warehousing has developed over the last 20 to 30 years, as they started emerging between 1984-88 [21]. The trends of today's enterprises towards data warehousing can be judged by a survey conducted by the META Group (Stanford, USA) that shows almost 95% of the corporations have plans to build data warehouses [22].

A database is a generalised and integrated collection of stored and operational data together

with their descriptions, and is managed in such a way that it can fulfil the differing needs of its different users [14]. A data warehouse can be defined as a single, complete, and consistent store of data obtained from a variety of sources and made available to end users in a way they can understand and use in a business context [21]. Mattison[23] explained data warehouse as a collection and organization of data to serve as a neutral data storage area that is non volatile, can readily be used for data

mining and/or other applications, and meets the specific business requirements. The most interesting and precise definition in terms of knowledge acquisition is concerned is given by [24] as, "an analytical database that is used as the foundation of a decision support system". A data warehouse is an organized and indexed set of stable historic data that is separated from an organization's data entry system [25]. The data warehouse concept provides integrated information, which can be used in an informational or analytical manner to provide management with reports to support or facilitate their decision-making. Data Warehouse is a subject oriented, integrated, non-volatile and time variant collection of data to support management's decision making processes [26]. It is a tactic for consolidating and sharing information [27]. The reports from the data warehouse enable management to examine aspects of business performance [2] and provides input for strategic decision-making [28].

The data warehouse must be structured to respond to queries related to different aspects of the process or business [29]. Users normally access operational databases using transactions that are also called On-Line Transactional Processes (OLTP), and often use executive information system (EIS). The disadvantage of OLTP is that the results of the queries of two users may be different if their queries are made at different times because the data is changing continuously and the second user may get updated results. However, with the data warehouse all the users will get the same results for similar queries, providing the queries are made during the intervals between updating the warehouse.

The existence of any data warehouse is very important in a manufacturing enterprise when data mining is to be used as a knowledge retrieval tool. A data warehouse saves substantial time that would be wasted in collecting data from multiple sources during the initial stages of data mining. This is particularly true in multi-site operations where manufacturing processes do not all reside at one site and the product has to move from one site to another during its manufacture (as shown in the Figure 2). In such a complicated manufacturing environment the data should be collected from each individual site and then after cleaning the integrated information should be stored in a data warehouse. If data has to be collected from the individual sites before it is used for mining, considerable effort will have to be put into pre-processing. But if the process requires the mining to be done online then a network needs to be established which shares the information extracted or any governing rules discovered on one stage or site, with the other stages or sites, using data mining tools, as explained in section 4. An example of such an

integrated online data mining system is explained in detail in the last section of this paper. For static (offline) data mining where historical data is analysed to determine any relationships between the different processes or machines to improve quality of the product, or to decrease the production time or to introduce a more flexible manufacturing system then a common data warehouse will be the best choice. Data from all the manufacturing sites and processes should be archived at a common storage location after cleaning and integrating to avoid any duplications and errors. If the requirements of data-mining implementations are considered when information is stored in the data warehouse, pre-processing effort will be reduced and in consequence, the time of the whole knowledge discovery process will also be reduced.

#### 4. Knowledge Discovery in Database

The term knowledge discovery in databases (KDD) was formalized in 1989 in reference to the general, 'high level' concept of seeking knowledge from data. This term (data mining) has been used by statisticians, data analysts and the management information systems (MIS) community. KDD has been mostly used by artificial intelligence and machine learning researchers.

Data mining is just one of several terms, used by the people in the data mining field, including knowledge extraction, data archaeology, information harvesting, and even data dredging, that actually describe the concept of knowledge discovery in databases. Data Mining includes all methods and techniques, which allow practitioners to analyse very large data sets to extract and discover previously unknown structures and relations out of huge quantities of details. Information is filtered, prepared and classified so that it will be a valuable aid for decisions and strategies [30]. The most authentic definition of knowledge discovery in database or data mining is "*non-trivial process of identifying valid, novel, potentially useful, and ultimately understandable patterns in data*" [31]. With the explosive growth of data in databases the desire to extract useful information is also increasing. The manufacturing enterprises' databases contain treasures of information that tempt analysts to detect trends or patterns in them and react flexibly to them. However useful information may be hidden within the mountains of other data, and cannot be discovered using conventional database management systems. Data mining is becoming an increasingly important research area [32] [33] [34], since knowledge, e.g. extracted knowledge trends and patterns, can be used to help and improve business decision making.

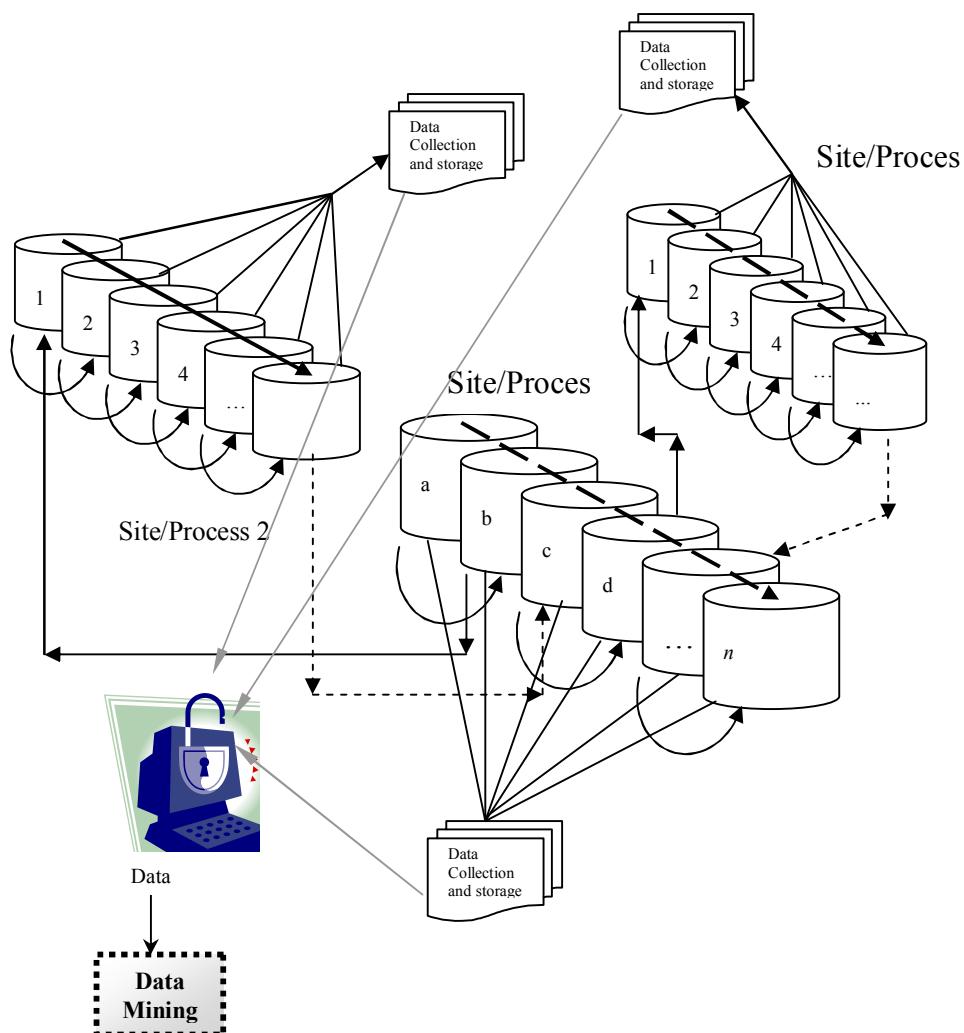

Fig2: Data warehouse supported data mining in a manufacturing process

**Legend:**

- Data Collecting stage of a Manufacturing Process
- A manufacturing process flow where product can be moved to another site and then return
- A manufacturing process flow where product continuously flows till the end of the process
- Movement of the in process product from one stage to the other
- Data Collection and recording at the local storage
- Product is being transferred from one site to
- Finalized product from one site bring back to the original production line for further operations

### **Background:**

The seed of statistics was planted in the 18<sup>th</sup> century with the probability theories of Fermat and Pascal developed through analysing games of chance [35]. Statistical learning theory developed by Vapnik and Chervonenkis in the 60's brought a new set of approaches to comparing competing models that overcame some of the difficulties of traditional statistical modelling [36].

Data Mining can trace some of its roots back to the discipline of artificial intelligence and cognitive psychology born in the 50's [37]. Hosking [38] points out that in statistics we often work with fixed conceptual and hypotheses spaces where we select a set of parameters and a model to test our hypotheses. In data mining we also have a fixed conceptual space but the hypotheses space is left to the learning algorithm, which attempts to create a model with a minimum of prediction error. Statistics involve very small databases whereas in data mining we deal with very large databases.

Most data mining programmes are based upon the machine learning algorithms similar to our own mind's discovery process of trial and error and derives its mystique from the ability of the computer to calculate more quickly than most humans. This approach requires vast computer processing power and was not practical until the early 1980s, when computers began to offer useful power at reasonable prices. Another development occurred with the introduction of machine learning techniques in the data-mining field in 80s and 90s with the commercialisation of the computers. Machine learning is a combination of the statistical techniques and artificial intelligence.

Statistics use familiar formulas for analysis but in data mining there is not a particular formula for the analysis. It works just like a black box and the degree of success that will be achieved is unpredictable. Data Mining finds its own way to the solution for a problem. New formulas are developed by the algorithms, to identify what actually governs the problem scenarios.

### **Data Mining:**

Data Mining normally works together with a data warehousing as this is necessary to organize historical information gathered from large-scale client/server bases applications as discussed in the previous section. Due to the explosive growth of data in the companies in the recent years and the non-availability of any proper technology to exploit this data in the past made data mining a very important research topic [31] [39] [40].

In order to understand how KDD can be implemented in manufacturing enterprises, it is

important to understand the whole process, especially the discovery stage and its tools. For simplicity the whole knowledge discovery process is divided into six different stages: data cleaning, integration, selection, transformation, mining and evaluation/visualization [41] [42]. Fayyad [31] proposed five steps including, retrieval of data, selecting of data, sampling and cleaning, applying the appropriate transformations and fitting models to the proposed data. IBM [43] defined the four major operations for data mining as predictive modelling, database segmentation, link analysis and deviation detection. The above divisions show the actual discovery or mining process comes at the end and takes a very small fraction of the total time involved in the discovery process. Gonzalez and Kamrani [44] conclude that as much as 80% of KDD is about preparing data, and only the remaining 20% is about mining. Pre-processing is therefore very important and the details of how to implement the pre-processing steps can be found in lots of available data mining books in the market.

Some standard methodologies like SEMMA (Sample, Explore, Modify, Model, Assess) [45] and CRISP-DM (Cross Industry Standard Process for Data Mining) [46] have also been developed for data mining process and to simplify its implementation in the industry.

Data mining in its traditional forms has been used to find patterns in the historical databases like banking, insurance, fraud detection, telecommunication data etc keep their old data for future strategy and planning. In the manufacturing process both the old and current trends of the process; policies & strategies and quality are important. The traditional way of data mining can help in finding the faulty processes and bad strategies in the manufacturing process and suggest remedies for them but finding the online or current trends is very important in any kind of manufacturing processes to control the whole process for better scheduling and quality. Data mining can also be used to solve this problem by embedding it in the process to find out the run time errors of the process if they occur [47]. In this kind of mining process, all the pre-processing steps are eliminated by automating the whole process for collecting the data, analyzing it and making corrective actions.

### **Data Mining Techniques for Manufacturing Enterprises:**

The analysis or mining of the manufacturing enterprise data can be done using all the popular data mining techniques. Some of the effective techniques for data mining like association rule, rule induction etc. are mostly used for retail market or basket

analysis [48] [49] but are helpful in any kind of manufacturing databases too. The data mining techniques can be divided into three main categories, statistical techniques which uses simple to complex statistics to analyses the databases, the second category is artificial intelligence tools which become popular with the increase in the computing power over the last two decades and the third is machine learning tools which are actually a combination of statistics and artificial intelligence tools.

A very interesting survey has been done by [50] analyzing the efficiency and productivity of different data mining techniques with different kinds of problems. For example the survey shows that for data that has many attributes, like manufacturing data, and that is numeric in nature, the most suitable algorithms are decision trees, nearest neighbors and neural networks. But it really depends on what kind of problems are being examined in the manufacturing enterprises. The above techniques can be used to search for any kind of trends in the past data but in any specific problem the choice of the technique really also depends on other factors of the problem and algorithms.

A few of the most common data mining tools are listed here in the context of manufacturing databases. Only a brief introduction is given, as details can be traced back the references provided.

#### **Statistics:**

Statistics can be counted as a data mining tool since statistics is actually the origin of data mining. There are lots of statistical techniques including regression, discriminant analysis, classification, clustering and time series which are very popular in the data mining community and are extensively used for the large database analysis. With the passage of time these techniques are now mixed with the artificial intelligence tools to give even better, more reliable and faster results than the current simple statistical methods.

Statistics has always been a very popular tool in the manufacturing enterprises for process and quality controls. In any kind of data mining process the preprocessing stage commonly uses different statistical techniques and the initial analysis of the data is also done using statistics and Structured Query Language (SQL). [42] [51] and [52] have stated that for the most part, about 80% of the interesting information can be abstracted from a database using SQL commands. However, as [30] stress, extraction of the remaining 20% of hidden information requires advanced techniques like expert systems, fuzzy expert systems, case-based learning, decision trees, neural networks, genetic algorithms etc. Hence statistics are a good starting point for the

analysis of the data, to try to identify some trends for further detailed analysis.

#### **Decision Trees:**

Decision trees are normally used for classification purposes. These are tree shape structures resulted by the decision taken at each node. The database is divided into different fields that enable the analysts to look at the behavior of the database at different stages or to distinguish among different patterns present in the data. Different decision tree methods used as a data mining technique are Classification and regression Trees (CART) [53] and Chi Square Automatic Interaction Detection (CHAID) [54]. The first efficient decision tree model called ID3 [55] was based on the concept of entropy means the choice of the next feature used for branching should increase knowledge [56]. Decision trees are simple enough to understand and explain, and are easy to build, have relatively short training time and need very low memory [7].

#### **Neural Networks:**

Neural networks, is a very popular AI technique that mimics the working of neurons of human brain. Neural networks are not new as they trace back their history about 50 years ago when McCulloch and Pitts started working on them. [57], [58]. Neural networks are complex to interpret but very good in terms of accuracy. Carol [7] tabulated different data mining techniques such as neural networks, rule induction, decision trees, nearest neighbour etc and tabulated their important characteristics. It is a good idea to keep in mind the different characteristics of the data before choosing a specific data mining technique.

Artificial neural networks are simple computer programmes, which can automatically find non-linear relationships in data without any predefined model. According to [59], neural network-based database approach consists of three major-phases:

- 1 - Network construction and training: in this phase a layered neural network based on the number of attributes, number of classes and chosen input coding method are trained and constructed.
- 2 - Network pruning: in this phase, redundant links and units are removed without increasing the classification error rate of the network.
- 3 - Rule extraction: rules are extracted in this phase.

#### **Genetic Algorithms:**

This is one of the most recent methodologies used as a data-mining tool. Their basis is on the evolutionary computing which become very popular within the machine learning methodologies [60]. The basic concept of Genetic Algorithms comes from

Darwin's theory of evolution. A genetic algorithm is reminiscent of sexual reproduction in which the genes of two parents combine to form those of their children and only the fittest will survive. The next generation improves and is better than the previous generation only if the strongest members of the population mate together to produce the next generation. The same principle can be applied to problem solving if the population consists of possible solutions to the problem. Each of these generated solutions have some characteristics that enable them to be categorized as a more or less fit as member of the next generation of offspring. The best members of a generation are given more chance for mating and producing the subsequent generation. In this way, each successive generation consists of better solutions, until an optimal solution is generated.

Genetic Algorithms can be very helpful in finding solutions that are very difficult to optimise. Another advantage of using genetic algorithms is that they can propose many possible solutions of a problem. The main advantage of using genetic algorithms (GAs) is, they can be synthesized without making use of the detailed, explicit knowledge of the underlying process. This means they will find a pattern if any exists even if the problem is new and no previous solutions are known. However, limited or noisy training data may result in inconsistent, meaningless output. This has been known to be a severe problem of genetic algorithms [61]. Another problem for genetic algorithms is they require lot of computing power to achieve a significant solution. In data mining problems specially to find out the relationships between the different entities genetic algorithms prove to be very effective. [62] shows a successful implementation of a search technique in big databases using genetic algorithms in solving a data mining problem.

The generic genetic algorithm consists of the following steps [56]

- 1- Each offspring (generation) is evaluated for fitness
- 2- The population is increased through mating and mutation of fit members to generate the new set of rules (generation)
- 3- Weak members from the generations are eliminated (reducing the size of the population)
- 4- A terminating condition is checked and if the optimal solution is not achieved then mating and mutation are done to produce the new generation.

There are many other popular data mining techniques including fuzzy logic, rule induction, association rule, k-nearest neighbor, intelligent agents etc, and this list continues to increase.

## 5. INTEGRATED DATA MINING

As explained in the first section of this paper a manufacturing enterprise can benefit from data mining in solving problems, but there is an important need for an integrated data mining system for diagnosing and solving online manufacturing problems. Here we introduce a relatively complex integrated data-mining architecture for a manufacturing enterprise. This architecture can be used to suggest solutions to particular problems, to learn from this, and subsequently to also help solve problems at other processes/sites with similar kind of parameters.

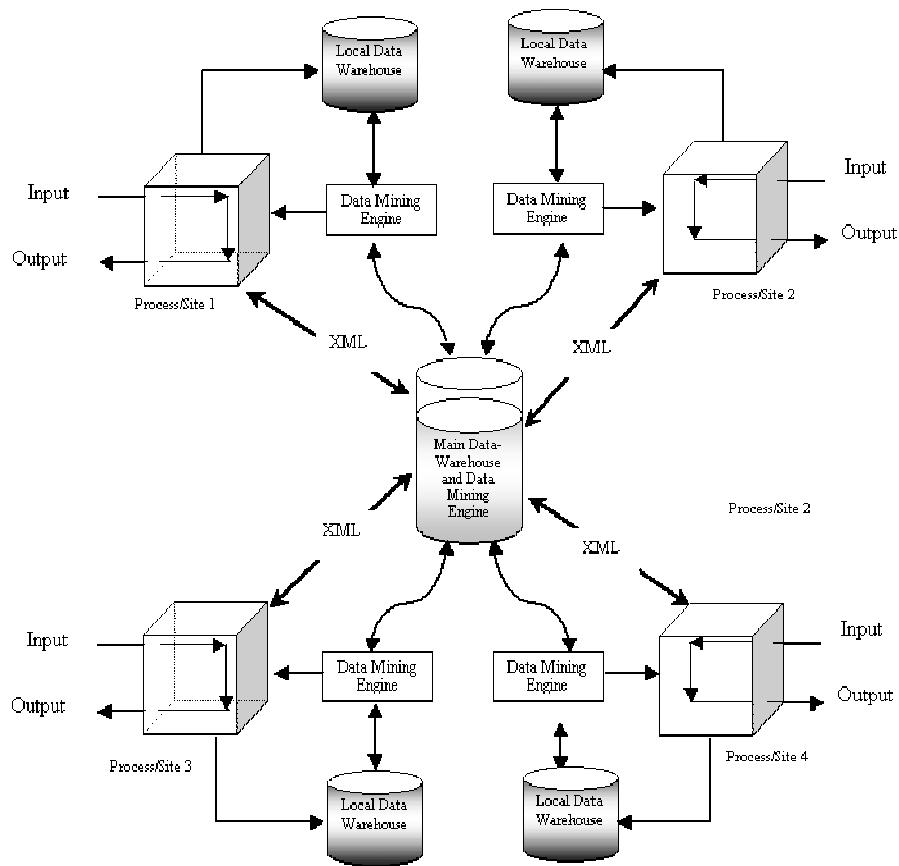

The KDD process is generally driven by individual user skills and experience and is not efficient to use in manufacturing applications where fast intervention may be required if things are going out of control. Since the production process in a factory is usually automated and manufacturing data is obtained continuously from the process, the data must be monitored without interruption so that any anomaly in the process may be detected and eradicated immediately, therefore, the KDD process must run concurrently with the production process [47]. Enterprises aim for increasing levels of accuracy and improvement as manufacturing processes become more advanced and sophisticated and data is continuously recorded.

Manufacturing databases are dynamic with very regular updates made to the records. In the proposed integrated data mining model, data mining techniques can be applied at the micro level within sections of the manufacturing processes, whilst a Main Data Mining Engine may coordinate, share and exchange knowledge between the individual data mining engines. The main Data Mining Engine when connected to individual data mining engines establishes a data-mining network (see Fig. 3), which helps to mine the whole process. The whole manufacturing process may be divided into small steps and the data relating to each step and its adjacent steps are mined independently. The same principle can be applied to the extended manufacturing enterprises where the sites are not in one premises but are located at different places, cities, countries or even continents. The whole process is therefore supported and explored by the remainder of the network. Its activities and results are consistently communicated through the Main Data Mining Engine. Thus individual areas of data mining activity are kept to a manageable size whilst still supporting related areas of activity.

In an integrated manufacturing environment where the product is developed at separate locations or in discrete steps data mining can best be used to control any individual process or step through identification of hidden information in its associated data. The data-mining algorithm say rule induction can discover the relationships within the individual process, or dependent processes. It cannot however be utilized for the other discrete steps unless a common data warehouse collects the data. The concept of the proposed integrated data mining model works on the basis that rules; principles and concepts applicable to one manufacturing stage/site may also be utilized (tested and applied) for other similar stages, (by the exchange of activity and rules information via the Main Data Mining Engine). This integrated data mining model will work where a product goes into different stages and data for each and every step is collected and stored in a pre-designed data warehouse or in the pattern warehouse as knowledge is much more compact than data [63]. Data mining activities and the main data warehouse will work in parallel during the whole activity with the production process data and company data warehouses.

Each stage will have its own local data mining engine and data warehouse where the data will be stored after cleaning. The data will also be transferred to the main data warehouse, which has a direct link with a pattern warehouse for the analysis or mining of the whole system's data.

If the same methodology is applied to an integrated system where production is being done at different sites then the central data warehouse will be built on a standard format. The data from the individual sites will be transferred to the main data warehouse using XML format where the data will be mined for the whole process and rules/knowledge extracted will be returned back in the same format.

**Figure 3. An Integrated Data Mining System Model**

The integrated data mining will be productive in the sense that if different rules are identified for two individual, but similar small manufacturing/production steps, the rules can be shared, and each data-mining engine can use its knowledge to refine the "best" one for its particular application. In this way, knowledge can be fed into the main data warehouse, so results can be reused in the future, as a pattern warehouse will be developed. Future applications can then make use of the stored patterns and rules instead of always having to return to the original manufacturing process databases.

The figure shows four manufacturing processes or sites. The input and output of the manufacturing process is shown and the data from the manufacturing process is collected at the local data warehouse and is also transferred to the main central data warehouse in a neutral format say XML. The outcome of the data mining process (if any) is implemented to the manufacturing process and same information is also reported to the central system which analyzes the kind of problem tackled by the local system and stores an index and the parameters for the problem occurred. If any of the other

processes indicate similar kinds of problem then the central or Main Data Mining Engine first tries the same solution to that problem to see if it works. This methodology will help in future to minimize the time spent on understanding the problems and finding the solution. The data-mining engine can also suggest alternative solutions, but using an old solution and refining it to suit the present requirements should help to tackle the problem in more efficient, cost effective ways.

The integrated model should also be aided with the online visualization model so that the worker who is working on the machines/products can get a clear idea about the process and products. Visualisation should allow a user to discuss and explain the logic behind the model with colleagues, internal/external customers, and other users [64]. For example if there is a recurring problem with a particular step or process on a product then visual checks for previous trends/rules or current results at other sites with the same or similar steps will help in getting a workable idea to fix the problem. Therefore visualisation of the whole mining process will help and enable the output of the data mining system to be understood qualitatively.

### **Conclusion:**

It has been showed that along with other areas, manufacturing enterprises can be benefited with the data mining techniques. There are lots of areas within manufacturing enterprises, few of them are explained in this paper, where data mining can find its ways of implementation and can give results comparable to any other corrective measures based on the engineering methodologies. The data mining architecture proposed in this paper can be refined from a small factory to an extended enterprise. Such kind of data mining approach will be an essential part during the designing of an advanced manufacturing process in future which can learn from its own mistakes and will do the corrective actions not only for its own processes but will help the other processes with its experiences.

# Available Zn Distribution, Response and Uptake of Rice (*Oriza sativa*) to Applied Zn Along a Toposequence of Lake Gerio Fadama Soils at Yola, North-eastern Nigeria.

H. E. Shehu and G. Y. Jamala

Department of Crop Science, Adamawa State University, Mubi, P. M. B 25 Mubi, 650001, Adamawa State, Nigeria.  
[harushe2003@gmail.com](mailto:harushe2003@gmail.com)

**Abstract:** A screen house pot experiment was conducted at FAO/TCP farm of the Adamawa State University, Mubi north-eastern Nigeria, to study the response of rice to Zn fertilizer application and the distribution of Zn along toposequence of the Lake Gerio Fadama soils of North-eastern Nigeria which was used for the study. The experiment consisted of four Zn rates of 0, 5, 7.5 and 10 kg Zn ha<sup>-1</sup> as ZnSO<sub>4</sub>.7H<sub>2</sub>O. The effect of treatment on Zn concentration and dry matter yields response were determined. The 0.1N HCl and DTPA extractable Zn ranged from 8.5 to 9.5 mg kg<sup>-1</sup> soil, 2.2 to 2.7 mg kg<sup>-1</sup> soil with mean values of 9.08 and 2.35 mg kg<sup>-1</sup> soil respectively. Available Zn soil status is therefore assessed as medium. Dry matter yields and Zn uptake were optimum at 5 kg ha<sup>-1</sup> with corresponding values of 2.04 and 11.86 mg kg<sup>-1</sup> respectively.

Journal of American Science 2010;6(11):1013-1016]. (ISSN: 1545-1003). (<http://www.americanscience.org>)

**Key words:** Zinc uptake; Toposequence; Fadama soils; Rice

## Introduction

The need to increase food production becomes a major concern considering the rate at which population is increasing. This resulted in intensive use of land with the consequence of depleting the macro and micro nutrients faster than they can be restored. Attention has been given to the supply of macronutrients only forgetting the micronutrients.

In Nigeria and even in many developing countries, study on soil micronutrients was neglected in both soil science and crop production. Most work on soil in Nigeria has been on soils developed on crystalline basement complex, sedimentary and metamorphic rocks (Kparmwang *et al* 1995) and most savanna soils are reported to have low clay contents, organic matter and cation exchange capacities (Lombin, 1983). Zn deficiency was first diagnosed in rice on the calcareous soils of northern India (Nene, 1966). It was subsequently found to be a wide spread phenomenon in lowland rice areas of Asia, and next to N and P deficiencies.

Zn deficiency is now considered the most widespread disorder in lowland rice (Neue and Lantin, 1994). Quijano-Guerta *et al*, 2002) reported that Zn is the major cause of low rice yields in the major rice producing areas as Zn deficiency is one of the prevalent chemical stresses that is linked to coastal hydrology. With the initiation of several irrigation schemes in north-eastern Nigeria particularly the Lake Gerio Irrigation project, Gerio basin has become agriculturally important. The area

covers about 850 ha and only 320 ha are currently under cultivation and rice is the main irrigated crop.

Information on the micronutrient fertility status of these soils particularly Zn is not documented in the literature though deficiency has been noted in other crops.

Therefore, this investigation was carried out to study and determine the available Zn distribution along toposequence and responses of rice to applied Zn under pot culture conditions.

## Materials and Methods

A pot experiment was conducted in screen house in the FAO/TCP farm of the Adamawa State University, Mubi (10° 16' N and 13° 17' E) to determine the distribution of available Zn along the toposequence of lake Gerio fadama soils in Yola, north-eastern Nigeria and to asses the response and uptake of rice (*Oriza sativa*) to applied Zn from 11<sup>th</sup> August to 27<sup>th</sup> September 2008. Soil samples were collected from points using Geo-reference system satellite receiver (GPS, 2002 – GARMIN 12). The sampling points were divided into upper, middle and down slopes. The upper slope ranged between 156.4 to 159.3 m above sea level. The middle slope ranged from 153.4 to 159.0 m above sea level while the down slope ranged from 155.7 to 156.6 m above sea level. These primarily represent the soils of Lake Gerio Fadama irrigation projects of the lower Benue trough of north-eastern Nigeria. The soil samples were sieved using 2 mm sieve and analyzed for particle size, pH, electrical conductivity, organic

carbon, available P, total N, K, Ca, Na and available Zn.

Available Zn was extracted by 0.1N HCl and DPTA. Soil solution ratio was 1:10 and 1:2 for HCl and DPTA respectively. This was shaked for 2 hours and the filtrate analyzed for Zn on atomic absorption spectrophotometer (Buck Scientific model – 210 VG). To determine the response of rice to applied Zn, composite surface soil samples, 0-15 cm were used. The treatments include 0, 5, 7.5 and 10 kg Zn ha<sup>-1</sup> replicated three times in a complete randomized design. Rice seeds (IITA 2-1-2 Cv.) were sown in pots and filled with 4 kg soil and was grown for seven weeks. Deionized water was used for irrigation. Shoots were harvested and oven dried at 70 °C and dry matter yields were determined. Data was subjected to statistical analysis using SAS software (1999).

## Results and Discussion

Particle size and Zn distribution are presented in Table 1. The texture of the soil ranged from silt clay to silt clay loam. The Zn content ranged from 8.5 to 9.5 mg kg<sup>-1</sup> with mean value of 9.1 mg kg<sup>-1</sup>. Critical limits for Zn suggested by Nelson *et al* (1959), Trerweiler and Landsay, (1969) and latter confirmed by Shukla and Kwari (1990) were 0 to 4.5, 3.5 to 4.0,

4.5 and 4.5 mg kg<sup>-1</sup> HCl extractable Zn respectively. Considering these reports, all HCl extractable Zn of Lake Gerio irrigation project were higher than the 4.5 mg kg<sup>-1</sup> critical levels for Zn and thus could be classified as medium. Medium Level has also been reported in some lowland areas of Nigeria such as Sokoto, Zamfara, Kebbi, Bayelsa, Rivers and part of Niger state (FAO, 2005). There were no marked differences in the distribution of available Zn along toposequence which agrees with the findings of Voncir *et al*, (2008).

The DPTA critical limits reported by Lindsay and Norvel, (1978) and Landon, (1984) to be 0.6 to 0.8 and 0.5 to 1.0 mg kg<sup>-1</sup> soil DPTA extractable Zn respectively were lower than the values obtained at Lake Gerio fadama soils with mean value of 2.4 mg kg<sup>-1</sup>. This also could be classified as moderate confirming the HCl extractable Zn status.

Some chemical properties of the experimental soil are presented in Table 2. Soil pH ranged from 6.4 to 6.8. Organic matter content was also low (ranged from 1.7 to 2.1%). The distribution of available P ranged from 3.2 to 10.9 mg kg<sup>-1</sup> while N lower and upper values were 0.03 and 0.08% respectively. The ECEC ranged from 20.1 to 22.5 meq 100 g<sup>-1</sup> as EC ranged from 0.22 to 0.46 ms cm<sup>-1</sup>.

**Table 1: Particle size and Zn distribution of the experimental soil.**

Toposequence	Particle size (%)			Textural class	DPTA (mg kg <sup>-1</sup> )	0.1N HCl (mg kg <sup>-1</sup> )	Zn status
	Sand	Silt	Clay				
Upper slope	72.0	11.0	17.0	SL	2.4	9.5	medium
Middle slope	69.0	12.0	19.0	SCL	2.7	9.2	medium
Down slope	66.0	10.0	24.0	SCL	2.2	8.5	medium
Composite	68.0	12.0	20.0	SCL	2.4	9.1	medium
Mean	69.0	11.0	20.0	SCL	2.35	9.08	medium

SL= Silt Loam; SCL=Silty Clay Loam

**Table 2: Distribution of DPTA/HCl extractable Zn and other soil properties along toposequence of Lake Gerio irrigation Project, Yola, North- eastern Nigeria.**

Toposequence	pH 1:2.5 (H <sub>2</sub> O)	Organic C (%)	%N	Bray P (mg kg <sup>-1</sup> )	ECEC (meq kg <sup>-1</sup> )	EC (ms cm <sup>-1</sup> )
Upper slope	6.6	1.7	0.08	10.9	20.1	0.26
Middle slope	6.4	2.1	0.03	1.5	20.1	0.22
Down slope	6.8	2.1	0.03	3.2	22.5	0.46
Composite	6.6	2.0	0.05	5.0	20.2	0.31
Mean	6.6	2.0	0.05	5.15	20.7	0.313

**Table 3: Zn uptake and dry matter responses of rice plant to applied Zn.**

Zn (kg ha <sup>-1</sup> )	Dry matter (g pot <sup>-1</sup> )		Zn uptake (mg pot <sup>-1</sup> )	
	Mean	SE	Mean	SE
0	0.83 <sup>b</sup>	±0.21	5.79 <sup>b</sup>	±1.45
5	2.04 <sup>a</sup>	±0.29	11.86 <sup>ab</sup>	±2.90
7.5	1.77 <sup>a</sup>	±0.23	14.54 <sup>a</sup>	±2.79
10	2.50 <sup>a</sup>	±0.24	15.72 <sup>a</sup>	±2.07

Means with the same letter are not significantly different using Duncan's Multiple Range Test at 5% level of significance.

**Table 4: Correlation coefficient between dry matter and Zn, N, P and K uptake by rice.**

	Zn	Dry matter	Zn uptake	N uptake	P uptake
Zn	1.000				
Dry matter	0.755**	1.000			
Zn uptake	0.712**	0.700**	1.000		
N uptake	0.414	0.720**	0.709**	1.000	
P uptake	0.511	0.799**	0.493	0.786**	1.000
K uptake	0.702**	0.987**	0.678*	0.713**	0.783**

\* = Significant at 5% level of probability

\*\* = Significant at 1% level of probability

The response of dry matter to applied Zn is shown in Table 2. Though the soils showed a moderate Zn content, increase in dry matter yield was recorded. Optimum dry matter yield was obtained at 5 kg ha<sup>-1</sup> Zn application which gave a corresponding dry matter yield of 2.04 g pot<sup>-1</sup> while the highest dry matter yield was recorded at 10 kg Zn ha<sup>-1</sup> rate of 2.50 g pot<sup>-1</sup>. This is confirmed in the positive correlation (Table 4) that exists between Zn and dry matter yield ( $r = 0.755$ ). Lack of significant response between the Zn rates could be attributed to the soil Zn status and thus the demand for the crop could be met at 5 kg ha<sup>-1</sup>. Other factors that might have contributed to no marked response of dry matter to Zn application could be attributed to low organic matter content and Mg:Ca ratio as also noted by Neue and Landin, (1994).

Zn uptake response by rice plant to applied Zn (Table 3) was significant at  $P = 0.05$ . The application at 5, 7.5 and 10 kg Zn ha<sup>-1</sup> had uptake advantage of 105, 151 and 172% respectively over soils that did not receive Zn application. Optimum Zn uptake was obtained at 5 kg ha<sup>-1</sup> Zn application. This shows that

uptake of Zn in plants is a function of the amount of Zn applied. This is shown in the significant correlation between applied Zn and Zn uptake of  $r = 0.712$ . In assessing the uptake of Zn, the previous work of Dobermann and Fairhurst (2000) who also observed that ratio of P:Zn in the shoot are good indicators of Zn deficiency where values are not to exceed 20 to 60:1. The application of Zn has contributed to the positive correlation between N and P uptake ( $r = 0.786$ ) and N and K uptake ( $r = 0.713$ ).

Nutrient utilization efficiency (NUE) of Zn indicated that the rate of increase in uptake from 5 to 7.5 kg ha<sup>-1</sup> Zn rate is greater than the rate of increase from 7.5 to 10 kg<sup>-1</sup>. This shows that decline in NUE starts at 7.5 kg ha<sup>-1</sup> rate. The low utilization of this element may not be unconnected with the medium level soil status of Zn since the element is required in small quantity.

### Conclusion

The inferences drawn from the response of rice to Zn application confirms the results of soil analysis where most of the soil along the toposequence are at medium level and will require low level of Zn

application of 5 kg Zn ha<sup>-1</sup> for optimum yields in the Lake Gerio irrigation projects.

# Approximate Optimal Control for a Class of Nonlinear Volterra Integral Equations

Akbar H. Borzabadi, Akram Abbasi and Omid S. Fard

Department of Applied Mathematics, Damghan University, Damghan, Iran  
[borzabadi@dubs.ac.ir](mailto:borzabadi@dubs.ac.ir)

**Abstract:** In this study an iterative approach to extract approximate solutions of optimal control problems which are governed by a class of nonlinear Volterra integral equations is presented. The structure of approach is based on the parametrization of the control and state functions. Considering some conditions on the problem, the convergence of the given approach is studied. Numerical examples illustrate the efficiency of the given approach.

[Akbar H. Borzabadi, Akram Abbasi and Omid S. Fard. Approximate Optimal Control for a Class of Nonlinear Volterra Integral Equations. Journal of American Science 2010;6(11):1017-1021]. (ISSN: 1545-1003). (<http://www.americanscience.org>).

**Keywords:** Optimal control; Volterra integral equations; iterative schemes; approximation

## 1. Introduction

The classical theory of optimal control was developed in the last years as a powerful tool to create optimal solutions for real processes in many aspects of science and technology. Complexity of applying analytical methods for obtaining fast and near optimal solutions is the reason for creating numerical approaches. An overview of numerical methods for solving optimal control problems described by ODE and integral equations can be found in (Schmidt, 2006). However these methods are not much developed for optimal control of nonlinear integral equations. Belbas (1999; 2007; 2008) has introduced and elaborated some interesting iterative schemes with their convergence for optimal control of Volterra integral equations considering some conditions on the kernel of integral equation. Also some methods based on approximating the kernel of integral equation which gives rise to a system of ordinary differential equations for approximating the Volterra integral equation can be seen in (Lukas and Teo, 1991; Wu *et al.*, 2007).

Of course it seems that the lack of general methods for solving Volterra integral equations makes serious difficulties in using of these schemes.

The idea of combination of some numerical methods for solving optimal control problems and Volterra integral equations may lead to present executable numerical approaches for obtaining near optimal solutions of optimal control problems governed by Volterra integral equations. This study intends to actualize this idea by combining the method of parameterization, (Mehne and Borzabadi, 2006; Teo *et al.*, 1999a; 1999b) and the method of power series, (Maleknejad *et al.*, 2007a; 2007b; Tahmasbi and Fard, 2008), which are successful methods for solving some classes of optimal control problems and

Volterra integral equations, respectively, for providing a numerical scheme to find approximate optimal control of systems governed by some classes of nonlinear Volterra integral equations which can be described by the following minimization problem:

$$\text{Minimize } J(x, u) = \int_0^T \zeta(t, x(t), u(t)) dt \quad (1)$$

Subject to:

$$x(t) = y(t) + \int_0^t k(s, t, x(s)) ds, \text{ a.e. on } [0, T] \quad (2)$$

where,  $x(\cdot), u(\cdot) \in C^\infty([0, T])$ ,  $\zeta \in C([0, T] \times P \times P)$  and  $k \in C([0, T] \times P \times P \times P)$ .

After this and without loss of generality we suppose  $T = 1$ . Analytical discussions about existence and uniqueness of the optimal control of systems governed by nonlinear Volterra integral equations can be found in (Angell, 1976).

## 2. The control and state parameterization

Let  $Q$  be the subset of product space  $C^\infty([0, 1]) \times C^\infty([0, 1])$  contains all pairs  $(x(\cdot), u(\cdot))$  that satisfy in the integral Eq. 2. Also let  $Q_{m,n}$  be the subset of  $Q$  consisting of all pairs  $(x_m(\cdot), u_n(\cdot))$  where  $u_n(\cdot)$  is a parameterized control function as the following polynomial:

$$u_n(t) = \sum_{i=0}^n a_i t^i \quad (3)$$

And  $x_m(\cdot)$  is extracted solution of the integral equation:

$$x(t) = y(t) + \int_0^t k(s, t, x(s), u_n(s)) ds \quad (4)$$

and it is considered as a polynomial of degree at most  $m$ :

$$x_m(t) = \sum_{j=0}^m e_j(\alpha_0, \alpha_1, \dots, \alpha_n) t^j \quad (5)$$

such that  $e_j : P^n \rightarrow P$ ,  $j = 1, 2, \dots, m$ , are continuous functions. Now we consider the minimizing of  $J$  on  $\mathcal{Q}_{m,n}$  with  $\{\alpha_k\}_{k=0}^n$  as unknowns. This is obviously an optimization problem in  $n$  dimensional space:

$$\{(\alpha_0, \alpha_1, \dots, \alpha_n) \in \square^{n+1} : \alpha_0 = u_n(0) = u_0, \sum_{k=0}^n \alpha_k = u_n(1) = u_1\}$$

and  $J(x_m, u_n)$  may be considered as a function  $J(a_0, a_1, \dots, a_n)$ .

Suppose  $(x_m^*(\cdot), u_n^*(\cdot))$  be the solution of minimizing  $J$  on  $\mathcal{Q}_{m,n}$ ,  $m = 1, 2, \dots, n = 1, 2, \dots$  then polynomial form of  $u_n^*(\cdot)$ ,  $n = 1, 2, \dots$  in (3) and considering the special form of integral equation kernel allow us applying a method based on power series for extracting polynomial solution of (4), (Tahmasbi and Fard, 2008), where applying this method give rise to obtain a sequence of state functions  $\{x_m^*(\cdot)\}_{m=1}^\infty$  as Taylor series, see Theorem 1 in (Tahmasbi and Fard, 2008) and finally to achieve a minimizing sequence  $\{(x_m^*(\cdot), u_n^*(\cdot))\}_{m,n}$ .

**Lemma 1:** If  $\alpha_{m,n} = \inf_{\mathcal{Q}_{m,n}} J$  for  $m, n = 1, 2, \dots$ , then  $\{\alpha_{m,n}\}_{m,n=1}^\infty$  is a convergent sequence.

**Proof:** By definition  $\mathcal{Q}_{m,n}$  we have:

$\mathcal{Q}_{1,1} \subset \mathcal{Q}_{1,2} \subset \mathcal{Q}_{2,2} \subset \dots \subset \mathcal{Q}_{m,n} \subset \mathcal{Q}_{m+1,n} \subset \dots \subset \mathcal{Q}$ , and therefore:

$$\alpha_{1,1} \geq \alpha_{1,2} \geq \alpha_{2,2} \geq \dots \geq \alpha_{m,n} \geq \alpha_{m+1,n} \geq \dots \geq \alpha,$$

Now it can be concluded that  $\{\alpha_{m,n}\}$  is convergent because it is a no decreasing and bounded from below sequence.

**Theorem 1:** If  $\lim_{m,n \rightarrow \infty} \alpha_{m,n} = \alpha$  then  $\alpha = \inf_{\mathcal{Q}} J$ .

**Proof:** By Lemma 1, let  $\{\alpha_{m,n}\}$  is convergent to namely  $\hat{\alpha} \geq \alpha$ . By contradiction if  $\hat{\alpha} > \alpha$ , then  $\hat{\alpha} - \alpha > 0$ . By the properties of infimum, (Rudin, 1976), there exists  $(x(\cdot), u(\cdot))$ , such that:

$$J(x(\cdot), u(\cdot)) < \alpha + \epsilon = \frac{\hat{\alpha}}{2} + \frac{\alpha}{2} \quad (6)$$

From the continuity of  $J$ , there is a  $\delta > 0$  where:

$$|J(v(\cdot), w(\cdot)) - J(x(\cdot), u(\cdot))| < \epsilon, \quad (7)$$

Whenever:

$$\|v(\cdot), w(\cdot) - (x(\cdot), u(\cdot))\|_\infty < \delta. \quad (8)$$

Here  $\|\cdot\|_\infty$  is a norm on the vector space  $C^\infty([0,1]) \times C^\infty([0,1])$  which can be defined as follows:

$$\|v(\cdot), w(\cdot)\|_\infty = \|v(\cdot)\|_\infty + \|w(\cdot)\|_\infty,$$

and one can easily check the properties of the norm for it. On the other hand side, the set of all polynomial pairs are dense in  $C^\infty([0,1]) \times C^\infty([0,1])$ , so there is a pair of polynomials  $p_m(t)$  of degree at most  $m$  and  $q_n(t)$  of degree at most  $n$  such that:

$$\|(p_m(\cdot), q_n(\cdot)) - (x(\cdot), u(\cdot))\|_\infty < \frac{\delta}{3}. \quad (9)$$

Whereas the pair  $(p_m(\cdot), q_n(\cdot))$  does not satisfy:

$(p_m(0), q_n(0)) = (x_0, u_0)$ ,  $(p_m(1), q_n(1)) = (x_1, u_1)$ , We have to define another polynomials:

$$v_m(t) = p_m(t) + (x_0 - p_m(0))(1-t) + (x_1 - p_m(1))t,$$

$$w_n(t) = q_n(t) + (u_0 - q_n(0))(1-t) + (u_1 - q_n(1))t,$$

that satisfy  $(v_m(0), w_n(0)) = (x_0, u_0)$  and

$$(v_m(1), w_n(1)) = (x_1, u_1), \text{ so } (v_m, w_n) \in \mathcal{Q}_{m,n}.$$

From (9) for  $t = 0, 1$  we have:

$$\|(p_m(0), q_n(0)) - (x_0, u_0)\|_\infty < \frac{\delta}{3},$$

$$\|(p_m(1), q_n(1)) - (x_1, u_1)\|_\infty < \frac{\delta}{3}$$

Now for  $t \in [0, 1]$  by definition  $v_m(\cdot)$  and  $w_n(\cdot)$  we have:

$$\begin{aligned} \|v_m(\cdot), w_n(\cdot) - (x(\cdot), u(\cdot))\|_\infty &\leq \|v_m(t) - x(t)\|_\infty + \|w_n(t) - u(t)\|_\infty \\ &\leq \|p_m(0), q_n(0) - (x_0, u_0)\|_\infty(1-t) + \|p_m(1), q_n(1) - (x_1, u_1)\|_\infty t \end{aligned}$$

$$< \frac{\delta}{3} + \frac{\delta}{3} + \frac{\delta}{3} = \delta.$$

Therefore:

$$\|v_m(\cdot), w_n(\cdot) - (x(\cdot), u(\cdot))\|_\infty < \delta,$$

and (7-8) imply that:

$$|J(v_m(\cdot), w_n(\cdot)) - J(x(\cdot), u(\cdot))| < \epsilon,$$

and so from (6):

$$J(v_m(\cdot), w_n(\cdot)) < \frac{\hat{\alpha}}{2} - \frac{\alpha}{2} + J(x(\cdot), u(\cdot)) < \hat{\alpha}$$

a contradiction concludes with  $(v_m(\cdot), w_n(\cdot)) \in Q_{m,n}$ , so  $\hat{\alpha} = \alpha$ .

Now we summarize the above results in a numerical algorithm for obtaining approximate optimal control of minimizing (1) subject to (2).

**Algorithm 1:** Choose  $\varepsilon_1 > 0$  and  $\varepsilon_2 > 0$  for accuracy of the solution.

Step 1: Let  $m, n, k = 1$ ,  $u_1(t) = a_0 + a_1 t$ ,  $x_1(t) = e_0 + e_1 t$  and  $\alpha_1 = J(x_1(\cdot), u_1(\cdot))$ , where  $e_0 = e_0(a_0, a_1)$  and  $e_1 = e_1(a_0, a_1)$ .

Step 2: Let  $m \rightarrow m+1$  and  $k \rightarrow k+1$  and find  $\alpha_k = \inf_{Q_{m,n}} J$ .

Step 3: If  $|\alpha_k - \alpha_{k-1}| < \varepsilon_1$  then go to Step 4, otherwise go to Step 2

Step 4: Let  $n \rightarrow n+1$  and  $k \rightarrow k+1$  and go to Step 2

Step 5: If  $|\alpha_k - \alpha_{k-1}| < \varepsilon_1$  then stop, otherwise go to Step 4

### 3. Numerical results

In this section some examples show the interesting results of the proposed iterative approach.

**Example 1:** In the first example we consider the optimal control of minimizing:

$$J = \int_0^1 \left( (x(t) - \cos(t))^2 + (u(t) - t)^2 \right) dt \quad (10)$$

subject to the following nonlinear Volterra integral equation:

$$x(t) = y(t) + \int_0^t u(s)^2 (x(s) + ts) ds \quad (11)$$

Where:

$$y(t) = \cos(1-2t) + \sin(t(2-t^2)) - \frac{1}{4}t^5$$

The exact optimal solution of problem (10-11) are  $x^*(t) = \cos(t)$  and  $u^*(t) = t$  with optimal criteria  $J^* = J(x^*(t), u^*(t)) = 0$ . We apply Algorithm 1 on this problem. Let  $m, n = 1$ , so we have:

$$\begin{aligned} u(t) &= a_0 + a_1 t, \quad x(t) = e_0 + e_1 t \\ \Rightarrow x(t) &= 1 + e_1 t, \quad (e_0 = y(0)). \end{aligned}$$

Substituting  $x(t)$  and  $u(t)$  in (11) concludes that  $e_1 = \alpha_0^2$ . To optimize  $J$  on  $(a_0, a_1)$  gives rise to  $a_0 = 0, a_1 = 1$  and so  $e_1 = 0$  and  $\alpha_{1,1} = 0.0444$ . Now let  $m = 2$  and  $n = 1$ . We have:

$$u(t) = \alpha_0 + \alpha_1 t, \quad x(t) = 1 + \alpha_0^2 t + e_2 t^2$$

and again substituting  $x(t)$  and  $u(t)$  in (11) conclude

$e_2 = \frac{1}{2}\alpha_0^4 + \alpha_0\alpha_1 - \frac{1}{2}$  and optimizing  $J$  eventuate the following results:

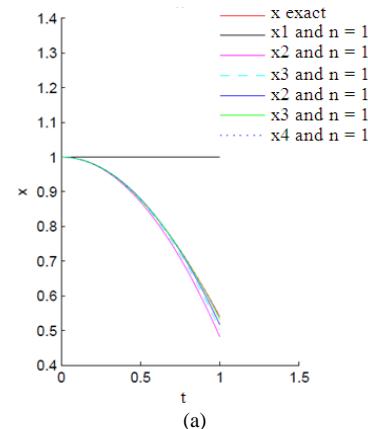

$$a_0 = -0.0187, a_1 = 0.9612,$$

$$e_1 = 3.4969 \times 10^{-4}, e_2 = -0.5180$$

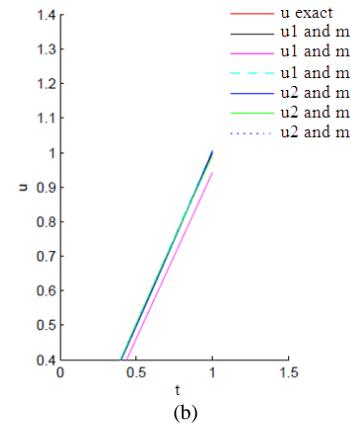

and  $\alpha_{2,1} = 0.0107$ . In Table 1 the successive applying of Algorithm 1 for some values of  $m$  and  $n$  is shown. Also the state and control functions that are obtained in process of using Algorithm 1 for problem (10-11) are shown in Fig. 1.

Table 1: The results of applying proposed algorithm in Example 1

$n$	$m$	$\alpha_{m,n}$
1	1	0.0444
1	2	0.0107
1	3	$1.5226 \times 10^{-4}$
2	2	$7.8920 \times 10^{-5}$
2	3	$2.5166 \times 10^{-5}$
2	4	$1.0922 \times 10^{-7}$

(a)

(b)

Fig. 1: The state and control functions in example 1

**Example 2:** In this example the optimal control problem of minimizing

$$\text{Minimize } J = \int_0^1 ((x(t) - \sin(t))^2 (u(t) - t)^2) dt \quad (12)$$

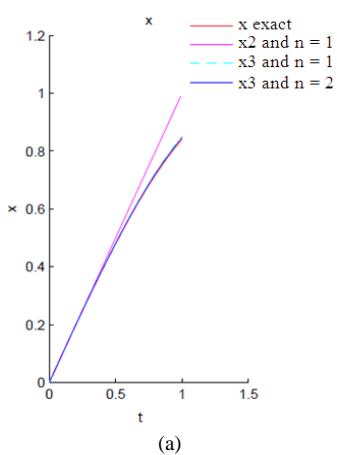

governed by the nonlinear Volterra integral equation:

$$x(t) = y(t) + \int_0^t u(s)(x(s) + t) ds \quad (13)$$

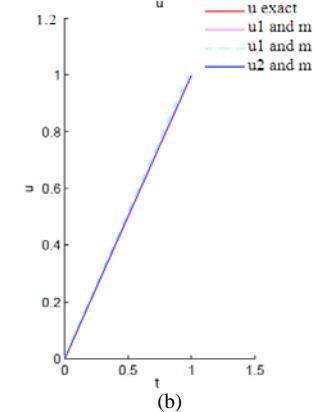

where,  $y(t) = t \cos(t) - \frac{1}{2}t^3$  is considered. The results of successive applying Algorithm 1 on this problem, as previous example, is shown in Table 2. Also the state and control functions obtained during the application of Algorithm 1 on problem (12-13) are shown in Fig. 2.

Table 2: The results of applying proposed algorithm in Example 2

$n$	$m$	$\alpha_{m,n}$
1	2	$3.5575 \times 10^{-11}$
1	3	$1.4975 \times 10^{-12}$
2	3	$3.0905 \times 10^{-14}$

(a)

(b)

Fig. 2: The state and control functions in example 2

**Example 3:** It seems to obtain suitable approximate solution for problems that have the exact solution as exponential function is difficult. In this example we consider the optimal control problem of minimizing nonlinear functional:

$$\text{Minimize } J = \int_0^1 ((x(t) - e^t)^2 (u(t) - e^t)^2) dt \quad (14)$$

on the Volterra integral equation:

$$x(t) = y(t) + \int_0^t u(s)(x(s) + t) ds \quad (15)$$

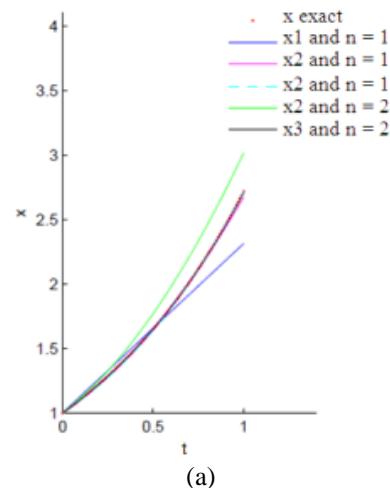

Where:

$$y(t) = e^t(1-t - \frac{1}{2}e^t) + t + \frac{1}{2}$$

The exact optimal control and state functions are  $u^*(t) = e^t$  and  $x^*(t) = e^t$  respectively and optimal criteria is  $J^* = J(x^*(t), u^*(t)) = 0$ . Table 3 shows interesting results by applying proposed approach on the problem (14-15). In Fig. 3, one can see the state and control functions that are obtained during the process of applying Algorithm 1 on problem (14-15).

Table 3: The results of applying proposed algorithm in example 3

$n$	$m$	$\alpha_{m,n}$
1	1	$2.1070 \times 10^{-4}$
1	2	$2.3385 \times 10^{-7}$
1	3	$1.9795 \times 10^{-8}$
2	2	$1.4383 \times 10^{-8}$
2	3	$4.2201 \times 10^{-10}$

(a)

#### 4. Conclusion

In this study, we have proposed a numerical scheme for finding approximate solution of optimal control problems governed by a class of nonlinear Volterra integral equations. Our limitation in the application of this method depends on the type of integral equations that we face because of the power series method only for solving certain categories of integral equations may be applied. Although the presented numerical examples show the efficiency of the method for solving a wide range of problems.

**ABSTRACT:** Microbiological and molecular techniques were used to determine the virulence factors, plasmid profile and antibiotic susceptibility spectrum of *Staphylococcus aureus* and CON-*Staphylococcus* spp isolated from patients with acute otitis media attending University of Uyo Teaching Hospital, General Hospital, Ikot-Ekpene and Nekede Paediatric Hospital between January, 2009 and January, 2010. 42 (30.9%) *Staphylococcus aureus* and 21 (15.4%) CON *Staphylococcus* spp were isolated from the aural swab samples collected. *Staphylococcus aureus* produced 16 (38.1%), 22 (52.4%) and 4 (9.5%) of alpha, beta and gamma haemolysis, respectively, while CON-*Staphylococcus* spp. produced more of beta haemolysis than both alpha and gamma. The results showed that 14 (33.3%) *Staphylococcus aureus* and 9 (42.9%) of CON-*Staphylococcus* spp are beta-lactamase producer. The antibiotics susceptibility testing showed that 29 (69.0%), 26 (61.9%), 27 (64.3%), 28 (66.7%) and 29 (69.0%) of *Staphylococcus aureus* were sensitive to peni-cillin, ceftriaxidime, cefoxitin, ciprofloxacin and levofloxacin, respectively. 12 (28.6%) of *Staphylococcus aureus* were resistant to streptomycin and iminipen, while about 45.2% - 50.0% were resistant to cephalothin and amoxicillin. CON-*Staphylococcus* spp also showed varied percentages of sensitivity ranging between 42.9% for streptomycin and 71.4% for moxifloxacin. The result also showed that 19.2 % of *Staphylococcus aureus* and 9.6% of CON-*Staphylococcus* spp. were resistant to more than eight antibiotics with (MAR) index ranging from 0.25 to 1.00 and 0.25 to 0.75 for *Staphylococcus aureus* and CON-*Staphylococcus* spp. respectively. The results obtained in this study are statistically significant ( $p \leq 0.05$ ). Most of the *Staphylococcus aureus* and CON-*Staphylococcus* spp were cured of their plasmids showing that they are plasmid borne. Large molecular weight plasmids ranging from 23.13kbp to 50.0kbp were harboured by both *Staphylococcus aureus* and CON-*Staphylococcus* spp obtained from acute otitis media. However, continuous surveillance to monitor antimicrobial resistance and guide the antibacterial therapy is overwhelmingly necessary.

## INTRODUCTION

Otitis media is the inflammation of the middle ear due to pathogenic micro-organisms that are resident in the middle ear (Damoiseaux, 2005; Ekpo *et al.*, 2009). Otitis media which may be acute otitis media (AOM), acute suppurative otitis media (ASOM) or chronic suppurative otitis media (CSOM) occurs in the area between the ear drum and the inner

ear, including the Eustachian tube (Richard and Robert, 1996; Bluestone, 1998). Otitis media is prevalent among children because their eustachian tube is shorter, straighter, made up of more flaccid cartilage, more horizontal than adults and also they have not developed the same resistance to bacteria as found in adults (Bluestone and Klein, 2001; Ihsan *et al.*, 2010). Research showed that 83% of

children will have at least one episode of AOM by the age of three years and this accounts for a large proportion of paediatric presentations to health care professionals and is the most common cause of hearing loss in children (Bluestone and Klein, 2001). The patients with acute otitis media (AOM) and chronic otitis media (COM) present the classic "earache", pain that is severe, continuous and is often accompanied by fever (39°C or more), possibly causing febrile seizures and can lead to insomnia for patients, mild to moderate hearing loss, loss of balance, unusual irritability, unresponsiveness to quiet sounds, and draining of fluid in the ear.(Ehrlich *et al.*, 2002; Rovers *et al.*, 2006). Staphylococci are Gram positive, facultative anaerobes, spherical bacteria in cluster with diameter ranging from 0.5 to 1.5 µm (Adejuwon *et al.*, 2010; Brock and Frazier, 1996). *Staphylococcus aureus*, a worldwide pathogen with its natural reservoir in human belongs to genus of the Micrococcaceae. It is recognized as one of the major causes of severe soft tissue infections, toxic shock syndrome (TSS) and as well as scalded skin syndrome in humans (Lowy, 1998; Weems, 2001). Over time, treatment of serious *S. aureus* infections can be challenging as the widespread use of antibiotics has led some *S. aureus* becoming more resistant to antibiotics (Archer, 1998; Akinjogunla *et al.*, 2010). Recent development in the treatment of patients with otitis media include the evidence of the efficacy of antibiotics especially β-lactam antibiotics and newer topical quinolones such as ofloxacin and ciprofloxacin (Bearden and Danziger, 2001; Loy *et al.*, 2002). The most common causes of bacterial resistance to β-lactam antibiotics are the production of β-lactamases, the presence of plasmid and mutation. Incidence of β-lactamase production in *Staphylococcus aureus* has consistently been reported to be over 80% in all parts of the world (Parker and Collier, 1990). Most developed countries have reported an increase in colonization and infection in hospitalized patients by CON-*Staphylococcus* spp. while there are scanty data on infections caused by CON-*Staphylococcus* spp. in developing countries. The levels of antibiotic resistant infections in the developing world have increased steadily in the last few decades as a result of combination of microbial characteristics and the selective pressure of antimicrobial use (Blondeau and

Tillotson, 2002). Microorganisms' mechanisms of overcoming the activities of antimicrobial agents include the production of structure-altering or inactivating enzymes (e.g. beta-lactamase or amino glycoside-modifying enzymes), alteration of penicillin-binding proteins or other cell-wall target sites, altered DNA gyrase targets, permeability mutations, active efflux and ribosomal modification (Gold and Moellering, 1996; Aaterson, 2001; Levy, 2002). Multidrug-resistant bacteria in both the hospital and community environment are important concern to the clinician, as it is the major cause of failure in the treatment of infectious diseases, increased morbidity, and mortality and the evolution of new pathogens (Hacker *et al.*, 1997; Jones and Phaller, 1998).

Plasmids allow the movement of genetic material, including antimicrobial resistance genes between bacterial species and genera (Miranda *et al.*, 2004). Plasmid profiles determination is the earliest DNA-based method used as serotype-specific reference patterns for detecting certain strain with possible variation in plasmid content which is very important in epidemiological studies. This study was carried out to determine the virulence factors, plasmid profile and curing analysis of multi-drug resistant *Staphylococcus aureus* and coagulase negative *Staphylococcus* spp. isolated from patients with acute otitis media.

## MATERIALS AND METHODS

Middle-ear swabbed samples from 136 patients with acute otitis media attending University of Uyo Teaching Hospital, General Hospital, Ikot-Ekpene and Nekede Paediatric Hospital in Akwa Ibom, were collected from January, 2009 to January, 2010 under aseptic conditions and inoculated into broth cultures for 4-6hrs and later inoculated onto plates of Mannitol Salt Agar (MSA). The plates were incubated aerobically for 24 hrs at 37°C. After overnight incubation, the plates were examined for fermentation of mannitol indicated by colour change of the medium around each colony from red to yellow. The organisms on the positive plates were sub-cultured onto nutrient agar slants and further speciated by conventional laboratory techniques including Gram staining; catalase test, coagulase test, urease production, indole production, citrate

utilization and Voges-proskauer test and coagulase test and isolates that were Gram-positive cocci in cluster, indole negative, catalase positive, citrate positive and coagulase positive were considered as *Staphylococcus aureus* while the coagulase negative were considered as coagulase negative *Staphylococcus* spp (CON-*Staphylococcus* spp).

#### THE ANTIBIOTIC SUSCEPTIBILITY TESTING

The antibiotic susceptibility of the bacterial species isolated was performed on Muller-Hinton agar (MHA) (Merck) plates by disk diffusion method as described by the National Committee for Clinical Laboratory Standards with slight modification. 0.1 ml of each bacterial isolates was seeded into each of the Petri dishes containing Mueller-Hinton agar and were allowed to stand for 30 mins to enable the inoculated organisms to pre-diffuse. The commercially available discs containing the following antibiotics: Penicillin (PEN,10ug), streptomycin (STR,10ug), amoxicillin (AMY,10ug), iminipen (IMI,10 ug), ceftriaxone, (CEF,30ug), cephalothin (CEP,30ug), ceftazidime, (CAZ ,30ug), cefotaxime (CTX , 30ug), ofloxacin (OFL,5ug), ciprofloxacin (CIP, 5ug), levofloxacin (LEV, 5ug) and Moxifloxacin (MOX,5ug) (Oxoid, UK) were aseptically placed on the surfaces of the sensitivity agar plates with a sterile forceps and were incubated at 37°C over night. Zones of inhibition after incubation were observed and the diameters of inhibition zones were measured in millimeters. The interpretation of the measurement as sensitive and resistant was made according to the manufacturer's standard zone size interpretative table. The percentage resistance was calculated using the formula  $PR=a/b \times 100$ , where 'PR' was percentage resistance, 'a' was the number of resistant isolates and 'b' was the number of isolates tested with the antibiotic. The percentage sensitivity was calculated using the formula  $PS=c/d \times 100$ , where 'PS' was percentage sensitivity, 'c' was the number of sensitive isolates and 'd' was the number of isolates tested with the antibiotic.

#### DETERMINATION OF MULTIPLE ANTIBIOTIC RESISTANCE INDEX (MAR)

Multiple antibiotic resistance index (MAR) was determined using the formula  $MAR=x/y$ , where  $x$

was the number of antibiotics to which test isolate displayed resistance and  $y$  is the total number of antibiotics to which the test organism has been evaluated for sensitivity.

#### TEST FOR HEMOLYTIC ACTIVITY

The hemolytic activities of the bacterial species (*Staphylococcus aureus* and Coagulase negative *Staphylococcus* spp.) were identified by the presence of diffuse ( $\alpha$ -hemolysis) or clear ( $\beta$ -hemolysis) halos around the colonies. A colony of each of the bacterial isolates was subcultured onto freshly prepared blood agar (nutrient agar containing human blood) plates incubated at 37°C for 24 hours, after which the colonies were examined for hemolytic activity.

#### TEST FOR BETA LACTAMASE PRODUCTION

Beta-lactamase test was carried out using the Starch Paper Method (SPM) described by Odugbemi et al. (1977). Strips of starch paper about 4 – 6 cm were cut and sterilized using 70% ethanol, the strips were soaked for about 10 min in benzyl penicillin dissolved in phosphate buffer. The cut strips were then spread evenly on Petri dishes and about 18 – 24 hrs old cultures grown on Nutrient Agar were inoculated on the surface of the test starch paper and spread over an area of 2 -3 mm. The Petri dishes were incubated at 37°C for 30 min then Gram's iodine solution was used to flood the plate and drained off immediately. The starch paper turns uniformly black within 30seconds of application. Colonies with decolourized zones are positive for beta-lactamase but colonies with black background show beta-lactamase negative.

#### PLASMID CURING EXPERIMENT:

Plasmid curing was carried out to determine in order to determine the location (plasmid-borne or chromosomal) of the drug resistance marker(s). The curing (elimination) of the resistant plasmids of the (*Staphylococcus aureus* and Coagulase negative *Staphylococcus* spp.) isolated was done using sub-inhibitory concentration of 0.10 mg/ml of acridine orange as described by Sheikh et al. (2003); Yah et al (2007); Akortha and Filgona (2009) with slight modification. Isolates *Staphylococcus aureus* and

Coagulase negative *Staphylococcus* spp. isolates were grown for 24hrs at 37°C in nutrient broth containing 0.10 mg/ml acridine orange. After 24hrs, the broth was agitated to homogenize the content and loopful of the broth medium were then subcultured onto Mueller Hinton Agar (MHA) plates and antibiotic sensitivity testing was carried out as previously described. Absence of zone of inhibition on Mueller Hinton agar was indicative of plasmids-mediated resistance (plasmid cured), while presence of zone of inhibition on Mueller Hinton agar was indicative of chromosome-mediated (plasmid not cured).

### **PLASMID PROFILING AND AGAR GEL ELECTROPHORESIS**

Plasmid extraction was carried out using the method described by Ehrenfeld and Clewell 1987 with slight modification. Pure isolates were inoculated on MRS broth and incubated. The grown cells were harvested and suspended in 200µl of solution A (100mM glucose-50mM Tris hydrochloride (pH 8)-10mM EDTA) containing 10 mg of lysozyme per ml and 10µg/ml mutanolysin and incubated for 30 min at 37°C in an incubator. 400µl of freshly prepared 1% sodium dodecyl sulfate in 0.2 N NaOH was added and the samples were mixed by inverting tubes. 300µl of a 30% potassium acetate solution (pH 4.8) was added and the samples were mixed by vortexing. After incubating on ice for 5 minutes, the debris was removed by a 5-minute centrifugation in a centrifuge (model 5415R; Eppendorf). The supernatant was removed and extracted once with a phenol-chloroform mixture (1:1) and precipitated with an equal volume of isopropanol. The plasmid DNA was then dissolved in 100µl of TE buffer. Electrophoresis of the DNA was carried out on a 0.8% agarose gel in a 0.5X concentration of Tris-Borate-EDTA (TBE) buffer. Agarose gel was prepared by boiling 0.8g of agarose powder in 100mls of 0.5X TBE buffer. After boiling, the solution was allowed to cool and 10µl of ethidium bromide was added to the cooled agarose solution. This was poured into a casting tray with a comb placed across its rim to form wells. The gel was allowed to set for 30 minutes and the comb was removed. 20µl of the plasmid DNA samples were then loaded into the wells after mixing with 2µl of bromophenol blue. A DNA molecular weight marker

was also loaded into one of the wells. The gel was thereafter electrophoresed in a horizontal tank at a constant voltage of 60V for about 1 hour 30 minutes. After electrophoresis, plasmid DNA bands were viewed by fluorescence of bound ethidium bromide under a short wave ultraviolet light transilluminator and the photograph were taken using a digital camera. The DNA bands were matched with those for Lambda DNA Hind III digest molecular weight marker in the range 0.1 - 23.1kb. The approximate molecular weight of each plasmid was consequently obtained by extrapolation on graphical plots of molecular weight of marker against the distance traveled by the respective band

### **STATISTICAL ANALYSIS OF RESULTS**

Frequencies and percentages were calculated for study variables. Chi-square ( $\chi^2$ ) test was used to calculate probabilities and determine significance. A p-value of less than or equal to 0.05 was considered to be statistically significant ( $p \leq 0.05$ ), while p-value more than 0.05 was considered to be statistically not significant (NS).

### **RESULTS AND DISCUSSIONS**

The results of the morphological and biochemical characteristics of *Staphylococcus aureus* and CON-*Staphylococcus* spp. isolated from acute otitis media are shown in Table 1. The occurrence of the Bacterial spp. Isolated from 136 Patients with Acute Otitis Media are shown in Table 2. The virulence factors produced by *Staphylococcus aureus* and CON *Staphylococcus* spp. isolated are shown in Tables 3 and 4, with 16 (38.1%), 22 (52.4%) and 4 (9.5%) of *Staphylococcus aureus* producing alpha (diffuse haemolysis), beta (clear haemolysis) and gamma (absence of haemolysis), respectively, while CON-*Staphylococcus* spp. produced more of beta haemolysis than both alpha and gamma. The results showed that 14 (33.3%) *Staphylococcus aureus* are  $\beta$ -lactamase ( $\beta$ L) producer, while only 9 (42.9%) of CON-*Staphylococcus* spp. produced  $\beta$ -lactamase (Table 4).

The antibiotic susceptibility testing data are shown in Table 5. Of the forty-two *Staphylococcus aureus* screened for susceptibility to the 12 antibiotics the results showed that 29 (69.0%), 26

(61.9%), 27 (64.3%), 28 (66.7%) and 29 (69.0%) of *Staphylococcus aureus* were sensitive to penicillin, ceftriaxidime, cefoxitin, ciprofloxacin and levofloxacin, respectively. A total of 12 (28.6%) of *Staphylococcus aureus* were resistant to both streptomycin and iminipen, while about 45.2% - 50.0% were resistant to cephalothin and amoxicillin. The results of the antibiotic susceptibility profile of the twenty-one CON-*Staphylococcus* spp also showed varied percentages of sensitivity ranging between 42.9% for streptomycin and 71.4% for moxifloxacin. The resistant of CON-*Staphylococcus* spp to ciprofloxacin, levofloxacin, ceftriaxidime and moxifloxacin were low compared to the result obtained when tested with streptomycin and iminipen (Table 5). The most effective antibiotic against *Staphylococcus aureus* and CON-*Staphylococcus* spp isolated from acute otitis media was moxifloxacin as only 26.0% of the bacteria were resistant to it. The multiple antibiotic resistance (MAR) indexes of the *Staphylococcus aureus* and CON-*Staphylococcus* spp are shown in Table 6. The antibiotic resistant *Staphylococcus aureus* have MAR index of 0.25 to 1.00, while the antibiotic resistant CON-*Staphylococcus* spp have MAR index of 0.25 to 0.75. The result showed that 19.2 % of *Staphylococcus aureus* and 9.6% of CON-*Staphylococcus* spp. were resistant to more than eight antibiotics. All the resistant *Staphylococcus aureus* and CON-*Staphylococcus* spp were subjected to plasmid-curing experiments using acridine orange and the results obtained showed that most of the strains lost their plasmids as a result of the cure by acridine (Mutagenic substance) (Tables 7 and 8). The plasmids molecular weights of both *Staphylococcus aureus* and CON-*Staphylococcus* spp ranged from 23.13kb to 50.0kb (Figures 1 and 2). The isolation of *Staphylococcus aureus* and coagulase negative *Staphylococcus* spp. in the middle ear of patients suffering from patient with acute otitis media in this research is in agreement with the report by Ekpo et al., 2009. The fermentation and growth of *Staphylococcus aureus* and CON-*Staphylococcus* spp on mannitol salt agar in this study could be attributed to its ability to grow on relatively high concentrations of sodium chloride, as contained in the medium (Nester et al., 1998). Pathogenicity of *Staphylococcus aureus* in acute otitis media are attributable to

virulence factors such as coagulase and hemolysin produced by the organisms and the occurrence of this virulence factors in *Staphylococcus aureus* is in conformity with the reports of Nester et al., (1998). Geary et al, (1997) reported that coagulase negative *Staphylococcus* spp resistant to beta-lactam antibiotics produced beta-lactamase and this is in agreement with our finding as some of the coagulase negative *Staphylococcus* spp isolated are resistant to penicillin, iminipen, ceftriaxone, cephalothin, ceftriaxidime, and cefotaxime (beta-lactam antibiotics).

Resistant *S. aureus* was seen in clinical practice as early as the 1950s, by acquiring a plasmid that encodes the production of beta-lactamase enzymes causing resistance to beta-lactam antibiotics. The activities of antibiotics against *Staphylococcus aureus* and coagulase negative *Staphylococcus* spp. isolated from acute otitis media patients attending the three Hospitals showed the varied levels of multiple antibiotics resistance. There is wide variation in the use of antibiotics among the physicians of different nations from as low as 31% of cases of acute otitis media in Netherland to as high as 90% in Australia and United States (Delmar et al., 2003). The exceedingly increases and emergence of multidrug resistance pathogens in the developing countries can be attributed to indiscriminate use of antibiotics, complex socio-economic, behavioral antecedents and dissemination of drug-resistant pathogens in human medicine. (Okeke et al., 1999). Antibiotic resistance of pathogens typically causative of acute otitis media continues to increase as the emergence of multi-drug resistant strains especially *Staphylococcus aureus* and CON-*Staphylococcus* spp complicate the management of acute otitis media and increase the risk for treatment failure (Leibovitz, 2003).

Plasmid replication is inhibited by various agents especially acridine (acridine orange) that intercalates between the bases of DNA, without inhibiting the chromosomal DNA replication. In order to determine whether the observed multi drug resistance pattern in the isolates was plasmid or chromosomal mediated, the isolates were screened for the presence of conjugative plasmids using acridine orange and resultantly, some of the resistance markers were stably lost, the lost of resistance markers using acridine orange is line with

that of Yah et al (2007) and Akortha and Filgona (2009). Isolation of plasmids using agarose gel electrophoresis and observation under UV transilluminator showed the various bands for the *Staphylococcus aureus* and coagulase negative *Staphylococcus* spp. with the molecular weights of plasmids ranging from 23-50 Kbp .The molecular weights seemed to be strain specific rather than species specific. In conclusion, culture and sensitivity testing will be instrumental in the management of this infection and continuous surveillance to monitor antimicrobial resistance and guide the antibacterial therapy is overwhelmingly necessary.

**Abstract:** This article attempts to illustrate the barriers of agricultural development in Fars, Iran. Agriculture is certainly a major contributor to rural development in many countries. It is one of the most important economic sectors in Iran. But, there are a significant number of barriers to effectively using agriculture industry as a tool for rural development. The findings through focus group discussion indicated that there are some organizational barriers in agricultural development in some villages in Fars. The finding can assist the local agriculture organizations for remove this problem in face of agriculture for rural development.

**Keywords:** agriculture development, rural area, barriers

### Introduction

According to the U.S agriculture census, agriculture is described as a place of three acres or more on which any field forage crops were harvested or vegetables were harvested for sales of \$100 or more (Mills, 1984; Mwaijande, 2007). Agriculture can provide a way for improving the potential economic of rural communities. Agriculture is the core of the export market and it is accountable for one fourth to one-half of (GDP) gross domestic product in developing countries (Karbasioun et al., 2008).

About 25% of the Gross National Product, 33% of employment, 25% of non-oil exports and 80% of food requirements have been provided by the agricultural sector in Iran. Nevertheless, there are some evidence that agricultural development has some barriers. For instance, about 30% of the forests located in the North of Iran were destroyed during the last two decades. Furthermore, large portions of pastures and grasslands were rendered unproductive because of overuse by the cattle of the nomadic population and farmers (Darvishi, 2003; Karbasioun et al., 2008). Salinity of soil and water resources is a serious threat in many parts of the country (Siadat et al., 1997). The research of this study explores the policy constraints as institutional barriers within agriculture sectors. Roughly one-third of Iran's total surface area is suited for farmland, but because of poor soil and lack of adequate water distribution in many areas, most of it is not under cultivation. Only 12% of the total land area is under cultivation (arable land, orchards and vineyards) but less than one-third of the cultivated area is irrigated; the rest is devoted to dry farming. Some 92 percent of agro products depend on water (Wikipedia, 2010a).

### Method

In this study the general purpose is to investigate the barriers of agriculture development in Fars' villages in Iran. Fars is one of the 30 provinces and known as Cultural Capital of Iran. It is in the south of the country and its center is Shiraz. It has an area of 122,400 km. In 2006, this province had a population of 4.34 million people, of which 61.2% were registered as urban dwellers, 38.1% villagers, and 0.7% nomad tribes. Agriculture is of great importance in Fars. The major products include cereal, citrus fruits, dates, sugar beets and cotton (Wikipedia, 2010b). Iranian agriculture is thousands of years old and this reflects the length of time during which soil and water resources of the country have been utilized for crop production. This study is based on quantitative methodology to investigate the barriers of agriculture development. Hence to achieve the objectives of this study, the researcher uses quantitative method. Some villages in Abadeh Tashk in Fars Province, Iran were selected as a case study area because it provided many opportunities to develop agriculture. *Jahan Abad, Koushkak, Hassan Abbad, Khajeh Jamali, Deh murd, Tashk, Dehzir,* were villages which have been chosen for this study (see the figure 1). Focus group discussion (FGD) was performed to collection data from local farmers. FGD is probably the most widely used technique of gathering qualitative data (Aref, 2010; Grover & Vriens, 2006). According to Rafipoor (2005) FGD technique is an appropriate technique in science research in terms of Iranian culture. FGD was conducted in a group setting and was used for obtaining a better understanding of participants' attitudes towards the barriers of agriculture development. There is no consensus among qualitative researchers on the optimal number of participants in FGD. Some researchers suggest the

number of studied argued four to twelve people (Mendis-Millard & Reed 2007). But the ideal number of participants in each FGD is six to ten. Participants of FGD were classified according to their place in the villages. All respondents were male. They ranged in age from 27 to 73 years. The researcher explained to them the objectives of the study and what questions would be asked. The researchers examined, categorized participants responses from each focus group of villagers that were recorded in video tapes.

## **Result**

Information for this study was gathered from rural residents through FGD. A qualitative analysis was undertaken to determine viewed the barriers of agriculture development. According to the collected baseline data, farming is the most common occupation in the 7 villages in *Jahan Abad, Koushkak, Hassan Abbad, Deh e Murd, Khvajeh Jamali, Tashk, Dehzir, Chah-Ghaz, Ghah- Sorkh*, There were overall 65 participants with an average of 57 years old. All participants; were males. They were chosen because of their engagements in agriculture products. The questions were asked about to barriers of agriculture development. The findings showed that agriculture development in their villages is without any certain planning for rural development. Although the FGD respondent referred to variety barriers in terms of agriculture in their villages but in this study we refer to some common barriers which have been discussed in majority of FGD groups. The most barriers in terms of agricultural development were including:

1) Salinity of water: The majority of FGD participants believed there is no suitable water for irrigation in their village. They believe that their villages have many lands, but they don't have enough water to irrigation of these lands. Another problem associated with the expansion of irrigated farming is the overdraft of ground water. In support of this finding Sadat et al (1997) also state that the sustainability of our agricultural production is highly dependent on the "health" of our soil and water resources. But, the future of these resources is highly threatened by salinization and eventual desertification (Siadat et al., 1997).

2) Lack of resources: The most participants in FDG groups mentioned to this issue as main obstacles to agriculture development. Lack of credit resources also was another barrier to develop agriculture development in their area.

3) Lack of human resource development. Most of young villagers immigrated to the citied and so however, there are many educated people from the rural area of Iran but they don't have apathy to engage in agricultural activities.

4) Lack of government support: lack of government support to provide funding for poor farmer to develop their activities. Focus groups often complained about the lack of agricultural organization support to provide adequate facilities for farmers.

5) Lack of agricultural organization capacity: FGD respondents believed the lack of capacity of agriculture was behind the failure investment for their agriculture product. However in the end of any discussion they refer to the barriers of agriculture development through government policy as well as local organizations.

6) Lack of agricultural knowledge: However, in agricultural modern the role of knowledge is important. But regarding the discussion with famers, they stated that government did not support them with new knowledge. Base on my observation the farmers had traditional knowledge in agriculture. With mention to above focus group discussion about barriers of agriculture development, I summarized these barriers in two groups: community barriers and organizational barriers.

## **Conclusion**

This paper has identified the barriers agriculture development. Lack of capable organizations and community resources were an important element contributing to limited agriculture development. They refereed to government policy and lack of local organizational capacity as main barriers related agriculture development. Clearly, the described barriers may not be only specific to Fars province; some of them may also be considered as common general problems of agriculture development in other communities in Iran. Base on the findings, it can be suggest that rural empowerment can be a tool for agriculture development in Iran. The findings of this study can be useful for academics, researchers and all stakeholders involved in designing, assessing or promoting agriculture projects which are in any way associated with general development goals. An understanding of the existing barriers of agriculture provides basic information for setting a policy agenda to enhance agriculture.

# Immunostimulatory and Protective Properties of *Lactobacillus brevis* Used as a Biocontrol Agent *in Vivo*

Agarry, O. O.

Department of Biological Sciences, Microbiology Unit, University of Abuja , P. M. B. 117, Abuja, Nigeria  
E-mail: [oluagarry@yahoo.com](mailto:oluagarry@yahoo.com)

**Abstract:** The immunostimulatory and protective properties of *Lactobacillus brevis* isolated from cassava starch were studied in vitro and in vivo. Antagonism was measured by the zone of inhibition between the bacterium streak/ring and fungus plug. Subsequent increases in inhibition were observed and complemented by a small but progressive decrease in the distance between the bacterium and the fungus. *L. brevis* significantly (>74%) inhibited the growth rate of *Fusarium moniliforme* after 168 h. Biochemical indices of albino rat plasma showed that the bacterium had liver improvement functions. Plasma aspartate aminotransferase (AST) activity of the rats dosed with *L. brevis* alone was lower (8.33 IU/L) than the control. A mild elevation of AST and alanine aminotransferase (ALT) activities was observed in rats administered with *L. brevis* and *F. moniliforme* implying that the bacterium possesses antimycotic properties capable of reducing the severity of pathogen attack on the host. However, there was a significant ( $P<0.05$ ) decrease in the plasma globulin and protein levels. There was a reduction in the count of *F. moniliforme* in rats dosed with both organisms during feeding trials. The weight gain by rats in the treatment group compared favourably with the control. Further pathological investigation confirmed a pale and friable liver while the small intestine was inflamed. The administration of *L. brevis* had an immunostimulatory effect. *Lactobacillus brevis* has not only potent in vitro antifungal activity against *F. moniliforme* but also in vivo control efficacy against *Fusarium* infection. Further evaluation of its effectiveness for disease control and applications should be done

[Agarry, O. O. Immunostimulatory and Protective Properties of *Lactobacillus brevis* Used as a Biocontrol Agent *in Vivo*. Journal of American Science 2010;6(11):1038-1045]. (ISSN: 1545-1003). (<http://www.americanscience.org>)

**Keywords:** Immunostimulatory properties, *Fusarium moniliforme*, *Lactobacillus brevis*

## INTRODUCTION

*Lactobacillus brevis* is a species of lactic acid bacteria. Ingestion has been shown to improve human immune function, and it has been patented several times (Yoshindo, 2005). While interferon is attracting international attention as a specific medication for the treatment of cancers and viral diseases, *Lactobacillus brevis* has been observed to increase the production of interferon in the body (Akihiko, 1994; 1995). In addition to strengthening the specific immunity, lactic acid bacteria also seem to reinforce the non-specific mechanisms of defense such as phagocytosis and cytokine production. Secretion by these organisms of compounds having anti-inflammatory or antimicrobial effects has also been suggested (Heyman, 2000). *Fusarium* is one of the emerging causes of opportunistic mycoses (Anaissie *et al.*, 1988; Guarro and Gene, 1995). Infections due to *Fusarium* spp. are collectively referred to as fusariosis. Outbreaks of nosocomial fusariosis have also been reported. Existence of *Fusarium* in hospital water distribution systems may result in disseminated fusariosis in

immunosuppressed patients. *Fusarium* is one of the most drug-resistant fungi. *Fusarium* infections following solid organ transplantation tend to remain local and have a better outcome compared to those that develop in patients with hematological malignancies and bone marrow transplantation patients (Deshpande and Koppikar, 1999; Tanure *et al.*, 2000 and Schell, 2000).

The colonic microflora microflora is important to health. The growth and metabolism of the many individual bacterial species inhabiting the large bowel depend primarily on the substrates available to them, most of which come from the diet. The microflora normally presents a barrier to invading organisms; but pathogens often become established when the integrity of the microbiota is impaired through stress, illness, antibiotic treatment, changes in diet, or physiological alterations in the gut. Innovative approaches have been tried as alternative to antibiotics in treating gastrointestinal diseases and these include using live biotherapeutic agents such as yeast (*Saccharomyces* spp.) and bacterial isolates (*Lactobacillus* spp.) or faecal enemals (Fuller 1992).

*Lactobacilli* have been widely used in treating diarrhoeal diseases such as pseudomembranous colitis, but the results have been mixed. Feeding freeze-dried powders of *L. acidophilus* NCDO 1748 had no effects on patients with pseudomembranous colitis (Aronsson *et al.* 1987). The presence of this group of bacteria in the gut is considered to have several potential benefits such as protection from pathogens (Casas and Dobrogosz 2000), anticholesterolaemic effect (Bertazzoni *et al.* 2001) and immunostimulation (Aattouri *et al.* 2001). However, not all lactobacilli are effective in combating enteric pathogens.

*Fusarium* is listed as one capable of causing mycetomas (Schell, 2000) and it has repeatedly been isolated from human keratitis (Deshpande and Koppikar, 1999) and corneal ulcers. Experimental animals often experience hepatotoxicity, nephrotoxicity or both; rats have also been shown to experience necrosis of stomach mucosa and myocardium due to the toxins, fumonisins. Liver cancers are induced. Fumonisins are also among the chief suspects for the agent(s) of elevated levels of esophygael cancer in certain parts of the world (Pitt, 2000).

In the current situation where the discovery of new antimicrobial agents are becoming increasingly difficult, the present study suggests that investigation of lactic aid bacteria may offer some potential applicability to chemotherapy.

## MATERIALS AND METHODS

### Microbial culture

*Lactobacillus brevis* and *Fusarium moniliforme* were isolated from cassava starch on de Mann Rogosa and Sharpe (MRS) agar and Malt Extract Agar (MEA). All growth media were supplied by Oxoid (Melbourne, Australia). The isolates were characterized using colonial, morphological and biochemical methods.

### *In vitro* antifungal activity

Modified methods of Fokkema (1973) and Adetuyi and Cartwright (1985) were used for the detection of antagonistic activity of bacterial isolate towards the growth of the fungal culture as adapted by Agarry and Osho (2005).

### *In vivo* feeding

Sixteen albino rats (Wistar strain) Aged 6-8 weeks were obtained from the Department of Biochemistry, University of Ilorin, Nigeria. The rats were fed on basal diet broiler starter (Amo-Byng Feeds and Concentrates, Oyo State, Nigeria). They were randomly assigned to 4 treatment groups designated as BUU (Basal diet only, uninfected with

fungus and untreated with bacterium (control)), BUT (Basal diet, uninfected with fungus but treated with bacterium), BIU (Basal diet, infected with fungus and untreated with bacterium), and BIT (Basal diet, infected with fungus and simultaneously treated with bacterium , and each was made up of 4 rats per group. Lyophilised *Lactobacillus* cells were reconstituted by dissolving 1 g in 10 ml of sterile water.

Adult Wistar albino rats were held under specific pathogen free conditions. Group BUU animals were kept on the basal diet alone (control). Animals in Groups BUT and BIU were fed on the basal diet and were orogastrically dosed with *L. brevis* (0.3 ml) and *F. moniliforme* (0.3ml) respectively. Group BIT were fed with basal diet, orogastrically challenged with  $10^8$  cfu/spores of *F. moniliforme* and then treated with the administration of 0.3 ml of *L. brevis* ( $10^5$  cfu/g). . The above treatments were repeated for a second day and a post-ingestion period of 14 days was observed after the administration of the cultures. Rats were then killed by cervical dislocation and blood samples collected into EDTA bottles for analysis of some plasma biochemical markers. The liver kidney, spleen, stomach and small intestine were removed for examination.

### Biochemical assay

The biomarkers assayed for: aspartate aminotransferase (AST), alanine aminotransferase (ALT), alkaline phosphatase (ALP), albumin, globulin and total proteins were conducted according to the conventional methods reported by Mokady *et al.* (1989). The haematological parameters namely packed cell volume (PCV), haemoglobin (Hb) count, white blood cell count (WBC) and differential counts were conducted using the methods of Aning *et al.* (1998).

### Monitoring the progress of infection and faecal levels of *A. fumigatus*

The body weights of animals were recorded daily up to 14 days post-pathogen challenge. The data gathered were used to calculate the following parameters: (i) weight gain = final weight – initial weight (ii) percentage weight gain = weight gain/final gain x 100.

For enumeration of viable faecal *Aspergillus fumigatus*, freshly voided faecal pellets were collected and pooled from each rat (0.3-0.4 g per rat) at 1, 2, 7 and 14 days post-dosing (Chang *et al.* 2001). Faeces were weighed and homogenized. Faecal homogenates were serially diluted in sterile water, and a0.1 ml aliquot was added in duplicate onto MEA plates. Plates were incubated in aerobic condition for 4 days at 25°C. Colonies were

characterized on the basis of morphology and pigmentation. The population levels were converted to log values before plotting out in graphs.

#### Histopathological tests

At autopsy the internal organs were inspected for morphological lesions. Samples of the liver, kidney, stomach, spleen and small intestine from each animal were fixed in 10% formalin, dehydrated in different percentages of alcohol, cleared in xylene for 2 h and impregnated in liquid for 2 h for embedding. The embedded organs were sectioned to 2 $\mu$ m using a microtome and stained with haematoxylin eosin (Silva *et al.* 1999).

#### Statistical analysis

Results are expressed as means  $\pm$  standard error of the mean. For statistical comparison, the data gathered were processed by one-way analysis of variance (ANOVA), SPSS 10.0. Means were compared by Duncan Multiple Range Test Statistical analysis was conducted with the Statistical Analysis System for personal computers (SAS Institute, Cary, NC, USA) software with the level of significance set at  $p < 0.05$ . Ethical declaration The study protocol was conducted in accordance with internationally accepted principles (European Community guidelines EEC Directive of 1986, 86/609/ee; US guidelines, NIH publication H85-23, revised in 1985) for laboratory animal use and care.

## RESULTS AND DISCUSSION

#### Antifungal activities

*Lactobacillus brevis* inhibited the growth of food spoilage and phytopathogenic fungus, *Fusarium moniliforme* (**Plate I**).

Physical contact between the bacterium and the fungus mycelium was never observed during the incubation period. An uncolonized zone between the bacterium and fungus was maintained throughout suggesting that diffusible metabolites of bacterial origin were responsible for inhibition of mycelium growth (**Plate I**). The bacterium was not directly lethal to the fungus under the conditions of the bioassay but strongly inhibitory to the mycelial growth and spore formation. The use of a separate control apart from the Fokkema "control" side of the culture in the Fokkema-type bioassay was made to judge its true presentation of normal unchallenged mycelial growth. When compared to the 'true' control plate which has no bacterial inoculum on it, there appeared to be no significant difference (Fig. 1) in the two controls. Measurements of growth rate inhibition showed variations between the two techniques, and overall levels of activity were essentially similar (**Fig. 1**) but the streak bioassay of Fokkema (1973) method gave an erratic pattern of

inhibition over the bioassay period than did the concentric ring method of Adetuyi and Cartwright (1985). The points at which inhibition was first detected and at which complete cessation of fungal growth (streak method: 96 h; ring method: 72 h) occurred in the two methods were also different with . The ring bioassay detected inhibition earlier(48h) than the streak bioassay(72h) (**Fig 1**). It also facilitated measurements of the distance between the bacterium and the fungus, and allowed accurate determination of fungal colony radius, since inhibitory effects were exerted equally around the colony. *L. brevis* inhibited fungal growth up to >74% in the ring method and >92% in the streak method (**Fig 1**). Oyetayo (2006) reported the inhibition of growth of pathogenic and food spoilage bacteria by *L. plantarum*.

#### Hepatoprotective effect

Plasma biomarkers in experimental animals after orogastric dosing with *L. brevis* reveal a significant reduction in aspartate aminotransferase (AST) and alanine aminotransferase (ALT) levels as compared with those placed on basal diet and dosed with *F. moniliforme* (**Table 1**). Experimental animals often experience hepatotoxicity, nephrotoxicity or both due to the toxins, fumonisins produced by *F. moniliforme*. Fumonisins are also among the chief suspects for the agent(s) of elevated levels of esophageal cancer in certain parts of the world (Pitt, 2000). The rise in AST in rats fed basal diet and *F. moniliforme* could be attributed to possible secretion of mycotoxins. Oboh *et al.* (2000) reported aflatoxin B1 to be implied in liver damage.

AST values were reduced in rats dosed with the bacterium more than control rats (**Table 1**). Plasma AST and ALT are important enzymes used in monitoring liver damage (Johnston 1999). An increase in the level of these enzymes in the serum/plasma is an indication of hepatocellular damage (American Liver Foundation 1995).

AST and ALT are enzymes located in the liver cells and leak out and make their way into the general circulation when liver cells are injured (David and Johnston 1999). Mild or moderate elevations of AST or ALT are non-specific and may be caused by a wide range of liver diseases (American Liver Foundation 1995, 1997; David and Johnston 1999)

There was significant change(Table 1) ( $P<0.05$ ) in plasma albumin, globulin and protein of the albino rats in all groups when compared with that of the control diet. Albumin measures the main protein made by the liver and tells how well the liver is making this protein. Low albumin as reported for Group BIU animals (11.60g/dL) may be caused by acute or chronic inflammation or liver disease (David

and Johnson, 1999; Younossi and Mehta, 1998). Slight elevation of albumin in Group BUT animals indicated an increase in the protein production made by the liver. The bacterium has the ability to stimulate the immune system of the rats. Albumin is produced mainly in the liver and therefore is a test of liver function. Low albumin levels and no other liver function test abnormalities are likely to result from a nonhepatic cause (David and Johnson 1999). Total protein measures albumin and other proteins in blood, including antibodies made to help fight off infections (Liver Function Tests 2005; Younossi and Mehta 1998).

### Immunostimulatory effect

The WBC count increased in groups BIT and BUT (**Table 2**). This might result from the production of more white blood cells to engulf the antigen. T lymphocyte and other key cells of the immune system are known to activate production of antibody polymorphonuclear granulocyte to destroy an invading pathogen (Prescott *et al.*, 1999). Differential leucocyte counts in Wistar rats dosed with *L. brevis* reveal a significant increase in neutrophil and ensinophil counts and mild decrease in lymphocyte counts as compared with the control (**Table 2**). The primary role of lymphocytes is in humoral antibody formation and cellular immunity (Baker and Silver 1985). An absolute increase in lymphocytes had been found in most bacterial infection such as Staphylococcal infection (Monica 2000). The administration of *L. brevis* to Group BUT animals had an immuno-stimulatory effect. Immunoglobulins are often sought in children with recurrent infections or a combination of infections with injury (Baron *et al.* 1994, pg 158). The PCV and Hb compared favourably with the standard (Mitraka and Rawnsley 1977; Baker *et al.* 1979; Weihe e 1987). Aning *et al.* (1998) and Oboh and Akindahunsi (2004) reported similar findings on the haematological parameters of albino rats fed sorghum and brewer's grains and albino rats fed *Saccharomyces cerevisiae*-fermented cassava flour diet. The PCV and Hb of the control diet and other groups were significantly different ( $P>0.05$ ) suggesting that the treatment is not haemolytic. This result also agrees with Aletor (1993) to the extent that cassava products do not have negative haemotological effects. Agarry (2006) reported an improvement in blood composition of treated Wistar rats with an antagonistic pair of microbial isolates of cassava products origin. The improvement in blood composition that followed feeding of the animals with the bacterium indicated an immunological security for the group of animals given such treatment. (Table 2).

### Other benefits

Animals singly dosed had fluctuating weight gain/loss over the 2-week period. The weight gain in the control group compared favourably with that in group BUT(Fig 2). This implies that the treatment enhanced the growth of the animals. A reduction of the faecal level of the fungus and increase in the level of the beneficial bacterium (*L. brevis*) was also observed (Fig 3). Animals of group BUT contained a low faecal number of pathogens. The faecal levels of the bacterium increased in animals of groups BUT and BIT. Although animals were doused with isolates for only 2 days after pathogen challenge, they were protected beyond that time(Fig 3). These observations are in line with observations made by Henriksson and Conway (2001), who demonstrated that a range of new bifidobacteria may provide protection against infection by *Salmonella typhimurium* in mice resulting in both an initial reduction of *S. typhimurium* levels in feaces and a reduced weight loss of animals challenged with the pathogen.

However, the pathological studies revealed possible damage to the internal organs of the animals. The small intestine, stomach and liver of rats showed significant lesions. Distention of issue parenchyma, cellular infiltration and partial erosion of the mucus membrane apparent while no significant lesions in the spleen and kidney was observed.

## CONCLUSION

*L. brevis* has a stimulatory effect on humeral immunity of albino Wistar rats with the following benefits: antimicrobial activity against important

pathogens and a food spoilage fungus: *Fusarium moniliforme*; hepatoprotective effect as a result of the ability to lower plasma aminotransferase levels and immunostimulatory effect.

**Abstract:** Matching of feature vectors extracted from speech sample of an unknown speaker, with models of registered speakers is the most time consuming component of real-time speaker identification systems. Time controlling parameters are size and count of extracted test feature vectors as well as size, complexity and count of models of registered speakers. We studied vector quantization (VQ) for accelerating the bottlenecking component of speaker identification which is less investigated than Gaussian mixture model (GMM). Already reported acceleration techniques in VQ approach reduce test feature vector count by pre-quantization and reduce candidate registered speakers by pruning unlikely ones, thereby, introducing risk of accuracy degradation. The speedup technique used in this paper partially prunes VQ codebook mean vectors using partial distortion elimination (PDE). Acceleration factor of up to 3.29 on 630 registered speakers of TIMIT 8kHz speech data and 4 on 91 registered speakers of CSLU speech data is achieved respectively.

[Muhammad Afzal, Shaiq A. Haq. Accelerating Vector Quantization Based Speaker Identification, Journal of American Science 2010;6(11):1046-1050]. (ISSN: 1545-1003). <http://www.americanscience.org>.

**Keywords:** Speaker identification, vector quantization, partial distortion elimination, speaker pruning.

## 1. Introduction

Automated Speaker Identification (ASI) systems identify a test speaker from the database of its registered speakers (Quatieri, 2002). ASI systems have three major units namely Feature Extraction (FE), Model Training (MT) and pattern matching (PM) as shown in Figure 1.

**Figure 1. Major Components of an ASI System**

FE unit is used both by MT and PM units as front processor. The input to FE unit is a digital

speech signal which is converted by it to a sequence of  $d$ -dimensional vectors each consisting of  $d$  values of speaker specific features. Mostly Mel-frequency Cepstral Coefficients (MFCC) feature vectors of 12 to 20 elements are used (Kinnunen, 2006). MT unit of VQ based ASI systems compresses feature vector sequence  $\tilde{X} = (\tilde{x}_1, \tilde{x}_2, \tilde{x}_3, \dots, \tilde{x}_{\tilde{T}})$  of size  $\tilde{T}$  to smaller number of mean vectors by generally implementing Linde Buzo Gray (LBG) clustering algorithm (Bei and Gray, 1985). The set of  $M$  mean vectors is termed as codebook,  $C \in \mathbb{R}^{M \times d}$ . For an ASI system of  $N$  registered speakers,  $N$  codebooks are computed and stored in a repository,  $R$ , mathematically given by Expression (1).

$$R_{store} \leftarrow \left\{ \sum_{LBG}^N \tilde{X} \Rightarrow C \right\} \quad (1)$$

Where  $\mathbb{R}$  represents real number space,  $\tilde{X} \in \mathbb{R}^{\tilde{T} \times d}$ ,  $R \in \mathbb{R}^{N \times M \times d}$  and;  $d$ ,  $M$  and  $N$  are as defined above.

VQ codebook is called non-parametric model while GMM is termed as parametric model. GMM training is mostly initialized with LGB clusters

to determine its parameters using expectation maximization (EM) algorithm (Alpaydin, 2004). GMM based speaker recognition systems have been extensively studied for improving speed (Kinnunen et al., 2006). In this paper we present speeding results for VQ based systems which are as efficient as GMM (Kinnunen and Li. 2009).

Full search based PM unit of VQ system computes  $\Delta$ ,  $d$ -dimensional Euclidean distances between each vector of sequence of the test feature vectors,  $X = (x_1, x_2, x_3, \dots, x_T)$ , and each of the mean vector of each target registered speaker's codebook stored in repository,  $R$ , using Equation (2). Where  $T$  is the number of feature vectors extracted from the samples and  $X \in \mathbb{R}^{T \times d}$ . Euclidean distances are used to compute similarity measure called single vector distortion  $D_{t,s}$  between each test vector  $x_t$  and each stored target codebook of speaker  $s$ ,  $R_s$ , as given by Equation (3). Identification decision is done using Equation (4).

$$\forall \begin{cases} 1 \leq t \leq T, \\ 1 \leq s \leq N, \\ 1 \leq m \leq M \end{cases} \Delta_{t,s,m} = \sqrt{\sum_{i=1}^d (X_{t,i} - R_{s,m,i})^2} \quad (2)$$

$$\forall 1 \leq t \leq T, 1 \leq s \leq N \quad D_{t,s} = \arg \min_{1 \leq m \leq M} \Delta_{t,s,m} \quad (3)$$

$$\text{Decision Speaker id} = \arg \min_{1 \leq s \leq N} \sum_{t=1}^T D_{t,s} \quad (4)$$

Full search speaker identification as given by Equations (2)-(4) shows that  $T \times N \times M \times d$  multiplications,  $2 \times T \times N \times M \times d$  additions and  $T \times N \times M$  square root computations are required. Identification time order can be given by  $O(T \times N \times M \times d)$ . Such high time order complexity of minimum distortion slows down the identification process. Real-time speech processing systems require fast speaker identification front-end to adapt to speaker specific speech model. This emphasizes the need for research to accelerate speaker recognition task.

Brief review of existing accelerating techniques for ASI systems is given in section 2. Algorithm used to speedup ASI system that partially prunes codebooks along with its performance analysis is presented in section 3. Description of speech material used in this study,

experimental setup and its parameters are given in section 4. Results of experimental are shown and discussed in section 5 followed by conclusions in section 6.

## 2. Existing Techniques

Inserting  $\Delta_{t,s,m}$  definition for EUD from Equation (2) into Equation (3) reduces square root computations from  $T \times N \times M$  to  $T \times N$  as shown by Equation (5)

$$D_{t,s} = \sqrt{\arg \min_{1 \leq m \leq M} \sum_{i=1}^d (X_{t,i} - R_{s,m,i})^2} \quad (5)$$

Reducing  $T$  by silence detection in raw speech signal is a normal practice. Further, best speedup techniques as reported by Kinnunen et al (2006) reduce  $T$  by pre-quantization (PreQ) of test vector sequence. They have used Vantage Point Tree (VPT) indexing technique to avoid mean vectors of codebooks in searching closest of  $M$  mean vectors. They used probabilistic measure to reduce  $N$  by pruning unlikely speakers.

**Table 1. Parameters and Results of Kinnunen et al. (2006) Experiments on TIMIT Database**

Code Book Size	Speedup Technique	Error Rate %	Times (S)	Speedup Factor
32	Baseline	0.63	1.15	1 : 1
	VPT+PreQ	0.63	1.11	1.04 : 1
	VPT+ Pruning	--	--	--
64	Baseline	0.48	2.37	1 : 1
	VPT+PreQ	0.64	0.48	4.9 : 1
	VPT+ Pruning	0.48	0.43	5.5 : 1
128	Baseline	0.16	4.82	1 : 1
	VPT+PreQ	0.64	0.59	8.2 : 1
	VPT+ Pruning	0.00	1.88	2.6 : 1
256	Baseline	0.16	10.2	1 : 1
	VPT+PreQ	0.64	1.18	8.6 : 1
	VPT+ Pruning	0.00	3.28	3.1 : 1

Information specific to the test speaker is distributed all along the test vector sequence and pre-quantization of test vectors is likely to distort it as shown in Table 1 by test results by (Kinnunen, et al., 2006) for VPT+PreQ.

Table 1 shows absolute identification time and speedup ratio in (Kinnunen, et al., 2006) for

different speedup techniques exercised on a cluster of 2 Dell Optiplex G270 computers having 2.8 GHz processor and 1 GB RAM each. In Table 1 the effect of Vantage Point Tree (VPT) for speedup is multiplied with their other speedup algorithmic steps to simplify comparison with our results. We use PDE to speedup ASI system rather than VPT and speaker pruning as a whole.

### 3. Speedup Technique Used

Let ‘SI’ stand for identity number,  $\text{id}$ , of the best matching registered speaker, more specifically, the candidate speaker, and ‘Dmin’ stand for the minimum distortion of the candidate speaker. Algorithm presented next speeds up computation for Equation (5) by avoiding mathematical operations when ever possible and outputs the  $\text{id}$  of the test speaker.

Neighborhood search for closest mean vector to a feature vector, as expressed by Equation (3), is made faster by PDE algorithm proposed by Bei and Gray (1985). PDE algorithm has been largely employed in image compression for encoding and decoding images (Lee and Chen. 1994). We investigated its capability for speeding up speaker identification in partially pruning mean vectors that are unlikely to be nearest neighbor of a test feature vector,  $x_t$ , in the process of computing  $D_{t,s}$  for modeling of any speaker  $s$ . Effectively, PDE reduces parameter  $d$  in time order complexity  $O(T \times N \times M \times d)$ .

Embedded PDE in the presented algorithm avoids superfluous multiplications and twice as many additions, whenever  $D2 \geq D2m$  causes Prune Events (PE1) or (PE2) by termination of EUD computation for current value of  $m$  and initiation of distance computation for  $(m+1)$ . Line labels PE1 and PE2 used in the algorithm correspond to prune events that occur during the algorithm execution. In hypothetically best case  $(M-1)(d-1)$  multiplications are avoided if PE1 or PE2 occur at  $i=1$  for  $\forall 2 \leq m \leq M$ . In the worst case no multiplication or addition is avoided if PE1 or PE2 never occurs. In general  $D_{t,s}$  is computed with partial scan through the speaker model. It follows from best and worst cases that average case speedup

factor, given by  $\frac{2 \times M \times d}{M \times d + M + d - 1}$ , is less than 2.

The following algorithm outputs  $\text{id}$  of test speaker and requires input of test feature vectors,  $X \in \mathbb{R}^{T \times d}$ , and repository of codebooks of registered speakers,  $R \in \mathbb{R}^{N \times M \times d}$ . Square brackets are used for indices rather than subscripts.

**Algorithm:** VQ ASI with embedded PDE

#### 4. Experiment

TIMIT (Garofolo et al., 1993) speech data was down sampled to 8kHz using anti-aliasing filter to match with sampling frequency of CSLU (Cole et al., 1998) data. Three TIMIT ‘si’ files were concatenated to get 8.4 seconds long test sample on the average. TIMIT data consists of read speech of microphone recordings. Hence speaker recognition results for TIMIT data are highly optimistic. For the purpose of validation we used CSLU speaker recognition corpus that consisted of telephonic speech in response to prompts. In total 40 prompts, labeled by two letters e.g., ‘aa’, ‘aq’ etc., were sent to participant speakers and their response speeches mostly repeated 4 times by the speakers were recorded over telephone. Some prompts were not sent to all the participants for unknown reasons in each of 12 sessions distributed over two year interval. Speech data of first four sessions was used in our experiments. For testing speech data files with prompts labeled as ‘aa’, ‘ab’, ‘ac’, ‘am’, ‘an’, ‘ao’ and ‘av’ were selected from sessions 2, 3 and 4. Average duration of speech per speaker was 28 seconds.

For system training all ‘sa’ and ‘sx’ TIMIT files were concatenated to get approximately 23 second long speech samples. While from CSLU corpus files corresponding to prompts labeled as ‘aq’, ‘ar’, ‘as’, ‘at’, ‘au’, ‘be’, ‘bf’, ‘bg’, ‘bh’ and ‘bi’ from sessions 1-4 were used. Total average duration of speech data per speaker was 99 seconds. Speech data selection thus made, allowed all the experiments for speaker identification to be conducted in text independent mode.

MFCC feature vector extraction was done by standard process (Deller et al., 2000). Hamming window was applied on 33% overlapping frames. Energy based silence detection was used for all tests. Raw speech frames were reduced by 9% and 8% from training and testing samples respectively for TIMIT while for CSLU data the values were 8.4% and 4.8% respectively.

A bank of 19 triangular filters was applied on magnitude real DFT spectrograms of 30 millisecond speech frames. MFCC vectors of size  $d=12$  were computed from response of triangular filterbank once and stored for use both in training and testing for TIMIT. For CSLU speech data that had undergone telephone degradation, first 3 and last 2 triangular filters were not applied. Consequently frequencies between approximately 230 Hz to 3185 Hz were processed.

VQ codebook repository was prepared using LBG algorithm for all 630 TIMIT and 91 CSLU speakers from MFCC feature vectors extracted from training data. LBG trained codebooks with  $M = 32, 64, 128, 256, 512$  were computed once and stored to use in testing. For CSLU data, codebooks with  $M=1024, 2048$  were also trained. All algorithms were coded in Microsoft C#. Programs were run on 32-bit Windows Vista(TM), installed on HP Compac DX7400 with Intel(R) Core(TM)2 Duo CPU E6550 @2.33 GHz with 2 GB RAM. Time intervals were computed by calling ‘System.DateTime.Now’ method of C#.

#### 5. Results and Discussion

Test results for speaker identification for TIMIT and CSLU corpora are shown in Table 2 and Table 3 respectively.

**Table 2: Average Speaker Identification Performance for TIMIT data**

VQ System		TIMIT DATA		
Model Size	Search Type	Error %	Time (S)	Speedup Factor
32	Baseline	15.71	1.25	1 : 1
	PDE	14.92	0.52	2.40 : 1
64	Baseline	5.40	2.45	1 : 1
	PDE	4.92	0.95	2.58 : 1
128	Baseline	1.27	4.84	1 : 1
	PDE	1.27	1.74	2.78 : 1
256	Baseline	0.32	9.61	1 : 1
	PDE	0.32	3.17	3.03 : 1
512	Baseline	0.48	19.15	1 : 1
	PDE	0.48	5.83	3.29 : 1

**Table 3: Average Speaker Identification Performance for CSLU data**

VQ System		CSLU DATA		
Model Size	Search Type	Error %	Time (S)	Speedup Factor
32	Baseline	6.59	0.31	1:1
	PDE	6.59	0.12	2.58:1
64	Baseline	2.20	0.64	1:1
	PDE	2.20	0.25	2.56:1
128	Baseline	0.00	1.13	1:1
	PDE	0.00	0.38	2.97:1
256	Baseline	0.00	2.21	1:1
	PDE	0.00	0.69	3.20:1
512	Baseline	0.00	4.35	1:1
	PDE	0.00	1.27	3.43:1
1024	Baseline	0.00	9.69	1:1
	PDE	0.00	2.73	3.55:1
2048	Baseline	0.00	19.36	1:1
	PDE	0.00	4.95	3.91:1

VQ models larger than 512 for TIMIT are not made since count of feature vectors extracted from training sample is less than 1024.

Accuracy of speaker identification increases with codebook size from 32 to 256. Systems, with codebook size 512 of TIMIT data, show over fitting degradation effects, as reported by Kinnunen et al (2006). Test results of our speedup technique with PDE show that it did not degrade accuracy when compared with corresponding full search (Baseline) systems. The technique is applicable on larger as well as smaller models. Speedup factor increases with increase in model size.

Identification accuracy for CSLU data is higher than corresponding TIMIT data that may be due to less number of speakers in CSLU data than that in TIMIT data. Speedup factor of PDE increases monotonously with codebook size for both TIMIT and CSLU data. Whereas in (Kinnunen, et al., 2006) speedup factor decreases from model size 64 to 128 and then increases for 256. In case of CSLU data there is no over fitting accuracy degradation for larger codebooks. PDE speedup factors of our systems corresponding to VPT+Pruning speedup factors shown in (Kinnunen, et al., 2006) are better in general. It is noteworthy that experimentally achieved average speedup factors of FDE for all codebook sizes are greater than theoretically possible factor 2.

## 6. Conclusions

Performance of a simple to implement technique, PDE, as compared to VPT and speaker pruning techniques given in (Kinnunen, et al., 2006), for speeding up VQ based real-time speaker identification systems, is presented in this paper. PDE is used to partially prune speaker models by obviating full scan of mean vectors of codebooks. Overall speedup factor of up to 4 is achieved. The time order,  $O(T \times N \times M \times d)$  parameter  $d$  that is ignored in (Kinnunen, et al., 2006) can be successfully manipulated to speedup ASI systems. PDE can be applied to substantially speedup VQ based speaker identification for small as well as large sized models.

# Curcumin/Irbesartan Combination Improves Insulin Sensitivity and Ameliorates Serum Pro-inflammatory Cytokines levels in Diabetes Rat model

Mohamed Khaled Mohamed. Mahfouz

Department of Biochemistry, Faculty of Vet Medicine, Benha University, [Banha, Al Qalyubiyah](#), Egypt  
[drm\\_mahfouz@hotmail.com](mailto:drm_mahfouz@hotmail.com)

**Abstract:** To evaluate the impact of chronic administration of an angiotensin II receptor antagonist (Irbesartan) and/or curcumin on fasting blood glucose level (FBG), insulin sensitivity, and proinflammatory cytokines in experimentally-induced diabetes in albino rats. Materials and Methods: The study included 80 (20 as control group) male albino rats; diabetes mellitus (DM) was induced using intraperitoneal injection of a single dose of 50 mg/kg of streptozotocin (STZ) after animals were maintained on high-fat diet for 2-weeks (30 rats) for induction of non-insulin dependent DM (NIDDM) or without dieting regimen (30 rats) for induction of IDDM. One-week later, rats received oral irbesartan (2.5 mg/kg/day), oral curcumin (200 mg/kg) or both lines for 6 weeks. Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) and rapid insulin sensitivity test (RIST) were used for clinical assessment. Two fasting venous blood samples were obtained prior to initiation and at 6-wks after treatment for estimation of FBG and ELISA estimation of fasting plasma insulin (FPI), serum interleukin (IL)-1 $\beta$  and -6 and tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ). Results: Both lines of treatment induced significant reduction of FBG and FPI levels compared to pre-treatment levels with significant reduction of FBG on using curcumin compared to irbesartan, but combination therapy significantly lowered FPI levels compared to either drug alone. Post-treatment serum levels of studied cytokines in all groups were significantly lower compared to pre-treatment levels, but curcumin alone significantly reduced serum levels of IL-6 and TNF- $\alpha$  compared to irbesartan alone. Post-treatment HOMA-IR and RIST indices were significantly improved compared to pre-treatment levels. Conclusion: Chronic administration of irbesartan/curcumin combination showed anti-diabetic effect manifested as decreased FBG and FPI levels and ameliorated the increased serum levels of pro-inflammatory cytokines. The use of such combination could be recommended for clinical trials so as to document its use for control of both types diabetes.

## 1. Introduction

Insulin resistance is typically defined as decreased sensitivity or responsiveness to metabolic actions of insulin, such as insulin-mediated glucose disposal in skeletal muscle and adipose tissue and inhibition of hepatic glucose production, (Muniyappa et al., 2008). Cross-talk between inflammatory signaling pathways and insulin signaling pathways causes metabolic insulin resistance and endothelial dysfunction, (Kim et al., 2006).

Insulin resistance plays a major pathophysiological role in type 2 diabetes and is tightly associated with major public health problems, including obesity, hypertension, coronary artery disease, dyslipidemias, and a cluster of metabolic and cardiovascular abnormalities that define the metabolic syndrome, (Petersen et al., 2007). The metabolic syndrome is

considered to be a pro-inflammatory state because it is associated with elevated levels of high-sensitivity C-reactive protein, IL-6, fibrinogen, and plasminogen activator inhibitor-1, all of which promote the development of atherosclerotic cardiovascular disease, (Salmennienmi et al., 2008). Therefore, improvement of insulin sensitivity is an important therapeutic goal.

Improvement of insulin sensitivity has been suggested in many reports to be feasible by certain herbs and drugs. For instance, it was reported that curcumin improve blood glucose and insulin sensitivity in rat models of diabetes, (Weisberg et al., 2008). Curcumin, a polyphenolic compound, is the major yellow-colored pigment found in the spice, turmeric. It has been used in traditional Indian medicine for centuries, and has numerous pharmacological activities, including potent anti-inflammatory, antioxidant,

chemopreventive and chemotherapeutic actions, (Hatcher et al., 2008, Bengmark et al., 2009).

Angiotensin II (Ang II), the main effector peptide of the renin–angiotensin system (RAS), is implicated in the development of vascular, cardiac, and renal pathologies. Several lines of evidence suggest that Ang II impairs insulin sensitivity and provoke glucose intolerance, (Ogihara et al., 2002). Furthermore, angiotensin type-1 receptor (AT1R) blockers (ARBs) have recently been demonstrated to exert beneficial effects on glucose and lipid metabolism in adipocytes and adipose tissue, (Clasen et al., 2005). The RAS by blockade of the AT1R substantially lowers the risk for type 2 diabetes, (Dahlof et al., 2002). Additionally, blockade of the AT1R has been shown to improve insulin sensitivity in animal models of insulin resistance, (Henriksen et al., 2001). However, the mechanisms underlying the insulin-sensitizing and antidiabetic effects of the ARBs have not been defined. Findings from in vitro and in vivo studies have revealed that two newer ARBs, telmisartan and irbesartan, have the potential to improve insulin sensitivity and beta-cell responsiveness, (Schupp et al., 2005).

The present study was designed to evaluate the impact of chronic administration of an angiotensin II receptor antagonist (Irbesartan) and/or curcumin on blood glucose level, insulin sensitivity, and pro-inflammatory cytokines in experimentally-induced diabetes in albino rats.

## 2. Materials and Methods

**Animals:** The present study comprised 80 male albino rats with weight range of 250-300 grams. Rats were grouped and kept in separate animal cages, under the prevailing atmospheric conditions and maintained on a balanced diet (bread, barely, carrots, lettuce, milk) and fresh-water supply.

### Induction of diabetes

- A) Type 1 diabetes mellitus (IDDM group) was induced by injecting rats intraperitoneally with a single dose of streptozotocin (STZ) (Sigma) in a dose of 50 mg/kg body weight dissolved in 0.2 ml of citrate buffer (pH 4.5), (Islam and Choi, 2007) without dieting regimen.
- B) Type 2 diabetes mellitus (NIDDM group) was induced by feeding rats with high-fat diet (HFD) consisting of 22% fat, 48% carbohydrate and 20% protein. After two weeks, rats were injected intraperitoneally

with a single dose of streptozotocin (STZ) (Sigma) in a dose of 50 mg/kg body weight dissolved in 0.2 ml of citrate buffer (pH 4.5), (Islam and Choi, 2007).

**Diagnosis of diabetes:** On the third day of injection, the animals were checked for the presence of glucose in the urine using enzymatic test strips as STZ induces diabetes within 3 days by destroying the beta cells, (Karunananayake et al., 1975). Confirmation was done by measuring fasting blood glucose levels by taking a drop of blood from the rat-tail using a glucose-measuring device (Glucocard). Rats had FBG of  $\geq 200$  mg/dl were considered diabetic, (Islam and Choi, 2007).

**Drugs:** Irbesartan (Sanofi-Aventis) and curcumin (Sigma chemicals) were dissolved in 1% gum acacia so that 0.5 to 1 ml contained the desired dose. The therapeutic human dose of irbesartan was converted to rat dose according to Paget converting table, (Paget and Barnes, 1964) and about half of the therapeutic dose was used in this study.

### Grouping & Dosing:

**Group I (Control group):** 20 animals were considered as a control group for estimated parameters and were divided into 2 subgroups:

- a) Group I-A: included 10 rats received no medications and kept under the same conditions as prior to start of the study.
- b) Group I-B: included 10 rats were injected intraperitoneally with one injection of citrate buffer and received 1ml/rat of 1% gum acacia orally for 6 weeks.

**Group II:** included 30 rats had induced IDDM and were subdivided into 3 equal subgroups:

- a) Group II-A: 10 rats were administered irbesartan in a dose of 5 mg/kg/day, (Richer et al., 1999) in the drinking water for a period of 6 weeks, (O'Donnell et., 1997).
- b) Group II-B: 10 rats were administered 200 mg/kg body weight of curcumin in 1% gum acacia, orally/day for a period of 6 weeks
- c) Group II-A/B: 10 rats were administered both irbesartan in a dose of 5 mg/kg body weight in the drinking water and curcumin in a dose of 200 mg/kg body weight in 1% gum acacia; orally/day for a period of 6 weeks.

**Group III:** included 30 rats had induced NIDDM and were subdivided into 3 equal subgroups:

- a) Group III-A: 10 rats were administered irbesartan in a dose of 5 mg/kg/day in the drinking water for a period of 6 weeks.
- b) Group III-B: 10 rats were administered 200 mg/kg body weight of curcumin in 1% gum acacia, orally/day for a period of 6 weeks.
- c) Group III-A/B: 10 rats were administered both irbesartan in a dose of 5 mg/kg body weight in the drinking water and curcumin in a dose of 200 mg/kg body weight in 1% gum acacia; orally/day for a period of 6 weeks.

Biochemical Evaluation: Two fasting venous blood samples, withdrawn from the tail vein, were obtained, the 1<sup>st</sup> after induction of diabetes and prior to initiation of therapy and the 2<sup>nd</sup> at the end of the 6-wks treatment period. Blood samples were divided into 2 parts:

- A) The first was put in a tube containing sodium fluoride (2 mg sodium fluoride/ ml blood) to prevent glycolysis. Plasma was separated by centrifugation and used for estimation of glucose by glucose oxidase method, (Tinder, 1969).
- B) The second part was allowed to clot then serum was separated by centrifugation at 3000 rpm for 10 min. Serum was removed, divided into 2 parts: the first for RIA determination of serum level of insulin, (Gordon et al., 1985) and the second part was placed in pyrogen-free Eppendorf tubes and stored at -80°C until ELISA assayed (within one month) for estimation of serum levels of IL-1 $\beta$ , (Dinarello et al., 1992), IL-6, (Engvall et al., 1972) and TNF- $\alpha$ , (Beutler et al., 1985) using Quantikine ELISA kits from R & D Systems, Inc., (Minneapolis, MN).

Insulin sensitivity Evaluation: Insulin sensitivity of control and studied animals was evaluated by both tests, for comparison with IDDM using RIST and NIDDM using HOMA-IR test

- a. Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) (Matthews et al., 1985) on the basis of fasting insulin and glucose levels and according to the formula HOMA-IR= I x G/22.5, where I is fasting plasma insulin level ( $\mu$ IU/ml) and G is fasting blood glucose in mg/dl divided by 18, considering an abnormal HOMA-index >2, (Ascaso et al., 2001).

- b. Rapid insulin sensitivity test (RIST): The RIST starts with the administration of an insulin bolus (50mU/kg i.v.), over 5 min. At 1 min after initiating the insulin infusion, arterial blood glucose was measured and glucose infusion (D-Glucose/saline, 100 mg/ml, i.v.) was started at a rate of 5mg/kg/min. According to arterial glucose concentrations measured at 2 min intervals, the infusion rate of the glucose was readjusted to maintain euglycemia. When no further glucose infusion was required, usually within 35 min, the test was concluded. The amount of glucose necessary to maintain euglycemia along the test quantifies insulin sensitivity and is referred to as the RIST index (mg glucose/kg) (Lautt et al., 1998).

Statistical analysis: obtained data were presented as mean $\pm$ SD, ranges, numbers and ratios. Results were analyzed using one-way ANOVA test and Chi-square test. Statistical analysis was conducted using the SPSS (Version 10, 2002) for Windows statistical package. P value <0.05 was considered statistically significant.

### 3. Results

Estimated variables showed a non-significant ( $p>0.05$ ) difference between both subgroups of control rats, (Table 1), so all statistical analyses of study groups were compared versus control group I-A that arbitrary named control group.

Table (1): Mean values of estimated in both control subgroups

Variable	Group I-A	Group I-B
FBG (mg/dl)	77.4 $\pm$ 9.1	81 $\pm$ 9.3
FPI( $\mu$ IU/ml)	0.9 $\pm$ 0.2	0.82 $\pm$ 0.21
HOMA-IR index	0.17 $\pm$ 0.03	0.16 $\pm$ 0.05
IL-1 $\beta$ (pg/ml)	1.28 $\pm$ 0.23	1.19 $\pm$ 0.31
IL-6 (pg/ml)	12.2 $\pm$ 3.3	11.9 $\pm$ 4.2
TNF- $\alpha$ (pg/ml)	1.82 $\pm$ 0.6	1.86 $\pm$ 0.52

Fasting blood glucose levels estimated either prior to or at end of therapy, were significantly higher in all studied animals compared to control levels. Both lines of treatment either alone or in combination induced significant reduction of FBG levels in both study groups, irrespective of type of diabetes. However, administration of curcumin either alone or in combination with irbesartan induced significant

reduction of FBG, irrespective of type of diabetes, compared to irbesartan alone with non-significant difference between animals received curcumin, (Table 2).

Fasting plasma insulin (FPI) levels estimated either prior to or at end of therapy, were significantly higher in group III animals compared to both control and group II animals that had significantly lower FPI levels compared to control animals. As regard treatment subgroups, there was non-significant difference between group II subgroups with non-significant difference between pre and post-treatment levels. However, group III animals administered combination therapy showed significantly lower FPI levels compared to animals received either irbesartan or curcumin alone with a non-significant difference of FPI levels in animals received irbesartan compared to those received curcumin alone, (Table 3).

Pre- and post-treatment estimated levels of studied pro-inflammatory cytokines were significantly higher in groups II and III compared to control level, irrespective of type of induced diabetes or line of treatment used. However, post-treatment serum levels of studied cytokines were significantly lower compared to pre-treatment levels, irrespective of line of treatment applied. Post-treatment serum levels of IL-1 $\beta$  were significantly lower in group III animals compared to group II animals, irrespective of line of treatment, (Table 4, Figure 1).

On contrary, there was non-significant difference between post-treatment serum levels of IL-6 and TNF- $\alpha$  between studied animals, irrespective of type of diabetes. However, administration of curcumin, either alone or in combination with irbesartan significantly reduced serum IL-6 in comparison to irbesartan alone, irrespective of type of diabetes and in IDDM animals, combination therapy significantly reduced serum IL-6 compared to curcumin alone and significantly reduced serum TNF- $\alpha$  compared to irbesartan alone, but non-significantly compared to curcumin alone, (Tables 5 & 6, Figures 2 & 3).

In group III, HOMA-IR index calculated prior to initiation of therapy was significantly higher in studied subgroups compared to control index with non-significant difference among studied subgroups. Post-treatment HOMA-IR index was significantly decreased in the three subgroups compared to pre-treatment levels, despite still being significantly higher compared to control group. Combination therapy significantly reduced HOMA-IR index compared to either irbesartan or curcumin alone with a significant difference in favor of irbesartan, (Table 7).

#### 4. Discussion

Both applied lines of treatment either alone or in combination induced significant reduction of FBG levels in both study groups, irrespective of type of diabetes. However, administration of curcumin either alone or in combination with irbesartan induced significant reduction of FBG, irrespective of type of diabetes, compared to irbesartan. These findings spotlight on the fact that both of curcumin and irbesartan induced lowering of FBG by a different mode of action towards one target, i.e. lowering FBG and both could act synergistically and that the response for either curcumin or irbesartan differed between both types of diabetes.

In NIDDM animals, FPI levels estimated at end of therapy despite being still significantly higher compared to control levels, were significantly lower compared to their pre-

treatment levels and animals administered combination therapy showed significantly lower FPI levels compared to animals received either irbesartan or curcumin alone. These finding indicated that the effect of the studied drugs on diabetic animals was conducted through increasing the sensitivity of insulin receptor to the available secreted amount of insulin and consequently increased glucose metabolism with lowering FBG without any impact on insulin secretion.

The obtained results coincided with and supported that previously reported by Pari and Murugan, (2005), who investigated the effect of tetrahydrocurcumin (THC), one of the active metabolites in curcumin, on the key hepatic metabolic enzymes involved in carbohydrate metabolism in streptozotocin-induced diabetic rats and found that in untreated diabetic control rats, the activities of the gluconeogenic enzymes were significantly increased, whereas hexokinase and G6PD activity and glycogen levels were significantly decreased, while both THC and curcumin were able to restore the altered enzyme activities to near normal levels and normalize blood glucose in diabetic rats. Also, Murugan and Pari, (2006), investigated the effect of THC on lipid profile and lipid peroxidation in type-2 diabetic rats and reported a significant reduction in blood glucose, which proved its antidiabetic effect and caused a significant reduction in lipid peroxidation and lipids in serum and tissues, suggesting its role in protection against lipid peroxidation and its antihyperlipidemic effect.

Thereafter, Murugan and Pari, (2007), and Suryanarayana et al., (2007) examined the effect of THC and curcumin on erythrocyte membrane bound enzymes and antioxidants activity in type-2 diabetic model and reported that administration of THC and curcumin induced increased levels erythrocyte antioxidants and the activities of membrane bound enzymes and concluded that these biochemical observations indicate that the THC and curcumin possess a significant beneficial effect on erythrocyte membrane bound enzymes and antioxidants defense in addition to its antidiabetic effect.

In support of the reported data, post-treatment HOMA-IR and RIST indices were significantly improved in the studied subgroups compared to pre-treatment levels, with the effect was more significantly pronounced with combination therapy. Such clinical implication of the obtained results goes in hand with various clinical studies; Huang et al., (2007) suggested

that a local pancreatic renin-angiotensin system and pravastatin, captopril and irbesartan treatment may be selectively controlling pancreatic islet blood flow, augmenting insulin secretion and thereby improving glucose tolerance and concluded that the antidiabetic actions of renin-angiotensin system inhibitors might occur, in part, through this beneficial direct islet effects. Cetinkalp et al., (2008), found the short-term treatment of irbesartan is effective to decrease microalbuminuria in normotensive type-2 diabetes patients independent of its antihypertensive effect and such decrease was associated with significantly decreased fasting and non-fasting blood glucose, and HbA1c compared to pre-treatment values.

Furthermore, post-treatment serum levels of studied cytokines were significantly lower compared to pre-treatment levels, irrespective of line of treatment applied; such ameliorative effect of curcumin and irbesartan administered separately or in combination on pro-inflammatory cytokines could be a possible mechanism for the reported effects on insulin sensitivity that proved to be improved irrespective of type of diabetes or the drug used.

These data go in hand with Ceriello et al., (2005), who reported an independent and cumulative effect of postprandial hypertriglyceridemia and hyperglycemia on endothelial function and inflammation, suggesting oxidative stress as a common mediator of such an effect and short-term treatment with irbesartan may counterbalance this phenomenon. Also, Persson et al., (2006), evaluated the impact of irbesartan treatment on biomarkers of low-grade inflammation in patients with Type 2 diabetes and microalbuminuria and found irbesartan treatment yielded significant changes in CRP with a 5.4% decrease per year versus a 10% increase per year in the placebo group, IL-6 showed a 1.8% increase per year compared with placebo's 6.5% increase per year and changes in IL-6 were associated with changes in albumin excretion and concluded that irbesartan reduces low-grade inflammation in this high-risk population. Vieitez et al., (2008), found systemic and local administration of irbesartan lowers glomerular expression of growth factors and TNF- $\alpha$  and concluded that part of the effect of lowering the expression of these growth factors and cytokines is due to a direct blockade of glomerular renin-angiotensin system.

The reported beneficial effects of curcumin alone or combination on IDDM could

be attributed to the anti-oxidant and anti-inflammatory effects of curcumin and go in hand with Tikoo et al., (2008), who reported that treatment of type-1 diabetic rats with curcumin significantly decreased blood urea nitrogen and creatinine and increased albumin; variables associated with the development of diabetic nephropathy and prevented the increased levels of HSP-27 and MAP kinase (p38) in diabetic kidney and at nuclear level curcumin prevented the decrease in dephosphorylation and increases acetylation of histone H3. Moreover, Kanitkar et al., (2008), demonstrated that curcumin in vitro protects pancreatic islets against cytokine-induced death and dysfunction by scavenging ROS and normalized cytokine-induced NF-kappaB translocation by inhibiting phosphorylation of inhibitor of kappa B alpha (IkappaBalpha) and in vivo curcumin prevents STZ-induced diabetes.

Kang and Chen, (2009) found curcumin dose-dependently eliminates insulin-induced hepatic stellate cells (HSC) activation by suppressing expression of type I collagen gene, interrupts insulin signaling in HSC by reducing the phosphorylation level of insulin receptor and suppressing its gene expression. Furthermore, curcumin attenuates insulin-induced oxidative stress in HSC by inducing gene expression of glutamate-cysteine ligase leading to de novo synthesis of glutathione. Also, Lin et al., (2009) found curcumin suppresses gene expression of lectin-like oxidized LDL receptor-1, leading to the blockade of the transport of extracellular oxidized LDL into cells through interruption of Wnt signaling and the activation of peroxisome proliferator-activated receptor-gamma

It could be concluded that chronic administration of irbesartan/curcumin combination showed anti-diabetic effect manifested as decreased FBG levels with concomitant decreased FPI and ameliorated the increased serum levels of pro-inflammatory cytokines and such effects are manifested in both types of diabetes. The use of such combination could be recommended for clinical trials so as to document its use for control of both types diabetes.

**Abstract:** Objectives: Recent evidence favors primary role of cellular autoimmunity and its humoral mediators in pathogenesis and following Type I diabetes mellitus (IDDM) The present study is carried out to investigate serum concentration of TNF- $\alpha$ , IL-6 and sIL-2 R in children with IDDM. Potential role of glycemic control, body mass index and disease duration were evaluated. Design and Methods: Thirty five children with IDDM and 30 age and sex matched non diabetic healthy subjects were recruited for this study from the out patients Clinic of diabetes of National Institute of Diabetes and Endocrinology. Results: Circulating level of TNF- $\alpha$  IL-6 and sIL-2R were elevated in children with type I DM ( $39.91 \pm 17.46$  pg/ml,  $14.89 \pm 10.69$  pg/ml and  $779.0 \pm 467.06$  pg/ml respectively). Compared with nondiabetic controls ( $5.67 \pm 1.88$  pg/ml,  $6.23 \pm 2.78$  pg/ml and  $254.33 \pm 173.6$  pg/ml respectively). These differences were statistically highly significant ( $<0.0001$ ). Glycemic control, Insulin dose and disease duration were not significant predictors of cytokine concentration in children with IDDM. A significant negative correlation was obtained between TNF - $\alpha$  with age, weight, BMI and sIL-2R in diabetic patients. However there was a significant positive correlation between IL-6 with weight and BMI in those children. Conclusion: Circulating levels of inflammatory cytokines were elevated in patients with IDDM suggesting activation of the inflammatory immune response system. Their levels were not affected by glucose level , insulin dose or duration of the disease.

## 1. Introduction:

Diabetes Mellitus is a primary error of carbohydrate metabolism characterized by hyperglycemia with or without glycosuria with secondary disturbance of protein and fat metabolism, which is believed to result from autoimmune destruction of B-cells of the pancreas. (Hussain *et al.*, 1988).

Cytokines are regulatory proteins produced and secreted by lymphocytes and monocytes. Those produced by lymphocytes are called lymphokines. (Karlsson *et al.*, 2004).

According to increasing experimental and clinical evidence, proinflammatory cytokines may play important roles alone or in combination with the pathogenesis of type I diabetes mellitus.

Interlukin-2 is a lymphokine produced by T-helper cells after its stimulation by interlukin-1 (IL-1). The action of IL-2 is mediated through its binding to specific IL-2 receptors (IL-2R) that are variably present on T-cells depending on their degree of activation by antigen. The lymphocytes can shed their IL-2 R in soluble form, so many investigators have

proposed that measurements of IL-2R concentration may be useful in assessing immunological function in autoimmune disorders. (Blandino 2008 et al.).

Plasma concentration of (IL-6) was found to be elevated in diabetic patients. IL-6 through its effects on soluble intercellular adhesion molecule-1 (s ICAM-1) and tumour necrosis factor (TNF-alpha), may promote vascular adhesion adding to vascular disease risk.

Aim of the work

- To investigate serum concentrations of interleukin-6 (IL-6), soluble interleukin-2 receptor (sIL-2R) and tumour necrosis factor alpha (TNF-alpha) in children with IDDM.
- To evaluate potential role of glycemic control, body mass index (BMI) and disease duration on serum levels of these cytokines.

## 2. Subjects and Methods:

### Patient Group

This group included 35 children suffering from IDDM. They were selected from the out patients Diabetes Clinic of International Institute of

Diabetes and Endocrinology. Their ages ranged from 7-17 years, with a mean ages of  $12.03 \pm 2.2$  years.

#### Healthy subjects

30 apparently healthy children with no family history of diabetes were taken as a control group. They were free from any systemic disease. Their ages ranged from 7-16 years with a mean age of  $12.77 \pm 2.76$  years.

#### Methods

All participants were subjected to the following :

- 1- Full history taking laying stress on the age, the duration of the insulin dose.
- 2- Thorough clinical examination.
- 3- Anthropometric measurements weight, height and BMI ( $\text{kg}/\text{m}^2$ ) measurement were done
- 4- Laboratory assessment of random blood sugar glycohemoglobin and serum, sIL-2R, serum IL-6 and TNF- $\alpha$ .

#### Sampling

Five milliliters of venous blood were collected from each child 4 ml of blood in a clean dry tube without the addition of any anticoagulant. It was left to clot for 15 minutes, centrifuged and serum was separated. Assessment of random blood sugar was done immediately and the rest of the serum was kept frozen at  $-20^\circ\text{C}$  for the subsequent assay of IL-2R, IL-6 and TNF - $\alpha$  and 1 ml was added in tube with anticoagulant as EDTA to made glycotheamoglobin.

#### Analytical Methods

##### A- Random Blood sugar:

Assay was done by quantitative determination of glucose IVD using a kit provided by SPINRE ACT Inc.

##### B- Glycohemoglobin:

Assay was done by quantitative colorimetric determination of glycohemoglobin in whole blood using a kit provided by STANBIO LABORATORY INC cat. No 0350.

##### c- Tumour Necrosis factor- $\alpha$ :

This was done by sandwich enzyme immunoassay using a Kit provided by INSTRUCTION for the quantitative determination of human TNF- $\alpha$  in plasma, serum, and culture supernatant fluids. cat. No. 1121

##### D- IL-6 assay:

This was done by a solid phase sandwich enzyme linked immunosorbent assay using a kit provided by Biosource International, Inc. cat No KHC0062

##### E- sIL-2R assay:

This was done by a salid phase sandwich enzyme linked immunosorbent assay using a kit provided by Biosource International, Inc. cat. No. KHR0022

#### Statistical analysis

Data were analyzed by computer using the statistical program SPSS v12 for Windows. Group was compared by the Student's test for normally distributed data or by the Mann-Whitney test otherwise. The linear relationship between variables was assessed by Pearson's correlation coefficient (r). For all tests, P values less than 0.05 were considered statistically significant. Sensitivity, specificity and ROC curves were done for all inflammatory cytokines.

#### 3. Results

Clinical and physical characteristics of children with IDDM and healthy subjects were demonstrated in table (1). There was a significant change in weight and BMI in diabetic patients as compared with healthy group. However, Age and height of diabetic patients didn't have significant change than healthy one.

Comparison of serum glucose levels and glycosylated hemoglobin (Hb A<sub>1c</sub>) between children with diabetes mellitus and healthy subjects were shown in table (2). The results indicated that serum glucose and Hb A<sub>1c</sub> levels were highly significant in diabetic patients than healthy subjects ( $P<0.001$ ).

As can be seen from table 3 & Fig. 1, the mean values of serum inflammatory cytokins [TNF- $\alpha$  , IL-6 and sIL-R] levels were highly significant in diabetic patients than healthy one ( $P<0.001$ ). The recorded increase was 603.9, 139 and 206.3 respectively.

**Table 1: Physical characteristics of children with IDDM and control [Mean  $\pm$  SD (Range)]**

	Diabetics (n=35)	Control. (n=30)	% of change	P value
Age (years)	$12.03 \pm 2.2$ (7-17)	$12.77 \pm 2.76$ (7-16)	-5.8	n.s
Weight (kg)	$41.69 \pm 11.31$ (22-64)	$52.93 \pm 13.94$ (29-95)	-21.2	0.0006
High (cm)	$146.57 \pm 12.12$ (125-168)	$150.57 \pm 16.54$ (125-175)	-2.7	n.s
BMI ( $\text{Kg}/\text{m}^2$ )	$19.04 \pm 2.94$ (14.1-26.2)	$23.06 \pm 2.98$ (18-32.1)	-17.4	<0.0001

**Table 2: Serum glucose levels and glycosylated haemoglobin level in patients and control [Mean ± SD (Range)]**

	Diabetics (n=35)	control. (n=30)	% of change	P value
Glucose (mg/dl)	224.34 ± 118.78 (90 – 516)	86.0 ± 7.97 (72-107)	160.9	<0.0001
Hb A <sub>1c</sub> (%)	9.01 ± 1.61 (6.6-15)	6.6±0.34 (6.0-7.1)	36	<0.0001

**Table 3: Serum inflammatory cytokines levels in patients and control [Mean ± SD (Range)]**

	Diabetics (n=35)	control. (n=30)	% of change	P value
TNF - α (Pg/ml)	39.91 ± 17.46 (12 – 80)	5.67 ± 1.88 (2.5-10)	603.9	<0.0001
IL-6 (Pg/ml)	14.89± 10.69 (6-48)	6.23 ± 2.78 (3-15)	139.0	<0.0001
sIL-2R (Pg/ml)	779.0 ± 467.06 (100- 1750)	254.33±173.06 (50-700)	206.3	<0.0001

**Table 4: Inflammatory cytokines in children with newly diagnosed ( $\leq 1$  year) and long Standing ( $>1$  year) type 1 diabetes mellitus [Mean ± SD (Range)]**

	Duration≤ 1 year (n=12)	Duration>1 year (n=23)	P value
TNF - α (Pg/ml)	43.0 ± 19.12 (22 – 80)	38.3 ± 16.74 (12-80)	>0.05
IL-6 (Pg/ml)	12.17± 5.69 (6-23)	16.3± 12.43 (6- 48)	>0.05
sIL-2R (Pg/ml)	677.5 ± 467.28 (100-1700)	831.96± 468.41 (150-1750)	>0.05

On trying to elucidate the effect of duration of illness on the inflammatory markers we compared serum level of TNF- $\alpha$ , IL-6 and sIL-2R in Diabetic patients with duration of illness less than one year and those in patients with duration of illness greater than one year (table 4).

The relationships between serum inflammatory cytokines and all clinical and biochemical indices in children with children with IDDM and healthy subjects were obtained in Table 5. A significant negative correlation was obtained between TNF- $\alpha$  with age, weight, BMI and sIL-2R in diabetic patients. However, there were significant positive correlations between IL-6 with weight and BMI in both diabetic children and healthy subjects. Insulin dose and glycosylated hemoglobin were not correlated to any of the inflammatory markers.

**Table (5): Correlation coefficient between inflammatory cytokines and all clinical and biochemical characteristic in children with IDDM and healthy subjects.**

Group	Diabetic patients (n=35)			Healthy group (n=30)		
	Variables	TNF- $\alpha$ (pg/ml)	IL-6 (pg/ml)	sIL-2R (Pg/ml)	TNF- $\alpha$ (pg/ml)	IL-6 (pg/ml)

Roc analysis was used to determine the accuracy of each serum cytokines as a marker for diagnosis of children with IDDM in 35 patients and 30 healthy subjects. The data obtained in tables 6, 7 and fig. 1, proved that TNF- $\alpha$  test was the best test to discriminate children with diabetes mellitus from healthy subjects with an area under the curve of 1 and cut-off value of 10 Pg/ml. The sensitivity and specificity were 100 %. IL-6 showed an area under the curve of 0.86 for cut-off value of 6pg/ml, the sensitivity was 88.6% and

specificity was 66.7% (tables 6, 7 and fig. 2). The data illustrated in tables 6, 7 and fig. 3, proved that sIL-2R had an area under the curve 0.87 for cut-off value of 330 pg/ml. The sensitivity was 85.7% and specificity was 86.7%.

Multivariate analysis using logistic regression indicated that all tested inflammatory cytokines [TNF- $\alpha$ , IL-6 and sIL-2R] were found to be independently associated with diabetes mellitus ( $P<0.001$ ) fig 4.

**Table (6): Results of ROC analysis to differentiate between patients and healthy subjects.**

	Cut-off	AUC	$\pm$ SE	95% CI	Sensitivity	Specificity
TNF	>10pg/ml	1.00	0.00	0.94-1*	100%	100%
IL-6	>6 pg/ml	0.86	0.05	0.75-0.94*	88.6%	66.7%
SIL-2R	>330 pg/ml	0.87	0.04	0.77-0.94*	85.7%	86.7%

\* Significant ( $P<0.05$ ) AUC = area under the curve SE = standard error

95% CI=95% confidence interval for AUC.

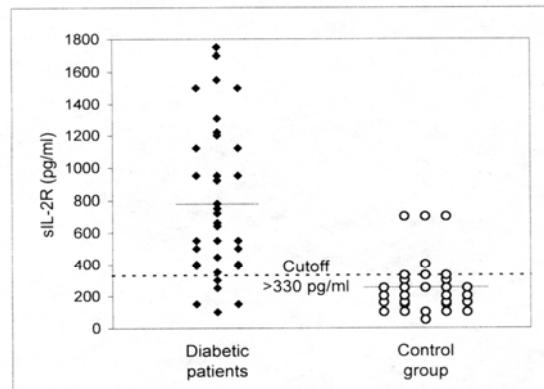

**Table (7): Chi-square analysis using determined cut-offs**

	Patients		Controls		Chi square	P value
	N	%	n	%		
TNF	>10	35	100%	0	0%	<0.001
	<=10	0	0%	30	100%	
IL-6	>6	31	88.6%	10	33.3%	<0.001
	<=6	4	11.4%	20	66.7%	
SIL-2R	>330	30	85.7%	4	13.3%	<0.0001
	<=330	5	14.3%	26	86.7%	

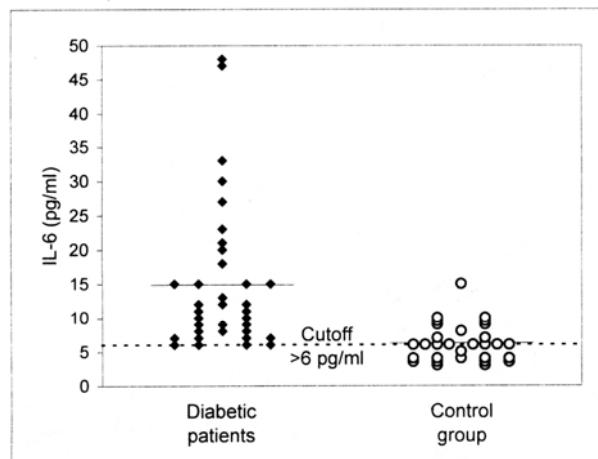

**Fig. 1: Scatter diagram of TNF- $\alpha$  (pg/ml) level in diabetic patients and healthy group.**

The horizontal line represents the cut-off value of 10 pg/ml. The sensitivity is 100% at specificity 100%.

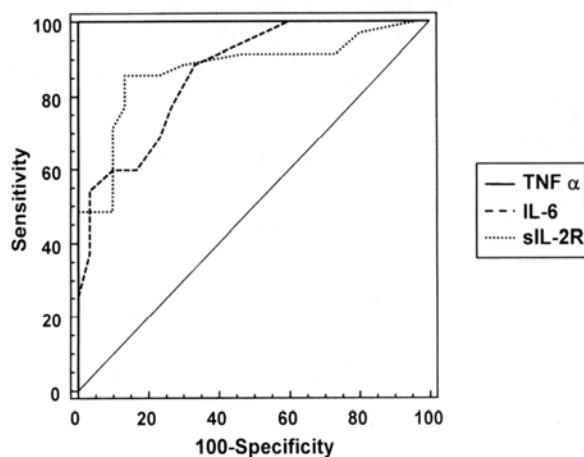

**Fig. (2): Scatter diagram of sIL-2R (pg/ml) level in diabetic patients and healthy group.**

The horizontal line represents the cut-off value of 330pg/ml. The sensitivity is 85.7% at specificity 86.7%.

**Fig. (3): Scatter diagram of IL-6(pg/ml) level in diabetic patients and healthy group.**

The horizontal line represents the cut-off value of 6pg/ml. The sensitivity is 88.6% at specificity 66.7%.

**Fig. (4): Roc curve testing the ability of TNF- $\alpha$ , IL-6 and sIL-2R.**

Differentiate between patients with type (1) diabetes mellitus and healthy group. Areas under the curve (AUC) are 1.0, 0.86 and 0.87 for TNF- $\alpha$ , IL6 and sIL-2R respectively P<0.0001 for comparison of the markers.

#### 4. Discussion:

Insulin dependent diabetes mellitus is the effect of T cell dependent autoimmune destruction of insulin production beta cells in the pancreas. Insulin is one of the islet autoantigens responsible for activation of T-lymphocyte functions, inflammatory cytokine production and development of IDDM (Tchorzewski et al., 2001).

Information about the inflammatory state of an individual can become of clinical relevance since factors that determine inflammation can be modified,(Chatz et al,2010).

The proinflammatory cytokines TNF- $\alpha$  and IL-6 play an important role in the pathogenesis of insulin- development diabetes mellitus (Alexandrak et al.,2008) while TNF- $\alpha$  is also involved in promoting insulin resistance, development or progression of IDDM (Shbaklo et al., 2003).

Data of the present study revealed that serum cytokines (TNF $\alpha$ , IL-6 and sIL-2R) levels were significantly higher in patients than healthy control. These results are in agreement with those of Wasmuth et al., 2004, Dondona et al., 2004, Glowinska & Urban, 2003 and Miranda et al., 2003 who reported that the inflammatory activity is increased in individuals with type-1 diabetes, may be

due to hyperglycemia and the formation of advanced glycation end products. Another report indicated that TNF- $\alpha$  is identified as the unifying principle linking the pathogenesis of insulin-dependent diabetes mellitus and non insulin-dependent diabetes mellitus. Elevated TNF- $\alpha$  initially increases and then inhibits, the activity of a number of key enzymes involved in energy metabolism and major histocompatibility (MHC) class I molecule expression. These enzymes include protein-tyrosine kinase (PTPase). Enzymes involved in energy metabolism, cell proliferation and stimulation of MHC class I molecule pathway (Foss et al.,2007) and concomitant destruction of pancreatic beta cells. So, TNF- $\alpha$  can be implicated as indicator of continuing autoimmune aggression against beta-cells before the development of extensive beta - cell destruction (Haller and Schatz 2008).

It is well documented that TNF- $\alpha$  can be cytotoxic, cytostatic since it inhibits insulin synthesis and secretion (rabinovitch 2002 & Suarez-Pinzon, 1998). Additionally TNF- $\alpha$  and IL-6 mediated damage to micro-and macrovascular tissues, altered insulin secretion directly or through stimulation of free fatty acids production and altered glucose homeostasis (Peraldi & Spiegelman, 1998, Schmidt et al., 1999, Corbett et al., 1997 and Unger, 1995).

About the molecular mechanisms for increased IL-6 under hyperglycemia, Igarashi et al. (1999) found that high glucose has been shown to activate p38 MAPK (Mitogen Activated Protein kinase) which regulate the production of inflammatory cytokines such as TNF- $\alpha$  and IL-6 (Yamakawa et al., 1999). On the same line, Sridevi et al. (2005) reported that under high glucose, monocytes secrete increased amounts of IL-6, via upregulation of protein kinase (PKC- $\alpha$ - and  $\beta$ ), P38 MAPK and Nuclear factor (NF- $\kappa$ B) activity leading to increased IL-6 transcription and release .

There is a discrepancy between the data obtained by our work and that of Haller and Schatz. (2008) who found non significant change in serum TNF- $\alpha$  levels of diabetic children when compared with age-matched healthy controls. Similarly,) Todd et al. (2005), indicated that serum TNF- $\alpha$  and IL-6 levels were comparable in diabetic and non diabetic groups. However, newly diagnosed (<1yr ) cases had higher TNF- $\alpha$  and IL-6 levels compared with larger standing DM<sub>1</sub>. Another study obtained by Chatzi et al. (2010) found that the duration of diabetes was associated with TNF- $\alpha$  and general scores of inflammatory markers. Unlike previous reports, our data indicated that the elevation of cytokine markers were comparable in diabetic patients with a duration of disease more than one year as well as in diabetic patients with a shorter duration of diabetes ( $\leq$ 1 yr).

This results are in agreement with that given by Blandino et al. (2008). On the other hand, another study indicated that IL-6 concentrations were statistically higher at onset diabetes than in diabetic patients with long-term disease (Wedrychowicz *et al.* 2004) and Fosset *et al.* 2007. We have tested the correlation between cytokine levels and duration of disease to confirm whether these difference observed in cytokine levels have any pathophysiological consequences. Inflammatory, diabetes preventing or diabetes promoted effects have been suggested for altered cytokine (Rabinovitch *et al.*, 2002). On the other hand there is increasing evidence that a number of acute phase proteins such as CRP and IL-6 itself are antiinflammatory and immuno suppressive being involved in the resolution of the inflammatory response (Haller and Schatz 2008).

Adipocytes can produce IL-6 and TNF- $\alpha$  and many studies in non diabetic (Onate *et al.*, 2001, & Yamada *et al.* 2001) and diabetic (Festa *et al.*, 2000, Saraheimo *et al.*, 2003) individuals, have shown an association between estimates of body fat and inflammatory activity. Our data revealed that BMI was negatively correlated with TNF- $\alpha$  levels ( $r=-0.42$ ,  $P<0.05$ ) in diabetic children and positively correlated with IL-6 levels ( $r=0.50$ ,  $P<0.01$ ) in the same group. BMI showed also positive correlation with IL-6 levels in non diabetic children. The data obtained by Karlsson *et al.* 2004 suggesting that BMI was associated with all inflammatory markers (TNF $\alpha$ , IL-6) in diabetic children that support our data. On the other hand, there is no evidence correlation between these cytokines and BMI. was reported in other reports (Ayse *et al.* 2001).

Many cytokines play an important role in the etiopathogenesis of type 1-DM, among these is IL-2 which induces its action through its binding to specific interleukin-2 receptors (IL-2Rs) that are present on the surface of T-cells (Zhenge *et al.*, 1999 & Kretowski *et al.*, 1999).

Interleukin-2 system which involves IL-2 production, IL-2 receptor expression and response to IL-2, is associated with autoimmune phenomena. Immunological abnormalities including autoimmune phenomena are believed to contribute to the pathogenesis of IDDM (Blandino *et al.*, 2008). It was found that the percentage of IL-2 receptor positive circulating T-cells was significantly increased in diabetic children than non diabetic group (Gartner *et al.*, 1995). Similar results were obtained by previous study of Chatz and his co-workers (2010) who indicated that there was no correlation between sIL-2R and any metabolic parameters in type-1 diabetic patients. This results are in accordance with our data that revealed serum sIL-2R levels were significantly higher in diabetic children than non diabetic group.

On the other hand, correlation was not detected between level of sIL-2R and any clinical or biochemical parameters in diabetic patients except TNF- $\alpha$  that showed significant negative correlation with sIL-2R ( $r=-0.39$ ,  $P<0.05$ ). Supportive to our results, is the evidence that TNF- $\alpha$  cytokine regulate production of other soluble factors (Foss *et al.*, 2007). Furthermore, the TNF- $\alpha$  gene is located on chromosome 6 in close proximity to the MHC class II region. Thus further studies must address the question as to whether there is an association between TNF- $\alpha$  and the abnormalities of cytokine production and its soluble receptors such as IL-2R as observed in the present study.

Previous data indicated that 46% of diabetic patients, 40% of their parent and 55% of their sibling had sIL-2R levels exceeding the highest normal value. Moreover, the authors found increased levels of TNF- $\alpha$  and IL-6 in the diabetic patients and their healthy relatives. They explained such spectrum of immunological abnormalities in diabetic patients and their family members by heightened immune response in these individuals in which activated T-lymphocytes express IL-2R with shedding of these receptors in the serum (Hussain *et al.*, 1998).

Contradictory results, indicating decrease in the concentration of sIL-2R in pre diabetic and diabetic patients with newly diagnosed type-1-DM. when compared with age-matched control subjects). Such inconsistency and contradiction might be due to a difference in stages of the autoimmune process (Alexandraki *et al.*, 2008).

Regarding our study that revealed level of IL-2R were not correlated with disease duration, random blood sugar or age in the diabetic patients or non diabetic group. These results are in agreement with other previous studies (Rabinovitch *et al.*, 2002, Kukrega *et al.*, 2002 & Haller and Schatz *et al.*, 2008).

In order to determ if the inflammatory cytokines (TNF- $\alpha$ , IL-6 and sIL-2R) were useful as markers in screening for early IDDM and in monitoring immunological treatment, diagnostic reliability was performed to choose the best cut-off value within the patient group (calculated from control group). Our data proved that TNF- $\alpha$  was the best to discriminate type 1 DM. and its cut-off value of 10 Pg/ml and at this value, the sensitivity was 100% and specificity was 100%. The next most useful test for predicitng type-1 DM, among our patients, was IL-6 with cut-off value of 6 pg/ml at which the sensitivity was 88.6% and specificity was 66.7%. the data obtained also, proved that sIL-2R with cut-off value of 330 pg/ml had a sensitivity of 85.7% and specificity of 86.7%.

In conclusion, circulating levels of tumor necrosis factor, interleukin-6 soluble interleukin-2 receptor are significantly increased in patients with IDDM as compared to healthy subjects and their levels are not affected by glucose level, insulin dose or disease duration. This is highly suggestive of the availability of these non invasive indices to help in further examining Type 1DM pathophysiology and monitoring pharmacological interventions to interfere with disease development and progression.

**Abstract:** The most valuable treatment objective in dental practice is to afford the patient a pain-free treatment. The **aim of this study** was to compare the use of low-power laser irradiation and the non-steroidal anti-inflammatory drug diclofenac sodium, as dental analgesic postoperative tools. **Materials and Methods:** Ninety patients undergoing non- surgical extraction of lower third molar with local anaesthesia (2% lidocaine with epinephrine 1:80.000) were enrolled in this study. Sixty received a preoperative single dose of 100 mg diclofenac sodium; thirty patients of them had postoperative low power laser irradiation in addition. They were compared to a third group with only regular postoperative recommendations (30 patients). **Results** showed that low-power laser irradiation significantly reduced postoperative pain intensity than in patients pre-medicated with diclofenac alone, or depend only on regular recommendations (controls).**In conclusion:** We suggested that the use of low-power laser irradiation enables the best postoperative analgesic effect and the most comfortable postoperative course after non surgical extraction of lower third molar than non-steroidal anti-inflammatory drugs or regular postoperative treatment.

**Key words:** Post operative pain- laser therapy- Diclofenac sodium - VAS.

## 1. INTRODUCTION

The primary obligation and ultimate responsibility of oral health care providers is not only to restore function, but also to relieve pain. Currently available analgesic agents include aspirin and other non-steroidal anti-inflammatory drugs (NSAIDs). The efficacy and safety of NSAIDs have been reviewed extensively, Shapiro and Cohen (1992). Potential adverse effects of NSAIDs included peptic ulcer disease, gastrointestinal (GI) bleeding, GI perforation, impaired renal function and inhibition of platelet function. So, there is a need to depend on another analgesic tool with minimal side effects, Fisher et al., (1988). The application of low energy lasers in the field of dentistry and oral surgery has been described since the 1970s. Low energy laser light was supposed to reduce pain, to accelerate wound healing and to have a positive effect on

inflammatory processes, Neckel et al.,(2001). The aim of this study was to compare the use of low-power laser irradiation and the non-steroid anti-inflammatory drug diclofenac sodium, which are claimed to be among the most successful aids in postoperative pain control.

## 2. Materials and Methods:

### 2.1.Materials:

#### Patients

Ninty healthy patients of both sexes, randomly selected among patients undergoing non surgical third molar extraction with local anesthesia (2% lidocaine with epinephrine 1:80.000) in the outpatient oral surgery clinic- National Research Centre-Cairo. Informed consent was obtained from participating patients. The study was approved by the local ethical committee. Exclusion criteria were

chronic diseases – pregnancy- known allergy to local anaesthetics – recent history of chronic pain medication.

## 2.2.Methods

### 2.2.1.Procedure

Sixty patients received a preoperative single dose of 100 mg diclofenac sodium, one hour before surgical procedure, thirty of them had postoperative low power laser irradiation in addition. They were compared to a third group with only regular postoperative recommendations (30 patients) (cold packs, soft diet, etc.) which is also given after extraction procedure to all the investigated patients. The laser group received a low-power laser using a soft laser SL-202 (PETRO LASER, Pr. Stachen, Saint-Petersburg, 198097, Russia) with an 870 nm wave length applied intra-orally from a distance of 1 cm for 10 minutes after extraction procedure. The energy output was 4 J/cm<sup>2</sup>, with constant power density of 80 mW. Laser treatment was performed once. The extraction was performed by a single surgeon to minimize individual technical differences to prevent pain bias. Postoperatively, extraction wounds were primarily closed by interrupted sutures. Although the patients were grouped randomly, the duration of surgical procedure and its complexity, based on the need for root separation, were again comparable among all the investigated patients, regardless of the used analgesic regimen (Table 1). After surgical procedure, all the patients were instructed to note pain intensity (using visual analogue scale [VAS]), and any possible side effects, for example, dizziness and nausea. Postoperative analgesic efficacy was estimated by the postoperative VAS of 100 mm length, where patients marked the maximal pain intensity they experienced during the postoperative period.

### 2.2.2. Statistics:

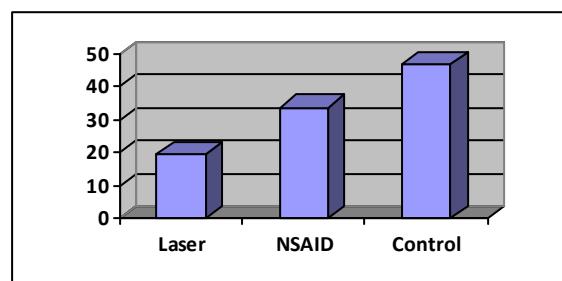

Data was analyzed using professional statistics package (SPSS for windows, Release 7.5, SPSS Inc., and Chicago, IL, USA). Descriptive data represented as mean  $\pm$  SD for numeric data. Data of the three studied groups were compared using one-way analysis of variance (one way ANOVA) test. sig. (2-tailed) p<0.05 was considered significant.

**Table (1): General and operation characteristics among the three studied groups**

Parameter	Laser N = 30	Diclofenac N = 30	Control N = 30	P
<b>Age</b>	28 $\pm$ 7.9	29 $\pm$ 6.5	27.5 $\pm$ 5.8	> 0.05
<b>Sex distribution</b>	18 (60%) 12 (40%)	17(56.7%) 13(43.3%)	19(63.3%) 11(37.7%)	> 0.05
<b>Duration of surgery</b> (mean $\pm$ SD)	27.9 $\pm$ 13.5	30.5 $\pm$ 10.6	28.9 $\pm$ 11.5	> 0.05
<b>Distribution of the duration of surgery:</b> < 30 min. 30 – 60 min.	26(86.7%) 4 (13.3%)	25(83.3%) 5 (16.7%)	26 (86.7%) 4(13.3%)	> 0.05
<b>Tooth separation:</b> Yes No	13(43.3%) 17(56.7%)	15 (50%) 15 (50%)	14 (46.7%) 16(53.3%)	> 0.05

## 3. Results

The general and operative characteristics of the studied groups were presented in table (1). There was no significant difference between the three groups regarding their mean age, sex distribution, mean duration of surgery, the distribution of the duration of surgery and the incidence of tooth separation (one way ANOVA test) (P > 0.05). The results showed that there was significant reduction of pain intensity in patients treated with low-power laser irradiation, in comparison to patients medicated with diclofenac sodium alone and to the controls (fig 1).

**Fig. (1): Mean Pain score as assessed by VAS (visual analogue scale) among the three groups**

In laser group, the mean pain intensity obtained by VAS was 19.7  $\pm$  24.8 mm, the maximal value was 65 mm and the minimal was 3 mm. While in patients preoperatively medicated with diclofenac sodium only, the average pain intensity was 33.8 mm,

the maximal value was 85 mm and the minimal was 10 mm. In control patients, the average pain intensity was 46.7 mm, the maximal value was 90 mm and the minimal was 15 mm (Table 2).

**Table (2): Comparison of post-operative analgesic effect (Assessed by \*VAS) among the studied groups**

Group	N	Minim um	Maxim um	Mean ± SD	P
Laser	30	3	65	19.7 ± 24.8	< 0.01
Diclofenac	30	10	85	33.8 ± 22.9	< 0.01
Control	30	15	90	46.7 ± 38.6	< 0.05

\*VAS: visual analogue scale

These differences were statistically significant for pain reduction in patients treated with low-power laser irradiation compared to patients medicated with diclofenac sodium alone or in controls. There were no clinically evident side effects that could be attributed to the used diclofenac sodium or low level laser therapy.

#### 4. Discussion

It has been emphasized that one of the most valuable treatment objectives in dental practice is to afford the patient a pain-free treatment Ngan et al., (1999). By the evolution of the laser applications, the dental committee aimed to achieve this goal without analgesic drugs and painful methods , Walsh (1997).

The use of laser as a non-surgical medical treatment modality for assisting the normal processes of healing has increased over the last few years. However, the efficacy of laser in reducing pain or promoting tissue repair still remains controversial, Enwemeka et al.,(2004).

Laser therapy aims to restore the normal biological function of injured or stressed cells so ‘Normalization’ is the keystone of laser therapy Tunér and Hode (2002). The stimulatory effect of laser therapy can be seen in wounded cells or in cells that are growing suboptimally whereas cells that are normal or fully functional remain unaffected and no therapeutic effect can be observed ,Smith (1991).

Laser light has the unique properties of monochromaticity (a single wavelength), collimation (travels in a single direction without divergence) and coherence (with all waves in phase) Denise and Heidi (2007). These properties are what allows laser light to penetrate the skin surface non-invasively, Matic et al.,(2003); Theralase. (2003) and Schindi (1999).

Therapeutic lasers are athermal with no appreciable heat transfer (<0.65 °C) so the photonic energy is transferred directly to the target cells and thermal damage is avoided Matic et al.,(2003); Theralase. (2003). Therapeutic lasers use monochromatic light in the 630 to 905 nm range, known as the “therapeutic window” Stadler et al.,(2004) .

The unique pain reduction abilities of LLLT (Low Level Laser Therapy) have been extensively researched and documented in numerous clinical studies and medical papers. Because the pain amelioration capabilities of LLLT are accomplished via the combination of local and systemic actions — utilizing enzymatic, chemical and physical interventions — the process is very complex. However, there is a preponderance of medical evidence that justifies a conclusion that effective pain reductions can be achieved via increase in

b-Endorphins, blocked depolarization of C-fiber afferent nerves, Ohno(1997), increased nitric oxide production, increased nerve cell action potential, axonal sprouting and nerve cell regeneration, decreased Bradykinin levels, increased release of acetylcholine or ion channel normalization, Byrnes et al.,(2002)and Rochkind et al.,(1997).

Many clinical studies and case reports investigated the use of oral soft laser applications. Positive laser effect was used for the prevention of pain, swelling or trismus after removal of third molars and periodontal surgery procedures as well as for reducing orthodontic post-adjustment pain Kreisler et al., (2004)and Roynesdal et al.,(1993).

Moreover, soft lasers were used for the treatment of craniomandibular disorders, chronic facial pain, chronic sinusitis, gingivitis, herpes simplex, dentinal tooth hypersensitivity, and sensory aberrations in the inferior alveolar nerve. The results were controversial. While some studies reported on a positive laser effect with regard to the investigated parameters others showed no or only negligible clinically relevant influence of LLLT, Youssef et al., (2008)

Amarillas-Escobar et al. (2010) found that the use of therapeutic laser in the postoperative management of patients having surgical removal of impacted third molars, decreased postoperative pain, swelling, and trismus, but without statistically significant differences. In agreement with Douglas et al.(2004) and Little et al.(1997).

Aras and Güngörümüş (2009) Stated that extraoral LLLT is more effective than intraoral LLLT for the reduction of postoperative trismus and swelling after extraction of the lower third molar.

Fernando et al. (2001) in their randomized double blind comparative study of low level laser

therapy following surgical extraction of lower third molar teeth showed that there was no evidence of a difference in pain and swelling on the third day after operation between laser and placebo sides. There was no difference between the two sides when they were assessed for healing 7 days after surgery.

Roynesdal et al. (1993) had reached similar conclusion where they found no statistically significant differences observed in comparison of the experimental side with the placebo side. They concluded that soft-laser treatment had no beneficial effect on swelling, trismus, and pain after third molar surgery.

In the current study we compared between low-power laser irradiation and a non-steroid anti-inflammatory drug diclofenac sodium in postoperative pain control after surgical removal of third molars. Postoperative analgesia is one of the most important segments of surgical extraction of third molars. Many attempts have been made to control postoperative pain, the results being satisfactory only to some extent, Seymour and Walton (1984). It seems, from the results of this study that the use low power laser irradiation is the most promising type of therapy in reducing the post-operative extraction pain.

The results of this study indicated that postoperative use of low-power laser irradiation after surgical extraction of third molars significantly reduces postoperative pain. Compared with the postoperative analgesic effect of diclofenac sodium that was beneficial but less prominent. The Influence of preoperative use of diclofenac-Na on postoperative pain after removal of impacted lower third molars was investigated before and its positive effects reported. However it had slow effect, Gregg(1992) ; Markovic and Todorovic(1995).

Also results of the current study agreed with the results of the study of Alekxa et al. (2006) who investigated the analgesic effect of low level laser therapy after lower third molar extraction and they found that LLLT was superior than non-steroidal anti-inflammatory drug diclofenac and long acting anaesthetic drug (bupivacaine). Markovic and Todorovic (2007) Suggested that low power laser irradiation after lower third molar surgery can be recommended to minimize swelling. The effect is enhanced by simultaneous local intramuscular use of dexamethasone.

The mandate for dentistry in the 21st century calls for continued efforts directed toward eliminating dental disease and enhancing the overall health and well-being of patients by translating scientific discovery into clinical practice, Kreisler et al., (2004)

This persuades us to strongly recommend the use of LLLT for molar extraction in addition to the usual conservative measures and the anti inflammatory drugs.

**Abstract:** This study focuses particularly on how people living as one community organize themselves to fulfill their needs and expectations through various groups, as revealed and directed by respondents in the research process. Therefore, the analysis and interpretation of the data is based on the people's expressed experiences of participating in such processes by treating those experiences as one entity, regardless of the type of groups they represented.

[Asnarulkhadi A. S & Fariborz Aref. **Organizational, Operational and Interactional Processes of People's Participation in Community Activities in Malaysia**. Journal of American Science 2010; 6(11):1073-1077]. (ISSN: 1545-1003). (<http://www.americanscience.org>).

**Keywords:** participation, community activities, planning

### Introduction

This study focuses on the people's participation process in conducting their community activities. It describes the interaction and operational processes by which community members mobilized themselves to organize and plan their activities, and subsequently participated to implement and manage them based on mutual agreement. While describing these processes, important elements in discussing people's participation, the decision making process and the way they solved their internal group problems, are also examined. It is important to note here that the decision making process not only took place at the planning stage but in some community groups this process also took place at the implementing and managing stages. Hence, the central issue in discussing people's participation will be examined in both stages; organizing and planning, and implementing and managing. The type of people's participation will be examined at these stages. This study also discusses the development of leadership and the role played by the leaders in initiating, mobilizing, enabling, facilitating, campaigning, leading, and directing the community work and community development activities. In short, this study examines the process whereby people are exercising their capabilities, individually and collectively, in participating towards achieving their common needs or expectations, and solving the shared problems faced, in their respective groups. The information gathered is mainly based on interviews and observations, supplemented by secondary recorded materials provided by them.

### Methodology

This study employs a qualitative-ethnographic approach that uses a flexibility and open-ended framework of research design. In this kind of interactive research, the basic aim of the whole process of the research activity is not only to gain information and to understand the meaning and process of participation. This study, which can be classified as the 'knowledge-development research' in Thomas's community work research typology (Thomas, 1980), emphasizes the process approach: describing and analyzing the people's participation experience, rather than examining participation through a snapshot approach as in a quantitative study. The interactive and responsive techniques of data collection of in-depth and follow-up interviews, and group discussions advocated by this approach allowed the people to be directly involved in the research process and helped to facilitate an understanding of their participation in the activities of the community (Asnarulkhadi & Aref, 2009).

### Literature Review

Participation is a dynamic process. Participation is considered as an important factor for successful and prosperity of local development (Aref et al., 2010). Hence, it is difficult to predict or even to quantify using a standard 'measurement'. Participation is rather molded by, and originates from, individuals' experiences in participating. As such, the qualitative-ethnographic approach employed in this study was able to assist in understanding the process of people's

participation in community development activities. This approach has also helped to deepen the knowledge about participation itself (Asnarulkhadi & Aref, 2009). Community participation processes can support and uphold local culture, tradition, knowledge and skill, and create pride in community heritage (Lacy et al., 2002). Ashley& Roe, (1998) describe community participation as a spectrum from passive to active involvement to full local participation, where there is active community participation and venture ownership. Community participation also is the mechanism for active community involvement in partnership working, decision making and representation in community structures (Chapman & Kirk, 2001). It should be noted that community participation often means the involvement of people or community with the government. Numerous studies about community participation have been published (Aref et al., 2010; Bozlul, 1994). However, this study emphasized the participation of the community as an involvement of local people in community activities processes.

## **Findings & Discussion**

### **Organizing and Planning**

It is obvious that the outcome of people's empowerment is objectified and manifested in the activities implemented by the various types of groups. However, prior to that the process of how the community or group members engaged themselves in organizing, planning, implementing, and sustaining the group activities resulted from their awareness to take their own initiative to achieve the shared goals within the existing structure to improve the community living situation is an important aspect of understanding people's empowerment. In order to understand this it is necessary to explore the people's participation and their interaction process in organizing and planning the activity. This can be examined in three ways: first, in the pre-group process; second, in the group process; and lastly, in the decision making process. In practice, the second and third stages took place simultaneously and will therefore be examined together.

#### ***Pre-group process***

Before deciding on any activity, it is common practice among all community groups to invite members to attend a group meeting or discussion. Most of the group leaders interviewed mentioned that they had invited their group members to plan and organize the activities. The practice of

informing members about group meetings was not only restricted to the younger leaders, who mostly led the formal or 'modern' type community groups as portrayed above, but was also used by the 'traditional' type of community groups that were led by middle aged women, such as the self-help Group. From the descriptions above it can be seen that inviting group members to organize or plan an activity in a meeting is a normal practice of the leaders. Although the date for the meeting is decided by the leaders themselves, their efforts to inform the members about the meeting shows that they realize the importance of a meeting and are able to organize themselves. At this point, it can be deduced that the leaders' participation in encouraging their members to attend the meeting, through his or her personal invitation shows that, from the point view of the leaders and the local activists, the group process in organizing and planning an activity is an important aspect of organizing the activity.

#### ***Group Process***

The actual group process normally takes place in a meeting. There are two types of group meeting; formal and informal. Formal group meetings are practiced by the Youth Club, Mosque Committee, and the Anti-Drugs Campaign Committee. From their files and by personal attendance, it was found that these groups have formalized their meetings. Prior to the meeting, each group produces an agenda and keeps updated minutes of meetings. The informal meetings are practiced by four neighborhood groups; the self-help groups, the Crockery Association/ Rice and Egg Cooperative, the Community Death Fund Association, and the Women's Study Circle group. In comparison with the other groups, these informal groups do not have proper agendas for their meetings. Decisions made during the meetings are recorded in a small book or diary, which is kept by the leaders. The exception is the self-help group, which does not possess any sort of documentation.

In practice, both types of group meetings (informal and formal) eventually end up as group discussions. Group meetings are a focal point for most community group members to sit together in discussing, planning and deciding on their group activities. Since different groups have different ways of planning their activities, and because within the same group different activities demand different ways of organizing, the experiences gained by the members in these meetings (at the planning stage) are different. In general, from the information gathered it could be deduced that

there are two functions of having a group meeting; first as a medium for sharing and communicating ideas and problems and making decisions, and second as a medium for requesting, directing and informing. These two distinctive functions of group meetings employed by the community groups eventually influence the group members' participation in the decision making process, as explained below. In other words, it is within group meetings that the process and level of peoples' participation in planning emerges simultaneously.

#### Type of participation

In general, from the experiences described by the respondents at the planning stage, there are four types of participation in community work practice:

- Self-directed participation
- Joint-participation
- Leader directed/induced participation
- Externally directed participation

This division is not a rigid classification, but is based on one fundamental dimension, that is the process within which the activity is decided: how and who determines the activity for the people and to what extent a group has 'a say' in the decision making process. The degree, type of participation and community activity is as shown in Table 1.

In self-directed participation, the group members themselves decide the type of activity, then design and plan it - they decide the time, identify content, budget, strategies and tactics, and finally organize members to carry out the activity. In this type of participation, members have direct control over their own project or activities, which indicates that they have the opportunity and capacity to control their own affairs to fulfill their needs and expectations. They have the chance to utilize and develop their abilities, skills, confidence and competency to shape the activity that they pursue to achieve their targeted goals and every member has the opportunity and power to decide for themselves.

**Table 1: Degree of Participation, Type of Participation and Activities**

Degree	Type of Participation	Activities
High ↑	Self-directed participation	<b>Community-Initiated</b> Self-help and community care activity. Islamic Family Course My Home My Heaven project . Meat Market project. Community sport. Religious talks/communal feasts/ religious classes Cooking, craft work & sewing classes (WSA). Religious School, Religious Camp .Campaigning for better school project .Motivational Training project .Bill Paying Service project Neighborhood watch project (for drugs abuser)
	Joint-participation	<b>Partnership</b> Group Replanting Scheme
	Leader-directed participation	<b>Leader-Induced</b> Greening the village project Book Corner project
	External-directed participation	<b>External-directed</b> All competition activities Social gathering; and Exhibitions organized by WI District level

Thus, the activity that offers the greatest opportunities for members to identify, choose and decide for themselves in the decision making process, possesses a high degree of people's participation. It can be said that community members are in control of their lives and possess the ability to affect the development process

through participating in self-initiated activities or projects.

Self-directed participation is not limited to describing the features of people's participation in the community-initiated groups. People's participation in the WSA (and its activities - cooking, craft work and sewing classes), and in the Meat Market project organized by the Mosque

Committee can also be considered as self-directed participation, even though the group is under the auspices of, sponsored and patronized by, the state agency, RISDA and the State Islamic Department respectively. This is because the initiation of the group (WSA) and its activities was decided by the women members themselves, aimed at improving their situation in the village, while the Meat Market project aims to offer services for the whole community during the festival session. Therefore, the whole process of participation, in identifying and deciding the activities is similar to that of self-directed participation in the community-initiated activities of the community-based groups.

When a project is joint-ventured, the activity is conducted along the lines of a partnership. In the case of rubber replanting program, RISDA had to accept the decision of the people. Through a series of meetings between both parties (RISDA and the settlers) and followed-up by group discussions among the settlers, they chose the GRS, rejecting the mini-estate scheme. At this point, the people (the settlers) had the power to decide and choose the option that would be most beneficial to them, and subsequently to influence the decision of the authorities. However, since the activity involved bureaucratic procedures and the funding came from the state as the patron, the people's control over the project was restricted within certain regulations and by-laws outlined by the state agency. The GRC established by the settlers provided a platform for the members to decide certain issues pertain to the activity and act as the settlers' representative body in choosing the contractors and monitoring their work in the plantation. This was based on advice given by RISDA personnel, although the GRC had the right to select one of the few bidders. It is the responsibility of the GRC to monitor the contractors work and keep account of the money allocated for the scheme. Monitoring the quality of work performed by the contractor so that, allowing for the budget, the work schedule was met in accordance with the replanting guidelines encouraged members to decide their tactics and strategies in supervising the contractor's work. It is within this context that settlers have the power to control the contractor to ensure they are not being cheated.

An activity that is put forward by a leader for the members to carry out is the basic characteristic of leader-directed/induced participation. In this kind of participation, although members are requested to carry out a particular project, they have the opportunity to decide how to carry it out: the

launch date, organizing manpower and so forth. Since this type of activity is inspired by the leader, and thought to be beneficial for the community at large, it has the potential to be more empowering if members make full use of opportunities to influence the outcome of the project. As far as collective decision making is concerned, leader-induced participation to some extent has undermined the critical stage, the group process in deciding and prioritizing the type of activity needed, where the meeting can be used to redefine and reemphasize the reason for initiating the activity.

On the other hand, in externally directed participation, the arena for members to exercise their power to choose an activity is taken away from them, and instead, they are obliged to follow the directive of the higher-level organization, as experienced by the *WI Kg. Barem*. Being under the patronage of the District WI and strictly devoted to carry out the activity planned by higher management means that they are being co-opted. The only decision they have is in determining who should be sent to represent the local WI group in the district competition. This type of decision-making is not empowering enough to encourage and motivate group members to develop their abilities and skill to determine for them, compared with the community initiated activity. Therefore, it was a wise step taken by the WI members to be involved in helping to plan, implement and manage some of the joint-ventured activities with other local community groups as this action probably complements the 'vacuum' that they experience in participating in the directed-activities. In short, these four different types of participation set the pattern for the process of members' involvement in planning, implementing and managing the group activities. It is within this participation process that people showed their commitment and ability to utilize their inherent skills and knowledge to achieve group goals, as well as developing and constructing the features of community development they want, and at the same time increase and develop their own competencies.

### Conclusion

The study showed organizational, operational and interactional processes of people's participation in community activities in Malaysia. The position between leaders and members is diffused between community groups. In one group a respondent is an ordinary member but in another group the same respondent may act as leader. Due to this,

one can see that the role of a respondent varies from being an initiator in one group or just an ordinary member in another. It is not unusual for some respondents to play different roles in different community groups. From the in-depth interviews and observations made in this study, it was found that all the respondents are involved in various forms of participation in conducting an activity in at least in one of the groups they were involved in. 'Form of participation' here is defined as an individual action in organizing the activity. There are three forms of people's participation, which emerged out of the induction and deduction process of analysis. First, giving ideas; second, task, work or role performed; and third, attending the group meetings. In general, all three forms of involvement are present in all group activities, but the degree of participation varies.

# Influence of Organic Matter and Different Rates of Sulphur and Nitrogen on Dry Matter and Mineral Composition of Wheat Plant in New Reclaimed Sandy Soil

**El-Fatah., M.S. and Khaled, S.M.**

Plant Nutrition Dept., National Research Centre. Dokki, Cairo, Egypt

**Abstract:** A pot experiment was carried out in greenhouse on reclamation sandy soil from (Abu-Rwash) region north of Egypt to evaluation effect of organic matter at rate 2% of soil weight and different rates of elemental sulphur at a rate, i.e. (100 and 200) ppm ( $S_1$  and  $S_2$ ) respectively and nitrogen, i.e. (50, 100 and 150) ppm ( $N_1$ ,  $N_2$  and  $N_3$ ) respectively at from ammonium sulphate  $(NH_4)_2SO_4$ . Dihydrogen potassium phosphate  $H_2KPO_4$  was added as at a rate 200 ppm as sources to phosphorus and potassium. All treatments were added before the culture of a week at one dose. The growth stages were divided to three stages (planting, elongation and maturity) each stage for two months about. The determination was performed each stage to soil and plant (whole plant). The results can be summarized as follows: (1) Soil pH decreasing at significantly especially at rates, i.e. 200 ppm S and 150 ppm N treatment in each of planting and elongation stages then began a gradual return to initial in maturity stage. (2) Electric conductivity (E.C) is rising at significantly especially with  $S_2 - N_3$  treatment then starting the gradual return to initial in maturity stage. (3) Thiosulphate  $S_2O_3^-$  was found in soil as a result sulphur oxidation as it affects inhibition on the nitrification process. (4) Available nitrogen ( $NH_4^+$  and  $NO_3^-$ ) continued a long experiment period. (5) Dry weight was more significantly with  $S_2-N_3$  treatment in comparison to other treatments. (6) Mineral contents were more significantly with  $S_2-N_3$  treatment along of time experiment except potassium and zinc elements as decreasing in maturity stage.

**Key Words:** organic matter-Sulphur-Nitrogen-wheat plant reclamation sandy soil-mineral composition-dry matter.

## 1. Introduction:

Now the world became at the strongest necessity to new reclamation soils to meeting the need excess to the food as a result to increase of population on the world level, they not in the front of unlike incursion of the desert soils and reclamation it. Egypt to suffer of the same problem, the majority of the desert soils decline in sandy and calcareous soil. These soils suffer of badly of physical properties such as weakness of biological activity, less of the soil structure and less available for nutrients. Elemental sulphur and organic matter of to soil beneficent as its improving of available nutrients, the soil structure, increasing to keep of the water and increasing of exchangeable capacity of soil, which enhanced on the rise of soil production.

A correlation was observed between sulphur oxidizing activity and organic matter content. (Barrow 1960 and Stewart et al 1966) showed that

the addition of organic materials and plant residues can greatly affect the process of sulphur mineralization. In this case, the C/S ratio of added organic material will determine whether mineralization or immobilization occurs.

The aim of this work is to evaluate the efficiency of sulphur and organic matter in reclamation of sandy soil under wheat plant cultivation.

## 2. Materials and methods

A pot experiment in greenhouse to evaluate the effect of different rates of sulphur (100 and 200) ppm and nitrogen (50, 100 and 150) ppm at form ammonium sulphate  $(NH_4)_2SO_4$  and plant organic matter at a rate 2% of soil weight on dry matter and mineral composition of wheat plant under sandy reclaimed soil from (Abou-Rwash) region, Egypt. Table (1) shows some chemical and physical

characteristics of the studied soil. Pot contents with 5 kg soil. All treatments under the study were added of mixed soil with culture at one dose. Potassium dihydrogen phosphate  $\text{KH}_2\text{PO}_4$  was added at a rate, i.e. 200 ppm as a source for potassium and phosphorus. Ten seeds of wheat were sown and thinned to 5 plants per pot. Wheat plant of class seeds (1). Each of growth stage continued for two months. Plant harvested after six months (All plant). The moisture contents of the pot were maintained at 80% of water holding capacity. One of the cutting samples was immediately frozen to nitrate determination. Dried plant exhibited to constant weight at 80°C in a ventilated oven. Nitrogen was determined using

devarda alloy by (Microkjeldahel distillation) according to (Jackson, 1985). The phosphours is determined by spectrophotometer, potassium using a flame photometer. Fe, Mn and Zn were determined by atomic absorption, (Jackson, 1985). Thisoulphate ( $\text{S}_2\text{O}_3$ ) was determined according to, (Nor and Tabatabai 1975) by the colorimetric method in lithium chloride 0.1 M extract after filtration added ml of 0.1 M KCN, after 15 min, add 2 ml of 0.033 M cucl<sub>2</sub> and 1ml of Fe ( $\text{NO}_3$ )- HNO<sub>3</sub> reagents. Make the volume to 25 ml with 0.1 M LiCl, invert the flask several times to mix the contents, measure to a wavelength of 460 m $\mu$ .

**Table (1): Some chemical and physical characteristics of the experimental soil.**

Parameter	Value	Parameter	Value
Soil pH (1 : 2.5)	7.98	Sulphate $\text{SO}_4^{=}$ ppm	72.4
E.C dsm <sup>-1</sup> (1 : 5)	0.185	Thiosulphate $\text{S}_2\text{O}_3^{=}$ ppm	3.0
$\text{NH}_4^+$ ppm	5.0	Total $\text{CaCO}_3$ %	0.40
$\text{NO}_3^-$ ppm	17.3	Organic matter (O.M) %	0.21
Total nitrogen %	0.042	Texture type	Sandy
Available P ppm	6.3		
Available K ppm	12.3		
Available Fe ppm	7.2		
Available Mn ppm	6.3		
Available Zn ppm	2.6		

### 3. Results and Discussion:

This experiment was carried out in sandy reclaimed soil from Abou-Rwosh, Egypt in purpose of the evaluation of the effect addition of elemental sulphur with different rates (100, 200) ppm, rates of nitrogen (50, 100, 150) ppm as ammonium sulphate ( $(\text{NH}_4)_2\text{SO}_4$ ) and plant organic matter at one rate 2% of the soil weight under wheat cultivation.

Data in table (2) contents shows that some parameters in sandy soil at three stages of wheat plant (planting, elongation and Maturity).

Soil pH and E.C status:

Soil pH was decreasing significantly due to the addition of sulphur and organic matter, which is continued to a long time of experiments. The relationship was positive between sulphur concentrations and pH decreasing from 7.86 to 6.11 about 1.75 units.

The data showed that the treatments with rate 200 ppm sulphur, 150 ppm nitrogen and 2% organic matter of soil weight at planting stage were useful. While, in the maturity stage the decreasing ratio started to lessen, but it remains continues to the end may be due to a weakness of buffering capacity of sandy soil as a result to a little of calcium carbonate and clay ratio.

**Table (2); Effect of organic matter and different rates of sulphur and nitrogen on some parameter reclamation soil under wheat plant cultivation.**

Growth Stages	Fertilization Treatments	pH	E.C $\text{dsm}^{-1}$	$\text{S}_2\text{O}_3^{\equiv}$	$\text{NH}_4^+$	$\text{NO}_3^-$	$\frac{\text{NH}_4}{\text{NO}_3}$

Elemental sulphur:  $\text{S}_1 = 100 \text{ ppm}$ ,  $\text{S}_2 = 200 \text{ ppm}$ Nitrogen as ammonium sulphate:  $\text{N}_1 = 50 \text{ ppm}$ ,  $\text{N}_2 = 100 \text{ ppm}$ ,  $\text{N}_3 = 150 \text{ ppm}$ 

(Sallade and Sims 1992, El-Fayoumy and El-Gamal 1998) showed that, thiosulphate was oxidized to tetrathionate then to sulphate in the end; they have effect on soil pH decreasing, this effect increases with the increase of organic matter ratio and decreasing of calcium carbonate than sulphur alone.

On the other hand, soil salinity affected by sulphur and organic matter, whereas EC increased ( $0.06 \text{ dSm}^{-1}$ ) as a consequence of excess of the soluble salts which added with sulphur. As the result of the characteristics of sandy soil which poor in elements (salts), the rising was limited.

The treatment of  $\text{S}_2\text{-N}_3$  (200S – 150N) ppm at planting stage is more effected in comparison with the other treatments along the experiment, and then the gradual decrease started at elongation stage and continued to the end of maturity stage. The decrease in salt content may be due to leaching of soluble salts and/or absorption by growing plants until to reach on equilibrated level corresponding to the initial content.

Sulphur was oxidized to sulphide then to tetrathionate then to thiosulphate and then to sulphate by heterotrophic bacteria, actinomycetes and filamentous fungi (Guittonneau and ketlling 1932).

Through data at table (2) was noticed that oxidation of the sulphur ratio to thiosulphate was to be slow may be due to the weakness of the biological activities in sandy soil. Sulphur oxidation to thiosulphate at planting stage was more of a ratio than the other two stages as thiosulphate concentration was a high relatively, the highest value of thiosulphate was 18 ppm at 200 ppm S and 150 ppm nitrogen treatment, positive contact was found between sulphur concentration and thiosulphate concentration at planting and elongation stages clearly. Organic matter addition may be enhanced at slow of oxidation. (Kowalenko and Lowe 1975) they found that samples with high C:S and C:N ratios have low values of mineralizable sulphur and nitrogen. Awad (1990) studied the oxidation regime of the added sulphur in the sandy soil was delayed than the remainder of soil types.

#### Nitrogen availability status in soil:

Data in table (2) indicated that, nitrification process was occurred by slow rate at planting and elongation stages while the normal period to convert ammonium ( $\text{NH}_4^+$ ) into nitrate about two weeks.

Plant uptakes each of them but the ammonium can not be loosed from the soil easily as it hold on the surface of soil granules. Nitrate is exposed to losses by the leaching as a result to repeat of irrigation and denitrification process (nitrate convert to nitrogenous volatilization oxides). This is the positive effect due to sulphur and organic matter were added as a result of sulphur oxidation compound of thiosulphate ( $\text{S}_2\text{O}_3^{2-}$ ), which will inhibit the nitrification process as noticed that thiosulphate remained along growth period due to weakness of biological activities in the sandy soil. Thus organic matter decomposed into some organic acids and other compounds, which inhibit the effectiveness of the nitrification process. Available nitrogen (ammonium + nitrate) continued in soil along experiment period.

From the result, it can be indicated that sulphur, and organic matter are contributed to raise qualification of nitrogenous fertilizers. (Mostafa et al 1995) Indicated that elemental sulphur application reduces the extracted  $\text{NO}_3^-$  and increased the  $\text{NH}_4^+$ , due to the inhibition of nitrification. The effect was more pronounced in sandy soil. (Frgl et al 2005). Found that sulphur and organic matter application as ammonium fertilizers to cause retardation of nitrification (nitrate formation) was positively related to the rate of sulphur addition.

Data in table (3) represent the dry weight and mineral contents of wheat plant in reclamation of soil (sandy) as affected by organic matter and

different rates of sulphur (100 and 200) ppm and nitrogen (50, 100 and 150) ppm.

#### Dry weight (gm/pot) status in whole plant:

Dry weight of wheat plant is the reflection for all treatments during three stages of wheat plant (planting, elongation and maturity). The first stage show that effect of dry weight as found a positive relationship between rates of sulphur and dry weight as an increasing rate of the sulphur, increase the dry matter, same this contact was occurred between rates of nitrogen and dry matter as increasing rates of nitrogen, increase weight of dry matter. This connection was continued a long time of an experiment (three stages), this effect due to the beneficial effect of sulphur and organic matter are included in its effect on the chemical conditions of the soil such as reducing the pH of the soil and making some plant nutrients more available. (Green and Chaudhry 2006) explained the indirect effect of sulphur in soil by its conversion to the sulphuric acid which has a solvent action for several important nutrients. (Barrow 1960) showed that the addition of organic materials and plant residue can greatly affect the process of sulphur mineralization. In this case, the C/S ratio of added organic material will determine whether mineralization or immobilization occurs.

#### Nitrogen status in plant:

Data in table (3) concerning nitrogen uptake by wheat plant under the effect of organic matter addition at a rate 2% of soil weight and different rates of sulphur (100 and 200) ppm and nitrogen (50, 100 and 150) ppm during three stages of wheat plant (planting, Elongation and Maturity). It is found a positive relationship between the rates of sulphur and nitrogen added and nitrogen contents in plant as increasing of rates of sulphur and nitrogen follow up by increasing of nitrogen uptake.

The high values of nitrogen uptake were at sulphur rate 200 ppm and nitrogen rate of 150 ppm treatments and this contact was continued during three stages of plant.

These results reflect to the range of importance of sulphur for increasing of nitrogen content in plant as is entered in the structure of many amino acids. (Brazozowska et al. 1964) reported that, sulphur deficient plants of groundnut (*Aroctis hypogea* L.) had less protein N in all plant organs. There was an accumulation of arginine, a sparagine and a decrease in cystine, cysteine and methionine contents.

#### Phosphorus status in plant:

At planting stage found a positive contact between rates of sulphur, nitrogen and phosphorus contents in plant as a high value in this stage with

rate of sulphur 200 ppm and nitrogen 150 ppm. At elongation stage found that the values were a low relatively in comparison with planting stage but these differences not significantly may be due to phosphours entity at form unavailable at form limited. In maturity stage was positive contact among rates of sulphur, nitrogen and phosphour contents

may be due to increasing of the representation for phosphour element as a result of increasing plant growth. (Aulok and Posrichs 1997) showed that, the negative effect of sulphur and phosphorus fertilizers upon the uptake and utilization of each other was conspicuous when they were simultaneously.

**Table (3) Effect of organic matter and different rotes of sulphur and nitrogen on dry weight (gm/pot) and mineral contents of wheat plant in reclamation soil (sandy).**

Elemental sulphur: S<sub>1</sub> = 100 ppm, S<sub>2</sub> = 200 ppm

Nitrogen as ammonium sulphate: N<sub>1</sub> = 50 ppm, N<sub>2</sub> = 100 ppm, N<sub>3</sub> = 150 ppm

### Potassium status in plant:

Potassium content in plant was at a positive contact with rates of sulphur and nitrogen in each of planting and elongation stages. Head values of potassium uptake with  $S_2 = 200$  ppm and  $N_3 = 150$  ppm treatment along period experiment. At maturity stage potassium uptake was lesser than previously of two stages may be due to maturity stage not require to more potassium as the plant complete of growth stages. (Modaihsh et al 1989 and Solimon et al 1992a) who found that the uptake of K significantly increased as a result of increasing sulphur rates application to the soil while potassium uptake was decreasing at late of growth stages.

### Micronutrients status in plant:

Positive contact was found between increasing rates of sulphur and nitrogen with the uptake of iron, manganese and zinc by wheat plant during of three stages of the growth except zinc uptake as decreasing at maturity stage. Head values of Fe, Mn and Zn uptake were with the rate of sulphur 200 ppm and nitrogen 150 ppm treatments. Sulphur application in all soil types is effective on the solubility and availability on nutrients as influenced by soil pH, organic matter and oxidation of soil amendments by lowering of soil pH and therefore, increased plant uptake of these nutrients. (Procopiou et al 1976) indicated that Fe levels in the leaves was increased at lower sulphur levels.

The tendency of sulphur to increase the level of Mn in plant was pronounced on both the concentration and the uptake levels of Zn and Fe were increased by most, if not all, levels of sulphur. They concluded that the positive effect of sulphur varied according to the level of sulphur application.

# Presumed Chronological, Developmental and Clinical Classification of Human Dentitions

Said Mahmoud Hani

Oral Biology Department, Faculty of Dental Medicine, Al-Azher University, Cairo, Egypt

[hani.said@yahoo.com](mailto:hani.said@yahoo.com)

**Abstract:** Diphyodont, including man, have traditionally two dentitions the deciduous and permanent. The significances of the presence of two dentitions may lie behind the fact that once the teeth have been developed, they are unable to grow, by the common sense of the word. Since the individual organs and tissues grow by time and the jaws also do, therefore, other generation of dentition is needed to match the new situation, that is, the permanent dentition. However, this typing of dentition into two sets is oversimplified and nonindcative for the condition in which the teeth are variably represented. It also, does not exhibit the different and definite cases by which the teeth are expressed. Taking these drawbacks into consideration, a presumed classification has been presented indicating the developmental, clinical and chronological situations of the different sets of dentitions. The presumed classification may be valuable not only for pedagogic purposes but also for the developmental and clinical studies. [Journal of American Science 2010;6(11):1085-1090]. (ISSN: 1545-1003). (<http://www.americanscience.org>).

**Keywords:** Classification, Dentitions, Human

## Principles of classification

The human dentition may have two sets, three phases and two conditions which may be indicated as follow:

1 - The two sets are the deciduous and permanent dentitions.

2- The period of time for the existence of each set of dentition is not sharply distinct from the other, However, both dentitions partly share a common period is termed the phase of mixed dentition. In this phase, some of the deciduous teeth and some of the permanent teeth simultaneously exist.

3- Each set of dentition tends to be only present at a certain period of time before or after the phase of mixed dentition. Therefore, the time consumed from the start of deciduous teeth development to the beginning of the permanent teeth development, in which the deciduous teeth predominate, is termed the phase of pure deciduous dentition. Also, the time elapsed between the exfoliation of the last deciduous teeth to the loss of all permanent teeth, in which the permanent teeth predominate, is termed the phase of pure permanent dentition.

4- In respect to the condition by which the teeth exist, the distinction whether the teeth are present intraosseously inside the jaw crypt or appearing in the mouth is determined. The former situation is termed the *developmental condition* while the latter is termed the *clinical condition*.

5- The nomenclature of *developmental dentition* denotes the period of time starting with the commencement of enamel organ development and terminates with the complete root formation. The

observation of this variant of dentition can be partly determined either by radiographic or by postmortem investigations for the unerupted developing teeth and for the growing root of the teeth which have already erupted. However, the teeth in this variant of dentition continue their root development following the eruption event.

6. The nomenclature of *clinical dentition* denotes the period of time starting by the eruption of the crown in the mouth until the ultimate tooth loss. The disappearance of the teeth may occur either physiologically by exfoliation or due to the various environmental influences. The observation of this variant of dentition can be determined clinically, as its name implies, by the naked eyes.

7. The accounting for the time consumed either for the beginning of certain event of odontogenesis, was considered for either the deciduous or permanent dentition as a whole. For instance, it is accounted by the time elapsed from the commencement of enamel organ development of the firstly formed teeth in deciduous dentition, that is, the incisor teeth at about 7 WIU to the lastly developed enamel organ of the maxillary second deciduous molars at about 9 WIU.

The same also was done for accounting the time for the root completion, where the first completely formed roots are those of deciduous incisors at about 1.5 year of age and the last completely formed roots are those of the deciduous second molars at about 3 years of age. So that the time consumed for the developmental deciduous dentition is about 2-3.5 years of age. The same was also followed for the time

consumed with the developmental permanent dentition which may figure about 10.5-16 years of age. The same strategy was also followed for the time consumed with the developmental permanent dentition which may figure about 10.5 -16 years of age.

### **Classification of human dentitions**

The various human dentitions, presumed through the present study, can be mainly classified into chronological and typal ad eitherone has its proper characteristics as follow:

#### **I. Chronological Classification**

1. *Developmental dentition*: it is concerned with the completion of development of either set of teeth, whether they are deciduous or permanent. The developmental dentition would be accounted from the time of start of development of the firstly formed enamel organs in either set of teeth until the time of root completion. This is based on the last tooth to end its root development in that set.

a) *Developmental deciduous dentition*: it begins with the development of enamel organ of the deciduous teeth at 7-9 WIU in their crypts inside the jaw. However, by 1.5-3 years of age the roots of all the deciduous teeth have been completely developed. So, the developmental deciduous dentition may consume about 2- 3.5 years, that is, the time required for completing the development of all deciduous dentition.

b) *Developmental permanent dentition*: it begins with the development of enamel organ of the permanent molars at about 4 MIU - 4 years in their crypts inside the jaw. However, by the time from 10-25 years of age, all the permanent teeth have completely developed their roots. So that the developmental permanent dentition may consume about 10.5-16 years, that is, the time required for the complete development of all permanent dentition.

2. *Clinical dentition*: it is concerned with the period of appearance and maintenance of either set of teeth in the mouth. The clinical dentition, therefore, would be accounted from the start of teeth eruption until their loss by the shedding of deciduous teeth or the extraction of permanent teeth for whatever reason. This can be recorded *clinically* in a contradistinction to the developmental dentition which can be recorded *radiographically* or by the *postmortem investigation*.

a) *Clinical deciduous dentition*: it begins by the eruption of mandibular central deciduous incisors at

6-8 months of age, and the second maxillary deciduous molars at 30 month of age. It ends by about 11 years of age; the time of exfoliation of the last deciduous teeth, that is, the maxillary canines. So, the clinical deciduous dentition may consume about 10.5-8.5 years, that is, the time the deciduous teeth are physiologically represented or remain in the human mouth.

b) *Clinical permanent dentition*: it begins by the eruption of the first permanent molars at about 6 years of age, and ends by the loss of all permanent teeth. However, no definite time can be recorded for the end of the clinical permanent dentition.

#### **II. Typal classification**

1. *Pure dentition*: it refers to the exclusive presence of a certain set of teeth, that is, the deciduous or permanent dentition. The pure developmental dentition only exists in case of the deciduous teeth.

a) *Pure developmental deciduous dentition*: it begins by the development of the deciduous incisor – molar enamel organs at about 7-9 WIU to the commencement of development of the first permanent molar enamel organs at about 4 MIU. Through these two months, intervening these chronological events, only the deciduous enamel organs are seen developing intraosseously in the jaw. Therefore, the time consumed by this variant of dentition is about 2 months..

b) *Pure clinical deciduous dentition*: it begins by the eruption of deciduous incisors at about 6-8 months of age and ends by the eruption of the first permanent molars at about 6 years of age. So, the pure clinical deciduous dentition may consume about 5.5 years, that is, the time thorough which the pure deciduous dentition only appeared in the mouth.

c) *Pure clinical permanent dentition*: it begins at about 11 years of age when all the deciduous teeth are exfoliated by shedding of the maxillary canines, and continues until all the permanent teeth are ultimately lost.

2. *Mixed dentition*: it means the simultaneous presence of the two sets of teeth; the deciduous and permanent. Their existence, however, not only occurs clinically but can also be noted developmentally.

a) *Developmental mixed dentition*: since the developmental dentition is initially concerned with

the enamel organs development. So that the developmental mixed dentition begins at about 4 MIU. At which time, the enamel organs of the first permanent molars are starting their development while the previously developed enamel organs of all the deciduous teeth have already existed inside the jaw. The developmental mixed dentition ends by the complete root formation of the deciduous incisors – molar at 1.5-3 years of age. So that the time consumed for the developmental mixed dentition is about 2-3.5 years.

b) *Clinical mixed dentition:* it occurs as the child reaches the age of 6 years. At this time, the first permanent molars are clinically seen erupting distal to the second deciduous molars. The clinical mixed dentition continues to about the age of 11 years, where the maxillary deciduous canines exfoliate ending the phase of mixed dentition. So that this variant of dentition consumes about 5 years.

### Problems resolved

(1) The nomenclature of the *developmental dentition*, in this classification, denotes and accounts the period of time starting with the commencement of development of enamel organ and ends by the complete root formation. The determination of this variant of dentition can be partly performed either radiographically or by the postmortem analysis, where the developing teeth are initially present intraosseously, and partly by the naked eye following their eruption.

The eruption process may normally intervene between the commencement of enamel organ development and the root completion. So, through the time of developmental dentition, lying between the eruption and the root completion, the crown can be seen clinically while the relative amount of the root formed can be accounted radiographically. Theoretically, it is known that as the tooth erupts, about  $\frac{1}{3}$  to  $\frac{1}{2}$  the normal root length may be formed and may be completed after the eruption of permanent teeth by about 3 years and after the eruption of deciduous teeth by about 1 year.

(2) The forementioned rule was being well applied for accounting the *developmental dentition*, that is , starting with the development of enamel organ and ending with the complete root formation. However, a problem has been encountered, that is, reflected with the incapability of the application of this rule in respect to the developmental mixed dentition as indicated in the following categories:

a) The commencement of the enamel organs development of the deciduous dentition coincides with that of the deciduous incisors at about 7 WIU while it occurs for the enamel organs of the permanent dentition, coinciding with that of the first permanent molars, at about 4 MIU. Thereby, it is apparent, from this presentation, that there is unsharing period between these two chronological ages (Fig.1). This periods, unfortunately, can not be accounted in the domain or the expense of the mixed developmental dentition.

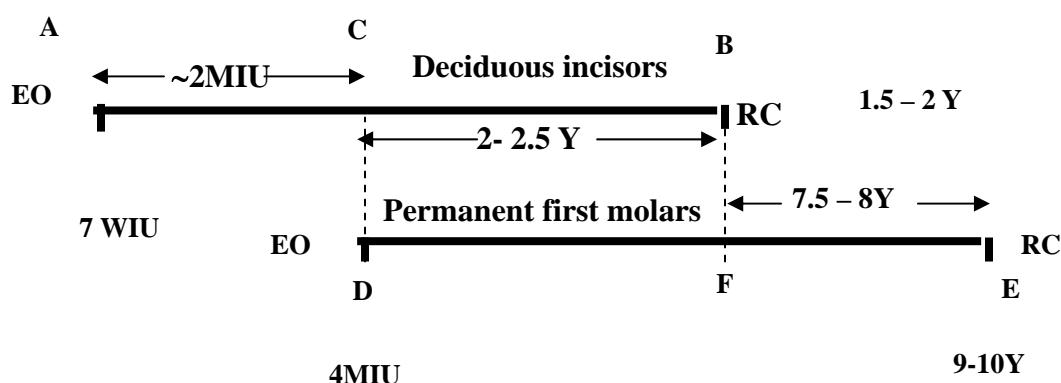

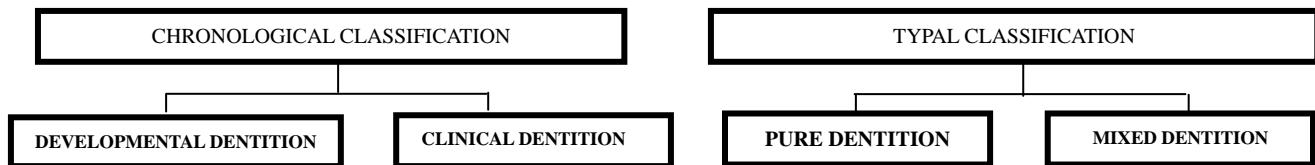

Fig. 1: diagram showing the *sharing periods of time* (2-2.5y) of deciduous dentition (C-B) with permanent dentition (D-F) during developmental mixed dentition. *Unsharing period of time* (A-C) for deciduous dentition occurs between deciduous incisor enamel organs development (A) at 7WIU to first permanent molar enamel organ development (D) at 4MIU. Other *unsharing period of time* (F-E) for permanent dentition occurs between deciduous incisors root completion (B) at 1.5-2 years of age to first permanent molars root completion (E) at 9-10 years of age. Enamel organ (EO) and root completion (RC).

## CLASSIFICATION OF HUMAN DENTITIONS

It denotes the teeth formation from the development of the enamel organ to the root completion

### **1. Developmental deciduous dentition**

- Begins by the development of incisor-molar enamel organs at about 7-9WIU
- Ends by the root completion of incisors-molars at 1.5-3Y.
- The time consumed is about 2-3.5 Y.

It denotes the appearance of teeth in the mouth which begins by the time of teeth eruption to their loss.

### **1. clinical deciduous dention**

- Begins by the eruption of incisors –molars at about 6-30M
- Ends by the shedding of maxillary canine at 11Y
- Time consumed is at about 10.5-8.5Y

It denotes the exclusive presence of one set of teeth, either the deciduous or permanent

### **1. Pure developmental deciduous dentition**

- Begins by development of incisor-molar enamel organs at about 7-9WIU
- Ends by development of the first permanent molar enamel organs at about 4MIU.
- Time consumed at about 2M

It denotes the presence of both the deciduous and the permanent teeth simultaneously

### **1. Developmental mixed dentition**

- Begins by the development of the enamel organ of the first permanent molar at about 4MIU
- Ends by the root completion of the deciduous incisors-molars at about 1.5-2Y
- Time consumed is at about 2-2.5Y.

### **2. Developmental permanent dentition**

- Begins, by the development of the first –third molar enamel organs at 4MIU-4Y.
- Ends by the root completion of the first-third molars at 10-25Y
- Time consumed is about 10.5-16Y

### **2. Clinical permanent dentition**

- Begins by the eruption of the first molars at 6Y
- End by the loss of all the teeth.
- Variable time is consumed.

### **2. Pure clinical deciduous dentition**

- Begins by the eruption of the deciduous incisors at about 6-8M
- Ends by the eruption of the first permanent molars at about 6Y.
- Time consumed is at about 5.5Y.

### **2. Clinical mixed dentition**

- Begins by the eruption of the first permanent molars at 6Y.
- Ends by the shedding of the deciduous maxillary canines at about 11Y
- Time consumed is at about 5Y.

### **3. Pure clinical permanent dentition**

- Begins as all deciduous teeth are exfoliated at about 11Y
- Ends by the ultimate loss of all permanent teeth.
- Variable time is consumed.

M: Month of age

Y: year of age

WIU: week intra-uterine

MIU: month intra-uterine

b) The complete root formation of deciduous dentition, coincident with that of deciduous incisors, ends at 1.5-2 years of age. At which time, the roots of permanent molars, partly sharing the development of deciduous incisors, are not yet completely formed, where their root development completes at 9-10 years of age. Thereby, it is apparent, from this presentation, that there is *unsharing period* between these two chronological ages (Fig.1) This unsharing period, between these two chronological ages, can not be accounted in the domain or in the expense of the mixed developmental dentition.

These dual technical discrepancies were reconciled by regarding the commencement of

developmental mixed dentition, in which the deciduous and permanent dentitions simultaneously develop and share certain period of time, at about 4 MIU meanwhile, the end of root formation for this dentition occurs at about 1.5-3 years of age. This situation will simulate an exclusive exception to the aforementioned rule for accounting of the mixed developmental dentition.

(3) In concern to the accounting of both the timing and the commencement of developmental dentition, which is designated to begin with the enamel organ development and ends by the complete root formation, two approaches have been arised:

• Firstly, *single representation concept*: it considered the start of the developmental deciduous dentition, for instance, with the time of development of the initially formed enamel organ of the deciduous incisor at about 7 WIU as a single representative for the initiation of the deciduous developmental dentition. However, this dentition is presumed to end with the root completion of the second deciduous molar at about 3 years of age. This concept may designate the chronology for the deciduous developmental dentition individually by marking the start of this dentition and its end with either the developmental events for a single tooth.

• Secondly; *dual representation concept* : it considered the beginning of developmental deciduous dentition, for instance, with the initially developed enamel organs of both the deciduous incisors group of teeth and the second molars group at about 7 and 9 WIU, respectively. With the same strategy, the consideration for the end of deciduous developmental dentition was followed. Thereby, the end of this dentition will be represented by the time of complete root formation for both the deciduous incisors and the second molars at about 1.5-2 and 3 years of age, respectively.

• The presumed classification presented, here in this study, has adopted the dual representation concept since it was the more inclusive and representative for the whole dentition in general.

(4) The accounting of time consumed by any variant of dentition is considered by recording the period of time elapsed between the two subsequent chronological events. For instance, throughout the developmental deciduous dentition, the first chronological event is the development of enamel organ for the initially formed teeth, the deciduous incisors, is at about 7 WIU. The subsequent chronological event, that is, the root completion for these incisor teeth occurs at about 1.5 years of age. Accordingly, the time consumed for the developmental dentition is about 2 years. The same strategy was also used for both the deciduous molars and the developmental permanent dentition.

(5) In case of the *clinical permanent dentition*, while it is accounted to begin with the eruption of the first permanent molar, however, there is no expectation for the end /or loss of this dentition. This is due to the absence of an actual expectation for the end of clinical permanent dentition. Crucially, any of the environmental, endocrinological or genetic factors may be highly significant in the determination of the end

of this dentition. These factors are variable between the different individuals and the various communities which certainly influence the timing of loss for the permanent teeth.

(6) Occasionally, some deciduous teeth may abnormally remain orally even after their proper time of exfoliation and so they are traditionally referred to as the *retained teeth*. In the extreme, early eruption of the permanent successors may also be encountered in association with the premature loss of deciduous teeth. All these instances are regarded abnormal departure from the ideal condition and are excluded from the present classification.

(7) Some deciduous teeth have shown a premature root resorption even prior to their complete root formation. Such situational discrepancy in the time of root resorption for deciduous teeth were coinciding with the complete crown formation for their permanent successors. This is based on the concept that the eruptive - resorptive dialogue which denotes and endorses the synchronism between the root resorption and the crown completion. That is to say that immediately after or in association with the crown completion, the root begins to form which per se is coinciding with the start of the pressure-resorption process where the crown of permanent successor contacts the root of deciduous predecessor.

(8) *The pure developmental dentition* exclusively exists in case of the deciduous dentition. In the extreme, no pure developmental permanent dentition does exist. This is due to the initiative and exclusive presence of the developing deciduous teeth while the permanent teeth initiate their development thereafter.

**Abstract:** Recent studies demonstrated a key role of angiogenesis, thrombosis and fibrinolysis in tumour invasion and metastasis. We aimed to clarify the potential link between angiogenic factor {vascular endothelial growth factor (VEGF)}, prothrombotic factor {von Willebrand factor (vWF)} and fibrinolytic markers {tissue plasminogen activator (t-PA), plasminogen activator inhibitor-1 (PAI-1) and D-dimer} with disease progression and metastatic dissemination in bladder cancer patients. The study enrolled forty five bladder cancer patients classified into three groups: 20 patients with locally invasive tumours, 15 patients with regional lymph nodes involvement and 10 patients with distant metastasis. In addition to 15 subjects served as a control group. Enzyme linked immunoassay method was used for measurement of VEGF, vWF, t-PA, PAI-1 and D-dimer. Enhanced angiogenesis was evident by high level of VEGF with subsequent high release of endothelial vWF. Also activation of fibrinolytic system was pronounced by elevated t-PA, PAI-1 and D-dimer. In addition, highest values of these factors were associated with relatively advanced tumour stage, as they showed a significant direct correlation with the stage of bladder cancer. Regression analysis proved that VEGF, vWF, t-PA and D-dimer are independent determinant for the stage of bladder cancer. Conclusion: These results suggest that VEGF, t-PA, PAI-1 and D-dimer are potential prognostic markers in bladder cancer patients. These findings may have future implications for the treatment of patients with metastatic disease.

**Key words:** cancer bladder; vWF; VEGF; t-PA; PAI-1; D-dimer.

## 1. Introduction:

Some haemostasis and angiogenesis-related factors such as platelets, vWF, fibrinogen, PAI-1, D-dimer and VEGF have been highlighted as new potential response and survival predictors in cancer patients<sup>(1)</sup>.

Metastasis is a multi-step process involved in the alterations of cell-cell adhesion, angiogenesis, degradation of extracellular matrix, escape of immune surveillance and cell-matrix adhesion<sup>(2)</sup>. Degradation of extracellular matrix is important for tumour growth and invasion, which in part is regulated by the plasminogen activation system. Cell matrix adhesive interaction plays an important role in the normal organization and stabilization of the cell layer in epithelial tissue. However in tumour cells the adhesive interaction of these cells and the subendothelial matrices is essential for their invasive and metastatic capabilities, and the molecules that mediate this adhesive process may facilitate tumour cells to metastasize<sup>(3,4)</sup>.

Vascular endothelial growth factor (VEGF) is one of the most important angiogenic mediator both in physiological and pathological states<sup>(5)</sup>. Angiogenesis and coagulation system activation are

associated with tumour growth and metastasis<sup>(6)</sup>. Their aberrancies are integral parts of the pathobiology of cancer growth and dissemination<sup>(7)</sup>. We reported previously that enhanced platelet activation in cancer bladder patients associated with release of platelet derived angiogenic factor (VEGF), plays an important role in tumour growth and dissemination<sup>(8)</sup>.

Von Willebrand factor (vWF) is a glycoprotein, synthesized mainly in endothelial cells and in megakaryocytes<sup>(9)</sup>. It mediates the adherence of platelets to subendothelial matrices during vascular-endothelial damage and acts as a carrier protein for coagulation factor VIII<sup>(10)</sup>. Increased plasma vWF have been reported in patients with various types of cancer such as prostate cancer<sup>(11)</sup>, cervical and ovarian carcinoma<sup>(12)</sup>, head and neck cancer<sup>(13, 14)</sup> and colorectal cancer<sup>(1, 15, 16)</sup>. Moreover, high plasma vWF concentrations often correlates with advanced tumour staging and may have prognostic significance in these patients<sup>(11, 12, 13, 14, 15, 16)</sup>.

It has been demonstrated that the fibrinolytic system, in particular the urokinase-type plasminogen activator system (uPA), is involved in the process of

tumour cell invasion and metastasis. uPA binds to the urokinase-type plasminogen activator receptors (uPAR), which is present on tumour cells and monocytes, thus facilitating the conversion of plasminogen to plasmin. Plasmin is a protease not only able to cleave the fibrin network of a clot but also degrades the extracellular matrix, thereby allowing tumour cells and monocytes to invade the extracellular matrix and surrounding tissues<sup>(17, 18)</sup>.

Elevated tumour levels of uPA, uPAR and PAI-1 are associated with poor prognosis in various malignancies, including colorectal cancer<sup>(3, 4, 19, 20)</sup>, bladder and renal cell cancer<sup>(21)</sup>, squamous cell cancer<sup>(22)</sup> and breast cancer<sup>(23, 24, 25)</sup>.

D-dimer is a degradation product of cross-linked fibrin clots and reflects fibrin concentration. D-dimer levels are increased in patients with enhanced fibrin formation and have been reported as sensitive indicators for deep venous thrombosis and pulmonary embolism<sup>(26, 27)</sup>. In addition, preoperative plasma D-dimer level correlates with tumour stage and prognosis for patients with lung cancer<sup>(28, 29, 30, 31)</sup> and colorectal cancer<sup>(32, 33)</sup>.

Von Willebrand factor and other coagulation/fibrinolysis factors should be seriously considered as potential future prognostic and predictive indicators in bladder cancer patients. We aimed to evaluate the level of angiogenic factor (VEGF), coagulation factor (vWF), fibrinolytic parameters (t-PA, PAI-1 and D-dimer) and their possible relation to tumour progression and prognosis in cancer bladder patients. It is hoped that a better understanding of these factors will ultimately lead to the development of more targeted strategies that may have a positive effect on the process of tumour growth and dissemination.

## 2. Patients and Methods:

This study was conducted on forty five patients (32 males and 13 females having mean age of  $63.57 \pm 10.52$ ) with urinary bladder cancer admitted to Urology Department, Theodor Bilharz Research Institute, Giza, Egypt. Results were compared to those of fifteen age and sex matched healthy subjects (10 males and 5 females having a mean age of  $59.71 \pm 10.45$ ) that served as a control group.

The study protocol was approved by the international committee for the protection of human participants and confirmed by the guidelines of the 1975 Declaration of Helsinki.

All studied patients' groups were subjected to detailed history taking, thorough clinical examination, abdominal and pelvic ultrasonography, chest X-ray, Computed Tomography (CT), urine cytology and

histopathological diagnosis of urinary bladder biopsies obtained by cystoscopy.

Accordingly, patients were classified clinically into three groups:

- 20 patients (13 males and 7 females having a mean age of  $62.23 \pm 10.41$ ) with primary locally invasive urinary bladder cancer (de novo urinary bladder carcinoma) with no regional lymph nodes involvement and distant metastasis.

- 15 patients (12 males and 3 females having a mean age of  $63.26 \pm 10.34$ ) with urinary bladder cancer accompanied by regional lymph nodes involvement.

- 10 patients (7 males and 3 females having a mean age of  $65.23 \pm 8.41$ ) with urinary bladder cancer accompanied with regional lymph nodes involvement as well as distant metastasis.

According to the results of the above mentioned investigations for each case, determination of the stage using Tumour-Node-Metastasis (TNM) staging system were done.

Depending on histopathological examination of cystoscopic bladder biopsies, patients were classified into three types:

- 31 out of 45 patients (68.9%) with transitional cell carcinoma.

- 13 out of 45 patients (28.9%) with squamous cell carcinoma.

- 1 out of 45 patients (2.2%) with adenocarcinoma.

For all studied subjects, five ml blood samples were collected under complete aseptic conditions by clean venipuncture without venous stress, samples were distributed into the following tubes:

- One ml blood was collected on EDTA containing tube for complete blood picture.

- Two hundred  $\mu$ l Na citrate (3.8%) containing vacutainer was completed to 2 ml with blood in a ratio of 1:9. Centrifugation at 3000 rpm for 20 minutes was done and plasma samples were separated and preserved in small aliquots and stored at  $-20^{\circ}\text{C}$  for assay of haemostatic parameters (vWF, t-PA, PAI-1 and D-dimer). Two ml of blood was left to stand for clot formation. Serum was separated and divided into small aliquots for assay of liver and kidney function tests and serum level of VEGF.

All individuals were subjected to general investigations including an automated haemogram (using ACT differential, Beckman, France), liver and kidney function tests using autoanalyzer (Hitachi 736, Hitachi, Japan).

Haemostatic parameters were assayed for all studied groups by enzyme immunoassay, including assay of plasma level of vWF (Helena, Laboratories), tPA (Hyphen Biomed, France), PAI-1 (Stago Diagnostica, USA), Plasma D-dimer (Hyphen Biomed, France). In addition, determination of serum level of VEGF was also done by enzyme

immunoassay technique (using R&D System, VEGF, USA). All specific assays were carried out according to manufacturer's guidelines.

#### Analysis of data

SPSS for Windows version 9.0 computer program (SPSS Inc., Chicago, Illinois, USA) was used for statistical analysis. Means of different groups were compared using one-way ANOVA. Pearson correlation coefficient 'r' was used to measure the relationship between two variables. Stepwise multiple regression analysis was employed to evaluate any association between both angiogenic factor (VEGF) and haemostatic parameters (vWF, tPA, PAI-1 and D-dimer) with tumour progression and prognosis (tumour stage and distant spread) in bladder cancer patients. For all tests, a P value of less than 0.05 was considered statistically significant.

#### 3. Results:

The results of studied parameters in patients' and control groups are shown in Table (I). Table (II) shows the result of the studied parameters in control, locally invasive tumours, tumours with LN involvement and tumours with distant metastasis. Cancer Bladder patients showed increased serum angiogenic factor (VEGF) level compared to controls ( $P<0.05$ ). A significant high VEGF level was detected in patients with regional LN involvement compared to those with localized tumours ( $P<0.05$ ). Also a significant high VEGF level was noted in patients with distant metastasis compared to both locally invasive tumours ( $P<0.05$ ) and those with regional LN involvement ( $P<0.05$ ).

Our study showed a significant increase in plasma vWF in patients' groups compared to control group ( $P<0.05$ ). A significant high level was detected in locally invasive tumours compared to control group ( $P<0.05$ ). Also vWF was significantly higher in patients with regional LN involvement compared to both control group ( $P<0.05$ ) and patients with locally invasive tumours ( $P<0.05$ ). In addition, vWF was significantly higher in patients with distant metastasis compared to control ( $P<0.05$ ), locally invasive tumours ( $P<0.05$ ) and tumours with regional LN involvement ( $P<0.05$ ).

Regarding the fibrinolytic system, our data showed a statistical significant difference in patients'

group compared to control group. A significant high plasma level of both t-PA and PAI-1 was observed in locally invasive tumours compared to control group ( $P<0.05$ ). In addition, both t-PA and PAI-1 were significantly higher in tumours with regional LN involvement compared to control ( $P<0.05$ ) and locally invasive tumours ( $P<0.05$ ). Moreover, the highest levels of t-PA and PAI-1 were observed in patients with distant metastasis and their levels were significantly higher compared to control ( $P<0.05$ ), locally invasive tumours ( $P<0.05$ ) and tumours with regional LN involvement ( $P<0.05$ ).

D-dimer level was significantly raised in patients' group compared to control group ( $P<0.05$ ). A statistical significant difference was observed in locally invasive tumours compared to control group ( $P<0.05$ ). Also, a statistical significant rise was detected in tumours with regional LN involvement in comparison to both control ( $P<0.05$ ) and locally invasive tumours ( $P<0.05$ ). In addition, a statistical significant difference was noticed on comparing tumours with distant metastasis with control ( $P<0.05$ ), locally invasive tumours ( $P<0.05$ ) and tumours with LN involvement ( $P<0.05$ ).

Correlation analysis revealed a significant direct correlation between VEGF and vWF ( $r=0.734$ ,  $P<0.05$ ), suggesting the influence of angiogenic factors in increasing the production of endothelial vWF by the newly formed blood vessels. On the other hand, the angiogenic factor (VEGF), procoagulant factor (vWF) and fibrinolytic factors (t-PA and D-dimer) showed a significant direct correlation with the stage of bladder cancer ( $r=0.875$  and  $r=0.579$  respectively). These results give an evidence for the role of angiogenic and haemostatic factors in tumour growth and distant dissemination of malignant tumours (table: III).

Stepwise multiple linear regression analysis revealed that the angiogenic factor (VWGF), haemostatic factor (vWF) and fibrinolytic factors (t-PA and D-dimer) are independent determinant for the stage of bladder cancer tumour ( $f=11.982$ ,  $p=0.000$ ), ( $f=2.456$ ,  $p=0.024$ ), ( $f=4.059$ ,  $p=0.001$ ) and ( $f=12.857$ ,  $p=0.000$ ) respectively. These data give strong evidence for the importance of these parameters as prognostic markers for bladder cancer tumours.

**Table I: Results of studied parameters in control and patients' groups**

		Control Group (n=15)	Patients' Group (n=45)
VEGF (pg/ml)	Mean±S.D. Range	58.93±29.14 10-115	257.77±172.0* 52-762
vWF (%)	Mean±S.D. Range	112.46±16.80 82-130	143.51±34.08* 89-195
tPA (ng/ml)	Mean±S.D. Range	5.7±2.7 3.0-9.0	8.77±3.4.2* 4.5-19.5
PAI-1 (IU/ml)	Mean±S.D. Range	55.30±21.20 34.0-78.0	81.56±16.29* 38.0-180.0

vWF	r=0.427*
tPA	r=0.414*
PAI-1	r=0.113
D-dimer	r=0.579*

\*: Correlation is significant at ( $P<0.01$ )

#### 4. Discussion:

The development of metastasis is a stepwise process that starts when cancer cells separate from a primary tumour, migrate across blood vessel walls into blood stream and disperse throughout the body to generate new colonies. During the transit into the circulating system, tumour cells are exposed to fluid mechanical forces, plasma proteins and the vascular cells such as platelets. All of which may affect their survival and extravasations from the vasculature<sup>(16)</sup>.

As we previously reported<sup>(8)</sup>, our recent study demonstrated a significantly raised serum levels of VEGF in both transitional cell carcinoma and squamous cell carcinoma in comparison to control subjects. Moreover, its level showed a direct correlation with the tumour stage. VEGF has been associated with angiogenesis, lymphangiogenesis and regional lymph node metastasis and was reported to have anti-apoptotic and proliferative role<sup>(34)</sup>. Also Suzuki et al., (2005)<sup>(35)</sup>, reported that VEGF expression is an important predictive factor of pelvic lymph node metastasis in bladder cancer patients.

vWF plays a very important role in the pathogenesis of metastasis, by promoting the binding of tumour cells to platelets, and subsequently, to vascular endothelium<sup>(36, 37, 38)</sup>. The binding of vWF to several types of collagen may contribute to the attachment of platelets to the extracellular matrices of subendothelium, furthermore, a direct interaction between vWF and neoplastic cells has been demonstrated<sup>(39)</sup>. This interaction forms heterotypic cellular emboli, which are not easily recognized by the immune system and have more chance of

attaching to the endothelial surfaces than single tumour cells<sup>(36, 37)</sup>.

Elevated plasma vWF had been reported in different types of cancer. Our study demonstrated a significantly higher plasma vWF levels in bladder cancer patients compared to healthy controls, and the highest levels were observed in patients with metastatic disease. Elevations in vWF plasma levels in disseminated disease reflect the enhancement of angiogenic activity (as evident by high serum VEGF levels and its direct correlation with plasma vWF) to sustain a larger tumour cell burden and the metastatic progression<sup>(15)</sup>. In addition, the release of thrombin by tumour cells may induce vWF production in endothelial cells and enhance the adhesion of tumour cells<sup>(16)</sup>. Furthermore, the metastatic status of these patients may represent an effect of the adhesive property of vWF, which seems to play a crucial role during the course of haematological spread<sup>(16)</sup>. Accordingly, vWF may serve as a potential biological marker of disease progression in these patients.

It is well known that the fibrinolytic system is of importance in inflammation, wound healing and fibrosis development. However, it is also important in the process of tumour invasion and metastasis<sup>(3)</sup>. The present study demonstrated high plasma level of both t-PA and PAI-1 compared to control subjects and the highest levels were reported in patients with distant metastasis.

Numerous independent studies have demonstrated that patients with low levels of u-PA and PAI-1 in their primary tumour tissue have significantly better survival than patients with high levels of either factor<sup>(23, 24)</sup>. Tumour cells can express everything required for regulation of the fibrinolytic pathway on their cell surface. They possess both the urokinase-type (u-PA) and the tissue-type plasminogen activator (t-PA) and can also produce plasminogen activator inhibitor-1 (PAI-1)<sup>(40, 41)</sup>. Indeed, tumour cells are known to carry the specific PA receptors (u-PAR) (CD 87) on their membranes, which can facilitate the activation of the fibrinolytic system<sup>(42)</sup>. Extravasation and intravasation of solid malignant tumours is controlled by attachment of tumour cells to components of the basement membrane and the extracellular matrix, by local proteolysis and tumour cell migration<sup>(17)</sup>. Recent data strongly suggest that the delicate balance between plasminogen activators and their inhibitors plays a role in tumour invasion, tumour cell progression and metastasis and associated with shortened disease free and or overall survival in patients affected with malignant solid tumours. Levels of one or more of these markers have been recognized as predictors of disease-free interval and long-term survival in some patients with malignant disease<sup>(17, 22, 24, 41)</sup>. Moreover,

intravesical administration of PAI-1 significantly inhibits tumour progression in an in vivo model of bladder cancer<sup>(43)</sup>. The above mentioned data clarify the clinical impact of fibrinolytic system in tumour invasion and metastasis, and the future relevance in anti cancer therapy.

Plasma D-dimer levels have been shown to be increased in patients with various solid tumours including lung, prostate, cervical, ovarian, breast and colon cancer<sup>(33)</sup>. An elevated plasma D-dimer level indicates activation of coagulation and fibrinolysis<sup>(32)</sup>. A close interaction exists between venous thromboembolic disease and cancer. In the present study, we demonstrated a high plasma D-dimer level in cancer bladder patients compared to controls. Moreover, its level showed a significant correlation with the stage of the tumour. These data suggest that tumour progression is associated with activation of coagulation and fibrin formation, which is both implicated in cancer proliferation and metastatic dissemination<sup>(44)</sup>. Accordingly, elevated plasma D-dimer might be a sign of poor prognosis and preoperative plasma D-dimer level can be used to predict postoperative survival.

In summary, our data indicates that serum VEGF and plasma vWF, t-PA, PAI-1 and D-dimer levels are elevated in a stage-dependent manner, and higher levels correlate with metastatic diseases. Accordingly, they can serve as potential biological markers of disease progression in bladder cancer patients.

**Abstract:** In this study, the effect of different plant cultivation densities on the oil content and yield of *Foeniculum vulgare* Mill. Cv. Soroksary seeds was studied at the Faculty of Agricultural Sciences and Engineering, Karaj, Iran (Latitude 35° 47' N and Longitude 50° 59' E) in 2008. Five plant spaces studied were 10, 15, 20, 25, and 30 cm and the distance between rows in all treatments was 40 cm using a complete randomized block design with three replicates. According to results, the effect of plant density on oil content and yield was significant ( $P<0.01$ ). The highest oil content (3.33%) and yield per hectare (116.73 liter) was obtained with the lowest plant density. [Jalal Khorshidi, Seyed Fazel Mirahmadi, Mohammad Fakhr Tabatabaei. Oil content and yield of *Foeniculum vulgare* Mill. cv. Soroksary seeds as affected by different plant cultivation densities. Journal of American Science 2010;6(11):1098-1100]. (ISSN: 1545-1003). (<http://www.americanscience.org>).

**Keywords:** *Foeniculum vulgare* Mill. cv. Soroksary; Plant density; Oil content; Oil yield

## 1. Introduction

Fennel (*Foeniculum vulgare* Mill.) is one of the most important medicinal plants, native of Mediterranean regions and belongs to the Apiaceae family (Omidbaigi, 2007). The plant has abundant applications in various industries; for instance, the essential obtained from seeds is added to perfumes, soaps, pharmaceuticals and cosmetics. Fennel oil, seeds or extracts are also used to flavor prepared foods including meats, ice cream, candy, baked goods and condiments. Recent studies have shown that essential oil of this plant can be used as an valuable antioxidant, antibacterial and antifungal agent (Lucinewton et al., 2005).

One of the major restraints in crop production is improper crop spacing in the field (Dupriez and Deleener, 1989). The effect of spacing on growth and secondary metabolites is largely due to change in the interception of radiant energy (Yao and Shaw, 1964). When crops are overcrowded, there will be competition. In the wider spacing, plants have more nutrition, water and air, but in the narrower spacing, they have restricted conditions for development (Ozar, 2003). Plant density is one of the most important factors affecting yield, yield components, oil and essential oil in medicinal plants. Masood et al (2004) investigated the effect of row spacing (40, 50, 60, and 70 cm) on morphological characters and seed yield of fennel and reported that the highest plant height, seed yield per bed, and seed yield per hectare were obtained with the lowest row spacing. Najafi and Moghadam (2002) reported that with increase in the plant density seed and biological yield increased. Arabaci and Bayram (2004) reported

that the highest effective substances yield in the Basil (*Ocimum basilicum* L.) was obtained in lower plant density. The maximum oil percentage and oil yield in Coriander (*Coriandrum sativum* L.) were obtained in density 30 plant per m<sup>2</sup> (Masood et al., 2004).

The objective of this study was to evaluate the percentage variation and oil yield of *Foeniculum vulgare* Mill. cv. soroksary in different plant population densities.

## 2. Material and Methods

A field study was conducted at the Faculty of Agricultural Sciences and Engineering, Karaj, Iran (Latitude 35° 47' N and Longitude 50° 59' E) to determine the effect of different plant cultivation densities on the oil content and yield of *Foeniculum vulgare* Mill. cv. Soroksary seeds in 2008. Results of soil analysis are shown in (Table 1). Experiment was conducted based on completely randomized block design with three replicates and five plant densities. The plot size was 2.5x1.5m. The distance between blocks and plots were 1m. Five plant spaces studied were 10, 15, 20, 25, and 30 cm. The distance between rows in all treatments was 40 cm. Each plot consisted of five rows. The bitter fennel seeds were sown on the 7th March 2008.

The following irrigation regime was followed;

1. 2-3 day's interval irrigation until germination stage,
2. 4-5 day's interval irrigation from germination to appearance of first flowers stage,

3. 7 days interval irrigation from appearance first flowers to harvest stage.

Thinning was done when plants had 4-5 leaves. All agronomic practices were kept for all the treatments. The seeds were harvested twice after ripening (20th August and 30th August) and dried in a shade for 72 hours. Afterwards, 15 grams of seeds were powdered and their oil content was extracted using a soxhlet apparatus with hexane solvent method (Laurence, 1999). After isolation, the oil was purified in a rotary vacuum evaporator apparatus (Buchi, Switzerlan).

Data collected were analyzed using Duncan Multiple Range Test (Duncan, 1955) and statistical software (SPSS).

Table 1. Results of soil analysis

Soil sample	Properties
pH (in 2:1 water)	8.1
Sand (%)	30
Clay (%)	32
Silt (%)	38
Ca (g/kg)	293
Fe (mg/kg)	12.1
Organic matter (g/kg)	0.78
N (g/kg)	0.092
P (cmol/kg)	12.83
K (cmol/kg)	305

### 3. Results

Results of present study showed that the oil content and yield of seeds was affected by change in plant density. With increasing spaces between plants, the oil content of seeds was increased but the pattern of oil yield changes was irregular. Generally with increase in spaces between plants, the oil percentage increased significantly ( $P<0.01$ ).

The maximum oil percentage (3.33%) and yield (116.73 Lit/he) were obtained in the lowest plant density. While the minimum oil percentage (1.33%) was obtained in the highest plant density and the minimum oil yield (65.27 Lit/he) was obtained in 15cm space between plants (Fig 1 and Fig 2).

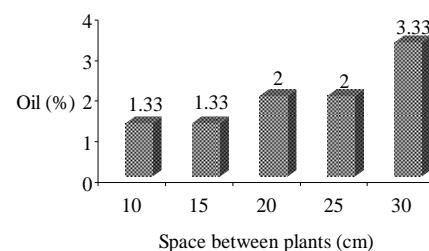

Fig 1. Relationship between plant density and oil percentage

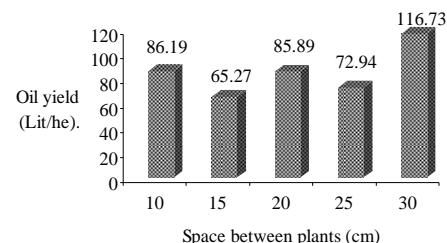

Fig 2. Relationship between plant density and oil yield

Comparison of treatments indicated that there was no significantly difference in the oil percentage between 10 and 15 cm of plant densities. Similarly, there was no significantly difference in the oil percentage between 20 and 30 cm of plant densities (Table 2).

Table 2. Oil content and yield of seeds in different plant cultivation densities

Space between Plants (cm)	Oil content (%)	Oil yield (Lit/he)
10	1.33a	86.19c
15	1.33a	65.27a
20	2b	85.89c
25	2b	72.94b
30	3.33c	116.73d

Different letters in each column indicating significant difference at  $P<0.01$

### 4. Discussions

These results are in agreement with findings Akbarinia et al (2006), and Ozer (2003). The studies in most plants have shown that plant density is an important factor affecting on yield. In the lower plant density, plants have more nutrition, water and air, and therefore have the better growth and finally produce the higher yield. But in the lower plant density, they have restricted conditions for development and thus produce the lower yield. In conclusion, to reach the

maximum oil yield of *Foeniculum vulgare* Mill. cv. Soroksary, the minimum plant density is suggested.

In this study, increases observed in the yield of seeds can be attributed to the better growth of plants and subsequently the better canopy development which led ultimately to the better use of solar irradiance and higher photosynthesis. Considering the significant effect of different plant cultivation densities, it can be argued that seed yield increases in suitable plant densities are due mainly to production of more seeds in each umbel. In other words, plant density by affecting the absorption of nutrients and exposure of the plant to the light can affect the photosynthesis rate and production of oil content.

## Cyanobacteria of a Tropical Lagoon, Nigeria.

Adesalu, Taofikat Abosede<sup>1</sup>, Nwankwo, Dike Ikegwu.<sup>2</sup>

<sup>1</sup>Department of Botany and Microbiology, University of Lagos, Nigeria.

<sup>2</sup>Department of Marine sciences, University of Lagos, Nigeria.

[boseadesalu@yahoo.com](mailto:boseadesalu@yahoo.com).

**Abstract:** Investigations for the first time into the blue green algae of Lekki lagoon were carried out for 24 months (June 2003- May 2005) at monthly intervals using standard plankton net of mesh size 55µm. One hundred and seventy nine species belonging to thirty genera were observed. The filamentous blue green algae *Oscillatoria* formed the most abundant genus making up twenty three species followed by *Phormidium* eighteen species. *Anabaena* and *Chroococcus* recorded thirteen species each while the genera, *Gleocapsa*, *Merismopedia* and *Microcystis* recorded ten, eight and twelve species respectively. Only one genus each of *Cyanosarcina*, *Calothrix* and *Scytonema* were encountered. Bloom forming species identified were *Microcystis aeruginosa*, *M. flos-aquae*, *M. wesenbergii* and *Anabaena flos-aquae*. In this study, thirty-nine new species were recorded for Lagos lagoon complex in which Lekki lagoon is one of it while *Cyanosarcina hueberliorum* is new record for Nigeria.

**Key words:** Cyanophytes, tropical, bloom, Lagos lagoon complex

### Introduction

The coastline of South Western Nigeria is a meandering network of lagoons and creeks of which Lagos lagoon with an area of 208sqkm is the largest (Nwankwo 1989). The geography and hydrology of various parts of Lagos lagoon complex in which Lekki lagoon is one it have been described by several workers. These include Lekki lagoon (Ikusemiju 1973); Lagos lagoon (Hill and Webb 1958) and harbour (Olaniyan 1957). Checklists of planktonic algae in some parts of Nigeria have been documented by different workers. For instance in the North, Holden and Green (1960) studied the phytoplankton of River Sokoto while Khan and Agugo (1990) studied Kongiri dam, Jos mine lakes was studied by Anadu et al. (1990).

In Southern region, studies include Opute (1990,1991,1992) who studied Warri Forcados estuary phytoplankton, New Calabar river by Nwadiaro and Ezefili (1986). Biswas (1984, 1992) had report for eastern region while western region reports include that of Imevbore (1968) on Eleiyele reservoir, Egborge and Sagey (1979) on Ibadan freshwater ecosystem . Nwankwo (1988) studied the planktonic algae of Lagos lagoon, Nwankwo (1993) reported eight cyanobacteria bloom species of coastal waters in South Western Nigeria excluding Lekki lagoon, Nwankwo (1997) reported dinoflagellates list of Lagos lagoon. Adesalu and Nwankwo (2005, 2009) reported the diatoms of Olero creek and Lekki lagoon respectively, Wujek et al. (2003) studied the chrysophytes of Lekki lagoon while Kadiri (1989, 1993, 1999, 2000) reported the rich flora of

*Micrasterias*, desmids, algae composition and euglenoids of Ikpoba reservoir respectively.

Of the entire aforementioned checklist, none specifically reported the cyanobacteria checklist in Nigeria coastal waters. The present study was undertaken to investigate the composition of cyanobacteria species of Lekki lagoon for possible biological monitoring since the lagoon is a source of fish supply for people of South Western states and beyond.

### Description of study area

Lekki lagoon (Fig.1) a large expanse of shallow freshwater extends between Lagos and Ogun states. It covers an area of about 247km<sup>2</sup>. A greater part of the lagoon is shallow (<3.0 m), while some areas are up to 6.4m deep. It lies between longitudes 4°00' E and 4°12' E and latitude 6°25' N and 6°37' N. The lagoon is fed by river Oni in the north eastern part, while rivers Osun and Saga flow into the north western part. Two peaks of rainfall are associated with this lagoon, a major peak in July and a lesser peak in September. There are two peaks of sunshine hours which approximately correspond to the equinoxes. The mainstay of communities that live around this environment is artisanal fishing.

### Materials and methods

#### Collection of sample

Biological samples were collected monthly from twelve stations (Table 1) using Hydrobios plankton net of 55µm mesh size. For quantitative analysis

5litres of the water was concentrated. Biological samples were preserved in 4% unbuffered formalin. Identification was done using Olympus BX51 photomicroscope. Water samples were collected into clean plastic containers for chemical analysis while *in situ* measurements of temperature, transparency, pH and depth were made.

#### Physical and chemical analysis of water sample

The methods described by America Public Health Association (APHA 1998) were used for physical and chemical analysis. The air and surface water temperature were measured *in situ* with a simple mercury thermometer while the transparency was measured using a 20cm diameter Secchi disc. The depth was measured with a calibrated pole and the water pH determined using a Phillips pH meter (Model PW950). The chemical factors determined include Salinity, conductivity, dissolved oxygen (DO) and biological oxygen demand (BOD<sub>5</sub>). Salinity was determined using the Silver Nitrate Chromate titration method as described by Barnes (1980) while Dissolved oxygen content was determined using a Griffin oxygen meter. Oxygen saturation was recorded in percentage. Biological Oxygen Demand is the measure of the amount of dissolved oxygen that could be depleted from the water body during natural biological assimilation or degradation of organic compounds by the organisms present especially bacteria. This was done after the dissolved oxygen had been measured using the standard method of biochemical consumption of oxygen in 5 days at 20°C while conductivity was

determined using the HANNA instrument (H18733), a wide range conductivity meter that has salinometer range in  $\mu\text{S}$ . Conductivity values were recorded as  $\text{mScm}^{-1}$  at  $25^\circ\text{C}$  (APHA 1998). The department The Federal Meteorological Department, Oshodi, Lagos kindly provided rainfall and sunshine hours data for the period of investigation (Table 2).

### Nutrient determination

For nitrate determination, Hach Cadmium reduction method was used (APHA 1998). Phosphate-phosphorus is known to be important in a number of ways, one being that it facilitates the uptake of nitrogen. It was determined by ascorbic acid method. The values obtained were recorded in milligrams per litre ( $\text{mgL}^{-1}$ ) (APHA 1998) (Table 2).

### Water chemistry

The physical and chemical characteristics of the study area are presented in Table 2. The mean pH of the water with a range of 7.41-7.46 indicated that the system is highly buffered. Conductivity which is the numerical expression of the ability of a solution to carry an electric current represents the total ions of water ranged between 0.47-0.56  $\mu\text{Scm}^{-1}$  the lowest value for phosphate-phosphorus, nitrate-nitrogen and sulphate were 2.42, 2.70 and 0.002  $\text{mgL}^{-1}$ . Salinity recorded the least value of 0.40‰ while chloride ion had the highest value of 10.00  $\text{mgL}^{-1}$ .

## Results

### Cyanobacteria analysis

In this study, cyanobacteria genera are arranged alphabetically within families and the species in alphabetical order within genera (Table 3).

**Table 3: Cyanobacteria checklist at Lekki lagoon, Nigeria.**

#### Division : Cyanophyta

#### Class : Cyanophyceae

#### Order: Chroococcales

##### Family 1: Chroococcaceae

*Chroococcus decorticans*

*C. dispersus* (V.Keiss) Lemm.

*C. limnecticus* Lemm.

\**C. limnecticus var. subsalsus* Lemm.

*C. minor*

*C. minutus* (Kutz.) Rabenh.

*C. palidus* Nageli

*C. prescottii* Dr. & Daily

*C. turgidus* (Kutz.) Lemm.

*C. turicensis* (Nag.) Hangirg

*C. varius* A. Braun

*Chroococcus* sp 1

*Chroococcus* sp 11

\**Cyanosarcina huebeliorum* Komarek & Anagnostids

*Dactylococcopsis raphidioides* Hansg.

*D. smithii* Chodat & Chodat

*Dactylococcopsis* sp.

##### Family 2: Merismopediaceae

*Agmenellum quadruplicatum*

*Agmenellum* sp.

*Aphanocapsa delicatissima* West & West

*A. elaschista* West & West

*A. elachista var conferta* West & West

\**A. nubilum* Nygaard

*A.pulvrea*

*A. rivularis*

#### *Aphanocapsa* sp.

\**Aphanothece bullosa* var *major* Geitler

*Aphanothece* sp.

*Merismopedia angularis* Geitler

*M. convoluta* Breb.

*M. elegans* A.Br.

*M. glauca* (Ehr.) Nag.

*M. major* G.M.Smith

*M. marsonii* Lemm.

*M. punctata* Meyen.

*M. tenuisima* Lemm.

#### Family 3: Chaemasiphonaceae

*Clastidium setigerum*

*Clastidium* sp.

#### Family 4: Microscystaceae

\**Gleocapsa alpicola* (Lyng.) Bornet

\**G. arenaria* (Hass.) Rabenh.

*G. biformis* Novacek

*G. compacta* Kutz.

*G. conglomerata* Kutz.

\**G. decorticans* (A.Br.) P.Richter

*G. delicatissima*

*G. magma* (Breb.) Kutz.

*G. quarternata* (Breb.) Kutz

*Gleocapsa* sp.

*Gleothece heufleri*

*Gleothece linearis* Nag

*Gleothece* sp.

*Microcystis aeruginosa* Kutz.

*M. aeruginosa* var *elongata* Rao,C.B

\**M. aeruginosa* var *major* (Witt.) Smith

*M. elongata* sp.nov.

\**M. firma* (Kutz.) Dr. & Daily

*M. flos-aquae* (Witt.) Kirchner

*M. paludosus*

\**M. pulvrea* (Wood) Forti

\**M. ramosa* Bharadwaja

\**M. robusta* (Clack) Nygaard

*M. viridis* (A. Br.) Lemm.

*M wesenbergii* Kosinskaja

#### Order 2: Nostocales

##### Family: Nostocaceae

*Anabaena azollae* Strasburger

*A. circinalis* (Kutz.) Rabh.

\**A. confervoides* Reinsch

*A. constricta* Lauter b.

*A. cycadeae* J.Reinsch

*A. cylindrica* Lemmermann

*A. fircinalis*

*A. flos-aquae* (Lyng.) Breb.

- A. limnectica* G.M.Smith  
*A. spiroides* Lemm.  
*\*A. torulosa* (Carm.) Lagerh.  
*Anabaena* sp.1  
*Anabaena* sp 11  
*Aphanabaena* sp  
*Calothrix* sp  
*Cylindrospermum catenatum* Ralfs  
*Cylindrospermum majus* Kutz.  
*Cylindrospermum* sp 1  
*Nostoc carneum*  
*Nostoc linkia*  
*N. muscorum* Agardh  
*N. peltigerae* Letellier  
*N. sphaericum* Vauch.  
*Nostoc* sp.1  
*Nostoc* sp 11  
**Order 3: Oscillatoriales**  
**Family 1: Oscillatoriaceae**  
*Lyngbya birgei* G.M.Smith  
*L. contorta* Lemm.  
*\*L. lagerheimia* (Mobius) Gom.  
*L. limnectica* Lemmermann  
*\*L. martensiana* Menegh.  
*L. versicolor* (Wattman)Gomont  
*Lyngbya* sp  
*Oscillatoria acuminata* Gomont  
*O. acutissima* Kufferath  
*O. agardii* Gomont.  
*O. angustissima* West & West  
*O. articulata*  
*O. brevis* Kutz.  
*O. curviceps* Agardh  
*O. formosa* Bory.  
*\*O. formosa f. edaghica* Novickova  
*O. germinata* Meneghini  
*O. lacustris*  
*\*O. lemmermanni* Wolosz  
*O. limnectica* Lemm.  
*O. limosa* (Roth) Ag.  
*O. margaritifera* Kutzing (Gomont)  
*O. minima*  
*O. planctonica* Wolosz  
*\*O. rubescens* DC ex Gomont  
*O. sancta* (Kutz.)Gom  
*\*O. simplissima* Gomont.  
*O. subrevs* Schmidle  
*O. tenuis* Ag.  
*Oscillatoria* sp.  
**Family 2:Phormidiaceae**
- Arthrospira fusiformis* Fott & Karim  
*Arthrospira* sp.  
*Microcoleus codii* Fremy  
*M. subtorulosus*  
*M. willeana*  
*Microcoleus* sp.1  
*Microcoleus* sp 11  
*Phormidium angustissimum* West & West  
*\*P. caerulescens* Geitler  
*\*P. chlorinum* Komarek  
*P. cortianum*  
*P. crouanii* Gomont  
*P. foveolarum* (Mont.) Gomont  
*\*P. insigne* Skuja  
*\*P. laetevirens* Skuja  
*P. luridum* (Kutz.) Gomont  
*\*P. luteum* Kosinskaja  
*\*P. molle* Palik  
*P. nigro-viride* Gomont  
*\*P. papyraceum* (Ag.) Gom.  
*P. retzii* (Ag.) Gomont  
*P. tenue* (Menegh.)Gom.  
*P. tinctorium* Kutz.  
*Phormidium* sp 1  
*Phormidium* sp 11  
*\*Plantothrix clavarata* Skuja  
*\*P. cryptovaginata* Skacelova & Komarek  
*\*P. isothrix* Komarek  
*P. minor*  
*P. planctonica*  
*Plantothrix* sp1  
*Plantothrix* sp 11  
*Trichodesmium laucustre* Klebahn  
*Trichodesmium* sp.  
**Family 3:Pseudanabaenaceae**  
*\*Limnothrix planctonica* Geitler  
*Limnothrix* sp.  
*\*Pseudoanabaena curta* Hollerbach  
*\*P. moniliformis* Komarek & Kling  
*\*P. thermalis* Anagnostidis  
*Pseudoanabaena* sp  
*Spirulina filiformis*  
*S. princeps* W.et G.S.West  
*S. major* Geitler  
*S. meneghiniana* Anagnostidis  
*S. tenerima*  
*Spirulina* sp 1  
*Spirulina* sp 11  
*\*Leptolyngbya hypolimnectica*  
*\*Leptolyngbya ocricana* Cardo

*L. tenuis*

*Leptolyngbya* sp.

\**Plantolyngbya brevicellularis* Cronberg

&Komarek

\**P. minor* Komarek&Cronberg

\**P. tallingii* Komarek & Kling

\**P. minor*

*Planktolyngbya* sp.

#### Family:Schizotrichaceae

*Schizothrix pulvinata*

*S. friesii* (Ag.) Gomont

*Schizothrix* sp.

*Scytonema* sp.

#### Discussion

The cyanobacteria checklist reflects the influence of hydrological conditions of this area. The dominance of *Oscillatoria* throughout the season could be a pointer that the hydrology and salinity of the studied area favours its growth. The particular high diversity of blue-green observed in the lagoon could also be that the water chemistry favours growth of cyanophytes. Five bloom forming cyanophytes identified in this study include *Microcystis aeruginos*, *M. wesenbergii*, , *Anabaena flos-aquae*, *A. spiroides* and *Oscillatoria formosa*.

The variation in physical and chemical parameters observed during the study period may be as a result of the influence of weather conditions. For instance, the rainy season occurring between June and October, characterized by low transparency and pH; increased total suspended solids, higher turbidity and increased flood water condition which might have initiated stressful environmental condition and these conform with Dart and Stretton (1980) who stated that variations in water temperature could cause alterations in the pH due to changes in ionization and increased solubility or precipitation of bottom deposits. Nwankwo and Onitiri (1992) also pointed out that it is possible that rainfall triggers off flood situations which usually increases total solids, reduces transparency and consequently light penetration and also dislodges attached algal forms. The phytoplankton community and the physico-chemical parameters exhibited seasonal changes closely related to the pattern of rainfall. The presence or absence of any blue-green species may be due to the changing physical environment other than pollution (Nwankwo 1994).

# *The Journal of American Science*

ISSN: 1545-1003

The international academic journal, "*The Journal of American Science*" (ISSN: 1545-1003), is registered in the United States, and invites you to publish your papers.

Any valuable papers that describe natural phenomena and existence or any reports that convey scientific research and pursuit are welcome, including both natural and social sciences. Papers submitted could be reviews, objective descriptions, research reports, opinions/debates, news, letters, and other types of writings that are nature and science related. All the manuscripts will be processed in a professional peer review. After the peer review, the journal will make the best efforts to publish all the valuable works as soon as possible.

Here is a new avenue to publish your outstanding reports and ideas. Please also help spread this to your colleagues and friends and invite them to contribute papers to the journal. Let's work together to disseminate our research results and our opinions.

Papers in all fields are welcome, including articles of natural science and social science.
