# The Journal of American Science

The *Journal of American Science* is an international journal with a purpose to enhance our natural and scientific knowledge dissemination in the world. Any valuable paper that describes natural phenomena and existence or any reports that convey scientific research and pursuit is welcome. Papers submitted could be reviews, objective descriptions, research reports, opinions/debates, news, letters, and other types of writings that are nature and science related. All the manuscripts will be processed in a professional peer review. After the peer review, the journal will make the best efforts to publish all the valuable works as soon as possible.

**Editor-in-Chief:** Hongbao Ma ([mahongbao@gmail.com](mailto:mahongbao@gmail.com))

**Associate Editors-in-Chief:** Shen Cherng ([cherng@msu.edu](mailto:cherng@msu.edu)), Jingjing Z Edmondson ([jjedmondso@gmail.com](mailto:jjedmondso@gmail.com)), Qiang Fu ([fujiang@neau.edu.cn](mailto:fujiang@neau.edu.cn)), Yongsheng Ma ([ysma66@163.com](mailto:ysma66@163.com))

**Editors:** George Chen ([chengu@msu.edu](mailto:chengu@msu.edu)), Mark Hansen, Mary Herbert, Wayne Jiang ([jiangwa@msu.edu](mailto:jiangwa@msu.edu)), Chuan Liang, Mark Lindley, Margaret Ma, Mike Ma, Jagmohan Singh Negi ([negi\\_js1981@yahoo.co.in](mailto:negi_js1981@yahoo.co.in)), Da Ouyang ([ouyangda@msu.edu](mailto:ouyangda@msu.edu)), Xiaofeng Ren, Ajaya Kumar Sahoo, Shufang Shi, Tracy X Qiao, Pankaj Sah, George Warren, Qing Xia, Yonggang Xie, Shulai Xu, Lijian Yang, Yan Young, Mona Saad Ali Zaki ([dr\\_mona\\_zaki@yahoo.co.uk](mailto:dr_mona_zaki@yahoo.co.uk)), Tina Zhang, Ruanbao Zhou, Yi Zhu

**Web Design:** Jenny Young

## Introductions to Authors

### 1. General Information

**(1) Goals:** As an international journal published both in print and on internet, *The Journal of American Science* is dedicated to the dissemination of fundamental knowledge in all areas of nature and science. The main purpose of *The Journal of American Science* is to enhance our knowledge spreading in the world. It publishes full-length papers (original contributions), reviews, rapid communications, and any debates and opinions in all the fields of nature and science.

**(2) What to Do:** *The Journal of American Science* provides a place for discussion of scientific news, research, theory, philosophy, profession and technology - that will drive scientific progress. Research reports and regular manuscripts that contain new and significant information of general interest are welcome.

**(3) Who:** All people are welcome to submit manuscripts in any fields of nature and science.

**(4) Distributions:** Web version of the journal is opened to the world. The printed journal will be distributed to the selected libraries and institutions. For the subscription of other readers please contact with: [editor@americanscience.org](mailto:editor@americanscience.org) or [americansciencej@gmail.com](mailto:americansciencej@gmail.com) or [editor@sciencepub.net](mailto:editor@sciencepub.net)

**(5) Advertisements:** The price will be calculated as US\$400/page, i.e. US\$200/a half page, US\$100/a quarter page, etc. Any size of the advertisement is welcome.

### 2. Manuscripts Submission

**(1) Submission Methods:** Electronic submission through email is encouraged and hard copies plus an IBM formatted computer diskette would also be accepted.

**(2) Software:** The Microsoft Word file will be preferred.

**(3) Font:** Normal, Times New Roman, 10 pt, single space.

**(4) Indent:** Type 4 spaces in the beginning of each new paragraph.

**(5) Manuscript:** Don't use "Footnote" or "Header and Footer".

**(6) Cover Page:** Put detail information of authors and a short title in the cover page.

**(7) Title:** Use Title Case in the title and subtitles, e.g. "**Debt and Agency Costs**".

**(8) Figures and Tables:** Use full word of figure and table, e.g. "**Figure 1. Annual Income of Different Groups**", **Table 1. Annual Increase of Investment**".

**(9) References:** Cite references by "last name, year", e.g. "(Smith, 2003)". References should include all the authors' last names and initials, title, journal, year, volume, issue, and pages etc.

### Reference Examples:

**Journal Article:** Hacker J, Hentschel U, Dobrindt U. Prokaryotic chromosomes and disease. *Science* 2003;301(34):790-3.

**Book:** Berkowitz BA, Katzung BG. Basic and clinical evaluation of new drugs. In: Katzung BG, ed. *Basic and clinical pharmacology*. Appleton & Lange Publisher. Norwalk, Connecticut, USA. 1995:60-9.

**(10) Submission Address:** [editor@sciencepub.net](mailto:editor@sciencepub.net), Marsland Company, P.O. Box 21126, Lansing, Michigan 48909, The United States, 517-980-4106.

**(11) Reviewers:** Authors are encouraged to suggest 2-8 competent reviewers with their name and email.

### 2. Manuscript Preparation

Each manuscript is suggested to include the following components but authors can do their own ways:

**(1) Title page:** including the complete article title; each author's full name; institution(s) with which each author is affiliated, with city, state/province, zip code, and country; and the name, complete mailing address, telephone number, facsimile number (if available), and e-mail address for all correspondence.

**(2) Abstract:** including Background, Materials and Methods, Results, and Discussions.

**(3) Key Words.**

**(4) Introduction.**

**(5) Materials and Methods.**

**(6) Results.**

**(7) Discussions.**

**(8) References.**

**(9) Acknowledgments.**

1	<p><b>Indirect Boundary Element Method for Calculation of Compressible Flow past a Symmetric Aerofoil with Linear Element Approach Using Doublet Distribution Alone</b></p> <p>Muhammad Mushtaq* &amp; Nawazish Ali Shah</p> <p>Department of Mathematics, University of Engineering &amp; Technology Lahore – 54890, Pakistan</p> <p>Corresponding Author, e-mail: mushtaqmalik2004@yahoo.co.uk</p> <p><b>Abstract:</b> In this paper, an indirect boundary element method is applied to calculate the compressible flow past a symmetric aerofoil. The velocity distribution for the flow over the surface of the symmetric aerofoil has been calculated with linear boundary element approach using doublet distribution alone. To check the accuracy of the method, the computed flow velocity is compared with the exact velocity. The comparison of these results has been given in the tables and graphs. It is found that the computed results are in good agreement with the analytical results. [Journal of American Science. 2010;6(11):1-9]. 2	<p><b>Use of Long Yam Bean (<i>Sphenostylis stenocarpa</i>) as Soil Amendment for the Growth, Leaf Chemical Composition and Yield of White Yam (<i>Dioscorea rotundata</i> L)</b></p> <p>Emmanuel Ibikunoluwa Moyin-Jesu<sup>1</sup> and Francis Omotayo Adekayode<sup>2</sup></p> <p><sup>1</sup>Agronomy Department, Federal College of Agriculture Akure, Nigeria</p> <p>moyinjesu2004@yahoo.com</p> <p><sup>2</sup>Department of Crop, Soil and Pest Management, Federal University of Technology, Akure, Nigeria.</p>	Full Text 2

**Abstract:** An experiment was carried out to investigate the use of long yam bean (*Sphenostylis sternocarpa*) as soil amendment for the growth and yield of white yam (*Dioscorea rotundata L*) between 1999 and 2003 at Akure in the rain forest zone of Nigeria. There were four treatment namely; NPK 15 – 15 – 15 fertilizer applied at 250kg/ha, poultry manure at 6 t/ha, long yam beans planted at two seeds per hole at a spacing of 1m x 0.5m between rows of yam plots (soil amendment) and a control (no fertilizer). The treatments were arranged in a randomized complete block design (RCB) and replicated five times. The soil analyses before planting and after harvesting were carried out. Each plot size is 4m x 4m (16m<sup>2</sup>). The growth parameters measured for the yam were vine length (cm), leaf population and stem girth (cm). At harvest, yam tuber weight (kg), tuber length (cm) tuber girth; root length and seed yield of long yam bean plants were determined. The leaf and soil N, P, K, Ca, Mg, pH and organic matter contents were also analysed at end of the experiment. The results showed that there were significant ( $p<0.05$ ) increases in the vine length, leaf population, stem girth, tuber weight, tuber length, tuber girth, soil and leaf N, P, K, Ca, Mg; pH and organic matter of white yam cultivated under the different fertilizer treatments compared to the control treatment. Long yam bean plants used as soil amendment increased the yam vine length, stem girth, leaf population, tuber weight, tuber length and tuber girth by 81%, 88.4%, 69.5%, 88.97%, 76% and 94% compared to the control. The same treatment (long yam bean plants) also increased the leaf population, tuber weight, tuber length and tuber girth of yam by 11%, 31%, 30% and 55% respectively compared to NPK fertilizer treatment. Long yam plants also increased the soil pH, O.M, K, Ca and Mg by 29%, 92%, 97%, 86%, 96%, 97% and 89% respectively compared to the control treatment. It increased soil pH, organic matter, K Ca and Mg by 31%, 87%, 1.42, 98% and 98.5% compared to NPK fertilizer. Long yam plants gave seed yield of 2.3 t/ha and produced yam tuber yield of 4900kg/ha amounting to \$6,050 compared to \$3453.00 and \$3,380.00 estimated on yam yields alone under poultry manure and NPK fertilizer treatments. Finally, the use of long yam bean plants as biological fertilizer source for yam production could substitute for 250kg/ha NPK fertilizer and 6t/ha poultry manure. [Journal of American Science. 2010;6(11):10-17]. (ISSN: 1545-1003).

#### Biochemical and Molecular Profiles of Gibberellic Acid Exposed Albino Rats

Hanan A.E.Soliman<sup>1</sup>; Mona M. Mantawy<sup>2</sup> and Hany M. Hassan<sup>3</sup>

<sup>1</sup>Chemistry Departement, Biochemistry Branch, Faculty of Science, Beni suef University, Egypt. <sup>2</sup>; Department of Medicinal chemistry , National Research Center, Dokki , Egypt and <sup>3</sup> Immunobiology and immunopharmacology unit , Animal Reproduction Research Inst., Giza , Egypt

3

**Abstract:** The present study casts the light on the influence of the plant growth regulator, Gibberellic acid (GA3), on antioxidant defense systems [glutathione peroxidase, superoxide dismutase (SOD), and catalase (CAT)], lipid peroxidation level (malondialdehyde = MDA), AST, ALT , alkaline phosphatase, creatinine, total protein , albumin globulin , total lipids , total cholesterol, calcium and glucose . Moreover, histopathological examination of kidney and liver was done. On the molecular level, the DNA damage was determined. The rats were received 75 ppm of GA3 in drinking water ad libitum for 50 days. Gibberellic acid (GA3) treatments caused different effects on the estimated parameters compared to control. Gibberellic acid exposure induced significant elevations of plasma AST, ALT, alkaline phosphatase, creatinine and malondialdehyde. However, Gibberellic acid produced non significant alterations in plasma total protein, albumin globulin, total lipids, total cholesterol, calcium and glucose. On the other hand, exposure elucidate significant reductions of catalase, superoxide dismutase and glutathione peroxidase in comparison to control group. The histopathological findings revealed that Kidney sections of Gibberellic acid treated rats suffered from areas of interstitial fibrosis which appear as segmental and global glomerular sclerosis tubulointerstitial injury. On the similar ground, liver section of Gibberellic acid treated rats revealed that Gibberellic acid induced liver fibrosis; fatty metamorphosis and necrosis. The total genomic DNA electrophoretic pattern of lymphocytes deprived from Gibberellic acid treated rats revealed strong and obvious DNA damage as represented by a lot of fragments migrated from the wells. As a conclusion, Gibberellic acid (75 ppm) produce hepatonephrotoxicity, subsequently has oxidative stress role and DNA damage in albino rats 50 days post treatment. [Journal of American

Amjadfarooquet@gmail.com

**ABSTRACT:** The Web and XML have influenced all walks of life especially those that involve business activities over the Internet. People like to do their business activities and transactions from their homes to save time and money. Many business and commercial companies such as insurance companies and banks maintain their records using relational database management systems. But the traditional relational database technology is unable to provide all these new facilities to the users. To enable the traditional relational database technology to cope with the new challenges of the Web and XML technologies, we need a transformation between the XML technology and the relational database technology as a middleware. To achieve this objective, we already proposed and reported an algorithm. In this paper, we extend our previous work and present automation details, testing, and performance report of our proposed algorithm. The result shows that the implementation of the algorithm is more efficient than the existing algorithms for the same purpose [Journal of American Science. 2010;6(11):24-37]. (ISSN: 1545-1003).

**Keywords:** XML, web, rational database, transforming algorithm

### Effect of injector types, irrigation and nitrogen levels on II-Garlic yield, water and nitrogen use efficiency

Tayel, M.Y., \*Shaaban, S.M., Ebtisam I. El-Dardiry and Sabreen Kh.

Water Relations and Field Irrigation Dept., National Research Centre, Dokki, Cairo, Egypt.

\*shaabansm@yahoo.com

**Abstract:** Field experiments were conducted during two consecutive growing seasons in split split plot design on a clay loam soil at Shalaquan, Qalubia Governorate, Egypt. Experiments investigated the effect of three injectors types by-bass pressurized mixing tank ( $J_1$ ), venturi ( $J_2$ ) and piston pump ( $J_3$ ); three rates of irrigation 50, 75; 100% of  $ET_c$  ( $I_1, I_2, I_3$ ); three nitrogen levels 60, 90; 120 kg fed<sup>-1</sup> ( $N_1, N_2, N_3$ ) on garlic yield, water use efficiency (WUE) and nitrogen use efficiency (NUE). The main results could be summarized as follows; the maximum and minimum garlic yields (6.34, 2.38 ton fed<sup>-1</sup>) were obtained with treatment  $J_3 I_2 N_3$  and  $J_1 I_1 N_1$ , respectively. Maximum value of WUE was 3.29 kg garlic m<sup>-3</sup> of irrigation water as recorded with the treatment  $J_3 I_1 N_3$ , while the minimum value was 1.30 kg garlic m<sup>-3</sup> of irrigation water as recorded with the treatment  $J_1 I_3 N_1$ . The maximum and minimum values of NUE in kg garlic kg<sup>-1</sup> N were 83.22 and 29.17 for  $J_2 I_2 N_1$  and  $J_1 I_1 N_3$ , respectively. A positive linear relationship was found between WUE and NUE. [Journal of American Science. 2010;6(11):38-46]. (ISSN: 1545-1003).

**Keywords:** Field experiments; clay loam soil; water use efficiency (WUE); nitrogen use efficiency (NUE)

### Software Cost Estimation through Entity Relationship Model

**Abstract:** Software Cost Estimation is essential for efficient control and management of the whole software development process. Today, Constructive Cost Model (COCOMO 11) is very popular for estimating software cost. In Constructive Cost Model lines of code and function, points are used to calculate the software size. Actually, this work represents the implementation stages but in early stages in software development, it was not easy to estimate software cost. The entity relationship model (ER Model) is very useful in requirement analysis for data concentrated systems. This paper highlights the use of Entity Relationship Model for software cost estimation. Pathway Density is ushered in. By using the Pathway Density and other factors, many regression models are built for estimating the software cost. So in this paper, Entity Relationship Model is based on estimated cost of software. [Journal of American Science. 2010;6(11):47-51]. (ISSN: 1545-1003).

**Abstract:** Semantic Web is an extension of current web in which the web resources are equipped with formal semantics about their interpretation for the machines. These web resources are integrated in the form of web information systems, and their formal semantics are normally represented in the form of web-ontologies. Using the database terminology, we can say that web-ontology of a semantic web system is schema of that system. Since web-ontology is an integral element of semantic web systems, therefore, design quality of a semantic web system can be measured by measuring the quality of its web-ontology. The key consideration is that after completing design of a web-ontology, it is appropriate time to assess its quality so that in case, the design is of low quality, it can be improved before its instantiation. This can save a considerable amount of cost and effort for developing high quality semantic web systems. Metrics are considered as suitable tools for evaluating quality. In this paper, we propose certain metrics for web-ontology quality evaluation. These metrics may contribute in developing a high quality semantic web system. [Journal of American Science. 2010;6(11):52-58]. (ISSN: 1545-1003).

**Abstract:** Almond (*Prunus amygdalus*) belongs to Rosaceae family and sub-family of Pomoideae. Physical traits of agricultural products are main parameters in designing of grading, conveying, processing, and packing systems. In this study the physical traits such as dimensions, mass, volume, sphericity, geometric average of Mama'e and Shahrud 12 almonds and their kernels were measured and calculated. The average amounts of length, width, and thickness for both almond varieties were 37.41, 23.21, and 16.63 mm, respectively, and for almonds' kernel were 28.05, 13.4, and 7.82 mm, respectively. Results from modeling of almond and its kernel masses based on dimensions and volume showed that there exists a great correlation coefficient between the samples actual volumes and masses, but since determining actual volume of almond and its kernel is a time-taking task, it was suggested to use calculated volume and presuming that the cross-sectional area of the almond is oval. Also the mass model based on the thickness had the highest determination coefficient and lowest regression error which was the best option for industrial and economical applications. [Journal of American Science. 2010;6(11):59-64]. (ISSN: 1545-1003).

**ABSTRACT:** Groundwater is one of the most valuable natural resources and for that reason, its protection and management is vital for human evolution, socio-economic development and ecological diversity. Because of the known health and economic impacts associated with groundwater contamination, steps to assess groundwater vulnerability must be taken. This study aimed to assess groundwater pollution potentials of the north-eastern part of the deep confined aquifer of block XIX, Tamtsag basin, Mongolia. The normal DRASTIC model was applied to the study area with the help of GIS. DRASTIC parameters were calculated from geological data, soil and elevation contour maps, and groundwater level data of the study area. ArcInfo/GIS was used to demarcate vulnerable zones based on their vulnerability index. Finally, a sensitivity analysis of the parameters constituting the model was performed in order to evaluate the relative importance of the each DRASTIC model parameters. The aquifer vulnerability map revealed that only 2% of the study area is under moderate vulnerability to contamination, the remaining zone was determined to be in a low risk category. GIS greatly facilitated the implementation of the sensitivity analysis applied on the DRASTIC vulnerability index which otherwise could have been impractical. Appropriate methods for keeping groundwater resource sustainability in the study area have been suggested. [Journal of American Science. 2010;6(11):65-78]. (ISSN: 1545-1003).

**Abstract:** Measuring the physical properties of soil provides a good opportunity for careful study of processes such as evaporation from the soil surface, formation of water runoff, sediments and erosion. In this research, the change of some soil hydrological properties was studied in four kinds of primary soil cultivation activities by using a mechanical micro-relief meter. This study was conducted in a randomized complete block design. Data was collected in frames with 9025 cm<sup>2</sup> area and 400 data height were collected for every frame. Measured soil properties were: Root Mean Square (RMS) of height data, superficial Profile Length Ratio (RZ) of soil roughness, Infiltration Recession Factor (RECS), plough depth, the volume of displaced soil, comparison of the area change in relation to superficial evaporation of soil. The RMS of height data was higher ( $p<0.05$ ) with moldboard plow and modified disk plow than chisel and traditional ploughshares. The analysis of height data collected from plots showed that surface evaporation of soil moisture didn't differ by plowing with moldboard plow or traditional ploughshares, compared with two other ploughshares. This statistic was less than the recorded value of developed dish-like ploughshare ( $p<0.01$ ). Also displaced soil mass by these two ploughshares was much more than chisel and traditional ones ( $p<0.01$ ). The developed ploughshare prevents more evaporation. Therefore, plowing surface with this instrument provides high pot-hole store and penetration coefficient compared with other ploughshares. [Journal of American Science. 2010;6(11):85-89]. (ISSN: 1545-1003).

**Keywords:** RMS of height data, RZ, plough, height data, surface evaporation, pot-hole store

**Variations in some heavy metal concentrations in soil and *Manihot esculanta* tuber from the East and North eastern part of Nigeria**

S. T. Garba <sup>1\*</sup>, J. T., Barminas, <sup>2</sup> and A. H. Santuraki,<sup>1</sup>

<sup>1</sup>Department of Chemistry, University of Maiduguri, Borno state. P. M. B. 1069. Nigeria.

<sup>2</sup>Department of Chemistry, Federal University of Technology Yola (FUTY), P. M. B. 2076. Adamawa state. Nigeria. stelagarba@yahoo.com

**Abstract:** The levels of the heavy metals: Cr, Cd, Pb, Cu, Zn and Mn were determined in *Manihot esculanta* tubers and the soil used for its cultivation. This was done to asses the pollution level of the farmland and hence the safety status of *Manihot esculanta* tubers produced. Samples were collected from Konduga local government area of Borno state in the North East and from Umuahia local government area of Abia state in the East, all in Nigeria. These were treated and digested and the heavy metal concentrations were determined using Atomic Absorption Spectroscopy (AAS). The result obtained shows that, the samples from the North East had the highest levels of the elements Pb 30.14, Zn 88.65, Cd 3.15, Cu 16.00, Cr 6.74, and Mn 13.00 ppm in the soil sample while 5.47, 9.09, 5.05, 2.60, 3.37 ppm for the elements Pb, Zn, Cu, Cd, and Mn respectively were observed in *manihot esculanta* tubers sample. All these were found higher than what was observed in the soil and *manihot esculanta* samples collected from the East. Cr, was however, found below detection limits in *manihot esculanta* tuber samples from both the regions. [Journal of American Science. 2010;6(11):90-94]. (ISSN: 1545-1003).

**Abstract:** The exploitation of palm wine is one of activities which many people from southern Benin particularly the municipality of Ze have engaged. This study aims to analyze the socio-economic and environmental impacts of the exploitation of palm wine in the municipality. The methodology consisted of collecting demographic, agricultural, socio economic data, processing and analysis of data collected in real area based on components of the Leopold matrix. The exploitation of palm wine has changed the agricultural landscape of the municipality of Ze. The soil is becoming unproductive for food crops after a long fallow palm wine causing impoverished land due to overuse. The vegetation is endangered because of the rarity of certain plant species like Acacia sp (acacia), Antiaris africana, sapadi Blighia (bligia tasty), Chlorophora excelsa, Cola nitida, etc. But, in other aspect this activity is contributing to improve the living conditions of farmers and reduce the production of oil palm in this area. The production of alcohol provides employment to about 42% of the active population in the municipality of Ze, (municipality of Ze, 2007). At various levels of production that is from felling to alcohol distillation there are large numbers of people being employed. [Journal of American Science. 2010;6(11):95-102]. (ISSN: 1545-1003).

**Sorption characteristics of copper in some calcareous soils of western Iran**

Full Text

A. R. Hosseinpur<sup>1</sup> and F. Dandanmozd<sup>2</sup><sup>1</sup>.Soil Sci. Dep. Shahrekord Univ. Shahrekord, Iran<sup>2</sup>.Soil Sci. Dep. Bu-Ali Sina Univ. Hamadan, Iran.*E-mail:* hosseinpur-a@agr.sku.ac.ir

**Abstract:** The environmental impact of metal additions to soil depends on its sorption ability. To evaluate the sorption of copper (Cu) on to some soils an experiment was conducted with ten calcareous soils of Hamadan province in the west of Iran. Half g soil samples were equilibrated at 25±1 and 45±1°C with 25 ml of 0.01 M CaCl<sub>2</sub> containing 0 to 30 mgL<sup>-1</sup> Cu as CuSO<sub>4</sub>. Suspensions were centrifuged, filtered and concentration of Cu in the clear extract solution was calculated. The thermodynamic parameters viz. K, G, H and S were determined by using sorption data and concentration of Cu in equilibrium solution at two different temperature. Thermodynamic parameters revealed that Cu sorption increased as the values of K and G increased with rise in temperature from 25 to 45 °C. The G° values at 25 and 45°C were negative and ranged from -18.39 to -24.10 and -21.167 to -26.267 kJ mol<sup>-1</sup> respectively. The values of enthalpy (H°) and entropy (S) were positive and ranged from 8.184 to 42.852 kJ mol<sup>-1</sup> and 102.457 to 206.184 J mol<sup>-1</sup> K<sup>-1</sup>. The results showed that Cu sorption is a spontaneous process and endothermic reaction. The results also showed that calcareous soils can sorb high amounts of Cu and that thermodynamic parameters are useful in describing Cu sorption. [Journal of American Science. 2010;6(11):103-108]. (ISSN: 1545-1003).

**Abstract:** Gallinacins are antimicrobial peptides that play a significant role in innate immunity in chicken. The aim of this study was to determine the relationship between candidate genes of innate immunity and resistance to Marek's disease and to predict whether the amino acids substitutions lead to produce new phenotypes. We used in current study two inbred lines of White Leghorn chickens, line 6 which selected for resistant to Marek's disease and line 7 which selected to susceptible to Marek's disease from ADOL, ARS, USDA. We examined Gal-1 and Gal-2 in current study by sequenced a 1.38 kb in two directions from two inbred lines (6 and 7). A total of 6 SNPs were identified within the sequenced regions. This equates to an SNP rate of 4.34 SNPs/kb, nearly to the previously reported 5 SNPs/kb across the entire chicken genome. The current study showed that the gallinacin genes are polymorphic because there are many single nucleotide polymorphisms (SNPs) in both inbred lines of White Leghorn chickens and some of these SNPs are nonsynonymous and others are synonymous and some of them are located in intronic region and the rest are in exonic region. All identified SNPs were intronic; except for Gal-1 was exonic resulting in amino acids changes which have a non-synonymous SNP resulting in amino acids alterations of asparagine to serine, histidine to tyrosine and tyrosine to serine, respectively. From SIFT (Sorting Intolerant from tolerant) program which used to predict whether an amino acids substitutions can affect protein function resulting in phenotypic effect , that is may be made the inbred line 7 of White Leghorn chickens are susceptible to Marek's disease rather than line 6. We are concluded that a new chromosomal region with effects on the response to Marek's disease in chickens was characterized in this study. Within this region, the SNPs in the gallinacin candidate genes could potentially be used in a marker assisted selection program to enhance the response to Marek's disease. Analysis of the gallinacin genes in the protective pathways of disease resistance has also opened the possibilities for therapeutic strategies using endogenous antimicrobial peptides. [Journal of American Science. 2010;6(11):109-114]. (ISSN: 1545-1003).

#### **Endometrial Cytology and Bacteriological Isolates From Buffaloes With Retained Fetal Membranes and Their Effects on the Reproductive Efficiency**

Amer H. A.<sup>1\*</sup>, AbouZeid N. Z.<sup>2</sup> and Barakat T. M.<sup>1</sup>

Department of Theriogenology<sup>1</sup> and Infectious Diseases<sup>2</sup>, Faculty of Veterinary Medicine, Zagazig University, Egypt  
samarmed84@yahoo.com

16

16

**Abstract:** This study aimed to determine if the buffaloes with retained fetal membranes (RFM) and without systemic involvement had an effect on the subsequent reproductive efficiency. One hundred buffaloes with or without placental retention were allocated into 4 groups, including 25 buffaloes at day 15 post-calving had RFM (1<sup>st</sup> group), 25 buffaloes at 45 days post-calving had RFM (2<sup>nd</sup> group), 25 buffaloes without RFM at day 15 post-calving as control (3<sup>rd</sup> group ) and 25 buffaloes without RFM at day 45 post-calving as control (4<sup>th</sup> group). The intrauterine perfusion fluid (10ml) was collected and examined bacteriologically and cytologically to evaluate the intrauterine environment. The reproductive parameters were determined in both buffaloes with or without retained fetal membranes. The detection rate of bacterial spp. was significantly ( $P<0.05$ ) higher in buffaloes with RFM collected at day 15 after parturition than those in other groups. All 25 buffaloes with RFM at 15 days post-partum (100.0 %) showed positive results. From 22 of them (88.0%), more than one bacterial species was isolated. An *Archaeobacterium pyogenes* (A. pyogenes) was isolated from 56.0% of buffaloes with RFM after 15 days post-calving. On the other hand, 5 (20.0%) out of 25 buffaloes with RFM at 45 days post-partum showed positive results. Nine out of 25 (36.0%) buffaloes without RFM at 15 days post-partum showed positive results. Moreover, 4 out of 25 (16.0%) control buffaloes at 45 days post-partum showed positive results. The bacterial species most frequently

isolated was *Lactobacillus spp*. The number of buffaloes with 70% PMNs or 40% lymphocytes cells was higher (24/25, 96%) in the 1<sup>st</sup> group (RFM) at 15 days than those in 2<sup>nd</sup> group (RFM) at 45 days post-calving. The number of buffaloes with 70% PMNs or 40% lymphocytes cells was also significantly ( $P<0.01$ ) higher in control group (17/25, 65%) at 15 days than those in control group (6/25, 24%) at 45 days. There were no significant variations among the groups of the buffaloes with retained placenta and the control groups at 15 and 45 days post-calving in postpartum uterine involution, the number of days from parturition to initial insemination, the number of days to conception and the number of services per conception. The overall conception rate was 15(60%) and 16(64%) in the RFM group, meanwhile, it was 19(76%) and 20(80%) in the control groups. It could be concluded that, in most buffaloes, the retained fetal membranes without systemic involvement had no major effect on the postpartum reproductive performance. [Journal of American Science. 2010;6(11):115-121]. (ISSN: 1545-1003).

17

**Abstract:** One hundred slaughtered goats (2-3 years old) were used for diagnosis of toxoplasmosis in naturally infected goats, and 12 healthy pregnant and nonpregnant goats were used to study the pattern of toxoplasmosis as experimental study. Prevalence of toxoplasmosis in 100 slaughtered goats revealed that 29 (29%) and 27 (27%) were seropositive by LAT and IHA tests, respectively. There were agreement between LAT and IHA 97.3% in seronegative and 93.1% in seropositive sera in goats. There were complete concordance between LAT and bioassay in cats and mice. While the agreement between IHA result and bioassay in cat and mice was 93.1% in goats. Clinical examination of experimentally infected goats revealed that all goats had slight rise of body temperature; depression, anorexia, cough, muscular hyperesthesia and diarrhea by day 5 and returned to normal by day 11. The age of fetus at the time of *T. gondii* infection is one of the known causes for the variability in clinical response. As infection of goats in early stage of pregnancy result in fetal reabsorption, while infection in mid pregnancy lead to abortion in one goat at 28 days post-infection and the other was aborted at 40 days post-infection. Moreover infections in late pregnancy resulted in delivery of viable kids. On the other hand controls goats were clinically normal and pregnant does were birth viable kids. LAT showed rapid response after 14 days post-infection, while IHA detected antibodies after 3 weeks post-infection. The antibody titers of both tests remained high until the end of experiment (48 weeks), while the titers were decreased around abortion or parturition and increased again after one week. Both LAT and IHA tests were insensitive in the pre-suckling kids from infected goats, whereas PCR gave positive results. In conclusion, PCR considered the most reliable tool for diagnosis of prenatal infection of toxoplasmosis, while LAT and IHA were considered unreliable tools for diagnosis of toxoplasmosis if they applied one week before or after kidding. #### Photocatalytic Degradation of Monoazo and Diazo Dyes in Wastewater on Nanometer-Sized TiO<sub>2</sub>

S.A. Abo-Farha

18

18

Chemistry Department, Faculty of Science, Al-Azhar University (Girls), Naser City, Cairo, Egypt

samiaelhosieny@yahoo.com

**Abstract:** Advanced oxidation processes (AOPs) have proved very effective in treatment of the various hazardous organic pollutants in water. The photocatalytic degradation of two azo dyes, monoazo dye

Acid Orange 10(AO10) and diazo dye Acid Red114(AR114) present in wastewater were studied. Homogeneous photocatalytic degradation of the two azo dyes with UV/H<sub>2</sub>O<sub>2</sub> process was investigated. The rates of disappearance of the two azo dyes were monitored spectrophotometrically at the visible maximum absorption wavelengths. It was found that the rate of decolorization rises by increasing the initial dosage of H<sub>2</sub>O<sub>2</sub> up to a “critical” value at which it is maximum and beyond which it is inhibited. The rates of reactions follow pseudo-first-order kinetics. Also heterogeneous photocatalytic degradation of the two azo dyes with UV/TiO<sub>2</sub> (titanium dioxide) interface was investigated. The photocatalytic degradation rate depends on dye structure, dye concentration, TiO<sub>2</sub> concentration and pH of the medium. The mechanism of the photodegradation process under UV-visible light illumination involves an electron excitation into the conduction band of the TiO<sub>2</sub> semiconductor leading to the generation of very active oxygenated species that attack the dye molecules leading to photodegradation. Photocatalytic activity of TiO<sub>2</sub> was examined by focusing on its enhancement by electron scavengers in the photocatalytic decomposition of the two azo dyes. The electron scavengers employed was inorganic oxidant such as H<sub>2</sub>O<sub>2</sub>, adequate dose of H<sub>2</sub>O<sub>2</sub> led to a faster degradation of the two azo dyes in the TiO<sub>2</sub> photocatalytic system. The fast decolorization of monoazo dye (AO10) than diazo dye (AR114) is an indication that, the number of azo and sulphonate groups in the dye molecule may be a determining factor for increasing the degradation rates. [Journal of American Science. 2010;6(11):130-142]. (ISSN: 1545-1003).

**Phenotypic and genetic trends for milk production in Egyptian buffaloes**

Fooda, T. A.; Kawthar A. Mourad and Gebreel, I. A

Animal Production Research Institute-Buffalo Breeding Research Department- Dooki- Giza - Egypt

**Abstract:** A total of 3495 records collected from 904 buffalo cows progeny of 174 sires and 470 dams through period from 1990 to 2008 in all Stations belonging to Animal Production Research Institute, Ministry of Agriculture were used to estimate the phenotypic and genetic trends for total milk yield. LSM for total milk at different year of calving ranged between 1334 kg and 1692 kg, 1028 kg and 1561 kg, 1209 kg and 1633 kg, 1355 kg and 1415 kg and 1137 kg and 1355 kg for El-Nattafe El-Gidid (NG), El-Nattafe El-Kadim (NK), Mahalet Mousa (MM), Gemiza (G) and Sids (S) stations, respectively. Estimates of the positive breeding value (BV, %) at different year of calving ranged between 40 % and 52 %, 31 % and 52 %, 40 % and 56 %, 37 % and 55 % and 45 % and 59 % for NG, NK, MM, G and S stations, respectively. Annual phenotypic trend for milk production ranged between -11.7 kg and +36.7 kg for S and NK stations, respectively. While, the annual genetic trend ranged between -0.16 kg and +0.6 kg for G and NG stations, respectively. The results of the present study showed that there are increased of improvement of phenotypic and genetic trend in all MM farms from 1990 until now. [Journal of American Science. 2010;6(11):143-147]. **Effect of Probiotic (*Saccharomyces cerevisiae*) Adding to Diets on Intestinal Microflora and Performance of Hy-Line Layers Hens**

Saadia M. Hassanein<sup>1</sup> and Nagla K. Soliman<sup>2</sup>

<sup>1</sup>Microbiology Dept, Faculty of Science, <sup>2</sup>Poultry Production Dept., Faculty of Agriculture, Ain Shams University, Cairo, Egypt.

**Abstract:** An experiment was conducted to evaluate the effect of adding various levels of a live yeast to laying hen diets on their laying and feeding performance, egg shell, egg components and some blood constituents, as well as the intestinal microflora make-up. This was studied to validate the mode of a live yeast action in improving laying hens performance. For this purpose 75 Hy line (W-36) white layers were selected from 70 to 79 week of age in individual cages and randomly distributed into five experimental groups of 15 layers each. The individual hen was represented as an experimental unit. The five experimental groups were fed on five graded levels of a live yeast as 0.0% (control), 0.4%, 0.8%, 1.2% and 1.6%. The main results indicated an increase in egg production percentage of layers fed with 0.4% and 0.8% a live yeast which recorded 83.4% and 80.6% respectively compared with 74% of control which was similar to the groups of layers fed 1.2% (74.9%) and 1.6% (74.6%). Average egg weight was not influenced by adding yeast into diets. Egg mass results were parallel to these of egg production where the values of 46.7, 51.0, 50.2, 48.3 and 46.1 g egg/hen/day were recorded for the group of birds fed with 0%, 0.4%, 0.8%, 1.2% and 1.6% a live yeast respectively. Egg albumen and egg yolk were affected significantly. There was a slight improvement in egg shell thickness and percentage. Feed intake values were approximately similar within the different treatments. Feed conversion ratios (g feed/g egg) of layers fed yeast levels of 0.4% (2.08) and 0.8% (2.07) were better than the control group (2.27). Blood total protein levels of birds fed 0.4% (3.82), 0.8% (3.65) and 1.2% (3.97) yeast were lower than the control (4.16), while the value of 1.6% yeast (4.16) was slightly higher than control. Blood albumen levels were parallel to those of blood protein while blood globulin values were not affected. Blood cholesterol levels of layers fed yeast-supplemented diets were lower than the control. Blood total lipids were not affected by treatments. Ileal content pH of layers fed 0.8% and 1.2% yeast levels was lower than the control. Microbiological examination of ileal content indicated an obvious reduction in bacterial total count. While Lactobacilli bacterial count was increased. There were reductions in bacterial strains of *Escherichia coli* (*E.coli*), *Klebsiella sp.*, *Staphylococcus sp.*, *Micrococcus sp.*, *Campylobacter sp.*, and *Clostridium perfringens* of layers fed various yeast levels. The results of this study suggest adding live yeast at 0.4% or 0.8% into laying hen diets can enhance the productive performance and nutrients utilization via the inhibitory effect of yeast against pathogenic bacteria. [Journal of American Science. 2010;6(11):159-169]. (ISSN: 1545-1003).

jeljakee@yahoo.com

**Abstract:** Enterotoxigenic *S. aureus* in milk poses a potential health hazard to consumers. In this paper 106 *S. aureus* isolated from cow and buffalo milk samples were investigated for production of

21

21

22

22

enterotoxins. RPLA results showed high incidence of type C enterotoxin followed by type A and type B with incidence of 34 (32.1%), 19 (17.9%) and 15 (14.2%) respectively. Toxigenic *S. aureus* isolates produced golden yellow, creamy and white colonies on agar in percent of 69.11%, 27.94% and 2.94% respectively. Regarding to hemolytic activity on sheep blood agar, 92.65% of toxigenic *S. aureus* isolated from bovine milk samples were hemolytic. A correlation exists between toxigenic isolates and coagulase and DNase production. On crystal violet agar medium, 23.53% of the *S. aureus* isolates yielded yellow colonies, 64.71% yielded violet colonies, while 11.76% yielded white colonies from the toxigenic *S. aureus* isolates. It is clear that most of bovine isolates yielded violet colonies on the medium. Out of 68 isolates of toxigenic *S. aureus* isolates 51 (75%) showed SpA by agglutination test positive. Results obtained showed 100% agreement between RPLA and PCR techniques. [Journal of American Science. 2010;6(11):170-178]. (ISSN: 1545-1003).

#### Hydro-Thermal Safety Control of Karun-1 Dam under Unusual Reservoir Level Reduction

Mojtaba Labibzadeh<sup>1</sup>

<sup>1</sup>. Department of Civil Engineering, Faculty of Engineering, Shahid Chamran University, Ahvaz, Iran

Labibzadeh\_m@scu.ac.ir

**Abstract:** Karun-1dam safety was examined through carrying over a 3D finite elements analysis. The dam as well as its foundation and abutments have been modeled in a relatively exact manner. Furthermore, the vertical contraction joints were simulated in calculations. Hydrostatic, gravity and thermal effects have been taken into account as the load collections. 10m reduction of reservoir level from normal water level of the dam reservoir was applied in the modeling and the possibility of initiate and development of cracks in dam body was investigated by means of monitoring of principal stresses. The obtained results showed that mentioned possibility existed and the downstream face of the dam in vicinity of the abutments near to crest level probably experiences the tensile cracks. [Journal of American Science. 2010;6(11):179-184]. (ISSN: 1545-1003).

#### Prevalence of HBV Genotypes in Egypt among Hepatitis Patients

Iman A.El Aziz Khaled<sup>\*1</sup>, Ola M. Mahmoud<sup>1</sup>, Abeya F.Saleh<sup>1</sup>, and Emad A. Baioumi<sup>2</sup>

<sup>1</sup>Haematology &Blood Bank, <sup>2</sup>Tropical Medicine, Theodor Bilharz Research Institute (TBRI).Cairo, Egypt; <sup>\*</sup>iman\_khaled@yahoo.com

**Abstract:** Phylogenetic analysis has led to the classification of hepatitis B virus into eight genotypes, designated A to H. The genotypes have differences in biological properties and show heterogeneity in their global distribution. These attributes of the genotypes may account not only for differences in the prevalence of hepatitis B virus mutants in various geographic regions, but also makes them responsible for differences in the clinical outcome and response to antiviral treatment in different population groups. Africa is one of the highly endemic regions of HBV with five genotypes (A-E) identified. Almost all patients in the Mediterranean area are infected with genotype D. However, there is little information of genotype distribution in Egypt. A total of 140 Egyptian patients with hepatitis B surface antigen (HBsAg) positive were enrolled in this study. Of the 140 patients, only100 patients were HBV DNA positive and only these were included in the study. They were classified in to 20 patients with acute hepatitis (AH), 75 patients with chronic active hepatitis (CAH) and 5 patients with hepatocellular carcinoma (HCC)]. HBV genotypes were determined using INNO-LiPA methodology which is based on the reversed hybridization principle. Results: This study showed that genotype D constituted 87% of the total infections (75% CAH, 7% AH & 5% HCC). The other 13% showed mixed infections of D/F. Conclusion: These findings show that the most prevalent genotype in Egypt is genotype D especially in CAH and HCC patients while the mixed type D/F is mostly encountered in AH. [Journal of American Science. 2010;6(11):185-190]. (ISSN: 1545-1003).

The protective role of antioxidants pro vitamin -carotene and vitamin E in minimizing these genotoxic effect was also studied. The study focused on the effect of schistosomiasis on the induction of sister chromatid exchange (SCEs) and other chromosomal aberrations. Patients and Methods: This work was conducted on 24 Schistosoma mansoni infected patients and 10 healthy adults as a control group. Lymphocytes from peripheral blood of patients and control group were used for culture and subsequent cytogenetic studies. Results: The results indicated that schistosomiasis was genotoxic in all examined tests. It induced a significant increase in the percentage of structural chromosomal aberrations and the frequency of SCEs. It also inhibited cell division and caused cell cycle delay. Lymphocyte cultures of <i>S. mansoni</i> patients treated with 10 µg/ml -carotene or 20 mg/ml vitamin E showed a significant decrease in the percentage of structural chromosomal aberrations and the frequency of SCEs. Conclusion: schistosomiasis has a genotoxic effect on peripheral blood lymphocytes. The use of the antioxidants -carotene and vitamin E can be considered a promising approach not only toward inhibiting the genetic damage of schistosomiasis but also as prophylactic agents against infection with <i>S. mansoni</i>. Furthermore, higher doses of antioxidant drugs, -carotene and vitamin E, should be tried as an adjuvants to conventional therapy in a trial to improve treatment of schistosomiasis. 	<p><b>BIOCHEMICAL PATTERN FOR HEPATITIS C AND ACUTE LYMPHOBLASTIC LEUKEMIA IN HUMAN SERA</b></p> <p>Abulyazid<sup>1</sup>, I., Mohga S. Abdallah<sup>2</sup>, Hayate I. Sharada<sup>3</sup> and Sama H. Okasha<sup>4</sup></p> <p><sup>1</sup>, Molecular Biology Department, Atomic Energy Authority</p> <p><sup>2, 3, 4</sup> Chemistry Department, Faculty of Science, Helwan university</p> <p><b>Abstract:</b> Present experimental work aimed to show role of the molecular biology in diagnosis of hepatitis C liver disease (HCV) and acute lymphoblastic leukemia (ALL) which occur as a result of the disturbances of protein and enzymes fractions at the molecular level. The study carried out using vertical slab gel electrophoresis for detection of the protein pattern, catalase and peroxidase. Protein fractionation of the control samples produced 13 bands with Rf ranged between 0.17 and 0.96 and (amount, 3.14 - 7.24). Comparing hepatitis C with control one out of these 13 bands are completely disappeared at Rf 0.86 (amount 9.34). Ten bands appeared to be common bands in all HCV samples except one sample only nine common bands were produced while the band number ten was disappeared. The data showed that 5 characteristic bands were produced. One from these five bands determined at Rf 0.7 in all HCV sera samples except the first sample. Comparing leukemia samples with control only two were considered as common bands. These bands completely appeared in all sera samples. On the other side one band was completely disappeared in all leukemia samples. The rest bands distributed between different leukemia samples. 15 bands produced as characteristic bands. Electrophoresis pattern for catalase mentioned that six bands were produced in control samples. When hepatitis C compared with the control showed that two out these six bands were completely disappeared and other all HCV four bands considered as common bands. The amount of catalase enzyme completely decreased in all bands. In leukemia five common bands were produced with the appearance of one characteristic band, from the</p>	Full Text	26

other side one band was disappeared. A documentation of peroxidase pattern data showed that tow common bands were appeared with Rf 0.1 and 0.33, the amount of these two bands were decreased when the amount of HCV compared with control in the same rows. In leukemia there is only one common band was produced with appearance of a three characteristic bands. [Journal of American Science. 2010;6(11):203-216]. (ISSN: 1545-1003).

**Serum resistin levels and haemostatic changes in experimentally induced diabetic and high fat fed rats**

Mohammad I. Hoseen, Mai M .Hassan, Dalia I. Abd-Alaleem and Eman M. Faragallah.

Department of physiology, Faculty of medicine, Zagazig University.

**Abstract:** Adipose tissue is considered as an active endocrine gland that affects many aspects of body homeostasis. Adipose tissue derived molecules “adipokines” regulate energy homeostasis, dietary behavior, as well as insulin sensitivity and immunity; it refers to leptin, adiponectin, resistin, apelin, visfatin and omentin. Resistin is a cysteine-rich adipokine that is released by adipocytes and macrophages and has been involved in the development of insulin resistance in rodents. Moreover a strong link between diabetes, hypercoagulability and thrombogenesis, had been recognized for decades. Aim: In a trial to identify any possible relationship between resistin levels and some haemostatic changes in streptozotocin-induced diabetic and high fat diet-fed rats (HFD); the present work had been carried out. Design: A total number of 40 adult male albino rats were divided into 2 main groups: Group I (n= 24): To study the effect of streptozotocin-induced type 1 diabetes and was further divided into 3 equal subgroups (n= 8 in each) and survived for 30 days: Ia: (control group), Ib: (experimental diabetic non-treated group (by a single i.p. injection of streptozotocin (65mg/Kg B.W), Ic (experimental diabetic group treated with insulin). Group II (n= 16) : To study the effect of high fat diet and was further divided into 2 equal subgroups (n= 8 in each) and survived for 7 weeks: IIa: (control group), IIb (high fat diet fed (58% fat). In all groups, serum levels of glucose, insulin, resistin, total cholesterol(TC), triglycerides (TG), HDL, LDL, BT, WBCT, PT, aPTT, plasma fibrinogen level, plasma D-dimmers level and platelet count were measured. Results: The results of this study showed a significant decrease in serum resistin levels ( $p<0.001$ ) in streptozotocin-induced diabetic group in comparison with its control group and insulin-treated group. Moreover, no significant correlation could be detected between resistin levels and any of measured parameters in these groups except the significant positive correlation with body weight at the end of experimental period. In addition, our study revealed a significant increase in serum resistin levels ( $p<0.001$ ) in HFD-fed group in comparison with its controls, which was correlated positively and significantly with body weight, serum glucose levels, insulin levels and HOMA-IR index ( $p<0.001$ ), atherogenic lipid profile and markers of hyper-coagulability (except for platelet count). Conclusion: No role for resistin in metabolic and haemostatic changes in type 1 diabetic rats was detected. Although, hyperresistinemia may represent a link between metabolic signals, atherogenesis, and hypercoagulability in type 2 diabetic rats. However, further studies are needed to clarify this relationship in human cardiovascular diseases. [Journal of American Science. 2010;6(11):217-227]. (ISSN: 1545-1003).

1. **Abstract:** The biodynamic response behaviors of seated human body subject to whole-body vibration have been widely investigated. The biodynamic response characteristics of seated human subjects have been extensively reported in terms of apparent mass and driving-point mechanical impedance while seat-to-head vibration transmissibility has been widely used to characterize response behavior of the seated subjects exposed to vibration. These functions (apparent mass, driving-point mechanical impedance) describe “to-the-body” force–motion relationship at the human–seat interface, while the transmissibility function describes “through-the-body” vibration transmission properties. The current study proposed a 4-DOF analytic biomechanical model of the human body in a sitting posture without backrest in vertical vibration direction to investigate the biodynamic responses of different masses and stiffness. Following the analytical approach, numerical technique developed in the present paper to facilitate and rapid the analysis. The numerical analysis used here applies one of the artificial intelligence technique to simulate and predict the response behaviors of seated human body for different masses and stiffness without the need to go through the analytic solution every time. The Artificial Neural Network (ANN) technique is introduced in the current study to predict the response behaviors for different masses and stiffness rather than those used in the analytic solution. The results of the numerical study showed that the ANN method with less effort was very efficiently capable of simulating and predicting the response behaviors of seated human body subject to whole-body vibration. [Journal of American Science. 2010;6(11):228-239]. (ISSN: 1545-1003).

**Design Synthesis of New Peptide Derivatives and Evaluated DNA Binding Activity, Anticancer and Antimicrobial Activity.**

A. A. EL-HENAWY

Chemistry Department, Faculty of Science, Al-Azhar University, Nasr City, Cairo-Egypt.

**Abstract:** Recently, sulfonamides have been reported to show significant antitumor activity in vitro and/or in vivo. There are a variety of mechanisms for the anticancer activity. The present work reports the synthesis some novel peptide sulfadiazine derivatives, this may play a role in their anticancer activity. All the newly synthesized compounds were evaluated for DNA binding activity and antimicrobial activity, some synthesized compounds showed high DNA binding activity and antimicrobial activity. Some selected compounds were evaluated for anticancer activity against breast cancer cell line (MCF7) in vitro. All selected compounds showed interesting cytotoxic activities compared to a reference drug. [Journal of American Science. 2010;6(11):240-249]. (ISSN: 1545-1003).

The crowns were divided into 4 groups (N=10 each) according to the adhesive luting systems. Group (U): using RelyX Unicem resin cement (self-adhesive system). Group (V): Variolink II (total-etch system). Group (GU) and group (GV): application of G-bond (self-etch) on dentin preceded previously used adhesive systems. A stereomicroscope was used to record the vertical marginal gap distance before and after cementation. The crowns were subjected to cyclic loading and fracture resistance test. Data were statistically analyzed using One-way Analysis of Variance (ANOVA) SPSS 15.0. A scanning electron microscope was used to qualitatively examine the dentin/resin interface. Results: Groups (GU) (<math>67.6 \pm 5.8 \mu\text{m}</math>) and (GV) (<math>68 \pm 6.4 \mu\text{m}</math>) recorded the significantly lowest vertical marginal gap, followed by group (V) (<math>82 \pm 6.8 \mu\text{m}</math>). Group (U) showed the highest marginal inaccuracy (<math>114 \pm 6.4 \mu\text{m}</math>). Group (GU) recorded the significantly highest fracture resistance (<math>2840.5 \pm 3.8 \text{ N}</math>), followed by group (GV) (<math>2411.3 \pm 3.3 \text{ N}</math>) and group (V) (<math>2365.8 \pm 3.6 \text{ N}</math>). Group (U) showed the lowest results (<math>2270.9 \pm 3.4 \text{ N}</math>). Conclusions: Ceramic restorations luted with total-etch system offer better vertical marginal gap distance and fracture resistance than restorations luted with self-adhesive system. Treatment of the dentin surface prior to the application of the bonding system is efficient. [Journal of American Science. 2010;6(11):264-273]. 33	<p><b>Do Desensitizers Affect the Retention of Questionable Preparations?</b></p> <p>Jylan F. ElGuindy<sup>1</sup>, Dina H. Mostafa <sup>*2</sup> and Mona A. El Agroudi<sup>1</sup></p> <p><sup>1</sup>Fixed Prosthodontics Department and <sup>2</sup>Biomaterials Department, Faculty of Oral and Dental Medicine,</p>	Full Text	33

**Abstract:** Objectives: This study aimed to investigate the effect of different desensitizers on the retention of short and over-converged preparations. Methods: Eighty molars were prepared with 3mm occluso-cervical height and 24 degrees convergence angle. Nickel-chromium copings were cast with a loop at the occlusal surface for tensile loading after cementation. The copings were assigned to two groups (N=40 each) according to the cement used. Group 1: resin cement (Duolink). Group 2: glass-ionomer (Ketac-Cem). Each group was assigned to four subgroups (N=10 each) according to desensitizers used prior each cement. Subgroup I: control (untreated), subgroup II: Gluma Comfort + Desensitizer, subgroup III: Oxalate (Bisblock) and subgroup IV: Fluoride varnish (Flor-Opal). The retention was determined by uniaxial tensile mode of force. Two-way Analysis of Variance (ANOVA) SPSS 16.0 was used to assess cements, desensitizers and their interactions on copings retention. Results: Resin group: Oxalate ( $212.10 \pm 7.41$ N) showed the significant highest mean of retention, followed by Gluma ( $201.52 \pm 6.93$ N), then control ( $177.52 \pm 6.14$ N). Fluoride ( $153.80 \pm 6.03$ N) recorded the lowest mean. Glass-ionomer group: control ( $135.54 \pm 4.58$ N) and Oxalate ( $132.62 \pm 4.84$ N) recorded the significant highest mean, followed by Gluma ( $126.84 \pm 4.75$ N). Fluoride ( $101.96 \pm 6.34$ N) recorded the lowest mean values. Conclusions: With questionable preparations, fluoride desensitizer drastically affected the retention of both cements. Oxalate and Gluma enhanced the retention with resin cement. Oxalate desensitizer can be efficiently used with glass-ionomer. [Journal of American Science. 2010;6(11):274-283]. (ISSN: 1545-1003).

**Accuracy of working casts and dies produced by fast-setting polyvinyl siloxane impressions**

Mona El-Agroudi MD DDS<sup>1</sup> and Eman Essam, MD DDS<sup>2</sup>

Assistant professor of Fixed Prosthodontics, Faculty of Oral and Dental Medicine, Cairo University. , Egypt.

<sup>2</sup> Lecturer of Fixed Prosthodontics, Faculty of Oral and Dental Medicine, Al Azhar University. , Egypt.

**Abstract:** Purpose: This study aimed to evaluate the effect of spacer on the accuracy of working casts and dies produced from fast-setting polyvinyl siloxane impressions.

**Materials and Methods:** Twenty Impressions of the mandibular arch of a modified Dentoform master model incorporating a stainless steel circular crown preparation were made, using a fast-set Polyvinyl siloxane (Affinis perfect impressions Coltene/Whaledent AG) using 2/step impression technique with and without a spacer. Gypsum working casts and dies were produced from the poured impressions. Measurements of the master model and working casts were carried out including anteroposterior (AP) and cross-arch (CA) dimensions. The stainless steel circular crown preparation incorporated within the master model was also measured in buccolingual (BL), mesiodistal (MD), and occlusogingival (OG) dimensions and compared to measurements from recovered gypsum dies. Linear measurements were made using a measuring stereomicroscope. **Results:** Double impression technique without spacer showed statistically significant higher mean percent relative change than double impression technique with spacer. With each technique, the means percent relative change in die measurements showed statistically significant higher mean values than cast measurements. There was no statistically significant difference between means percent relative change in the BL and MD dimensions which showed the statistically significant highest mean values. The means percent relative change in the OG dimension showed the statistically significant lowest mean value. **Conclusion:** Accuracy of fast-setting polyvinyl siloxane impression material was favorably affected with the use of spacer, as the space resulted from contraction of the putty material was not enough to produce accurate detail reproduction by the light material. The working dies; from the fast- setting polyvinyl siloxane

impression material without spacer demonstrated an increase in (mesio-distal and bucco-lingual) dimensions, while for cast dimensions, there was no difference between the two techniques. [Journal of American Science. 2010;6(11):284-292]. (ISSN: 1545-1003).

**Kinetics and Thermodynamics of Oil Extraction from Jatropha Curcas in Aqueous Acidic Hexane Solutions**

Full Text

Sh. K. Amin, S. Hawash, G. El Diwani\*, and S. El Rafei

Chemical Engineering and Pilot Plant Department, National Research Center, Cairo, Egypt.

\*geldiwani@yahoo.com

**Abstract:** Jatropha oil curcas (JOC) extraction was performed in aqueous HCl, H<sub>2</sub>SO<sub>4</sub>, and H<sub>3</sub>PO<sub>4</sub> solutions with n-hexane (C<sub>6</sub>H<sub>14</sub>) at 30, 40, 50, and 60 °C using 10 gm of Jatropha seeds over 1 hours with 10 minutes sampling intervals. The optimum acid concentration was 15 % by weight for each acid, and the highest oil yield was obtained in the extraction procedure with n-hexane containing HCl. The extraction process was observed with regard to the percent oil yield versus time, and the reaction order was found to be first-order kinetics by the differential method. The activation energy for the oil extraction kinetics of Jatropha seeds with 15 % HCl was E<sub>a</sub> = 26.6763 kJ/mol, and the activation thermodynamic parameters at 60 °C were H = 23.908 kJ/mol, S = -239.927 J/mol.K, and G = 103.803 kJ/mol. The enthalpy value was H = 0.1586 kJ/mol, and the other thermodynamic parameters at 60 °C were calculated to be S = 15.275 J/mol.K, and G = -4.928 kJ/mol. [Journal of American Science. 2010;6(11):293-300]. (ISSN: 1545-1003).

**Methodology for Selective Adsorption of Lithium Ions onto Polymeric Aluminium (III) Hydroxide**

Full Text

S. Hawash, E. Abd El Kader and G. El Diwani\*

Chemical Engineering and Pilot Plant Department, National Research Center, Cairo, Egypt.

\*geldiwani@yahoo.com

**Abstract:** The recovery of lithium as lithium aluminate from Egyptian bitterns was investigated. Studies were performed on synthetic Li<sup>+</sup> solution and on three high – salinity end brines which contain Li<sup>+</sup> of concentrations varying between 5.5- 19.5 ppm. Pretreatment with a mixture of Na<sub>2</sub>SO<sub>4</sub>- Na<sub>2</sub>CO<sub>3</sub> is achieved to precipitate BaSO<sub>4</sub>, SrCO<sub>3</sub>, CaCO<sub>3</sub> and possibly MgCO<sub>3</sub>. A co-precipitation method was employed using aluminum salt as (AlCl<sub>3</sub>.6H<sub>2</sub>O). Lithium ion is adsorbed onto aluminum hydroxide, which is freshly produced by adding AlCl<sub>3</sub>.6H<sub>2</sub>O and Na OH to the brines at Al<sup>3+</sup> / Li<sup>+</sup> molar ratio 5-7. Results obtained indicate that high Li<sup>+</sup> adsorption was performed at pH = 6-7 for Alexandria-Arish and Emissal salines, even for small concentration of aluminum salt added. Also, Lithium ions uptake decreased with increasing adsorption temperature from 10°C to 30°C but over 30°C increase in temperature does not affect lithium uptake on Al(OH)<sub>3</sub>, which proved that the process is physical adsorption. Equilibrium isotherms have been determined for the adsorption of Li<sup>+</sup> onto Al(OH)<sub>3</sub> at 30°C and pH= values (5 to 9), the maximum adsorption capacity of Al(OH)<sub>3</sub> at 30°C and pH = 9 is 123 mg/gm. The results indicated that applied isotherms were shown to be "favorable" and were fitted with Langmuir and Freundlich isotherms. Li<sup>+</sup> desorption from Al(OH)<sub>3</sub> was investigated using hydrofluoric acid (HF) or sulphuric acid (H<sub>2</sub>SO<sub>4</sub>) with different concentrations, and results obtained showed that HF is more efficient than H<sub>2</sub>SO<sub>4</sub> concerning Li<sup>+</sup> desorption. From the obtained results, Li ion can be recovered successfully from bittern and saline solutions. [Journal of American Science. 2010;6(11):301-

Khalil and Nora M. El-Sheikh</p> <p>Biochemistry and Nutrition Department, Women's College, Ain Shams University, Cairo, Egypt.</p> <p><b>Abstract:</b> Propolis and bee pollen are substances produced by honey bees its components are strong antioxidant and free radical scavengers. The present study aimed to study the protective effects of propolis and bee pollen supplementation against toxicity of sodium fluoride in rats. After the end of experimental period, the rats sacrificed and biochemical analysis were carried out. The results showed that the administration of fluoride (F) alone causes significant increase of malondialdehyde (MDA) level and significant decrease of antioxidant system as erythrocyte superoxide dismutase (SOD) activity and reduced glutathione (GSH) levels in blood and brain. Also F causes significant increase alkaline phosphatase (ALP) activity, urea, creatinine, sodium and potassium levels. And significant decrease total protein, calcium, magnesium and phosphorus levels as compared to control group (<math>P &lt; 0.05</math>). Whereas administration of propolis or bee pollen with F led to significant decrease in MDA level and significant increase in SOD activity, GSH levels in blood and brain. And significant decrease ALP activity, urea, creatinine, sodium and potassium levels in serum. The propolis or bee pollen enhanced total protein, calcium, magnesium and phosphorus levels in serum as compared to F group alone.</p> <p>In conclusion; supplementation of natural antioxidant (propolis or bee pollen) during Fluoride administration, facilitate reduction of the toxic effects and enhanced the antioxidant system, the levels of minerals in serum. 38	<p><b>Diet Selection, Feed Intake Capacity and Performance of Growing Female Camels: Effects of Type of Roughage and Level of Concentrates Offered</b></p> <p>M.F.A. Farid, A.M. Abdel-Wahed, Safinaz M. Shawket* and N.I. Hassan</p> <p>Animal Nutrition Department, Desert Research Centre, Al-Matareya, Cairo, Egypt.</p> <p>dr.safinazshawket@hotmail.com*</p> <p><b>Abstract:</b> The feeding trials were intended to investigate diet selection, feed intake capacity (FIC) and animal performance when concentrates (corn grains and commercial concentrates mixture) and roughages (Atriplex, clover hay or rice straw) were fed ad lib free-choice in a cafeteria feeding system, and also the effect of restricting concentrates offered. The roughages were selected to represent different grazing conditions prevailing in arid rangelands. Eighteen growing she-camels were randomly allotted to three groups. Each group was assigned one of the three roughages offered ad lib for the duration of the whole experiment. Results indicated that type of roughage and concentrate levels, and their interaction, affected (<math>P &lt; 0.05</math>) FIC and diet selection, and consequently live weight gain. Average total and roughage DMI were 78.9 and 16.1, 83.9 and 22.5, 96.4 and 33.4 g DM/day/Kg<sup>0.75</sup> for straw, hay and atriplex groups, respectively. Irrespective of the roughage fed, growing camels consumed three-times as much corn grains as that from the cottonseed meal. Limiting concentrates offered to 75% or 50% of ad lib intake, decreased FIC, while the proportion of roughages in DMI increased significantly, total OMI and total protein decreased and crude fibres intake increased, more so in the straw fed camels. The Atriplex fed camels recorded the higher ADG, followed by the hay fed ones and the straw fed mates grew the least, 516, 429 and 240 g/d, respectively. Restricting the level of concentrates offered decreased significantly (<math>P &lt; 0.05</math>) the ADG (691, 305 and 189 g/d in camels fed 100, 75 and 50% of ad lib concentrate intake. These results tend</p>	Full Text	38

to indicate that growing camels having free choice to select their diets from both concentrates and roughages were capable of regulating their voluntary food intake predominantly through physiological mechanisms to satisfy energy requirements. This was true for the atriplex and hay groups but not for the straw group or when concentrates offered was limited. [Journal of American Science. 2010;6(11):317-326]. (ISSN: 1545-1003).

### **Application of Proposed Distribution Network Planning Rules on Fast Developing Countries**

Salem M. Elkhodary<sup>1</sup>, and M. Khafagy<sup>2</sup>

<sup>1</sup> Faculty of Engineering, Ain Shams University,, Cairo, Egypt,<sup>2</sup> Saudi Electricity Company, KSA.

**Abstract:** With the ever increasing need to electric energy and the fast development of loads in many countries especially in the fast developing ones such as the GULF countries, the load growth as well as the forecasted loads, are highly increased depending on new and arising factors and conditions. In turn, Electricity Companies build rapidly generating plants, transmission and distribution networks to meet the rapid load demand. Usually, power system expansion follows the load growth which may exist at random locations. This adds to the absence of prior proper planning, especially medium and long term planning, resulting in network configurations that do not match with optimum siting and sizing planning rules. Operation of such networks faces several problems that may sacrifice the power quality. Thus, proper planning of new networks, expansion or rehabilitation of existing ones should be based on most accurate and proper planning rules. This calls for the investigation of a new exact cost function for optimum sizing and siting of network substations, and hence the H.V. feeds (incoming) and the M.V. distribution (outgoing) feeders. Therefore, this paper presents a newly proposed methodology that takes into consideration the capital costs of all electrical components, losses in these components, operation and maintenance costs. The inflation rate can be also taken into consideration. This methodology gives important results, which conclude that the optimum distance between substations and hence the optimum number of substations, greatly depends on different factors that were not taken into consideration before, for example : the kWh price, cost of the HV incoming feeders (66-110 kV feeders) besides the cost of the MV outgoing feeders (6.6-22 kV feeders), cost of the distribution substations (MV/LV), cost of losses in transformers, cost of losses in all feeders, incoming and outgoing, Operation and maintenance costs ....etc. [Journal of American Science. 2010;6(11):327-]. (ISSN: 1545-1003).

**Keywords:** Cost function. Objective function. , Distribution network planning. Optimum siting and sizing of substation

### **New Proposed Method of Damping Temporary Overvoltages on Power System Interconnections**

Salem M. Elkhodary<sup>1</sup>, and Ali S. Abd El-Munem<sup>2</sup>

<sup>1</sup> Faculty of Engineering, Ain Shams University , <sup>2</sup>Egyptian Electricity Holding Company, Cairo, Egypt

**Abstract:** The interconnection between countries links different networks. These interconnections may be exposed to several disturbances. These disturbances (such as transient and temporary overvoltages phenomena, faults ...etc.) threaten the interconnection security and reliability. This paper presents actual field measurements of transient and temporary overvoltages appearing on the Egyptian – Libyan system interconnection as an example. These overvoltages were recorded for different cases of operation. These cases were modeled and simulated using the most recent version of Alternative Transient Program (ATP) computer package to compare the results of the computational method with the actual field measurements. The comparison between the ATP output results and the actual field measurements were found less than  $\pm 4\%$ . Within the research activities of the Egyptian Electricity Holding Company (EEHC) temporary overvoltage phenomena on the Egyptian – Libyan interconnection network were detected. EEHC carried field measurements of the temporary overvoltage by using a special transient mobile test laboratory. This detected temporary overvoltage was due to the generated reactive power along the line on switching, in spite of this leading reactive

power was compensated by connecting number of reactors at different nodes. The economical aspect has been taken into consideration to reduce the number of reactors to the network, which showed the best effect on damping the temporary overvoltage. This paper, thus, presents a proposed technique to damp the temporary overvoltage and keep the system voltage within the permissible limits by estimating the optimum number and location of reactors that must be connected to the network. [Journal of American Science. 2010;6(11):336-342]. (ISSN: 1545-1003).

**Evaluation of *Corynebacterium variabilis* Sh42 as a degrader for different poly aromatic compounds**

Yasser M. Moustafa<sup>1</sup>, Nour Sh. El-Gendy<sup>1</sup>, Salem A. Habib<sup>2</sup>, Sherif Ali<sup>1\*</sup>

<sup>1</sup>Egyptian Petroleum Research Institute, Cairo, P.O. 11727, Egypt.

<sup>2</sup>Mansoura University, Faculty of Science, Damietta, Egypt.

**Abstract:** *Corynebacterium variabilis* sp. Sh42 is used to investigate the biodegradation potentials and metabolic pathways of different poly aromatic compounds (PACs) in batch flasks. Effects of PACs size, molecular weight, alkylation and their presence individually or in mixture on biodegradation potentials of Sh42 were studied; Naphthalene (Nap) as a model compound for di-aromatic ring; Anthracene (Ant) and Phenanthrene (Phe) as model compounds for tri-aromatic ring; while Pyrene (Pyr) as a model compound for four-aromatic ring compounds were used as representatives for different PAHs. Dibenzothiophene (DBT), 4-methyldibenzothiophene (4-MDBT) and 4,6-dimethyldibenzothiophene (4,6-DMDBT) were taken as representative models for PASHs compounds. While, 2-hydroxybiphenyl (2-HBP) and 2, 2'-bihydroxybiphenyl (2, 2'-BHP) were taken as models for phenolic compounds. The experimental results show that biodegradation rate decrease with increase ring size, alkylation's group within homologous series and Sh42 has the highest capability to biodegradation of toxic phenolic compounds either in single (BD% 90%) or mixed substrates cultures (BD% 48%). To ensure detoxification and mineralization of these toxic PACs; metabolic pathways of representative model compounds (Pyr, DBT and 2,2'-BHP) were elucidated by GC/MS analysis which confirmed that, Sh42 completely metabolized all representative compounds to CO<sub>2</sub> and H<sub>2</sub>O. [Journal of American Science. 2010;6(11):343-356]. (ISSN: 1545-1003).

**In vitro assessment of gastrointestinal viability of potentially probiotic Lactobacilli**

Kawther,.EL-Shafei, N.F.Tawfik, Nadia, M.A.Dabiza, O.M.Sharaf, and B.A.Effat

Dairy Science Department, National Research Center Dokki, Cairo, Egypt.

**Abstract:** The objectives of this study were to assess the potential of four probiotic lactobacillus strains, *Lactobacillus bulgaricus*, *Lactobacillus johnsonii* B-2178, *Lactobacillus gasseri* B-14168 and *Lactobacillus salivarius* B-1950 in human upper gastrointestinal tract in vitro and evaluate the effect of milk proteins addition on viability of these strains in simulated gastric juices and in yoghurt during storage for 15 days at 4°C. The viability of lactobacilli strains in simulated gastric transit conditions (pH 2.0, pH 3.0 and pH 4.0) gastric juices with or without milk proteins singly or in combination with starch was tested. All the treatments were determined with three replicates. The simulated gastric transit tolerance of *L. johnsonii*, *L. gasseri* and *L. salivarius* strains was pH-dependent and correspondingly showed lower viability at pH 2.0 after 180 min compared with pH 3.0 and pH 4.0. The addition of milk proteins singly or in combination with starch enhanced the survival of probiotic lactobacilli strains in simulated gastric juices different tested pH values. Results showed that addition of milk proteins in combination with starch improved the viability of *L.johnsonii* B-2178, *L. gasseri* B-14168 and *L. salivarius* B-1950 in yoghurt during storage. Sensory evaluation showed that yoghurt

Full Text

42

fortified with milk proteins plus starch recorded the highest score for and overall acceptability than the other treatments. However, yoghurt manufactured with *L. johnsonii* and *L. gasseri* and fortified with sodium caseinate plus starch showed the highest organoleptic score. It is suggested that the yoghurt of acceptable quality and high total probiotic bacterial count during storage can be made from milk supplemented with 0.5% (w/v) starch plus 0.5% (w/v) sodium caseinate. [Journal of American Science. 2010;6(11):357-367. (ISSN: 1545-1003).

**ABSTRACT:** In this work extraction oil from canola (*Brassica Napus*) seed with supercritical CO<sub>2</sub> extraction at pressure of 1500 to 2750 Psi , temperature of 308 to 333 k, and particles size 0.08 to 0.2 mm in flow rate 5 Lit/hr was investigated in a bench scale apparatus, The extraction was modeled by the sovova extended lack's model. The fluid phase mass transfer coefficient (k<sub>f</sub>), solid phase mass transfer coefficient (k<sub>s</sub>), and hardly accessible solute (x<sub>p</sub>) were a just able parameter of Models. The broken and intact cells model fit the experimental data, quite well, showing the applicability of the model to the supercritical extraction system studied here. [Journal of American Science. 2010;6(11):368-373. (ISSN: 1545-1003).

44

**Abstract: Background:** Psoriasis has been characterized by hyperproliferation accompanied by acanthosis and aberrant differentiation of keratinocytes. Several growth factors and cytokines, are assumed to be important. Recent studies indicate that various cytokines including tumor necrosis factor - ( TNF - ), IL - 2R and IL - 6 play an essential role in the induction and maintenance of psoriatic lesion. **Objectives:** To analyse relevant inflammatory mediators in the serum of patients with active psoriasis ( Psoriasis vulgaris ) of mild-to-moderate and severe psoriasis compared to healthy controls. **Patients / Methods:** Forty psoriasis patients were recruited from the dermatology outpatient clinic of Cairo University Hospital. Patients body mass index ( BMI ), waist circumference and psoriasis area and severity index. ( PASI ) were recorded. Fasting serum samples were obtained on enrolment. All the patients did not receive any treatment (locally or systemically), for at least four weeks before enrolment. Age, sex and ( BMI ) matched with forty healthy controls were also recruited. Serum TNF - , IL - 2R and IL - 6 levels were estimated using an Enzyme-Linked Immunosorbant Assay ( ELISA ) technique. The patients group were subdivided to two groups according to the diseases severity, PASI , into, mild-to-moderate psoriasis group and severe psoriasis group. **Results:** Serum TNF - , IL - 2R and IL - 6 were all statistically significant elevated in the patients group compared to healthy controls ( p < 0.05 ). Also they were all statistically significant increased in severe psoriasis compared to mild-to-moderate psoriasis ( p <0.05 ). **Conclusions:** These data support the view that serum TNF - , IL - 2R and IL - 6 are involved in the pathogenesis of

psoriasis, possibly by induction and maintenance of psoriatic lesion. We recommend a use of an array of these cytokines as a useful follow-up marker for monitoring of psoriatic patients and optimizing therapeutic strategies. Also we suggest the study of antisense therapy using the antibody of these cytokines in psoriatic patients. [Journal of American Science 2010;6(11):374-380]. (ISSN: 1545-1003).

**Abstract:** Food derived antioxidants have a strong potential for long term use as chemopreventive agents in disease states involving oxidative stress, such as hepatitis and alcoholic liver diseases. This study aimed to investigate the effect of different extracts of *Eruca Sativa* in ethanol induced liver injury in rats. Eighty eight male albino rats were divided into 3 main groups included control, prophylactic and treated groups using different extracts of *Eruca sativa*. Serum liver functions tests, lipid profile and oxidants/antioxidants profile were estimated. The results showed that *Eruca Sativa* extracts improved liver functions, Lipid profile and antioxidants parameters. We concluded that, *Eruca sativa* extracts may exert their prophylactic and treatment role against oxidative stress produced by ethanol by increasing/maintaining the levels of antioxidant molecules and antioxidant enzymes. [Journal of American Science 2010;6(11):381-389]. (ISSN: 1545-1003).

**ABSTRACT:** *In vivo* and *in vitro* extracted cardiac glycosides of immature seeds (IS) cultures of *Thevetia nerifolia* Jussieu. and *T. thevetioides* Kunth. were chemically identified. Calli were grown on modified Murashige & Skoog (MS) medium supplemented with 1mg/l 2,4-dichlorophenoxyacetic acid (2,4-D) +3mg/l kinetin (Kin). The content of cardiac glycosides in IS cultures of *T. nerifolia* and *T. thevetioides* were monitored by HPLC. Two major compounds were detected and isolated from IS extracts i.e. digitoxigenin and thevetin B. The different structures of the *in vivo* and *in vitro* isolated compounds were verified by means of MS and NMR spectral analysis, as well as those compounds were identified and determined using HPLC technique. **ABSTRACT:** Arresting the observed low productivity and continued decline in the output of rice especially in the face of rising population and the concomitant escalating increases demand has been a lingering socioeconomic problem. Continued increase in rice production through a number of options including expansion into high potential areas especially the inland valleys has been proposed. This study was designed to examine resource use efficiency in rice production systems in Abia State of Nigeria. Primary data collected from a sample of 142 farmers consisting of 46 inland valley, 41 upland and 55 swamp rice farmers were analysed by the ordinary least squares multiple regression analysis and analysis of variance (ANOVA). Results indicate that the upland rice farmers are technically more efficient than the swamp and inland rice farmers and that there is no difference in technical efficiency between the swamp and inland rice farmers. None of the farmer groups achieved absolute allocative efficiency. The upland rice farmers achieved least allocative efficiency ( $W_{ij}$  is farther from unity), underutilized all farm resources ( $W_{ij} > 1$ ) while both the inland valley and the swamp rice farmers under utilized farmland, other inputs and capital and over utilised ( $W_{ij} < 1$ ) family labour and hired labour. There was no significant difference in the mean output of rice from the production systems; upland, inland valley and swamp while each operated in region one on the production surface indicating that overall, resource levels could be increased to achieve higher levels of productivity in each system. Economic policies and programmes that could encourage the reallocation and if possible the redistribution of farm production inputs for increased farm productivity and efficiency were recommended. [Journal of American Science 2010;6(11):396-408]. (ISSN: 1545-1003).

**Abstract:** Field experiment was conducted in 2005/06 cropping season in Kombolcha to understand the comparative effect of organic and inorganic sources of soil ameliorant for managing surface soil crust under basin and furrow irrigation practices to boost potato production. A factorial experiment was conducted on plots of 12 m<sup>2</sup> (4 m x 3 m) and arranged in RCBD with three replicates, which combine irrigation methods and soil amendments. The treatments were the control (no amendment), FYM, *chat* residue (decayed leaves of *Chata edulis*) and sediment (sub surface inorganic material locally known as ‘decay dimma’). Results have, therefore, revealed that FYM and *chat* made compost significantly ( $p \leq 0.05$ ) improved moisture content, bulk density, porosity and infiltration rate over the sediment amended plot and the control. However, yield harvested from plots, which were amended with *chat*-made compost was significantly ( $p \leq 0.05$ ) lower than FYM under furrow irrigation practice. [Journal of American Science 2010;6(11):420-425]. (ISSN: 1545-1003).

**Abstract:** Social scientists and development agencies have long been interested in the conditions that empower women. Since the empowerment could give women freedom of choice, equal access to domestic and community resources, opportunities and powers, thus, empowerment of women and the improvement of their status, particularly in respect of education, health and economic opportunities (occupation), are highly important ends in themselves. However, there are many factors which stop women benefiting from such development and contribute to women’s powerlessness such as inequality in economic opportunity, lack of knowledge, skills, and lack of access to education. This study elucidates the relationship between socio-demographic variable of women and their empowerment in Shiraz, Iran. Indeed, this study discovered the effect of respondents’ background i.e., age, education, occupation, family income and marital status on their empowerment. Data was collected from 195 women who participated in empowerment process which organized by NGOs in the whole city of Shiraz. The result of study showed that among the socio-demographic variables, only education and marital status had effect on empowerment. It can be concluded that access to education and knowledge play an important role increasing women empowerment. The result of study also showed that the divorced women have high level of empowerment compare to married and widow women. This is might due to that married women couldn’t get their husband permission to participate in empowerment

process. [Journal of American Science 2010;6(11):426-434]. (ISSN: 1545-1003).

**Abstract:** Reports on ethnobotanical surveys reveal that a good number of plant species are being used by various tribal communities as emergency food. The present work deals with some parameters regarding nutritive value of leaves of *Oxalis corniculata*. L. used as alternative vegetable during emergency by some tribes of central India. The leaves have been found to be rich in moisture ( $82.42\pm 0.5\%$ ), total carbohydrate ( $24.67\pm 0.4\%$ ), crude protein ( $22.28\pm 0.5\%$ ), crude lipid ( $23.7\pm 0.5\%$ ), sodium ( $1.12\pm 0.02\%$ ), potassium ( $2.17\pm 0.31\%$ ), calcium ( $2.5\pm 0.08\%$ ), nitrogen ( $3.56\pm 0.70\%$ ) and magnesium ( $0.25\pm 0.03\%$ ). **Abstract:** The aim of this study was to investigate the effects of sports participation on the psychological stress levels of female students 15-18 years old. Psychological stress is defined as a collection of nonspecific reactions against organisms in reflections and exposure to any factor that should be faced. Stress control includes several factors, and, in particular, sports participation is thought to be effective. This quasi-experimental research was performed using pre-test plan-test, after-test, and control groups. Research subjects for the control group were 30 people chosen randomly. The subjects of stress were tested by a 40-item stress questionnaire and then tested in step independent variable "Sports participation" included volleyball education and skills training for three months and three weekly sessions of 75-90 minutes. This was carried out to investigate its effect on the dependent variable "stress." We did not observe any statistically meaningful difference between the mean scores of stress-control group and experiment group scores at pre-test in  $p<0.05$ ; however, statistically meaningful differences were observed between the mean scores of stress control group and experiment group scores on the post test stage ( $p<0.05$ ) and between the mean scores of stress in the control group pre-test and

post-test in ( $p<0.05$ ). In addition, A statistically meaningful difference was observed statistically meaningful differences were observed between the mean scores of stress in the experiment group pre-test and post-test ( $p<0.05$ ). [Full text](#)

**ABSTRACT:** The effect of atmospheric turbulence on the diffraction-limited imaging of celestial bodies is one of the major problems in observational astronomy. The speckle interferometric technique was introduced in the 1970s to solve this problem. The technique is used to decode the diffraction-limited spatial Fourier spectrum and image features of the celestial objects, using a series of short-exposure (< 20 ms) images. Since most common binary orbit periods vary from 10 to 30 years, a large number of these binary systems, studied using the speckle data, completed one or two revolutions. In this study, an algorithm developed by the Indian Institute of Astrophysics (IIA) and an algorithm developed by Hartkopf's group at Georgia State University were used to plot the orbits of two binary systems, 00122+5337=Bu 1026AB and WDS 04136+0743 = A1938. The orbital parameters of these binary systems have been calculated using speckle data and other interferometric data. The former algorithm is based on standard least square technique with iterative improvement of the orbital parameters. Unlike the latter algorithm, the former algorithm does not require any previous knowledge of the period and the eccentricity of the binary systems. The results of this comparative study have shown that both algorithms generate almost the same orbital parameters. However, the algorithm developed by the IIA requires fewer steps to calculate the orbital parameters of these binary systems. [Journal of American Science 2010;6(11):442-448]. (ISSN: 1545-1003).

**Abstract:** Ethnomedically genus *Origanum* L. is one of the most commonly used herb in many countries as a stimulant, analgesic, antitussive, expectorant, sedative, anti-inflammatory and antihelminthic agent. The hepatoprotective and therapeutic effects of *Origanum syriacum* aqueous methanolic extract on paracetamol induced liver cell damage in mice with respect to antioxidant status was investigated. Mice were treated with extract and sylimarin in recommended dose after or before paracetamol administration (400mg/ kg/ day). Lipid peroxides concentration was considerably

54

decreased due to the elevation of reduced glutathione concentration(GSH) and enhancing of glutathione reductase(GR), glutathione transferase(GST), glutathione peroxidase (GPx)and superoxide dismutase(SOD) activities as compared to paracetamol or sylimarin treated mice. Liver function parameters are still in the normal levels in extract treated mice as compared to control. Using extract as a treating agent after subjecting mice to paracetamol gave better results, the liver tissue showing a nearly normal liver tissue except for a little cellular infiltrate around main blood vessels while sylimarin showing a noticeable dilatation of blood vessels that are surrounded by fibrosis and cellular infiltration. Liver tissue from mouse received *Origanum* extract and then paracetamol showing mild dilatation of blood sinusoids and cellular infiltration around main blood vessels while sylimarin treated mice showed marked dilatation of blood sinusoids, vacuolar degeneration in many of the hepatocytes and focal necrotic areas among the hepatocytes. In conclusion, *Origanum syriacum* extract has potent therapeutic activity than hepatoprotective activity and it is more effective than sylimarin in two cases. The plant extract was screened for its phytochemical constitutions.

**Abstract:** The objective of the present study was to determine the effects of *Lactobacillus acidophilus* on the sensory attributes, ripening time, and composition of Gouda cheese and to investigate the survival of *L. acidophilus* during ripening. Five types of Gouda cheeses, control cheese (Tc), made with with mesophilic lactic starter bacteria, Ta1, Ta2 , Tb1 and Tb2 cheeses made using modified mesophilic

lactic starter bacteria by freeze-shocked at -10°C/-20°C for 24 , 96 hrs and probiotic Lactobacillus, as adjunct culture. Cheese samples were assessed for microbiological and compositional properties, proteolysis, and sensory evaluation at different ripening stages. The composition and the pH value were almost identical between control and experimental vats within a single trial cheese. Characterization of proteolysis of gel electrophoresis of cheese samples at various stages of ripening showed that the extent of casein degradation varied between samples in all cheeses,  $\alpha_1$ -Casein was more extensively degraded than  $\beta$ -casein. However, levels of soluble nitrogen (SN/TN) increased with ripening period for all cheeses, only moderate enhancement of proteolysis as in amino acid -N in all trials. The formation of non protein nitrogen (NPN/TN) was slightly increased compared to control at the end of ripening. Organoleptic evaluation showed that probiotic cheese had higher sensory evaluation than control cheese, without probiotic strain. The population of Lactobacillus survived to numbers  $> 10^7$  cfu/g, which is necessary for positive effects on health. These results showed that the contribution of modified mesophilic lactic starter bacteria by freeze-shocked and probiotic strain as adjunct culture can be successfully used in production of Gouda cheese.

#### **Gap Analysis for Protected Areas of Andhra Pradesh, India for conserving biodiversity**

C. Sudhakar Reddy

Forestry and Ecology Division, National Remote Sensing Centre, Indian Space Research Organisation, Balanagar, Hyderabad -500 625, India. [drsudhakarreddy@gmail.com](mailto:drsudhakarreddy@gmail.com)

**Abstract:** A gap analysis was carried out to assess the Protected Area (PA) network system in Andhra Pradesh, India. The decisive factors of vegetation type distribution, elevation and endemism was used to determine the representativeness of PA system. In Andhra Pradesh, vegetation cover occupies 23.03% of geographical area and distributed in Coastal Plains, Deccan Plateau and Eastern Ghats. There are 27 PAs for conservation in Andhra Pradesh. The total area protected for biodiversity is about 12,555 km<sup>2</sup> or 4.56% of geographical area of Andhra Pradesh. Of the three physiographic regions, Eastern Ghats represents very high area under PAs which was estimated as 7811.38 km<sup>2</sup> followed by Deccan plateau of 3526.89 km<sup>2</sup>. Three main forest types (semi evergreen forests, thorn forests and dry evergreen forests) missing in the existing PA network were identified. Moist deciduous forests of Eastern Ghats of northern Andhra Pradesh were under-represented in PAs. The land area in an elevation range of 900m-1527m was not included in PA network. Of the 103 species of endemics, 64 species were not included in PA system. Many PAs are experiencing threat from invasive species, forest fires, grazing pressure etc. There is a need to consider for possible ways for effective conservation and to extend the present PA network system in India.

**Abstract:** Three rhizobacteria and two yeasts isolates were used as biocontrol agents against *Meloidogyne incognita* in laboratory and greenhouse. The used biocontrol agents were identified as *Bacillus amyloliquefaciens*, *Brevibacterium otitidis*, *Sanguibacter inulinus*, *Candida incommunis* and *Wicherhamiella domercqiae*. They inhibited the egg-masses hatching *in vitro* and exhibited strong nematicidal activity by killing the second stage juveniles of *Meloidogyne incognita* to various degrees in greenhouse. The most effective treatment was the complete culture of the four biocontrol agents (propagules and filterate) suppressed galls and egg-masses formation by 100% *Br. otitidis* reduced galls and egg-masses by 43.7 and 52.19 %, respectively compared with the untreated control. The microorganisms used in greenhouse test reduced nematode populations in the rhizosphere and promoted the growth of tomato plants over the control treatment.

[Moussa Lobna and Hanaa Zawam. Efficacy of some Biocontrol Agents on Reproduction and Development of *Meloidogyne incognita* Infecting Tomato. Journal of American Science 2010;6(11):495-509]. (ISSN: 1545-1003).

**Key words:** Biocontrol; *Meloidogyne incognita*; tomato; Rhizobacteria; yeast

**Phytochemical and Elemental Analysis of *Acalyphe wilkesiana* Leaf**

\*Madziga, H. A.<sup>1</sup>, Sanni S.<sup>2</sup> and Sandabe U. K.<sup>1</sup>

[hannamadziga@yahoo.com](mailto:hannamadziga@yahoo.com)

**ABSTRACT:** Phytochemical and Elemental determination of *Acalyphe wilkesiana* was conducted. The result of the Phytochemical analysis of the aqueous leaf extract of *A. wilkesiana* revealed a high presence of carbohydrates, Tannins and Flavonoid, a moderate presence of Phlobatannins, Saponins. Alkaloids and Cardiac glycosides and minute quantity of Terpenes and Steroids. Anthraquinone derivatives was not present. The Elemental analysis showed presence of chloride, sodium, potassium, calcium, iron, magnesium, zinc copper and manganese in moderate quantity while cadmium and lead were not detected. It is therefore concluded that the aqueous leaf extract of *A. wilkesiana* contains

**Abstract:** This study was conducted to evaluate the effect of feeding buffalo cows on ration supplemented with two levels from iodine (I) during late pregnancy (three months before parturition) and postpartum period (six months after parturition) on nutrients digestibility, some blood constituent, birth weight of their offspring, Concentrations of immunoglobulin in colostrums, milk (yield and composition) and reproductive parameters. Eighteen buffalo cows (2-4 lactations) in late pregnancy period were selected to carry out the experimental work. The animals were divided into three similar groups (6 female buffaloes in each). Concentrate feed mixture (CFM), berseem hay (BH) and rice straw (RS) were given to animals as a control ration ( $I_0$ ) without supplementation, while the other groups  $I_1$  and  $I_2$  received the control ration with iodine at levels of 0.3 and 0.5 mg I per kg DM intake /h/d, respectively. Results indicated that supplementation ration of buffalo cows with different levels of I had improved the digestibility of all nutrients, TDN, DCP at pre and post partum, feed efficiency, increased milk yield, 7% fat correct milk yield and its composition. Birth and weaning weight of calves in treated groups were higher than that control group. Immunoglobulin concentration in colostrums indicated higher values with animals feed supplemented rations than those fed the control. Moreover, addition of I improved RBC, WBC, Hb, PCV, plasma total protein, globulin, glucose, T<sub>3</sub> and T<sub>4</sub>. Supplemented rations of buffalo cows with 0. 5 mg I/h/d tend to significantly ( $P < 0.05$ ) higher in actual milk yield, 7% FCM yield, fat %, protein %, lactose %, SNF % and TS %, while supplemented with 0. 3 mg I/h/d appeared to the same higher trend with no significantly differences. Moreover, better feed efficiency was observed with animals fed supplemented rations. The periods required for fetal membrane expulsion was significantly reduced in  $I_2$  group when compared to  $I_1$  or control groups. Moreover, only control group showed a case of abortion and still birth, while treated dams delivered 100% healthy calves. Buffaloes of group  $I_2$  had the least ( $P < 0.05$ ) calving interval due to the shorter intervals for uterine involution, onset of the 1<sup>st</sup> postpartum heat and days open. Iodine supplementation showed significant differences among groups in studied parameters such as NSPC and CI. Mean period elapsed from calving until placenta drop significantly decreased  $I_2$  than the control group. Generally, it concluded that I supplementation for ration of buffalo cows improved immunity, nutrients digestibility, calves birth weight and increased milk (yield and composition) and showed better feed efficiency as well as higher some traits of reproductive performance.

**ABSTRACT:** This study utilized the integrated theoretical model (ITM) to assess strategies to ameliorate screening for sickle hemoglobinopathies in the age of genomic medicine. Also discussed, is the relevance of predictive, preventive, personalized and participatory interventions. Comparison was made between universal and targeted screening. The international guidelines for neonatal screening were reiterated. The self-efficacy and empowerment of mothers is crucial in ensuring that they effectively participate in the treatment and follow-up of their new-born babies. We emphasized the compliance with the ethical, legal and social implications of newborn screening for genetic diseases.

**Abstract:** A total of 100 nasal swabs as well as blood samples were collected from 75 diseased calves suffered from respiratory manifestations and 25 apparently healthy calves of ages ranges from 2-12 month old from three herds. Also 80 clinically pneumonic lung specimens of slaughtered calves were collected from El-warak and El- moneeb abattoir. All were examined to establish the extent of involvement of Bovine Viral Diarrhea (BVDV), *Mycoplasma* species (*M. spp.*) and *Mannheimia haemolytica* (*M. haemolytica*) in cases of chronic calf pneumonia. On virological studies, AGPT and commercial ELISA kits were rapid and accurate tests for detection of BVDV antigen. BVDV was isolated on MDBK cell line from Buffy coat, nasal swabs collected from diseased calves and lung specimens. The isolated virus was identified by IFAT using reference antisera. Also 100 serum samples collected from diseased and apparently healthy calves were tested by VNT for the detection of neutralizing antibodies against BVDV. Moreover, on bacteriological investigation. *M. haemolytica* were recovered from lung specimens of slaughtered calves as well as nasal swabs of diseased ones and apparently healthy ones. The isolated strains were biotyped as biotype A (56 isolates, 80 %) and biotype T (14 isolates , 20 %). The resistance of the isolates to most antimicrobial agents was high to ceftiofur, nalidixic acid, gentamicin, oxytetracycline, and cephalexin. While they were highly sensitive to norfloxacin, ampicillin and erythromycin. Although, *Mycoplasma* species recovery rate from the examined nasal swabs of pneumonic calves was (46.67%) relatively higher than that recovered from apparently healthy calves (32.00%), the isolation rate from the examined lung tissues reached to (25.0%). The most prevalent isolated species was *M.bovis* followed by *M.dispar*, then glucose positive, arginine negative species. Considering the mixed infection, results showed that, simultaneous isolation of the three pathogens from nasopharyngeal swabs of the examined pneumonic calves was relatively

high (12.00%), followed by simultaneous isolation of BVDV & *Mycoplasma sp* as well as *M.haemolytica* & *Mycoplasma sp.* (9.33%). On the other hand, there was simultaneous isolation of both BVDV and *M.haemolytica* from nasopharyngeal swabs of (8.00%) out of the examined pneumonic calves. Examination of 80 clinically pneumonic lung tissues of slaughtered calves that were collected from abattoirs revealed that, a high percentage (17.50%) of examined lung tissues colonized both *Mycoplasma sp.* and *M.haemolytica* together. On the other hand, simultaneous isolation of the three pathogens was detected in (3.75%). However, simultaneous isolation of both BVDV and *Mycoplasma sp.* as well as BVDV and *M.haemolytica* was recorded in (2.50%) of examined lung tissues. Regarding histological studies of lung tissue specimens, there were five types of pneumonia distinguished according to types of necrosis, and cellular infiltrations in relation to microbial isolation, Caseonecrotic bronchopneumonia, 3.75%, Fibrino-necrotizing bronchopneumonia 12.5%, Acute and chronic fibrinosuppurative bronchopneumonia 13.75%. In conclusion *M. bovis* showed two necrotic patterns, where an original focus of coagulative necrosis evolves with time into caseous necrosis ended by fibrosis.

**Abstract:** Objectives: the aim of this study was to evaluate the efficiency of denture adhesives in improving phonation in complete denture wearers and to compare the efficacy of three different types of denture adhesives. Methodology: Fifteen completely edentulous patients with flat mandibular ridge shared in this study, complete denture was constructed for each patient according to the conventional method. Phonetic analysis was performed in the Phoniatric Unit via both Perceptual and Acoustic techniques to compare the efficacy of three chemically different denture adhesives (Super corega, Fittydent and Fixodent) on Arabic phonemic production. Results: a marked improvement in patients' articulation after application of the denture adhesives was reported, perceptually and acoustically, where the Fixodent denture adhesive gave the highest values. Conclusion: Whenever possible, denture adhesives should be used to improve retention and articulation. The polymethylvinyl ether malate-based adhesives (Fixodent) are strongly recommended as a highly reliable type of denture adhesives.

**Abstract:** The aim of this study is to assess working memory (WM) abilities in normal children and Children Who Stutter (CWS) then to compare the results in order to detect if WM deficits have a role in the development of stuttering. 30 normal children and 30 children who stutter were subjected to WM recall abilities tests and nonword repetition tasks. The WM recall tests included recall of word sets different in length and rhyming, digit span, letter sequences and picture-number test. The nonword repetition test was used to assess phonological encoding through measuring number of phonological errors produced on repeating the task, and to measure the reaction time. The children who stutter (CWS) had performed poorly on some working memory tests compared to the control group. Conclusion: Children who stutter may have diminished ability to recall nonwords and some of working memory abilities and that further investigation into this possibility may shed light on the emergence and characteristics of childhood stuttering.

Nobaya Ahmad

Department of Social and Development Sciences, Faculty of Human Ecology, Putra University, Malaysia. Email: [nobaya@putra.upm.edu.my](mailto:nobaya@putra.upm.edu.my)

**Abstract:** The purpose of this paper is to describe the citizen's attitude toward local government and its relationship with level of participation. Participation in local government issues, requires a favorable attitude towards local government, councilors and councils' performance in terms of efficiency. The paper is based on the study of citizens' attitude towards local government, which was carried out in Torbat Hedarieh city, Iran. The analysis of data uses Pearson correlation to determine the relationship between variables involved. The findings revealed that two level of ladder participation (Tokenism and Citizen-power) have positive and significant relationship with attitude, while Non-participation level of ladder participation has negatively significant relationship with attitude. The findings of the study imply that those respondents who have positive attitude toward local government, councilors and council performance, would have the higher tendency to be actively involved in higher levels of participation, whereas who have negative attitude toward local government, would put less effort in higher levels of participation.

**Algal Abundances and Growth Performances of Nile Tilapia (*Oreochromis niloticus*) as Affected by Different Fertilizer Sources**

M.A. Elnady\*, H.A. Hassanien, M.A. Salem and H. Marian Samir

Department of Animal Production, Faculty of Agriculture, Cairo University, Giza , Egypt.  
[melnadyahmed@yahoo.com](mailto:melnadyahmed@yahoo.com)

**Abstract:** The experiment was designed to study the effect of different fertilizer sources (chemical fertilizer, organic fertilizer or combined chemical +organic fertilization) on plankton abundances , growth performances of Nile tilapia juveniles and water quality parameters in concrete tanks compared to feeding fish at satiation .The average secchi disk readings were shallower in the chemical and combined fertilizer treatments compared to those of the ration and organic fertilizer treatments as a result of increased algal density and abundances. Ammonia and orthophosphate concentrations in the chemical and combined fertilizer treatments were higher with an increase in algal growth, abundance. Within fertilizer treatments, the daily weight gains of Nile tilapia reared in the chemical and combined fertilizer treatments (0.43 and 0.5 g/fish/day, respectively) were significantly higher than those reared in the organic fertilizer treatment (0.32g/ fish/ day). This indicated that the use of chemical fertilizer in a fertilization program is superior in increasing fish growth compared to that of the organic fertilizer .It can be concluded that Nile tilapia juveniles can obtain major nutritional requirements for growth( 48% of its total feed requirements) from feeding only on algae during this stage of growth. Results of the current experiment recommended that organic fertilizer should not be used as sole source in fertilizer programs and should be combined with chemical fertilizer in order to produce good algal growth necessary for the nourishment of farmed fish.

[M.A. Elnady, H.A. Hassanien, M.A. Salem and H. Marian Samir. Algal Abundances and Growth Performances of Nile Tilapia (*Oreochromis niloticus*) as Affected by Different Fertilizer Sources. Journal of American Science 2010;6(11):584-593]. (ISSN: 1545-1003).

**Abstract:** This study examined whether, spiritual intelligence (SI) and emotional intelligence (EI) can be considered as predictor for mental health. The present investigation was also to test the moderating effects of age on the relationship of SI and EI with mental health among high school students. The participants in the study were 247 High school students (124 male and 123 female) in the age range of 14-17 years old, at the Gorgan City, north of Iran. Three valid and reliable instruments were used to assess SI, EI and mental health. Descriptive statistics, multiple and moderated regression analysis were used to analyses the data. The result demonstrated that mental health can be influences by SI and EI. In addition, the moderated effect of age on the relationship of SI and EI with mental health was not found.

[Jafar Shabani\*, Siti Aishah Hassan, Aminah Ahmad, Maznah Baba. Age as Moderated Influence on the Link of Spiritual and Emotional Intelligence with Mental Health in High School Students. Journal of American Science 2010;6(11):394-400]. (ISSN: 1545-1003).

[Full text](#)

**Abstract:** Nicotine is a major toxic component of cigarette smoke and it is a major risk factor in the development of functional disorder of several organ systems. The natural diet contains a variety of compounds that exhibit protective effects towards different toxicities of nicotine as green tea. Four groups of male Swiss albino mice were divided: untreated control group; Nicotine-treated group (2.5 mg/kg/day); Green tea-treated group (40 mg/kg./day); and Nicotine and green tea treated group interperitoneal administration for successive 28 days. Results showed that disorganization of the seminiferous tubules associated with reduction of spermatogenic cells, leading to widening of lumen of tubules upon nicotine toxicity. Many of seminiferous tubules exhibited degenerative phases of spermatocytes and spermatides as well as missing of sperms and hypo-spermatogenesis. The recorded data in nicotine intoxicated group showed significant and gradual decrease of number of leydig cells throughout all intervals of experiment. In the last, cytogenetically examination demonstrated significant increased in the number of nucleated polychromatic erythrocytes (MnPCE) and decreased in number of polychromatic erythrocytes (PCE) in bone marrow of nicotine-treated animals using micronucleus assay. Green tea treatment reduced number of nucleated polychromatic erythrocytes (MnPCE) and restored number of polychromatic erythrocytes (PCE) to nearly normal. In conclusions, intake of green tea might suppress the toxicity and mutagenic activity of nicotine.

### Mohammad Taleghani

Assistant professor, Islamic Azad University - Rasht Branch, IRAN. [Taleghani@iaurasht.ac.it](mailto:Taleghani@iaurasht.ac.it)

**ABSTRACT** - Probably, the greatest single deterrent to tourism development is the lack of appreciation and enthusiasm for tourism by civic and business leaders. When tourism is not understood and its benefits are unclear, planning and implementation of measures to improve the industry are often lacking. Notably, global tourism has become the largest industry in the world, with nearly 500 million consumers of tourism services per year spending hundreds of billions of dollars. The industry provides employment to over 100 million people worldwide. Thus, in view of tourism's increasing role in economic activity, the factors affecting its performance should be analyzed. An understanding of these factors is crucial to determine the ways in which national and international financial institutions, NGOs and other entities can play the most value-adding role. This paper provides a brief profile of key factors and trends in tourism and their economic effects at the global, national and regional levels.

### Impact of Metformin on Immunity and Male Fertility in Rabbits with Alloxan- Induced Diabetes

**Naglaa, Z.H. Eleiwa<sup>\*</sup>; Hesham, A.M.; Hosny Abdel Fadil and Abdel Motal, S.M.**

Dept. of Pharmacology, Faculty of Veterinary Medicine, Zagazig University, Egypt.  
<sup>\*</sup>[eleiwa02@yahoo.com](mailto:eleiwa02@yahoo.com)

[Full text](#)

**Abstract:** A study was designed to explore the possible side effects of metformin on immunity and fertility of male rabbits with alloxan- induced diabetes. Sixteen adult male rabbits were used in this study, they were classified into four equal groups as follows: the first group received neither alloxan nor metformin and remained as control group. Rabbits in the 2<sup>nd</sup> group were orally treated with metformin at a dose of 120 mg/kg b.wt once a day for 3 months .Rabbits in the 3<sup>rd</sup> group were administered alloxan, I/V, at a single dose of 100 mg/kg b.wt.Rabbits in the 4<sup>th</sup> group were administered alloxan ( 100 mg/kg b.wt, single I/Vdose ) then treated orally with metformin (120 mg/kg b.wt.) once daily for 3 months. Rabbits in all groups were subcutaneously injected with 2 ml polyvalent rabbit pasteurellosis vaccine after two months from the beginning of experiment for studying the immunological profile of the drug. Treatment of diabetic and non-diabetic rabbits with metformin evoked a significant decrease ( $P < 0.05$ ) in nitric oxide production on the 1<sup>st</sup> and the 2<sup>nd</sup> day post vaccination .In response to treatment with metformin, rabbits demonstrated a significant decrease ( $P < 0.05$ ) in serum lysozyme activity on the 1<sup>st</sup>, 2<sup>nd</sup> , 3<sup>rd</sup> day and in the 1<sup>st</sup> week post vaccination while diabetic rabbits treated with metformin showed a significant decrease ( $P < 0.05$ ) in serum lysozyme activity on the 3<sup>rd</sup> day and on the 1st , 3rd and 4th week post vaccination . In addition, treatment with metformin of diabetic and non-diabetic rabbits resulted in a significant decrease( $P < 0.05$ ) in testicular weight , sperm cell count, sperm motility and serum testosterone with a significant increase in sperm abnormalities and dead sperm %. Summing up our observations, the present study calls into question the justification for the use of metformin in a frame of a therapeutic strategy for diabetes due to its resulting negative impact on immunity and male fertility.

[Naglaa, Z.H. Eleiwa; Hesham, A.M.; Hosny Abdel Fadil and Abdel Motal, S.M. Impact of Metformin on Immunity and Male Fertility in Rabbits with Alloxan- Induced Diabetes. Journal of American Science 2010;6(11):417-426]. (ISSN: 1545-1003).

### Amniotic Membrane Extract for Acute Ocular Chemical Burns

**Hosam Sheha, Hisham Hashem, Lingyi Liang, Mohamed Ramzy, , Ahmed ZaKi**

[Full text](#)

73

**Abstract:** Background: Ocular chemical burns induce devastating and permanent damage to the ocular surface. Rapid intervention is required for maximal visual rehabilitation. Amniotic membrane transplantation (AMT) may save the ocular surface, however it introduces a potentially unnecessary surgical trauma in such compromised eyes. Amniotic membrane extracts (AME) could be a practical substitute of AMT in acute chemical burn. Aim: To evaluate the efficacy of topical AME in the management of acute ocular chemical burn. Methods: Non-comparative interventional case series. Six eyes of 4 consecutive patients with mild to moderate acute chemical burn, exhibiting persistent epithelial defect, inflammation and haze despite extensive conventional therapy were recruited. Topical AME was prepared and added to the conventional treatment within 2 days of the injury. Pain relief, inflammation, haze, and corneal epithelial healing were monitored. Results: Pain was significantly relieved, and inflammation was markedly reduced in all cases. The corneal epithelial defects rapidly healed while visual acuity improved within 11 (range 4-23) days. During an average follow-up period of 6 months (range, 3-8 months), all eyes retained stable surface with improved corneal clarity without neovascularization or symblepharon. Conclusions: Topical application of AME could be an effective adjunct in the treatment of mild to moderate cases of acute chemical burns. It allows non-traumatic and economic early intervention to promote epithelialization, reduce pain, haze and inflammation in acute phase, and prevent cicatricial complications in chronic phase. This result justifies additional large series controlled studies in the future.

[Hosam Sheha, Hisham Hashem, Lingyi Liang, Mohamed Ramzy, Ahmed ZaKi. Amniotic Membrane Extract for Acute Ocular Chemical Burns. Journal of American Science 2010;6(11):427-433]. (ISSN: 1545-1003).

**Abstract:** Biochemical and molecular characterization of eight tomato varieties were carried out based on seed storage proteins electrophoresis and RAPD markers. The electrophoretic pattern of water soluble protein produced 4 monomorphic bands, 6 polymorphic band and 3 unique bands .The pattern of non soluble protein produced 9 bands, one band is unique and considered a positive specific band of tomaten cartago variety and the others are polymorphic bands. RAPD results revealed a high level of polymorphism among the studied genotypes. All of the seven random primers screened gave reproducible polymorphic DNA bands. A total number of 81 amplified DNA bands were generated across the studied genotypes with average of 11.57 bands /primer. 37 bands out of the total number were polymorphic and 19 were unique. Combination of the all data derived from the SDS-protein markers of both water soluble and non soluble proteins produced a dendrogram almost similar to that obtained by the RAPD analysis. It could be concluded that, both of SDS-Protein and RAPD markers are equally important for genetic analysis and indicate a considerable amount of genetic diversity between the different studied varieties of *Lycopersicon esculentum* L.

**Abstract:** **Objective:** To assess the effect of acidulated phosphate fluoride gel (APF), sodium fluoride varnish (NaF) and casein phosphopeptide-amorphous calcium phosphate fluoride paste (CPP-ACPF) on the dental erosion produced by coca cola in primary and permanent teeth. **Design:** Sixty extracted human primary molars ( $n = 30$ ) and young permanent premolars ( $n = 30$ ) were used in this study. The coronal portion of each tooth was removed and transversely sectioned from the mesial to distal surface using a diamond coated saw blade. The crown sections were embedded in acrylic resin blocks leaving the enamel surfaces exposed. The enamel surfaces were ground and polished. Test specimens were randomly assigned to one of three groups each of 10 according to the protective agent used: APF gel (1.23% F), NaF varnish (2.26% F), and CPP-ACPF paste (0.2% F). Half of the exposed enamel surface was protected with adhesive tape during the treatment of the remaining surface according to their group. Fluoride gel and CPP-ACPF paste were applied for 4 minutes and fluoride varnish for 24 hours. Six daily demineralisation–remineralization cycles of 5 minutes of immersion in a cola drink (pH 2.3) and 30 minutes in artificial saliva were conducted for 14 days. All specimens were stored in artificial saliva between and after cycles. Surface Vickers Micro-hardness readings were recorded at baseline and 14 days later for both halves. Percentage surface microhardness reduction (%SMHR) was then calculated. Data were analyzed using ANOVA and Duncan's post-hoc test ( $p < 0.05$ ). **Results:** For primary enamel, the mean ( $\pm SD$ ) % surface microhardness reduction (SMHR) for treated and untreated half was, respectively: gel ( $18.6 \pm 3.3$  and  $29.6 \pm 6.7$ ), varnish ( $29.3 \pm 9.6$  and  $33.9 \pm 12.2$ ), and CPP-ACPF paste ( $29.8 \pm 15.4$  and  $34.8 \pm 12.2$ ). For permanent enamel, such values were: gel ( $28.7 \pm 16.3$  and  $35 \pm 16$ ), varnish ( $42.9 \pm 2$  and  $49.6 \pm 1.6$ ) and CPP-ACPF paste ( $23.6 \pm 8.8$  and  $36.7 \pm 16.3$ ). Analysis of Variance (ANOVA) was used to compare between means of the three groups at  $P < 0.05$ . **Conclusions:** All of the tested fluoride treatments were able to reduce erosive enamel loss in both primary and permanent groups but both CPP-ACPF paste and APF gel showed significantly higher protective anti-erosive effect in permanent teeth. In primary teeth only APF gel showed significantly higher anti-erosive effect. Primary and permanent enamel substrates reacted differently to different fluoridated compounds.

**Abstract:** The diatoms of Ologe lagoon for the first time were studied at monthly intervals for two years (February 2002-January 2004). A total of forty-eight species belonging to eighteen genera was found in diatoms, with pinnate forms being more diverse and less abundance than the centric forms. *Aulacoseira granulata*, *A. granulata* var. *angustissima*, *A. granulata* var. *angustissima f.spiralis*, *A. granulata* var. *angustissima f. curvata*, *A. granulata* var. *muzzaensis*, *A. islandica* and *Cyclotella meneghiniana* were

the more abundant and frequently occurring centric species throughout the study period. More frequently occurring pennate diatoms include: *Synedra ulna*, *Nitzschia closterium*, *Pinnularia major*, *Navicula oblonga*, *Cymbella minuta*, *Nitzschia palea*, *Suirella elegans* and *Gomphonema parvulum*. Rarely occurring diatoms at this station included *Biddulphia laevis*, *Melosira varians*, *Nitzschia accicularis*, *Pinnularia laevis*, *Cocconeis placentula* and *Eunotia gracilis*. In this study, six new diatoms species were recorded for Lagos lagoon complex. Community structure analysis shows a highly diverse environment.

#### Can Dermatoglyphics be used as an Anatomical Marker in Egyptian Rheumatoid Patients?

Hanan M. Elsaadany<sup>1</sup>, Elham Kassem<sup>1</sup>, Mervat El-Sergany<sup>\*1</sup> and Abdel -Razek A. Sheta<sup>2</sup>,

<sup>1</sup>Rheumatology & Rehabilitation, <sup>2</sup>Anatomy Departments, Faculty of Medicine, Tanta University, Tanta, Egypt. [\\*elahm77@hotmail.com](mailto:*elahm77@hotmail.com)

**Abstract:** Background/aim: Rheumatoid arthritis (RA) is supposed to be influenced by genetic and environmental factors and so also dermatoglyphics. Therefore, the present study was undertaken to find out a possible correlation of some quantitative and qualitative dermatoglyphic variables with rheumatoid arthritis (RA) and its radiological grading. Materials and methods: This study was conducted on 60 clinically confirmed RA patients and an equal number of controls. Different qualitative dermatoglyphic patterns (ulnar& radial loops, whorls and arches) and quantitative dermatoglyphic measures (total finger ridge count, pattern intensity and a-b ridge count) in addition to palmar creases were studied on rheumatoid arthritis patients and controls. Comparison between patients and controls in both sexes was done and recorded. Also, correlation between significant dermatoglyphic changes in RA patients and radiological changes were studied. Results: Loops were the most common type of the qualitative dermatoglyphic patterns of the fingers, followed by whorls then arches. In both male and female patients, there was significant marked decrease in ulnar loops and significant increase in arches. Total ridge count and pattern intensity of patients were decreased in both hands of both sexes; however, this decrease was significant in the left hand of males and right hand of females. Moreover, the a-b ridge count was significantly decreased in both hands of female and left hand of male patients. Regarding the unusual palmer flexion creases, there was significant increase only in the Sydney line in female right hands. Significant inverse correlation was noted between total ridge count of the fingers and the radiological erosion in both males and females. Conclusion: The findings of the present work demonstrate the association between some dermatoglyphic patterns and RA suggesting that dermatoglyphics can represent an anatomical, non-invasive, inexpensive tool for screening high-risk population, and thus facilitate early detection and management. Also the relationship between total ridge count and the aggressive type of RA indicate that this dermatoglyphic variable might play a significant role not only for screening but also for studying the behavior of the disease.

**Abstract:** Eighty six cultures were isolated from soil of different Egyptian Governorates including Quina, El-Menofeya, El-Gharbia, El-Sharkia, El-Behera and Kafr EL-Sheikh Governorates. Investigations on the mosquitocidal Egyptian isolates have revealed that isolate No.1 have the ability to form more toxin than the international reference strain *Bacillus sphaericus* 2362(Bs 2362).The selected isolate No.1 exhibited a lower LC<sub>50</sub> and LC<sub>90</sub>values than the International strain *B.s* 2362 upon bioassay against second instars' larvae of *Culex pipiens*. The Egyptian isolate No.1was identified morphologically and biochemically as *Bacillus sphaericus*. Physiological factors affecting growth and toxin formation in *B. sphaericus* No 1 in comparison to *B.s* 2362 were carried out. THE organism grown on modified Nutrient broth medium yielded the highest larval toxicity against the second instars' of *Culex pipiens* for both *Bacillus sphaericus* isolate No 1 and the international strain *Bacillus sphaericus*. The Optimum air : medium ratio were 9:1 and 4:1 of the flask volume for 4 and 3 days incubation periods using 2%and 3% sizes of inocula for *B. sphaericus* 2362 and the Egyptian isolate *B. sphaericus*No.1, respectively. Sodium acetate was the suitable carbon source for the isolate *B. sphaericus* No.1, while *B.s* 2362 was capable to utilize both sodium acetate and sodium succinate as carbon sources.The Egyptian isolate *B. sphaericus* No.1exhibited the highest mosquitocidal activity upon growth on kidney beans seeds and sesame meal as nutrient substrates at 3% final concentration, while *B.s* 2362 exhibited the highest mosquitocidal activity by utilizing soy beans, lentils and sesame meal as complete media for growth and mosquitocidal toxin production.

**Abstract:** Accurate, precise and reproducible isocratic RP-HPLC method was developed and subsequent validated for the analysis of Torasemide (I), Irbesartan (II) and Olmesartan medoxomil (III) at ambient temperature, using Atlantis 4.6 mm x 250 mm RP-C18 Column, with a flow rate of 1.5 ml.min<sup>-1</sup>, and UV. detector at 288 nm and 260 nm for (I) and (II and III), respectively. By adopting the mentioned chromatographic technique, (I) and (III) were determined in the presence of their acidic and alkaline-degradates separately as stability-indicating methods utilizing phosphate buffer pH = 3:acetonitrile (60:40, v/v), phosphate buffer pH = 3.2:acetonitrile (60:40, v/v) as a mobile phase, respectively, while (II) was determined in presence of Hydrochlorothiazide (HCTZ), using phosphate buffer pH = 4:acetonitrile (70 :30, v/v). All the proposed methods were validated according to the International Conference on Harmonization (ICH) guidelines and successfully applied to determine the mentioned studied drugs in pure form, in laboratory prepared mixtures and in pharmaceutical preparations. The obtained results were statistically compared to the reference methods of analysis [for I and "II and III", respectively] and no significant differences were found.

**Abstract:** The present investigation studied the diversity of 19 *S. aureus* isolates (9 from bovine and 10 from human sources) in comparison with the standard Cowan I strain by conventional methods and by PCR technology. The latter uses primers targeted to species-specific parts of genes encoding coagulase (*coa*), enterotoxin A (*sea*) and B (*seb*), *mec A* gene encoding methicillin resistant *S. aureus* (MRSA) and *Staphylococcus* protein A (*spa*) gene. *S. aureus* isolates (19) as well as the Cowan 1 strain were tested for antimicrobial sensitivity with 15 antibiotics by disk diffusion method and classified as susceptible, intermediate and resistant. 57.9% of isolates had a relatively high molecular weight plasmid. The *mec A* gene among the chosen MRSA *S. aureus* isolates recovered from human and bovine sources was discussed. Polymorphisms of *coa* and *spa* genes were detected among *S. aureus* isolates. The examined isolates had coagulase gene ranging from 423 bp to 658 bp and the Cowan -1 strain had amplified fragment at 642 bp. All examined *S. aureus* isolates gave an amplified *spa* gene product at approximately from 396-464 bp. The prevalence of enterotoxin genes *sea* and *seb* were determined and the diversity among the chosen isolates was recorded.

**Abstract:** The objective of the present study is to develop an easy method for detection of toxigenic *C. perfringens* isolates .4 *C. perfringens* isolates (type A, B, C & D) were collected from chickens and reconfirmed on the basis of conventional tests and multiplex PCR. Antisera were prepared from *C. perfringens* types A, B, C & D separately in different groups of rabbits. The titres of the prepared hyperimmune sera were estimated by ELISA & staphylococci protein A (SpA) agglutination test. An attempt was carried out to detect *C. perfringens* toxins in infected fecal samples. The fecal samples were infected by 20 &40 µg /ml *C. perfringens* toxins (A, B, C & D) and examined by double sandwich ELISA & SpA agglutination methods. In addition the sensitivity of PCR for detection of *C. perfringens* types were compared with conventional culture technique among fecal samples contaminated with *C. perfringens* types and the results were discussed.

**Abstract:** The Egyptian government has paid special attention to the software industry as Egypt to provide it with a competitive advantage that makes this emerging industry promising. Thus, the State has supported the Egyptian companies to make use of the Capability Maturity Model Integration (CMMI). Since 2009, more than thirty companies obtained the CMMI at different levels. However, these companies suffer from lack of a mechanism to exchange experience and information among themselves although they could be similar in the culture of their engineers and perhaps in the nature and size of their software projects. So, we provide in this research a survey to gauge the quality of methods, tools and processes used in these Egyptian companies winning the CMMI. Then we analyzed the results to reach the recommendations aimed at enriching the software industry in Egypt.

**Abstract:** The objectives of this study were to find the prevalence of *S. aureus* and *S. epidermidis* in urine samples of patients placed on catheter in Federal Medical Centre, Yola (FMCY) and State Specialist hospital, Yola (SSHY) and the efficacy of some commonly used antibiotics against the isolates of *S. aureus* and *S. epidermidis*. A total of one hundred and five samples (60 from SSHY and 45 from FMCY) were collected and inoculated into Cystine lactose electrolyte deficient (CLED) agar for isolation of Staphylococcal species. A total of seventy six presumptive Staphylococcal isolates were obtained on CLED agar and these isolates were identified using gram staining, morphological characteristics and standard biochemical tests. Serological studies revealed that out of 76 isolates, 56 were *S. epidermidis* (coagulase negative) and 20 were *S. aureus* (coagulase positive). Fifty one point eight percent (51.8%) of the isolates of *S. epidermidis* were sensitive to ceftazidime followed by ciprofloxacin (46.4 %) whereas 45% of the isolates of *S. aureus* were sensitive to ceftriaxone followed by cefotaxime and ciprofloxacin (40%).

\*Genetics Department , National Research Centre , Cairo, Egypt

**Abstract:** The present investigation was carried under green house conditions during 2009 and 2010

seasons included two conditions (normal irrigation and salinity) using model of half diallel analysis by five cultivars of rice “Gz1368-s-5-4, Hybrid1, Sakha102, Giza 181 an IE1444”. Five parents and ten crosses were grown under two conditions and the results showed that: (1) The most desirable mean value and positive and highly significant for heterosis, general and specific combining ability effects for all genotypes under normal and salinity conditions were observed from the genotypes.; Gz1368-s-5-4, hybrid1, IET1444, Gz1368-s-5-4 x hybrid 1, Gz1368-s-5-4 x IET1444, Hybrid 1 x IET1444, Sakha 102 x IET1444 and Giza 181 x IET 1444 for all traits studied. (2) From the foreign discussion, it could be concluded that the crosses Gz1368-s-5-4 x Hybrid 1, G21368-s-5-4 x IET1444, Hybrid 1 x IET1444 and Giza 181 x IET1444 were contained of 1, 5, 1 and 56 and 5 using PM15 primer, 6, 3, 6 and 6 bands using AY334988 and 6, 2, 4 and 5 bands using HL-17 primer, which indicated that these bands were found to be index and marker for salinity tolerance in rice by increasing K<sup>+</sup> content and decreasing of Na<sup>+</sup> content.

**Abstract:** Two field experiments were conducted during two successive seasons of 2008/2009 and 2009/2010 at the Agricultural Experiments Station of the National Research Centre at Nobariya, Behaira Governorate, Egypt, to study the effect of adding urea or ammonium sulphate at 2% to herbicide solution on weed control efficiency in onion fields. Weed control treatments were as follows: Metosulam at 20 ml/fed or Clodinafop-propargyl at 70g/fed with or without addition of urea or ammonium sulphate (AMS) at 2% of herbicide solution in comparison to Metosulam at 40 ml/fed, Clodinafop- propargyl at 140g/ fed, Metosulam at 20 ml + Clodinafop- propargyl at 70 g / fed, two hand hoeing and unweeded check. All weed control treatments significantly depressed weed growth when compared to the unweeded one. Two hand hoeing showed the best control of broadleaved weeds in both seasons, followed by that of Metosulam at 40 ml, Metosulam + urea and Metosulam + AMS treatments, respectively. Clodinafop – propargyl at 140 g, Clodinafop – propargyl at 70 g, Clodinafop – propargyl + urea, Clodinafop – propargyl + AMS and Metosulam + Clodinafop – propargyl were very effective in controlling most grass weeds. Meanwhile, hand hoeing , Metosulam + Clodinafop – propargyl, Metosulam at 40 ml and Clodinafop – propargyl at 140 g /fed were the most effective in controlling onion weeds. All herbicidal treatments as well as hand hoeing markedly increased onion yield in both seasons. Maximum values of bulb length, diameter, weight and bulb yield (t/fed) were recorded from Metosulam + Clodinafop – propargyl, Metosulam at 20 ml and hand hoeing twice.

**Abstract:** A survey of the prevalence of gastro-intestinal tract (GIT) parasites in 240 sheep was conducted in different area in the zoo garden (110) and in Sinai district (130) during the period of March 2009 to February 2010. The overall prevalence of infections with nematodes; fasciola and coccidiosis in sheep in Sinai and zoo garden were 66/240 (27.5%); 24/240 (10.0%) and 16/240 (6.7%) respectively. Of the 240 examined sheep, 12.5%; 0.0% and 8.6 % young lambs (1-6 month), 37.7%; 6.9 % and 9.2 % immature sheep (>6-12 months) and 17.1 %; 21.4 % and 1.4 % adult sheep (>one yr) were infested with nematodes, fasciola and coccidia respectively. Most of the animals examined during the present survey had low to moderate infestation. Serum biochemical parameters revealed that serum calcium, inorganic phosphorus, magnesium, copper and iron levels were significantly decreased in all parasitic infested animals. All treated sheep showed significant improvement & disappearance of most clinical signs and significant decrease of egg per gram (EPG) with complete disappearance of eggs in 5<sup>th</sup> day; 4<sup>th</sup> day and 6<sup>th</sup> day post treatment with albendazole (valbazine); doramectin (dectomax) and trichlabendazole (fasinex) respectively. There were gradual increases in the levels of biochemical parameters in 3 groups after one and two weeks post treatment and their levels reached nearly similar to standard levels after 3 week post treatment. Study surveys suggest, appropriate parasitic control approach be explored and tried in order to alleviate the problem of worm burden.

**Abstract:** The epidemic increase in the prevalence of obesity is now seen in most countries. Dietary composition, the relative proportions of calories coming from fats, carbohydrates, protein and intake of fiber has been suspected of playing a role in obesity. So, the aim of the present study was to analyze the diet quality and also to determine if an association exists between obesity and the relative percentage of fats, carbohydrates, protein and fiber in the diets of children and adolescent. A cross-sectional survey, comprised 5760 children (2638 boys and 3122 girls) was recruited from 6 public schools. Each child underwent a complete physical examination, including anthropometric measures. Body mass index (BMI) was calculated as weight (in kilograms) divided by height (in meters) squared. Only one thousand and one hundred children of the total sample (19.1%), (417 boys and 683 girls, aged 13.43±2.65 years), with the complaint of obesity, were included. Repeated Twenty-four hour recall method, record food intake for three scattered days (3 recalls), includes one day as a holiday was done to assess the nutritional status of obese children. Nutrient intake were calculated using the computer program World Food Dietary Assessment System<sup>(1)</sup> compared with National Research Council USA1989<sup>(2)</sup>, while vitamins and minerals were compared with USDA, 2005<sup>(3)</sup>. This study highlights the importance of

nutritional data that it is not what you eat but rather how much the total number of calories consumed which contributes to obesity. Success in obesity prevention is most likely to be achieved when preventive measures are initiated early and sustained throughout childhood and adolescence. More researches must be done for more evaluation, also, to achieve physical activity and life style for obese children and adolescence.

**Improvement Growth, and Yield of Wheat Plants Grown Under Salinity Stress by Using Silicon**  
Abd El-Monem M. Sharaf

[Full text](#)

Botany and Microbiology Dept. Faculty of Science, Al-Azhar Univ. Cairo, Egypt,  
[sharaf5858@yahoo.com](mailto:sharaf5858@yahoo.com)

**Abstract:** The present study aims to improvement of wheat production under saline conditions using silicon (Si) treatment. Salinity caused significant reduction in the growth parameters, photosynthetic pigments and yield components of wheat plants. The magnitude of reduction increased by increasing salinity level. Significant increases were observed in activities of superoxide dismutase (SOD), peroxidase (POX), catalase (CAT) and glutathione reductase (GR) in shoots of salt stressed plants. Silicon treatment in absence and presence of NaCl had great changes on most of the assayed parameters. The adverse effects of salinity as regards the growth characters, photosynthetic pigments and yield components were significantly mitigated by Si supplement. Application of Si caused great variations in the activities of antioxidant enzymes. Under normal (Non-saline) condition, addition of Si, especially at 1 mM, markedly increased the activity of both SOD and CAT, however activity of both POX and GR was significantly decreased. Addition of Si markedly reduced the increases in the activities of SOD, POX, CAT and GR were observed in salt stressed plants. Great variations were also observed as regards the contents of endogenous phytohormones in response to Si, NaCl and their interactions. Generally, it could be concluded that Si have (to more extent) a beneficial regulatory role in plants grown under salt stress conditions.

**Re-introduction of Elephant's Infant into Wild Group: First Attempt and Case Study from North-West India**

[Full text](#)

**Ritesh Joshi**

Doon Institute of Engineering and Technology, Shyampur, Rishikesh, Dehradun, 249 204, Uttarakhand, India. E-mail: [ritesh\\_joshi2325@yahoo.com](mailto:ritesh_joshi2325@yahoo.com)

**Abstract:** Elephant's infant is considered extremely difficult to re-introduce into the wild. On 21<sup>st</sup> of November 2009, an eight day old elephant's infant was found strayed from its group at Shyampur forest of the Haridwar forest division. For the first time in the history of Uttarakhand, attempts had been made by forest officials to re-introduce the orphaned baby elephant into the wild. It is noteworthy that during the introduction attempts, group of seven elephants had taken the baby within group, but left her behind after a while. They had responded from all directions to the cries of the baby elephant but the attempts were in vain. Radha – the domesticated elephant at Chilla forest of the Rajaji National Park nurtured the infant for 10 days before infant's death and Radha's behaviour always illuminated something new about elephant's life. It was the first attempt to re-introduce the infant to wild in north-west India in which some lessons came forward and could be helpful in management of elephants and in documentation of conservation-oriented action plan. Additionally, studies on the behaviour of wild elephants are highly

required and recommended so that we can ensure the future survival of this endangered species.

**Abstract:** With the increase in applications using ontologies to represent semantic information, the issue of partially reusing the ontologies is getting more focus of researchers. Ontology construction from scratch is protracted and labor intensive job. Therefore, it is good to fabricate the ontologies by reusing the existing ontologies. Existing techniques for partially importing the ontology do not consider the user choice while selecting the most relevant ontologies for reusing. Most of the approaches have restriction on the size of ontology that is to be modularized. An approach for partially importing the ontologies has been presented in this paper. The proposed technique selects important keywords from a document by calculating term frequency, IR measure and precision along with class match measure to rank the most relevant ontologies. An algorithm to extract ontology fragments has been presented. This algorithm is independent of the size of ontology being reused.

### The Use of Lemongrass Extracts as Antimicrobial and Food Additive Potential in Yoghurt

**Shaaban, M. Abd-El Fattah<sup>\*1</sup>; Abo sree, Yahia Hassan<sup>1</sup>; Hala M. Bayoum<sup>2</sup> and Hesham A. Eissa<sup>3</sup>**

Food Toxins and contaminants Department<sup>1</sup>, Dairy Department<sup>2</sup>, Food Technology Department<sup>3</sup>, National Research Centre, Cairo, Egypt. [shaabanmostafa@yahoo.com](mailto:shaabanmostafa@yahoo.com)

91

**Abstract:** The following study was conducted to investigate the antifungal and food additive potential of medicinal plants. herbal decoction and essential oil (EO) extracts of *Cymbopogon flexuosus* (lemongrass) leaves and stems were tested for their inhibitory action against spoilage organisms and mycotoxins formation in two separated experiments. In the first experiment, yeast- extract sucrose medium (YES) was used as a basal medium to examine the mold growth and mycotoxin production by three pathogenic fungi: *Aspergillus flavus* (*A. flavus*), *Aspergillus parasiticus* (*A. parasiticus*) and *Aspergillus ochraceus* (*A. ochraceus*). The YES medium was supplemented with four different concentrations of Lemongrass oil, inoculated with 1-mL of a spore suspension containing  $10^5$ - $10^6$  conidia of each test mold and then incubated at 28° C for 14 days. After incubation period, cultures were analyzed for mycelial dry weight and mycotoxin accumulation. In the second experiment, yoghurt

[Full text](#)

91

medium was used as a basal medium and the same system of study was applied in two different degrees of temperature (5°C and 28°C) for 4 weeks. Evaluation of the Lemongrass oil activity in yoghurt samples focused on the microbial stability of yoghurt, sensory evaluation as well as mold growth and mycotoxin formation. In the 1<sup>st</sup> experiment, the level of 0.1% of the EO extract was effective in inhibition both mold growth and mycotoxin production for all tested molds, and 0.3 % extract completely prevented the growth and toxin production. whereas, 1% of the decoction extract was effective. So, the EO extract was the suitable agent in the second experiment. It is of interest to note that while reduction in mold growth due to increasing extract concentrations was observed, the most striking effect was the reduction of mycotoxin production. The obtained data from the second experiment showed that the EO extract (0.1% concentration) inhibited viable yeasts and preserved yoghurt for over 28 days at 5°C. Also, the inhibitory action of the EO extract against yeasts was concentration dependent. The maximum inhibitory effect of was found when the extract level increased above 0.1%. Incubation temperature had an important role in growth and mycotoxin production in yoghurt medium. During cold storage for 28 days at 5°C, the different concentrations of the EO extract added to yoghurt samples displayed different titratable acidity and total bacterial cells and pH than the control yoghurt ( $p < 0.05$ ). Overall sensory acceptability of yoghurt supplemented with the EO extract was higher than that of the control yoghurt prepared without the EO extract. The results indicate that the addition of the appropriate the EO concentration (0.1%, w/v) improved the physicochemical properties as well as sensory characteristics of yoghurt, could be used for decontamination of dairy products such as yoghurt from mycotoxicogenic fungi and mycotoxins formation, beside its beneficial properties as a functional food.

\* [shimaakhalifa2003@yahoo.com](mailto:shimaakhalifa2003@yahoo.com)

**Abstract:** This study was carried out on 360 freshwater fishes (240 *Oreochromis* species and 120 *Clarias gariepinus*). They were collected from different governorates and during different seasons. Naturally infected fishes showed clinical abnormalities such as skin darkening, exophthalmia, corneal opacity, abdominal distention, ulceration of the skin and cotton wool like growths on various parts of the body. Fishes were then subjected to post mortem examination which revealed many abnormalities. Mycological examination revealed the isolation of 2081 fungal isolates from 150 diseased and 210 apparently healthy fish samples (1658 mould and 423 yeast isolates), of which 1334 were isolated from *Oreochromis* species and 747 isolates from *Clarias gariepinus*. Isolated moulds belonged to the following genera: Saprolegnia (4.2%), Aspergillus (43.0%), Fusarium (14.1%), Mucor (14), Penicillium (17.2), Rhizopus (4.8%), Scopulariopsis (1.2%), Paeciliomyces (1%) and Curvularia (0.4%). Yeasts isolated also from both fish species had the following incidence: *Candida albicans* (35.9 %), other *Candida* species (19.1%), *Rhodotorula* species (31.4%) and *Torulopsis* species (13.5%). Experimental infection with the most predominant fungi (Aspergillus flavus, Fusarium species and *Candida albicans*) was conducted to evaluate the pathogenicity of these isolates. Clinical pictures of experimentally infected fish were similar to those of natural infection. Inoculated fungi were re-isolated from different organs. Results were confirmed with histopathological examination, which revealed the presence of fungal hyphae and spores in different organs.

<sup>\*</sup>[mamdochyouosif@yahoo.com](mailto:mamdochyouosif@yahoo.com)

**Abstract:** Marine fishes are suffering from continuous depletion due to bacterial pathogens infections triggered by devastating environmental changes at their native aquatic environment. Qarun Lake and Suez Gulf are among the most vulnerable areas. 600 fish samples of Six different fish species; *Epinephelus tukula*, *Siganus rivulatus*, and *Dedalechilus labiosus* native to Suez-gulf at Suez governorate; *Mugil capito*, *Solea vulgaris* and *Tilapia zilli* native to Qarun Lake at El-Fayoum governorate were examined throughout the different year seasons. Gram positive and negative fish pathogenic bacteria were isolated from a total of 245 fish sample. Among those samples, the following bacteria were retrieved in the following percentages respectively, 17.55% (*Vibrio anguillarum*), 16.73% (*Vibrio alginolyticus*), 15.51% (*Pasteurella piscicida*), 15.91% (*Pseudomonas fluorescens*), 13.46% (*Streptococcus faecalis*), 11.02% (*Aeromans hydrophila*), 6.12% (*Aeromans sobria*) and 3.67% were infected with *Staph. aureus*. The *Siganus rivulatus* was the highest infected fish species with a prevalence of 8.33%, while *Mugil capito* was the lowest infected species (5.67%). The highest total prevalence of bacterial infection was recorded in summer season (40.81%) while the lowest was recorded in winter (15.91%). The aforementioned bacterial isolates were successfully re-isolated from experimentally infected fish. The retrieved isolates were confirmed by semi-automated (API 20 E) and conventional biochemical tests.

### Effect of Antioxidant on Lead-Induced Oxidative Damage and Reproductive Dysfunction in Male Rabbits

[Full text](#)

<sup>\*</sup>**El-Tohamy, M.M., and El-Nattat,W.S.**

Department of Animal Reproduction and A.I., National Research Centre, Cairo, Egypt.

<sup>\*</sup>[eltohamymagda@yahoo.com](mailto:eltohamymagda@yahoo.com)

**Abstract:** The objective of this study was to characterize the Lead toxicity syndrome, to assess biomarkers that may be most useful for detecting toxicant-induced reproductive dysfunction, and to determine whether supplemental vitamin C would tend to alleviate the lead toxicity in rabbits. To test the hypothesis that the level of lead exposure is associated with an adverse effect on semen quality, in terms of sperm concentration, morphology, motility to assess antioxidant as important markers of disease using total antioxidant status. Adverse effects of lead on the testes may be mediated by oxidative damage and subsequent lipid peroxidation. The effect of lead acetate administration on testicular, hepatic and renal functions and the biomarker of effect for them were investigated in the present study with a trial of treatment by vitamin C. 35 male rabbits were divided into five groups. One control group and four groups received orally low and high doses of lead acetate (10.8 and 15 mg/kg b.wt.,

93

94

respectively). One low and one high received, in addition, 1 g vitamin C / L in drinking water. SOD,  $\gamma$ -GT, AST, ALT, cholinesterase, acid phosphatase, and LDH activities were measured in both serum and semen. Also semen characteristics were measured. Results concerning all the enzymes were promising. SOD, LDH, ALT and acid phosphatase activities in serum and semen were obviously affected by lead. Vitamin C was a good antioxidant that recuperates from the normal enzymatic status in both serum and semen. In conclusion, lead levels led to testicular hypo function, which is supported by the results of semen picture. The hazardous effect of lead led to disturbance in the activities of enzymes under investigation such as SOD,  $\gamma$ -GT, LDH, AST, ALT, Cholinesterase, Acid phosphatase. Vitamin C proved its antioxidant effect on recuperating from the normal status of enzymes in semen and serum. LDH and prostatic acid phosphatase are shown to be biomarkers of testicular dysfunction, while LDH, ALT may be used as biomarkers for hepatic and renal dysfunction. This study established the principle that lead toxicity can be prevented and makes it worthwhile to establish an acceptable treatment or preventive regimen in the light of the present results.

#### **Tara Gum Carbamate: A New Thickening System for Cotton Printing Using Vat Dyes**

A. Hebeish<sup>1</sup>, A.A. Ragheb<sup>1</sup>, S.H.Nassar<sup>1</sup>, E.Allam<sup>2</sup> and J.I. Abd El -Thalouth<sup>2</sup>

<sup>1</sup>Textile Research Division, National Research Center Dokki , Cairo Egypt

<sup>2</sup> Faculty of Applied Arts, Helwan University, Cairo, Egypt

**Abstract:** Green technology-based textile thickeners, namely, glactomannan was isolated from tara seeds and harnessed to vat printing of cotton fabrics before and after being carbamated. Carbamation was effected through reaction with urea at 160 °C for 15 and 90 min. to produce tara carbamate derivatives having 1% N and 3.12 % N respectively. These derivatives are soluble in water at room temperature and characterized by non-Newtonian pseudoplastic behaviour. However, for a given rate of shear, tara carbamate derivative having 1% N exhibits lower apparent viscosity than the derivative with 3.12 % N. On the other hand the apparent viscosity of pastes prepared from these two derivatives increases by storing for 24 or 48 hours before commence measuring. Prints could successfully be achieved using either of the two new tara carbamate derivatives in single use or in admixture with conventional thickener viz. Lameprint A6. Colour strength (K/S) values of prints prepared using the new tara carbamate -based thickeners are higher than those obtained with the conventional thickener, meanwhile the overall fastness properties of all prints are equal, irrespective of the thickener used.

[A. Hebeish, A.A. Ragheb, S.H.Nassar, E.Allam and J.I. Abd El -Thalouth. Tara Gum Carbamate: A New Thickening System for Cotton Printing Using Vat Dyes. Journal of American Science 2010;6(11):623-631]. (ISSN: 1545-1003).

**Abstract:** Desertification is considered as an important problem facing arid and semi-arid regions, as Egypt. These processes are resulted either from human activities or adverse natural conditions. However, the combination of both is often applicable. The aim of this study is the identification of areas sensitive to desertification in the north coast of Egypt. Based on the MEDALUS approach and the characteristics of the study area regional model developed using GIS. Three main indicators of desertification, including: soil, vegetation and climate were considered. The several sub-indicators affecting the quality of each main indicator were identified. Based on the MEDALUS approach, each sub-indicator was quantified according to its quality and given a weighting of between 1 and 2. Arc-GIS 9.2 was used to analyze and prepare the layers of quality maps using the geometric mean to integrate the individual sub-indicator. ETM and SRTM satellite images, geologic and soil maps were used as main sources for calculating the Environmental Sensitivity Areas Index (ESAI) for desertification. The results show that the soil of the north coast is characterized mainly by high sensitive areas for desertification (44.01 % of the total area), distributed mostly in the north western coast and the northern part of Sinai, where the soil quality, climatic quality and vegetation quality are low, while, 9.37 % of the total area exhibit are sensitive. The areas of moderate sensitive to desertification revealed in the studied area, representing an area of 3834.577 Km<sup>2</sup> (11.04 %) of the total area. The low sensitivity areas for desertification exhibit the whole area of the Nile Delta, as they represent 27.17 % of the total area (i.e. 9434.928 Km<sup>2</sup>). The low sensitivity for desertification is due to the good vegetation cover and soil quality. It can be concluded that implementing the maps of sensitivity to desertification is rather useful in the arid and semi arid areas as they give a more likely quantitative trend for frequency of sensitive areas. The integration of different factors contributing to desertification sensitivity may lead to plan a successful combating. The usage of space data and GIS proved to be suitable tools to rely on estimation and to fulfill the needed large computational requirements. They are also useful in visualizing the sensitivity situation of different desertification parameters.

**Efficiency of Natural Minerals in Presence of Different Nitrogen Forms and Potassium Dissolving Bacteria on Peanut and Sesame Yields**

[Full text](#)

**Gehan H. Youssef, Wafaa M. A. Seddkik and Mona A. Osman**

Soil, Water and Environ. Research Institute, agricultural Research Center (ARC), Giza, Egypt

**Abstract:** A field experiment was carried out for two summer seasons at Ismailia Agric. Res. Station to study the effect of some natural minerals combined with potassium dissolving bacteria inoculation in the presence of different nitrogen forms on chemical properties of soil, nutritional status and yield of peanut-sesame. Each experiment was designed in a split-split design with three replications. Three forms of nitrogen fertilizer were included along with two natural minerals, in a presence of potassium dissolving bacteria inoculation, as well as one mineral fertilizer as source potassium fertilizer. Furthermore, data show high significant increases in available N due to the application of ammonium nitrate in combination with feldspar, and calcium nitrate in combination with potassium sulfate in a presence of inoculation for peanut and sesame, respectively. However, application of calcium nitrate combined with potassium sulfate, and ammonium nitrate in combination with feldspar, in a presence of inoculation, led to significant increases in K available in soil for peanut and sesame, respectively. Oppositely, the pH values, different to those of EC, decreased either for inoculation or non-inoculation as compared to control. In spite of that, the values of EC and pH of soil were higher with application of either bentonite or bentonite + feldspar in a presence of all nitrogen fertilizer forms. Generally, the highest EC values in soil, after the two studied seasons were encountered with calcium nitrate fertilizer as well as bentonite mineral. Moreover, applying feldspar mineral and ammonium nitrate treatments had recorded the highest values of yield components as well as nutrient (N and K) uptake by either peanut or

sesame crops, particularly in the presence of inoculation as compared to those given by other treatments.

**Abstract:** Local meat production in Egypt is in continuous decrease and can not meet the local market requirement. So this study was designed to throw light on true repeat breeding syndrome (RBS) as one of the reproductive disorders that hinders the buffalo meat and milk production. A field survey was carried out on 1358 female buffaloes which were subjected to clinical and gynecological examination, and blood samples were collected for carrying out some relevant analyses. Treatment trials were practiced using different ways to control the condition and the economic impact of this syndrome has been studied. Results revealed that the incidence of clinical repeat breeding (RB) in the examined buffalo cows was 4.34 %. Typical repeat breeders represented 7.25 % of total reproductive disorders in female buffaloes. Serum progesterone level was  $1.44 \pm 0.39$  and  $3.66 \pm 0.84$  in RB and normal buffaloes (NB), respectively. Oxidant/antioxidant markers in RB buffalo-cows showed increased malondialdehyde (MDA) and nitric oxide (NO) and decreased catalase (CAT), superoxide dismutase (SOD), ascorbic acid (ASCA), reduced glutathione (R-GSH) and total antioxidant capacity (TAC). Serum zinc, copper, iron and selenium values were lower in repeat breeder cows compared to normal animals. Repeat breeder buffalo-cows responded to the treatments with mineral mixture, GnRH and Lugol's solution with recovery rates; 63.64, 61.54 and 60.00%, respectively. The study concluded that special care should be paid for food additives to control this syndrome.

**ABSTRACT:** The current study was carried out to utilize each of whole meal wheat flour (control), some legumes (lupin and fenugreek), turmeric and vital gluten flour in blends for preparation of pan bread more nutrients and healthy in order to enhance the dietary fiber and amino acids contents. The biological parameters of rats (non and induced diabetic) fed on such pan bread was also estimated. A significant higher amount of soluble, insoluble and total dietary fiber contents was found in the turmeric, fenugreek and lupin, pan bread compared to that found in control once( whole wheat flour). Normal rats (nondiabetic and fed on basal diet) exhibited an insignificant decrement in blood glucose. However, in the diabetic rats a significantly lowered blood glucose trend was found. The tested pan bread samples were more slightly effective in lowering liver and kidney function in the diabetic rats in a relation to

diabetic rats, when compared with the positive control. Finally, it is recommended to utilize whole meal flour to prepare healthy diets to deal with diabetic status and control of some biological parameters.

### Scleral Fixation Intraocular lenses

<sup>1</sup>Ayman Shouman, <sup>1</sup>Mohamed Marzouk, <sup>1</sup>Hesham Ali and <sup>1</sup>Ehab Zakzook

<sup>1</sup>Ophthalmology Department, Research Institute of Ophthalmology, Giza

[shoumanaes@yahoo.co.uk](mailto:shoumanaes@yahoo.co.uk)

**Abstract:** Background: The 1ry indication for scleral fixation of intraocular lenses (IOL) is dislocation as a principal complication of cataract surgery. Inadequate capsular support is the most common cause of IOL dislocation. Other indications include traumatic phakic lens dislocation (cataractous or clear), surgically aphakic eyes or anterior chamber IOL with complications (persistent hyphema, uveitis). Methods: 20 eyes of 20 patients were done, surgery was done only when the IOL was dislocated peripheral to the visual axis and was causing symptoms of visual loss sufficient to interfere with the patient's activities of daily living, or patients who were left aphakic for a 2ry implantation procedure. A modification of the technique was done which made the procedure faster and preserved the surrounding conjunctiva. Results: Best corrected visual acuity (BCVA) preoperatively ranged from 1/60 -6/60 and postoperatively between 6/60 – 6/6. Statistical analysis of the logarithm of the minimum angle of resolution (LogMAR) between the preoperative and postoperative visual acuity revealed significant improvement ( $p < 0.05$ ). Intraoperative complications included one case of accidental iris injury, two cases of mild vitreous hemorrhage, two cases of moderate vitreous hemorrhage. Early postoperative complications included pupillary block. Midterm post operative complications occurred in one case with the occurrence of cystoid macular edema. Conclusion: Scleral fixation of IOL is a safe procedure with minimal complications, but needs surgical skills to be managed optimally.

### Technological Properties of some Egyptian New Wheat Varieties

**Ahmed M. S. Hussein, Mohie M. Kamil and Gamal H. Ragab**

National Research Centre, Food Technology Department, Dokki, Cairo, Egypt

email: [ResearchTeamMMK@yahoo.com](mailto:ResearchTeamMMK@yahoo.com)

**Abstract:** Whole meal and flour 72% of Gemmeiza 7, Gize 168, Sohage 3 and Sakha 93 wheat varieties were evaluated to produce pan bread, pasta and biscuits. Pan bread of whole meal wheat varieties had higher contents of moisture, protein, fat, ash and fiber than wheat flour 72% of the same varieties. Pan bread of Sakha 93 characterized with its higher baking quality (weight, volume and specific volume) than pan breads of other varieties. Crust color of pan bread slightly affected with whole-meal wheat varieties, where its color score maximized in Sakha 93 (7.7) and Sohage 3 (6.7). This result agreed with the obtained color parameter of Hunter, where lightness (L) maximized to 55.95 and 49.79 in pan bread crust of Sohage 3 and Sakha 93, respectively. Pasta characterized with its higher protein (13.12%), fat (2.59%) and crude fiber (2.82%) in case of using whole meal of Sohage 3, Giza 168 and Gemmeiza 7 varieties, respectively. Pasta cooking quality ranked first in case of using Sohage 3 whole meal, where its weight increase, volume increase and cooking loss reached to 265%, 305.3% and 8.3%, respectively.

Pasta color parameter showed that, wheat flour 72% and whole meal of Sakha 93 characterized with its higher lightness (L). Sensory evaluation showed that, pasta of wheat flour 72% accepted slightly in appearance and color if compared with whole meal pasta of the same variety. In addition, there were no significant difference between pasta of wheat flour 72% and whole meal in flavor, tenderness and stickiness. Biscuit of whole meal characterized with its higher content of protein, fat, ash and crude fiber than wheat flour 72%. Whole meal biscuit of Sohage 3 characterized with its higher protein (12.13%), fat (31.0%) and ash (2.51%) contents; and lowest carbohydrate content (52.18%). Biscuit of Sakha 93 variety (whole meal or flour 72%) was higher in baking quality. Hunter color parameter and sensory evaluation showed that, biscuit of whole meal varieties was slightly darker than biscuit of wheat flour 72% varieties. In addition, biscuits flavor, taste, texture, appearance and overall acceptability of wheat flour 72% not affected significantly in case of using whole meal flour of the same variety.

[Full text](#)

**ABSTRACT:** Premature atherosclerosis seen in systemic lupus erythematosus (SLE) patients is not explained by traditional risk factors. Circulating endothelial cells (CECs) have been shown to be a surrogate marker of endothelial dysfunction. The aim of this study was to assess the number of CECs in SLE patients and to determine any potential correlation between CEC count and endothelial function (FMD%), disease activity, organ involvement and therapy used. Also, to investigate VCAM-1 and ICAM-1 levels as markers of vascular inflammation and injury. This study was performed on 30 premenopausal female SLE patients and 20 age and sex matched healthy controls (HC). Patients were subjected to full history taking, complete clinical examination and assessment of disease activity using (SLAM) score. For both patients and controls, endothelial function (FMD%), laboratory estimation of CEC count, and serum level of VCAM-1 and ICAM-1 were performed. CEC count was significantly elevated in SLE patients comparing to HC ( $P<0.001$ ). CEC count was positively correlated with SLAM score, while negatively correlated with FMD%. Serum levels of VCAM-1 and ICAM-1 were significantly increased in SLE patients than controls. Moreover, VCAM-1 correlated significantly with disease activity and CEC count while ICAM-1 did not correlate with any of them. There was significant correlation between CEC count and skin vasculitis, renal involvement and anti-malarial medications. In conclusion, increased number of CEC may be a biomarker of disease activity and disseminated vasculopathy occurring in the course of SLE and may represent one of the first specific cellular markers to provide a direct link with the pathophysiology of cardiovascular disease (CVD). VCAM-1 is considered a marker of activation of endothelial cells. Taking together, this may predict patients at increased risk of CVD complications, lupus nephritis or vasculitic skin affection.

[Aak\\_abouarab2007@yahoo.com](mailto:Aak_abouarab2007@yahoo.com)

**ABSTRACT:** Polycyclic aromatic hydrocarbons (PAHs) are a group of chemicals composed of two or more fused aromatic rings that are formed from the incomplete combustion or high-temperature pyrolysis of coal, oil, gas, wood, fossil fuel, garbage or other organic substances, such as tobacco, charbroiled meat and exhaust from automobile and trucks. They enter the environment and release to air, soil, water and food. Some PAHs have shown to have toxicological, carcinogenic and mutagenic effects on animals and humans. Biodegradation of PAHs in the presence of the three types of lactic acid bacteria (*Bifidobacterium bifidum*, *Streptococcus thermophilus* and *Lactobacillus bulgaricus*) were studied during the different incubation periods (2, 4, 6, 8, 10, 12, 24, 48 and 72 h) at 37°C. The reduction of PAHs concentration proved that these compounds were affected by the previous lactic acid bacteria. At the end of incubation period (72 h), the reduction percent were 46.6, 87.7 and 91.5% with *Bifidobacterium bifidum*, *Streptococcus thermophilus* and *Lactobacillus bulgaricus*, respectively. These results could be explained as the bacterial cell is a high proteinous material and so may adsorbs PAHs which could interfere with cellular metabolism. Also, the variation of pH values during the incubation periods may control in the adsorbed PAHs on the cells. The biodegradation of PAHs by yoghurt starter during yoghurt manufacture were studied. Slightly reduction was observed during the incubation periods (1, 2 and 3 h). The reduction percent was 3.46 at the final product. It could be revealing that the persistence of PAHs depend on a number of factors such as the type of microorganism, the interaction between microorganisms, the microbial concentration, the composition of the medium, and the microbial growth conditions of temperature and pH. The foregoing information reveal that extra care must be taken when comparing the results since in-vitro studies are not always relevant to real situation in food products.

<sup>3</sup> Internal Medicine Department, National Research Center, Egypt

[Full text](#)

**Abstract:** *Objectives:* To assess the level of expression of the antiapoptotic signal "Survivin" in Egyptian patients with acute leukemias and to delineate any significant correlation between the level of Survivin with the clinical and haematological findings in those patients. *Patients and Methods:* Survivin expression was quantitatively determined by a real-time PCR technique in 30 acute leukemia patients; ALL and AML in two age groups; pediatric group (<18 years) and adult group (≥18 years) and in age and sex matched control healthy subjects. *Results:* Statistically significant higher expression was noted in both ALL and AML groups when compared to the control group (p-value = 0.0001). A statistically significant negative correlation was detected between Survivin expression and RBCs count, HB level and Platelet count with p-values = 0.01, 0.01 and 0.0001 respectively. Positive correlations were found with T.L.C, peripheral blood blasts, bone marrow malignant cells, LDH, ALP and uric acid levels with p-values = 0.0001, 0.0001, 0.03, 0.0001, 0.006 and 0.001 respectively. During the post-induction phase,

Survivin expression showed a statistically insignificant difference between patients achieving complete remission and those showing unfavorable response with a p-value = 0.7. After follow up, the expression change between patients achieving complete remission and those showing unfavorable response was statistically insignificant with a p-value = 0.6. *In summary*, The previous data emphasized important correlations between Survivin expression and established risk factors in acute leukemia patients. Thus Survivin could be used as a marker for assessment of bone marrow infiltration that in future could be used to refine treatment stratification.

**ABSTRACT:** Roselle (*Hibiscus sabdariffa* L.) has a considerable industrial, pharmaceutical and economic values in Egypt and many other countries around the world, mainly for its pleasant sepals. There are many colored types of Roselle depends on sepals color. The biochemical and molecular characterization of three roselle types, green (G), light red (LR) and dark red (DR), were studied. RAPD-PCR patterns for their genomic-DNA were significantly different. The total protein electrophoretic profile of their seeds was similar except for some inter-individual variation in band density. Their total protein contents were 46.0, 66.5 and 68.1 mg/g seed, respectively. In addition to the water-soluble antioxidant capacity, the total polyphenolic-content and the antioxidant activity of 12 roselle extracts, three colored types in 2 solvent systems (aqueous, A and 30% ethanolic, E) and 2 extraction temperatures (hot, H and cold, C), were determined by Folin-Ciocalteu reagent and 1,1-diphenyl-2-picrylhydrazyl (DPPH) methods, respectively. The ability of these roselle extracts to inhibit the formation of nitrous acid-induced tyrosine nitration decreases in the order of LREC > DREC > LREH > GEC > DREH > GEH > GAC > DRAH > LRAC > GAH > LRAH > DRAC.

**Abstract:** Statement of Problem: Oral devices may be helpful in the management of obstructive sleep apnea by improving upper airway potency. Purpose: Management of obstructive sleep apnea using oral appliance with magnetic versus oral appliance with increased vertical dimension. Material and Methods: 12 patients with mild to moderate obstructive sleep apnea were evaluated in this study before and after wearing devices for six months. The patients randomly divided into two equal groups(A and B ). Group A used oral appliances with magnetic for six month Patients in group B wear oral appliances with increased vertical dimension, Evaluation was done by Polysomnograph, clinical findings and cephalometric x-rays. Results: The results of this study revealed that improvement of clinical finding, symptoms and apnea index for patients wearing two types of oral appliance. Conclusions: It can be concluded that oral appliance, with magnetic and increase vertical dimension, make improvement for OSA patients oral appliances with magnets are more effective in management of mild and moderate obstructive sleep apnea in comparison to appliances with increased vertical dimension.

**Abstract** Pregnancy is the more prevalent stress in under feeding small ruminant with multiple bearing. Fifty Ossimi ewes of two years old and their body weight ranging between 35 and 50 kg were allotted into three groups; Group I: contains ten non pregnant non lactating ewes were used as control group. Group II: contains twenty single pregnant ewes\* and Group III: contains twenty twin pregnant ewes used as experimental animals. Our study focused on the comparison between single and twin bearing ossimi ewes in the last three weeks of pregnancy and the day of parturition by measurement of reduced glutathione (GSH) level and the activities glutathione peroxidase (GSH-Px); glutathione reductase (GR-ase); glutathione-S-transferase (GST) and total superoxide dismutase (t-SOD) in erythrocytic haemolysate. In addition, glucose, non esterified fatty acid (NEFA), Beta hydroxyl butyric acid (BHBA), cortisol, insulin and protein electrophoretic patterns were measured in serum. Our results concluded that, In erythrocytic haemolysate the mean values of GSH-Px and GST in group II and III during the period of 2<sup>nd</sup> and one week before parturition and at the day of parturition were high significantly increased. While, GSH and t-SOD were high significantly decreased ( $P<0.01$ ) and GR-ase activities were significantly decreased. While serum insulin level decreased while serum NEFA, BHBA and cortisol were increased in single and twin but in twin the values is more significant. The data showed that twin bearing ewes are more susceptible to pregnancy toxemia than single bearing that may be decrease the productivity and performance of those animals.

#### **Study the Efficiency of Investment and its Determinants in the Agricultural Sector**

Khairy Hamed Eleshmawy, Enaam Abd elFattah Mohamed, Laila Mustafa ELShrif, Haitham Bauomy

[Full text](#)

**Abstract:** The promotion of increased rates of the investment growth is the main priority of the economic development, where there can be no development without adequate levels of investment. The problem has been narrowed to study in lower volume of investment goes to agriculture in spite of the importance of this sector to increase the rate of economic growth, the study aims to identify the relative importance of the investment total agricultural and agricultural domestic and foreign farm, as well as identify the most important factors affecting each. In addition to, identify the efficiency of agricultural investment. The results indicated that, overall agricultural investment and agricultural domestic and foreign farm represented about 9.38%, 7.98%, 1.4% of the total investments, and investments amounted to local agriculture, and foreign to 84.88%, 15.12% of the total agricultural investment. Estimating the efficiency indicators of agricultural investments shows that, there is efficiency in agricultural investment despite lower Kimpalastmarat directed to the agriculture sector during the study period. The results showed that, the agriculture sector capital intensive, in addition to increasing the coverage of agricultural savings to agricultural investment as much as about 46% in 2008. While the share of one acre of agricultural investment from 283.65 pounds in 1999 to about 194 pounds in 2008. The results showed that, the most important factors affecting the local agricultural investments are in value-added farm income and saving agricultural and domestic liquidity and interest rate on farm loans. While the GDP and the budget deficit and non-agricultural investments, the most important factors affecting foreign investments in agriculture. Therefore, the study recommends the need to increase investments directed to the agricultural sector given the importance of this sector and its contribution to economic growth. You need to follow monetary policies that reduce the interest rate on agricultural loans to encourage investment in agricultural projects, in addition to the need to reduce taxes on agricultural projects as a means to stimulate the agricultural investor.

[Khairy Hamed Eleshmawy, Enaam Abd elFattah Mohamed, Laila Mustafa ELShrif, Haitham Bauomy Hassan. Study the Efficiency of Investment and its Determinants in the Agricultural Sector. Journal of American Science 2010;6(11):749-755]. (ISSN: 1545-1003).

**Abstract:** Eighty six cultures were isolated from soil of different Egyptian Governorates including Quina, El-Menofeya, El-Gharbia, El-Sharkia, El-Behera and Kafr EL-Sheikh Governorates. Investigations of the mosquitocidal Egyptian isolates have revealed that isolate No.1 have the ability to form more toxin than the international reference strain *Bs*2362. The selected isolate No.1 exhibited a lower LC<sub>50</sub> and LC<sub>90</sub>values than the International strain *B. sphaericus* 2362 upon bioassay against secondinstars' larvae of *Culex pipiens*. The Egyptian isolate No.1 was identified morphologically and biochemically as *Bacillus sphaericus*. Physiological factors affecting growth and toxin formation in *B. sphaericus*No 1 in comparison to *B.s* 2362 were carried out. THE organism grown on modified Nutrient broth medium yielded the highest larval toxicity against the second instars' of *Culex pipiens*for both *Bacillus sphaericus*isolate No 1 and the international strain *Bacillus sphaericus*. The Optimum air : medium ratio were 9:1 and 4:1 of the flask volume for 4 and 3 days incubation periods using 2%and 3% sizes of inocula for *B. sphaericus* 2362 and the Egyptian isolate *B. sphaericus*No.1, respectively. Sodium acetate was the suitable carbon source for the isolate *B. sphaericus* No.1, while *B. sphaericus* 2362 was capable to utilize both sodium acetate and sodium succinate as carbon sources. The Egyptian isolate *B. sphaericus* No.1exhibited the highest mosquitocidal activity upon growth on kidney beans seeds and sesame meal as nutrient substrates at 3% final concentration, while *B. sphaericus*2362 exhibited the highest mosquitocidal activity by utilizing soy beans, lentils and sesame meal as complete media for growth and mosquitocidal toxin production.

112	<p><b>The Effect of Combining Herbal Therapy with Conventional Chemotherapy on the Incidence of Chemotherapy Side Effects in 2nd Stage Breast Cancer Patients</b></p> <p>Nagla Hamdi Kamal Khalil, Sanaa Alaa El- Din, Maha Adel Salem</p> <p>Medical-Surgical Nursing Department, Faculty of Nursing,</p> <p>Ahmed Adel Seif El-Din, Pharmacognosy Department, Faculty of pharmacy</p> <p>Waleed Osman Arafat, Oncology department,Faculty of Medicine, Alexandria University</p> <p style="text-align: center;"><a href="mailto:Mahaadel52@yahoo.com">Mahaadel52@yahoo.com</a></p> <p><b>Abstract:</b> The purpose of this study is to identify the effect of the combination of herbal mixture and conventional chemotherapy on minimizing the incidence of chemotherapeutic side effects for 2<sup>nd</sup> stage breast cancer. Forty adult female patients aging 20 to 65 years old diagnosed with breast cancer stage (II), receiving chemotherapy for at least one month and will continue to receive it for 3 months- were selected randomly and divided equally into study and control groups. They were free from any associated co-morbid diseases as diabetes, renal, cardiac. The patients were interviewed in the oncology outpatient clinic. Study group patients were instructed about the importance of taking herbal capsules regularly with chemotherapeutic cycles, on a scheduled dose of 1 capsule three times per day for 3months. Complete assessment for both groups as baseline data to assess the chemotherapeutic side effects, laboratory investigations and the nutritional status of the patients were done, and then after 45days and after 3 months. The results revealed that (45%) of cancer breast women were in age group 49-65 years. The greater proportion of the sample (62.5%) breast fed and lactated for three times and more through their life. The least affected systems with chemotherapeutic side effects and the most affected systems when combined herbal to conventional therapy were: liver functions and endocrine studies, renal functions, reproductive system, urinary system, and weight changes. While psychological status, nervous system, and skin, hair, and nails were the most affected systems with the side effects of chemotherapy, and they were the least affected systems when combined herbal to conventional chemotherapy. Also it was found that there was significant difference between the study and control groups in relation to second and third assessments related to all body systems. It is recommended that herbal education should be introduced in nursing and medical curriculum. Further researches related to these herbal components to measure its efficacy on minimizing the side effects of chemotherapy for breast cancer and/ or other types of cancer. Further researches are also needed on larger number of sample. Clinical studies should be done to identify the effect of these herbs on different cancer therapies, different chemotherapeutic protocols, specifically pre or post mastectomy.</p> <p>[Nagla Hamdi Kamal Khalil, Sanaa Alaa El- Din, Maha Adel Salem. **Abstract:** An exploratory descriptive study was conducted at two Maternal and Child Health Centers (MCH) selected randomly in Albeheira Governorate to assess women's awareness of danger signs of obstetric complications. The study subjects consisted of 200 pregnant women attending the previously mentioned setting for tetanus toxoid immunization during pregnancy was enrolled in the study. (100 from each) A structured interview schedule was developed by the researcher after reviewing of the relevant literature and used to collect the necessary data. It comprised the following parts: Part I: Socio-demographic data such as age, level of education, occupation and number of family members...etc Part II: Obstetric characteristics such as gravidity, parity, abortions, antenatal follow up and presence of any complications. etc. Part III: questions related to knowledge about signs of obstetric complications, complaining of any obstetric complication, what to do if the woman has any of these signs. The study revealed that slightly more than one quarter of the study subjects (26.5 %) were unaware of obstetric danger signs compared to almost the same proportion (26.0 %) that had good awareness about such signs, while 47.5 % of the study subjects exhibited fair awareness. Lack of awareness about obstetric danger signs was related younger age, low level of education, gravidity and parity, previous experiences with any obstetric complications and lack of antenatal care. This study reflects the need for strategic plane to increase the awareness to shape health seeking behavior of the public related to signs of obstetric complications.

**ABSTRACT:** The following study was conducted to investigate the antifungal and food additive potential of medicinal plants. herbal decoction and essential oil (EO) extracts of *Cymbopogon flexuosus* (lemon grass) leaves and stems were tested for their inhibitory action against spoilage organisms and mycotoxins formation in two separated experiments. In the first experiment, yeast- extract sucrose medium (YES) was used as basal medium to examine the mold growth and mycotoxin production by three pathogenic fungi: *Aspergillus flavus* (*A. flavus*), *Aspergillus parasiticus* (*A. parasiticus*) and *Aspergillus ochraceus* (*A. ochraceus*). The medium was supplemented with four different concentrations of Lemongrass oil, inoculated with 1-mL spore suspension containing  $10^5$ - $10^6$  conidia of each test mold and then incubated at 28°C for 14 days. After incubation period, cultures were analyzed for mycelial dry weight and mycotoxin accumulation. In the second experiment, yoghurt medium was used as a basal medium and the same system of study was applied in different degrees of temperature (5°C and 28°C) for 4 weeks. Evaluation of the Lemongrass oil activity on yoghurt samples focused on the microbial stability of yoghurt, sensory evaluation as well as mold growth and mycotoxin formation. In the 1<sup>st</sup> experiment, the level of 0.1% of the EO extract was effective in inhibiting both mold growth and mycotoxin production for all tested molds, and 0.3 % extract completely prevented mold growth and toxin production, whereas, 1% of the decoction extract was effective. So, the EO extract was a suitable agent in the second experiment. It is of interest to note that while reduction in mold growth decreased increasing extract concentrations was observed, the most striking effect was the reduction of mycotoxin production. The obtained data from the second experiment showed that the EO extract (0.1% concentration) inhibited viable yeasts and preserved yoghurt for over 28 days at 5°C. Also, the inhibitory action of the extract against yeasts was concentration dependent. The maximum inhibitory effect of was found when the extract level increased above 0.1%. Incubation temperature had an important role in growth and mycotoxin production in yoghurt medium. During cold storage for 28 days at 5°C, the different concentrations of the extract added to the yoghurt samples displayed different titratable acidity and total bacterial cells and pH than the control yoghurt ( $p < 0.05$ ). Overall sensory acceptability of yoghurt supplemented with the EO extract

higher than that of the control yoghurt prepared without the EO extract. Total sensory evaluation of experimental yoghurt used as a control was up to 4.3 scores lower compared to yoghurt samples treated with the EO extract. The results indicate that the addition of the appropriate EO concentrations (0.1%, v/v) improved the physicochemical properties as well as sensory characteristics of yoghurt, could be used for decontamination of dairy products such as yoghurt from mycotoxicogenic fungi and mycotoxins formed beside its beneficial properties as a functional food.

<sup>\*</sup>[shimaakhalifa2003@yahoo.com](mailto:shimaakhalifa2003@yahoo.com)

**Abstract:** This study was carried out on 360 freshwater fishes (240 *Oreochromis* species and 120 *Clarias gariepinus*). They were collected from different governorates and during different seasons. Naturally infected fishes showed clinical abnormalities such as skin darkening, exophthalmia, corneal opacity, abdominal distention, ulceration of the skin and cotton wool like growths on various parts of the body. Fishes were then subjected to post mortem examination which revealed many abnormalities. Mycological examination revealed the isolation of 2081 fungal isolates from 150 diseased and 210 apparently healthy fish samples (1658 mould and 423 yeast isolates), of which 1334 were isolated from *Oreochromis* species and 747 isolates from *Clarias gariepinus*. Isolated moulds belonged to the following genera: Saprolegnia (4.2%), Aspergillus (43.0%), Fusarium (14.1%), Mucor (14), Penicillium (17.2), Rhizopus (4.8%), Scopulariopsis (1.2%), Paeciliomyces (1%) and Curvularia (0.4%). Yeasts isolated also from both fish species had the following incidence: Candida albicans (35.9 %), other Candida species (19.1%), Rhodotorula species (31.4%) and Torulopsis species (13.5%). Experimental infection with the most predominant fungi (Aspergillus flavus, Fusarium species and Candida albicans) was conducted to evaluate the pathogenicity of these isolates. Clinical pictures of experimentally infected fish were similar to those of natural infection. Inoculated fungi were re-isolated from different organs. Results were confirmed with histopathological examination, which revealed the presence of fungal hyphae and spores in different organs.

**Abstract:** **Objective:** The aim of this study was to evaluate the effects of 6 months of balanced caloric moderately deficit diet program combined with individualized moderate Physical exercise on the body weight, body composition and fat distribution of adolescent girls. **Subjects & methods:** It was a longitudinal survey comprised 1244 adolescent girls, aged from 14 to 18 years. Their body weight and height were measured, and the BMI was calculated. Of the total sample, only one hundred and eleven girls (8.9%), with mean age was  $15.82 \pm 0.75$  years, were suffering from obesity based on their body mass index; which is greater than the 95<sup>th</sup> percentile for age and gender based Egyptian Growth Reference Charts. These obese girls were undergoing nutritional intervention (specific dietary program, nutritional education and exercise) for 6 months. At the start of this program, the obese girls were assessed for their anthropometric measures: the body weight, body height (or stature), body mass index (BMI), waist and hip circumferences, waist/hip ratio, skin folds thickness at 5 sites and, according to BIA, their body composition. This assessment was repeated after 6 months. Only thirty eight girls completely finished the program till the end. **Results:** The current study showed that after following the dietary program and physical activity, there were highly significant reduction in waist circumference, the skin fold thickness at the 5 sites (triceps, biceps, sub scapular, suprailiac and abdominal), peripheral and central adiposity, and fat mass, and significant reduction in body weight, hip circumference and fat%. The change in BMI was not significant. On the other hand, there was a highly significant increase of the total body water and Basal metabolic rate after following the dietary program and physical activity. **Conclusion:** The nutritional intervention program was succeeded in 38 obese adolescent girls. These girls show highly significant reduction in body composition and body fat distribution. This revealed that the combined program of diet restriction and exercise is necessary.

**Abstract:** Morphological characteristics and random amplified polymorphic DNA (RAPD) marker were used to assess inter-specific relationships among four heteroforms of gray mangrove (*Avicennia marina* (Forssk) Vierh.) grown in Al-Sharm Al-Bahari site, 33Km south Al-Qussier, Red Sea Coast, Egypt. The four heteroforms viz. I, II, III and IV were detected in two distinct habitats (marine and desert). The morphological and molecular data indicated high variation between form I&III and II&IV. On the other hand, low variation between form I&II and III&IV. Dendrogram based on morphological, anatomical and genetic data supported the segregation of the four heteroforms of *Avicennia marina* into two groups; one includes form I & III and the second include form II & IV. The study concluded that the four heteroforms can be classified as two subspecies, *A. marina* subsp. *eucalyptifolia* (form I) and the *A. marina* subsp. *marina* (form II). In addition, forms III and IV considered as phenotypes from I and II, respectively.

**Abstract:** A computational model simulating the behavior of the concrete subjected to the high temperature environment has been presented here by means of micro-planes framework. The constitutive equations using damage formulations developed earlier by (Labibzadeh and Sadrnejad, 2006) have been adapted here to account for the effects of elevated temperatures. These damage formulations have been founded upon five fundamental damage functions which are directly related to the loading history of each micro-plane. The characteristic features of the proposed model have been verified through making comparison with published experimental results for uniaxial compression and tension tests in the literatures. This suggested model could be easily implemented into a 3D finite elements code to detect damages of concrete structures subjected to fire events.

**Abstract:** The present study was directed to explore the toxic effects of orally administered  $TiO_2$  in mature male albino rats . Eighteen mature male albino rats were classified into three equal groups. The first group was used as control and fed on  $TiO_2$  free ration (C), the second and the third groups (T1) and (T2) were fed on ration containing 1% and 2%  $TiO_2$  respectively for 65days . The body weight of male albino rats fed 1% and 2%  $TiO_2$  showed a significant decrease along the experimental period. Animals were scarified after termination of the experimental period. The sera were separated for estimation of nitric oxide and testosterone levels. Liver samples were preserved for antioxidants enzyme activities determination. Liver, testes and seminal vesicle samples were preserved in formalin for histopathological study. The results indicated that  $TiO_2$  resulted in a significant decrease in body weight gain, sperm motility %, sperm cell concentration, sperm viability and serum testosterone level. While, a significant increase in sperm abnormalities, serum nitric oxide (NO), hepatic superoxide dismutase (SOD), glutathione reductase (GR) enzyme activities and malondialdehyde (MDA) concentration were recorded. Histopathological findings revealed reduction in the number and size of the epithelial lining of the tubuloalveolar gland and hyperplastic glandular epithelium of seminal vesicle. Testes showed mild spermatogenesis besides congested testicular blood vessels. Liver showing vacuolar, hydropic degeneration and cell death of some hepatic cells and steatosis .The present study concluded that,  $TiO_2$  elicited a marked ruinous effect on male fertility and biochemical parameters as well as histopathological picture.

**Abstract:** The present study was designed to investigate the effects of *Lepidium sativum L* (LS) on the nutritional status and some biochemical analyses of serum and liver in hypercholesterolemic rats. Forty-two adult albino male rats Sprague Dawley strain were classified into six groups. One was fed on standard diet and kept as control (-ve) group. The other five hypercholesterolemic rat groups were control (+ve), drug, LS extract, 5 % or 10 % LS powder rat groups. In comparison to control (- ve) group, the control (+ve) group showed a significant higher value of weight gain , feed efficiency ratio (FER), serum cholesterol, triglycerides , LDL-c ,VLDL-c, cholesterol/ HDL-c and LDL-c/ HDL-c, serum (AST& ALT) ,creatinine ,urea, liver cholesterol and total lipids but significant decrease in HDL-c,

119

119

120

120

globulin and liver triglycerides .Also, LS extract and 5% LS powder rat groups showed a significant increase in weight gain, cholesterol/ HDL-c and LDL-c/ HDL-c, serum (AST& ALT) however, drug and 10% LS powder rat groups showed a significant increase in cholesterol/ HDL-c. On the other hand, The drug, LS extract , 5% and 10% LS powder rat groups showed a significant increase in serum cholesterol ,triglycerides VLDL-c , LDL-c ,serum creatinine and urea level when compared to control (- ve) group. In comparing with control (+ ve) group, The drug, LS extract , 5% and 10% LS powder rat groups showed a significant lower value of weight gain , feed efficiency ratio, serum cholesterol ,triglycerides VLDL-c , LDL-c level, cholesterol/ HDL-c , LDL-c/ HDL-c , serum (AST& ALT) ,serum creatinine, urea, liver cholesterol and total lipids with a significant increase in both serum globulin and liver triglycerides.

**Investigation of MLS<sub>B</sub> and tetracycline resistance in coagulase-negative staphylococci isolated from the skin of Egyptian acne patients and controls**

**El-Mahdy, T.S. <sup>\*1,2</sup>; Abdalla, S. <sup>3</sup>; El-Domany, R. <sup>2</sup> and Snelling, A.M.<sup>1</sup>**

<sup>1</sup>Dept. of Biomedical Sciences, University of Bradford, UK <sup>2</sup>Faculty of Pharmacy, University of Helwan, Egypt

<sup>3</sup>Faculty of Pharmacy, University of Suez-Canal, Egypt; \*[Sata186@hotmail.com](mailto:Sata186@hotmail.com)

[Full text](#)

**Abstract:** A total of 335 antibiotic-resistant coagulase-negative staphylococci (CNS) were isolated from face of 53 Egyptian acne patients, 13 dermatology staff and 36 controls. Prevalence of tetracycline resistant CNS was the most common with a rate of 87.3% of total population sampled. Acne patients treated with antibiotics were found to have significant higher risk of carrying erythromycin and clindamycin resistant CNS than patients not under treatment. Staff group was the most common cohort to carry multi-resistant CNS strains with a prevalence of 81.2%. Four erythromycin-resistance genes were screened for 43 CNS strains from patients. The most widely distributed determinants were *msr(A)* alone (48.8%), followed by *erm(C)* alone (39.6% strains) while both determinants together were accounted in 11.6% of the isolates. In addition, 48 non-duplicate tetracycline resistant CNS strains from patients were screened for the presence of four tetracycline resistance genes. Forty-seven of the isolates (97.9%) had *tet(K)* gene. *Tet(L)* gene was only found in four isolates (8.3%), from which three isolates were found to carry also *tet(K)* gene. This study revealed that the high carriage rate of *msr(A)* in our isolates suggests the effective therapy with clindamycin for most of erythromycin resistant CNS infections. In addition, the mechanism of tetracycline resistance in our isolates is mainly by active efflux and we might expect the success of treatment with minocycline in most of tetracycline resistant CNS from Egypt.

**Abstract:** The main purpose of this study was to measure the development level of Guilan rural districts based on Morris Inequality Index. The study employed a descriptive survey design. The statistical population of this study was all Guilan rural districts consisting of 109 rural districts in 2006. In order to investigate and to determine the key indexes of development or backwardness in each region, some variables in five groups (agricultural, health, infrastructure and social) had been used. For data analysis and assessment of development level, Morris Inequality Index was used. Findings revealed that out of the total Guilan rural districts in developmental situation, six rural districts were underdeveloped and more percent of villages were in less developed

Outdoor cooling units, such as cooling towers, air-cooled chillers and rooftop units, all create noises at different levels that can disturb neighbors or occupants inside the building itself. Creating a comfortable acoustic environment in most of Heating, Ventilating and Air-Conditioning, HVAC, applications falls on the mechanical engineering disciplines because most background noise sources are generated by the mechanical apparatuses and cooling devices. This paper investigates the prediction of sound pressure levels emitted from outdoor HVAC systems. The sound level of outdoor units in various applications is dependent upon several significant factors. These factors include equipment location, directivity of the source, barrier shielding, sound path, and attenuation due to distance, atmospheric sound absorption and ground attenuation. A developed simplified model called "Outdoor Modeling Acoustic Code, OMAC" has been utilized taking into consideration the influences of previously mentioned parameters. This OMAC code has been used to analyze and predict the noise level emitted from roof-top air-cooled chillers located on office building as a case study. Predicted noise regimes were compared with the collected field measurements for the validation and verification purposes. Detailed analyses and comparisons between predicted and measured noise spectrums were carried out based on the local and international standards. These comparisons show a good agreement among predicted noise criterions, measured data and dedicated standard thresholds. It was concluded that it is mandatory to utilize such prediction "modeling" tool during the early stages of HVAC design process to allow the authority having jurisdictions to predict the impact outdoor noises within the new development urban.</p> <p>[Ahmed A. **Abstract:** Aim of the work: Assessing the Effect of green, roasted and decaffeinated coffee on serum glucose, insulin and serum lipid profile in diabetic rat models. Methods: Design of the Study: Thirty female wistar rats weighing  $124.5 \pm 5.41$ g (mean  $\pm$ S.D) were divided into 5 groups. The first group served as a control and consumed a standard diet according to (AIN – 93). The other 4 groups were injected intraperitoneally with 105 mg / kg body weight of alloxan . One group was kept without further treatment and served as a positive diabetic control. Groups 3, 4, 5 consumed 5% green, roasted and decaffeinated coffee in drinking water, respectively. The feeding trial continued for four weeks. At the end of the experiments, the animals were sacrificed, blood samples were collected, and the liver, kidney ,spleen and heart were separated, washed ,dried and weighed. Laboratory investigations Consisted of serum glucose, insulin, calcium, phosphorus and complete lipid profile was determined to test the magnitude of antioxidant potential green, roasted and decaffeinated coffee. Results: The present study show a significant difference ( $p < 0.05$ ) in body weight gain and food intake between all treatment groups , with non significant difference in water intake , relative weight of organs including liver , kidney , spleen and heart . the study also shows significant elevation ( $p < 0.05$ ) in serum glucose and insulin in diabetic control group as compared to normal control group. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ( $p < 0.05$ ) .There is a significant decrease ( $p < 0.05$ ) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green, roasted and decaffeinated coffee respectively indicating an association between coffee consumption and bone health. our results also shows that alloxan injection produced a significant increase( $p < 0.05$ ) in serum total- cholesterol(TC); triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio however a significant decrease ( $p < 0.05$ ) in serum HDL-C is observed ; In diabetic rats compared to normal control .green, roasted and decaffeinated coffee resulted in a significant decrease ( $p < 0.05$ ) in triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ( $p < 0.05$ ) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study .

Conclusion: The observed improvement in glucose, insulin profile, triacylglycerol and HDL-C confirm the potent biological action of green, roasted and decaffeinated coffee and suggest that chlorogenic acid (a component in coffee) might have an antagonistic effect on glucose transport. Suggesting a novel function of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

**Key words:** Green, roasted, decaffeinated coffee, glucose, insulin and lipid profile

**The Impact of Obesity and Weight Reduction Program with Xenical Drug Treatment on Health Status of Obese Adolescent Girls in Saudi Arabia**

[Full text](#)

**Hend Hassan Ali Ganbi**

Nutrition and Food Science Dept., Faculty of Education for Home Economics and Art Education , King Abd – Elaziz University, Jeddah , Saudi Arabia  
[dr.gamal\\_rawayshed@yahoo.com](mailto:dr.gamal_rawayshed@yahoo.com)

**Abstract:** The present investigation aimed to assess the health problems and diseases associated with obesity in Saudi Arabian adolescent girls, and to evaluate the impact of obesity and weight reduction program with xenical (Orlistat) drug treatment on health status of tested obese adolescent patients. This study was performed on a group of 160 obese adolescent girls, aged 15 – 20 years, attending Physical Rehabilitation and Obesity Treatment Centers at Jeddah, Saudi Arabia. The obese patients group, under investigation, was selected from the adolescent girls who want in the treatment of obesity after obtaining their consent to participate in this study. The present results revealed that most tested obese adolescent girls suffered with a lot of health problems and diseases. The obesity was associated with deterioration of health status for obese subjects. Also, the weight reduction program with xenical (Orlistat) drug treatment caused a significant loss ( 0.01) in body weight of obese adolescent girls by 7.42 and 11.35 % after 30 and 60 days respectively. In addition that tested weight reduction program with orlistat treatment exhibited a significant enhancing impact ( 0.01) on all tested health status parameters of obese patients ; especially when obese patients engaged with tested weight – reduction program based upon being on a nutritionally balanced , reduced – calorie dietary regimen and practicing the physical activities regularly at least 6 hours a day , as showing by its enhancing effect on liver functions, serum lipid profile , liver and renal functions and by its lowering effect on blood glucose , insulin and LDL - cholesterol levels ; within the reference reported range of all health status items for health individual adolescent girls. Therefore, it is recommended that the obese adolescent girls and women should be orally treated with xenical drug capsules with their obligation by being on a dietary regimen ; a nutritionally balanced , reduced – calorie diet (800 – 1200 calorie) , and practicing the physical activities regularly at least 6 hours a day.

<sup>4</sup>Microbiology Dept., College of Pharmacy, Misr University for Science and Technology, Cairo, Egypt

**Abstract:** Strains of *Lactobacillus* and *Bifidobacterium* were isolated from processed milk collected in Cairo, Egypt. *Lactobacilli* was isolated on Acetate media (SL) of Rogosa and Mitchell-Weisman. While *Bifidobacterium* was isolated on DSM medium (Difco Sporulation Medium). The isolates were characterized microscopically, morphologically and by some biochemical tests. DNA was extracted from the specified isolates using (Qiagen, Germany. Cat #51306) and species-specific primers for *Lactobacillus* and *Bifidobacterium* were designed to amplify the 16S rDNA gene as a conserved region in the bacterial DNA. Elution of the target band from the gel was performed efficiently and the 16S rDNA region was subjected to sequencing using Sequencer ABI PRISM 3730XL Analyzer. The sequencing data obtained suggested that the two studied isolates were (at the genus level) designated as *Lactobacillus* and uncultured *Bifidobacterium*. When the sequencing data was aligned on <http://www.ncbi.nlm.nih.gov>, it shows 88% homology and expected value of 7e-164 to

129

129

Maturation and Histological characteristics of ovaries in Mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria

[Full text](#)

LAWSON, Emmanuel Olugbenga

Department Of Fisheries, Faculty of Science, Lagos State University, Ojo.

P.O. Box 001, LASU Post Office Box, Lagos, Nigeria.

[ollulawson@yahoo.com](mailto:ollulawson@yahoo.com).

**Abstract:** Maturation and histological characteristics of female gonads in mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria were investigated between July 2004 and July 2006. This species is found in abundance in the mud flats of the mangrove swamps of Lagos lagoon where it forms part of its fisheries. Its importance lies on its availability as food for man and as baits for artisanal and offshore fisheries. Diurnal collections were made with non return valve traps. Biometric data were recorded and sexes separated. Ovaries were carefully removed from 1390 individual specimens that were with no abnormalities or pathological changes. The histological structure of the ovaries was based on a temporal scale after intensive sampling. The ovaries were observed macroscopically and processed by standard histological technique. ICES, BITS and IBTS scales and Bucholtz manuals were employed in the classifications of its maturity and gonadal stages. Seven stages of maturity which included: immature (stage I), immature and developing (stage II), ripening (stage III), ripe (stage IV), ripe running (Stage V), spent (stage VI) and recovering-spent (stage VII) were observed among the specimens. These constituted 1.15, 47.99, 15.32, 9.86, 19.50, 4.68 and 1.51% of the specimens examined in the study respectively. The pre-spawning phase was represented by I, II and III; the spawning by IV and V; and post-spawning by VI and VII. Histological development of the species indicated six (6) developmental stages of oocytes development viz: oogonium, primary oocyte, primary, secondary, and tertiary vitellogenic and hyaline oocytes. Specimens were found with oocytes which had developed over the migratory nucleus stage, indicating maturation can still proceed in the fish on the mudflats before migrating to spawning nests in the burrows. Stages V and VI ovaries contained all stages of oocyte. The GSI of the species increased at initial phase and then became stable at the later period. The species was a multiple and synchronous spawner, spawning in February, March, and October. The mean GSI varied from  $1.03 \pm 0.09\%$  in May to  $8.40 \pm 1.67\%$  in February 2006. Less than  $8.40 \pm 1.67\%$  of the body biomass was converted by the species to development of ovaries. The minimum size of spawning females was 110 mm TL. Therefore, this study provides the necessary information on maturation and histological development of oocytes as an appropriate strategy for optimum utilization and conservation of this commercially valued fish species in Lagos lagoon, Nigeria.

[LAWSON, Emmanuel Olugbenga. Maturation and Histological characteristics of ovaries in Mudskipper, *Periophthalmus papilio* from Lagos lagoon, Nigeria. Journal of American Science 2010;6(11):965-976]. (ISSN: 1545-1003).

Residual Available Copper and Boron in Soil as Affected by Zinc sulfate and Boric acid in a Zinc and Boron Deficient Soil

[Full text](#)

Farshid Aref

Department of Soil Science, Firouzabad Branch, Islamic Azad University, Iran

Tel: +989173383896, [farshidaref@yahoo.com](mailto:farshidaref@yahoo.com)

**Abstract:** Micronutrients such as copper (Cu) and boron (B) are needed in small amounts, and

131

131

132

132

there are also likely to be residual effects for some years after their application. A field experiment with maize plant grown on Zn and B deficient soil was conducted to evaluate the effect of Zn and B interaction on the residual available Cu and B content in the soil during 2009 at Fars Province, Iran. Treatments including five levels of Zn (0, 8, 16 and 24 kg ha<sup>-1</sup> and Zn foliar spray) and four levels of B (0, 3, and 6 kg ha<sup>-1</sup> and B foliar spray) in a completely randomized block design were set up. The findings showed that in all treatments, the residual available Cu and B in the soil increased compared to its initial levels (before culture). The main effect of Zn and B on the residual Cu was insignificant relative to the no Zn and B level. No treatments, showed a significant difference on the residual Cu in the soil as compared with the control and also the effect of Zn-B interaction on the residual Cu was insignificant. In most treatments, the residual B in the soil decreased compared to its initial level levels (before culture). The Zn-B interaction was significant on the residual available B content in the soil. The presence of Zn prevented from increase of the available B remaining in the soil by B use relative to the soil B content before culture. Application of a high amount of Zn in the soil decreased residual available B in the soil relative to the no Zn level.

**Chemistry Department, Faculty of science, Helwan University, 11795 Egypt**  
*\* [ismailscience@gmail.com](mailto:ismailscience@gmail.com)*

**Abstract:** The diameter of silica nanoparticles is mainly affected by the relative contribution from nucleation and growth. Once the total number of nuclei is fixed, the resultant particle size is then determined via the growth process by the total quantity of TEOS. In this work, we will demonstrate the effect of TEOS and NH<sub>3</sub> concentrations on particle size of silica nanoparticles. Experimental results indicate that the size of silica colloids decreases with increasing with TEOS and ammonia concentrations where both the rate of hydrolysis and condensation become Faster and influence the solubility of intermediate [Si (OC<sub>2</sub>H<sub>5</sub>)<sub>4-x</sub>(OH)<sub>x</sub>] and hence the supersaturation for the nucleation process. With higher catalyst concentration, the number of nuclei is increased and therefore smaller silica colloids are obtained. Also surface modification of the silica nanoparticles by hexamethyldisilazane was studied to prevent the particles aggregation and to give good dispersion of silica nanoparticles in hydrophobic mediums.

**Abstract:** This work aimedto study the early postpartum dietary practices among a group of Saudi women.A retrospective study was carried out on a convenient sample of 300 women during their post-partum period who attended seven primary health centers in Riyadh and Taif, KSA. The subjects were interviewed individually throughout a period of four months fromSeptember 2009 to January 2010.An interview questionnaire and a dietary scale of King and Jakobson were used for data collection. The results showed that73.3% of the study subjects had incomplete knowledge about post-partum nutrition and anequal proportion of them (28.3%) had

133

133

134

134

either excellent or borderline dietary practices during their early post-partum period and about one-fifth of them (19.3%) had dangerous dietary practices. The study concluded that Saudi women's post-partum dietary practices were significantly associated with their general characteristics such as age, education, employment and number of family member as well as with their obstetrical characteristics including their gravidity and parity.

**Abstract:** In recent years data mining has become a very popular technique for extracting information from the database in different areas due to its flexibility of working on any kind of databases and also due to the surprising results. This paper is an attempt to introduce application of data mining techniques in the manufacturing industry to which least importance has been given. A taste of implementable areas in manufacturing enterprises is discussed with a proposed architecture, which can be applied to an individual enterprise as well as to an extended enterprise to get benefit of data mining technique and to share the discovered knowledge among enterprises. The paper proposes conceptual methods for better use of different data mining techniques in product manufacturing life cycle. These techniques include statistical techniques, neural networks, decision trees and genetic algorithms. An integrated and unified data mining platform is anticipated then to improve overall manufacturing process.

Department of Crop Science, Adamawa State University, Mubi, P. M. B 25 Mubi, 650001, Adamawa State, Nigeria. [harushe2003@gmail.com](mailto:harushe2003@gmail.com)

[Full text](#)

**Abstract:** A screen house pot experiment was conducted at FAO/TCP farm of the Adamawa State University, Mubi north-eastern Nigeria, to study the response of rice to Zn fertilizer application and the distribution of Zn along toposequence of the Lake Gerio Fadama soils of North-eastern Nigeria which was used for the study. The experiment consisted of four Zn rates of 0, 5, 7.5 and 10 kg Zn ha<sup>-1</sup> as ZnSO<sub>4</sub>.7H<sub>2</sub>O. The effect of treatment on Zn concentration and dry matter yields response were determined. The 0.1N HCl and DTPA extractable Zn ranged from 8.5 to 9.5 mg kg<sup>-1</sup> soil, 2.2 to 2.7 mg kg<sup>-1</sup> soil with mean values of 9.08 and 2.35 mg kg<sup>-1</sup> soil respectively. Available Zn soil status is therefore assessed as medium. Dry matter yields and Zn uptake were optimum at 5 kg ha<sup>-1</sup> with corresponding values of 2.04 and 11.86 mg kg<sup>-1</sup> respectively.

138

138

**ABSTRACT:** Microbiological and molecular techniques were used to determine the virulence factors, plasmid profile and antibiotic susceptibility spectrum of *Staphylococcus aureus* and CON-*Staphylococcus* spp isolated from patients with acute otitis media attending University of Uyo Teaching Hospital, General Hospital, Ikot-Ekpene and Nekede Paediatric Hospital between January, 2009 and January, 2010. 42 (30.9%) *Staphylococcus aureus* and 21 (15.4%) CON *Staphylococcus* spp were isolated from the aural swab samples collected. *Staphylococcus aureus* produced 16 (38.1%), 22 (52.4%) and 4 (9.5%) of alpha, beta and gamma haemolysis, respectively, while CON-*Staphylococcus* spp. produced more of beta haemolysis than both alpha and gamma. The results showed that 14 (33.3%) *Staphylococcus aureus* and 9 (42.9%) of CON-*Staphylococcus* spp are beta-lactamase producer. The antibiotics susceptibility testing showed that 29 (69.0%), 26 (61.9%), 27 (64.3%), 28 (66.7%) and 29 (69.0%) of *Staphylococcus aureus* were sensitive to penicillin, ceftriaxidime, cefoxitin, ciprofloxacin and levofloxacin, respectively. 12 (28.6%) of *Staphylococcus aureus* were resistant to streptomycin and imipenem, while about 45.2% -50.0% were resistant to cephalothin and amoxicillin. CON-*Staphylococcus* spp also showed varied percentages of sensitivity ranging between 42.9% for streptomycin and 71.4% for moxifloxacin. The result also showed that 19.2 % of *Staphylococcus aureus* and 9.6% of CON-*Staphylococcus* spp. were resistant to more than eight antibiotics with (MAR) index ranging from 0.25 to 1.00 and 0.25 to 0.75 for *Staphylococcus aureus* and CON-*Staphylococcus* spp. respectively. The results obtained in this study are statistically significant (p < 0.05). Most of the *Staphylococcus aureus* and CON-*Staphylococcus* spp were cured of their plasmids showing that they are plasmid borne. Large molecular weight plasmids ranging from 23.13 kbp to 50.0 kbp were harboured by both *Staphylococcus aureus* and CON-*Staphylococcus* spp obtained from acute otitis media. However,

continuous surveillance to monitor antimicrobial resistance and guide the antibacterial therapy is overwhelmingly necessary.

**Abstract:** This article attempts to illustrate the barriers of agricultural development in Fars, Iran. Agriculture is certainly a major contributor to rural development in many countries. It is one of the most important economic sectors in Iran. But, there are a significant number of barriers to effectively using agriculture industry as a tool for rural development. The findings through focus group discussion indicated that there are some organizational barriers in agricultural development in some villages in Fars. The finding can assist the local agriculture organizations for remove this problem in face of agriculture for rural development.

[Farshid Aref. Barriers of Agricultural Development in Iran: A Case study of Fars Province. Journal of American Science 2010;6(11):1034-1037]. (ISSN: 1545-1003). (<http://www.americanscience.org>).

140

**Abstract:** The immunostimulatory and protective properties of *Lactobacillus brevis* isolated from cassava starch were studied in vitro and in vivo. Antagonism was measured by the zone of inhibition between the bacterium streak/ring and fungus plug. Subsequent increases in inhibition were observed and complemented by a small but progressive decrease in the distance between the bacterium and the fungus. *L. brevis* significantly (>74%) inhibited the growth rate of *Fusarium moniliforme* after 168 h. Biochemical indices of albino rat plasma showed that the bacterium had liver improvement functions. Plasma aspartate aminotransferase (AST) activity of the rats dosed with *L. brevis* alone was lower (8.33 IU/L) than the control. A mild elevation of AST and alanine aminotransferase (ALT) activities was observed in rats administered with *L. brevis* and *F. moniliforme* implying that the bacterium possesses antimycotic properties capable of reducing the severity of pathogen attack on the host. However, there was a significant ( $P<0.05$ ) decrease in the plasma globulin and protein levels. There was a reduction in the count of *F. moniliforme* in rats dosed with both organisms during feeding trials. The weight gain by rats in the treatment group compared favourably with the control. Further pathological investigation confirmed a pale and friable liver while the small intestine was inflamed. The administration of *L. brevis* had an immunostimulatory effect. *Lactobacillus brevis* has not only potent in vitro antifungal activity against *F. moniliforme* but also in vivo control efficacy against *Fusarium* infection. Further evaluation of its effectiveness for disease control and applications should be done

**Abstract:** Matching of feature vectors extracted from speech sample of an unknown speaker, with models of registered speakers is the most time consuming component of real-time speaker identification systems. Time controlling parameters are size and count of extracted test feature vectors as well as size, complexity and count of models of registered speakers. We studied vector quantization (VQ) for accelerating the bottlenecking component of speaker identification which is less investigated than Gaussian mixture model (GMM). Already reported acceleration techniques in VQ approach reduce test feature vector count by pre-quantization and reduce candidate registered speakers by pruning unlikely ones, thereby, introducing risk of accuracy degradation. The speedup technique used in this paper partially prunes VQ codebook mean vectors using partial distortion elimination (PDE). Acceleration factor of up to 3.29 on 630 registered speakers of TIMIT 8kHz speech data and 4 on 91 registered speakers of CSLU speech data is achieved respectively.

**Abstract:** To evaluate the impact of chronic administration of an angiotensin II receptor antagonist (Irbesartan) and/or curcumin on fasting blood glucose level (FBG), insulin sensitivity, and proinflammatory cytokines in experimentally-induced diabetes in albino rats. Materials and Methods: The study included 80 (20 as control group) male albino rats; diabetes mellitus (DM) was induced using intraperitoneal injection of a single dose of 50 mg/kg of streptozotocin (STZ) after animals were maintained on high-fat diet for 2-weeks (30 rats) for induction of non-insulin dependent DM (NIDDM) or without dieting regimen (30 rats) for induction of IDDM. One-week later, rats received oral irbesartan (2.5 mg/kg/day), oral curcumin (200 mg/kg) or both lines for 6 weeks. Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) and rapid insulin

sensitivity test (RIST) were used for clinical assessment. Two fasting venous blood samples were obtained prior to initiation and at 6-wks after treatment for estimation of FBG and ELISA estimation of fasting plasma insulin (FPI), serum interleukin (IL)-1 and -6 and tumor necrosis factor- (TNF-). Results: Both lines of treatment induced significant reduction of FBG and FPI levels compared to pre-treatment levels with significant reduction of FBG on using curcumin compared to irbesartan, but combination therapy significantly lowered FPI levels compared to either drug alone. Post-treatment serum levels of studied cytokines in all groups were significantly lower compared to pre-treatment levels, but curcumin alone significantly reduced serum levels of IL-6 and TNF- compared to irbesartan alone. Post-treatment HOMA-IR and RIST indices were significantly improved compared to pre-treatment levels. Conclusion: Chronic administration of irbesartan/curcumin combination showed anti-diabetic effect manifested as decreased FBG and FPI levels and ameliorated the increased serum levels of pro-inflammatory cytokines. The use of such combination could be recommended for clinical trials so as to document its use for control of both types diabetes.

**Abstract:** Objectives: Recent evidence favors primary role of cellular autoimmunity and its humoral mediators in pathogenesis and following Type I diabetes mellitus (IDDM) The present study is carried out to investigate serum concentration of TNF- $\alpha$ , IL-6 and sIL-2 R in children with IDDM. Potential role of glycemic control, body mass index and disease duration were evaluated. Design and Methods: Thirty five children with IDDM and 30 age and sex matched non diabetic healthy subjects were recruited for this study from the out patients Clinic of diabetes of National Institute of Diabetes and Endocrinology. Results: Circulating level of TNF- $\alpha$  IL-6 and sIL-2R were elevated in children with type I DM ( $39.91 \pm 17.46$  pg/ml,  $14.89 \pm 10.69$  pg/ml and  $779.0 \pm 467.06$  pg/ml respectively). Compared with nondiabetic controls ( $5.67 \pm 1.88$  pg/ml,  $6.23 \pm 2.78$  pg/ml and  $254.33 \pm 173.6$  pg/ml respectively). These differences were statistically highly significant ( $<0.0001$ ). Glycemic control, Insulin dose and disease duration were not significant predictors of cytokine concentration in children with IDDM. A significant negative correlation was obtained between TNF - $\alpha$  with age, weight, BMI and sIL-2R in diabetic patients. However there was a significant positive correlation between IL-6 with weight and BMI in those children. Conclusion: Circulating levels of inflammatory cytokines were elevated in patients with IDDM suggesting activation of the inflammatory immune response system. Their levels were not affected by glucose level , insulin dose or duration of the disease.

**Abstract:** The most valuable treatment objective in dental practice is to afford the patient a pain-free treatment. The **aim of this study** was to compare the use of low-power laser irradiation and the non-steroidal anti-inflammatory drug diclofenac sodium, as dental analgesic postoperative tools.

**Materials and Methods:** Ninety patients undergoing non- surgical extraction of lower third molar with local anaesthesia (2% lidocaine with epinephrine 1:80.000) were enrolled in this study. Sixty received a preoperative single dose of 100 mg diclofenac sodium; thirty patients of them had postoperative low power laser irradiation in addition. They were compared to a third group with only regular postoperative recommendations (30 patients). **Results** showed that low-power laser irradiation significantly reduced postoperative pain intensity than in patients pre-medicated with diclofenac alone, or depend only on regular recommendations (controls).**In conclusion:** We suggested that the use of low-power laser irradiation enables the best postoperative analgesic effect and the most comfortable postoperative course after non surgical extraction of lower third molar than non-steroidal anti-inflammatory drugs or regular postoperative treatment.

**Abstract:** A pot experiment was carried out in greenhouse on reclamation sandy soil from (Abu-Rwash) region north of Egypt to evaluation effect of organic matter at rate 2% of soil weight and different rates of elemental sulphur at a rate, i.e. (100 and 200) ppm ( $S_1$  and  $S_2$ ) respectively and nitrogen, i.e. (50, 100 and 150) ppm ( $N_1$ ,  $N_2$  and  $N_3$ ) respectively at from ammonium sulphate ( $NH_4$ )  $SO_4$ . Dihydrogen potassium phosphate  $H_2KPO_4$  was added as at a rate 200 ppm as sources to phosphorus and potassium. All treatments were added before the culture of a week at one dose. The growth stages were divided to three stages (planting, elongation and maturity) each stage for two months about. The determination was performed each stage to soil and plant (whole plant). The results can be summarized as follows: (1) Soil pH decreasing at significantly especially at rates, i.e. 200 ppm S and 150 ppm N treatment in each of planting and elongation stages then began a gradual return to initial in maturity stage. (2) Electric conductivity (E.C) is rising at significantly especially with  $S_2 - N_3$  treatment then starting the gradual return to initial in maturity stage. (3) Thiosulphate  $S_2O_3$  was found in soil as a result sulphur oxidation as it affects inhibition on the nitrification process. (4) Available nitrogen ( $NH_4^+$  and  $NO_3^-$ ) continued a long experiment period. (5) Dry weight was more significantly with  $S_2-N_3$  treatment in comparison to other treatments. (6) Mineral contents were more significantly with  $S_2-N_3$  treatment along of time experiment except potassium and zinc elements as decreasing in maturity stage.

**Abstract:** Diphyodont, including man, have traditionally two dentitions the deciduous and

permanent. The significances of the presence of two dentition may lie behind the fact that once the teeth have been developed, they are unable to grow, by the common sense of the word. Since the individual organs and tissues grow by time and the jaws also do, therefore, other generation of dentition is needed to match the new situation, that is, the permanent dentition. However, this typing of dentition into two sets is oversimplified and nonindcative for the condition in which the teeth are variably represented. It also, does not exhibit the different and definite cases by which the teeth are expressed. Taking these drawbacks into consideration, a presumed classification has been presented indicating the developmental, clinical and chronological situations of the different sets of dentitions. The presumed classification may be valuable not only for pedagogic purposes but also for the developmental and clinical studies.

**Abstract:** Recent studies demonstrated a key role of angiogenesis, thrombosis and fibrinolysis in tumour invasion and metastasis. We aimed to clarify the potential link between angiogenic factor {vascular endothelial growth factor (VEGF)}, prothrombotic factor {von Willebrand factor (vWF)} and fibrinolytic markers {tissue plasminogen activator (t-PA), plasminogen activator inhibitor-1 (PAI-1) and D-dimer} with disease progression and metastatic dissemination in bladder cancer patients. The study enrolled forty five bladder cancer patients classified into three groups: 20 patients with locally invasive tumours, 15 patients with regional lymph nodes involvement and 10 patients with distant metastasis. In addition to 15 subjects served as a control group. Enzyme linked immunoassay method was used for measurement of VEGF, vWF, t-PA, PAI-1 and D-dimer. Enhanced angiogenesis was evident by high level of VEGF with subsequent high release of endothelial vWF. Also activation of fibrinolytic system was pronounced by elevated t-PA, PAI-1 and D-dimer. In addition, highest values of these factors were associated with relatively advanced tumour stage, as they showed a significant direct correlation with the stage of bladder cancer. Regression analysis proved that VEGF, vWF, t-PA and D-imer are independent determinant for the stage of bladder cancer. Conclusion: These results suggest that VEGF, t-PA, PAI-1 and D-dimer are potential prognostic markers in bladder cancer patients. These findings may have future implications for the treatment of patients with metastastatic disease.

**Abstract:** In this study, the effect of different plant cultivation densities on the oil content and yield of *Foeniculum vulgare* Mill. Cv. Soroksary seeds was studied at the Faculty of Agricultural Sciences and Engineering, Karaj, Iran (Latitude 35° 47' N and Longitude 50° 59' E) in 2008. Five plant spaces studied were 10, 15, 20, 25, and 30 cm and the distance between rows in all treatments was 40 cm using a complete randomized block design with three replicates. According to results, the effect of plant density on oil content and yield was significant ( $P<0.01$ ). The highest oil content (3.33%) and yield per hectare (116.73 liter) was obtained with the lowest plant density.

**Abstract:** Investigations for the first time into the blue green algae of Lekki lagoon were carried out for 24 months (June 2003- May 2005) at monthly intervals using standard plankton net of mesh size 55µm. One hundred and seventy nine species belonging to thirty genera were observed. The filamentous blue green algae *Oscillatoria* formed the most abundant genus making up twenty three species followed by *Phormidium* eighteen species. *Anabaena* and *Chroococcus* recorded thirteen species each while the genera, *Gleocapsa*, *Merismopedia* and *Microcystis* recorded ten, eight and twelve species respectively. Only one genus each of *Cyanoarcina*, *Calothrix* and *Scytonema* were encountered. Bloom forming species identified were *Microcystis aeruginosa*, *M. flos-aquae*, *M. wesenbergii* and *Anabaena flos-aquae*. In this study, thirty-nine new species were recorded for Lagos lagoon complex in which Lekki lagoon is one of it while *Cyanoarcina hueberliorum* is new record for Nigeria.

# Indirect Boundary Element Method for Calculation of Compressible Flow past a Symmetric Aerofoil with Linear Element Approach Using Doublet Distribution Alone

Muhammad Mushtaq\* &amp; Nawazish Ali Shah

Department of Mathematics, University of Engineering &amp; Technology Lahore – 54890, Pakistan

Corresponding Author, e-mail: [mushtaqmalik2004@yahoo.co.uk](mailto:mushtaqmalik2004@yahoo.co.uk)

**Abstract:** In this paper, an indirect boundary element method is applied to calculate the compressible flow past a symmetric aerofoil. The velocity distribution for the flow over the surface of the symmetric aerofoil has been calculated with linear boundary element approach using doublet distribution alone. To check the accuracy of the method, the computed flow velocity is compared with the exact velocity. The comparison of these results has been given in the tables and graphs. It is found that the computed results are in good agreement with the analytical results. [Journal of American Science. 2010;6(11):1-9]. (ISSN: 1545-1003).

**Keywords:** Indirect boundary element method, Compressible flow, Velocity distribution, Symmetric aerofoil, linear element.

## 1. Introduction

In the past, many numerical techniques such as finite difference method, finite element method, and boundary element method etc. came into being making possible to solve various practical fluid flow problems. Boundary element method has received much attention from the researchers due to its various advantages over the other domain methods. One of the advantages is that with boundary elements one has to discretize only the surface of the body, whereas with domain methods it is essential to discretize the entire region of the flow field. Moreover, this method is well-suited to problems with an infinite domain. The boundary element method can be classified into two categories i.e. direct and indirect. The direct method takes the form of a statement which provides the values of the unknown variables at any field point in terms of the complete set of all the boundary data. On the other hand, the indirect method utilizes a distribution of singularities over the boundary of the body and computes this distribution as the solution of integral equation. The equation of indirect method can be derived from that of direct method. (Lamb, 1932; Milne-Thomson, 1968, Kellogg, 1929 and Brebbia and Walker, 1980). The indirect method has been used in the past for flow field calculations around arbitrary bodies (Hess and Smith, 1967; Muhammad, 2008&2009, Luminita, 2008, Mushtaq, 2008, 2009 & 2010). Most of the work on fluid flow calculations

using boundary element methods has been done in the field of incompressible flow. Very few attempts have been made on flow field calculations using boundary element methods in the field of compressible flow. In this paper, the indirect boundary element method has been used for the solution of compressible flows around a symmetric aerofoil with linear element approach using doublet distribution alone.

## 2. Mathematical Formulation

We know that equation of motion for two-dimensional, steady, irrotational, and isentropic flow is

$$(1 - Ma^2) \frac{\partial^2 \Phi}{\partial X^2} + \frac{\partial^2 \Phi}{\partial Y^2} = 0 \quad (1)$$

where  $Ma$  is the Mach number and  $\Phi$  is the total velocity potential of the flow. Here  $X$  and  $Y$  are the space coordinates.

Using the dimensionless variables,  $x = X$ ,

$$y = \beta Y, \text{ where } \beta = \sqrt{1 - M a^2},$$

equation (1) becomes

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = 0$$

$$\text{or } \nabla^2 \Phi = 0 \quad (2)$$

which is Laplace's equation.

### 3. Symmetric Aerofoil

The Joukowski transformation

$$z = \zeta + \frac{a^2}{\zeta} \quad (3)$$

transforms the circle shown in figure (1) in the  $\zeta$ -plane on to symmetric aerofoil in the  $z$ -plane.

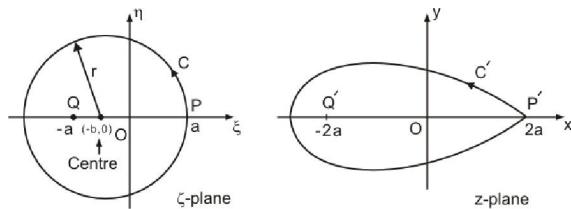

Figure 1

### 4. Flow Past a Symmetric Aerofoil

Consider the flow past a symmetrical aerofoil and let the onset flow be the uniform stream with velocity  $U$  in the positive direction of the  $x$ -axis as shown in figure (2).

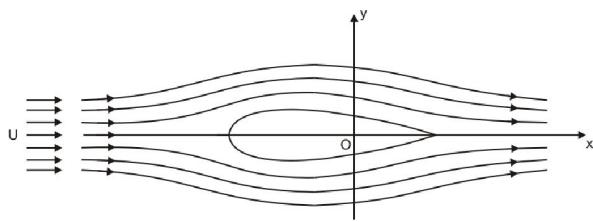

Figure 2: Flow past a symmetric aerofoil.

#### Exact Velocity

The magnitude of the exact velocity distribution over the boundary of a symmetric aerofoil is given by Chow[3] as

$$V = U \left| \frac{1 - \left( \frac{r}{z-b} \right)^2}{1 - \left( \frac{a}{z} \right)^2} \right|$$

where  $r$  = radius of the circular cylinder,  
 $a$  = Joukowski transformation constant  
and  $b = a - r$  =  $x$ -coordinates of the centre of the circular cylinder

In Cartesian coordinates, we have

$$\begin{aligned} V &= U \\ &\sqrt{\left[ \left\{ (x-b)^2 + y^2 \right\}^2 - r^2 \left\{ (x-b)^2 - y^2 \right\} \right]^2 + 4r^4y^2(x-b)^2} \\ &\quad \left[ (x-b)^2 + y^2 \right]^2 \\ &\times \sqrt{\left[ (x^2 + y^2)^2 - a^2(x^2 - y^2) \right]^2 + 4a^4x^2y^2} \\ &\quad \left[ (x^2 + y^2)^2 - 2a^2(x^2 - y^2) + a^4 \right] \end{aligned}$$

#### Boundary Conditions

Now the condition to be satisfied on the boundary of a symmetric aerofoil is

$$\nabla \cdot \hat{n} = 0 \quad (4)$$

where  $\hat{n}$  is the unit normal vector to the boundary of the aerofoil .

Since the motion is irrotational

$$\nabla = -\nabla \Phi$$

where  $\Phi$  is the total velocity potential . Thus equation (4) becomes

$$(-\nabla \Phi) \cdot \hat{n} = 0$$

$$\text{or } \frac{\partial \Phi}{\partial n} = 0 \quad (5)$$

Now the total velocity potential  $\Phi$  is the sum of the perturbation velocity potential  $\phi_{s.a}$  where the subscript  $s.a$  stands for symmetric aerofoil and the velocity potential of the uniform stream  $\phi_{u.s}$  .

$$\text{i.e. } \Phi = \phi_{u.s} + \phi_{s.a} \quad (6)$$

$$\text{or } \frac{\partial \Phi}{\partial n} = \frac{\partial \phi_{u.s}}{\partial n} + \frac{\partial \phi_{s.a}}{\partial n} \quad (7)$$

From equations (5) and (7) , we get

$$\frac{\partial \phi_{s.a}}{\partial n} + \frac{\partial \phi_{u.s}}{\partial n} = 0$$

$$\text{or } \frac{\partial \phi_{s.a}}{\partial n} = -\frac{\partial \phi_{u.s}}{\partial n} \quad (8)$$

But the velocity potential of the uniform stream , given in Milne – Thomson [ 6 ], Shah [ 7 ], is

$$\phi_{u.s} = -Ux \quad (9)$$

$$\begin{aligned} &= -U \frac{\partial x}{\partial n} \\ &= -U (\hat{n} \cdot \hat{i}) \quad (10) \end{aligned}$$

Thus from equations (8) and (10), we get

$$\frac{\partial u_{s.a}}{\partial n} = U (\hat{n} \cdot \hat{i}) \quad (11)$$

Now from the figure (3)

$$\hat{A} = (x_2 - x_1) \hat{i} + (y_2 - y_1) \hat{j}$$

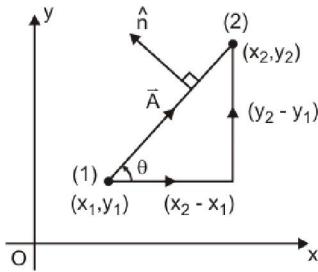

Figure 3

Therefore the unit vector in the direction of the vector  $\underline{A}$  is given by

$$\underline{A} = \frac{(x_2 - x_1) \hat{i} + (y_2 - y_1) \hat{j}}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}}$$

The outward unit normal vector  $\hat{n}$  to the vector  $\underline{A}$  is given by

$$\hat{n} = \frac{-(y_2 - y_1) \hat{i} + (x_2 - x_1) \hat{j}}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}}$$

$$\text{Thus } \hat{n} \cdot \hat{i} = \frac{(y_1 - y_2)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} \quad (12)$$

From equations (11) and (12), we get

$$\frac{\partial \phi_{s.a}}{\partial n} = U \frac{(y_1 - y_2)}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}} \quad (13)$$

Equation (13) is the boundary condition which must be satisfied over the boundary of a symmetric aerofoil.

#### Equation of Indirect Boundary Element Method

The equation of indirect boundary element method for two-dimensional flow in the case of doublet distribution alone [Muhammad,2008 & Mushtaq, 2009 & 2010] is :

$$-c_i \Phi_i + \frac{1}{2\pi} \int_{\Gamma-i} \Phi \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma + \phi_\infty \\ = -(\phi_{u.s})_i \quad (14)$$

where  $c_i = 0$  when 'i' is within  $R'$   
 $= 1$  when 'i' is within  $R$   
 $= \frac{1}{2}$  when 'i' is on  $S$  and  $S$  is smooth

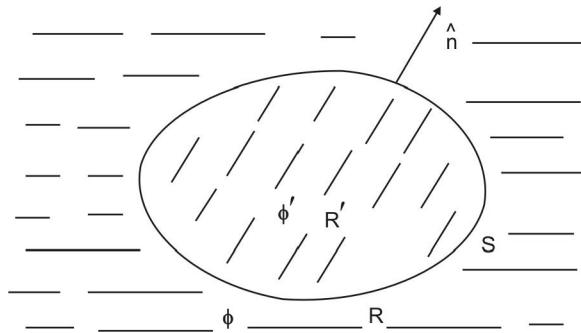

Figure 4

#### Matrix Formulation

Let the boundary of the region be discretized into  $m$  linear elements, then equation (14) can be written as

$$-c_i \Phi_i + \sum_{j=1}^m \left[ \frac{1}{2\pi} \int_{\Gamma_{j-i}} \Phi \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma \right] + \phi_\infty = -(\phi_{u.s})_i \quad (15)$$

where  $\Gamma_{j-i}$  is the length of the element 'j' excluding the point 'i'.

For the linear boundary element approach, the number of nodes will be more than the number of elements. Suppose that  $m$  is the number of nodes in this case. Since  $\Phi$  varies linearly over the element, its value at any point can be defined in terms of the nodal values and the two shape functions  $N_1$ ,  $N_2$ , that is

$$\Phi = N_1 \Phi_1 + N_2 \Phi_2 = [N_1 \ N_2] \begin{Bmatrix} \Phi_1 \\ \Phi_2 \end{Bmatrix} \quad (16)$$

where  $N_1 = \frac{1}{2}(1-\delta)$ ,

and  $N_2 = \frac{1}{2}(1+\delta)$ ,  $-1 \leq \delta \leq 1$

The integrals along the element 'j' i.e.

$$\frac{1}{2\pi} \int_{\Gamma_{j-i}} \Phi \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma$$

can be written as

$$\frac{1}{2\pi} \int_{\Gamma_{j-i}} \Phi \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma$$

$$= \frac{1}{2\pi} \int_{\Gamma_j-i} [N_1 N_2] \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma \begin{Bmatrix} \Phi_1 \\ \Phi_2 \end{Bmatrix}$$

$$= \begin{bmatrix} h_{ij}^1 & h_{ij}^2 \end{bmatrix} \begin{Bmatrix} \Phi_1 \\ \Phi_2 \end{Bmatrix} \quad (17)$$

where  $h_{ij}^1 = \frac{1}{2\pi} \int_{\Gamma_j-i} \Phi_1 \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma$ ,

$$h_{ij}^2 = \frac{1}{2\pi} \int_{\Gamma_j-i} \Phi_2 \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma$$

$$\text{or } h_{ij}^k = \frac{1}{2\pi} \int_{\Gamma_j-i} k \frac{\partial}{\partial n} \left( \log \frac{1}{r} \right) d\Gamma \quad (18)$$

$$k = 1, 2$$

The  $h_{ij}^k$  are influence coefficients during the interaction between the point 'i' under consideration and a particular node  $k$  on an element 'j'.

To write the equation (15) corresponding to the node 'i' the contributions from all elements associated with the node 'i' are to be added into one term, defining the nodal coefficients. This will give the following equation

$$-c_i \Phi_i + \left[ \hat{H}_{i1} \hat{H}_{i2} \dots \hat{H}_{im} \right] \begin{Bmatrix} \Phi_1 \\ \Phi_2 \\ \vdots \\ \Phi_m \end{Bmatrix} + \phi_\infty = -(\phi_{u.s.})_i \quad (19)$$

where  $\hat{H}_{ij}$  term is the sum of the contributions from all the adjoining elements of the node 'i'. Hence equation (19) represents the assembled equation for node 'i' and can be written as

$$-c_i \Phi_i + \sum_{j=1}^m \hat{H}_{ij} \Phi_j + \phi_\infty = -(\phi_{u.s.})_i \quad (20)$$

$$\text{or } \sum_{j=1}^m H_{ij} + \phi_\infty = -(\phi_{u.s.})_i \quad (21)$$

where  $H_{ij} = \begin{cases} \hat{H}_{ij} & \text{when } i \neq j \\ \hat{H}_{ij} - c_i & \text{when } i = j \end{cases}$

When all nodes are taken into consideration, equation (21) is  $M \times (M+1)$  system of equations. Which can put in the matrix form in case of linear element as

$$[H] \{U\} = \{R\} \quad (22)$$

where as usual  $[H]$  is a matrix of influence coefficients,  $\{U\}$  is a vector of unknown total potentials  $\Phi_i$  and  $\{R\}$  on the R.H.S. is a known vector whose elements are the negative of the values of the velocity potential of the uniform stream at the nodes on the region of the body. Note that  $\{U\}$  in equation (22) has  $(M+1)$  unknowns  $\Phi_1, \Phi_2, \dots, \Phi_m, \phi_\infty$ . To solve precisely this system of equations, the value of  $\Phi$  at some position must be specified. For convenience  $\phi_\infty$  is chosen as zero. Thus  $M \times (M+1)$  system reduces to an  $M \times M$  system of equations which can be solved as before but now the diagonal coefficients of  $[H]$  will be found by

$$H_{ii} = - \sum_{\substack{j=1 \\ j \neq i}} H_{ij} - 1 \quad (23)$$

### Process of Discretization

Now for the discretization of the boundary of the symmetric aerofoil, the coordinates of the extreme points of the boundary elements can be generated within computer programme using Fortran language as follows:

Divide the boundary of the circular cylinder into  $m$  elements in the clockwise direction by using the formula.

$$\theta_k = [(m+2)-2k] \frac{\pi}{m}, \quad k = 1, 2, \dots, m \quad (24)$$

Then the extreme points of these  $m$  elements of circular cylinder are found by

$$\xi_k = -b + r \cos \theta_k$$

$$\eta_k = r \sin \theta_k$$

Now by using Joukowski transformation in equation (3), the extreme points of the symmetric aerofoil are

$$x_k = \xi_k \left( 1 + \frac{a^2}{\xi_k^2 + \eta_k^2} \right)$$

$$y_k = \eta_k \left( 1 - \frac{a^2}{\xi_k^2 + \eta_k^2} \right)$$

where  $k = 1, 2, \dots, m$ .

The coordinates of the middle node of each boundary element are given by

$$x_m = \frac{x_k + x_{k+1}}{2}$$

$$y_m = \frac{y_k + y_{k+1}}{2}$$

$$k, m = 1, 2, \dots, n \quad (25)$$

and therefore the boundary condition (13) in this case takes the form

## 5. Conclusion

An indirect boundary element method has been applied for the calculation of compressible flow past a symmetric aerofoil with linear element approach using doublet distribution alone. The calculated flow velocities obtained using this method are compared with the analytical solutions for flow over the boundary of a symmetric aerofoil. It is found from the tables and figures that the computed results obtained by this method are excellent in agreement with the analytical ones for the body under consideration and the accuracy of the result increases due to increase of number of boundary elements.

[adekay98@yahoo.com](mailto:adekay98@yahoo.com)

**Abstract:** An experiment was carried out to investigate the use of long yam bean (*Sphenostylis stenocarpa*) as soil amendment for the growth and yield of white yam (*Dioscorea rotundata* L) between 1999 and 2003 at Akure in the rain forest zone of Nigeria. There were four treatment namely; NPK 15 – 15 – 15 fertilizer applied at 250kg/ha, poultry manure at 6 t/ha, long yam beans planted at two seeds per hole at a spacing of 1m x 0.5m between rows of yam plots (soil amendment) and a control (no fertilizer). The treatments were arranged in a randomized complete block design (RCB) and replicated five times. The soil analyses before planting and after harvesting were carried out. Each plot size is 4m x 4m (16m<sup>2</sup>). The growth parameters measured for the yam were vine length (cm), leaf population and stem girth (cm). At harvest, yam tuber weight (kg), tuber length (cm) tuber girth; root length and seed yield of long yam bean plants were determined. The leaf and soil N, P, K, Ca, Mg, pH and organic matter contents were also analysed at end of the experiment. The results showed that there were significant ( $p<0.05$ ) increases in the vine length, leaf population, stem girth, tuber weight, tuber length, tuber girth, soil and leaf N, P, K, Ca, Mg; pH and organic matter of white yam cultivated under the different fertilizer treatments compared to the control treatment. Long yam bean plants used as soil amendment increased the yam vine length, stem girth, leaf population, tuber weight, tuber length and tuber girth by 81% 88.4%, 69.5%, 88.97%, 76% and 94% compared to the control. The same treatment (long yam bean plants) also increased the leaf population, tuber weight, tuber length and tuber girth of yam by 11%, 31%, 30% and 55% respectively compared to NPK fertilizer treatment. Long yam plants also increased the soil pH, O.M, K, Ca and Mg by 29%, 92%, 97%, 86%, 96%, 97% and 89% respectively compared to the control treatment. It increased soil pH, organic matter, K Ca and Mg by 31%, 87%, 1.42, 98% and 98.5% compared to NPK fertilizer. Long yam plants gave seed yield of 2.3 t/ha and produced yam tuber yield of 4900kg/ha amounting to \$6,050 compared to \$3453.00 and \$3,380.00 estimated on yam yields alone under poultry manure and NPK fertilizer treatments. Finally, the use of long yam bean plants as biological fertilizer source for yam production could substitute for 250kg/ha NPK fertilizer and 6t/ha poultry manure. [Journal of American Science. 2010;6(11):10-17]. (ISSN: 1545-1003).

**Keywords:** Long yam bean, soil amendment, white yam performance.

## 1. Introduction

One of the major problems facing tropical agriculture is the inherently low fertility status of the soils because of the presence of low activity clay minerals (1:1 Kaolinite). Soil organic matter status is identified as one of the major indicators of soil fertility Agboola and Obatolu, (1989) and it is now very important that agricultural practices and farming systems must be evolved to ensure stable soil organic matter levels. In-addition, agricultural production in low input systems in the tropics relies partly on nutrient recycling and the maintenance of soil fertility through biological processes.

Many researchers have advocated the use of green manuring and, the application of household and industrial wastes for crop production, even though the adoption of these practices has been very low because of the difficulty in transporting the bulk materials to the

field, the labour intensive nature of the materials and absence of immediate income or source of food (Ojeniyi, 1998; Moyin-Jesu 2003; Cherr et al., 2006; Brennan et al., 2009; Alluvione et al., 2010).

Therefore, there is need to look inwards for alternative sources of biological fertilizers using the traditional leguminous shrub crops such as pigeon pea (*cajanus cajan*) and long yam bean (*Sphenostylis stenocarpa*) to enrich the fertility of the soil grown to arable crops, serve as source of income and food to the farmers and livestock.

Having reviewed literature extensively, there is scarcity of research information on the use of long yam bean as soil amendments to increase the soil fertility, growth and yield of white yam.

Mulongoy and Kang, (1986) and Usman et al. (2006) reported that legumes have the potentials to improve soil fertility, thereby boosting subsequent crop

yield. They stated further that other benefits of legumes include maintenance and improvement of soil physical properties, providing ground cover to reduce soil erosion, increasing soil organic matter, cation exchange capacity and reduction of soil temperature.

Kang (1992); Graham and Vance (2003) also reported that legumes could be integrated into existing cropping systems either as cover crops, live mulch, and food or fodder crops through planted fallows of multiple cropping systems. Therefore, the role of traditional legumes in soil fertility must be properly investigated.

Yam (*Dioscorea* spp) is a tuber crop belonging to the family Dioscoreaceae and it is a tropical crop with many species originating in South, east Asia. Among the species of yam is white yam (*Dioscorea rotundata* L) which produces edible tubers and it serves as sources of food to man and livestock and generates income to farmers (Adeyemi, 1999).

The objectives of this study are as follows:

- (i) To determine the suitability of long yam bean with the convectional fertilizers (poultry manure and NPK fertilizers) as soil amendments on the growth and yield parameters of yam.
- (ii) To determine their effectiveness on the yam leaf and soil chemical composition after harvesting
- (iii) To determine the comparative advantage of long yam bean plants as soil amendment over the convectional fertilizers in term of cost/benefit ratio to farmers.

## **2. Materials and Methods**

### *Collection, processing and analysis of the treatments used*

The poultry manure was collected from over 10,000 poultry birds of Rhode Island breed in the livestock unit of Federal College of Agriculture, Akure. The long yam bean seed were obtained from four hectares farm in the institution while NPK fertilizer were purchased from Ondo State Agricultural Input and Supplies Company, Akure and it is of high grade.

The poultry manure was stacked or heaped to allow for proper mineralisation processes while the long yam bean seeds were soaked in a 100ml 0.01M dilute H<sub>2</sub>S04 acid solutions for 30 minutes to weaken the hard seed coat for quick germination. The determination of the nutrients in the poultry manure was done using wet digestion method based on 25 – 5 – 5ml of H<sub>2</sub>N0<sub>3</sub> – H<sub>2</sub>S04 – HCl0<sub>4</sub> acids. The filtrate was collected for the amount of %P, K, Ca and Mg. The % P was evaluated using vanado-molybdate colorimetry and read on spectronic 20 while the % k and Ca were read on flame photometer. Mg was determined on atomic absorption spectrophotometry. The percentage N was determined by microkjedahl (Jackson, 1964)

while the nutrients composition of NPK 15 – 15 – 15 fertilizer was obtained from the manufacturer's label' (240kg N, 240kgP and 240 kg K)

### *Soil Analysis Before Planting*

The soil samples were collected from 0-15cm depth, air-dried, sieved with 2mm sieve and utilized for routine soil analysis. The particle size distribution was determined by the hydrometer method (Bouyoucos, 1951). The soil pH (1:1 soil/water and 1:2 soil/0.01M CaCl<sub>2</sub>) was determined (Crockford and Nowell, 1956).

The organic matter (O.M) was determined by the Walkley and Black (1934) while the exchangeable bases (K, Ca, Mg and Na) were extracted with 1M NH<sub>4</sub>OAc pH7 and the amount of K, Ca and Na were determined on the flame photometer using appropriate element filters. The Mg content in the extract was read on atomic absorption spectrophotometer (Jackson, 1958). The exchangeable acidity (H<sup>+</sup> and Al<sup>3+</sup>) was measured from 0.01M KCl extracts by titrating with 0.1M HC1 (McLean, 1965) while percent N was determined using microkjedahl method (Jackson, 1964). Available P was extracted using Bray P1 extractant and the extracts measured with Murphy-Riley blue method (Murphy and Riley, 1962) on spectronic 20 at 8821Um while the soil bulk density was determined using core method (Ojeniyi, 1985).

### *Field Experiments*

The experiments were carried out at Akure in the rainforest zone of Nigeria and the soil is sandy clay loam, skeletal, kaolinitic, isohyperthermic oxic paleustalf (Alfisol) or Ferric Luvisol (FAO). The site had been continuously cropped to cereals and tuber crops for 10 years while the two experiments were conducted between October 1999 and March 2001 and January, 2003 on the same site.

The annual rainfall of the study area is 1300mm and it is well distributed throughout the year while the annual temperature ranged between 22°C and 28°C. These climatic conditions are considered adequate for growth and yield of white yam. The land was cleared, ploughed, harrowed and ridged while the plots were laid out at 4m x 4m (16m<sup>2</sup>) and yam setts prepared from white yam variety (*Dioscorea rotundata* L) were planted in early November each cropping year into the plots at a spacing of 1m x 1m. The plots were mulched immediately to prevent scorching and decay of the planted yam setts by heat.

There were four treatments namely poultry manure, long yam beans, NPK 15 – 15 – 15 fertilizer and a control (no fertilizer; no manure), replicated six times and arranged in a randomized complete block design. The poultry manure was applied at 6 t/ha, NPK 15 – 15 – 15 fertilizer was applied at 250kg./ha, long yam beans were planted at two seeds per hole at a

spacing of 1m x 0.5m between the middle rows of yam plots and the control treatment ( no fertilizer; nor manure nor long yam bean plants).

Manual weeding operation was first carried out in the third week after sprouting and it continued at every three weeks interval until the 16<sup>th</sup> week sprouting. Individual staking of the yam vines was done in the second week after sprouting in early March 2001 and 2002 and the mulching materials were removed in each cropping year when the rain was steady. The young yam vines were trailed on the stakes to prevent vines from creeping on the soil and proper drainage channels were made to prevent the applied treatments from being washed away by rain water. The yam vine length (cm), leaf population and stem girth (cm) were measured at weekly interval beginning from two weeks after application of treatments till 12 weeks after sprouting.

Harvesting of the yam tubers was done at 32 weeks after sprouting and the yield parameters such as tuber girth, tuber length(cm) and tuber weight (kg) were measured. The harvesting of the long yam bean pods started in November 2000 to February 2001 for the first experiment and between November 2002 and February 2003 for the second experiment. The weight of the shelled grains were measured and recorded for each experiment. At end of the harvesting of the long yam bean pods in the first experiments, all the plants were allowed to dry in-situ and ploughed into the soil at the commencement of the second experiment.

#### *Leaf analysis of the yam plants*

At 18 weeks after sprouting, leaf samples were taken from the top, middle and lower parts of the yam crop in each treatment using secateurs, properly cleaned, milled into smaller pieces and dry ashed in a muffle furnace for 6 hours at 450°C. The ash produced, was made into solution, filtered and filtrates analyzed for N, P, K Ca and Mg.

The percentage N was determined using micro-kjedahl method (Jackson, 1964) while the P content was determined using Vanado-molybdate colorimetry and read on Spectronic 20 at 4421Um. The K and Ca contents were determined on flame photometer using appropriate filters while the Mg content was read on atomic absorption spectro photometer.

#### *Soil analysis after the experiment*

At the end of each experiment, soil samples were taken from 0-15cm depth from each treatment plot, air-dried, sieved and analyzed for soil pH, N, P, K, Ca, Mg and SOM, and soil bulk density as described earlier.

#### *Statistical analysis*

The data obtained from the means of the two experiments for the growth, yield parameters, leaf and soil chemical composition were analyzed using ANOVA F-test and the overall treatment effects were compared using Duncan Multiple Range Test at 5% level.

### 3. Results

#### *Soil fertility status before planting of yam*

Table 1 presents the soil physical and chemical properties before planting of yam.

Table 1: Pre-planting soil analysis

SOIL PROPERTIES	
pH (H <sub>2</sub> O)	5.80
(CaCl <sub>2</sub> )	5.30
Organic Matter (%)	0.50
Total Nitrogen (%)	0.06
Available Phosphorus (ppm)	5.08
Sodium (cmol/kg)	0.14
Potassium (cmol/kg)	0.06
Calcium (cmol/kg)	0.11
Magnesium (cmol/kg)	0.14
Bulk Density	1.60

The soil is acidic and very low in organic matter. The low organic matter content of the soil also reflected in the low values of soil N, P, K, Ca, Mg and Na, which were below 10mg/kg P, 0.20cmol/kg K, Ca, Mg and Na (Agboola and Corey, 1973) and 0.15% N (Sobulo and Osiname, 1981) considered as soil critical levels for optimum crop production in South western Nigeria. The soil bulk density was 1.60g/cm<sup>3</sup>.

Table 2 presents the chemical analysis of the poultry manure and long yam bean used for the cultivation of yam. The poultry manure had high values of %N, P, K, Ca, Mg, and Na.

Table 2: Chemical composition of the organic fertilizers used for the experiment

Organic Material	N	P	K	Na	Ca	Mg
<b>Poultry manure</b>	3.90	0.75	0.48	0.10	0.54	0.35
<b>Long yam bean</b>	226 kg/ha (symbiotic N fixed)	3.70	3.00	0.30	0.80	1.00

Source: Boonche and Anecksamphant (1993)

*Growth and yield parameters of yam under different treatments.*

Table 3: The growth and yield parameters of yam under different fertilizer treatments

Treatments	Vine length (cm)	Stem girth (cm)	Leaf population	Tuber weight (kg/ha)	Tuber length (cm)	Tuber girth (cm)
<b>Control (No fertilizer application)</b>	40.20	0.40	12.00	540.20	9.00	1.00
<b>NPK 15-15-15</b>	210.00	3.41	44.00	3380.40	26.00	7.00
<b>Poultry manure</b>	189.70	2.10	32.00	3453.20	30.00	9.00
<b>Long yam bean</b>	210.40	3.30	39.00	4900.00	37.00	15.70
<b>LSD</b>	<b>4.30</b>	<b>0.63</b>	<b>2.10</b>	<b>12.20</b>	<b>3.50</b>	<b>2.00</b>

Table 3 presents the values of leaf area, vine length, leaf population and stem girth, tuber weight, tuber length and tuber girth of white yam under the different fertilizer treatments. There were significant increases ( $P<0.05$ ) in these parameters for yam compared to the control treatment. The long yam bean treatment increased the yam vine length, stem girth, leaf population, tuber weight, tuber length and tuber girth by 81%, 88.4%, 69.5%, 89%, 76% and 94% compared to the control treatment. The same treatment (long yam bean plants) also increased these parameters by 10%, 37%, 18%, 29%, 19.4% and 40% respectively compared to the poultry manure treatment.

Long yam bean plants increased the leaf population, tuber weight, tuber length and tuber girth of yam by 11%, 32%, 30% and 55% respectively. Except in stem girth and vine length where NPK fertilizer treatment increased these parameters by 3.8% and 0.2% respectively compared to the long yam plants treatment.

#### *Leaf Chemical composition of Yam under different Fertilizer treatments*

Table 4: Leaf composition of yam under different fertilizer treatments

Treatments	N	P	K	Ca	Mg
<b>Control (No fertilizer application)</b>	1.50	0.30	0.20	0.15	0.15
<b>NPK 15-15-15</b>	2.50	1.80	1.73	0.10	0.12
<b>Poultry manure</b>	2.70	1.98	1.20	0.32	0.36
<b>Long yam bean</b>	2.80	1.93	1.50	0.42	0.45
<b>LSD</b>	<b>0.10</b>	<b>0.12</b>	<b>0.20</b>	<b>0.10</b>	<b>0.09</b>

Table 4 gives Leaf Chemical composition of Yam under different Fertilizer treatments.

There were significant ( $p<0.05$ ) increases in the leaf N, P, K, Ca and Mg under the fertilizer treatments compared to the control treatment (Table 4). The long yam bean plants increased the yam leaf N, P, K, Ca and Mg 99.14%, 99.45%, 97.3%, 90.3% and 88.6% respectively compared to the control treatment. It also increased the same parameters N, K, Ca and Mg by 2.13%, 20%, 31.3% and 26% respectively compared to the poultry manure treatment except in leaf P where poultry manure increased the value by 2.52% compared to the long yam beans. Long yam bean plants increased the yam leaf N, P, Ca and Mg by 10.63%, 6.7%, 96.7% and 97.14% respectively compared to the NPK fertilizer treatment.

*Soil Chemical Composition of yam plot after harvesting.*

Table 5: Soil chemical composition of yam plots after harvesting under different fertilizer treatments

Treatments	Bulk Density	pH	Organic Matter	N	P	K	Ca	Mg
<b>Control (No fertilizer application)</b>	1.63	5.1	0.21	0.04	3.40	0.05	0.03	0.07
<b>NPK 15-15-15</b>	1.66	5.0	0.34	1.40	29.30	1.38	0.02	0.01
<b>Poultry manure</b>	1.36	6.7	2.38	1.34	25.20	0.93	0.75	0.56
<b>Long yam bean</b>	1.20	7.2	2.70	1.37	27.30	1.40	0.91	0.65
<b>LSD</b>	<b>0.15</b>	<b>0.3</b>	<b>0.31</b>	<b>0.03</b>	<b>1.50</b>	<b>0.32</b>	<b>0.01</b>	<b>0.09</b>

There were significant increases ( $p<0.05$ ) in the soil pH, O.M, N, P, K, Ca and Mg, compared to the control treatment (Table 5).

The long yam bean increased the soil pH, organic matter, N, P, K, Ca and Mg by 29%, 92%, 97%, 86%, 96%, 97% and 89% compared to the control treatment. Long yam bean increased soil pH, organic matter treatment. Long yam bean increased soil pH, organic matter, K, Ca and Mg by 31%, 87%, 1.42%, 98% and 98.5% respectively. The long yam bean decreased the soil bulk density by 25% and 27% compared to control and NPK fertilizer treatments respectively.

*Comparative advantage of long yam bean plants as soil amendment.*

Table 6: Comparative advantages of pigeon long yam bean bio-fertilizer over the conventional organic and inorganic fertilizers in term of utility parameters

Treatments	Yield of yam (kg/ha)	Yield of Long yam bean seeds (kg/ha)	Total Cost of Production (US Dollars)	Total Revenue (US Dollars)	Discounted Factor at 15%	Cost-Benefit Ratio
<b>Control (No fertilizer application)</b>	540.2	Nil	500.00	540.2	0.87	1.08
<b>NPK 15-15-15</b>	3,380.4	Nil	567.00	3,380.4	0.87	5.96
<b>Poultry manure</b>	3,453.2	Nil	583.00	3,453.2	0.87	5.92
<b>Long yam bean</b>	4,900.2	2,300.0	517.00	6,550.0	0.87	12.67

Table 6 presents the data on the comparative advantage of long yam bean plants as bio-fertilizer plants over the convectional organic and inorganic fertilizers (poultry manure and NPK fertilizer) used in the fertilization of yam. The long yam bean plants produced 2.3t/ha (2300 Kg) of long yam bean seeds, in-addition, to the 4,900 kg/ha of yam tuber weight recorded compared to the 3,453.20 kg/ha and 3,380.40kg/ha of yam tuber weight recorded for poultry manure and NPK 15 – 15 – 15 fertilizer treatments respectively

**4. Discussion**

For the control treatment, the least values of growth and yield parameters such as vine length, leaf population, stem girth, tuber weight, tuber length and

tuber weight of white yam compared to that of NPK 15 – 15 – 15 fertilizer, poultry manure and long yam bean plants might be due to the initial low nutrient status of the soil before application of the fertilizer treatments. This observation was in line with the work of Agboola (1982), which reported poor growth and yield responses in soils that did not receive fertilizer application.

The low soil nutrient status also accounted for the least values of yam leaf N, P, K, Ca and Mg; soil pH, N, P, k, Ca, Mg and organic matter. The low organic matter status of the soil is consistent with low N and P status (Agboola and Corey, 1973). The low organic matter status also increased the initial bulk density values to 1.63 and 1.66 Mgm-3 in control and

NPK fertilizer treatments respectively as a result of continuous cultivation.

The significant increases in the growth and yield of white yam due to application of poultry manure, use of long yam bean plants and NPK fertilizer were adduced to increased availability of nutrients in the soil. The application of poultry manure and the use of long yam bean plants as soil amendment increased soil organic matter, N, P, K, Ca and Mg status and reduced the soil acidity. Soil acidity (low pH) is known to affect the yields of crops adversely through inhibition of nitrogen fixation processes. (Aduayi, 1980).

The highest nutrient contents (SOM, N, P, K, Ca and Mg) supplied by the long yam bean plants into the soil were responsible for the shoot, and yield development. K had been reported to encourage photosynthesis and tuber formation in yam (Adu Daaph et al, 1994). This could explain why the long yam bean plant produced the best values of yam tuber weight (kg/ha), tuber length and tuber girth compared to NPK, poultry manure and control treatments. Long yam bean plant is a legume which fixes N into the soil and increases the level of soil organic matter. For-instance, Boonche and Anecksamphant (1993) reported that long yam bean plant fixed into the soil 220kg/ha symbiotic N, 4.3% P, 3.00% K and 0.70% Ca.

The reduction in the soil bulk density by the use of long yam bean plants might have positively influenced other soil physical properties such as porosity, water-infiltration, permeability and aeration. Hence, the improvement of soil physical condition is consistent with the work of Woomer and Muchena (1993) which reported that continuous productivity of tropical soils is associated with maintenance and improvement of soil physical characteristics.

The increase in vegetative growth of white yam such as vine length, stem girth and leaf population under long yam bean plants compared to that produced by poultry manure and NPK 15 – 15 – 15 fertilizer might be attributed to the ability of the long yam bean plants to fix nitrogen into the soil. This finding agreed with the work of Boonche and Anecksamphant (1993) who reported that roots of nitrogen fixing crops such as legumes have nodules where nitrogen fixation takes place. Thus, the 220kg N/ha/yr fixed into the soil by long yam bean plants would enhance its use for soil fertility maintenance.

The reduction in the SOM of plots fertilized with NPK fertilizer also affected the Ca and Mg contents of the soils and this is because of high nutrient interactions between P and K contents in the soil fertilized with NPK and Ca or Mg contents (P/Mg, K/ca and K/mg ratio) which reduced their uptake and this view was supported by Bear (1950).

The comparative advantage of long yam bean plants as soil amendment compared to the poultry manure and NPK fertilizer in terms of providing additional food and income for farmers could be the major ways of improving farmers' standard of living and ensured food security. Ali (1996) also reported that in semi-arid tropics of Asia, pigeon pea, and soya bean-based systems can replace other systems because of higher monetary returns, thus, long yam bean plants can also help in improving farmers income in tropical Africa and Asian countries.

Agboola (1982) reported that the main reasons why farmers in the tropics could not adopt the use of green manure such as *Calopogonium mucunoides* for soil fertility maintenance was that it was labour intensive and farmers did not usually get food or income in return for their cultivation.

Therefore, the adoption of long yam bean plants by farmers would fertilize the soil, provides food and income for the farmers. For-instance, the 2.3 t/ha of long yam bean seeds and yam tuber yield under long yam bean seeds and yam tuber yield under long yam bean plants treatment provided (\$6,550.00) compared to \$3,453.20 and \$3,380.40 estimated on yam yields alone under poultry manure and NPK fertilizer treatments (Table 6). The higher Benefit/Cost ratio of 12.67 under long yam bean treatment was as a result of the sales of the additional 2,300kg/ha of long yam bean seeds.

However, the cultivation of traditional legumes such as long yam bean plants, pigeon pea, lima beans and forth by farmers had gone down drastically such that these crops were nearly going into extinction. There is need for a strong extension package on the cultivation and use of traditional legumes such as long yam bean, lima beans and pigeon pea as soil amendments for food crops. This will help in bringing them into commercial production by farmers, instead of the conventional legumes produced from research centers which encouraged heavy use of agrochemicals because they were susceptible to pests and diseases attack.

The use of long yam bean plants as soil amendment for yam production as reflected in the best values of yam tuber weight, tuber length and girth proved that it was compatible with food crops as an intercrop. This observation agreed with the work of Adeyemi (1999) which reported yield advantages in cocoyam/cowpea/maize/cassava intercrop.

## 5. Conclusion

The research work has identified that the use of fast growing legume such as long yam bean as soil amendment increased yam vine length, stem girth, leaf population, tuber weight, tuber length and girth;

leaf and soil N, P, K, Ca and Mg; soil pH and SOM. Therefore, the use of long yam bean plants as biological fertilizer source for yam production could substitute for 250kg/ha NPK fertilizer and 6t/ha poultry manure.

This recommendation agrees with the fact that long yam bean plant is environmentally compatible with the farming system in the tropics, provides additional source of food and income for the poor resource farmers. In-addition, the high cost of purchase, scarcity of inorganic fertilizers and the labour intensive nature of gathering high quantities of manure for crop production did not help farmers in achieving sustainable food production.

The utility of long yam bean as protein source and income will benefit the farmers but the successful adoption of long yam bean plants and other legumes based technologies may depend on dissemination of information on their production and utilization through extension approaches to stakeholders.

## Biochemical and Molecular Profiles of Gibberellic Acid Exposed Albino Rats

Hanan A.E.Soliman<sup>1</sup>; Mona M. Mantawy<sup>2</sup> and Hany M. Hassan<sup>3</sup>

<sup>1</sup>Chemistry Departement, Biochemistry Branch, Faculty of Science, Beni suef University, Egypt. <sup>2</sup>; Department of Medicinal chemistry , National Research Center, Dokki , Egypt and <sup>3</sup> Immunobiology and immunopharmacology unit , Animal Reproduction Research Inst., Giza , Egypt

**Abstract:** The present study casts the light on the influence of the plant growth regulator, Gibberellic acid (GA3), on antioxidant defense systems [glutathione peroxidase, superoxide dismutase (SOD), and catalase (CAT)], lipid peroxidation level (malondialdehyde = MDA), AST, ALT , alkaline phosphatase, creatinine, total protein , albumin globulin , total lipids , total cholesterol, calcium and glucose . Moreover, histopathological examination of kidney and liver was done. On the molecular level, the DNA damage was determined. The rats were received 75 ppm of GA3 in drinking water ad libitum for 50 days. Gibberellic acid (GA3) treatments caused different effects on the estimated parameters compared to control. Gibberellic acid exposure induced significant elevations of plasma AST, ALT, alkaline phosphatase, creatinine and malondialdehyde. However, Gibberellic acid produced non significant alterations in plasma total protein, albumin globulin, total lipids, total cholesterol, calcium and glucose. On the other hand, exposure elucidate significant reductions of catalase, superoxide dismutase and glutathione peroxidase in comparison to control group. The histopathological findings revealed that Kidney sections of Gibberellic acid treated rats suffered from areas of interstitial fibrosis which appear as segmental and global glomerular sclerosis tubulointerstitial injury. On the similar ground, liver section of Gibberellic acid treated rats revealed that Gibberellic acid induced liver fibrosis; fatty metamorphosis and necrosis. The total genomic DNA electrophoretic pattern of lymphocytes deprived from Gibberellic acid treated rats revealed strong and obvious DNA damage as represented by a lot of fragments migrated from the wells. As a conclusion, Gibberellic acid (75 ppm) produce hepatoneurotoxicity, subsequently has oxidative stress role and DNA damage in albino rats 50 days post treatment. [Journal of American Science. 2010;6(11):18-23]. (ISSN: 1545-1003).

**Keywords:** plant growth regulator; Gibberellic acid (GA3); antioxidant defense systems; superoxide dismutase (SOD); catalase (CAT); lipid peroxidation

### 1. Introduction

Gibberellic acids are a group of plant growth regulators that have been identified in different plants (MacMillian *et al.*, 1961) and they are used in agriculture as plant regulators to stimulate both cell division and cell elongation that affect leaves as well as stems (Taiz and Zeige, 1991). Gibberellic acid (actually a group of related substances called Gibberellic acids) was discovered as a metabolic by product of the fungus *Gibberella fujikuroi* (Riley, 1987). If gibberellic acid or one of its metabolites is applied to dwarf varieties of peas, broad beans or maize, growth is greatly accelerated (Jones, 1973).

In *Alstroemeria hybrida*, leaf senescence is retarded effectively by application of Gibberellic acids (Kappers *et al.*, 1997). Feeding toads, *Bufo regularis*, with Gibberellic acid A3 induced hepatocellular carcinomas in 16% of the animals. Moreover, it was showed that Gibberellic acid A3 induced breast and lung adenocarcinomas in mice (El-Mofty and Sakr, 1988). Gibberellic acid was found to induce chromosomal aberrations in human lymphocytes (Zalinian *et al.*, 1990) and mice (Bakr *et*

*al.*, 1999). The World Health Organization (1990) classified Gibberellic acid-A3 as a plant growth regulators related to pesticides.

Gibberellic acid (Gibberellic acid A3) is used extensively in Egypt to increase the growth of some fruits (such as strawberries and grapes) and some vegetables (such as tomatoes, cabbages and cauliflower)( Weaver *et al.*, 1961).

Recently, Kamel *et al.*(2009) recorded that Male rabbits treated with Gibberellic acid at all studied doses caused a significant increase in semen ejaculate volume, sperm concentration, total sperm out-put and sperm motility (%) and has direct androgenic-like action on testes compared to the control group.

The present investigation aimed to cast the light on the possible effects of Gibberellic acid on biochemical profile, histopathological image and DNA integrity of exposed rats.

### 2. Material and Methods

Twenty sexually mature male albino rats weighing  $170\pm10$  g were used. Animals were kept in the laboratory under constant temperature ( $24\pm2$  °C) for at least one week before and throughout the experimental work. They were maintained on a standard diet and water were available *ad libitum*.

Animals were divided into two groups. Ten rats in the first group were orally given Gibberellic acid-A3 (Berelex®, BDH chemical, Pool, UK) at 75 ppm in drinking water were continuously administered orally to rats *ad libitum* for 50 days (Celik *et al.*, 2007). Animals in the second group (10 rats) were served as controls. The treated animals and their controls were sacrificed by decapitation after the end of treatment.

For enzyme determination, Plasma were obtained by centrifugation of the blood samples and stored at  $-20^{\circ}\text{C}$  until assayed for the biochemical parameters. Transaminases (ALT, AST) and alkaline phosphatase activities were determined on the basis of King (1965).

Plasma creatinine levels were measured using the photometric determination according to the Jaffe method (Ecoline Mega, DiaSys Diagnostic Systems GmbH, Holzheim, Germany) described earlier (van Dokkum *et al.*, 2004).

Plasma total protein concentration as (g/dl) was measured by the Biuret method as described by Armstrong and Carr (1964). Albumin (A) concentration as (g/dl) was determined by the method of Doumas *et al.* (1971). Globulin (G) concentration as (g/dl) was calculated as the difference between total protein and albumin. Plasma total lipids (PTL) concentration as (g/dl) was estimated according to Frings *et.al.* (1972). Total cholesterol (TCh) concentration as (mg/dl) was determined according to Richmond (1973). Plasma glucose (PG) concentration as (mg/dl) was estimated according to the method of Trinder (1969). Serum calcium (SCa) concentration as (mg/dl) was measured according to the method of Sarkar and Chauhan (1967) using commercial kits (Stanbio kits).

Catalase activity was estimated by the method of Cakmak and Horst (1991). The reaction mixture contained 100 crude enzyme extract, 500  $\mu\text{l}$  10 mM H<sub>2</sub>O<sub>2</sub> and 1400  $\mu\text{l}$  25 mM sodium phosphate buffer. CAT activity of the extract was expressed as CAT units. Superoxide dismutase activity was determined with the reaction mixture contained 100  $\mu\text{l}$  1  $\mu\text{M}$  riboflavin, 100  $\mu\text{l}$  12 mM L-methionine, 100  $\mu\text{l}$  0.1 mM EDTA (pH 7.8), 100  $\mu\text{l}$  50 mM Na<sub>2</sub>CO<sub>3</sub> (pH 10.2) and 100  $\mu\text{l}$  75  $\mu\text{M}$  Nitroblue Tetrazolium (NBT) in 2300  $\mu\text{l}$  25 mM sodium phosphate buffer (pH 6.8), 200  $\mu\text{l}$  crude enzyme extract in a final volume of 3 ml. SOD activity was

assayed by measuring the ability of the enzyme extract to inhibit the photochemical reduction of NBT glass test tubes containing the mixture were illuminated with a fluorescent lamp (120 W); identical tubes that were not illuminated served as blanks. After illumination for 15 min, the absorbance was measured at 560 nm(Hernandez *et al.*, 2000). Glutathione peroxidase (GSH-Px) was measured by spectrophotometric method developed by Paglia and Valentine (1967). One unit of GSH-Px activity was defined as the amount of the enzyme that converted 1  $\mu\text{M}$  NADPH, substrate to NADP+ per minute. All the assays were carried out in triplicate using a spectrophotometer (Hitachi U-2000, Hitachi Ltd., Tokyo, Japan).

Malondialdehyde (MDA) was measured by colorimetric method (Stewart and Bewley, 1980).

#### Histological Examination

Rat kidneys were removed and portions fixed in 4% paraformaldehyde (PFA). Other kidney portions were frozen in optimum cutting temperature (OCT) compound (Miles, Elkhart, IN, U.S.A.) and stored at  $-80^{\circ}\text{C}$ . Fixed renal tissues were embedded in paraffin and cut into 4- $\mu\text{m}$ -thick sections. The sections were stained with periodic acid-Schiff (PAS) stain and Masson trichrome stain to reveal histological changes and areas of interstitial fibrosis.

Liver tissue sections were fixed in 100 mL/L formalin saline in phosphate buffer and processed in paraffin wax. Sections from blocks were stained with hematoxylin-eosin, histological analyses were performed blindly using light microscope.

#### Total genomic damage of DNA analysis

DNA was extracted from lymphocytes of blood samples using DNA extraction Kit (Fermentas life Sciences, Lithuania -Cat. #K0513).

Gel was prepared with 1.5% electrophoretic grade agarose (BRL) and 0.2% polyvinyl pyrrolidine (PVP, Sigma). The agarose and PVP were boiled with Tris Borate EDTA buffer (TBE buffer; 89 mM Tris, 89 mM boric acid, 2mM EDTA, pH 8.3). 0.5 mg ethidium bromide /ml distilled water (Sigma) was added to the gel at  $40^{\circ}\text{C}$ . Gel was poured and allowed to solidify at room temperature for 1h before samples were loaded ( 15  $\mu\text{l}$  of extracted DNA/well). Electrophoresis was performed for 2 hrs at 50 volt using IX TBE buffer as a running buffer. Gel was photographed using a polaroid camera while DNA was visualized using a 312 nm UV light under a transilluminator (Herolab, Germany) . The photographs were analyzed using Phoretex software version 3.0, UK to determine the degree of DNA damage (Cressman *et al.* ,1999) .

### Statistical analysis

All values were expressed as mean  $\pm$  standard error (SE). All statistical analyses were performed using SAS (version 8.02). Statistical differences among the experimental groups were assessed by one-way ANOVA. Tukey's test was used as a follow-up test and significance was defined at  $p<0.05$ .

### 3. Results

Table (1) revealed that Gibberellic acid-A3 exposure induced significant elevations of plasma

AST, ALT, alkaline phosphatase, creatinine and malondialdehyde. However, Gibberellic acid produced non significant alterations in plasma total protein, albumin globulin, total lipids, total cholesterol, calcium and glucose. On the other hand, Gibberellic acid exposure elucidate significant reductions of catalase, superoxide dismutase and glutathione peroxidase in comparison with control group.

Table (1): Effect of Gibberellic acid-A3 exposure on some biochemical parameters of rats.

Items	Control group	Exposed group
AST (iu/l)	$52.28 \pm 4.28$	$66.85 \pm 4.51^*$
ALT(iu/l)	$33.27 \pm 4.33$	$44.31 \pm 3.07^*$
Alkaline phosphatase (iu/l)	$103.85 \pm 12.36$	$137.08 \pm 5.88^*$
Creatinine (mg/dl)	$0.346 \pm 0.16$	$0.636 \pm 0.09^*$
Total protein (gm/dl)	$8.82 \pm 1.61$	$8.91 \pm 1.55$
Albumin (gm/dl)	$4.42 \pm 0.54$	$4.35 \pm 0.52$
Globulin (gm/dl)	$4.37 \pm 0.33$	$3.61 \pm 0.21$
Total lipids (gm/l)	$4.208 \pm 0.59$	$4.34 \pm 0.18$
Total cholesterol (mg/dl)	$72.58 \pm 5.78$	$75.89 \pm 5.48$
Glucose (mg/dl)	$138.24 \pm 10.95$	$145.35 \pm 7.51$
calcium (mg/dl)	$1.66 \pm 0.33$	$2.15 \pm 0.05$
Catalase (nmol/min/ml)	$18.77 \pm 1.91$	$15.04 \pm 0.33^*$
Superoxide dismutase (u/ml)	$105.28 \pm 10.58$	$85.28 \pm 5.71^*$
Glutathione peroxidase (nmol/min/ml)	$90.48 \pm 10.84$	$74.33 \pm 5.49^*$
Malondialdehyde (nmol/dl)	$4.33 \pm 1.63$	$6.85 \pm 0.35^*$

\*significant at  $p < 0.05$

### Total genomic damage of DNA:

Figure (1) shows the total genomic DNA electrophoretic pattern of lymphocytes deprived from control and Gibberellic acid treated groups. Gibberellic acid revealed strong and obvious DNA damage at the tested concentrations as represented by a lot of fragments migrated from the wells. On the other hand, control group did not reveal any damage of DNA.

### Histological Examination

Kidney sections of Gibberellic acid treated rats which stained with periodic acid-Schiff (PAS) stain and Masson trichrome stain to reveal histological changes and areas of interstitial fibrosis appear as segmental and global glomerular sclerosis tubulointerstitial injury (tubular dilatation, atrophy of tubular epithelial cells) (Photo , 1).

Histopathological examination of Hematoxylin and eosin-stained liver section of normal and Gibberellic acid treated rats with magnification -400 X, revealed that Gibberellic acid induced liver fibrosis; fatty metamorphosis and necrosis (Photo , 2).

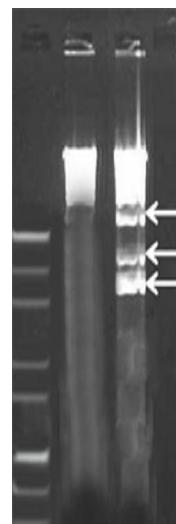

Fig (1): Effect of Gibberellic acid-A3 treatment on DNA damage of DNA of rats, arrows indicate that fragmented DNA bands in Gibberellic acid treated group.

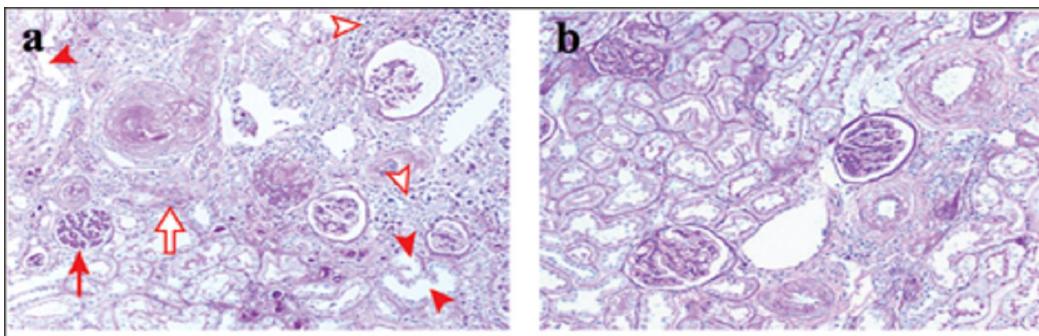

Photo (1): Rat renal tissue sections with PAS staining arrows indicating global glomerular sclerosis and tubulointerstitial injury: arrow heads; fibrosis: open arrow; and infiltration of inflammatory cells: open arrow heads) in Gibberellic acid treated (a) and control (b).

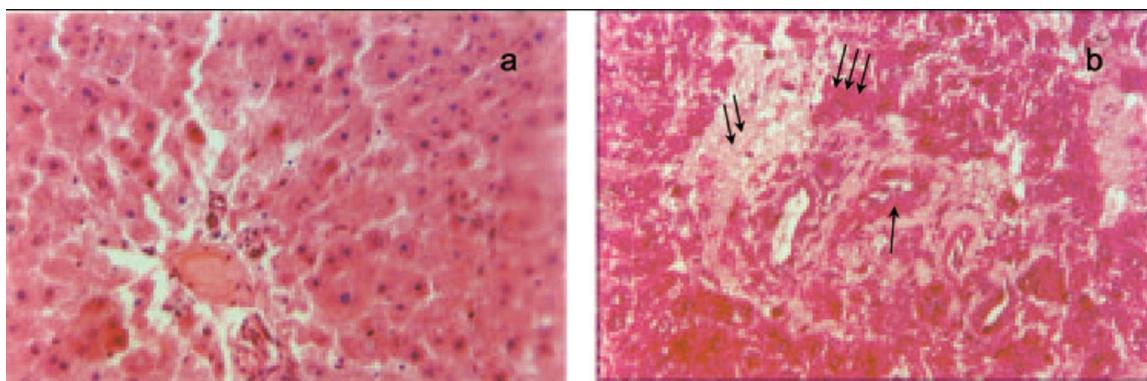

Photo (2): Liver tissue sections were stained with haematoxylin and eosine for light microscope observation

#### 4. Discussion

Gibberellic acid is a type of plant hormone which regulates growth. There are 126 known Gibberellic acids, divided into two classes, and many more may be discovered in the future. Plants produce these hormones naturally through biosynthesis as they grow, ensuring that they have the hormones they need to develop normally, and these hormones can also be applied to plants by gardeners and farmers to achieve specific desired outcomes (Fernandez and Rodriguez, 1979).

In the present study, Gibberellic acid induced significant elevations of plasma AST, ALT, alkaline phosphatase, creatinine and malondialdehyde. However, Gibberellic acid produced non significant alterations in plasma total protein, albumin globulin, total lipids, total cholesterol, calcium and glucose. On the other hand, Gibberellic acid exposure elucidate significant reductions of catalase, superoxide dismutase and glutathione peroxidase in comparison with control group.

The histopathological findings revealed that Kidney sections of Gibberellic acid treated rats suffered from areas of interstitial fibrosis appear as segmental and global glomerular sclerosis tubulointerstitial injury .

On the similar ground, liver section of Gibberellic acid treated rats with magnification -400 X, revealed that Gibberellic acid induced liver fibrosis; fatty metamorphosis and necrosis.

The previous findings were in accordance with the recorded findings of Sakr *et al.*(2003), who recorded that Gibberellic acid induced histopathological changes in the liver such as cytoplasmic vacuolization of the hepatocytes with pyknotic nuclei, blood vessel congestion and inflammatory leucocytic infiltrations. Histochemical observations revealed marked reduction in total carbohydrates and total protein contents in the hepatocytes. These changes proved to be time dependent.

On the same hand, Celik *et al.* (2007) recorded that gibberellic acid (GA3) has deleterious

effect on the antioxidant defense systems [reduced glutathione (GSH), glutathione reductase (GR), superoxide dismutase (SOD), glutathione-S-transferase (GST) and catalase (CAT)] and lipid peroxidation level (malondialdehyde = MDA) in various tissues of the rat were investigated during treatment as a drinking water 75 ppm of ABA and GA3 in drinking water were continuously administered orally to rats for 50 days. The lipid peroxidation end product MDA significantly increased in the lungs, heart and kidney of rats treated with GA3. The GSH levels were significantly depleted in the spleen, lungs and stomach of rats treated with GA3. SOD significantly decreased in the spleen, heart and kidney. While CAT activity significantly decreased in the lungs of rats treated with GA3. The drug metabolizing enzyme GST activity significantly decreased in the lungs of rats treated with ABA but increased in the stomach of rats treated with GA3. The authors concluded that GA3 produced substantial systemic organ toxicity in the spleen, lungs, stomach, heart and kidney during a 50-day period of subchronic exposure.

The present study discloses that the total genomic DNA electrophoretic pattern of lymphocytes deprived from control and Gibberellic acid treated groups. Gibberellic acid revealed strong and obvious DNA damage at the tested concentrations as represented by a lot of fragments migrated from the wells. On the other hand, control group did not reveal any damage of DNA.

These data on the same way of the findings of Hassab-Elnabi and Sallam (2002).

They recorded that higher concentration of Gibberellic acid induced total genomic damage of DNA. By the application of modified comet assay (single cell gel electrophoresis) technique, DNA damage was found at all applied doses. Also, Bakr *et al.* (1999) reported a significant increase in the incidence of total chromosomal aberrations induced by gibberellic acid in bone marrow cells of albino mice.

The illustrated results are fully agreed with that recorded by Zalinian *et al.* (1990). They reported that gibberellic acid induced chromosomal aberrations in human lymphocyte cultures. Gibberellic acid in this demonstration induced a significant damage of DNA. This result agreed with the data that declared by Abou-Eisha (2001). He showed that Gibberlic acid induces a dose-dependent increase in the level of DNA breakage in human blood cells , this increase attaining statistical significance at the highest concentrations tested (25, 100, 150 $\mu$ g/ml), which would confirm its genotoxicity.

So, the DNA damage may attributed to the direct attack of DNA by gibberellic acid causing alkali labile and single strand breaks and total genomic damage as revealed by our demonstration, or may be due to accumulation of nucleases as reported by Fath *et al.* (1999). The mechanism of gibberellic acid to induce DNA damage may be attribute to elevation of oxidative stress markers such as (ROS and GSH), Bcl-2 protein expression, mitochondrial membrane potential and caspase-3 activity. The sequel of these events lead to mitochondrial membrane depolarization and caspase-3 activation followed by apoptosis (Abou-Eisha , 2001).

From the recoded data , it could be concluded that Gibberellic acid (75 ppm) produce hepatonephrotoxicity , subsequently has oxidative stress role and DNA damage in albino rats 50 days post treatment.

**ABSTRACT:** The Web and XML have influenced all walks of life especially those that involve business activities over the Internet. People like to do their business activities and transactions from their homes to save time and money. Many business and commercial companies such as insurance companies and banks maintain their records using relational database management systems. But the traditional relational database technology is unable to provide all these new facilities to the users. To enable the traditional relational database technology to cope with the new challenges of the Web and XML technologies, we need a transformation between the XML technology and the relational database technology as a middleware. To achieve this objective, we already proposed and reported an algorithm. In this paper, we extend our previous work and present automation details, testing, and performance report of our proposed algorithm. The result shows that the implementation of the algorithm is more efficient than the existing algorithms for the same purpose [Journal of American Science. 2010;6(11):24-37]. (ISSN: 1545-1003).

**Keywords:** XML, web, rational database, transforming algorithm

## 1. Introduction

An electronic document contains regular and irregular structures and may not be completely understood by users (Suciu, 1999; Abiteboul & Vianu, 1997; Brayan, 1997). This type of document (or data) is referred to as *semistructured data* (Suciu, 1999; Abiteboul, 1997). Unlike the data in relational databases (RDBs), the semistructured data is stored without any schema or with a vague schema (Suciu, 1999; Buneman, 1997). There are many other sources of semistructured data, such as the Web, heterogeneous networking of integrated systems, file systems, electronic mail systems, digital libraries etc. (Abiteboul, 1997; Buneman, 1997).

The introduction of Extensible Markup Language (XML) as a standard data/information representation has facilitated the publication of electronic data on the Web (W3C). This language also provides a hierarchical format for the data exchange over the Web with structure (Laurent, 1999; Bray, 2002). Information in a XML document is represented as nested *element* structures (i.e. a tree structure), which start with a root element. An element can have an attribute or a sub-element (for further details about XML see (W3C; Bray et al., 2002). A XML document has an optional part, which is called *Document Type Declaration/Description (DTD)*. A DTD of a XML document is considered as the schema of the XML document (W3C; Bray et al., 2002; Men-Hin & Fu, 2001).

A relational database (RDB) has two main components, a schema and a set of operational data

files which are created according to the schema. As mentioned earlier, a DTD is considered as a schema of a XML document but there are noticeable differences between a RDB schema and DTD. A complete comparison between them is given in Table 1. The basic difference between them is their structural representations; a DTD represents a hierarchical structure whereas a RDB schema represents a relational (tabular) structure. We can consider XML documents schema analogous to the hierarchical data model schema.

XML is considered as the best tool for representing, transporting and exchanging information on the Web (Laurent, 1999; Bray et al., 2002). This language allows users to define and also display data on the Web. These features make XML powerful and different from Hypertext Markup Language (HTML) (Suciu, 1999; Comer, 2000). XML enables the user to define his own structures using the syntax of the elements in a DTD. A DTD describes the structure of information in a XML document in a hierarchical fashion (Bray et al., 2002). The structure of a DTD consists of elements which are further specified by attributes and/or sub-elements. Recursive and optional type of the sub-element can be defined using the operations \* (zero or more times), + (one or more times), ? (optional) and | (or). Many types of data value can be assigned to attributes, i.e. string-type or entity. The data value ANY means that an arbitrary declaration can be made by the programmer. An element in a XML document is uniquely identified by a special attribute ID. This

unique attribute of an element can be regarded as the primary key of the element. As it has been mentioned in Table 1, a DTD does not support the concept of the composite ID (or key). An attribute can be referenced in another element through a field called IDREF, and it is a type-less attribute. The concept of an IDREF is similar to the concept of a foreign key in relational databases. There is no concept of a root of a DTD (Bray et al., 2002).

Nowadays, many financial organizations want to empower their customers so that they can perform their financial activities from their homes through the Internet. For these financial organizations to provide their customers with this facility, it is essential and beneficial that the databases (which are mostly relational DB systems) should be presented and processed in the XML format. To provide this facility, we therefore need a technique that can process and transform a RDB and queries into a XML format and vice versa. This technique for the transformation is essential because most of the commercially available database management systems (DBMSs) are relational DBMSs.

To meet these requirements, we have proposed a transformation technique in the form of an algorithm and reported in (Shah et al., 2005). This technique integrates and handles heterogeneous RDBs in the same and uniform manner. Most of investigators agree that the currently available RDB technology

alone is not adequate to meet these objectives of using them on the Web without such transformation technique (Shanmug et al., 1999). Recently, some investigators have proposed a few algorithms for this purpose (Shanmug et al., 1999; Men-Hin & Fu, 2001; Williams, 2000; Mani & Lee 2002). In these transformation algorithms, most of the investigators have considered a DTD as a schema of the XML document, and they have used the tree data structure during the transformation. In our proposed algorithm, we didn't use tree data structure because the processes of creating and maintaining tree data structures are expensive and affect the performance of the transformation process as pointed out by Shanmugasundaram et al in (Shanmug et al., 1999). Also, there are many syntax options that are available for writing DTDs. Most of the existing transformation algorithms from DTD into RDB schema are unable to accept DTDs written in different ways (Men-Hin & Fu, 2001; Shanmug et al., 1999). In (Shah et al., 2005), we have used a different approach and proposed a simple algorithm that transforms any DTD of a XML document into RDB schema. In this paper, we extend that work and further report the implementation details and testing results of our algorithm. We also give its analytical analysis and performance comparison with the existing algorithms.

**Table 1:** Comparison between RDB schema and DTD

RDB Schema	DTD
Tabular format	Hierarchical format
It supports many data types.	It supports only character data types.
Schema and tuples of a relation are considered as two different entities, and they are stored in two different files.	XML document and its DTD can be stored in the same file or in two different files.
It is mandatory for a database.	It is optional for a XML document especially for small XML documents.
It is based on the rational data model.	It is not based on any such data model.
It supports the concept of a composite key.	The concept of composite key is not supported.
It supports the concept of foreign key.	Does not support any such concept.
A schema of a relation is defined before creating its instances (or tuples)	Since it is optional, it can, therefore, be defined after the creation of a XML document.

The remainder of this chapter is organized as follows. In Section 2, we describe and analyze the existing approaches for transforming a DTD of a

XML document into a relational database schema. In Section 3, we present our proposed approach for transforming a DTD into a relational database

schema, and in Section 4, we demonstrate the proposed approach in a case study. Finally, in Section 5, we give our concluding remarks and future direction of this work.

## 2. Related Work

Investigators have produced many different techniques for transforming DTDs into relational database schemas (Shanmug et al., 1999; Men-Hin & Fu, 2001; Eisenberg & Melton, 2002; Yan, 2001; Williams, 2000; Mani & Lee 2002). There are three (3) main issues that need to be handled during this transformation. These issues are: i) the complexity of the DTD element specifications, ii) the resolution of the conflict between arbitrary nesting in a DTD and relational schema, iii) set-valued attributes and recursion (Shanmug et al., 1999). In the following paragraphs, we give a brief description of the works of these investigators and give, in Table 2 (at the end of this chapter), a comparison of these transformation approaches and our proposed approach.

Shanmugasundaram et al initially proposed an approach in the form of algorithms for transforming a DTD of a XML document into a RDB schema. Men-Hin and Fu later proposed an improvement to the algorithms, (Men-Hin & Fu, 2001; Shanmug et al., 1999). Men-Hin and Fu proposed two algorithms both of which work in the same way, except that they differ mainly in their Step 2 and Step 5. In Step 2 of the improved algorithm they gave more rules for determining the roots. The transformation algorithm by Men-Hin and Fu works in six (6) steps, and they are briefly given below:

**Step 1: Simplifying the DTD:** This step simplifies DTDs of XML documents using the rules similar to regular expression rules. The information that is useful in constructing schema prototype trees is preserved in the DTDs. The value types (e.g. #IMPLIED, #FIXED etc) for the character data (CDATA) are removed from the DTDs.

**Step 2: Determining the Root node:** In this step, roots of the prototype trees are determined from the simplified DTDs using the set of rules that are suggested for this purpose.

**Step 3: Constructing Schema Prototype Trees:** The prototype trees are constructed from the roots that are determined in the previous step using a set of rules.

**Step 4: Generating a Relational Schema Prototype:** This step realizes a prototype relational database schema from the prototype tree using the following rules:

i) Regard all the necessary attributes and elements in the simplified DTD as the attributes that are treated in the entity- relationship (ER) Model.

ii) Inline all the necessary descendants of the schema prototype tree starting from the root. The necessary descendants refer to all the leaf nodes in the schema prototype tree, and the nodes marked with a “#” if they exist.

**Step 5: Discovering Functional Dependencies (FDs) and Candidate Keys:** In this step the traditional relational database design techniques are applied in order to produce suitable relational schemas. These design techniques reduce the redundancy and inconsistency in a relational database schema, and discover the functional dependencies and the candidate keys by analyzing the newly constructed relational database schema.

**Step 6: Normalizing the Relational Schema Prototypes:** This step applies the normalization rules on the relational database schema, after determining the FDs and candidate keys of a relational database schema in the previous step.

In the first algorithm of Men-Hin and Fu, hence functional dependencies are found in Step 5, first by analyzing the XML data, and then by applying the algorithm: Efficient discovery of functional and approximate dependencies using partitioning. Step 6 of this algorithm is time-consuming according to Men-Hin and Fu. Hence they modified this step to make the first algorithm more efficient (Men-Hin & Fu, 2001). The modified algorithm decomposes a DTD into small prototypes in Step 4: Tree Construction, and Step 5: Generating a Relational Schema Prototype. The reason for the decomposition is to minimize the cost of finding functional dependencies.

Both of these algorithms-the first and the modified algorithms- use the tree data structure in their transformation processes (or algorithms). The use of this data structure affects the performance of the transformation process because creating and maintaining the tree structure are costly procedures. Also, these two algorithms are unable to handle all types of DTDs as it has been mentioned in (Shanmug et al., 1999).

Eisenberg, and Melton in (Eisenberg & Melton, 2001; Eisenberg & Melton, 2002) gave an informal proposal for a bi-directional transformation between a XML document and a RDB. This transformation can do a complete or a partial transformation at schema level as well as tuple-level (or row-level). The partial transformation may however miss some semantics. This draft for the bi-directional transformations also suggests a transformation of the

data types. The authors did not give any proper formal algorithm for these transformations. It is therefore difficult to comment about the real effectiveness of these transformations.

Williams et al have proposed 18 steps for transforming DTD into a relational database schema and 11 steps for the reverse transformation (Williams, 2000). Both of these transformations do not use the tree data structure, but some steps in both of these transformations are unclear. For example, in Step 9 and Step 13 of the transformation of a DTD into a relational database schema, data types are assigned to attributes of a DTD without any explanation and justification. This type of vagueness in the transformation processes makes them difficult to understand and to draw any conclusion about their correctness and accuracy.

Mani, & Lee (Mani & Lee 2002) have proposed a process for transforming a DTD into a relational database schema using a regular tree grammar. The use of the regular tree grammar is helpful in maintaining semantics constraints in the transformation process. The theory of regular tree grammars provides a useful formal framework for understanding various aspects of XML schema languages. The two normal forms (NF1 and NF2) are used for the representation of regular tree grammars. NF1 is used in the XML document validation process, and to check whether a given XML schema satisfies the structural constraints imposed by the schema languages.

XML schema (or DTD) provides several unique data modeling features such as union type “+”, which does not exist in the traditional database models such as relational database model. In (Mani & Lee 2002), NF2 is used for representing the basic items of the conversion definition of the two schema languages, that is, a schema that supports union types (e.g., XML-Schema Language (Thompson, 2001), and a schema language that does not support union types (e.g., SQL). This conversion definition is used as the first step in this transformation process of XML schema into relational database schema. The entities and relationships, which form the basic items of data

modeling, are represented as elements and attributes of a DTD.

The process of mapping XML schema (or DTD) into RDB schema has several issues, and they have been pointed out in (Mani & Lee 2002). One of the most important among them is the semantic constraint which exists in the XML model. Since relational database schema cannot express these constraints in the XML schema languages, a useful and meaningful subset of those constraints should therefore be found in the mapping process. This process of finding the subset needs simplification of a XML schema. The concept of inlining technique is used for generating an efficient relational schema (Mani & Lee 2002), however; the inline technique that is presented in this work generates a huge number of relations. In addition, this work does not present any proposal for assigning data types to attributes of tables after or during the transformation process.

The transformation process of a XML DTD to relational data schema is the mapping of each element in the DTD to a relation, and it maps the attributes of an element to the attributes of the relation. However, there is no correspondence between elements and attributes of DTDs and entities and attributes of ER model. The attributes in an ER model are often represented as elements in a DTD.

```
<!ELEMENT author (name, address)>
<!ATTLIST author id ID #REQUIRED>
<!ELEMENT name (firstname , lastname)>
<!ELEMENT firstname (#PCDATA)>
<!ELEMENT lastname (#PCDATA)>
<!ELEMENT address ANY>
```

In the ER model, *author* would be taken as an entity and *firstname*, *lastname* and *address* would be taken as the attributes of the entity. But in defining a DTD there is no incentive to consider *author* as an element and *firstname*, *lastname*, and *address* as attributes. In the syntax of a DTD, if *firstname* and *lastname* were defined as attributes, then they could not be nested under *name* because DTD attributes cannot have a nested structure. A direct mapping of elements to relations therefore leads to an excessive fragmentation.

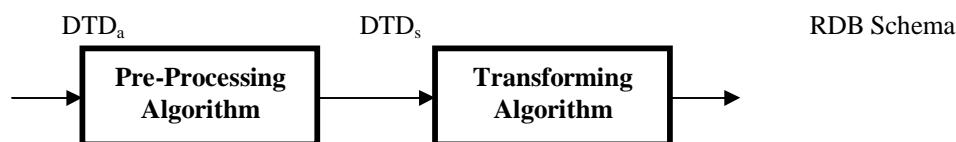

Figure 1: General view of the algorithm

### 3. The Proposed Algorithm

As mentioned earlier in (Shah et al., 2005), we have reported a transforming algorithm that works in two steps. In the first step it takes a DTD written in any form using the DTD syntax and transforms it into a *standard* form that is devised keeping in view the syntax of a relational database schema. The second step of the algorithm takes the standard DTD and transforms it into a relational database schema. Note that in our approach the transforming algorithm development, we did not include the processes of finding functional dependencies (FDs), assigning data types to attributes of relations after the transformation (note that DTD supports only one data type, i.e. PCDATA), and normalization of the

relation database schema. The reason for this is that these three processes are database design techniques and they depend on the perception of a database designer about the database schema (Elmasri & Navathe, 2000). These processes also need direct or indirect expert's intervention and decision. Therefore, in the proposed transforming algorithm, we have separated these three processes from the actual transformation process. Our decision is to separate the manual processes and the automated processes, and this has made our algorithm simpler and helped in achieving our objective of transforming any DTD into a relational schema. In this section, we present only those processes of the transforming algorithm that can be automated.

**Table 2:** Comparative study of our algorithm and existing algorithms

	<b>BI</b>	<b>SI &amp; HI</b>	<b>GSE</b>	<b>DSE</b>	<b>WIL</b>	<b>RTG</b>	<b>EIS</b>	<b>OPA</b>
<b>Data Structure Used</b>	Graph	graph	Tree	Tree	relational structure	regular tree grammars	relational structure	no such abstract data structure is used
<b>Type of conversion</b>	Structured	structured	Structured	Structured	Structured	structural &subset of semantics	mapping	Structural & semantic
<b>Operators Handling</b>	creates a relation for every element in the DTD	ensure that each element is represented only once in a relation	eliminates operators from DTD	preserves some operators to preserve some sub-elements occurrences	some rules are specified to handle them	support XML-Schema (not DTD)	support XML-Schema (not DTD)	Pre-processing algorithm processes them
<b>Advantage</b>	handles fragmentation problem*	the common elements are shared	actual data fields are available in relational schema	number of attributes of the schema is less than the algorithms basic inlining	preserves entities and definitions	maintains semantics constrains	bi-directional transformation	simple, direct mapping & maintains the semantics
<b>Disadv. F</b>	creates large number of relations	large number of joins in mapping for particular elements	number of possible minimal dependencies is exponential	works with limited number of elements and attributes	some rules of the mapping are vague such as assigning	a complex mapping process	miss some semantics	data types assigning is with human intervention
<b>Prfce. FF</b>	low	low	Low	low	didn't mention	didn't mention	didn't mention	high (expected)

**F:** Disadvantages.

**FF:** Performance.

\*: A direct mapping of elements to relations leads to excessive fragmentation of attributes (for more details see [(Mani & Lee 2002)].

Our proposed transforming algorithm further consists of two algorithms (or steps): i) *Pre-Processing Algorithm*, ii) *Transformation Algorithm*. In Figure 1, we have given a general view of our transformation process. Pre-Processing Algorithm transforms any DTD that is written in any form into the standard DTD that is referred to as *DTD<sub>s</sub>* (see Figure 1). The main objective of Pre-Processing Algorithm is to transform a DTD into a simple uniform and standard form which is denoted as *DTDs* in Figure 1. The second algorithm, (i.e., Transformation Algorithm), transforms a *DTDs* in this standard form into a RDB schema (see Figure 1). In the next two paragraphs, we briefly describe the working of these two algorithms. The details of these algorithms can be seen in (Shah et al, 2005).

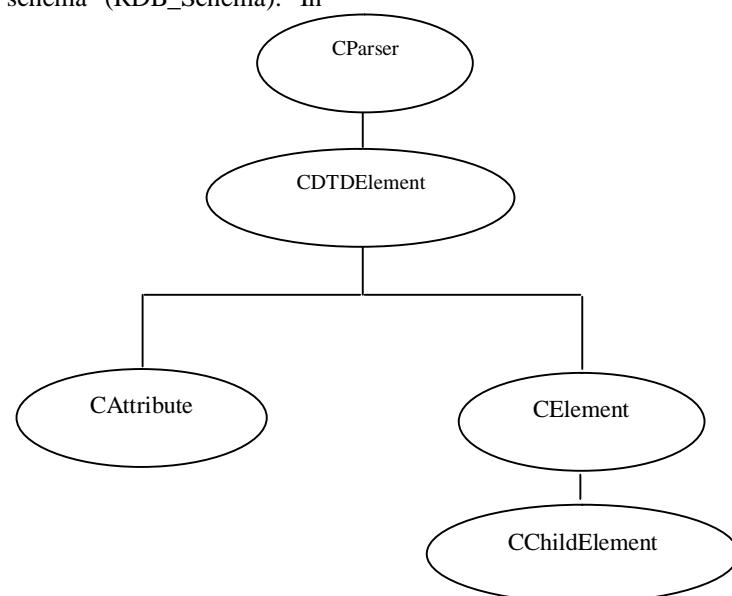

The main function of Pre-processing Algorithm is to enable the overall transformation process to handle *DTDs* which are written in different ways, and to transform them into a uniform and standard form. The output of this algorithm is the standard DTD denoted as *DTDs* (Shah et al, 2005) and it is used as the input to Transformation Algorithm as shown in Figure 1. The working of Pre-Processing Algorithm is given in Figure I-1 for more details see (Shah et al, 2005).

Transformation Algorithm takes the *DTD<sub>s</sub>* of a XML document input and transforms it into a relational database schema (RDB\_Schema). In

Figure I-2, we give the working of the algorithm. In this algorithm, there are two nested loops. The outer loop deals with elements of the *DTD<sub>s</sub>* and transforms them into corresponding tables/relations. The inner loop transforms every attribute of the element into the attributes of the corresponding relation. In Step (iii) of the algorithm (see Figure I-2), it transforms ID and IDREF attributes of an element into primary key and foreign key of the relation, respectively. Note that since the syntax of DTD does not allow the concepts of composite key, therefore, our proposed transformation process also does not support this concept.

## 1. Implementation Details

As we know from the previous section that the proposed transformation process consists of the two algorithms, and these algorithms are implemented on the platform Intel Pentium II, 400 MHz, Microsoft Windows 98, and using Visual C++ version 6.0. The implementation has two (2) modules corresponding to the two algorithms, namely the Pre-processing module and the Transformation modules. The design of the process is an object-oriented design and it consists of five base classes as show in Figure 2. The designs (or contents) of the classes are given in Appendix II.

**Figure 2:** Class-lattice of the transformation process

## 5. Testing and Analysis

In this section, we give description of the selected test cases and the test data (or instances) which are used to test our proposed transformation process/algorithm. Then we analyze the test results, and based on these results we compare our proposed algorithm with the existing transformation algorithms. We have taken five (5) different and typical test cases and one test data for each test case to test the proposed algorithm. In the next five sections, we describe the five test cases, give their test data, and report their test results.

### Test Case 1: Simple DTD

We consider DTD as a *simple DTD* if it contains the basic components/features of the DTD syntax. It does not contain the features such as nesting structures, ID and IDREF(s) attributes, or any referencing to any external entity. We have taken simple DTD as the first test case to the proposed algorithm. A test data (or instance) of this test case that is used for testing the algorithm, is given in Figure III-1 (see Appendix III). The execution of the algorithm for this test data was successful, and the result was as it was expected. The result/outputs of the test data is given in Figure III-2.

For the test case of the simple DTD, our finding is that its automatic transformation using our proposed algorithm into a relational schema is close to its manual transformation.

### Test Case 2: DTD Containing ID and IDREF

The concepts of ID and IDREF in DTD are important from database point of view. To test these concepts, we have taken a test case to test these concepts. For this purpose, we have picked a DTD of a Library system as an instance of this test case and it is shown in Figure III-3. After the execution of the algorithm with the instance (given in Figure III-3), the result/output is shown in Figure III-4. After testing this test case, we noticed that the results of our transformation algorithm and the existing algorithms are identical. Note that most of the existing algorithms are not automated.

### Test Case 3: DTD Containing Entity Reference and Operators

In a DTD, an entity referencing is a reference to a content of a named entity whether this entity is referencing to a separate external or an internal location, where the content is given in the declaration of the DTD. In this test case, we have picked a DTD as instance of the test case which has this characteristic. An instance (DTD) of this test case is given in Figure III-5. After the successful executing of the instance, the result is given in Figure III-6. The transformation algorithm has worked successfully for

the instance, and it has removed the entity declaration from the Catalog DTD as shown in Figure III-6.

### Test Case 4: DTD Containing Multiple Root Elements

Some DTDs may have irregular structure which means that these DTDs are missing their root elements. In other words, such type of DTDs have multiple root elements. Our next test case deals this type of DTDs. An instance of this test case is given in Figure III-7. Note that in the figure *Building* element has two parent elements and they are *owner* and *compound*. This instance was successfully executed, and the result of the transformation algorithm is the same as it was expected and given in Figure III-8.

### Test Case 5: DTD with Irregular Structure

Usually to write a DTD, there is no fixed format. In other words, DTD of a XML document can be written in many different ways. A DTD is called an *irregular DTD* if it has one element existing as a sub-element of two different main elements (Shah et al, 2005), an example is the element *person* in the Conference DTD, shown in Figure III-9, person element is a sub-element of the two main elements (*editor* and *author*). An instance of this test case is given in Figure III-9. After testing the instance, the result is shown in Figure III-10. From this test case an interesting result can be concluded, that is, if root element of a DTD contains an attribute of type ID, then the DTD could be a part of another DTD.

## DISCUSSION

In the previous section, we report testing result of our proposed and implemented transforming algorithm. These testing results show that this algorithm works successfully on more different types of DTDs as compared to many existing algorithms which are described in Section 2. Another main feature of our algorithm is its implementation because most of the existing algorithms are not implemented; therefore, it is hard to say about their test results and performance. We can conclude that the performance of our algorithm is better than the existing algorithms because our algorithm does not use the tree data structure during the transforming process. Our algorithm saves the heavy construction and maintenance of the tree structure.

During the testing of the algorithm, we have noted that the number of elements and attributes do not affect the working of the algorithm.

Now we summarize our findings of our algorithm, compare it with the existing algorithms and give our concluding discussion. In Table 2, we present the summary of main features of our

proposed and implemented algorithm, and the existing algorithms.

In the three algorithms, i.e., Basic Inlining, Hybrid Inlining, and Shared inlining, the evaluation is based on real DTDs which raise the performance concern as it has been mentioned in (Shanmug et al., 1999). This concern is due to a big number of relations generated by the algorithms. In Global-Schema extraction and DTD-Splitting, it has been pointed out in (Men-Hin & Fu, 2001) to the high cost of finding the functional dependencies because the cost of finding the possible minimal dependencies is exponential due to the number of attributes. The other algorithms did not mention their implementation and test results. As we have mentioned earlier that we have implemented our proposed algorithm and successfully tested it by taking different test cases. Whereas, most of the existing algorithms are not yet automated, and also they use graph or tree data structures during their transformation process (see Table 2). We did not use these data structure in our algorithm, which has caused better performance of our algorithm than the existing algorithms. By comparing other parameters in Table 2, it is obvious that our algorithm shows better results than the existing algorithms.

## 6. Concluding Remarks and Future Directions

In this paper, we have presented the extension of previous work that was reported in (Shah et al, 2005). Here, we have presented development details, testing results and analysis of our proposed algorithm. The proposed algorithm efficiently transforms the DTDs of a XML document (which are written in different ways using different syntax options) into a relational database schema. This transformation algorithm works in two steps/sub-algorithms: i) Pre-Processing Algorithm, and ii) Transformation Algorithm. The first step transforms DTD into a standard form of DTD which is closer to relational database schema. The second step does the actual transformation.

We have demonstrated and tested the working of our proposed algorithm by taking five different test cases. The results are encouraging. The main features of our proposed algorithm are that it is simpler and easy to understand, implemented and tested on different types of DTDs, and more efficient than the existing algorithms.

A possible extension of this work can be the reverse-directional transformation (i.e., RDB Schema into XML documents schema). These issues and future directions of this work are following:

- (i) Handling of IDREFS: It can be an interesting study to translate the concept of IDREFS into relational paradigm.
- (ii) Naming conflict between relations and attributes during the transformations.
- (iii) Assigning data types to attributes, because DTD supports only character data type and RDB schema supports multiple data types.

## Effect of injector types, irrigation and nitrogen levels on II- Garlic yield, water and nitrogen use efficiency.

Tayel, M.Y., \*Shaaban, S.M., Ebtisam I. El-Dardiry and Sabreen Kh.

Water Relations and Field Irrigation Dept., National Research Centre, Dokki, Cairo, Egypt.

[\\*shaabansm@yahoo.com](mailto:shaabansm@yahoo.com)

**Abstract:** Field experiments were conducted during two consecutive growing seasons in split split plot design on a clay loam soil at Shalaquan, Qalubia Governorate, Egypt. Experiments investigated the effect of three injectors types by-bass pressurized mixing tank ( $J_1$ ), venturi ( $J_2$ ) and piston pump ( $J_3$ ); three rates of irrigation 50, 75, 100% of  $ET_c$  ( $I_1, I_2, I_3$ ); three nitrogen levels 60, 90, 120 kg fed $^{-1}$  ( $N_1, N_2, N_3$ ) on garlic yield, water use efficiency (WUE) and nitrogen use efficiency (NUE). The main results could be summarized as follows; the maximum and minimum garlic yields (6.34, 2.38 ton fed $^{-1}$ ) were obtained with treatment  $J_3 I_2 N_3$  and  $J_1 I_1 N_1$ , respectively. Maximum value of WUE was 3.29 kg garlic m $^{-3}$  of irrigation water as recorded with the treatment  $J_3 I_1 N_3$ , while the minimum value was 1.30 kg garlic m $^{-3}$  of irrigation water as recorded with the treatment  $J_1 I_3 N_1$ . The maximum and minimum values of NUE in kg garlic kg $^{-1}$  N were 83.22 and 29.17 for  $J_2 I_2 N_1$  and  $J_1 I_1 N_3$ , respectively. A positive linear relationship was found between WUE and NUE. [Journal of American Science. 2010;6(11):38-46]. (ISSN: 1545-1003).

**Keywords:** Field experiments; clay loam soil; water use efficiency (WUE); nitrogen use efficiency (NUE)

### 1. Introduction

The use of modern irrigation systems becomes very important to save both water and chemicals. One of the most influencing operations for both production and costs is fertilizer application. Any improvement which takes place on this factor would, no doubt, have a considerably effect on production.

The academic and applied researches emphasized that, lots of fertilizers are lost through leaching with drainage water; this phenomenon is highly remarked under the conventional methods of fertilizing. So the application of fertilizer via the modern irrigation methods will be very effective. El-Gindy [1], studied the optimization of water use for pepper crop, he found that the drip irrigation method increased the pepper yield by 64.0% and water use efficiency over the furrow one. El-Adl [2], recorded maximum water use efficiency for peas crop in the treatment (surge drip irrigation, fertigation, and 75 % of  $ET_c$ ). WUE was 3.78 kg green pods and 0.693 kg dry grain m $^{-3}$  of irrigation water. On the contrary, the same author [3] in his study on peanut crop, found that the maximum value of WUE was 0.42 kg seed m $^{-3}$  of irrigation water for the treatment (irrigation every day with 100% of  $ET_c$  and traditional fertilization). Morad et. al. [4] revealed that FUE kg N unit $^{-1}$  was significantly affected by changing the doses of nitrogen; increasing dose from 90, 120 and up to 150 unit of nitrogen caused a considerable decrease in FUE kg N unit $^{-1}$ . These decreases were 13.72 and 21.93 %, respectively.

Panchal et. al. [5] studied the effect of irrigation rates as irrigation water/ cumulative pan evaporation ratios (IW/CPE of 1.0, 1.2 or 1.4), N (25,

50 or 75 kg ha $^{-1}$ ) and P $_2O_5$  (25, 50 or 75 kg ha $^{-1}$ ) on garlic yield. They found the bulb yields were highest at IW/CPE ratios of 1.2 or 1.4, N at 50 or 75 kg N ha $^{-1}$ , and P $_2O_5$  at 50 or 75 kg ha $^{-1}$ . In a study using garlic (cv. G1) grown on a clay loam soil, 5 levels of irrigation as ID/CPE of (0.5, 0.75, 1.00, 1.25 and 1.50) and 3 N levels (50, 100 and 150 kg N ha $^{-1}$ ) were compared [6]. They found that the highest yield was 157.33 q ha $^{-1}$  at 1.5 ID/CPE. These rates of irrigation and N also resulted in the greatest bulb diameters and weight of 10 bulbs. Carvalho et. al. [7] planted garlic, under the conditions of 3 rates of applied N (0-120 kg ha $^{-1}$ ) and 4 rates of K (0-160 kg K $_2O$  ha $^{-1}$ ) at irrigation rates corresponding to 60, 100 or 140% of maximum evapotranspiration (401.5 -716.5 mm). Rainfall during the growing season was relatively high and no significant effects of irrigation were observed. Although various effects of N and K on emergence and morphology were noted, total and marketable bulb yields were affected only by nitrogen. They added that the highest yields (2400-4440 kg ha $^{-1}$ ) were obtained with 70-76 kg N ha $^{-1}$ . Sadaria et. al. [8] studied the effects of irrigation (at irrigation water cumulative pan evaporation ratios (IW/CPE) of 1, 1.2 and 1.4). The highest bulb yields (5594 kg ha $^{-1}$ ) were obtained at IW/CPE= 1.4 the increase in productivity obtained in this treatment was significantly higher than that at IW/CPE= 1.2. It is suggested that higher water availability at 1.2 and 1.4 than at 1.0 IW/CPE increased nutrient availability, and therefore increased growth and productivity. The different N treatments tested had no significant effects on bulb yield, and the effects of P treatments were not clear. Tayel et. al. [9] conducted a

field experiment on onion (*Allium cepa*; Giza 20), potato (*solanum tuberosum*, sponta Holand) and peas (*Pisum Sativum*, Master B- Short) under different irrigation system; surface drip (SDI), sub surface drip (SSDI), uncontrolled surface irrigation (UCSI), and controlled surface irrigation (CSI). They found that WUE varied from 6.45 (SDI) to 10.37 (CSI) and from 2.47 (SSDI) to 5.08 (CSI) for onion and peas crop, respectively at Bahtem and Shalaqan sites. Data indicated that UCSI has the maximum value of WUE ( $10.2 \text{ kg m}^{-3}$ ) of irrigation water while CSI has the minimum one ( $4.96 \text{ kg m}^{-3}$ ) of irrigation water for onion crop. Tayel et. al. [10] studied the effect of different irrigation systems (drip, low head bubbler; gated pipe) on yield and both water and fertilizers use efficiency by grape (thompson seedless) grown in silty clay loam soil in Egypt. They found that nitrogen use efficiency ranged from 32.1 to 35.1  $\text{kg yield kg}^{-1}$ , whereas, water use efficiency varied from 0.51 to 1.07  $\text{kg yield m}^{-3}$  of irrigation water. They found high

significant linear relation ( $R^2 = 0.896^{**}$ ) between the yield (y) and nitrogen use efficiency (NUE),  $y = 0.0067 \text{ NUE} + 18.972$ . Also, high significant linear equation ( $R^2 = 0.911^{**}$ ) between WUE and NUE was found,  $\text{WUE} = 10.515 \text{ NUE} + 25.538$ . Abdel- Baset [11] found that the max yield of garlic (19.9 ton fed $^{-1}$ ) and the maximum WUE ( $12.57 \text{ kg m}^{-3}$ ) were achieved in the irrigation treatment 81.2 and 62.5 of ETc, respectively. The main objective of this work was to study the effect of injector types, irrigation and nitrogen levels on garlic yield, water and nitrogen use efficiency.

## 2. Material and Methods

Experiments were carried out at the Experimental Farm of the Faculty of Agriculture, Ain Shams University, at Shalaquan village, Qalubia Governorate as follow:

### 1. Soil

Soil samples were taken randomly to determine some physical and chemical properties as shown in table (1)

Table (1 ): Some soil physical and chemical properties of the experiment site.

Sample depths (cm)	Particle Size Distribution %			Texture class	w % at			BD (g cm $^{-3}$ )	pH 1:2.5	ECe ds m $^{-1}$ 1:5
	Sand	Silt	Clay		FC	WP	AW			
0-15	28.3	41.4	30.3	CL	35.5	19.2	16.3	1.25	7.9	0.26
15-30	28.2	41.2	30.6	CL	35.2	19.4	15.8	1.26	7.8	0.25
30-45	28.4	38.5	33.1	CL	34.7	19.8	14.9	1.28	7.6	0.26
45-60	29.1	37.3	33.6	CL	34.7	20.1	14.6	1.30	7.2	0.28

FC : Field capacity  
BD : Bulk density

WP : Welting point  
CL : Clay loam

AW : Available water

### 2. Fertilizer Injectors

Three injector types: By-bass pressurized mixing tank ( $J_1$ ), venturi ( $J_2$ ) and piston pump ( $J_3$ ) were used for nitrogen fertilizer injection in the form of  $(\text{NH}_4)_2\text{SO}_4$  solution.

### 3. Experiment layout

Field experiments were conducted during two consecutive growing seasons in split split plot design with three replications. Super phosphate 15.5%  $\text{P}_2\text{O}_5$  and potassium sulphate 48-52%  $\text{K}_2\text{O}$  were added in soil at rate of  $100 \text{ kg fed}^{-1}$  before transplanting and during the vegetative growth in two equal doses, respectively. Chinese garlic (*Allium Sativum*) variety (Cloves cv.) was planted at the second week of September. The main plots were devoted to irrigation treatment. Three irrigation rates

occupied the sub-plots. Three levels of N-fertilizer namely  $60, 90, 120 \text{ Kg N fed}^{-1}$  (one fed.  $4200 \text{ m}^2$ ) were added. Since three methods for fertilizer application (by-bass fertilizer tank, venturi, and piston pump) were used, the layout mentioned above was repeated three times. Garlic was drip irrigated. Interval between irrigation was 4 days. Total growing period of marketable yield was 195 days,

### 4. Examined parameters:

Water use efficiency (WUE)  $\text{kg garlic m}^{-3}$  of irrigation and nitrogen use efficiency (NUE)  $\text{kg garlic per kg N}$  were calculated according to Israelson and Hanson [12] as follows:

$$\text{WUE} = Y / W \text{ and } \text{NUE} = Y / C$$

where:

$Y$  = total crop yield,  $(\text{Kg fed}^{-1})$

$W$  = total water applied and  $(\text{m}^3 \text{ fed}^{-1})$

$C$  = amount of nitrogen fertilizer applied  $(\text{kg N fed}^{-1})$

were 50, 75, and 100 % of  $\text{ET}_c$  (1423, 2134 and 2846  $\text{m}^3 \text{ fed}^{-1}$ ). On the other hand, N-fertilizer treatments

### 3. Results and Discussion

The female partner was of average height and 1. Garlic yield:

Tables (2) and Figure (1) indicate the effects of injector types; by-bass pressurized mixing tank ( $J_1$ ), venturi ( $J_2$ ); and positive displacement pump ( $J_3$ ) irrigation treatments 50, 75; 100% of  $ET_c$  ( $I_1, I_2, I_3$ ) and nitrogen treatments 60, 90; 120 kg fed<sup>-1</sup> ( $N_1, N_2, N_3$ ) on garlic yield.

All the main effects of injector types, irrigation treatments and nitrogen treatments on garlic yield are significant at the 5% level on garlic yield. They can be put in the following ascending orders according to the yield  $J_1 < J_2 < J_3$ ,  $I_1 < I_3 < I_2$  and  $N_1 < N_2 < N_3$ . These results agree with those of [13].

All the first interactions:  $J_1 \times I$ ,  $J_1 \times N$ ,  $J_2 \times I$ ,  $J_2 \times N$ ,  $J_3 \times I$ ,  $J_3 \times N$  and,  $I \times N$  have significant effect at the 5% level on garlic yield in ton fed<sup>-1</sup>. The maximum yields (6.10, 6.04; 5.78) ton fed<sup>-1</sup> and the minimum ones (2.96, 3.23; 3.33) ton fed<sup>-1</sup> were obtained in the following interactions: ( $I_2 \times N_3$ ,  $I_3 \times N_3$ ;  $I_2 \times N_2$ ) and ( $J_1 \times I_1, I_1 \times N_1$ ;  $J_1 \times N_1$ ), respectively.

With respect to the second interactions they have significant effects at 5% level on garlic yield in ton/fed. The highest values of yields were 6.34, 6.26; 6.19 and the lowest ones were 2.38, 3.00; 3.36 ton/fed, in the following interactions: ( $J_3 \times I_2 \times N_3$ ,  $J_3 \times I_3 \times N_3$ ;  $J_3 \times I_2 \times N_2$  and ( $J_1 \times I_1 \times N_1$ ,  $J_1 \times I_1 \times N_2$ ;  $J_2 \times I_1 \times N_1$ ), respectively.

Data obtained could be due to one or more of the following reasons:

- 1-  $J_1$  and  $J_2$  decrease pressure within the irrigation system,
- 2- Nitrogen concentration is not constant with time in the case of injector  $J_2$
- 3- Nitrogen concentration decreased with time in the case of injector  $J_1$
- 4- Injector  $J_3$  does not decrease pressure within irrigation system and it's piston movement increases N solubility and decreases both precipitation and emitters clogging, [14],
- 5- Increment N levels increases plant growth and emitters clogging, and
- 6- Increasing irrigation rates increases emitters flushing and salt removal from root zone, and decreases both soil aeration and emitters clogging].

### 2. Water use efficiency

Table (2) and Figure (2) show that effects of injectors types ( $J_1, J_2, J_3$ ), irrigation treatments ( $I_1, I_2$ ;  $I_3$ ) and nitrogen treatments ( $N_1, N_2, N_3$ ) on the water use efficiency (WUE).

$I_3$ ) and nitrogen treatments ( $N_1, N_2, N_3$ ) on the water use efficiency (WUE).

Table (2) illustrates the main effects of injector types, irrigation rates and nitrogen levels on WUE. The three parameters have significant effect at 5% level on WUE. According to WUE values, obtained the studied parameters could be written in the following ascending orders:  $J_1 < J_2 < J_3$ ,  $I_3 < I_1 < I_2$  and  $N_1 < N_2 < N_3$ . Data obtained could be due to the effects of the following reasons on yield:

- 1- The decrease in nitrogen concentration with time when  $J_1$  is used,
- 2- The fluctuation in nitrogen concentration with time when  $J_2$  is used;
- 3- Increment of N concentration increases drippers clogging and vice versa.
- 4- Increasing irrigation rates to some extent ( $I_2$ ) increases yield and decreases drippers clogging.

In the first interactions, maximum values of WUE were 3.05, 2.93; 2.86 kg garlic m<sup>-3</sup> of irrigation water) and the minimum ones were 1.55, 1.60; 1.70 kg garlic m<sup>-3</sup> of irrigation water were obtained in the following interactions: ( $J_3 \times I_1$ ,  $I_1 \times N_3$ ;  $I_2 \times N_3$ ) and ( $I_3 \times N_1$ ,  $J_1 \times N_1$ ;  $J_1 \times I_3$ ), respectively.

Concerning the second interactions they led to significant effects on WUE in kg garlic m<sup>-3</sup> of irrigation water. The maximum values of WUE were 3.29, 3.07; 3.03 kg garlic m<sup>-3</sup> of irrigation water) and the minimum ones were 1.30, 1.66; 1.67 kg garlic m<sup>-3</sup> of irrigation water were due to the following interactions: ( $J_3 \times I_1 \times N_3$ ,  $J_3 \times I_1 \times N_2$ ;  $J_2 \times I_1 \times N_3$ ) and ( $J_1 \times I_3 \times N_1$ ,  $J_3 \times I_3 \times N_1$ ;  $J_1 \times I_1 \times N_1$ ), respectively.

### 3. Nitrogen use efficiency

Illustrated data in Figure (3) show the main effect of injector types, irrigation rates and nitrogen levels all have significant effects on NUE at 5% level. According to the values of NUE, the parameters under investigation could be put in the following ascending orders:  $J_1 < J_2 < J_3$ ,  $I_1 < I_3 < I_2$  and  $N_3 < N_2 < N_1$ . Reasons for this have been previously discussed under yield and water use efficiency.

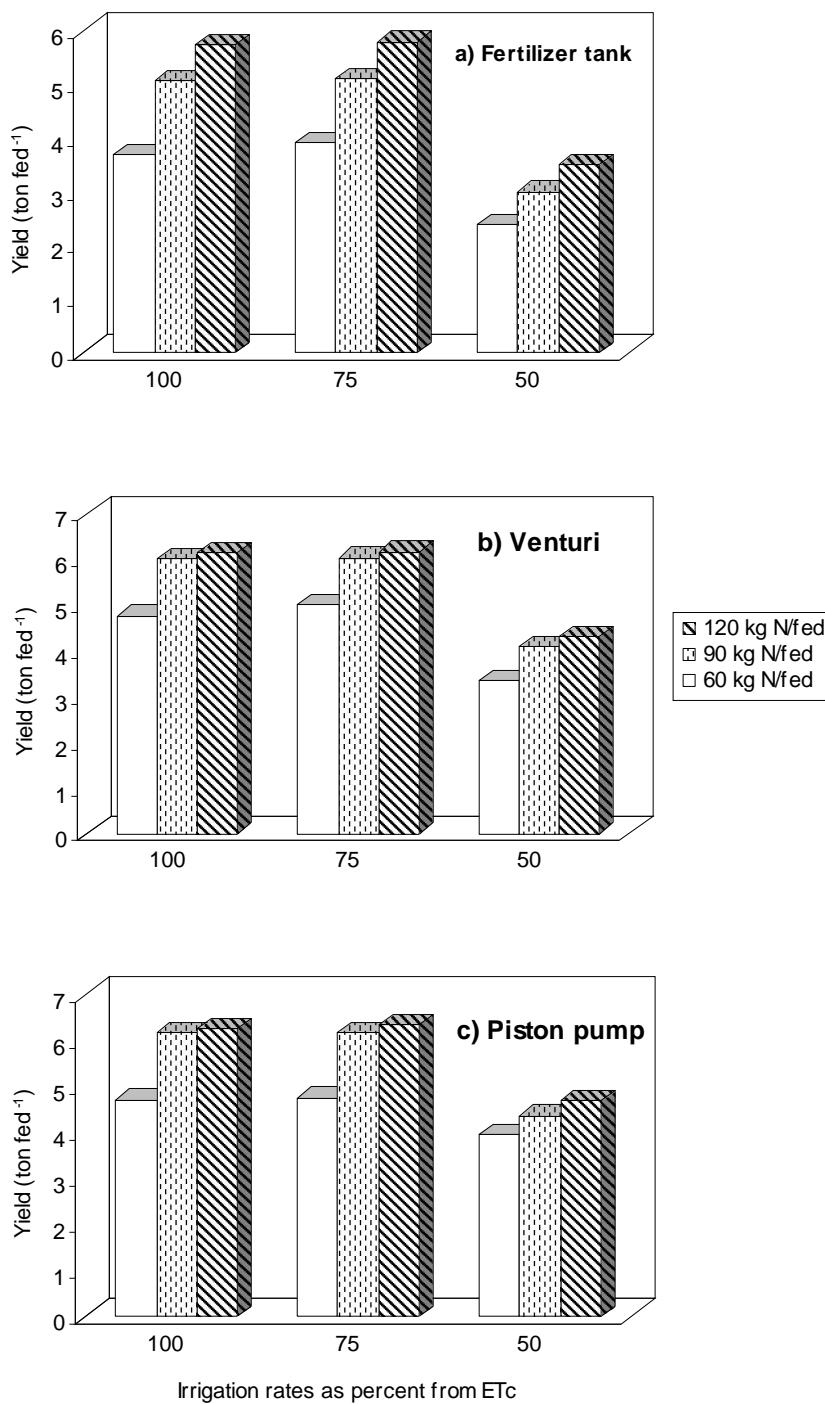

The maximum values of NUE for first interactions in kg garlic kg<sup>-1</sup> nitrogen were 75.9, 74.6; 73.4 and the minimum ones were 34.1, 34.7; 41.8 in the following interactions: ( $I_2 \times N_1$ ,  $J_3 \times N_1$ ;  $I_3 \times N_1$ ) and ( $J_1 \times I_1$ ,  $I_1 \times N_3$ ;  $J_1 \times N_3$ ), respectively.

In the case of second interactions, the maximum values of NUE in kg garlic kg<sup>-1</sup> N were 83.2, 79.7; 79.3 whereas the minimum ones 29.2, 33.3; 35.9 were achieved in following interactions.

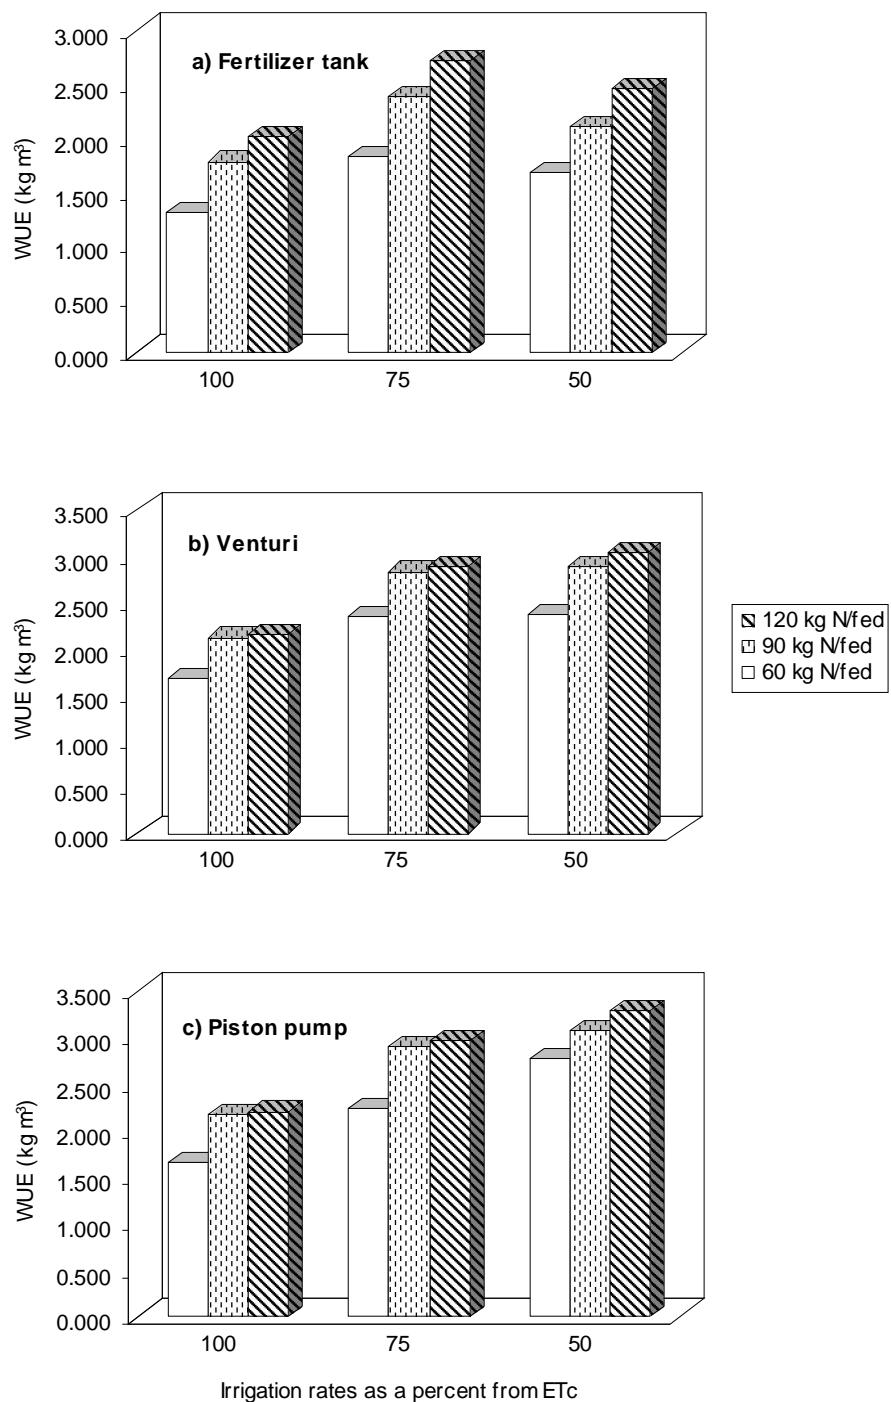

Table (2): Effect of irrigation and nitrogen fertilization levels on garlic yield, WUE\* and NUE\*\* under different injector types

Injector Types (J)	Irrigation rates (I) % of ETc	Nitrogen level (N) Kg fed <sup>-1</sup>	Yield Ton fed <sup>-1</sup>	WUE*, Kg m <sup>-3</sup>	NUE** (Kg kg <sup>-1</sup> )

WUE\*: water use efficiency. NUE\*\*: nitrogen use efficiency.

**Figure (1 ):** Effect of irrigation and nitrogen fertilization levels on garlic yield under different injection methods.

**Figure (2): Effect of irrigation and nitrogen fertilization levels on water use efficiency under different injection methods.**

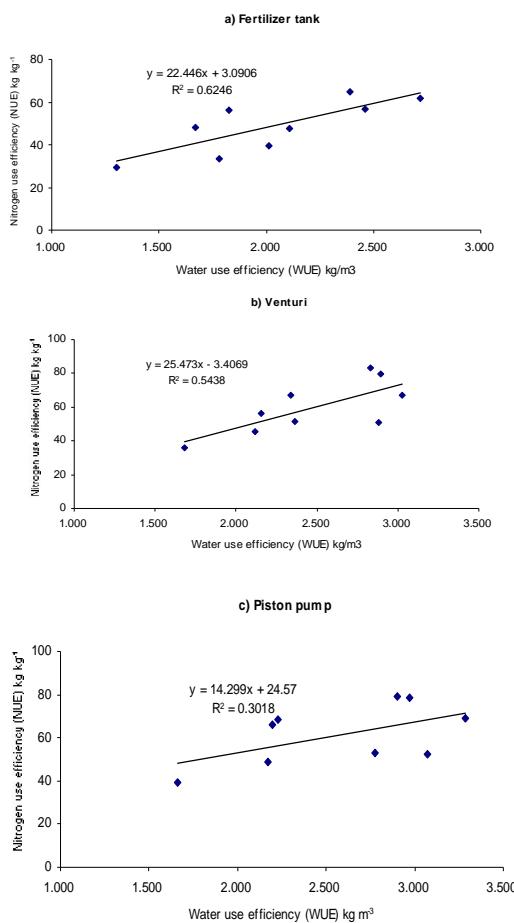

**Figure (3): Effect of irrigation and nitrogen fertilization levels on nitrogen use efficiency under different injection methods.**

$(J_2 \times I_2 \times N_1, J_2 \times I_3 \times N_1, J_3 \times I_2 \times N_1)$  and  $(J_1 \times I_1 \times N_3, J_1 \times I_1 \times N_2, J_2 \times I_1 \times N_3)$ , respectively.

#### 4. The relationship between water and nitrogen use efficiency

Figure (4) describes the relationship between water and nitrogen use efficiency under different injectors types indicating that there was a positive linear relationship between WUE and NUE which could be written as follow equations:  
 $NUE = 22.446 \text{ WUE} + 3.0906, R^2 = 0.6246^{**}$   
 $NUE = 25.473 \text{ WUE} + 3.4069, R^2 = 0.5438^*$  and  
 $NUE = 14.299 \text{ WUE} + 24.57, R^2 = 0.3018$   
for fertilizer tank ( $J_1$ ), venturi ( $J_2$ ), and piston pump ( $J_3$ ), respectively. Data on hand, indicate highly positive significant of correlation coefficient at 1% for  $J_1$ , positive significant at 5% for  $J_2$  and no significant for  $J_3$ . This means that any increase in WUE is followed by significant increase in NUE. These results are agreeable with those obtained by [9].

**Figure (4): The relationship between water and nitrogen use efficiency under different injection methods.**

#### 5. Conclusion

From the above mentioned presentation, it can be concluded that the highest and the lowest garlic yield (6.34; 2.38 ton fed<sup>-1</sup>) was obtained with treatment  $J_3 \times I_2 \times N_3$  and  $J_1 \times I_1 \times N_1$ , respectively. The maximum value of WUE was 3.29 kg garlic m<sup>-3</sup> of irrigation water as recorded with the treatment  $J_3 \times I_1 \times N_3$ , while the minimum value was 1.30 kg garlic m<sup>-3</sup> of irrigation water as recorded with the treatment  $J_1 \times I_3 \times N_1$ . The maximum value of NUE in kg garlic kg<sup>-1</sup> nitrogen was 83.2 and the minimum ones 29.2 in the following interactions between  $J_2 \times I_2 \times N_1$  and  $J_1 \times I_1 \times N_3$ , respectively. A positive linear relationship was found between WUE and NUE.

**Abstract:** Software Cost Estimation is essential for efficient control and management of the whole software development process. Today, Constructive Cost Model (COCOMO 11) is very popular for estimating software cost. In Constructive Cost Model lines of code and function, points are used to calculate the software size. Actually, this work represents the implementation stages but in early stages in software development, it was not easy to estimate software cost. The entity relationship model (ER Model) is very useful in requirement analysis for data concentrated systems. This paper highlights the use of Entity Relationship Model for software cost estimation. Pathway Density is ushered in. By using the Pathway Density and other factors, many regression models are built for estimating the software cost. So in this paper, Entity Relationship Model is based on estimated cost of software. [Journal of American Science. 2010;6(11):47-51]. (ISSN: 1545-1003).

**Keywords:** ER Model, Cost Estimation, Entity

## 1. Introduction

Software cost estimation is critical process for software development. It is important for efficient control and management of the whole software development process. A number of models, such as Farr and Zagorski Model, Woerton Model have been anticipated [1]. Now days Constructive Cost Model (COCOMO11) is popular cost Estimation model. COCOMO 11 is divided into three sub models:

- Applications Composition
- Early design strategy
- post-architecture strategy

They can be blended in various ways to deal with the current and likely future software practices market place [4] it accesses the software effort based on the same model:

$$E = a (EDSI)^b \times EAF$$

Where E is an effort estimate, expressed in person-months. EDSI refers to the number of Estimated Delivered Source Instructions. The parameters  $a$  and  $b$  are determined by the application complexity mode. EAF (Effort Adjustment Factor) is equal to one for the basic sub-model, and equals the product of fifteen cost factors for the intermediate and advanced sub-models [3, 4].

COCOMO II uses Function Points or Lines of Code for estimating the size of a software system. Intuitively, lines of code cannot be obtained or estimated at the early stage of the software development. Function Point appears to be requirements oriented. However, Function Point

counts the number of files updated and reports printed, etc, which are actually the result of design. As a result, it also confronts many problems [2]. This research proposes the use of the popular data model, ER model, for the estimation of software cost. ER model is usually constructed in the requirements analysis stage. The organization of this paper is as follows: section 2 shows the background of ER model and the factors we want to use in our research. Section 3 proposes a new term, Path Complexity and how to count the value of Path Complexity. Section 4 illustrates the new estimating model for software cost that is based on the multiple linear regression technique and gives the conclusion.

## 2. Background

The ER Diagram was brought to limelight by Professor Chen in 1976 [8] and adapted in the Information Engineering approach. The ER Diagram originally used in the database field and now is being used in Object-Oriented Analysis. An ER model is constructed to show the ideal organization of data, independent of the physical organization of the data and where and how data are used. Currently, data-intensive systems constitute a main domain in software. These systems maintain a large amount of structured data in a database built through a database management system (DBMS). Although UML (Unified Modeling Language) has gained its popularity as a standard software modeling methodology, ER model is still used to model the data conceptually in the requirement capturing and

analysis stages. Moreover, most of the design and development activities are based on the ER model. Therefore, ER model seems to have the most readily available information from requirements capturing and analysis stages. After studying the ER Diagram, we find that ER diagram is a non-directional graph[6]. It is easy to sketch an ER Diagram onto a directional graph by considering the entity as the vertex in a graph, and considering the relationship as the edge in a graph. From our observation, software effort is effected by the number of entities, relationships and attributes. In addition, it can be seen that more complex structure of ER Diagram is, mere effort that will be spent on the software system. Thus, we want to find out some relationships with software effort. In this research, we use the following metrics in the estimating model [7, 8]:

**NOE:** the number of entities in an ER Diagram.

**NOR:** the number of relationships in an ER Diagram.

**NOA:** the number of attributes in an ER Diagram.

**NOP:** the number of Path Complexity of an ER Diagram.

### 3. Complexity Metrics:

The ER Diagram shows the whole structure of the Database, where one entity can access the other entities through the relationship and get the related data. More ways one entity can access the other entities, more things we should consider about it. This can reflect the whole system complexity. Thus, we want to quantify the data that can be used in the software system. It is a problem of complexity metrics of the software product. Path Complexity is proposed as a complexity metrics to measure software effort [5]. In order to quantify the whole system data, we should first know through how many paths one entity could influence the other entities, and the length of each path. Because an ER Diagram can be converted into a graph, we can calculate these data by using graph theory path.

#### Definition 1:

Path Complexity of a vertex is:

$$P_i = \frac{1}{n} \sum_{j \neq i} l_{ij}$$

Where

The  $i$ th vertex is not the same to the  $j$ th vertex;

$P_i$  is the Path Complexity of the  $i$ th vertex;

$n$  is the number of the paths through which  $i$ th vertex can access the  $j$ th vertex;

$l$  is the length of each path through which  $i$ th vertex can access the  $j$ th vertex.

#### Definition 2

Path Complexity of an ER Diagram is:

$$P = \max_{v \in G} P_v$$

Where

$P$  is the Path Complexity of the whole ER Diagram;

$P_v$  is the Path Complexity of the  $v$ th vertex in the ER Diagram. Algorithm *Search Path* ( $G, s$ ) given by following is used to count how many paths we can get from a fixed vertex in a connected graph to the other vertices in the same graph, and the length of each. We assume that the input graph  $G = (V, E)$  is a connected graph and it can be represented using adjacency matrix. Each vertex  $u$  in the connected graph has a timestamp  $time[u]$ , it records how many edges it has in one path from  $s$  (the beginning vertex) to  $u$  (the destination vertex). We use  $P[u]$  to record a set of vertices that are ahead of the vertex  $u$  through a path.  $N(G)$  is a vertex set to present the vertices left in a connected graph

*Search Path*

```

1 for each component G
2 while ( ) (G N)
3 do select s N(G) as the Beginning Vertex
4 for each t } { } (s G N
5 set t = EndVertex
6 for each vertex u ) (G V
7 time[u] = 0
8 P[u] NIL
9) (s Search)
(s Search

1 for each vertex u Adj[s]
2 P[u] P[s] + s
3 time[u] time[s] +1
4 if u = t
5 print time[u]
6 else if u P[u]
7 break
8 else) (s Search)

```

#### 3.1 Proposed Model

We proposed a model to estimate software effort (shown in Figure 1). It contains an Adjacency Matrix Generator, A Path Complexity Generator, a Metric Generating Tool and a Statistical Module.

Among the existing techniques used in software estimation, regression-based techniques are the most popular ways of building models. After comparing four techniques (regression, neural networks, Case-Based Reasoning, Rule induction)[3] shows a result that regression and Case-Based Reasoning perform better than the other techniques [4] also compares the methods used in regression, neural networks and genetic programming. We winds up that although neural networks and genetic programming can improve the estimations of regression, the results are

not very impressive. Thus in its multiple linear regression model was adopted. All system data used in this project are actual industry data. Several software development companies in Singapore and Pakistan were considered, and provided twelve software systems' data. These projects cover multiple application domains including freight management, quotation, billing or order processing. We got data of NOE, NOR, NOA and NOP from those software systems. And we use Man-Day to measure software cost. (Shown in Figure1).

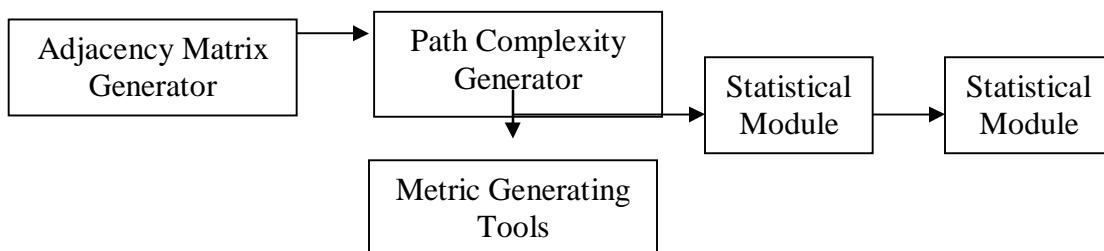

Figure 1: Complexity path definition

Factors and software cost, we use the coefficient of correlation  $r$ . The closer  $r$  is to 1, the stronger the positive linear relationship is. The values of  $r$  to NOE, NOR, NOA and NOP are respectively 0.9395, 0.9729, 0.9474 and 0.8842. According to these values, all these factors have the strong linear relationships with software cost. We got the multiple regression equation are  $Y = 23.01 + 3.80 \text{ NOV} + 1.03\text{NOR} - 0.01 \text{ NOA} - 0.49 \text{ NOP}$  to check the accuracy of this multiple linear regression model, we use the multiple coefficient of determination  $R^2$  and the F-statistic.  $R^2$  can evaluate the strength of the multiple regression relationship. In this project, the value of  $R^2$  is 0.8766. It shows this model has a high regression relationship. In order to use the F-statistic, the hypotheses were set as below, and

alpha =0.05:

$H_0$ : all the regression coefficients are zero

$H_1$ : not all the regression coefficients are zero

After F-statistic, it gives a p-value of 0.0171; this value is much smaller than, so  $H_0$  was rejected. It indicates that it is highly unlikely that all of the regression coefficients are zero. Therefore, we can jump to a conclusion that this multiple regression model is reasonable. The comparison of estimating cost and actual cost is shown in figure 2. Here, the authors are grateful to the support and help of AKEMCO Technology Pvt Ltd, IPACS e-Solutions(S) Pvt Ltd and Singapore Computer Systems Ltd. to provide the system data. However, only twelve projects are not enough, more system data will be collected in the future work.

	NOE	NOR	NOA	ODP	Predictive Cost	Actual Cost
1	6	5	112	9.33	45	48
2	6	5	75	8.33	46	38

Figure 2 Predictive Cost and Actual Cost

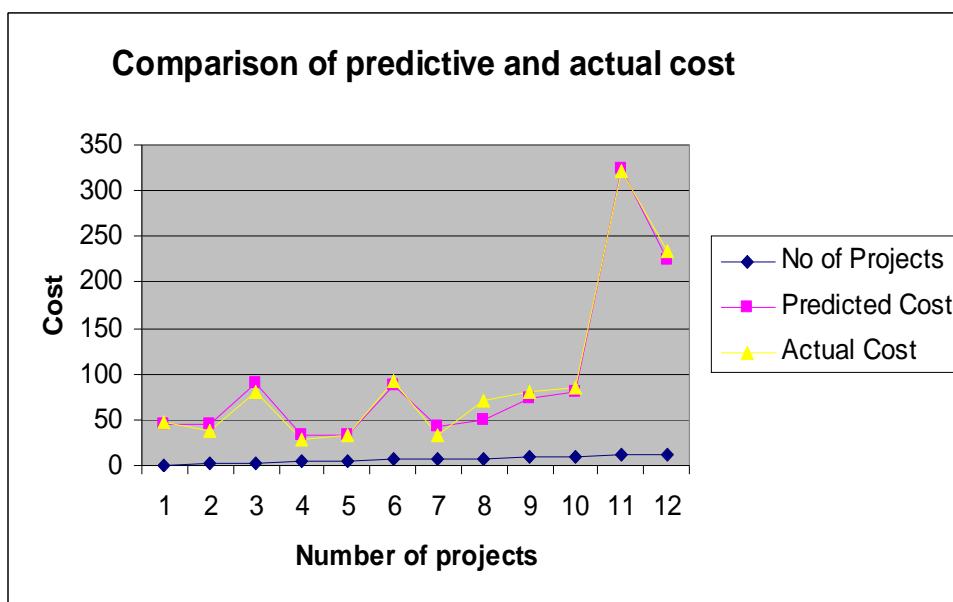

Figure 3. Comparison of Predictive and Actual Software Cost

This work is exploring a software cost estimation model, especially for software development industries [10] and it is best software cost estimation model for large-scale development and in house development. It is very plain model for software costing rather than the difficult techniques like COCOMO MODEL, which is not efficient in the environment of Pakistan. We can estimate a cost of a project from scratch by using this simple model. our aim to provide a model and a user-friendly tool to do those estimations in order to assist managers assessing the worthiness of the investment they are going to undertake. We believe that massively collected software project data present an interesting aspect of cost modeling, providing a unique opportunity to design helpful tools for software managers that wish to benchmark their projects and

are interested in developing knowledge concerning software measurement and estimation [9].

#### 4. Future Work:

This research focuses on the cost estimation technique and finds the best way cost estimation through ER Diagram for large-scale project and small projects. For future Extension, this area requires the improvement by using agile software cost methodology implementation technique to finds out the software cost estimation for better and more efficient way.

**Abstract:** Semantic Web is an extension of current web in which the web resources are equipped with formal semantics about their interpretation for the machines. These web resources are integrated in the form of web information systems, and their formal semantics are normally represented in the form of web-ontologies. Using the database terminology, we can say that web-ontology of a semantic web system is schema of that system. Since web-ontology is an integral element of semantic web systems, therefore, design quality of a semantic web system can be measured by measuring the quality of its web-ontology. The key consideration is that after completing design of a web-ontology, it is appropriate time to assess its quality so that in case, the design is of low quality, it can be improved before its instantiation. This can save a considerable amount of cost and effort for developing high quality semantic web systems. Metrics are considered as suitable tools for evaluating quality. In this paper, we propose certain metrics for web-ontology quality evaluation. These metrics may contribute in developing a high quality semantic web system. [Journal of American Science. 2010;6(11):52-58]. (ISSN: 1545-1003).

**Keywords:** Semantic web; Ontology metrics; quality measurement

## 1. Introduction

Web-ontologies are backbone of a new type of the Web, called the semantic Web. These provide declarative knowledge in a machine processable way. Within the web community, a web-ontology is a formal description of descriptive knowledge of a domain, coded in W3C recommended logic-based languages such as Web Ontology Language (OWL) (Peter et al., 2004). Web-ontologies are an integral part of a semantic web system as schema is an integral part of a database system. It is also obvious that performance of information or knowledge retrieval from semantic web systems depends on the design quality of its ontologies. Therefore, it is very much desirable that the design quality of ontologies should be measured as early as possible during the development of semantic web systems but is very difficult task (Parsia et al., 2005). In our opinion, after completing design of a web-ontology, it is appropriate time to assess its quality so that in case the design is of low quality, it can be improved before its instantiation. This can save a considerable amount of cost and effort for a developing semantic web system of good performance. In this paper, we attempt to achieve this objective and we propose design metrics for ontologies of a semantic web system.

The remainder of this paper is organized as follow. Current status of web-ontology metrics and overview of the related work are given in Section 2.

In Section 3, we propose design metrics for a web-ontology, and these metrics are validated in Section 4. Finally, the paper is concluded with recommendations for the future direction in Section 5.

## 2. Related Work

The AI-community has done a lot of work in the area of ontology as reported in literature such as in (Lozano-Tello et al., 2004), but the web-community has just started work on this area few years ago, especially when the idea of Semantic Web (Lee et al., 2001) was envisioned. Some design metrics for web-ontology have been proposed as reported in literature (Yang et al, 2006; Michael et al., 2005; Burton-Jones et al., 2005), but this area is still in its preliminary stage because little work has been done in this area. Coupling metrics have been suggested for design of web-ontology-based systems (Orme et al., 2006). These metrics are number of external classes, reference to external classes, and referenced includes. It has argued that system quality can be improved if the coupling is measured early in web-ontology-based system's development cycle.

Web-ontology cohesion metrics have been proposed to measure the modular relatedness of web-ontologies (Yao et al., 2005). These metrics compute the number of root classes, number of leaf classes and average depth of inheritance tree (or class-hierarchy). These can be helpful in determining web-ontology structure, its cost estimation and maintenance. These metrics are validated

theoretically and also empirically using the validation standards (Briand et al., 1996; Kitchenham et al., 1995).

Semantic metrics, conceptual metrics and web-ontology metrics, for semantic web systems, have been discussed, and compared (Etzkorn, 2006). And it is concluded that more work is needed to validate these metrics in different application areas and their role in the maintenance of those web-ontology-based software systems.

Web-ontology instance metrics have been proposed (Michael et al., 2005). These instance metrics can be used in measuring quantity and importance of data-placement in a web-ontology, and they reflect normalization and efficiency of web-ontology. The instance metrics are further divided into two types which are: knowledgebase metrics, and class metrics. Schema metrics are also proposed for evaluating different characteristics of web-ontology. These schema metrics are relationship-richness, attribute-richness and inheritance-richness metrics. These metrics are used to measure design quality of web-ontology.

As web-ontology is just like knowledge-intensive software therefore all generic metrics for software are also applicable for web-ontology. Some of them are: suitability, accuracy, interoperability, compliance, traceability, understandability, learnability, stability, customizability, user-friendliness, reusability, analyzability, changeability, testability and manageability (Hakkarainen et al., 2005; Korotkiy, 2005; Norman et al., 2003; Paslaru et al., 2005).

In (Baumeister and Seipel, 2005), authors have proposed metrics to measure quality of taxonomy and design of web-ontology. They have focused on inconsistency, incompleteness and redundancy attributes of taxonomy metric and lazy concepts, chains of inheritance, property clumps and lonely disjoints attributes of design metric. While aligning ontologies, the level of similarity among two entities can be measured by metric proposed (Stoilos et al., 2005), in this metric the similarity between two ontologies has been computed, based on their commonalities as well as to their differences.

### 3. Proposed Design Metrics

In this section we propose design metrics for web-ontology by keeping certain recommended guidelines like a metric may reach its highest value for perfect quality for excellent case and vice versa that is it may reach its lowest level when for worst case. It should be monotonic, clear, and intuitive. It must correlate well with human judgments and it should be automated if possible (King, 2003). The proposed metrics may give information about how

much knowledge can be derived from a given web-ontology; how much it is relevant to a user's specific requirements and how much it is easy to reuse, manage, trace and adapt. These metrics are named as *Knowledge Enriched (KnE)*, *Characteristics Relevancy (ChR)* and *Domains modularity (DoM)*.

#### 3.1 Knowledge Enriched metric

Knowledge Enriched (KnE) metric quantifies the reasoning capability of a web-ontology, and it based on two sub-metrics so-called *Isolated Axiom Enriched (IAE)* metric and *Overlapped Axiom Enriched (OAE)* metric. The axiom mostly consists of three parts: predicate, resource and object. If none of these is common with any other axiom of same domain then that axiom is termed as isolated axiom. Similarly two axioms are said overlapped if those have some common parts. There may be several transitively overlapped axioms in any domain. This metric determines the percentage of IAE and OAE, and if the former is more than the later one, then the web-ontology can be considered less knowledge enriched. IAE is formally defined as the ratio of total number of isolated axioms (tIAs) to the total number of domain axioms (tDAs).

$$IAE = \frac{\sum_{i=1}^n tIAs}{tDAs} \quad \text{for all } 1 \leq i \leq n \quad (1)$$

In Equation (1),  $n$  is total number of sub-domains of web-ontology. Similarly, the OAE metric is formally defined as ratio of total number of overlapped axioms (tOAs) to the total number of domain axioms. Mathematically it can be written as follows:

$$OAE = \frac{\sum_{i=1}^n tOAs}{tDAs} \quad \text{for all } 1 \leq i \leq n \quad (2)$$

In Equation (2),  $n$  is total number of sub-domains of web-ontology. Finally, the KnE metric is the difference of total number of overlapped axioms and the total number of isolated axioms. Mathematically it may be written as follows:

$$KnE = OAE - IAE \quad (3)$$

From equation (1) and equation (2)

In Equation (3) if the resultant value is positive, then the web-ontology is more knowledge enriched, if it is zero, then the web-ontology is average knowledge enriched, and if it is negative, then the web-ontology is less knowledge enriched.

#### 3.2 Characteristics Relevancy metric

Characteristics Relevancy (ChR) metric gives us an idea about how much a given web-ontology is close to a user's specific requirements and the degree of reusability of the web-ontology. Formally, it is defined as the ratio of the number of relevant attributes (nRAs) in a class to the total number of attributes (TnAs) of that class. Mathematically, it is written in Equation (4) as follows:

$$\text{ChR} = \frac{\sum_{i=1}^n \text{nRAs}_i}{\text{TnAs}}$$

for all  $1 \leq i \leq n$  ..... (4)

Where  $n$  in above equation is the total number of classes in the given web-ontology. ChR metric reveals the percentage of relevant attributes in the web-ontology, and this number gives insights how much a web-ontology is relevant.

### 3.3 Domain Modularity metric

Domain modularity (DoM) metric measures the component-orientation feature of a web-ontology. This metric indicates the grouping of knowledge in different components of web-ontology. The web-ontology is better manageable, traceable, reusable

and adaptable, if it is designed in components (sub-domains). Formally, the DoM metric is defined as the number of sub-domains (NSD) contained in a web-ontology. This metric also depends on the coupling and cohesion levels of sub-domains, and it is directly proportional to its cohesion level and inversely proportional to its coupling level.

$$\text{DoM} = \text{NSD} + \sum_{i=1}^n \text{DCoh}_i + 1 / \sum_{i=1}^n \text{DCoup}_i$$

for all  $1 \leq i \leq n$  ..... (5)

In Equation (5), DCoh represents level of domain cohesion and DCoup represents the level of coupling among sub-domains of web-ontology domain. DoM metric is a real number representing degree of partial reusability of a given web-ontology.

### 4. Case Study

We have taken a web-ontology of university domain for validating our proposed metrics KnE, ChR and DoM as described in previous sections.

<pre> &lt;rdf:RDF xmlns="http://www.owl-ontologies.com/uet-1.owl#"   xmlns:base="http://www.owl-ontologies.com/uet-1.owl"   xmlns:xsd="http://www.w3.org/2001/XMLSchema#"   xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"   xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"   xmlns:owl="http://www.w3.org/2002/07/owl#"&gt;   &lt;owl:Ontology rdf:about=""&gt;     &lt;owl:versionInfo rdf:datatype="&amp;xsd:string"&gt;       &gt;Web-ontology for Research Activity     Management Domain&lt;/owl:versionInfo&gt;     &lt;rdfs:comment       rdf:datatype="&amp;xsd:string"&gt;&lt;/rdfs:comment&gt;     &lt;owl:Ontology&gt;     &lt;owl:Class rdf:ID="Author"/&gt;     &lt;owl:Class rdf:ID="Director"/&gt;     &lt;owl:Class rdf:ID="DuptyDirector"/&gt;     &lt;owl:Class rdf:ID="Faculty"/&gt;     &lt;rdfs:subClassOf rdf:resource="#Person"/&gt;     &lt;owl:Class&gt;     &lt;owl:DatatypeProperty rdf:ID="hasAffiliation"&gt;       &lt;rdfs:domain rdf:resource="#Researcher"/&gt;       &lt;rdfs:range rdf:resource="&amp;xsd:string"/&gt;     &lt;owl:DatatypeProperty&gt;     &lt;owl:ObjectProperty rdf:ID="hasArea"&gt;       &lt;rdfs:domain rdf:resource="#ResearchGroup"/&gt;       &lt;rdfs:range rdf:resource="#ResearchArea"/&gt;     &lt;owl:ObjectProperty&gt;     &lt;owl:ObjectProperty rdf:ID="hasAuthor"&gt;   </pre>	<pre>     &lt;/owl:unionOf&gt;     &lt;/owl:Class&gt;   &lt;/rdfs:domain&gt;   &lt;rdfs:range rdf:resource="&amp;xsd:string"/&gt;   &lt;owl:DatatypeProperty&gt;   &lt;owl:DatatypeProperty rdf:ID="hasId"&gt;     &lt;rdfs:domain&gt;     &lt;owl:Class&gt;     &lt;owl:unionOf       rdf:parseType="Collection"&gt;         &lt;owl:Class rdf:about="#Author"/&gt;         &lt;owl:Class rdf:about="#Director"/&gt;         &lt;owl:Class           rdf:about="#DuptyDirector"/&gt;         &lt;owl:Class           rdf:about="#PaperCategory"/&gt;         &lt;owl:Class rdf:about="#Person"/&gt;         &lt;owl:Class           rdf:about="#ResearchArea"/&gt;         &lt;owl:Class rdf:about="#Researcher"/&gt;         &lt;owl:Class           rdf:about="#ResearchPaper"/&gt;         &lt;/owl:unionOf&gt;         &lt;owl:Class&gt;       &lt;/rdfs:domain&gt;       &lt;rdfs:range rdf:resource="&amp;xsd:int"/&gt;     &lt;owl:DatatypeProperty&gt;     &lt;owl:DatatypeProperty rdf:ID="hasName"&gt;       &lt;rdfs:domain&gt;       &lt;owl:Class&gt;       &lt;owl:unionOf         rdf:parseType="Collection"&gt;   </pre>
--	---

Figure 1: A Code Slice Of Sample Web-Ontology

First of all we verified its syntactical correctness using w3c validation service. Its RDF graph has show in figure 2. It was found syntactically correct.

### KnE - Knowledge Enriched metric

We are working to automate KnE metric, but now it is performed manually. With the help of w3c validation service, we transform web-ontology into list of triples in order to count total axioms, isolated axioms and

overlapped axioms present in web-ontology. Its sample is shown in figure 3. There were found 149 total axioms, 96 overlapped axioms and 53 isolated axioms.

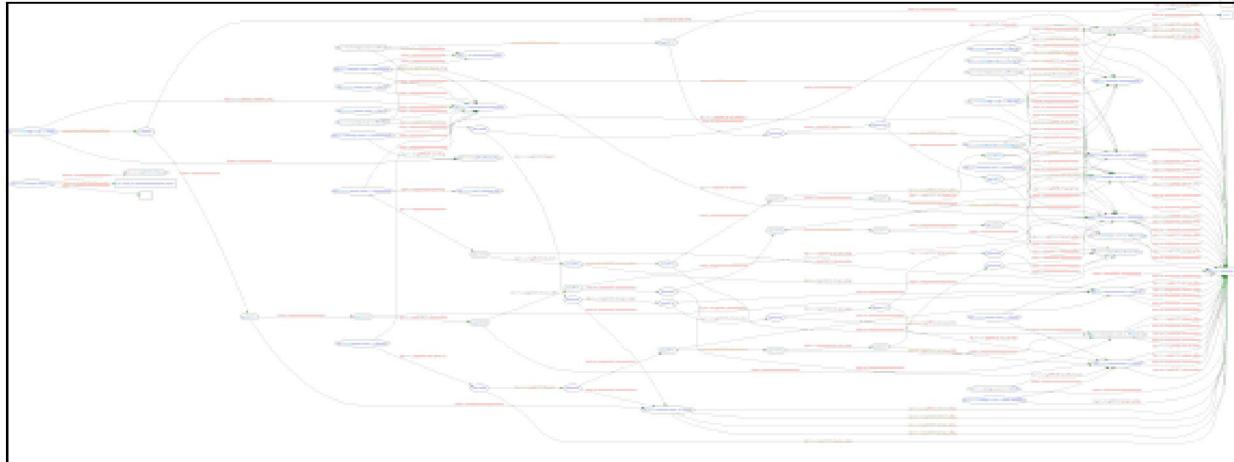

Figure 2: RDF –Graph of Sample Web-Ontology.

8	<a href="http://www.owl-ontologies.com/uet-1.owl#Person">http://www.owl-ontologies.com/uet-1.owl#Person</a>	<a href="http://www.w3.org/2000/01/rdf-schema#subClassOf">http://www.w3.org/2000/01/rdf-schema#subClassOf</a>	<a href="http://www.owl-ontologies.com/uet-1.owl#Person">http://www.owl-ontologies.com/uet-1.owl#Person</a>

Figure 3: Partial List of Triples

Although a university ontology is a multi-domain (i.e. there are different sub-domains in university domain) ontology, but this web-ontology file has shown that there is one domain (all sub-domains were merged), this means that n=1 in equation 1.

$$\text{IAE} = 50 / 200 = 0.25, \text{ from equation 1.}$$

$$\text{OAE} = 150 / 200 = 0.75$$

$$\begin{aligned} \text{KnE} &= \text{OAE} - \text{IAE} \\ &= 0.75 - 0.25 \\ &= 0.50 \end{aligned}$$

This indicates that web-ontology may be considered a knowledge-enriched ontology, with respect to criteria given in section 3.1.

#### ChR - Characteristics Relevancy metric

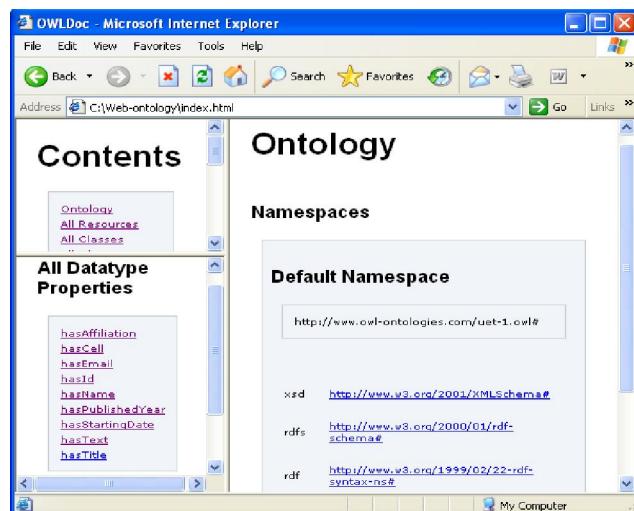

Figure 4: Web-Ontology Document Used For Counting Characteristics

We took a list of requirements from a concerned person from different universities, and then checked web-ontology for how much it was relevant to that user's specific requirements. There were 57 characteristics in the requirement-list, then determined, their presence in the web-ontology using web-ontology documentation, partially shown in figure 3. It was found that there were total 85 characteristics available in web-ontology, and only 22 were found relevant so by formula:  $ChR = 22 / 85 = 0.26$

This means that although available characteristics are more than the required list, but only 26 percents are relevant. It was concluded, that web-ontology is not appropriate for that user's requirements.

#### DoM - Domain Modularity metric

As we know that a university domain consists of multiple sun-domains. A separate web-ontology should be developed for each sub-domain then integrates all of them to develop a multi-domain ontology. But the sample web-ontology has been developed by merging all sub-domains as we have examined that no web-ontology has imported in sample web-ontology.

This means that whenever we need a web-ontology of any sun-domain of university domain, we have to use complete web-ontology. We have concluded that partial re-usability of the sample web-ontology is very poor. The coupling and cohesion level can be determined by using existing relevant metrics.

#### 5. Theoretical Analysis of Proposed Metrics

In the previous section, we have proposed design metrics for web-ontologies. In this section, we take web-ontology design schema of a university coded in OWL, and evaluate proposed metrics of the web-ontology using the same theoretical standards given in (Kitchenham et al., 1995).

According to (Baumeister and Seipel, 2003), an entity is the item being observed and an attribute is a property of that entity. To measure an attribute-value, its measuring unit should be specified. Measurement scales are nominal, ordinal, interval, or ratio. It has claimed that a valid metric must have validity of attribute, unit, instrument and protocol. Attribute validity states that the entity being evaluated has attributes. Unit validity states that the unit used should be appropriate for the attribute. Instrumental validity states that the underlying model should be valid and the measurement instrument should be regulated. And the protocol validity states that the protocol used for the measurement is consistent, unambiguous and prevents problems. In Short, the concepts necessary to be there in a valid metric are entity, attribute, measuring unit and scale type. A metric satisfying the validity constraints such as attribute validity, unit validity, instrumental validity and protocol validity, is called a valid metric. We have analyzed our metrics against all these constraints.

#### Analysis of Knowledge Enriched metric

*Web-ontology* is an entity for proposed metric; the attribute of this metric is the *axiom* to be counted; Unit is *number of attributes and Data Scale*

is absolute value. *Attribute validity*: The entity (the web-ontology being analyzed) has number of attributes (isolated and linked axioms). *Unit Validity*: The attribute is measured by counting the number of isolated and linked axioms respectively. *Instrumental Validity*: The instrument is valid as long as the axioms computing tool parse and count the number of isolated and linked axioms respectively. *Protocol Validity*: The computation performed according to equations given in this paper is consistent, unambiguous and error free.

#### **Analysis of Characteristics Relevancy metric**

For this metric the *attribute* to be counted, is treated as a concept or entity; *Relevancy* to the user specific needs is an attribute for this metric; unit is *percentage* of correct matches and data scale is *ratio*. *Attribute validity*: The entity (the attribute being analyzed) has attribute (i.e. relevancy). *Unit Validity*: The relevancy is measured by computing percentage of relevant attribute to the user needs. *Instrumental Validity*: We have implemented our model in java modules and it is working correctly, we have also verified it manually. *Protocol Validity*: The formal description of this metric given in this paper is consistent, unambiguous and error free.

#### **Analysis of Domain Modularity metric**

*Web-ontology* is an entity of this metric; attribute of this metric, is *sub-domain* to be counted; Unit is *number* of sub-domains; and Data scale is *absolute value*. *Attribute validity*: The entity (the web-ontology being analyzed) is number of sub-domains used for making the main web-ontology. *Unit Validity*: The sub-domains are counted in numbers. *Instrumental Validity*: We have implemented our algorithm for counting sub-domains, in java modules and it is working correctly, we have also verified it manually. *Protocol Validity*: The equation given in the proposed metric is performing the right calculation.

#### **6. Conclusion and Future Directions**

In this paper, we have proposed a set of quality metrics to evaluate design of ontologies. These proposed metrics may be helpful in evaluating design quality of ontologies and improving their design. In this way we may save a considerable amount of development time and cost of good quality semantic web applications. We feel that serious efforts and attentions are needed towards web-ontology design metrics to improve the quality of semantic web applications. It is expected that in the future most software development work will be the development of semantic web applications. By understanding the urgency and importance of this work, we are actively working in this direction.

[bahram\\_hs@yahoo.com](mailto:bahram_hs@yahoo.com)

**Abstract:** Almond (*Prunus amygdalus*) belongs to Rosaceae family and sub-family of Pomoideae. Physical traits of agricultural products are main parameters in designing of grading, conveying, processing, and packing systems. In this study the physical traits such as dimensions, mass, volume, sphericity, geometric average of Mama'e and Shahrud 12 almonds and their kernels were measured and calculated. The average amounts of length, width, and thickness for both almond varieties were 37.41, 23.21, and 16.63 mm, respectively, and for almonds' kernel were 28.05, 13.4, and 7.82 mm, respectively. Results from modeling of almond and its kernel masses based on dimensions and volume showed that there exists a great correlation coefficient between the samples actual volumes and masses, but since determining actual volume of almond and its kernel is a time-taking task, it was suggested to use calculated volume and presuming that the cross-sectional area of the almond is oval. Also the mass model based on the thickness had the highest determination coefficient and lowest regression error which was the best option for industrial and economical applications. [Journal of American Science. 2010;6(11):59-64]. (ISSN: 1545-1003).

**Keywords:** Almonds, Physical Properties, Mass Modeling, Dimensional Models, Volumetric Models

## 1. Introduction

According to the statistics released by FAO (2004), Iran with 80000 tonnes of almonds is fourth throughout the world which implies that with proper climatic conditions and development of various main and wild types of almond, Iran is a favorite place to grow almond and by paying special attention to this product, quiet a considerable wealth would be earned [FAO,2007].

Recognizing the physical and mechanical properties of agricultural produce has always been on the center of attention and interest of agriculture researchers. This especially in relation with designing of machineries and equipments which are used during harvest, transport, storing, and process of agricultural products is of utmost importance. Among physical properties of agricultural products, dimensions, mass, volume, projected area, and surface area have the most importance in grading systems. Therefore, dimensional grading of products decreases the packaging and transportation costs and allows using of proper packaging models [Peleg,1958].

Post harvest operations for almond generally consist of 3 phases of breaking the almond, slicing the kernel, and packaging. In Iran these operations often is done in small workshops and manually. Lack of standard principles for packaging and not considering consumers tastes have led to problems in importing section. Therefore, in order to design machinery to process almond, determining some of its physical and mechanical properties is essential. Otherwise, incoherence between machinery and

product causes losses of kernel and a decrease in final product quality [Khaza'e,2003].

Due to dissimilarity in almond dimensions, the almond breaking device should favor an adjusting ability for almonds with different dimensions. Therefore, in order to determine the working range of the device, knowledge about the averages of all the three dimensions of almond is necessary. Also for designing slicing devices and almond's kernel grading machineries, determining of all the three dimensions of almonds kernel and other center-inclination parameters are necessary.

Based on this, several studies on determining the physical and mechanical properties of different products have been carried out, which some of them are pointed out in the following.

Aydin studied the mechanical and physical properties of a kind of almond which grows in Turkey. Average amounts for length, width, and thickness for almond were 25.49, 12.03, and 12.17 mm, respectively, and for the kernel were 21/19, 11.34, and 6.38, respectively. Also averages for mass, volume, geometric average, and sphericity were 2.64 g, 2.61 cm<sup>3</sup>, 18.13 mm, and 69.59% for almond, respectively, and for the kernel were 0.73 g, 0.82 cm<sup>3</sup>, 11.42 mm, and 55.17%, respectively [Aydin,2003].

Turkan et al measured the average length, width, and thickness of a Golkan 23-101 almond cultivar to be 36.60, 19.24, and 11.47 mm, respectively, and 31.10, 18.31, and 11.04 mm for Nanparil cultivar, respectively. Also averages for mass, volume, geometric average, sphericity, and

surface area for Golkan 23-101 cultivar were 3.02 g, 4.24 cm<sup>3</sup>, 20.03 mm, 54%, and 12.61 cm<sup>2</sup>, respectively, and for Nanparil cultivar were 1.72 g, 3.33 cm<sup>3</sup>, 18.50 mm, 59%, and 12.80 cm<sup>2</sup>, respectively [Turkan et al,2007].

Moradi studied some of qualitative and quantitative properties of both Shahrud 12 and Mama'e cultivars of almond. He measured length, width, and thickness averages of Mama'e cultivar 22, 35, and 14.7 for almond, respectively, and for its kernel 26.7, 13, and 7.25 mm, respectively. Also length, width, and thickness averages for Sharud 12 almond were 37.6, 21.9, and 16.2 mm, respectively, and for its kernel were 25.9, 12, and 7.14 mm [Moradi,2002].

Aydin evaluated physical properties of hazelnut as a function of its moisture content. The objective of the study was to determine and evaluate dimensions, weight, unit volume, sphericity, density, porosity, projected area, limit velocity, breakage resistance, and static and dynamic friction coefficients of full hazelnut and its kernel. Moisture content of samples ranged between 2.87% to 19.98% (based on dry weight) [Aydin,2002].

Balasubramanian (2001) studied the physical properties of raw cashew nut due to lack of information on this field and the possibility of applying the results for designing process machineries. In this study average amounts of main dimensions (length, width, and thickness), weight ratio, equal diameter, and sphericity at 8.46% of moisture content and weight of a thousand seeds, porosity, bulk density, actual density, and friction coefficient at moisture range of 3.15 to 20.05% (5 levels of moisture content) were determined [Balasubramanian,2001].

Craig and Debra in addition to study physical properties of three almond kernels namely Nanparil, 23.5-16, and 23-122, also obtained regression models for kernel mass of three almond cultivars based on length, width, and thickness. According to their report it was determined that kernel mass favors the most correlation with length and lowest correlation with thickness [Craig,2006].

In this study some of the physical properties of two almond cultivars (Mama'e and Sharud 12) such as dimensions, mass, volume, diameter, geometric average, and sphericity degree were studied. Also regression models for almond and its mass based on geometric properties were determined.

## 2. Material and Methods

In this study tests were carried out on two almond cultivars of Saman region, Shahrud 12 and Mama'e. After cleaning and separating samples from their husks, the samples were packed. The package containing samples were held inside a refrigerator at

5°C in order to keep the moisture conditions and maintaining them for tests.

In order to determine almond dimensions, 3 perpendicular axes were defined. The longest dimension was considered as length (L). The longest dimension perpendicular to the length axis was considered as sample width (W) and the dimension perpendicular to length and width axes, was defined as thickness (T).[Eshaghbeigi et al,2008] Therefore, 120 almonds were selected and by a digital caliper with 0.01 accuracy length, width, and thickness of each almond were measured and then by breaking it and taking out its kernel, length, width, and thickness of the kernels were also measured, and in order to measure almond and kernel masses a digital weight with 0.1 g accuracy was used.

For determining the volume of almond and its kernel (V), platform weight method was used. In this method a bulb containing some water was placed on a weight with platform (0.1 g accuracy) and its mass was measured ( $M_{bw}$ ). Then the sample was floated in the water so that it would have no contact with bottom and edges of the bulb. This can be done by means of a nylon string (in case the sample is heavier than water) or a thin metal string (in case the sample is lighter than water).

In this case, the weight of bulb with water and the floated sample were determined ( $M_{bws}$ ). The difference in weight is caused by Archimedes force and the volume can be calculated by dividing the Archimedes force to water density.

$$V = (M_{bws} - M_{bw}) / \rho_w \quad (1)$$

Since the seed shape and other granule agricultural crops are usually irregular, seeds size is determined as geometric diameter. Geometric diameter can be calculated from equation 2.

$$D_g = (L * W * T)^{1/3} \quad (2)$$

If almond volume is presumed to be equal to an oval with three L, W, and T axes so that the peripheral sphere will have the longest axis of ellipsoid (L), then the sphericity coefficient can be calculated as follow.

$$Sp = \frac{D_g}{L} \quad (3)$$

In this study to estimate almond and its kernel masses two kind of models were used:

a) A model that predicts the mass with one or a combination of two or three dimension parameters (length, width, and thickness) as equation (4).

$$M = F(L, W, T) \quad (4)$$

b) A model that predicts mass based on real volume or calculated mass based on the extended sphere and ellipsoid as equation (5).

$$M = F(V_x) \quad (5)$$

In order to estimate crops volume through similarity of geometric shapes, equations (6) and (7) are respectively used for bodies like extended sphere and ellipsoid.

$$V = \frac{4\pi}{3} ab^2 \quad (6)$$

$$V = \frac{4\pi}{3} abc \quad (7)$$

In above equations a, b and c are half of diameters at direction of three main axes (X, Y, Z), respectively.

The measured data were transferred to Excel software and were categorized and saved in separate files. Average amounts and conditioning operations were done through Excel and regression equations on data were performed by MiniTab(12 version) software.

### 3. Results And Discussion

#### 3-1. Physical Properties of Almond its Kernel

Average amounts for dimensions, mass, volume, geometric diameter, and sphericity for both almond cultivars and kernels at moisture rage of 9-10% (on dry basis) are shown in tables 1 and 2.

Ranges of changes for dimensions i.e. length, width, and thickness for Mama'e almond were 34.65-45.35, 18.51-29.26, and 14.08-24.56 mm, respectively, and for Shahrud 12 were 28.93-40.11, 20.47-27.55, and 14.57-18.23 mm, respectively. Also ranges of changes of length, width, and thickness for Mama'e almond kernel were 23.67-34.5, 9.46-15.91, and 5.44-16.95 mm, respectively, and for Shahrud 12 almond kernel were 28.93-40.11, 20.47-27.55, and 14.57-18.23 mm, respectively.

#### 2-3 Determining Regression Models of Almond Mass Based on Geometric Properties

##### a) Dimensional Models

In table (3) seven models to show mass based on almond dimensions are shown. As it appears for both cultivars, model number 7, which models mass based on three perpendicular dimensions, has the highest determination coefficient ( $R^2$ ) and lowest regression standard error (RSE) among all the other models. Since in this model all the three dimensions should be measured is used for grading and sorting machineries which require high accuracy and the high costs have economic justifications. Among models 1, 2, and 3 which are single-variable models, model number 3 which predicts mass based on thickness is the best model. Due to above mention points equation (8) is suggested for predicting almond mass based on

$$\text{thickness for both cultivars.} \quad M = 4.27 + 0.525T \quad R^2 = 0.76 \quad (8)$$

##### b) Volumetric Models

Models that predict almond mass based on volume are indicated in table (4). Model 1 has the highest determination coefficient ( $R^2$ ) and lowest RSE rather than all the other models. Since determination of actual volume of almond is performed by expensive and complex machineries, therefore, it has fewer usages in practical applications; instead, one can use volumes calculated from dimensions, ( $V_{psp}$ ) and ( $V_{ellip}$ ). Results from table (4) show that mass predicting model based on presumed volume as an ellipsoid volume ( $V_{ellip}$ ) for all the observations has the highest  $R^2$  and lowest RSE. Therefore, this volume is suggested for determining almond mass in machineries, also mass model based on ellipsoid volume for all observations is determined from the following equation:

$$M = 0.563 + 0.000518V_{ellip} \quad R^2 = 0.75 \quad (9)$$

#### Determining Regression Models of Almond Kernel Mass Based on Geometric Properties

##### a) Dimensional Models

In table (5) seven models that estimate kernel mass based on geometric dimensions are shown. As it seems, model number 7 which predicts mass based on three perpendicular dimensions, has the highest  $R^2$  and lowest RSE rather than the other models.

Almond kernel mass model based on model number 7 (for total observations) is shown by equation (10).

Indeed, since this model increase the costs and complexity of machineries is cost worthy.

$$M = -2.2 + 0.114 T + 0.121 W + 0.04 L \quad R^2 = 0.91 \quad (10)$$

Regarding the results obtained from table (5), among single-variable models, model 3 that predicts mass based on thickness (equation 11) for Mama'e kernel, model 1 that predicts mass based on length (equation 12) for Shahrud 12, and model 3 that predicts mass based on thickness (equation 13) for total observations, have the highest  $R^2$  and lowest RSE. Also among bivariate models for both observed cultivars, model 6 that predicts mass based on width and thickness has the highest  $R^2$ .

$$M = 0.36 + 0.128 T \quad R^2 = 0.53 \quad (11)$$

$$M = -1.67 + 0.114 L \quad R^2 = 0.86 \quad (12)$$

$$M = 0.252 + 0.151 T \quad R^2 = 0.60 \quad (13)$$

##### b) Kernel Mass Model Based on Volume

Models that estimate kernel mass based on volume are shown. Model 1 has the highest  $R^2$  and

lowest RSE rather than the other models. Results indicate that calculated volume based on ellipsoid ( $V_{\text{ellip}}$ ) has a higher determination coefficient with mass; therefore, it is suggested to use ellipsoid

volume to predict kernel mass in machineries. Mass model based on ellipsoid volume for total observations is determined by equation (14).  
 $M=0.365+.000691V_{\text{ellip}} R^2=0.82$  (14)

#### 4. Conclusions

In this study, physical properties such as dimensions, mass, volume, sphericity, and geometric average were measured and calculated for Mama'e and Shahrud 12 almonds and kernels. The average amounts of length, width, and thickness for both almond cultivars were 34.41, 23.21, and 16.63 mm, respectively, and for both cultivars' kernels were 28.05, 13.40, and 7.82 mm, respectively. Mama'e dimensions were larger than Shahrud 12 and consequently had larger geometric diameter and volume.

Shahrud 12 cultivar had higher sphericity coefficient than Mama'e. At moisture range of 10-11 percent, 90% of Shahrud 12 masses were between

4.11 to 4.31 mm and also 90% of Mama'e cultivar's kernel masses were between 1.41 to 1.42 mm.

At moisture range of 7-8 percent, 90% of Shahrud 12 kernel masses were between 1.35 to 1.42 mm and also 90% of Mama'e cultivar masses were between 4.59 to 4.89 mm.

Results from modeling of almond and kernel masses based on dimensions and volume showed that there is great correlation between actual volume and mass of samples, which indicates the uniformity of almond's density. But since determination of actual volume of almond and kernel is a time-taking task, it is suggested to use calculated volume while presuming that the cross-section area of the almond is an ellipsoid ( $V_{ellip}$ ). Also mass model based on

thickness is suggested as the best option for industrial and economic applications in designing and manufacturing of machineries specified for breaking and grading.

**ABSTRACT:** Groundwater is one of the most valuable natural resources and for that reason, its protection and management is vital for human evolution, socio-economic development and ecological diversity. Because of the known health and economic impacts associated with groundwater contamination, steps to assess groundwater vulnerability must be taken. This study aimed to assess groundwater pollution potentials of the north-eastern part of the deep confined aquifer of block XIX, Tamtsag basin, Mongolia. The normal DRASTIC model was applied to the study area with the help of GIS. DRASTIC parameters were calculated from geological data, soil and elevation contour maps, and groundwater level data of the study area. ArcInfo/GIS was used to demarcate vulnerable zones based on their vulnerability index. Finally, a sensitivity analysis of the parameters constituting the model was performed in order to evaluate the relative importance of the each DRASTIC model parameters. The aquifer vulnerability map revealed that only 2% of the study area is under moderate vulnerability to contamination, the remaining zone was determined to be in a low risk category. GIS greatly facilitated the implementation of the sensitivity analysis applied on the DRASTIC vulnerability index which otherwise could have been impractical. Appropriate methods for keeping groundwater resource sustainability in the study area have been suggested. [Journal of American Science. 2010;6(11):65-78]. (ISSN: 1545-1003).

**Keywords:** Groundwater vulnerability / DRASTIC / Tamtsag basin

## 1. INTRODUCTION

Mongolia is a landlocked country between the Russian Federation and the People's Republic of China with over 3 million population and 1,565 thousands square kilometers territory. The country is rich in underground mineral resources. Currently, there are more than 80 proven minerals, including coal, copper, tungsten, fluorite, gold, silver, molybdenum, aluminum, tin, iron, lead, zinc, uranium, manganese, phosphorous, salt, petroleum and so on. The animal husbandry is a traditional economic sector and is the foundation of the national economy; the mining industry also has great potential. Scarcity of arable land and harsh climate make Mongolia unsuitable for agriculture production despite its large territory (seventeenth largest country in the world).

Mongolia belongs to not rich country in terms of water resources. The country's total water resource (30% of which is groundwater) was estimated to be 609.5 cubic kilometer in 2000 (Batsukh N.). Domestically, surface and ground water resources

play vital roles in Mongolia's economy, supporting agriculture, forestry, fishery, livestock production, industrial and domestic water demand and sanitation operations. Water demands are mainly met from the groundwater sources: 80% of the total water consumption. Mongolia's freshwater ecosystem is under increasing threats of degradation and resource depletion. Water shortage and scarcity is becoming inevitable with alarming numbers of dried-out rivers and lakes (WWF Mongolia Program Office). In 2005, UNDP commissioned a "Study on Economic and Ecological Vulnerability and Human Security for Mongolia", which pointed out water shortage as a major socio-economic problem that may soon create serious economic challenges throughout the country.

Despite its limited and finite nature, Mongolia's water has been subject to both natural and anthropogenic factors. Global climate change, which adversely impacts the natural dynamics of freshwater ecosystems, is one of leading natural factors. In some areas, water levels rise due to glacier and permafrost melting. In other, arid areas, lower water tables are

due to drought and loss of water retention capacity in riparian areas that have been heavily deforested. Anthropogenic activities causing excessive extraction and depletion of water resource include mining/gravel extraction; deforestation and wasteful irrigation systems. Socio-economic implications of water scarcity are gravest for those vulnerable to the poverty trap and water scarcity also escalates adverse change on an ecosystem level (WWF Mongolia Program Office). Mining also uses vast quantities of groundwater (rivers and underground water) which reduces the water table. If this process continues in long term, there might be a possibility that the future generation would be facing with scarcity and its ecological balance (Dolgorsuren G.)

In his book “Groundwater inventory”, A. Zaporozec stipulates that groundwater is one of the most valuable natural resources, because it:

- represents some 98 percent of the planet's freshwater resources (polar ice excluded),
- is extensively used for low-cost rural water supply,
- is increasingly developed for both large- and small-scale irrigation,
- is generally reliable in periods of drought because of its large storage capacity,
- is cheap to develop because of its widespread occurrence and its generally good natural quality.

Moreover, groundwater is the main source of water consumption of natural vegetation in arid regions. All ground water is vulnerable (The USA National Research Council, 1993). Even owing a function of self- remediation; it will be very difficult to be remediated once it was polluted. Therefore, a sustainable groundwater management should be based on prevention of contamination. An assessment of both the existing and potential sources of contamination and the spatial extent of the existing groundwater contamination is needed before considering methods to prevent future groundwater quality problems (A. Zaporozec et al. 2002)

This study aimed at assessing the vulnerability of groundwater to contamination in the vicinity of an oilfield exploration in Block XIX of Tamtsag Basin, Eastern Mongolia using a DRASTIC model (Aller et al., 1987) combined with a Geographic Information System (GIS). Many papers on the effects of oilfield on groundwater are available in the scientific literature, as are several comprehensive reviews. In their study of the impact of oilfield exploitation on eco-environment of the Daqing lakes, Yu S. et al. (2003) demonstrated that oilfield exploitation may harm its vicinity. Their paper stated that the impacts

became more evident with passage of time, and the intensity varied with areas. Actually, in any industrial activity, equipment can fail and employees may err; and groundwater pollution may result. Thus, it is important to evaluate sensitive areas to contamination is essential in order to prevent and control groundwater contamination.

The term ‘vulnerability of groundwater to contamination’ was introduced by Jean Margat in the late 1960s (Vrba and Zaporozec, 1994). He used the term “vulnerability” to mean the degree of protection that the natural environment provides against the ingress of pollutants to groundwater. Vulnerability assessment has been recognized for its ability to delineate areas that are more likely than others to become contaminated as a result of anthropogenic activities at/or near the earth’s surface (Babiker et al., 2007) The concept of groundwater vulnerability is based on the assumption that the physical environment may provide some degree of protection to groundwater against natural impacts, especially with regard to contaminants entering the subsurface environment. Consequently, some land areas are more vulnerable to groundwater contamination than others (Napolitano, 1995). Vulnerability assessment and vulnerability maps represent an important preliminary tool in decision-making pertaining to the management of groundwater quality. They provide a useful framework within which to designate priorities for the implementation of pollution protection and control measures. The vulnerability maps also serve to inform and educate the public, because non-professional people can readily understand their concept. They also create public awareness about potential pollution problems of groundwater, a situation needed for effective implementation of future protection programs (Rubhera, 2002).

## 2. STUDY AREA

The study area ( $116^{\circ}04'31''$  to  $116^{\circ}21'34''$  E and  $46^{\circ}50'01''$  to  $47^{\circ}04'17''$  N.) is located in the northeastern part of block XIX, Tamtsag basin. Situated in the eastern part of Mongolia, with an area of 381km<sup>2</sup>; it is located in the high plain zone with the altitude of 600 ~ 730m. The landform is relatively flat, the topography gradually rises from west to east, and it's in an undulant plain landform from a macroscopic view. There are no rivers in the study area but some small lakes in the northwestern part which are all dry in arid seasons.

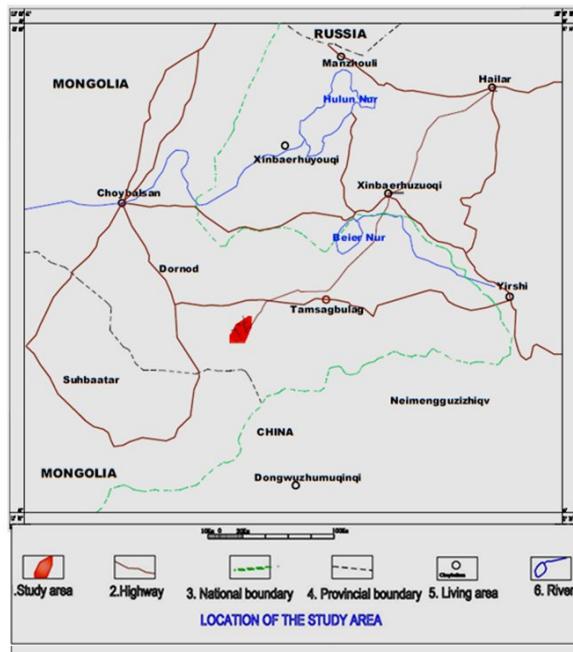

Figure 1 Location map of the study area

Climatically, the zone belongs to an arid area with an annual average precipitation of 276.4mm; an annual evaporation is 1518.7mm and an annual average temperature of -6.6°C ~ 3.9°C. It's a typical arid and semi-arid continental climate. Geologically, the top of the strata lithology is constituted by (1) a quaternary silty sand soil and silty clay, with partial sandy layer at the top; (2) a quaternary sandstone as water bearing layer and (3) cemented and loose sandstone, medium-sized coarse sandstone and fine sandstone.

Most of the working area is covered by sand soil, and the area has a very high sandy degree. It is also characterized by high alkali content. In the eastern part of the project zone, there exists an approximately south-north tectonic fracture. As a result, there is a huge water-rich difference on both sides of the fault zones which reflects the water-rich distribution of underground water. A water-rich belt of about 12-km-long and 8-km-wide is situated in the western part of the study area. A representation of the West-East (AA') cross-section and the South-North cross-section (BB') of the aquifer is illustrated in figure 2.

### 3. METHODS AND APPROACHES

#### 3.1. Model theory

The DRASTIC model was developed in USA for the purpose of protecting the groundwater resources (Aller et al., 1985; 1987). DRASTIC is an empirical

groundwater model that estimates groundwater contamination vulnerability of aquifer systems based on the hydrogeological settings of that area (Aller, et al., 1985, 1987).

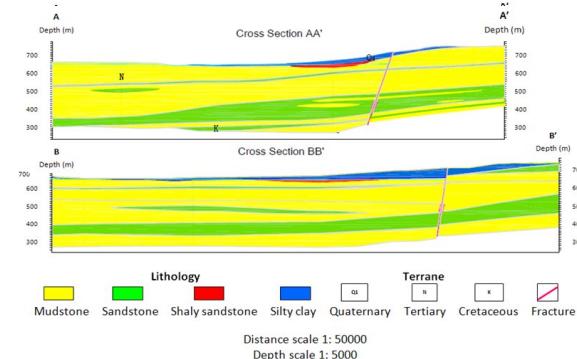

Figure 2 Simplified Cross Sections of the aquifer

The DRASTIC hydrogeologic vulnerability ranking method uses a set of seven hydrogeologic parameters to classify the vulnerability or pollution potential of an aquifer. The parameters are:

- Depth of groundwater (D);
- Recharge rate (R);
- the Aquifer media (A);
- the Soil media (S);
- Topography (T);
- the Impact of the vadose zone (I); and
- the hydraulic Conductivity of the aquifer (C)

Table 1 DRASTIC parameters assigned weights  
(Aller et al., 1987)

Factor	Weight
D Depth to top the of the Aquifer	5
R Net Recharge	4
A Aquifer Media	3
S Soil Media	2
T Topography	1
I Impact of the Vadose Zone	5
C Hydraulic Conductivity of the Aquifer	3

Each parameter is assigned a relative weight from one to five based on its relative susceptibility to pollutant (Shamsuddin, 2000) (Table 1). Similarly, parameter rankings are assigned on a scale of one to ten and are based on its significance to pollution potential in an assessed area (Dickerson, 2007) (Table 2 and 3). The set of variables that are considered for the DRASTIC model can be grouped according to three main categories: land surface factors, unsaturated zone factors and aquifer or saturated zone factors. The aquifer media properties and the hydraulic conductivity are the critical factors

identified for the saturated zone. The depth to water and the properties of the vadose zone characterize the water/contaminant path down to the saturated zone (Dirk et al., 1997). In soil and the unsaturated zone,

some mechanisms may affect the contaminant concentration much more than in the saturated zone (Gogu et al., 2000).

Table 2 Typical ranges and ratings of D, R and A

Depth to water (ft)		Net recharge (Inch)			Aquifer media		
Range	Rating	Range	Rating	Type	Rating	Typical Rating	
0-5	10	0-2	1	Massive Shale	1-3	2	
5-15	9	2-4	3	Metamorphic/igneous rocks	2-5	3	
15-30	7	4-7	6	Weathered metamorphic/igneous	3-5	4	
30-50	5	7-10	8	Thin bedded sandstone, limestone, shale sequence	5-9	6	
50-75	3	>10	9	Massive Sandstone	4-9	6	
75-100	2			Massive Limestone	4-9	6	
>100	1						

Table 3 Typical ranges and ratings of S, T, I and C

Soil media		Topography (percent slope)			Vadose zone media		Hydraulic Cond. (GPD/FT <sup>2</sup> )	
Range	Rating	Range	Rating	Range	Rating	Typical Rating	Range	Rating
Thin or absent	10	0-2	10	Silt, clay	2-6	3	1-100	1
Gravel	10	2-6	9	Shale	2-5	3	100-300	2
Sand	9	6-12	5	Limestone	2-7	6	300-700	4
Peat clay	8	12-18	3	Sandstone	4-8	6	70-1000	6
Shrinking or aggregated clay	7	>18	1	Bedded limestone, sandstone, shale	4-8	6	1000-2000	8
Sandy Loam	6			Sand and gravel with significant silt and clay	4-8	6	>2000	10
Loam	5			Metamorphic/igneous	2-8	4		
Silt loam	4			Sand and gravel	6-9	8		
Clay loam	3			Basalt	2-10	9		
Humus	2			Karst limestone	8-10	10		
Non-shrinking and non-aggregated clay	1							

The DRASTIC Index was computed by summing the weighted factors of each subdivision of the area. Generally, higher DI value indicates greater susceptibility to groundwater pollution

$$\text{DrasticIndex} = D_r D_w + R_r R_w + A_r A_w + S_r S_w + T_r T_w + I_r I_w + C_r C_w \quad (1)$$

Using the above equation, DRASTIC index values were obtained. According to the ranges, the degree of vulnerability of each area was concluded; a groundwater vulnerability map was then designed to show the vulnerability toward contamination of each area.

### 3.2. Data acquisition

Information about the seven parameters and all the necessary data were obtained from Daqing Tamtsag Co.,Ltd of China Petroleum. The data, in text (.doc), table (.xsl), drawing (.dwg), and ESRI shapefile (.shx, .dbf and .shp) formats include:

- Hydrogeological Reconnaissance report
- Geographical Prospecting Report on Underground Water Resources
- Hydrogeological Map of Hydrogeological Survey for Block 19 in Tamtsag Basin
- Underground Water Level Contour Map
- Underground Water Chemical Type diagram
- Well logs
- Aquifer roof elevation isoline diagram

These data are the result of different survey made by the Mining Group Co., Ltd. of Heilongjiang Province on the demand of Petrochina Daqing Tamtsag of China Petroleum. The works were undertaken between June 2007 and November 2008. Some of the data were ready to use but some others were in Chinese and needed a translation to English. Due to time constraint and the location of the study area, it was not possible to go to the site. However, a travel to Daqing was done in order to acquire technical advisory from knowledgeable individuals working for the Daqing Company. During the data manipulation, a close contact with a technical advisor from the company was necessary for the confirmation of the estimation of certain parameters.

Other information includes the Soil Map of the People's Republic of Mongolia and the Atlas of Mongolia which were published by the European Commission Joint Research Center (JRC) and the U.S Northern Circumpolar Soils Map respectively.

### **3.3. Development of the DRASTIC parameters**

#### **Factor 1: Depth to water**

Depth to water refers to the distance the contaminant travels before reaching the aquifer. Hence, it gives an insight of the contaminant's contact time with the surrounding media. Due to the presence of confining clay layers, the aquifer in the study area is classified as a confined aquifer. For a confined aquifer depth to water refers to the depth to the top of aquifer (DTTA). Because of the low permeability of the confining media, the contaminants travel to the aquifer is retarded; potential pollutants released from the ground surface cannot reach the aquifer easily. Therefore, confined aquifers have more natural protection from contaminants and are less vulnerable to pollution than unconfined aquifers. As the degree of confinement decreases, the pollution potential of the aquifer increases.

The depth to the top of the aquifer feature was obtained by combining the contour map of the ground elevation with that of the top of the aquifer (Eq.2).

DTTA = Groundwater elevation – Top of the Aquifer elevation <sup>(2)</sup>

The resulting map has shown that the DTTA varies between 179.7m and 280.6m which implies that most of the underground water in the study area is deep water.

#### **Factor 2: Net recharge**

Net Recharge represents the amount of water per unit area of land penetrating the ground surface and reaching the water table. It is thus influenced by the amount of surface cover, the slope of the land surface, the permeability of the soil and the amount of water that recharge the aquifer. The dispersion and dilution of contaminants depend greatly on the volume of water available in the vadose zone as well as in the saturated zone and thus on the net recharge. Additionally, the recharge water has the ability to carry contaminants to the water table and within the aquifer. Hence, a great recharge corresponds to a high potential for groundwater pollution. Net recharge is thereby an important factor in the contamination attenuation and is given a weight of 4. Regarding to the net recharge, the pollution potential of an area with confined aquifer is lesser than that of an unconfined one because of the presence of a confining layer.

The primary source of ground water is precipitation which infiltrates through the surface of the ground and percolates to the water table. Because the deep underground water in the project zone is isolated by the aquiferous stratum roof, the vertical infiltration of the local atmospheric precipitation replenishment cannot be directly received. Thus, the aquifer mainly receives the lateral flow replenishment from the upper reaches. The replenishment source of the Quaternary underground water of the study area and the replenishment mainly come from the jacking from the deep underground water to the top aquiferous stratum. The methodology prescribes that in this case, the recharge is negligible. Low recharge values were thereby chosen for aquifer.

Values of the net recharge are more difficult to obtain than the values of the six other parameters. As suggested by the model, more accurate estimates of net recharge should be done based on the available features which are believed to be important to the recharge component. The values were thus generated using the estimation formula that Piscopo established in 2001 and that Al-Adamat et al. applied in 2003 for their study of the Azraq basin, Jordan. Nevertheless, for the purpose of this study, the weighting factor of the normal DRASTIC was kept as all the parameters constituting the model were used. Because the major underground water resource volume in the zone is replenished with lateral runoff, the recharge map was constructed according to the following formula:

$$\text{Recharge value} = \text{Slope}(\%) + \text{Rainfall} + \text{Soil permeability} \quad (3)$$

Table 4 Range and factors of the features controlling the recharge value (Piscopo, 2001)

Slope	Rainfall		Soil permeability	
Slope (%)	Factor	Rain (mm)	Factor	Range
<2	4	>850	4	High
2–10	3	700–850	3	Mod-high
10–33	2	500–700	2	Moderate
>33	1	<500	1	Slow Very slow

First, a digital elevation model of the study area was generated from the 1m elevation contour map. Using the “surface analysis” function of the 3D analyst tool, the slopes values were deducted from the DEM and then classified according to the criteria cited in table 4. The slope values of the study area vary between 2 and 4% while the infiltration replenishment by precipitation is very slow, the annual evaporation being 5-7 times of the annual precipitation. The average rainfall of the study under investigation is 276.4mm (<500mm). With careful attention to the specific features of the study area cited in the above paragraphs, the soil permeability was estimated based on the typical classification of permeability given in table 5.

The next step consisted of classifying the soil permeability map into four classes: very slow (26%), slow (53%), moderate (16%) and high (5%). The thus obtained map was converted into grid coverage; then, a raster addition was performed using the 3D analyst tool of ArcGIS. The result which ranges from 3 to 10 was classified into ranges according to table 2. The final map of the net recharge was obtained by assigning the rating values as new values for each reclassified range.

The aquifer media has been chosen as the starting parameter because on it depend the values chosen for the other parameters. The aquifer medium determines the materials with which, the contaminant is in contact in the aquifer. Hence, it plays a significant role in the concentration attenuation process. Besides, it governs the groundwater flow system and consequently, affects the route and path length that the contaminant follows. These factors are important because they give an insight into the chance for the attenuation processes to occur. The pathways for groundwater flow are strongly influenced by the grain size of the medium, fractures or openings within the aquifer. The presence of a fracture implies a higher contamination potential because of the degree of secondary permeability it provides. Larger grain size and more fractures or openings imply a higher permeability and thus, a lower pollution attenuation capacity. Similarly, the presence of clay materials in the aquifer lowers the pollution potential. Hence, the rating for each aquifer

medium was evaluated based on the specific features of the aquifer.

Table 5 Typical values of permeability (Cashman et al., 2001)

Soil type	Typical classification of permeability	Permeability (m/s)
Clean gravels	High	$>1 \times 10^{-3}$
Clean sand and sand/gravel mixtures	High to moderate	$1 \times 10^{-3}$ to $5 \times 10^{-4}$
Fine and medium sands	Moderate to low	$5 \times 10^{-4}$ to $1 \times 10^{-4}$ $1 \times 10^{-4}$ to $1 \times 10^{-6}$
Silty sands	Low	$1 \times 10^{-6}$
Sandy silts, very silty fine sands and laminated or mixed strata of silt/sand/clay	Low to very low	$1 \times 10^{-5}$ to $1 \times 10^{-8}$
Fissured or laminated clays	Very low	$1 \times 10^{-7}$ to $5 \times 10^{-9}$
Intact clays	Practically impermeable	$>5 \times 10^{-9}$

### Factor 3: Aquifer media

Based on the geological description of the study area, there are two major aquiferous rock formations: Pre-Quaternary debris rocks and Quaternary loose rocks. The aquiferous stratum consists of medium-fine sands, with a thickness of 4-8 m. The Pre-Quaternary debris rocks are generally distributed in the study area; they consist of middle fine sandstone, medium coarse sandstone and medium sandstone. The map for the Aquifer media ranking was obtained from an interpolation of the lithology of the aquifer of each borehole. The typical ratings for aquifer media given in table 2 were not used; the rating for each medium was adjusted based on the characteristic of the zone. Higher ratings were chosen to indicate the presence of the North-South tectonic fault situated at the eastern part of the study area, the amount of fines and the clay within the aquifer. Conversely, lower ratings were assigned to the fine textured media

### Factor 4: Soil media

Soil is the first media the contaminant passes through when it percolates into the ground. Therefore, soil media influence strongly the recharge which percolates into the ground and hence, the contaminant movement. Several attenuation

processes can happen within the soil media, namely filtration, biodegradation, sorption and volatilization. These processes depend greatly on the thickness of the media and the material the contaminant is in contact with (type, texture...). Fine textured materials such as silts and clays restrict contaminant migration as they decrease the soil permeability. Similarly, a thick media offers greater chance for the attenuation processes to occur.

Soil ranking distribution was inferred from the soil map of the People's Republic of Mongolia, the Atlas of Mongolia and the written descriptions of the soil cover.

Most of the working area is covered by sand soil with different thicknesses in some areas, and the area has a high sandy degree. According to strata lithologic array, the top is the quaternary silty sand soil and silty clay with partial sandy layer, with the tertiary and cretaceous mudstone, sandstone, medium-sized coarse sandstone and interbedded fine sandstone at the bottom. These horizons of the soil profile were evaluated and the most significant textural layers which can affect the pollution potential were chosen for each zone. For the area where clay layer is the most significant soil texture, the shrink/swell potential was evaluated. The shrink/swell potential is important as it influences the transport of contaminants. Because the soil complexes were not particularly detailed, it was not possible to determine the degree of the shrink/swell potential. However, the drilling samples showed that the surface soils of the drilling samples have a very high hardness and are in a compact state. Thereby, a DRASTIC range of shrinking and aggregated clay was assigned to the clayey areas, as recommended by the methodology for soil with a moderate shrink/swell potential.

#### **Factor 5: Topography**

Even if topography is given the lowest weight (1), it has a relative significance as it controls the time during which contaminants remain on the surface. Topography expresses the slope and slope variability of the land surface. A high degree of slopes increases the runoff capacity. As the infiltration probability of contaminant is lessened, the groundwater pollution potential decreases. The topographic unit of the study area is a plateau area, and it belongs to a relatively flat area in Mongolia. It is characterized by a wavy plain relief: The overall topography of the project zone is high in the eastern and southwestern parts have a high topography while the northwestern part is low. The altitude varies between 618 and 717 m and the slopes range from 0

to 4.8%. Since the study area is relatively flat, the range 0 to 2% slope is predominant.

The mapping of the topography was the easiest process because the data required for this parameter were easy to find and didn't need many modifications. The slope map was generated using 3D analyst tool of Arcmap.

#### **Factor 6: Impact of the vadose zone**

The vadose zone is the portion of the subsurface in which granular openings are unsaturated or discontinuously saturated. The behavior of contaminants in the vadose zone is a key element in pollution attenuation as the media is the home to many natural organisms which break down many polluting substances into secondary by-products both harmful and harmless. Various attenuation processes may occur between the soil horizon and the water table; namely: biodegradation, neutralization, mechanical filtration, chemical reaction, volatilization and dispersion. The type of vadose zone is thereby of great importance because it determines the contact time for reaction to occur as it influences the path length and the routing of contaminants.

Regardless the presence of other layers composing the media, confining layer was chosen as the vadose zone media since the purpose of the study was to evaluate the confined aquifer. This is highly important because the confining layer is the media which most significantly impacts pollution potential.

#### **Factor 7: hydraulic conductivity**

The hydraulic conductivity of an aquifer is a measure of the aquifer's ability to transmit water when submitted to a hydraulic gradient. It is a critical factor because it controls the velocity of groundwater flow; which in turn controls the velocity of contaminant flow within the aquifer. An aquifer with high conductivity is vulnerable to substantial contamination as a plume of contamination can move easily through the aquifer (Rahman A., 2007). Hence, areas with high hydraulic conductivity values are more susceptible to contamination.

Values for hydraulic conductivity estimates were based on well yields and aquifer characteristics because the maps of hydraulic conductivity for the study area were not available in published reports. Thus, the hydraulic conductivity maps were generated using two components of conductivity: transmissivity and saturated thickness based on the formula  $T = K \cdot b$  where  $T$  represents the

transmissivity, K is the hydraulic conductivity and b the thickness of the aquifer

The procedure consisted of digitizing the contour lines of the aquifer thickness, hence creating a "DEM-like" surface image. The transmissivity maps were interpolated from pumping test data of some points of reference. The obtained values were divided by the aquifer saturated thickness on pixel-by-pixel basis using the Raster math tool of 3D analyst tool in ArcView. Generally, the study area has a low hydraulic conductivity ( $0.3 \times 10^{-6} \sim 5.3 \times 10^{-5}$  m/s). However, the central part of the aquifer has a higher conductivity compared to the rest of the study area.

### 3.4. Vulnerability mapping

A new raster data file for the DRASTIC Index was created according to Eq. 1 using the weighted sum overlay in spatial analyst tools using the 7 individual raster files created above. The first step was to consider the parameters one by one in order to calculate their respective index values. For each parameter the rating values were multiplied to the appropriate DRASTIC weight (table 1).

For all the parameters except the DTTA and the Impact of the vadose zone, the obtained index values were in raster format. For the DTTA, the rating value of the whole study area was equal to 1 and based on the weighting system; the result of multiplying Dr by Dw is equal to 5. Similarly, the net recharge index was obtained by multiplying  $I_r$  by  $I_w$ . 5 was obtained as a result and was also added to the total DRASTIC index as a constant value for all locations in the study area. In sum, a constant value of 10 was added to the final raster grid coverage. For the five remaining parameters, the values for each overlay were summed on pixel-by-pixel basis by running the model in ArcView GIS. The final raster for the Overall Vulnerability Index was created using the raster calculator in Spatial Analyst tools by combining the seven hydrogeological data layers as illustrated in figure 3.

Referring to Aller et al. (1987), the DRASTIC indexes were classified according to the ranges given in table 6. The final step of the vulnerability mapping consists of reclassifying the DRASTIC indexes and assigning to each group its degree of vulnerability; thereafter, groundwater vulnerability map was developed.

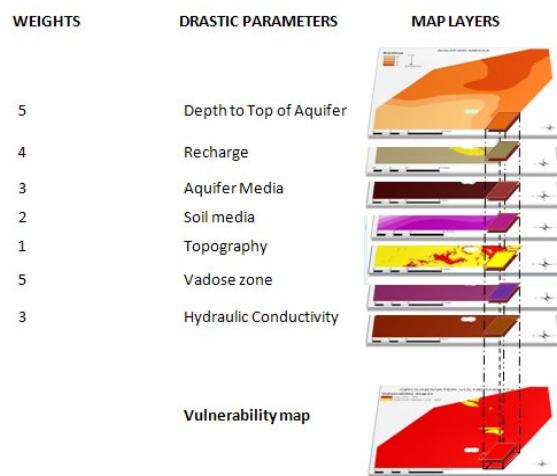

Figure 3 Vulnerability mapping

### 3.5. Sensitivity analysis

Sensitivity analysis (S.A) is a significant component of any modeling project as it allows evaluation of the accuracy of the result (Baker et al., 2005).

#### Map removal S.A

The map removal sensitivity analysis was performed to evaluate whether it was necessary to use all the parameters incorporated in the DRASTIC model. The sensitivity measure expressed in terms of variation index S is given by the formula:

$$S = \left( \frac{\left| \frac{V - V'}{N} - \frac{n}{V} \right|}{V} \right) \times 100 \quad (4)$$

where V is the unperturbed vulnerability index which represents the actual index used in the primary suitability using N parameters.  $V'$  is the perturbed vulnerability index while a lower number of parameters (n) were used.

The analysis comprised two studies. The first one was performed by removing only one layer at a time, considering each parameter constituting the DRASTIC model. This process aimed at evaluating the sensitivity of the vulnerability values upon the removal of the defined parameter. The second analysis consisted of removing a layer which compels less variation in the final vulnerability index. The thus obtained result was then used for the next removal analysis, and the same steps were followed until only one layer was left. For each new step, the layers assumed to be the most effective were considered each time (Babiker et al., 2005) while the least effective were removed. The computation was

done taking into account every sub-areas of the study area. The sensitivity value S was calculated for each grid cell using the Raster math tool of GIS according to the above formula (Eq. 4).

#### Single parameter S.A:

The next step of the analysis was to compare the effective weight of each parameter in each subarea with the theoretical weight assigned to it by the DRASTIC method. For each grid square element, the effective weight  $W_{pi}$  (in %) was calculated using a theory developed by Lodwick et al. (1990) and effectively used by Napolitano and Fabbri (1996), Rahman (2008), Babiker et al. (2005) among others.

$$W_{pi} = 100 * \left( \frac{P_{ri} * P_{wi}}{DI} \right) \quad (5)$$

Where  $P_{ri}$  and  $P_{wi}$  are the ratings and the weights respectively of the layer P assigned to the subarea i, and D.I is the vulnerability index. Based on this formula, the effective weight of each subarea was computed using GIS. In the same way as the first analysis, the analysis covered the whole study area and a statistical analysis was performed using the proUCL software for the display and the analysis of the obtained results.

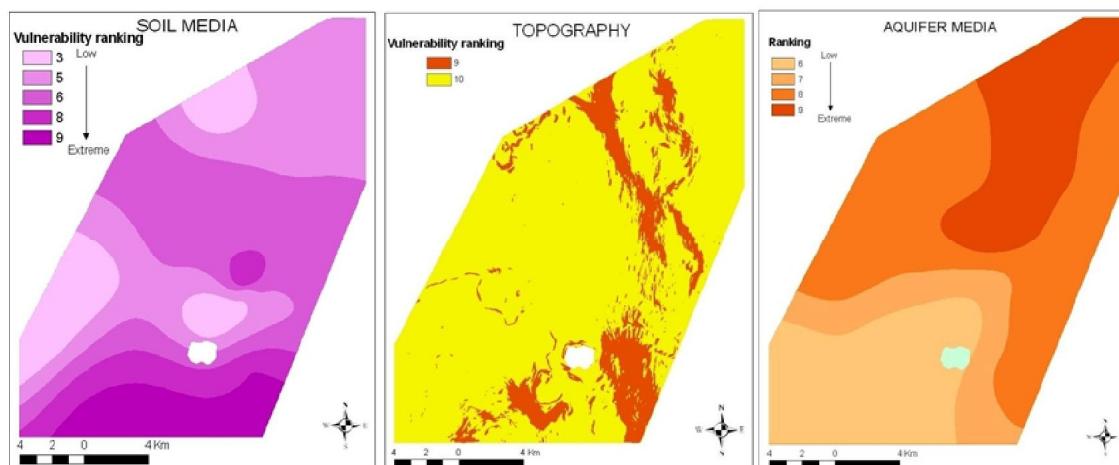

Figure 4 Examples of the rated maps of the DRASTIC parameters

The final integrated map of the groundwater vulnerable zones is presented in figure 5. The resulting DRASTIC values in the study area lay between 58 and 88. According to table 6, two classes of the vulnerability toward pollutants could be identified in the zone. In term of areal extent, almost 98 percent of the area was determined to have a low vulnerability toward contaminants. This can be associated to the presence of the confining layer as it is the media which significantly impacts pollution potential. Only a slight 2 percent, which is located in

## 4. RESULTS AND DISCUSSION

### 4.1. Groundwater vulnerability map

Figure 4 contains examples of the rated maps used to compute the DRASTIC vulnerability index. Regarding to the net recharge, about 72% of the study area has a low contamination risk, 27% is moderately vulnerable and only the remaining 1 % belongs to high vulnerable class. The high vulnerable class is situated in the shallower aquifer in the north-western area. With regards to the aquifer media, the major part of the study area has a relatively high vulnerability index. The northern part of the study area has a relatively high VI. It can be attributed to the coarser grain size of the unit that serves as an aquifer. The vulnerability index associated with the aquifer media indicates that GW resources surrounding the tectonic fault are susceptible to pollution to a high degree.

With a special consideration of the soil media, about 80% of the study area has low or moderate vulnerability toward contamination while almost the whole area is highly vulnerable regarding the topography slope.

the water-rich area, are more susceptible to pollutants. These zones are located in the north-western part and at the middle-eastern part of the study area. The vulnerability map offers the possibility to select priorities for restoration and remediation actions in regional planning. It is important as the toxicological index of the area under investigation has shown that the content of Na, Mg, Cl and Mn in the underground water are seriously over standard. It highlights need of establishing underground dynamic observation points to control the behavior of these chemicals.

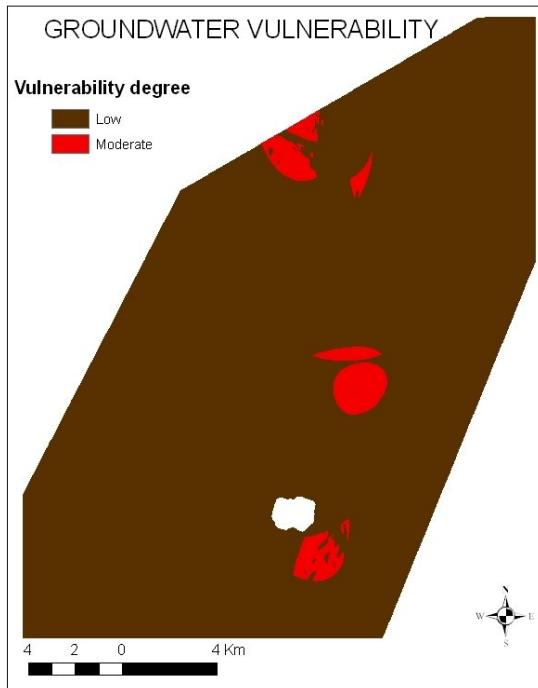

Figure 5 Groundwater vulnerable zones

#### 4.2. Summary of the DRASTIC parameters

A statistical summary of the seven parameters incorporated in DRASTIC model and which were used for the study is presented in Table 7. It shows that aquifer media has the largest impact on the intrinsic vulnerability of groundwater as it has the highest mean (22.8). Then, it is followed by the net recharge (with a mean of 14.24), the soil media (mean = 11.54) and the topography (9.15). The result also reveals that impact of vadose zone and DTTA which have both a mean value of 5 have low contribution to vulnerability index while hydraulic conductivity contributes the least as it has smallest mean value (3.02). Regarding the contribution to the variation of the vulnerability index; a small variation of the net recharge would greatly affect the values of the vulnerability indexes. This is exhibited by the high value of the coefficient of variation associated to this parameter (70.26%). Changes in soil media and aquifer media values (mean = 38.5 and 17.21 respectively) would have moderate impact on the system whereas variation in hydraulic conductivity would barely impact the vulnerability map (mean value = 0.47). Depth to aquifer and the impact of vadose zone both having fix value do not impact the variation of the sensitivity measure.

Table 7 Statistical summary of the DRASTIC parameters map

	D	R	A	S	T	I	C
Min.	5	4	18	6	9	5	3
Max.	5	32	27	18	10	5	6
Mean	5	14.24	22.8	11.54	9.15	5	3.02
SD	0	2.99	3.87	4.77	0.71	0	2.12
CV (%)	0	70.26	17.21	38.5	7.44	0	0.47

SD = Standard Deviation CV = Coefficient of Variation

#### 4.3. Map removal sensitivity analysis

The map removal sensitivity analysis was performed with the aim of establishing the significance of the parameters used for the DRASTIC model. The summary statistics of the map removal sensitivity analysis is displayed in table 8 and 9. Table 8 reveals that topography is the layer that affect least the variation in the final vulnerability index as the variation index has the least average value after its removal (= 0.23%). It is mainly due to the low contamination risk associated with topography (the mean rating value = 1). In contrast, a high variation of the vulnerability index is expected upon the removal of the aquifer media as this layer has the highest variation index (2.99%). It is mainly due to the presence of the tectonic South-North fault located in the eastern part of the study area which has a significant influence on pollution potential. In addition to the relatively high theoretical weight (3), aquifer media has high rating values in almost every subarea. Hydraulic conductivity removal also influences greatly the variation of the vulnerability assessment. It can be explained by the fact that the main recharge of the aquifer comes from lateral replenishment. The hydraulic gradient has therefore a significant impact on the fate of the travel of a plume of contaminant. The vulnerability index also seems to be sensitive to the removal of the impact of the vadose zone and the DTTA (their average variation indexes are both equal to 1.19). It could be attributed to the high theoretical weight (= 5) assigned to both of these layers. Moreover, the high mean value for the impact of the vadose zone confirms the fact that the confining layer is the media which most significantly impact pollution potential and thus the vulnerability of the aquifer; its removal will greatly impact the sensitivity measure of the area. The removal of the net recharge and soil media also have contributed to the variation of the sensitivity value of the aquifer; their mean value being 0.99 and 0.61 respectively.

Table 8 Statistical summary of one map removal sensitivity analysis

Parameters removed	Variation index (in percent)			
	Min	Max	Mean	SD
<b>D</b>	0.94	1.43	1.19	0.15
<b>R</b>	0.21	3.97	0.99	1.01
<b>A</b>	1.51	4.65	2.99	0.76
<b>S</b>	0	1.9	0.61	0.52
<b>T</b>	0	0.66	0.23	0.17
<b>I</b>	0.94	1.43	1.19	0.15
<b>C</b>	1.06	1.79	1.66	0.17

The variation of the sensitivity measure upon the removal of one or more maps from the computation is contained in table 9. It appears from the table that after the removal of the topography layer, the variation index has the least average value. This average variation index changes as more layer data are removed from the computation. However, there is no consistency on the trend of the mean variation index according to the number of parameters removed. This clearly demonstrates that all the seven parameters used to compute the DRASTIC model are all essentials in determining the vulnerability index.

Table 9 Statistical summary of the map removal sensitivity analysis

Parameters used	Variation index (in percent)			
	Min	Max	Mean	SD
D, R, A, S, I, C	0	0.66	0.23	0.17
D, R, A, I, C	0.03	2.26	0.71	0.62
D,A,I,C	0.05	4.22	1.63	1.14
A,I,C	0.06	3.94	0.74	1.29
A,C	0.64	9.15	3.55	3.02
A	6.39	10.75	9.72	1.82

#### 4.4. Single parameter sensitivity analysis

The single parameter sensitivity analysis compares the theoretical weight assigned to a parameter by the DRASTIC model with its real (or effective) weight. The result summarized in table 10 indicates the importance that should be accorded to some factors, namely the aquifer media; soil media and topography. With an average weight of 31.83 against a theoretical weight equal to 23.38, aquifer media mostly influences the vulnerability index. This is in agreement with the result from the map removal analysis which also states that aquifer media is the layer that compel most the variation of the final V.I. The effective weights of soil media together with topography exceed the theoretical weight imposed by DRASTIC. Their mean effective weights (%) are 15.93 and 12.42 respectively while their respective theoretical weight assigned by DRASTIC are both less than 10%. This reflects the importance of the aquifer media, soil media and topography layers in the model and the need to get accurate, detailed and

representative information about these factors. The net recharge almost conserves the weight that is assigned by the DRASTIC model: its real weight is just slightly greater than the theoretical weight. It is mainly due to the fact that in some portions of the aquifer, groundwater replenishment mainly comes from the jacking from the deep underground water to the top aquiferous stratum. Recharge of aquifer is thereby negligible in some parts of the study area. DTTA is the least important parameter as it exhibits a very low effective weight compared to the theoretical weight. This agrees with the basic assumption that depth to water is less important for confined aquifers.

Table 10 Statistical summary of the single parameter sensitivity analysis

Parameters	Theoretical weight	Theoretical weight (%)	Effective weight (%)			
			Mean	Min	Max	SD
<b>D</b>	5	21.7	6.68	5.68	8.62	1.12
<b>R</b>	4	17.4	19.52	5.97	38.09	9.52
<b>A</b>	3	13.0	31.83	23.38	42.19	5.72
<b>S</b>	2	8.7	15.93	6.82	25.71	5.98
<b>T</b>	1	4.3	12.42	10.34	17.24	2.45
<b>I</b>	5	21.7	6.68	8.62	5.68	1.29
<b>C</b>	3	13.0	3.91	3.53	7.89	1.58

#### 4.5. Conclusion and recommendations

DRASTIC system and GIS were used to analyze the Regional groundwater pollution susceptibility of a part of block 19 of Tamtsag Basin, in Mongolia. Topography, well, geology, soil databases were designed and constructed for the application of the DRASTIC model. Using these databases, hydrogeologic factors such as depth to water, net recharge, aquifer media, soil media, slope, hydraulic conductivity were extracted. The DRASTIC vulnerability index, which is defined as a linear combination of seven hydrogeological factors was computed with the help of GIS. The aquifer vulnerability map indicated that only 2% of the study area is under moderate vulnerability to contamination. The remaining zone was determined to be in a low risk category. GIS greatly facilitated the implementation of the sensitivity analysis applied on the DRASTIC vulnerability index which otherwise could have been impractical. The single-parameter sensitivity analysis has shown that aquifer media, soil media and topography are the most significant environmental factors which dictate the high vulnerability of the study area. This highlights the importance of obtaining accurate, detailed, and representative information about these factors. The map removal sensitivity analysis indicated that the vulnerability index is highly sensitive to the removal of aquifer media, hydraulic conductivity and the impact of vadose zone layers but is least sensitive to the removal of the topography layer. The analysis has

also demonstrated that all the seven parameters used to compute the DRASTIC model are all essentials in determining the vulnerability index.

Often only a portion of the groundwater in storage may be exploited without creating undesirable effects. Ground water pollution vulnerability maps, risk maps, groundwater quality maps etc may be used to assist planners, managers, and local officials in evaluating the potential for contamination from various sources of pollution. These maps are useful as preliminary screening tools for policy and decision. To keep groundwater resource sustainability, a reasonable management of the resource should be put forward based on the groundwater resource evaluation and groundwater vulnerability assessment. Therefore, the present vulnerability maps should be regarded as an important tool in prioritization of areas for monitoring purposes. Some precautionary measures should be taken for the more vulnerable zones and detailed study of the groundwater pollution should be carried out if necessary. Additionally, the study suggests that special consideration such as a denser monitoring system should be given to the zones with higher vulnerability. Knowing the vulnerable areas, users can recommend settings that are suitable for the areas which are critical to groundwater contamination.

Groundwater pollution susceptibility assessment is also necessary for systematic management and protection of groundwater resources in the study area for further works and projects (land use, well construction and abandonment for instance). It is suitable to evaluate the impact of a potential pollution source on the aquifer, not only for the oilfield exploitation but also for industries, storage areas, livestock rearing establishments, and any new development proposals in any locality within the same area of study. Although the vulnerability map showed the dominance of "low" vulnerability class, the results suggest that great care should be taken when siting developments in the moderate vulnerability areas. Without attention, prospecting and exploiting tasks would change the hydraulic balance between the various natural strata; which will cause a connection of underground water of different qualities. This can be a shortcut to artificial pollution.

Due to the large amount of salts in the underground water, negligence in water pollution and prevention might cause a serious soil compaction, land salinization and also a potential harm to the surface soils.

# Structure Of Whey Protein Consequence For Dairy Industry (Review)

Khorshid,M.A.and Fatma,A.M.

Dairy Department, National Research Center, Dokki , Cairo , Egypt  
Email:[khorshid88@hotmail.com](mailto:khorshid88@hotmail.com)

**Abstract:** Milk proteins play a range of roles which make dairy products and products containing dairy components are valuable. Theses include nutrition, physical functionality and breakdown under controlled condition to produce nutritional, functional or flavour full products. This article reviews the structure of whey protein consequence for dairy industry. [Journal of American Science. 2010;6(11):79-84]. (ISSN: 1545-1003).

**Keywords:** Milk proteins; dairy components; nutrition; review; dairy industry.

## Introduction

Milk proteins play a range of roles which make dairy products and products containing dairy components are valuable. Theses include nutrition, physical functionality and breakdown under controlled condition to produce nutritional, functional or flavour full products. There is also undesirable behavior include fouling of heated surface, gelling in processing equipment during manufacture of some products. All of these behaviors related to the structure, and possible changes in structure during processing of the component milk proteins, an understanding of the structure of milk proteins, and how those structure can change under processing conditions, is therefore, an important enabling tool for the dairy processing industry.

Complete three dimensional structural information about a protein can be obtained experimentally in one of two ways: X-ray crystallography and nuclear magnetic resonance (NMR) spectroscopy. There are more than 12000 sets of crystal structure coordinates for a wide variety of protein in the protein Data Bank, the so-called PDB coordinates (Berman et al .,2000), together with over 2000 sets of coordinates derived from NMR data. Not all of these sets of data are unique; many are of the same protein but with different small-molecule ligands, crystallized under different conditions of temperature and/ or pH, from different species, or with one or two amino acid residues mutated. However, each set of coordinates in the data base represents a unique structure determination. In spection of this vast data base reveals that there are relatively few families of proteins, probably about 1000, that are distinctly different in structure. Thus, most but not all, new structure can be assigned to an already known family of structures (Murzin et al., 1995, Thornton et al., 1999) which in turn makes the determination of new structure easier. Theoretical methods of protein structure prediction can be employed. Prediction

methods are still being developed and, at the present time, their success depends upon the closeness of the unknown protein sequence to that of a known structure. Generally, the closer the amino acids sequence is to that of known molecular structure, the better is the prediction. (Moult, et al., 1999).

## Milk Whey Proteins

### (1) - Lactalbumin :

Two genetic variants, A and B of this protein exist. They differ by a single substitution, A having Gln. And Behaving Arg. At position 10. The B variant is the only one in the milk of European breeds; both A and B occur in Indian cattle. Some minor forms of bovine - lactalbumin are revealed by electrophoresis. Some these contain covalently bound carbohydrate groups; the major components of bovine - lactalbumin are devoid of carbohydrates others of minor components seem to have fewer amide groups than the major ones, and one minor - latalbumin containing three instead of four disulfide. In total the minor components donor account for more than 10% of the -lactalbumin. The amino acid sequence of -lactalbumin is similar to lysozymes. Indeed, bovine -lactalbumin B and chicken egg white lysozyme have identical amino acids residues at 49 positions, and the four disulfide groups are located identically; they are at 6-120, 28-111, 61-77 and 73-91 in -lactalbumin. It is considered that -lactalbumin arose in evolution by gene duplication of an ancestral gene coding for lysozyme. Although the conformation of -lactalbumin has not been defined completely by X-ray crystallography, preliminary indications are that its structure is similar to that of the well defined lysozyme. The two proteins must have very different active centers, however, since neither has the biological activity of the other; nor do they interfere with each others activity. The biological activity of -lactalbumin is interaction with galactosyl transferase to promote the transfer of galactosefrom UDP galactose to glucose to

form lactose. The nature of the effects of LA was used to develop a model for the arrangement of binding sites for acceptor substrates and LA on galactosyl transferase. Fig (7). The acceptor binding site of galactosyl transferase is viewed as containing at least two subsides that are capable of binding monosaccharide, one of which can bind free N-acetylglucosamine or glucose with low affinity substrate (S1) while the second (S2) binds an additional sugar in extended substrates. In the model, the binding of LA at this site in galactosyl transferase, adjacent to the monosaccharide substrate binding site, brings an eight boring site in LA close to S1 this site in LASLA, which is proposed to be region corresponding to part of the lysozyme active site cleft, forms favorable, stabilizing interactions with a monosaccharide bound to S1. Secondary structure including four  $\alpha$ -helices, several regions of 10 Helix and  $\beta$ -pleated sheet table (2)

## (2) $\alpha$ -Lactoglobulin:

### **Effect of pH on the structure of $\alpha$ -lactoglobulin**

The properties of  $\alpha$ -lactoglobulin have been examined since the 1930 by effectively every available technique (Sawyer & Kontopidis, 2000).  $\alpha$ -Lg from ruminant milk is polypeptide of 162 amino acids that exists as a dimer. The pH affects the structure through a series of reversible conformational changes leading to dissociation at both high and low pH. Four out of the five cysteine residues from two disulphide bridges, 66-160 and 106-119. Leaving cys 121 as the free thiol that appears to be responsible through disulphide interchange, for the formation of aggregates upon heating (Manderson, et al., 1999). Between pH 6 and 8 there is a significant change in the reactivity of the free thiol, the disinterment of a carboxyl, now known to be Glu 89 (Qin et al., 1998) and the opening up the central, legend  $\beta$ -binding site. The legends that bind  $\alpha$ -Lg tend to be hydrophobic and include fatty acids, cholesterol and more weakly, hydrocarbon molecules such as toluene and pentane.

### **Structural Variations of native bovine $\alpha$ -Lg:**

Both NMR and X-ray methods reveal the same general structure for bovine  $\alpha$ -Lg, even though NMR experiments were done at pH 2 where the protein exists in monomeric form, and the X-ray diffraction experiments span the range of pH 6-8.1, where in all cases, including those where  $\alpha$ -Lg is liganded to fatty acid. A common dimeric structure is observed. (Jameson et al., 2002)

### **Denaturation of bovine $\alpha$ -Lg:**

Various schemes of different degree of complexity have been proposed over the years for the thermal denaturation of bovine  $\alpha$ -Lg

Although most agree that the basic steps involve (1) .The dissociation of the dimer into monomers, (2). The loosening of the structure into a form that may be, or at least may be resemble, "molten globule state"(3) the molten state leads to the unfolding of the protein, (4). The formation of aggregates by both disulphides interchange and cross linking, and non covalent interaction (Qi et al., 1997). More recently it has been found that on early step gives rise to non-native monomer  $\alpha$ -Lg that contains disulphide bond in non-native configuration. The temperature, the ionic strength, the pH and the presence of legends and cations are some of the parameters determining this complex process. It is possible to use structure based approach to study a series of changes that lead to gelation or precipitation through the denatured and aggregated state, the structure must be perturbed in some way and the effects must be monitored by X-ray or crystallography or by NMR spectroscopy.

The methods of perturbing the structure are to use a denaturing agent such as urea, to raise the temperature, to modify the protein chemically or by adding legends that make the protein more or less resistant to denaturation, or to vary the pressure. All of this methods have been used,  $\alpha$ -Lg and there are a large number of reports published over the years describing the chemical and spectroscopic effects in solution (Sawyer & Kontopidis, 2000). However, the tertiary structural details resulting from the application of these methods, where they have been applied, is recent.

### **Solvent unfolding:**

Urea as a denaturing agent has been applied recently to study the refolding of  $\alpha$ -Lg by NMR. The protein is first denatured or at least substantially unfolded in urea. The urea is then abruptly diluted, perhaps 20-fold to a concentration well below that required to unfold the protein. As the protein refold, the peptide N-H protons of certain residues lose their ability to exchange with solvent. Those residues, whose amide proton exchangeability is lost rapidly are those that refolded first whereas those that continue to exchange all long times after dilution of the urea are on the surface or in solvent accessible regions of the structure. With  $\alpha$ -Lg, the protein core involving strands F, G and H and the helix form rapidly with the rest of the protein then folding around this central core. One further feature of this process is that there strong evidence of some transient structure (  $\alpha$ -helix) that is not observed in the final native structure. The evidence in this case is that (re-) folding of  $\alpha$ -Lg is a hierarchical process (Kuwata et al., 2001b).

### **Effect of temperature on the structure of $\alpha$ -Lacto globulin**

Monitoring the effects of temperature has been most efficiently carried out using spectroscopic techniques. For example, circular diachronic (CD) or Fourier transform infrared (FTIR) spectroscopy can conveniently be used to show the melting of the three turn -helix of -Lg at around 65 °C (Qi et al., 1997). Crystallized protein at pH 7.6 that had been heated to 60 °C, and the structure at 2.6 Å resolution was that of the native protein this resolution is substantially worse than that typically observed for -Lg, and is a warning that the material crystallized may not be representative of the entire sample, a small part of which may have become irreversibly denatured. Although studies in solution indicate that thermal effects are reversible up to 68 °C (Qi et al., 1997), the differential scanning calorimetric (DSC) technique used would not be sensitive to a significant fraction (up to 10 %) of the protein having become irreversibly denatured. However, many studies have been shown that -Lg at natural pH gradually denatures irreversibly if held at temperatures as low as 59 °C., As not earlier, high-quality protein crystals are best obtained from pure, homogeneous material uncontaminated by other proteins or by material in non native or denatured conformations. Crystal's isomorphism with the native protein crystals will certainly grow at 50° C.

NMR studies also using deuterium exchange techniques at several temperature and pH 2 (Belloque & Smith 1998) reveal that the denaturation occurs in stages at 55 °C strand E and the B loop unfold, and the A strand becomes flexible. At 75°C the A strand and the helix unfold, but the residues in the two sheets, BCD and FGH, are surprisingly resistant to amid H/D exchange. Prolonged heating leads to the formation of a transparent gel and this does not involve disulphide bond cross-linking (Schokker, et al, 2000). At pH 7.4, similar effects are noticed but their rate is faster. Similar, but not identical observation have been made by (Edwards et al, 2002) who used a slightly different denaturation protocol and pure -Lg B.

#### **Effect of pressures on the structure of -Lacto globulin**

Another means of perturbing the structure is to use hydrostatic pressure and there the unfolding of the protein has been monitored by NMR (Kuwata, et al., 2001a). This show that the two B-sheet surfaces appear to unfold independently in excellent agreement with the results referred to above using temperature. The crystal structure of -Lg at ambient pressure, after pressurization to 250 bars in a process that was not completely reversible, shows both reduced unit cell dimension and also a slight contraction of the structure, which was most marked around - strand A.

#### **Stabilization by bound Legends:**

Legend – binding studies of -Lg have been carried out in solution using several different spectroscopic techniques including NMR. (Muresan& de Wolf.2001). IT has emerged from their crystallographic studies that the majority of legends, e.g. palmitate, retinal and cholesterol bind within the central cavity of the protein (Sawyer & Kontopidis, 2000). The effect of this is to increase the stability of the protein to both urea and thermal denaturation in a manner that is expected when a solvent accessible internal cavity is filled (Jameson et al., 2002).

#### **Side-chain modification:**

It is clear that chemical modification of the amino side chains of -Lg leads to changes that often result in the protein becoming more susceptible to denaturation and aggregation. (Morgan etal., 1999) Modification of Cys 121 by most reagents significantly enhanced dimmer dissociation. Thus heavy metal ions, such as mercury or gold, lead to a significant change in both the unit cell dimensions and in the structure of the dimer interface the separation of the ant parallel -strands I and I increase by around 1A° as well as small but significant changes in the structure of the monomer subunits. It is not obvious, however why reaction of Cys 121 should affect the interface because the residue is on the underside of the helix distal to the dimer interface, and moreover, the helices themselves do not interact directly in any of the distinct crystal structure of bovine -Lg.

#### **Site-directed mutations:**

A method somewhat akin to chemical modification as a perturbing influence is that of protein engineering (Batt, 1997). Although significant studies have been made using the natural genetic variation present in the different alleles within one species, and the variation between species, modern molecular biological techniques make site-specific mutation convenient and efficient (Sambrook & Russell,2001). For example, the two "half mixed" forms (D33G with V118, and D33 with V118A) of the A and B genetic variants promise to provide to the reason behind the different stabilities of the two forms. Similarly, C12 1S will remove the ability of -Lg to aggregate by disulphide interchange mechanism. Both porcine -Lg and equine -Lg are monomers at pH 7 but the X-ray structure of the porcine (Hoedemaeker etal.,2002) and NMR structure of the equine (Kobayashi et al.,2000) protein, respectively, show a high degree of similarity to the bovine and ovine crystal and NMR structure. Structural studies combined with site directed mutagenesis will uncover many of the determinants of stability, or instability, of bovine -Lg of importance to milk technology, the physiological role of -Lg to both the lactating cow as donor and the calf as recipient

remains almost as mysterious now as it was more than 60 years ago. Molecular biological techniques have now provided methods to address explicitly these mysteries by examining the physiological effects on both mother and calf of cows that are unable to express -Lg.

#### **Immunoglobulin:**

Immunoglobulin is antibodies synthesized in the response to stimulation by macromolecular antigens foreign to the animal. They are polymers of two kinds of polypeptide chains, light (L) of MW 22,400 and heavy (H). The latter are of several types, including (MW 52,000), (MW 52,000-56,000), and (MW 69,000). Each of the L and H chains consists of a relatively constant and highly variable sequence and appears to be coded for by two genes. IgG1 and IgG2 are each polymers of two light chains and two heavy chains of the type (1 and 2). The chains are joined by disulfide linkages to form two antibody sites, each consisting of the variable portion of an H and L chain. IgG1 and IgG2 have about 2.9% bound carbohydrate and MW of about 150,000. They differ slightly in electrophoresis mobility. IgA and IgM immunoglobulin likewise have the basic structure of two H and two L chains joined by disulfide bridges. In IgA the H chains are of the type, and in IgM they are of the type. IgA is secreted as a dimer of two of the basic four-chain units joined by polypeptide of MW about 25,000,

called J-component, and associated with another called secretor component, Sc. This complex is called secretor IgA (SIgA) and has a MW of about 385,000. The secretor component is a protein of MW about 75,000, consisting of a single polypeptide chain with a number of internal disulfides. It has a relatively high content (10- 15 %) of bound carbohydrate consisting of N-acetylglucosamine, N-acetylgalactosamine, D-galactose, D-mannose L-fucose, and N-acetylneuraminic acid. In addition to the amount that is bound in SIgA, it occurs in the free state in milk in concentrations of 50-100 mg liter

IgM consists of a pentamer of the basic four-chain units joined by the J-component. It has 11-12% bound carbohydrate and MW of 900,000; its diameter is about 30nm. In all cases the sites that bind antibodies consists of the variable protein of an H and L chain in juxtaposition to each other. IgG has two such sites, SIgA has four, and IgM has ten. The immunoglobulin of an animal thus consists of numerous different proteins; each antigen encountered has caused the synthesis of Ig with a different variable portion.

The immunoglobulin in milk can exert and antimicrobial action, particularly IgM, which acts as agglutinin, for instant, against some streptococci. Moreover, cow smilk (but not that of buffalo, goat, or

sheep) contains a cry globulin (mainly consisting of IgM) that is involved in the cold agglutination of milk fat globules and in the attachment of bacteria to fat globules. The immunoglobulin is among the most heat sensitive of the whey proteins.

#### **Protease-Peptone Fraction:**

Fractions of the whey proteins amounting to about 1g per kilogram of milk are not rendered acid-insoluble by previously heating them milk. It has long been called protease-peptone. Four principal groups of components of protease-peptone are distinguishable electrophoretically. The first components, which is probably derived from a fat globule membrane constituent, and components 5,8 fast, and 8-slow, which are derived by proteolysis of casein.

#### **Other whey proteins:**

A group of acid glycoproteins is retained on DEAE cellulose when blood serum or whey is passed through it at pH 4.5. Fractional elution separates a number of components. The total amount that can be obtained from bovine blood serum, colostrums, and milk are respectively, about 2.0, 1.0 and 0.3 g-liter. One protein of this group is acid glycoprotein, formerly called orosomucoid. It has been isolated from human serum, colostrums, and milk, and from bovine serum and colostrums, but it has not been detected in bovine milk. It consists of a polypeptide chain of 181 residues to which five heteropolysaccharide groups are linked to asparagine residues. The carbohydrate constitutes about 45% of the total molecules. The function of this protein is not known. In any event, acid glycoprotein comprises only a small portion of the acid glycoproteins obtainable from fractionation of colostrums or milk on DEAE cellulose. Five other fractions have been obtained in varying states of homogeneity. All contain carbohydrate and phosphate and promote the growth of *Bifidobacterium bifidum* var. *pennsylvanicus* (formerly *Lactobacillus bifidus*). The possibility that some of these glycoproteins represent partial degradation products of caseins or membranematerials has not been elucidated.

A specific protein that binds folate (FBP) has been isolated from milk. Affinity chromatography on sepharose to which folate has been attached is especially effective in isolating this protein. Its concentration in normal milk is about 8mg/kg.

#### **Fat globule membrane protein:**

The fat globule membrane contains approximately 50% protein and accounts for about 15 of the total protein of the milk. Some of the protein constituents of the membrane are enzyme but it is not possible at present to estimate the ratio of enzymatic and non enzymatic components. The fat globule

membrane proteins are difficult to resolve analytically and to separate privately because they interact strongly with one another and with lipids.

### **2-Microglobulin:**

This protein consists of a single polypeptide chain of about 100 amino acids, residues and MW of 11800. It is present in several body fluids and in membranes of various type4s of cells. Its amino acid sequence indicates homology with the constant regions of immunoglobulin light and heavy chains.

A protein that had long previously been crystallized from bovine milk and designated lactollin called bovine  $\alpha$  microglobulin. It is a polypeptide of 98 residues, two of which are Cys.

Direct analysis for microglobulin concentration have not been made in bovine milk; the amounts of lactollin that have been isolated from colostrums and milk are about 6 and 2 mg liter respectively.

### **Lactoferrin and Transferrin**

Two iron-binding proteins are found in milk. One of them, transferrin (Tf), is a common blood plasma protein; the other , lactoferrin (Lf), is secreted not only by mammary glands but also by kidney and endometrial mucosa. Both Tf and Lf appear to be large single-chain polypeptides of 600-700 residues. Reported molecular weight differ somewhat; recent work favors 75000 to 77000 for Tf, but values for Lf are not so consistent either 700 or 93000 being reported, In both proteins about 4 mol% of the residues are Cys, and both have covalently linked carbohydrate consisting of N-acetylgucosamine, mannose, galactose, and N-acetylneuraminc acid. All transferrins and lactoferrins yet worked with appear to bind 2 mol of Fe + per mole. Tf and Lf differ markedly from each other on amino acid composition and in electrophoretic mobility. They can be detected readily in electrophoretic patterns by autoradiography with Fe. Electrophoreticx patterns of milk and boold preparations from individual animals reveal the occurrence of genetic variants of both proteins. No immunological cross-reaction between Tf and Lf has been demonstrated even when both are from a single species. Amino acid analysis and partial sequences of human Lf and Tf indicate some degree of homology between the two and some internal homologoyf peptide segments within each; sequencing is far from complete, however, Both Tf and Lf can be determined quantitatively in a biological fluid by immunodiffusion using a specific antiserum. The concentrations and ratios of Tf and Lf in milk vary greatly among species and with stage of lactation. The concentration of Lf in colostrums is about 1250 mg/kg <sup>1</sup>; in mid lactation the concentration falls to less than 100mg/kg <sup>1</sup>.

concentrations of Yf in milk have not been determined accurately but may be similar to those of Lf. Lactoferrin is an inhibitor of bacteria because it deprives them of iron. The concentration of Lf in bovine milk is so low, however, that it does not exert any significant antibacterial effect.

# The Application Of Micro-Relief Meter For Soil Tillage Studies

M.A.Ghazavi<sup>1</sup>, A.Yosufvand<sup>1</sup>, B.Hosseinzadeh<sup>1</sup>

<sup>1</sup> Department of mechanical farm machinery, University of Shahrekord, Shahrekord 115 Iran

[Bahram\\_hs@yahoo.com](mailto:Bahram_hs@yahoo.com)

**Abstract:** Measuring the physical properties of soil provides a good opportunity for careful study of processes such as evaporation from the soil surface, formation of water runoff, sediments and erosion. In this research, the change of some soil hydrological properties was studied in four kinds of primary soil cultivation activities by using a mechanical micro-relief meter. This study was conducted in a randomized complete block design. Data was collected in frames with  $9025 \text{ cm}^2$  area and 400 data height were collected for every frame. Measured soil properties were: Root Mean Square (RMS) of height data, superficial Profile Length Ratio (RZ) of soil roughness, Infiltration Recession Factor (RECS), plough depth, the volume of displaced soil, comparison of the area change in relation to superficial evaporation of soil. The RMS of height data was higher ( $p<0.05$ ) with moldboard plow and modified disk plow than chisel and traditional ploughshares. The analysis of height data collected from plots showed that surface evaporation of soil moisture didn't differ by plowing with moldboard plow or traditional ploughshares, compared with two other ploughshares. This statistic was less than the recorded value of developed dish-like ploughshare ( $p<0.01$ ). Also displaced soil mass by these two ploughshares was much more than chisel and traditional ones ( $p<0.01$ ). The developed ploughshare prevents more evaporation. Therefore, plowing surface with this instrument provides high pot-hole store and penetration coefficient compared with other ploughshares. [Journal of American Science. 2010;6(11):85-89]. (ISSN: 1545-1003).

**Keywords:** RMS of height data, RZ, plough, height data, surface evaporation, pot-hole store

## Introduction

The data derived from a micro-relief meter is used in graphic technology and models and geography information system. These data is used to specify channel networks and characterize the location of micro-relief by analysis.

To conserve soil moisture in semiarid areas, superficial evaporation of soil should be prevented. In different of soil cultivation operations, the amount of upper area of plough exposed to evaporation is different so superficial evaporation of soil changes in proportion to the type of soil cultivation. The surface exposed to soil evaporation is obtained by numeral data analysis of roughness. Elliot et al (1997) stated that photometric technology is a good method because of its vast data collection with regard to its collection of more data in every square meter, but it is better to use a brook meter with photometric method. Pini et al (1997) made a laser micro-relief meter which was used by Sevelbent in 2003 to detect spatial distribution plan of sedimentation and micro-morphology. Nicola et al (1999) showed that during heavy rainfall, the physical properties of soil change significantly. They measured change of soil surface roughness by using a laser micro-relief meter. Gazavi et al (1999) compared the operation of moldboard and disk plower. The measured changes consist of the analysis of soils' measure, resistance against penetration, apparent and specific mass, and

roughness of the land surface, existing humidity and the amount of mixing materials in soil. They found that developed dish-like ploughshare has better performance in higher speeds. Kamphorest et al (2000) compared the ability of roughness indexes to define maximum pothole store. Five indexes were computed using Digital Elevation Model (DEM) as following: random roughness (RR), tortuosity (T), limiting elevation difference (LD), slope (LS), and Mean Unslop Depression (MUD). Regression analysis on five indexes showed that RR is the best definition about pothole store. Oliver et al (2000) made an automatic micro-relief meter to measure elevation distribution in 5cm network in order to use distribution equation (effusion) of rain erosion. Also, he presented an electronic micro-relief meter with 5cm networked pattern in 2001 and an algorithm to compute the capacity of soil superficial store with millimeter unit in 2002. Michael et al (2003) indicated that using the technique of "acoustic backscatter" shows similar evaluation with roughness statistics of laser micro-relief meter. When roughness degree was sufficiently measured by "acoustic backscatter", the difference between laser micro-relief meter and "acoustic backscatter" technique to compute RMS was less than 9% and for correlation length was less than 13%.

The rainfall modeling, penetration, store and water flowing procedures have been performed by

Brasington and Smart (2003), Betts et al (2003), Darboux and Huang (2005). The geometric definition of soil surface is needed in all models to determine roughness quantity and maximum superficial store.

Carvajal et al (2006) studied the relationship between digital model of ups and downs and estimation accuracy of maximum pothole store. They achieved a prediction model to estimate the error of maximum pothole store. In their study, usable data were roughness of soil surface and analysis of digital model. Arvidsson et al (2006) computed ups and downs of soil surface using a micro-relief meter with 0.64m area to study moisture effects of soil during plough and showed that in moldboard plowing in low soil moisture conditions, soil softness is more than plowing with chisel. The change in soil surface elevation has been performed in primary soil cultivation by measurement. Their study investigated individually the effect of several kinds of soil cultivation on soil physical properties. Mechanical micro-relief meter was used to remove roughness data of the surface. Measured properties were RMS of height data, superficial RZ of soil roughness, RECS, plough depth, the volume of displaced soil, comparison the rate of soil porosity and area change in relation to surface evaporation of soil.

### Material and Methods

Measurements were performed in Khatoonabad research farm of Azad Islamic University, Khorasan branch, in July 2007. Khorasan is located in east of Esfahan and with 51° 46' longitude and 32° 38' latitude. The farm soil has heavy clay texture and the wheat residues of previous season were in farm. The study was done according to randomized complete blocks. Four kinds of soil tillage machines moldboard plow, including converter, used chisel plow, traditional plow and modified disk plow (Yule and Roddy 1994; Ghazavi 1997) were used on three adjacent blocks. The width and length of every plot were 3 and 25 meters, respectively and slope of all plots was (0.004) and vertical on them (0.002). After soil plowing on plots, height data was measured by mechanical micro-relief meter. Micro-relief meter consisted of one row of pins which could be used to measure one row of height data on graded sheet by contacting the tip of pins ground. The height data could be read by the position of pin top tip from the graded sheet. Finally one plot with 9025 cm<sup>2</sup> area and 5cm networking were measured, and 400 height data were obtained for every set of micro-relief meter. Micro-relief meter provide data by which the surface of different lands after plough with different tillage machines can be compared. The erosion is studied by the data of surface roughness before and after rainfall

in different times. Furthermore, soil pothole store can be measured and according to rainfall statistics, land's roughness can be modified by soil tillage machines to prevent water flowing. This provides a good practical method for preventing erosion in both agricultural and grasslands.

The measured data was rendered as matrixes with coordinates (x , y , z) and in the form of digital elevation model (DEM) data. Then data of numeral model was transferred to the computer and its relevant micro-topography with drawn by SURFER (V.8) software, then parameters of these micro-topography were computed. The statistical analysis of data was done by SAS (v.8) software. Two factors were used to determine roughness indexes with RMS and superficial RZ. RMS is height numeral data and superficial RZ is obtained as following:

$$\text{RZ} = \frac{\text{the upper area of frame unit}}{\text{the area of frame unit}}$$

The more area of roughness is the more soil surface in direct contact with air increases. So evaporation increases that this matter is effective in wasting of water in arid and semiarid areas. Therefore, the surface exposed to evaporation was computed in different tillage's and then compared with each other. Also, positive micro-topographic volume was computed in high level of plough depth and called soil displacement volume for every plow. EUROSEM (The European Soil Erosion Model) has been designed to simulate the erosion of water and sediment by using grooving procedures. In this model, application scale is farms and small areas. EUROSEM uses two parameters to determine soil roughness. These parameters are RFR (roughness measure) and RECS. RECS is the mean of elevation difference between highest and lowest of width section of soil. This study uses RECS to specify the tool of soil cultivation. Micro-relief meter was used to determine RECS.

### Results and Discussion

Figure 1 shows the micro-topographies of some plots. The results of variance analysis have been shown as tables. According to these tables, RMS of plowed soil with moldboard plow is more than RMS of chisel and traditional ( $p < 0.05$ ). RMS of modified disk plow did not have differ with moldboard plow. In result, these two machines have the most roughness and pot-hole store. Superficial RZ of plots showed the same RMS order of height data. Also, the area exposed to evaporation and superficial RZ show meaningful difference in 1% statistical probability level. The analysis of removed height data showed that superficial evaporation of soil moisture does not indicate significant difference between moldboard

plow and composite plows (the evaporation in modified disk plow is less than moldboard plow because of plant remains on land surface, while for two others is less ( $p<0.01$ ) than modified disk plow). Table 5 shows the values of RECS measured for

tools. The coefficient of variation for measurements of elevations RMS is 12.7%. Where RZ and S had values 4.9% and 3%, respectively, showing appropriate accuracy of measurements.

### Conclusion

Displaced soil by modified disk and moldboard plows was much more than chisel and traditional plows. Because of high soil displacement and pothole store, the modified disk plow displaces soil with an angle less than moldboard plow. It can preserve soil moisture and prevents water evaporation. Therefore, plowed soil surface with this machine had high pot-hole store and penetration coefficient, reduces water run off, Prevents soil surface crusting and soil erosion in comparison with moldboard plows. In addition it would be possible to work at higher speed by using a more powerful tractor. Although, the moldboard plow is a standard tillage tool. The new one with above mentioned benefits can be used as an alternative machine for tillage operations and rainwater storage system.

## Variations in some heavy metal concentrations in soil and *Manihot esculanta* tuber from the East and North eastern part of Nigeria

S. T. Garba,<sup>1\*</sup> J. T., Barminas,<sup>2</sup> and A. H. Santuraki,<sup>1</sup>

<sup>1</sup>Department of Chemistry, University of Maiduguri, Borno state. P. M. B. 1069. Nigeria.

<sup>2</sup>Department of Chemistry, Federal University of Technology Yola (FUTY), P. M. B. 2076. Adamawa state. Nigeria. [stelagarba@yahoo.com](mailto:stelagarba@yahoo.com)

**Abstract:** The levels of the heavy metals: Cr, Cd, Pb, Cu, Zn and Mn were determined in *Manihot esculanta* tubers and the soil used for its cultivation. This was done to asses the pollution level of the farmland and hence the safety status of *Manihot esculanta* tubers produced. Samples were collected from Konduga local government area of Borno state in the North East and from Umuahia local government area of Abia state in the East, all in Nigeria. These were treated and digested and the heavy metal concentrations were determined using Atomic Absorption Spectroscopy (AAS). The result obtained shows that, the samples from the North East had the highest levels of the elements Pb 30.14, Zn 88.65, Cd 3.15, Cu 16.00, Cr 6.74, and Mn 13.00 ppm in the soil sample while 5.47, 9.09, 5.05, 2.60, 3.37 ppm for the elements Pb, Zn, Cu, Cd, and Mn respectively were observed in *manihot esculanta* tubers sample. All these were found higher than what was observed in the soil and *manihot esculanta* samples collected from the East. Cr, was however, found below detection limits in *manihot esculanta* tuber samples from both the regions. [Journal of American Science. 2010;6(11):90-94]. (ISSN: 1545-1003).

### INTRODUCTION

Food safety is the major public concern world wide, the increasing demand for food has stimulated research regarding the risk associated with the consumption of food stuffs contamination by pesticide, heavy metals and/or toxins (D'Mello, 2003). Plant constitute essential component of our daily food, contributing protein, vitamins, iron, calcium and energy which are must needed by our system (Thompson and Kelly, 1990). However, these plants may contain both essential and toxic elements, such as heavy metals, at a wide range of concentrations (Bahemuka and Mubofu, 1999).

Heavy metal pollution of the environment even at low concentrations and their resulting long-term cumulative health effects are among the leading health problem all over the world (Oluyemi *et al.*, 2008). Metals such as Pb, Cr, Cd and Cu are cumulative poisons. These metals cause environmental hazards and are reported to be exceptionally toxic (Ellen *et al.*, 1990). Bioaccumulation of Pb for instance, interferes with the functioning of mitochondria, there by impairing respiration, and also causes constipation, swelling of the brain, paralysis and eventual death (Chang, 1992). Contamination of plants with heavy metals may be due to irrigation with contaminated water, the application of fertilizers and based pesticides, industrial emissions, transportation, the harvesting process, storage and/or at the point of sale (Maleki *et al.*, 2008). The use of dumpsite as farmlands is a common practice in urban centres in

Nigeria because of the fact that decayed and composted waste enhances soil fertility (Ogunyemi *et al.*, 2003). These metals often contains heavy metals in various forms and at different contamination levels. Some heavy metals like, As, Cd, Hg and Pb are particularly hazardous to plants, animals and humans (Alloway and Ayres, 1997).

Human beings are encouraged to consume more of edible parts of plants, vegetables and fruits, which are a good source of vitamins, minerals, fibre, energy and beneficial for health (Maleki *et al.*, 2008). Soil is a vital resource for sustaining two human needs of quality food supply and quality environment. Plants grown on a land polluted with municipal, domestic or industrial waste can absorb heavy metals inform of mobile ions present in the soil solution through their roots or through foliar absorption. These absorbed metals get accumulated in the roots, stems, fruits, grains and leaves of plants (Fatoki, 2000). Plants roots have an ability to take up significant quantities of lead while simultaneously greatly restricting its translocation to above ground (Lane and Martins, 1977).

The importance of these plants as food and energy not only to human but other domesticated ruminants further prompts the interest in wanting to know the level of these heavy metal pollutants in the plants and the soil where they grow. By accumulating metals in above-ground level tissues, plants can transfer heavy metal pollutants from soil into the food chain, and this accumulation is one of the most serious

environmental concerns of the present day not only because of the phytotoxicity of many of these metals to the plants themselves, but also because of the potentially harmful effects , toxic metals could have on animal and human health (Radojevic and Bashkin, 1999).The monitoring of heavy metals in crop plants and other foods is therefore of great importance in protecting the public from the hazards of toxic pollution.

Cassava is important, not only as a food crop but even more so as a major source of income for rural households. It is largely consumed in many processed forms in Nigeria. Its use in the industry and livestock feed, is well known, but is gradually increasing, especial import substitution becomes prominent in the industrial sector of the economy. As a cash crop, cassava generates cash income for the largest number of household in comparison with other stables and as a food crop, cassava has some inherent characteristics which make it attractive, especially to the small holder farmers in Nigeria. First, it is rich in carbohydrates especially starch and consequently has a multiplicity of end uses. Secondly it is available all year round, making it preferable to other, more seasonal crops such as grains, peas and beans and other crops for food security. Compared to grains, cassava is more tolerant of low soil fertility and more resistant to drought, pest and diseases. Furthermore, its roots are storable in the ground for months after they mature. This study therefore was carried out to asses the contamination level of the soils and the extent to which the cassava tubers grown on the soil were exposed to heavy metals, and hence the safety levels of the tubers for consumption.

## MATERIALS AND METHODS

### Sample and Sampling Area

Five spots at a distance of 50 metre from each other were mapped out for the sample collections. Samples were collected using clean stainless steel trowel from 0 - 10cm depth. Cassava (*Manihot esculanta*) tubers grown on the soil were randomly collected with stainless steel trowel and knife. In the North East samples were collected in Konduga local government area of Borno state while in the East samples were collected from Umuahia local government area of Abia state, Nigeria. The Cassava tuber samples were identified by a botanist in Biological science department, university of Maiduguri, Borno state.

### Sample Preparation and Analysis

The collected dried soil samples were thoroughly homogenized in a clean plastic bucket to

obtain a representative sample, crushed and sieved with 2 mm mesh and stored in a well - labelled polythene bags before analysis. The cassava tubers were washed with water, sliced and dried to a constant weight in an oven at 70°C. The dried samples were pulverized using a pestle and mortor, and kept in polyethylene bags for further analysis. The soil samples were digested in a crucible with a mixture of HNO<sub>3</sub>, HCl and HF acids. Similarly the dried powdered cassava tubers were digested with a mixture of 60% HClO<sub>4</sub>, concentrated HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> acids. Blanks were also prepared to check for background contamination by the reagents used. The digested samples were analyzed for heavy metal concentrations using atomic absorption spectroscopy (AAS) model Unicamp 969 in Jos mining coporation, Plateau state, Nigeria.

## STATISTICAL ANALYSIS

Statistical analysis using Student's t-test showed that the soil texture, pH and organic matter content of the soils were not significantly different.

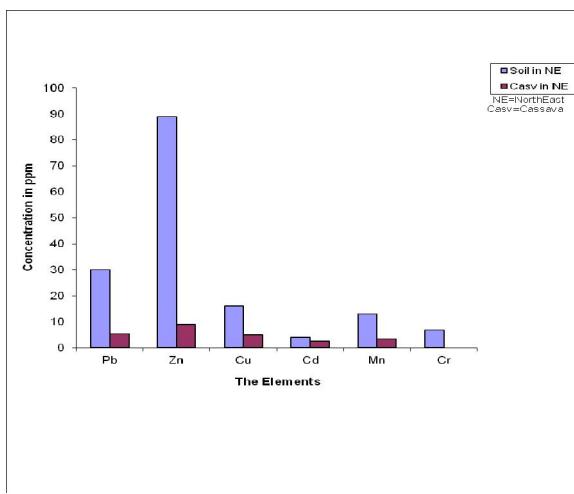

## RESULTS AND DISCUSSION

The soil properties obtained in this study are as shown in **table 1**.The percentage sand and clay were observed to be high in the soil samples from the east. This soil was found to be sandy clay loam in texture while, the soil samples from the North-east was found to be sandy clay in texture. The pH of the soil samples from the east were found to be slightly alkaline (7.4) with higher organic matter content while the soil from the North-east were found slightly acidic (6.65) with low organic matter content. The high pH level observed from the East may probably be due to the high organic matter content. This region also experienced high and frequent volume of rainfall which dilutes the soil solution leading to the high observed pH level.

The high organic matter content from this region may be due to the presence of to-much plant waste, frequent rainfall coupled with the high humidity level which catalyzed the decomposition of the plant waste. Organic matter plays an important role in soil structure, water retention, cation exchange and in the formation of complexes (Alloway and Ayres, 1997). In the North-east, the low pH level, may be attributed to the low and non-frequent rainfall, punctuated at times by dry air and high temperature hence low level of organic matter content was observed. At low pH level, metals are more soluble in the soil solution and therefore more available for plants use. Hence toxicity problems are more severe in acidic than in alkaline soils (Oluyemi *et al.*, 2008).

The heavy metal concentration in soil and cassava tubers from the East and the North-east are as

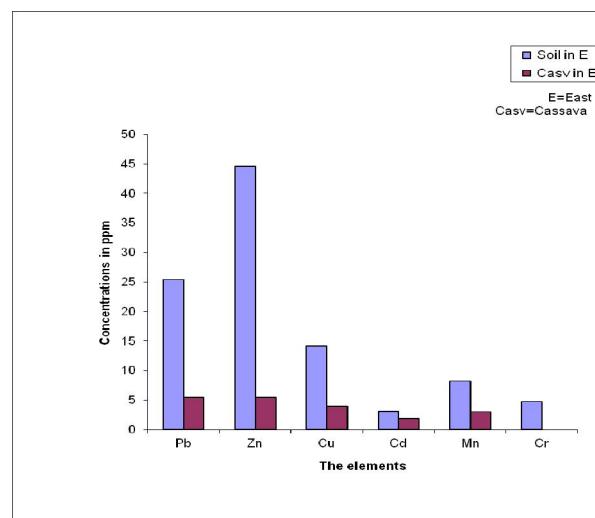

shown in **table 2**. The levels of these heavy metals in the samples from the North-east were found to be higher than what was observed in the samples from the East. This might be due to the dusty nature of the North-east region. Although samples were collected in the raining season, the rainfall was not frequent and heavy enough to wash or leached the deposited aerosol particulate matter. These aerosol particles originate mainly from the sahara desert from the neighbouring countries that share border with Nigeria in the North-east in the form of sandstorms. The sandstorm picks along with it a lot of aerosol particulate matter, loaded with heavy metals which get precipitated on the soil or plant by either rain or brought down by gravity under calm condition. Hence the high levels of these heavy metals in the soil and cassava tubers samples from the North-east than what was observed in the samples from the East. Figure 1 and 2.

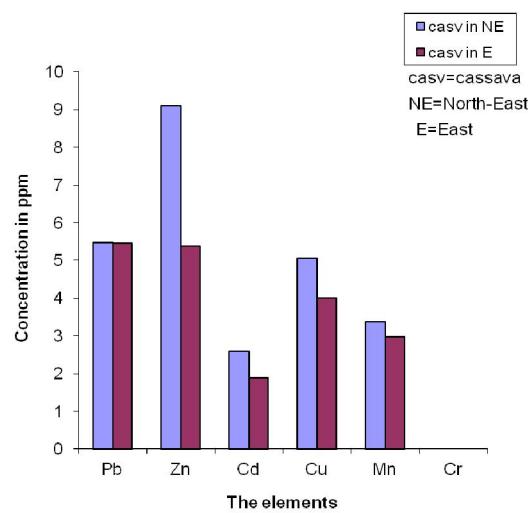

**Figure 1. Variation in the mean concentration of elements determined in Cassava and Soil From the North Eastern Part of Nigeria.**

As to the safety of the cassava tubers analyzed in this study regard to the levels of these heavy metal pollutants, it shows that, the level of contamination by Pb was 5.47 and 5.46 ppm in the samples from North - East and the East respectively. Zn had 9.09 and 5.34 ppm, Cd 2.60 and 1.88 ppm, Cu 5.05 and 4.00 ppm, Mn 3.37 and 2.98 ppm respectively. While Cr was found below the detection limits as shown in figure 3. It has been reported that, the normal non-toxic range of these metals in plants are: 0.2 - 20 mgkg<sup>-1</sup> for Pb, 1 - 400 mgkg<sup>-1</sup> for Zn, 0.2 - 2.4 mgkg<sup>-1</sup> for Cd, 5 - 20 mgkg<sup>-1</sup> for Cu and 20 - 1000 mgkg<sup>-1</sup> for Mn and the critical levels above which toxicity is likely are: 5 - 30 mgkg<sup>-1</sup> for Cd and Cr, 20 - 100 mgkg<sup>-1</sup> for Cu, 100 - 400 mgkg<sup>-1</sup> for Zn, 30 - 300 mgkg<sup>-1</sup> for Pb and 300 -

500 mgkg<sup>-1</sup> for Mn. Although the levels of metals observed in this study were slightly high, with the exception of Cr which was not detected, the levels are found within the range of the normal, non-toxic levels reported by Alloway, (1995).

**Figure 2. Variation in the mean concentration of elements determined in Soil and Cassava from the Eastern part of Nigeria**

**Figure 3. Variation in the levels of the heavy metals determined in cassava tubers from the East and the North-Eastern part of Nigeria**

**Table 1:** Soil properties

Soil	Depth (cm)	% Sand	% Clay	% Silt	pH	% Organic matter Content
Soil from Konduga, Borno State in the North-east	0 – 10	55.96	28.14	15.90	6.65	6.64
Soil from Umuahia, Abia state in the east.	0 – 10	58.54	22.23	19.23	7.4	7.54

**Table 2:** The mean  $\pm$  SD of heavy metal concentration in soil and cassava tubers from the East and North - eastern part of Nigeria.

Elements / Sampling Area	Zn	Cu	Cd	Pb	Mn	Cr
Soil from Konduga, the North-East	88.95 $\pm$ 0.02	16.00 $\pm$ 0.02	4.00 $\pm$ 0.03	30.14 $\pm$ 0.03	13.00 $\pm$ 0.03	6.74 $\pm$ 0.03

Key ND = Not detected; SD = Standard deviation

### Conclusion

Food safety is now a global issue. Therefore monitoring the levels of contaminants in food items for proper health management has become imperative and should be encouraged. The consumption of tuber crops nowadays to supplement the energy provided by other food items is becoming higher. Because of this, tuber crops are gaining more financial support from the government of Nigeria to boost production for subsequent exportation. It is therefore imperative to certify the safety in its consumption. The levels of the pollutant observed in this study were found to be within the safe limits of consumption.

# Exploitation of palms wine in the municipality of Ze (Benin): socio-economic and physical impacts

Ade Romaric Herman<sup>1\*</sup>, Bio Bigou Bani Leon<sup>2</sup>, Luo Zhaohui<sup>3</sup>

1. School of Environmental Studies, China University of Geosciences, Hubei province, 388 lomo Road, 430074 Wuhan, P.R China, , 008613797056028
2. University of Benin, (Abomey-Calavi), General Secretary of university Box: 526- Abomey- Calavi-Benin
3. China University of Geosciences, Department of Environmental Sciences, 388 Lumo Road, Wuhan City, Hubei province, 430074, P.R. China

**Abstract:** The exploitation of palm wine is one of activities which many people from southern Benin particularly the municipality of Ze have engaged. This study aims to analyze the socio-economic and environmental impacts of the exploitation of palm wine in the municipality. The methodology consisted of collecting demographic, agricultural, socio economic data, processing and analysis of data collected in real area based on components of the Leopold matrix. The exploitation of palm wine has changed the agricultural landscape of the municipality of Ze. The soil is becoming unproductive for food crops after a long fallow palm wine causing impoverished land due to overuse. The vegetation is endangered because of the rarity of certain plant species like *Acacia* sp (acacia), *Antiaris africana*, *sapadi Blighia* (bligia tasty), *Chlorophora excelsa*, *Cola nitida*, etc. But, in other aspect this activity is contributing to improve the living conditions of farmers and reduce the production of oil palm in this area. The production of alcohol provides employment to about 42% of the active population in the municipality of Ze, (municipality of Ze, 2007). At various levels of production that is from felling to alcohol distillation there are large numbers of people being employed. [Journal of American Science. 2010;6(11):95-102]. (ISSN: 1545-1003).

**Key words:** palm wine; sodabi; socio- economic and physical impact; municipality of Ze.

## 1- Introduction

Benin is one of the developing countries in Western Africa. Its size is just over 110.000 km<sup>2</sup> with a population of almost 8.500.000. Agricultural is a backbone of Benin in which about 70% of the active population is involved. It represents 90% of exports and contributes more than 40% to Gross Domestic Product (INSAE, 2008). Exploitation of Palm wine for local alcohol production is an activity in which farmers of southern Benin especially the people from the municipality of Ze have been involved. There are different types of palm trees which are palm wine, palm date and palm toddy (Brand and Durosset, 1995). However, this study was focused only on palm oil which has been grown in the municipality.

Previous studies on palm oil have not identified the impacts of exploitation of palm wine on the economic environment of Ze. Most of studies carried out in Benin focused on the palms of the plateau of Adja and Oueme without providing both the main socio-economic and environmental impacts of palm wine exploitation. The goal of this study is to identify and analyze the socio-economical and physical impacts of palm wine exploitation. This analysis is important to the authorities to have a view for mitigation of impacts through: the reduction strategy for felling of palm wine for alcohol production, improved processing techniques,

improved living conditions of farmers and their role. The production of alcohol is specific and important to local inhabitants of southern Benin. Historically, The “sodabi”, drinking palm wine and homemade, was prepared for the first time by the brothers Gbèhalaton Bonou and Sodabi Kiti in the village Sèdjè Houègoudo Allada in the municipality of Ze in Benin. However, constantly growing of the population and the number of agricultural active has promoted the increment production of alcohol. After one decade, production of palm schemes is constantly decreasing in the locality due to periodic and selective felling of palms for the production of alcohol added to climate change.

## 2-Methodology

### 2-1 Area of study

The municipality of Ze is one of the 77 municipalities of Benin located between 6° 34' and 6° 37' North latitude and 2° 10' and 2° 13' longitude in the southern Benin. It covers an area of 543 km<sup>2</sup>. The municipality of Ze housed a population of 58185 inhabitants in 1992. In 2002, the population rose to 68315 inhabitants, an increase of 10130 people in ten years (INSAE). This evolution reduces the arable land. Also, People attach themselves most importantly to the transformation of derivatives of palm oil especially palm wine. Land is moderately favorable

for the cultivation of perennial plants. The choice of this area is also justified by the fact that forest resources are threatened (OVIGEPAF, 2005) and

there are poorer soils as a result of the abuse of palm wine.

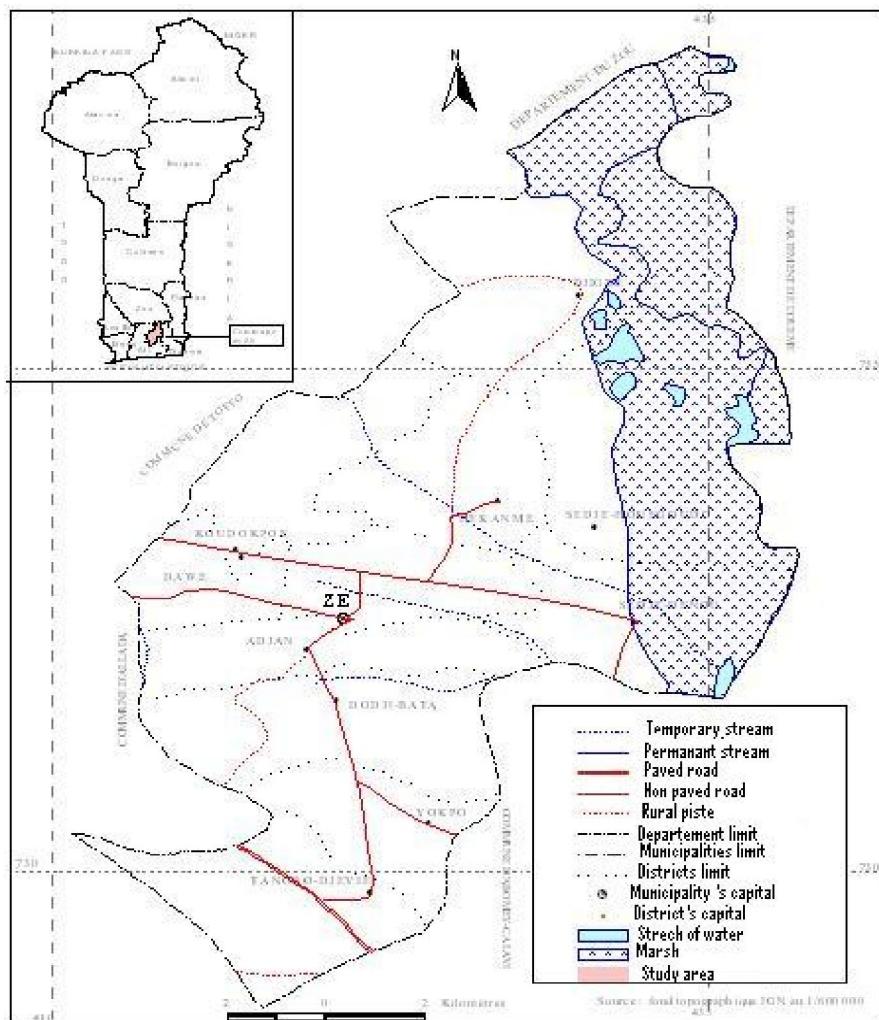

Figure 1: Geographic localization of area of study (Ze)

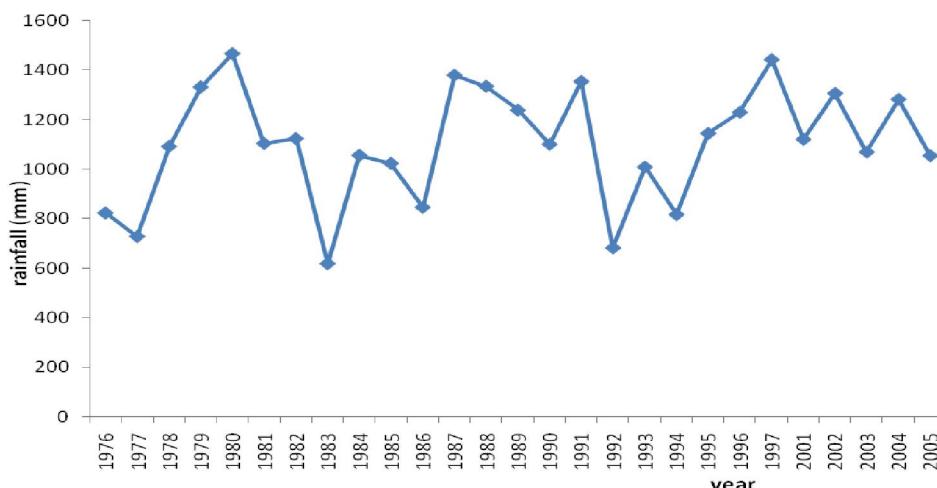

## 2-1-1 Climate

As we know, wine palm is a perennial plant that needs a minimum of 1800 mm of rain per year to grow up. A high and constant temperature with maximum average of about 29 ° and 33 ° and the mean minimum of about 22° to 24° is necessary for the palm wine. Also, they need constant sunshine of at least five to seven hours per day. However, the

municipality is under influence of climate subequatorial whose features are moderately favorable to the exploitation of the palm wine.

## 2-1-2 Precipitation

The average annual rainfall is around 1365.91 mm in this municipality. Figure 2 reflects the rainfall in the municipality of Ze from 1976 to 2005.

**Figure 2:** evolution of precipitation in Niaouilli (1976-2005)

Source: ASECNA, 2005.

The rainfall is generally unimodal, one year in five. The observation of Figure 2 identifies three levels. Of the 30 years the maximum rainfall 1478 mm was in 1987, 1310.7 mm in 1998 and 1395.2 mm in 2001. This situation has not been very favorable for the cultivation of palm trees, since the minimum required for its Growth is 1800 mm / year. This regime has encouraged the development of natural plant species which are threatened daily by the strong human influence.

### 2-1-3 Vegetation and soil

It is an area mostly covered with a large industrial plantation of palm trees organized into five cooperatives with an average of 600 hectares each, and private plantations of natural selected palm trees. The municipality of Ze is characterized by a sedimentary cover moderately favorable for the cultivation of palm trees. There are three types of soil, illustrated in Figure 3 (CeCPA, Ze).

- Ü The land bar or Continental Terminal, which covers more than half of the locality. It is favorable for growing food and palm wine;
- Ü Hydro-morphic soils in the valley of Oxeye at Djigbé, Sèdjè-Denou and Houégoudo. They are not favorable for the cultivation of palm wine;
- Ü Lateritic soils which are also favorable to palm wine.

Overall, the Continental Terminal is mostly favorable to the cultivation of palm wine than other types of soil.

### 2-2 Data analysis

The methodological approach used here was the collection, processing and analysis of data, and interpretation of results. The data collected here was both qualitative (access to land, access to credit, farming techniques, labor, etc.) and quantitative (the profitability of farming, the agricultural workforce, etc.) which allows the determination of parameters to identify the impacts associated with the exploitation of palm wine. There was much focus on those relating to socio-economic, agronomic and biophysical indicators and in addition, the collection of these data required an appropriate method in collecting literature.

#### 2-2-1 Data collection

Firstly, a literature review was conducted which provided guidance in collecting information that was relevant and gave orientation on the choice of the title to this paper. Information related to statistical data on palm wine, the evolution of vegetation cover and the felling of palms, the agricultural economy and living conditions of farmers were collected from different institutions namely: INSAE, INRAB, MAEP, OVIGEPAF, CeRPA and MEPN in Benin.

The second phase was for the field survey. It took place in villages of six districts of the municipality where the wine activity is very intense (Ze centre, Koundokpoe, Djigbé, Adjan, Sèdjè Houegoudo, and Hekanmè). Research units selected were the operators of palm wine or liquor producers as well as the various technical institutions responsible and Elders of the locality.

The choice of sampling was based on three basic criterions:

- Ø Farmer or producer of palm wine in the resort;

- Ø Processor of palm wine from the resort;
- Ø Occupation of the land under palm trees.

These investigations were made on the basis of self-administered questionnaires sent to farmers and processors derivatives of palm wine. The semi-direct have been made for the simple reason that over 50% of people surveyed were illiterate and were unable to complete questionnaires. The interviews were conducted, which helped to confront and complement the information gathered for using questionnaires and focus groups. This technique enhanced community participation at each level of the research.

Finally, observations were made on field to understand types of plantations, the palm operating systems, the state of vegetation cover, the chain of production of alcohol, systems of land tenure, etc.

## 2-2-2 Analytical method

Identification of potential impacts of the exploitation of palm wine on each element of the environment and the socio-economic framework was made by using Leopold Matrix method. It is a two dimensional array used to identify interactions between activities, appearing in rows, and environmental components which appears in the columns. It allowed us to establish the link between wine activity and its impacts on the natural environment. Impacts of the exploitation of palm wine identified were characterized by their nature (direct or indirect), their importance and scope. The overall impact was evaluated according to the magnitude of the impact and value of the element affected.

**Table:** Leopold matrix method adapted to the exploitation of palm wine in the municipality of ZE.

In order to understand the magnitude of impacts in the municipality using the Leopold matrix method, two indicators were used which were, the degree of impact on the environment element (dI) and the frequency of impact fI which could allow to establish the nature of the impact. Two formulae have been used:

∨

$$dI = \sum_{i=1}^n \frac{xij}{n}$$

with

- xij is the positive or negative matrix of the environment component which appear frequently
- n= 9

Analysis of degree of impact is based on following criteria: when  $dI < 0.5$  is considered that the element is partially affected,  $0.5 < dI < 1.5$ , the element is said affected and  $dI > 1.5$ , the element is said severely affected.

$$\checkmark \quad fI = \frac{e}{n} * 100 \text{ with}$$

- e is number of positive impact (minor and major) or negative impact(minor and major) on the element
- n=9

### **3-Results and discussion**

Two types of exploitation were observed in the municipality of Ze; the first one is traditional exploitation which is an artisanal process of local alcohol which needs to meet certain conditions and processing techniques before the actual production. This kind of exploitation occurs to both natural and private palm grove users. Second one is selective exploitation which relates to the palm industry and is organized by the authorities of the CAR and UR-CAR in the municipality. Palms which are felled are sold to local alcohol producers. For these two types of exploitation, they both have an implication on socio-economic and environmental impacts.

#### **3-1 Socio-economic impact of exploitation of Palm wine**

Local alcohol production is providing employment to population of the municipality of Ze. These jobs are at different levels in the chain production. The degree of impact  $dI= 3 > 1.5$  with  $nI= 88.88\%$  for the population and  $dI= 2.11 > 1.5$  with  $nI= 46.6\%$  for the profitability. Analysis shows that more than 33.33% of palm wine producers surveyed employ between 3-12 workers per hectare against 71.41% of wine processors that employ between 5-20 workers per day and per hectare for work on the felling, pruning, and the extraction of wine; in other way how the transformation of derivatives of palm wine is labor-intensive. The manpower recruited running a seasonal periods due to unfavorable wine activities that occur during the year. Also, according to surveys, 80% of producers of palm wine put their legacy parcels in palm grove planting. Thus, the retail foot palm allowed them to meet food needs and fulfill the obligations of customary order. In fact, from 300 feet of natural palm wine felled per hectare, on average 4800 liters of alcohol were produced locally by the processor in the interval of three months. After sales, the gross income per season from the operator was approximately \$969 per month an estimated profit of more than \$80 if the activity covered all year. It means that their income can contribute up to 50% for the family. Furthermore, in

the case of processors who sorely depend on this business, the production exceeds 4800 liters per farmer.

In the districts where investigations were conducted, the production of alcohol occurs only in dry season which is the peak period; the rainy season was often reserved for fieldwork. Figure 2 shows information on the proportion of each activity by peasant farmers from the total income.

The production of alcohol remains the main financial source. The income from this production is used for household, health care,etc. The evolution of alcohol production, reduced production of palm oil in the municipality of Ze has led to the scarcity of palm schemes which are also linked to climatic conditions, the pruning of young seedlings, especially the felling of palms. The low productivity of palm oil is also due to high costs and number of cheap laborers employed throughout the transformation process scale. According to the surveys, 80% of palm oil producers used an average 15 workers per day against an average of 8 workers in the alcohol producers. Figure 3 shows the frequency of each product from the processing of derivatives in the municipality of Ze.

#### **3-2 Environmental impact**

The exploitation of palm wine affects two major components of the environment. From the analysis, it has been shown that  $dI$  of soil was inferior to 1.5 and  $nI= 33.33\%$ . That mean the soil is the most negatively affected. Impoverished land due to overuse (cropping systems consist of a virtually continuous food crop palm wines plantations) has completely changed the agricultural landscape in the district of Adjan, Koundokpoé, Djigbé, Ze -center and Hékanmè (CeCPA-Ze, 2007). The soils become unproductive for food crops after a long fallow palm wine. Nutrients in vegetation and soils were slow to be recovered, therefore, causing a decrease in soil fertility (INRAB). This work gives an understanding as to why the municipality of Ze still imports food despite its climate favorable conditions to agriculture. However, palm improves soil fertility which enhances growth for certain food crops such as maize and cassava. It is also advantageous since people are compelled not to make fires. Ultimately, the vegetation that grows eventually decomposes thus increasing the organic matter in the soil there by returning the biological life.

In the district of koundokpoe, the field observation and analysis of data collected shows that after a fallow, there arises a problem of overuse of land, which does not favor good growth of some crops such as beans and peanut. Figure 4 illustrates the evolution of the felling of palms for the production of alcohol from 1997 to 2007 in the municipality of Ze. From 1997 to 2000, felling private Palms as well as industrial plantations had increased. This is due to the

increment of demand for alcohol and increased number of the alcohol producers. From 2000 to 2005, that amount had fallen due to the scarcity of natural palm trees and also the culling campaign co-organized by Rural Development of the municipality. In 2006, this amount had increased due to the regeneration of palms and also the lack of culling campaign by cooperatives.

On the other hand, the felling Palms' site has significantly better physical and chemical fertility characteristics within the radius of one meter and increases even more above 2m. All this is explained as the radius of one meter is rich and mostly because of inflorescences, fruits and almonds which fall on the ground and eventually decompose. Within the radius of 2 meters that is enriched by palm, there are about 100 plants per hectare. The fertilizing effect begins in the 2nd year. During, the first year after the felling of palms, there is decomposition of roots and plant debris in soil, immobilizing some of the nutrients such as nitrate (N), phosphate (P), potassium (K), calcium (Ca), magnesium (Mg) and nitrogen (Na). After plant decomposition, soils become richer and nutrients are available for crops.

In regards to the vegetation, the degree of impact dI was equal to  $0.77 > 0.5$  and nI equal to 55.55%. That means the vegetation was also mostly negatively affected. The cultivation of the palm wine and its exploitation for the production of alcohol requires destruction of natural vegetation formations. The use of plant species for the production of alcohol and the felling of regular palm is an alarming call to reduce deterioration of the physical environment of Ze. This was confirmed by comparative analysis of land use maps of 1994 and 2006 which show the evolution of vegetation cover. Figure 4 shows the decline of plant species, which is linked to human activities including palms exploitation for the production of alcohol.

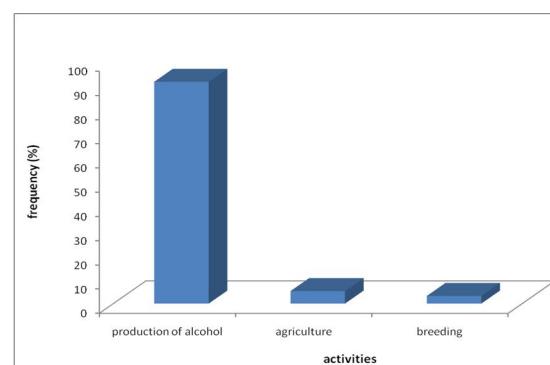

Figure 6 shows the rate of decline and increasing environmental components in the municipality of Ze. Training swamps, savannas and shrub lands as the relict forests have declined significantly between 1994 and 2006. The cultivation of over 40,000 of palm trees had lead to the destruction of vegetation cover in about 50 hectares in the northwestern part of the town. (CeCPA, Ze). The vegetation such as savannas, patches of dense forests (forest of worship "ORO"), swamp forests and forest reserves on Djigbé were threatened. The energy source used in the preparation of alcohol is the wood energy provided by different forest types of riverside villages. The lack of arable land due to the increment of population numbers is leading to pressure on forest products despite the prohibition laws. This has led to the loss of over a tenth of the total forest area of

3647ha per year. Plant species such as *Acacia sp* (acacia), *Antiaris Africana*, *Blighia sapadi*, *Chloroophora excelsa*, *Cola nitida* etc are gradually disappearing at an expense of agricultural crops in the municipality.

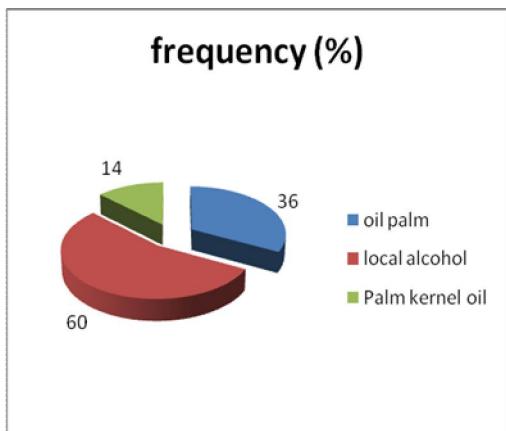

#### 4-Conclusion

The palm wine, particular oil palm is a multidimensional plant due to its multifaceted and varied character. The exploitation is one of the main activities of people in the municipality of Ze. From the production, processing and marketing of raw materials high numbers of labor are mobilized. It is emerging as a real source of income for the population and has been contributing for the improvement of living standards of farmers. In environmental terms, the exploitation of palm wine contributes to the degradation of the environment, including soil and vegetation. It is therefore necessary to have mitigation measures related to reduction strategies and improvement of impacts associated with the exploitation of palm wine.

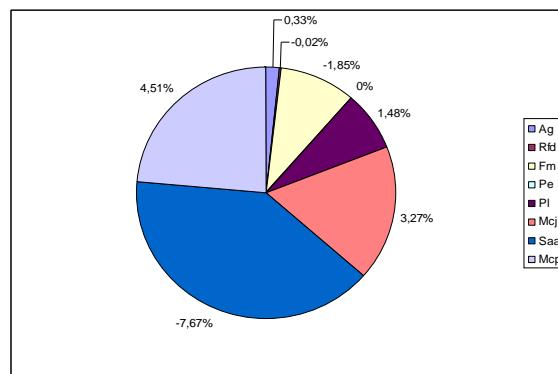

Amongst these measures, some of them are; the strategy of reducing felling of palm wine for the production of alcohol; adoption of the technique known as "tapping", which can improve processing techniques, soil fertility and living conditions of farmers by diversifying to other agriculture activities such as food crops and livestock farming. Diversification has a positive effect on the well-being of farmers in the sense that total revenue is high and the quality of the alcohol from palms is also improved since the volume of the alcohol produced is not much which brings in much focus during the production. In the long run, the beverage can also be enjoyed in all corners of Benin.

**Abstract:** The environmental impact of metal additions to soil depends on its sorption ability. To evaluate the sorption of copper (Cu) on to some soils an experiment was conducted with ten calcareous soils of Hamadan province in the west of Iran. Half g soil samples were equilibrated at 25±1 and 45±1°C with 25 ml of 0.01 M CaCl<sub>2</sub> containing 0 to 30 mgL<sup>-1</sup> Cu as CuSO<sub>4</sub>. Suspensions were centrifuged, filtered and concentration of Cu in the clear extract solution was calculated. The thermodynamic parameters viz. K, G, H and S were determined by using sorption data and concentration of Cu in equilibrium solution at two different temperature. Thermodynamic parameters revealed that Cu sorption increased as the values of K and G increased with rise in temperature from 25 to 45 °C. The G° values at 25 and 45°C were negative and ranged from -18.39 to -24.10 and -21.167 to -26.267 kJ mol<sup>-1</sup> respectively. The values of enthalpy (H°) and entropy (S) were positive and ranged from 8.184 to 42.852 kJ mol<sup>-1</sup> and 102.457 to 206.184 J mol<sup>-1</sup> K<sup>-1</sup>. The results showed that Cu sorption is a spontaneous process and endothermic reaction. The results also showed that calcareous soils can sorb high amounts of Cu and that thermodynamic parameters are useful in describing Cu sorption. [Journal of American Science. 2010;6(11):103-108]. (ISSN: 1545-1003).

### 1. Introduction

Adsorption is one of the most important chemical processes in soils. It determines the quantity of plant nutrients, metals, radionuclides, pesticides and other organic chemicals that are retained on soil surfaces and, therefore, is one of the primary processes that affect transport of nutrients and contaminants in soils. Sorption also affects the electrostatic properties of suspended particles and colloids. The electrostatic properties affect coagulation and settling (Sparks 1995). Sorption reactions on soil mineral surfaces potentially attenuate toxic soil solution (Goldberg 2002). Sorption isotherm analysis is a useful technique to study the retention of metals in soils. Sorption isotherms provide useful information about the soil retention capacity and the strength by which the sorbate is held on to the soil.

Sorption isotherm batch experiments are very important in soil science research. Theoretically, maximum monolayer sorption, empirical adsorption constants, and other important adsorption parameters can be determined by this method.. Selective adsorption of Cu and Zn has been related to their susceptibility to hydration, their charge / radius ratio, their electronegativity and their Misono softness (McBride 1989). Study of Zn and Cu adsorption onto soils of various kinds and onto certain individual soils fractions and other substrates have shown that the main physical and chemical factors governing these processes are pH and presence of organic and/or inorganic colloids (Lopez et al. 1998; Kardivelu et al. 2001; McBride et al. 1997). Copper is more soluble in acid soils

than in calcareous soils and their marked sorption hysteresis is most marked in the case of sorption by organic soil components (McLaren et al. 1983; Barow et al. 1989; Wu et al. 1999). In the absence of other metals, copper is generally considered to be adsorbed in greater quantities than other metals (Elliott et al. 1986), although they behave more similarly in soils with low organic matter content (Karathanasis 1999).

Adsorption increase with increasing temperature, due to the increase in number of active sites (Yavuz et al. 2003; Bouberka et al. 2005). To gain further insight into sorption process and its mechanism, thermodynamic approach can predict the final state of metal in the soil system from an initial nonequilibrium state (Sposito 1984). A thermodynamic approach was used to study the effect of temperature on the adsorption processes of lindane on a number of adsorbents (Mills and Bigger 1969a, b, c). Evaluation of the free energy change corresponding to the transfer of element from bulk solution into the appropriate site of the double layer or clay mineral lattice are helpful to express the sorption process. Similarly, an understanding of change in enthalpy and entropy helps in determining the free energy change and disorders occurring during sorption process. The high values of G° both for Pb and Cd indicated that both the reactions are spontaneous (Adhikari and Singh 2003). The values of H° were found to be negative for Cd and positive for Pb concluded that Cd sorption reaction was exothermic while Pb sorption was found to be an endothermic reaction in all the soils. (Adhikari and Singh 2003). The values of S were found to be positive due to the

exchange of the metal ions with more mobile ions present on the exchanger, which would cause increase in the entropy, during the adsorption process (Unlu and Ersoz, 2006). Information about Cu sorption characteristics and sorption thermodynamic parameters (STP) were limited in soils of Iran. The objectives of this research were to study the Cu sorption characteristics and determination of STP in some calcareous soils of Hamadan province in western Iran.

## 2.Materials and Methods

We collected bulk samples of the top soils (0-30cm depth) from ten calcareous soils from Hamadan province in the west of Iran. All samples were air dried, crushed and sieved through a 2-mm prior to soil analysis and sorption studies. Characteristics of the soils such as, particle size distribution, pH, EC, CEC, organic C, and calcium carbonate equivalent were determined using standard analytical methods (Gee and Bauder 1986; Rhodes 1996; Summer and miller 1996; Nelson and Sommers 1996 and Nelson 1982). Concentration of available Cu in soil samples was determined using DTPA method (Lindsay and Norvell 1978).

To study the sorption of Cu by different soils, 0.5 g soil sample was placed in 100 ml plastic bottles and equilibrated with 25 ml of 0.01 M  $\text{CaCl}_2$  solution containing graded levels of Cu, i.e. 0, 2, 5, 10, 15, 30  $\text{mg l}^{-1}$  Cu as  $\text{CuSO}_4$  solution. Solutions were prepared in 0.01 M  $\text{CaCl}_2$  to keep the ionic strength almost constant. Each sorption set, for Cu, was replicated thrice. The soil suspension shaken for 30 min and was equilibrated for 24 h at  $25\pm 1$  and  $45\pm 1^\circ\text{C}$  on an incubator. Based on preliminary studies, an equilibrium period of 24 h and soil/solution ratio of 1:50 were found optimum beyond which no significant change in metal content of equilibrium solution was recorded. After equilibration time, the suspension was filtered, and concentration of Cu in the clear extract solution was determined using Varian Atomic Absorption Spectrophotometry. Amount of Cu sorbed by soils was calculated from the difference between the initial and final concentration of Cu in the equilibrium solution. For studying the sorption relationship, the data were fitted to the following equations:

$$\text{C}_e/q = 1/K_b + 1/b\text{C}_e \quad \text{Conventional Langmuir}$$

$$\log q = \log K_f + n \log \text{C}_e \quad \text{Freundlich equation}$$

Where  $\text{C}_e$  is the Cu concentration in the equilibrium solution ( $\text{mg/l}$ ),  $q$  is the amount of Cu sorbed by the soil ( $\text{mg kg}^{-1}$ ),  $b$  is the sorption maxima ( $\text{mg kg}^{-1}$ ) and  $K_b$  is the bonding energy coefficient ( $\text{l mg}^{-1}$ ). The  $K_f$  is the Freundlich distribution coefficient and  $n$  is an empirical constant.

Langmuir and Freundlich isotherms don't give any idea about sorption mechanism, but Dubinin-Radushkevich (D-R) isotherm describes sorption on a single type of uniform pores. In this

respect the D-R isotherm is an analogue of Langmuir type but it is more general, because it does not assume a homogeneous surface or constant sorption potential (Unlu and Ersoz 2006). In order to understand the adsorption type, D-R isotherms were obtained. The D-R isotherm has the form:

$$\ln q = \ln q_m - k^2$$

and

$$= [RT \ln (1 + (1/C_e))]$$

Where  $\ln q$  is Polanyi potential,  $q$  is the amount of Cu sorbed by the soil ( $\text{mol g}^{-1}$ ),  $k$  is a constant related to the adsorption energy ( $\text{mol}^2 \text{kJ}^{-2}$ ) and  $q_m$  is the adsorption capacity ( $\text{mol g}^{-1}$ ). The mean free energy of adsorption ( $E$ ) was calculated from the  $k$  values using the equation:

$$E = (-2k)^{-0.5}$$

The magnitude of  $E$  is useful for estimating the type of adsorption process. If this value is between 8 and  $16 \text{ kJ mol}^{-1}$ , adsorption process can be explained by ion exchange (Unlu and Ersoz 2006).

Thermodynamic parameters were calculated from the variation of the thermodynamic equilibrium constant,  $K^\circ$ , computed by following the procedure outlined by Biggar and Cheung (1973). The value of  $K^\circ$  for adsorption reaction can be defined as:

$$K^\circ = a_s/a_e = sC_s/eC_e$$

where  $a_s$  denotes activity of adsorbed metals,  $a_e$  to activity of metals in equilibrium solution,  $C_s$  to milligrams of metals adsorbed per litre of solution in contact with the adsorbent surface,  $C_e$  to milligrams of solute per litre of solution in equilibrium solution,  $s$  is the activity coefficient of the sorbed metals and  $e$  represents the activity coefficient of metals in equilibrium solution. Since at lower concentration, activity coefficient approaches unity, above Eq. was reduced to:

$$K^\circ = C_s/C_e$$

The values of  $K^\circ$  were obtained by plotting  $\ln (C_s/C_e)$  vs.  $C_s$  and extrapolating to zero  $C_s$ . The standard free energy ( $G^\circ$ ) was calculated as follows:

$$G^\circ = -RT \ln K^\circ$$

The standard enthalpy ( $H^\circ$ ) was obtained from integrated form of the Vant Hoff equation:

$$\ln K_2^\circ/K_1^\circ = -H^\circ/R[1/T_2 - 1/T_1]$$

The standard entropy ( $S^\circ$ ) was calculated as

$$S^\circ = (H^\circ - G^\circ)/T$$

## 3.Results and Discussion

Selected chemical and physical characteristics of the soils are presented in Table 1. The texture of the soil samples are clay loam to sandy clay loam. The calcium carbonate equivalent ranged from 5 to 53.8%. Organic matter content ranged from 0.68% to 2.40%. The pH of the soils ranged from 7.44 to 8.20 which indicated that all of the soils are alkaline. The CEC ranged from 10 to 25.1  $\text{Cmol}_{(+)} \text{Kg}^{-1}$ . The DTPA extractable Cu ranged from 0.49 to  $4.15 \text{ mg kg}^{-1}$ .

For proper evaluation of the environmental threat posed by Cu or of its availability, it is necessary to supplement the individual sorption characteristics. Sorption isotherm for these soils exhibited difference in the amounts retained. Cu sorption didn't described by Langmuir equation ( $R^2=0.11-0.60$ ). Freundlich and D-R equation were described Cu sorption (Table 2). Constants of these equations were shown in Table 2. Freundlich distribution coefficient ( $K_f$ ) ranged from 798.18 to 73063.42 mg kg<sup>-1</sup>. Distribution coefficient represents the sorption affinity of the metal cations in solution for the soil solid phase and can be used to characterize the mobility and retention of Cu in a soil system. A distribution coefficient can be related to both plant uptake and environmental pollution. Low distribution coefficients indicate that most of the metals present in the system remain in the solution and are available for transport, chemical processes and plant uptake (Jalali and Moharrami 2007). Whereas higher values indicate lower

mobility and higher retention of metal in the soil. Soil no 8 had the highest  $K_f$ , its high CEC and clay content. Soil no 10 had the lowest  $K_f$ , its low CEC and equivalent calcium carbonate. So that Cu in soil no 8 had the lowest mobility and Cu in soil no 10 had the highest mobility. Freundlich distribution coefficient order was:

soil no 8>soil no 5>soil no 7> soil no 9>soil no 2>soil no 6>soil no 4>soil no 3>soil no 1> soil no 10

Freundlich constant n which indicates adsorption intensity (Jalali and Moharrami, 2007) ranged from 0.86 to 1.75. Soil no 3 and 10 had highest and lowest n respectively. Elzinga et al. (1999) also evaluated the batch sorption data and established general purpose, Freundlich isotherms for different heavy metals in soils. Mafton et al. (2000) reported that Zn adsorption in eight calcareous soils of Iran followed a Freundlich adsorption isotherm.

\* Significant at the 0.05 probability level

\*\* Significant at the 0.01 probability level

Distribution coefficient significantly correlated with CEC(Table 3). Reyhanitarabar et al. (2007) studying Zn retention of 20 calcareous soils

of central Iran, reported a significant relationship between Freundlich  $K_f$  with percentage of clay, CEC and CCE. Karimian and Moafpourian (1999)

reported that in calcareous soils of the southern part of Iran, Freundlich  $K_f$  showed a highly significant relationship with soil pH and Clay, but it didn't significantly correlate with CEC, CCE and OM.

Freundlich n didn't significantly correlate with soil properties. Reyhanitabar et al. (2007) reported a significant relationship between Freundlich n with percentage of clay. Elrashidi and O'Connor (1982) reported a significant relationship

between Freundlich coefficients and percentage of clay, CEC and pH, but not OM.

The values of  $q_m$  constant (D-R isotherm) which is the adsorption capacity ranged from 1.313 to 223.347 ( $\text{mol g}^{-1}$ ) (Table 2). Soil no 8 had the highest  $q_m$ , its high CEC and clay content and soil no 9 had the lowest  $q_m$ , its low OM and CEC. This parameter significantly correlated with percentage of clay and CEC (Table 3).

Table 3- Correlation between soil properties and adsorption isotherm parameters

Soil Properties	Freundlich constants		D-R constants		
	n	$k_f$	K	$q_m$	E
CCE	-0.25	0.23	-0.11	0.29	0.09
Clay	-0.19	0.33	-0.63*	0.69*	-0.62*

pH	0.07	-0.01	0.1	-0.08	0.09

\* Significant at the 0.05 probability level

The magnitude of E which is calculated from D-R isotherm is useful for estimating the type of adsorption process. In this study, E values for Cu ranged from 7.29 to 10.78  $\text{kJ mol}^{-1}$  (Table 2) that are between the values of ion exchange. Therefore it is possible to say that adsorption mechanism of Cu ions on soils can be explained with an ion-exchange process.

The values of k (D-R isotherm) which is constant related to the adsorption energy ranged from -0.0036 to -0.0094  $\text{mol}^2 \text{kJ}^{-2}$ . Soil no 8 had the highest k, its high CEC and Clay. Soil no 10 had the lowest k, its low CEC and CCE.

Evaluation of thermodynamic parameters viz.  $K^\circ$ ,  $G^\circ$ ,  $H^\circ$ ,  $S^\circ$  provide an insight into mechanism of Cu sorption in the soils. The data in Tables 4 indicates that value of  $K^\circ$  increased with rise in temperature from 25 to 45 °C in all the soils. The  $G^\circ$  values for Cu were negative in all the soils (Tables 4). These negative values indicate that the sorption process is spontaneous. The  $G^\circ$  at 25 °C ranged from -18.391 to -24.101  $\text{kJ mol}^{-1}$ . The  $G^\circ$  at 45°C ranged from -21.167 to -26.267  $\text{kJ mol}^{-1}$ . In all the soils, the free energy ( $G^\circ$ ) of the Cu sorption was more negative at higher temperature, which suggested that the spontaneity of the process increased with rise in temperature.

Table 4. Thermodynamic parameters of Cu sorption

Soil no	K		$G^\circ (\text{kJ mol}^{-1})$		$H^\circ (\text{kJ mol}^{-1})$	$S^\circ (\text{J mol}^{-1}\text{K}^{-1})$	
	25°C	45°C	25°C	25°C		25°C	45°C
1	1814.56	5385.15	-18.591	-22.714	42.853	206.184	206.184
2	1862.36	3409.43	-18.655	-21.506	23.821	142.538	142.538
3	4517.89	7700.96	-20.851	-23.660	21.001	140.467	140.467
4	2861.21	5447.98	-19.719	-22.745	25.369	151.303	151.303
5	7396.78	11883.43	-22.072	-24.807	18.676	136.740	136.740
6	5604.92	7069.89	-21.385	-23.434	9.147	102.457	102.457
7	4539.63	6555.11	-20.863	-23.234	14.473	118.576	118.576
8	16772.57	20645.53	-24.101	-26.267	8.184	108.338	108.338
9	4065.39	6481.45	-20.589	-23.204	18.374	130.751	130.751
10	1674.21	2998.90	-18.391	-21.167	22.962	138.771	138.771

Soil no 8 had the highest  $G^\circ$  at 25 and 45 °C, its high CEC and calcium carbonate equivalent. Soil no 10 had the lowest  $G^\circ$  at 25 and 45°C, its low CEC and calcium carbonate equivalent.

The values of isoteric heat (enthalpy) of Cu sorption ( $H^\circ$ ) were positive and ranged from 8.184 to 42.853  $\text{kJ mol}^{-1}$  (Table 4). This provides an indication that sorption reaction was endothermic for Cu. Similar findings were also observed by

Bigger and Chung (1973), Adhikari and Singh (2003), Dali-yousef et al. (2006) and Unlu and Ersoz (2006).

Although there are no certain criteria related to the  $H^\circ$  values that define the adsorption type, the heat of adsorption values between 5.0 and 100  $\text{kcal mol}^{-1}$  (20.9-418.4  $\text{kJ mol}^{-1}$ ), which are heats of chemical reactions, are frequently assumed as the comparable values for the chemical adsorption

processes (Unlu and Ersoz, 2006). Soil no 1 had the higher H°, and soil no 8 had the lowest H°.

The values of H° were calculated from plots of ln K° versus 1/T. The linear nature of the plot indicates that the mechanism of adsorption is not changed as temperature changed. But the amount of adsorption is changed because the supply of thermal energy is different. The endothermic nature of the adsorption processes shows that these processes don't energetically stable (Bigger and Cheung 1973).

If the values of H° for heavy metals had been within the range of the enthalpy change of adsorption for ion exchange (8.4-12.6 kJ mol<sup>-1</sup>) suggesting that the adsorption process of those ions is of ion exchange in nature (Helfferich 1962). The values of H° for Cu in this study were greater than 12.6 kJ mol<sup>-1</sup> which indicated that the presence of other mechanism for the adsorption of these ions occurs on soil beside ion exchange mechanism.

Table 5. Correlation coefficients between soil properties and thermodynamic parameters

Soil properties	K° (25)	K° (45)	G° (25)	G° (25)	H° (25)	S° (25)	S° (45)
CCE	0.74*	0.71*	-0.72*	-0.68*	-0.23	-0.17	-0.17
Clay	0.41	0.33	-0.53	-0.42	-0.25	-0.22	-0.22
Silt	0.08	0.37	-0.20	-0.30	0.05	0.08	0.08
O.M	0.54	-0.10	-0.33	0.12	-0.59	-0.59	-0.59
EC	0.12	0.02	0.07	0.13	-0.05	-0.06	-0.06
CEC	0.63*	0.14	-0.71*	-0.29	-0.65*	-0.62*	-0.62*
pH	0.21	0.34	-0.10	-0.30	0.19	0.21	0.21

\* Significant at the 0.05 probability level

The values of S° for Cu sorption were positive and ranged from 102.457 to 206.184 J mol<sup>-1</sup> K<sup>-1</sup>. The positive values of S° indicates that the increased randomness at solid-solution interface during the adsorption of this cation on sorbent, while the negative value of S° indicates the decrease of the degree of randomness at the surface of the sorbent during the adsorption process ions. This decreasing in the randomness lead to an increase in the adsorption capacity of the ion on sorbent (Abou-Mesalam 2003).

The thermodynamic equilibrium constant (K°) at 25°C significantly correlated with calcium carbonate equivalent and CEC, while at 45°C it only correlated with CCE. Standard free energy (G°) at 25°C significantly (p<0.05) correlated with CCE and CEC, but at 45°C it highly correlated (p<0.05) with CCE. Standard enthalpy (H°) and standard entropy (S°) were significantly correlated with CEC (Table 5).

### Conclusion

The results of this research showed that calcareous soils have a high capacity for Cu sorption. The experimental data were better fitted by D-R than Freundlich equation. The soil properties such as clay and CEC play an important role in Cu sorption.

Thermodynamic parameters revealed that Cu sorption reaction in soils studied were spontaneous and endothermic. These suggested that the sorption capacity of these soils enhanced with increased in temperature. Thus, for developing suitable strategies for proper management of heavy metal pollution, moreover soil properties and nature of pollutant, soil condition, particularly temperature

needs to be considered. Thermodynamic parameters significantly correlated with CCE and CEC.

## Association between Single nucleotide polymorphisms in Gallinacin genes and resistance to Marek's disease in White Leghorn chicken

Yacoub, H. A<sup>\*1</sup>, Galal, A<sup>2</sup>, El Fiky, S.A<sup>1</sup> and Fathi, M. M<sup>2</sup>,

<sup>\*</sup>Haitham\_yakoub@yahoo.com

**Abstract:** Gallinacins are antimicrobial peptides that play a significant role in innate immunity in chicken. The aim of this study was to determine the relationship between candidate genes of innate immunity and resistance to Marek's disease and to predict whether the amino acids substitutions lead to produce new phenotypes. We used in current study two inbred lines of White Leghorn chickens, line 6 which selected for resistant to Marek's disease and line 7 which selected to susceptible to Marek's disease from ADOL, ARS, USDA. We examined Gal-1 and Gal-2 in current study by sequenced a 1.38 kb in two directions from two inbred lines (6 and 7). A total of 6 SNPs were identified within the sequenced regions. This equates to an SNP rate of 4.34 SNPs/kb, nearly to the previously reported 5 SNPs/kb across the entire chicken genome. The current study showed that the gallinacin genes are polymorphic because there are many single nucleotide polymorphisms (SNPs) in both inbred lines of White Leghorn chickens and some of these SNPs are nonsynonymous and others are synonymous and some of them are located in intronic region and the rest are in exonic region. All identified SNPs were intronic; except for Gal-1 was exonic resulting in amino acids changes which have a non-synonymous SNP resulting in amino acids alterations of asparagine to serine, histidine to tyrosine and tyrosine to serine, respectively. From SIFT (Sorting Intolerant from tolerant) program which used to predict whether an amino acids substitutions can affect protein function resulting in phenotypic effect , that is may be made the inbred line 7 of White Leghorn chickens are susceptible to Marek's disease rather than line 6. We are concluded that a new chromosomal region with effects on the response to Marek's disease in chickens was characterized in this study. Within this region, the SNPs in the gallinacin candidate genes could potentially be used in a marker assisted selection program to enhance the response to Marek's disease. Analysis of the gallinacin genes in the protective pathways of disease resistance has also opened the possibilities for therapeutic strategies using endogenous antimicrobial peptides. ### 1. Introduction

Global production of chickens has experienced massive change and growth over the past 50 years. The commercial broiler and layer markets produce more than 50 billion birds annually to meet current worldwide consumer demands of more than 74 metric tons of meat and more than 66 million metric tons of eggs (Muir *et al.*, 2008).

In fact, poultry has become the leading meat consumed in the United States and most other countries and is the most dynamic animal commodity in the world; production has increased by 436% since 1970, more than 2.3 times and 7.5 times the corresponding growth in swine and beef, respectively (<http://faostat.fao.org>). Unfortunately, the poultry industry continues to be confronted with new and emerging infectious diseases such as Newcastle disease, avian leucosis, avian influenza and Marek's disease that can led to significant economic losses.

Marek's disease (MD) is a lymphoproliferative disease, caused by a member of

the herpesvirus family, that is estimated to cost the poultry industry nearly \$1 billion annually (Purchase, 1985). Diseased chickens infected by the Marek's disease virus (MDV), the causative pathogen, commonly exhibit paralysis, blindness, and visible lymphoid tumors that result in condemnation of the birds. Although vaccination programs have effectively reduced the incidence of MD, there is evidence that current vaccines do not protect well against some highly pathogenic MDV strains that have emerged in recent years (Witter and Hunt, 1993). Also, MD vaccines control rather than eliminate losses from MD because they do not block MDV infection, thus as a result, MDV is ubiquitous on poultry farms, and all chickens are exposed to the pathogenic agent at 1 day of age (Vallejo *et al.*, 1997).

All these factors point to the need to complement vaccinal protection with alternative methods such as genetic resistance (Spencer *et al.* 1974; Gavora and Spencer, 1979). And even if a

specific disease has been controlled through vaccination, genetic resistance is of value because it represents a safeguard against heavy losses in the case of disease outbreaks (Vallejo *et al.*, 1997).

Genetic resistance to MD has been known for more than 60 years (Calnek, 1985). Genetic resistance is a complex trait controlled by many genes though genetic selection for high levels of resistance can be obtained within relatively few generations (Cole, 1968), this is because of selection for certain MHC haplotypes, something that would not be done now to maintain biodiversity. The development of effective vaccines in the late 1960s, however, greatly reduced interest in the genetic control of MD. Ironically, genetically resistant lines were shown to have greater vaccinal immunity and higher egg production than susceptible lines (Von Krosigk *et al.*, 1972; Spencer *et al.* 1974; Gavora and Spencer, 1979).

One such class of genes that may play a role in resistance to Marek's disease are gallinacin genes, one family of antimicrobial peptides (AMP). Antimicrobial peptides (AMP) are relatively small molecules that are less than 100 amino acids in length and have a broad spectrum of antimicrobial activity (Ma *et al.*, 2007). Defensins are a type of AMP characterized by the presence of a conserved cysteine (Cys)-rich defensin motif. The three defensin subfamilies (α, β, and γ-defensins) found in humans and mammals, only α-defensins have been found in birds (Sugiarto and Yu, 2004; Satchell *et al.*, 2003; Bensch *et al.*, 1995 and Higgs *et al.*, 2005).

These Gals are widely expressed across most tissues, including those of the digestive system, respiratory system, genitourinary system, and several other anatomical areas in the chicken (Ma *et al.*, 2007). Further, different Gals are expressed in different tissues (Higgs *et al.*, 2005; Harwing *et al.*, 1994 and Lynn *et al.*, 2004).

The main objectives of this study is

1. To identify and analyze new candidate genes for their association with resistance to Marek's disease in the inbred White Leghorn Lines 6 subline 3 (6<sub>3</sub>) and 7 subline 2 (7<sub>2</sub>).
2. To predict whether an amino acid substitution in a protein will have a phenotypic effect.

## 2. Material and Methods

This study was carried out, at the Avian Disease and Oncology laboratory (ADOL),

Agricultural Research Service (ARS), United States Department of Agriculture (USDA), USA and Cell Biology Department, National Research Center of Egypt. The inbred White Leghorn Lines 6 subline 3 (6<sub>3</sub>) and 7 subline 2 (7<sub>2</sub>) had been taken to be used in current study, differ greatly in MD susceptibility (6<sub>3</sub> is resistant and 7<sub>2</sub> is highly susceptible; Crittenden, 1975; Pazderka *et al.*, 1975).

### 1. DNA isolation, PCR

Genomic DNA was prepared from chicken erythrocytes by using QIAgen DNA purification kit. To characterize the 3'-untranslated region of each gene, a pair of primers (**Table 1**) was developed using FastPCR, based on the published chicken genome assembly. PCRs were performed using 25-μl reaction mixture volumes that contain 25 ng of chicken genomic DNA, 0.8 μM of each primer, 200 μM of each deoxynucleoside triphosphate, 1 unit of Taq DNA polymerase, 2.5 μl of 10x PCR buffer, and 1.5 mM MgCl<sub>2</sub>.

The following cycling conditions were used:

1. An initial denaturation step at 94 °C for 3 min, followed by 35 cycles at
2. 94 °C for 1 min,
3. at the optimal annealing temperature for 1 min, and at
4. 72 °C for 1 min and
5. Final extension at 72 °C for 5 min. The PCR products were separated by electrophoresis through 1.5% gel.

### 2. The sequencing

The PCR products were purified using Sephadex-G, An ABI3100 DNA analyzer (Applied Biosystems, Foster City, CA) was used for direct sequence using nucleotide dye terminators. PCR products were sequenced at Avian Disease and Oncology Laboratory (ADOL), ARS, USDA.

### 3. Sequencing analysis

Sequencing alignment was achieved using Nucleotide-nucleotide BLAST (blastn) software in <http://www.ncbi.nlm.nih.gov/blast/> and CLASTALW 2.0.12. To detect the SNPs in inbred White Leghorn lines using Sequencher program version 4.8, also, to predict whether an amino acid substitution in a protein will have a phenotypic effect using Sorting Intolerant from Tolerant (SIFT) program [http://sift.jcvi.org/www/SIFT\\_aligned\\_seqs\\_submit.html](http://sift.jcvi.org/www/SIFT_aligned_seqs_submit.html).

## 3. Results

### 1. Sequence variation

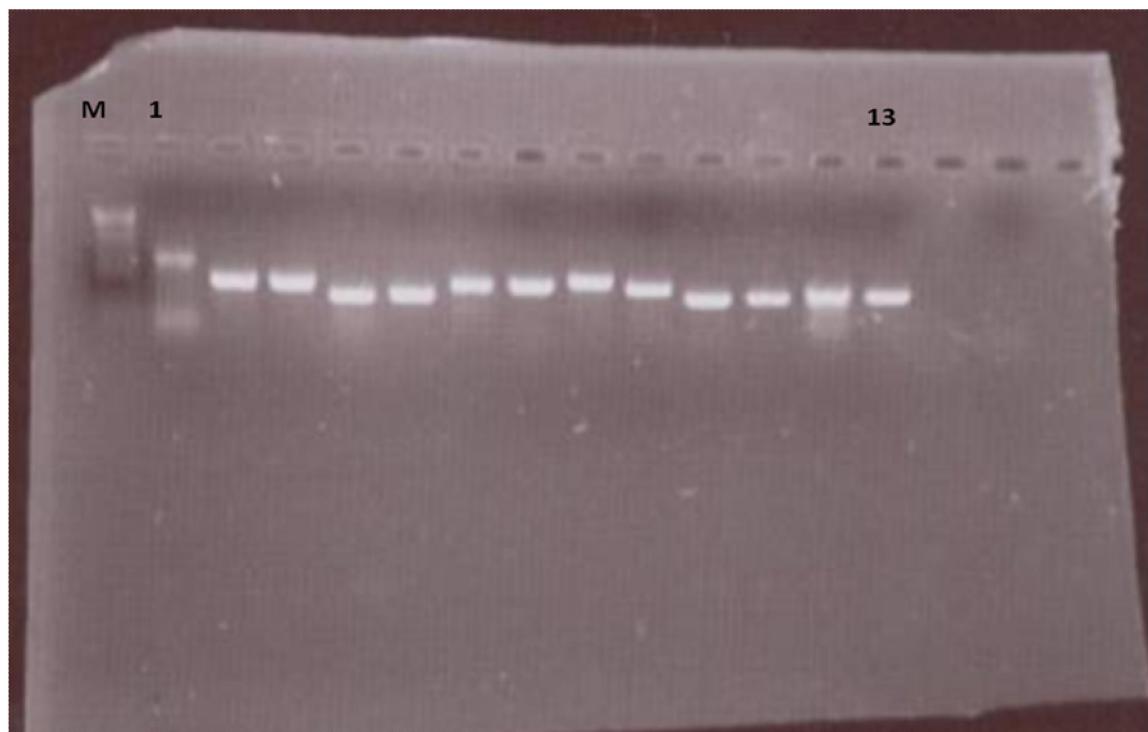

#### 1.1. Gallinacin-1

Single nucleotide polymorphism in gallinacin 1 in line 6 (resistant to Marek's disease) and line 7 (susceptible to Marek's disease) is showed in Fig (3). Primers designed from gallinacin 1 genomic DNA amplified a 872 bp fragment of the gene with SNPs of A-to-G, C-to-T and A-to-C within the exonic sequence in line 6 (resistant to MD) and line 7 (susceptible to MD), respectively. At positions 110,260,751, 110,260,716 and 110,260,781 of the chicken genome assembly the nucleotides are G, T and C, respectively. These nonsynonymous SNPs produced an amino acid change from asparagine to serine, histidine to tyrosine and tyrosine to serine, respectively.

## 1.2. Gallinacin-2

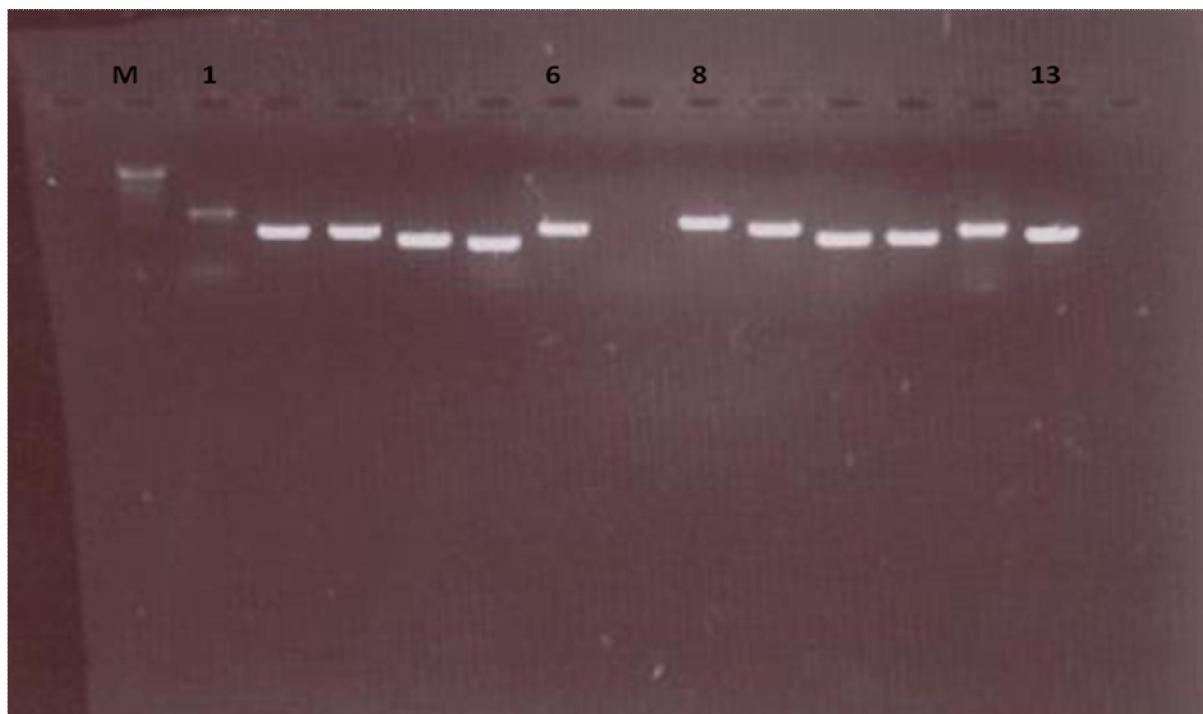

**Table. 1. Primer sequence of Gal-1 and Gal-2 .**

Gene	Primer sequence (Forward/reverse)	PCR product size bp	Annealing temperature	Accession Number
<b>Gal -1</b>	<b>5'-ACTGCAGGCCCATGGTGGATGTC-3'</b>	827	<b>58</b>	<b>HM136609</b>
	<b>5'-TGTTAGACTGAGATCCATGGGAC-3'</b>			<b>HM136612</b>
<b>Gal-2</b>	<b>5'-GCTGCTGAGGCCTTGCTGTAGC-3'</b>	553	<b>58</b>	<b>HM136610</b>
	<b>5'-ATGGCCATAGATGCCAGCAC-3'</b>			<b>HM136611</b>

**Fig.1. Amplified fragment of gallinacin genes (1-13) in inbred White Leghorn line 6 sub line 3. Lane M, DNA molecular weight marker. Lane 1-13, Gal-1- Gal-13.**

Single nucleotide polymorphism in gallinacin 2 in line 6 (resistant to Marek's disease) and line 7 (susceptible to Marek's disease) is noticed in Fig (4). For gallinacin 2 , a 553 bp product that contain two substitutions in an intron A- to G, A-to-G and A-to-G in line 6 (resistant to MD) and line 7 (susceptible to MD), respectively. At position 110,258,387,110,258,196 and 110,258, 137 of the chicken genome assembly the nucleotides are A, A and G respectively. This SNP is a synonymous SNP and it doesn't change amino acid.

**Fig.2.** Amplified fragment of gallinacin genes (1-6)(8-13) in inbred White Leghorn line 6 sub line 3. Lane M, DNA molecular weight marker. Lane 1-6 , Gal-1 –Gal-6. Lane 8-13, Gal-8 – Gal-13.

#### 4. Discussion

##### SNP detection and its rate

In total, 1.38 kb was sequenced in two directions from two inbred lines (6 and 7). A total of 6 SNPs were identified within the sequenced regions. This equates to an SNP rate of 4.34 SNPs/kb, nearly to the previously reported 5 SNPs/kb across the entire chicken genome (Wong *et al.*, 2004).

All identified SNPs were intronic, except for Gal-1 was exonic resulting in an amino acids changes which have a non-synonymous SNP resulting in amino acids changes of asparagine to serine, histidine to tyrosine and tyrosine to serine, respectively.

Non-synonymous SNP are of interest due to their potential effect on protein expression and, ultimately have minimal effects on genes expression (exceptions might be those nucleotides that are important in DNA–protein interactions in the promoter and the genomic regions or those nucleotides that are involved in RNA stability) and both synonymous and non-synonymous SNP are excellent genetic markers for mapping studies (Emara and Kim, 2003).

##### SNPs location

The current study showed that the gallinacin genes are polymorphic because there are many single nucleotide polymorphisms (SNPs) in both inbred lines of White Leghorn chickens and some of these SNPs are nonsynonymous and others are synonymous and some of them are located in intronic region and the rest are in exonic region.

##### Intronic SNPs

There were many intronic SNPs are located in non-coding region in gallinacin genes specifically for gal-2, 3 SNPs. Intronic SNPs, while not the causal mutations, can provide excellent markers for genetic selection for an increased immune response to Marek's disease.

##### Exonic SNPs

In a gallinacin 1 there were three nonsynonymous substitutions A-to-G, C-to-T and A-to-C within the exonic sequence in line 6 (resistant to MD) and line 7 (susceptible to MD), respectively. And these alterations lead to protein modification through changes of asparagine to serine, histidine to tyrosine and tyrosine to serine in lines 6 and 7, respectively.

From SIFT (Sorting Intolerant from tolerant) program which used to predict whether an amino acids substitutions can affect protein function resulting in phenotypic effect , that is may be made the inbred line 7 of White Leghorn chickens are susceptible to Marek's disease rather than line 6.

Most genetic variation is considered neutral but single base changes in and around a gene can affect its expression or the function of its protein products (Collins *et al.*, 1997 and Risch and Merikanges, 1996). A nonsynonymous or missense variant is a single base change in a coding region that causes an amino acid change in the corresponding protein.

If a nonsynonymous variant alters protein function, the change can have drastic phenotypic consequences. Most alterations are deleterious and so are eventually eliminated through purified selection. However, beneficial mutations can sweep through the population and become fixed, thus contributing to species differentiation.

It was observed that disease-causing Amino Acid Substitutions (AASs) had common structural features that distinguished them from neutral substitutions, suggesting that structure could also be used for prediction (Sunyaev *et al.*, 2000 and Wang and Moult, 2001).

The gallinacin genes are clustered within an 86-kb distance on the 3q3.5-q3.7 chromosome (Xiao *et al.*, 2004). The location of molecular markers within this cluster could be useful for marker assisted genetic selection and positional cloning works (Hasenstein *et al.*, 2006).

Bar-Shira *et al.* (2006) hypothesized that innate effector mechanisms such as gallinacin enable immune protection during the first week after hatching until functional maturation of the adaptive immune system occurs. They showed that mRNA levels of *Gal1* and *Gal2* decreased relative to the day of hatching throughout the first week of life and then increased again during the second week.

## 5. Conclusion:

We concluded that a new chromosomal region with effects on the response to *Marek's disease* in chickens was characterized in this study. Within this region, the SNPs in the gallinacin candidate genes could potentially be used in a marker assisted selection program to enhance the response to Marek's disease. Analysis of the gallinacin genes in the protective pathways of disease resistance has also opened the possibilities for therapeutic strategies using endogenous antimicrobial peptides.

# Endometrial Cytology and Bacteriological Isolates From Buffaloes With Retained Fetal Membranes and Their Effects on the Reproductive Efficiency

Amer H. A.<sup>1\*</sup>, AbouZeid N. Z.<sup>2</sup> and Barakat T. M.<sup>1</sup>

Department of Theriogenology<sup>1</sup> and Infectious Diseases<sup>2</sup>, Faculty of Veterinary Medicine, Zagazig University, Egypt

\*Corresponding author: [samarmed84@yahoo.com](mailto:samarmed84@yahoo.com)

**Abstract:** This study aimed to determine if the buffaloes with retained fetal membranes (RFM) and without systemic involvement had an effect on the subsequent reproductive efficiency. One hundred buffaloes with or without placental retention were allocated into 4 groups, including 25 buffaloes at day 15 post-calving had RFM (1<sup>st</sup> group), 25 buffaloes at 45 days post-calving had RFM (2<sup>nd</sup> group), 25 buffaloes without RFM at day 15 post-calving as control (3<sup>rd</sup> group) and 25 buffaloes without RFM at day 45 post-calving as control (4<sup>th</sup> group). The intrauterine perfusion fluid (10ml) was collected and examined bacteriologically and cytologically to evaluate the intrauterine environment. The reproductive parameters were determined in both buffaloes with or without retained fetal membranes. The detection rate of bacterial spp. was significantly ( $P<0.05$ ) higher in buffaloes with RFM collected at day 15 after parturition than those in other groups. All 25 buffaloes with RFM at 15 days post-partum (100.0 %) showed positive results. From 22 of them (88.0%), more than one bacterial species was isolated. An *Archonobacterium pyogenes* (A. pyogenes) was isolated from 56.0% of buffaloes with RFM after 15 days post-calving. On the other hand, 5 (20.0%) out of 25 buffaloes with RFM at 45 days post-partum showed positive results. Nine out of 25 (36.0%) buffaloes without RFM at 15 days post-partum showed positive results. Moreover, 4 out of 25 (16.0%) control buffaloes at 45 days post-partum showed positive results. The bacterial species most frequently isolated was *Lactobacillus* spp. The number of buffaloes with  $\geq 70\%$  PMNs or  $\leq 40\%$  lymphocytes cells was higher (24/25, 96%) in the 1<sup>st</sup> group (RFM) at 15 days than those in 2<sup>nd</sup> group (RFM) at 45 days post-calving. The number of buffaloes with  $\geq 70\%$  PMNs or  $\leq 40\%$  lymphocytes cells was also significantly ( $P<0.01$ ) higher in control group (17/25, 65%) at 15 days than those in control group (6/25, 24%) at 45 days. There were no significant variations among the groups of the buffaloes with retained placenta and the control groups at 15 and 45 days post-calving in postpartum uterine involution, the number of days from parturition to initial insemination, the number of days to conception and the number of services per conception. The overall conception rate was 15(60%) and 16(64%) in the RFM group, meanwhile, it was 19(76%) and 20(80%) in the control groups. It could be concluded that, in most buffaloes, the retained fetal membranes without systemic involvement had no major effect on the postpartum reproductive performance. [Journal of American Science. 2010;6(11):115-121]. (ISSN: 1545-1003).

**Keywords:** Buffaloes, Bacteriologically, Cytologically, Insemination, Conception.

## 1. Introduction

Risk factors for acute metritis were categorized by Sheldon and Dobson (2004) as intrauterine damages (Stillbirth, dystocia, twins, caesarean section, retained placenta, delayed uterine involution), metabolic disorders (milk fever, ketosis, left displaced abomasums) and the balance between pathogenicity and immunity (disruption of neutrophil function, type of bacterial flora, progesterone and glucocorticoids administration, early formation of corpus luteum, level of hygiene). The infection and to some extent the inflammation of the uterine wall during and after parturition must be accepted as a physiological process (Lewis, 1997; Hertl et al., 2010). Pathogenic species for metritis isolated from the uterine cavity are *Escherichia coli*, *A. pyogenes* and obligate anaerobic species *Fusobacterium (F) necrophorum* and *Prevotella* spp. (Lewis, 1997;

Sheldon et al., 2004; Bicalho et al., 2010). Besides the quantity and quality of bacteria in the uterus, the efficiency of uterine defense mechanisms determines the severity of metritis. The uterine defense mechanisms consist of anatomical and physical barriers i.e. the vulvar and cervical closure as well as the cell mediated and humeral immune systems. The initial cellular response to an infection of the uterine wall is an influx of PMNs and macrophages. Immunoglobulins and opsonins are released from the endometrium (Bondurant, 1999; Dhaliwal et al., 2001; Földi et al., 2006). Knowledge and characteristics of the intrauterine environment following placental retention is needed to establish effective measures for an improving the reproductive efficiency in cattle with retained placenta (Joosten et al., 1988; Salama et al., 1993). This study aimed to determine if the buffaloes with retained fetal

membranes (RFM) and without systemic involvement had an effect on the subsequent reproductive efficiency based on the bacteriological and cytological examinations of intrauterine perfusion fluid.

## 2. Material and Methods

### 2.1. Animals

This study was conducted "between" November, 2008 to October, 2009 using 800 Egyptian buffaloes housed in barn stalls belonging to private farms related to Balkas, Dakahlia Province. The age of the animals ranged between 3-8 years. The animals stall fed and had unrestricted access to hay and 8-10 kg concentrate feed for each. Fifty buffaloes had not expelled the placenta after 24 hours post calving were assigned to the experimental group (RFM), while the other fifty had expelled the placenta without manual interference were used as a control group (C). No treatment was administered to the buffaloes with placental retention (expect those animals showing systemic involvement associated with fever, were both systemically and locally treated and excluded from the study). One hundred buffaloes with or without placental retention were allocated into 4 groups, including 25 buffaloes at day 15 post-calving had RFM (1<sup>st</sup> group), 25 buffaloes at 45 days post-calving had RFM (2<sup>nd</sup> group), 25 buffaloes without RFM at day 15 post-calving as control (3<sup>rd</sup> group) and 25 buffaloes without RFM at day 45 post-calving as control (4<sup>th</sup> group).

### 2.2. Collection of intrauterine perfusion fluid

The intrauterine perfusion fluid was collected once only from four groups by the method performed by Kaneko et al. (1996). A vaginal speculum was inserted into the vagina after cleaning of the vulva with disinfection (Betadine). The tip of a balloon catheter (Terumo Inc. Tokyo, Japan Fr. 22) was inserted into the cervix as deep as possible without touching the vaginal wall. The vaginal speculum was removed, and then the balloon catheter was advanced into the uterus using the recto-vaginal method. The balloon was inflated with air. Sterile physiological saline (100 ml) was infused into the uterus through a balloon catheter and recovered by gentle massaging of the uterus.

### 2.3. Bacteriological examination of the intrauterine perfusion fluid

The perfusion fluid (10 ml) was centrifuged at 1000 rpm for 10 minutes and after removal of the supernatant, the sediment was resuspended in 1 ml of physiological saline. An allocate of the resuspended sediment (100 µl) was applied to soy agar with 5% sheep blood and incubated for 2-7 days at 37°C in both aerobic and anaerobic atmospheres. Using the

criteria of Kaneko et al. (1996), samples showing growth of more than 50 identical colonies were defined as positive control for bacteria and were considered to indicate bacteriological deterioration of the intrauterine environment. Gram-negative, a typical, pine leaf-like rods, which showed hemolytic reaction on sheep blood containing agar medium were negative to the catalase test, were judged to the *A. pyogenes*. Samples showing the growth of a more than one *A. pyogenes* colony were defined as positive for *A. pyogenes*. All bacterial isolates were identified according to Bergey's manual of a systemic bacteriology (Holt et al., 1994).

### 2.4. Cytological examination of the intrauterine perfusion fluid

The perfusion fluid (10 ml) was centrifuged as described above and the sediment was smeared on a glass slide, dried in air, fixed for 3 minutes with methyl alcohol and then the sediment was stained with Giemsa. A total of 200 cells was counted at x1000 in each specimen and classified into PMNs, eosinophils, lymphocytes and macrophages like cells. The percentage of PMNs and lymphocytes were calculated and recorded. Specimens with a PMNs ratio exceeding 70% or a lymphocytes ratio below 40% were considered to indicate a poor cytologically intrauterine environment (Kaneko et al., 1996).

### 2.5. Investigation of the postpartum reproductive performance

The postpartum uterine involution, number of days from parturition to initial insemination, number of days until conception and number of inseminations required to achieve conception, as well as the overall conception rate, were determined in both buffaloes with or without placental retention.

### 2.6. Statistical analysis

The positive rates for bacteria and for *A. pyogenes* were compared between groups by using Chi-square test. The PMNs ratio and the lymphocytes ratio in sediment, inflammatory cells and the reproductive performance were compared by a student's T-test according to Snedecor & Cochran (1982).

## 3. Results

The detection rate of *Streptococcus spp.*, *Bacteroids melaninogenias*, *Fusebacterium necrophorum*, *Escherichia coli*, *Pasteurella multocida*, *Proteus vulgaris*, *Lactobacillus spp.*, *Staphylococcus aureus*, *Enterococcus spp.* and *A. pyogenes* was significantly ( $P<0.05$ ) higher in buffaloes with RFM collected at day 15 after parturition than that in other groups (Table 1). All 25

RFM buffaloes at 15 days post-partum (100.0 %) showed positive results. From 22 of them (88.0%), more than one bacterial species was isolated. A mixed culture of *E. coli*, *Streptococcus spp.*, *Pasteurella multocida*, *A. pyogenes* and *Fusebacterium necrophorum* were most common. The bacterial species most frequently isolated was *E. coli*, (25 isolates, (100.0%), followed by *Streptococcus spp.*, (22 isolates, 88.0 %), *Pasteurella multocida* (15 isolates, 60.0%) and *A. pyogenes*, (14 isolates, 56.0%). Other bacteria as Bacteroids melaninogenias and *Fusebacterium necrophorum* were found at lower frequencies (10 isolates for each one) as presented in Table 1. On the other hand 5 (20.0%) out of 25RFM buffaloes at 45 days post-partum showed positive results. The bacterial species

most frequently isolated was *Staphylococcus spp.*, *Pasteurella multocida* and *Proteus vulgaris*.

Whereas 9 (36.0%) out of 25 control buffaloes at 15 days post-partum, showed positive results. From 4 of them (16.0%), more than one bacterial species was isolated. A mixed culture of *E. coli*, *Streptococcus spp.*, *Lactobacillus spp.* and *Enterococcus spp.* were most common. The bacterial species most frequently isolated was *E. coli* and *Lactobacillus spp.* (4 isolates for each, 16.0%), followed by *Streptococcus spp.* and *Enterococcus spp.* (3 isolates for each, 12.0 %) and *Fusebacterium necrophorum* (2 isolates, 8.0%). Moreover, 4 out of 25 (16.0%) control buffaloes at 45 days post-partum showed positive results. The bacterial species most frequently isolated was *Lactobacillus spp.* (Table 1).

**Table 1. Proportion of buffaloes with or without placental retained showing positive cultures of aerobic and anaerobic bacteria in the intrauterine perfusion fluid collected at 15 and 45 days after parturition**

Group	Bacterial species	No./Frequency of isolation (%)
<b>Buffaloes with retained fetal membranes</b>		
<b>at 15 days post-partum</b>	<i>Streptococcus spp.</i>	22/25 (88.0)
	<i>Bacteroids melaninogenias</i>	10/25 (40.0)
	<i>Fusebacterium necrophorum</i>	10/25 (40.0)
	<i>Escherichia coli</i>	25/25 (100.0)
	<i>Pasteurella multocida</i>	15/25 (60.0)
	<i>A. pyogenes</i>	14/25 (56.0)
<b>Total positive</b>		25/25 (100.0) <sup>a</sup>

Different superscripts in the same column (Total positive) mean significant difference P<0.05

The main number of PMNs in the 1<sup>st</sup> group (RFM) at 15days post-calving was higher (P<0.01) than any those in other groups. There was also significant different in the percentage of PMNs (P<0.01) between control groups at 15 and 45 days. The mean number of a lymphocytes was significantly lower (P<0.01) in 1<sup>st</sup> group (RFMs) at 15 days than those in other groups. Also, there was a significant

differences (P<0.01) between control groups at 15 and 45 days. The number of buffaloes with ≥70% PMNs or ≤ 40% lymphocytes cells was higher (24/25, 96%) in the 1<sup>st</sup> group (RFM) at 15 days than those in 3<sup>rd</sup> group (RFM) at 45 days post-calving. The number of buffaloes with ≥70% PMNs or ≤40% lymphocytes cells was also significantly (P<0.01) higher in control group (17/25, 65%) at 15 days than

those in control group (6/25, 24%) at 45 days (Table 2).

**Table 2. The mean value of PMNs and lymphocytes (mean  $\pm$  SD) in the intrauterine perfusion fluid of the buffaloes with and without RFM, collected 15 and 45 days after parturition**

Groups	No.	PMNs Mean $\pm$ SD	Lymphocytes Mean $\pm$ SD	No. (%)

RFM: Retained Fetal Membrane C: Control

#### 4. Discussion

The period immediately after calving is very important in the reproductive life cycle of buffalo because of the vast influence on reproductive efficiency. A normal uterine involution and the re-establishment of the ovarian function postpartum are crucial to obtain short calving to conception interval that is required to optimize milk and calf production. Retention of foetal membranes with the dominance of *E. coli* in the uterine lumen might favor the colonization of other bacteria including facultative anaerobic and strictly anaerobes in the uterine wall of buffaloes (Paisley et al. 1986; Hussain 1989). High prevalence of bacterial isolation from buffaloes after

15 days of calving in both buffaloes with or without RFM revealed mainly *E. coli*. This suggests that the bacterial contamination which is mainly *E. coli* present in the uterus shortly after parturition. This observation is in agreement with Dohmen and Sheldon (Dohmen et al. 2000; Sheldon et al. 2006) in cattle. This suggests that the bacterial contamination which is mainly *E. coli* present in the uterus after parturition might favor the development of uterine infection by other highly pathogenic organisms. While other facultative anaerobic bacteria and strictly anaerobic bacteria, which lack the ability to invade intact epithelium, are usually considered facultative pathogens (Dohmen et al. 1995; Sheldon et al. 2004).

The development of uterine disease depends on the immune response of the cattle, as well as the species and number (load and challenge) of bacteria (Sheldon et al. 2006). Therefore, damage to epithelium is usually required to establish infection (Cohen et al. 1995; Sheldon and Dobson 2004; Sheldon et al. 2004) either by *E. coli* infection or damaged epithelium resulting from obstetrical manipulation (Paisley et al. 1986; Hussain 1989). *A. pyogenes* and strictly anaerobic bacteria were never isolated from buffaloes with normal parturition after 15 days of parturition. *A. pyogenes* was isolated from 56.0% of buffaloes with RFM after 15 days post-calving. *A. pyogenes* induces metritis by synergism with gram-negative bacilli such as *F. necrophorum* and *prevotella* spp., where *F. necrophorum* is known to produce a potent leukocidal endotoxin, these toxins facilitate tissue invasion by *A. pyogenes* which in turn produces growth stimulating factor for the species of bacteriodes which seen to have unusual potent lipopolysaccharide molecules (Ruder et al., 1981; Kaneko et al., 1997; Lewis, 1997; Sheldon et al., 2004).

Bacterial isolation from RFM buffaloes after 15 days of calving included non-specific bacteria mainly *E. coli*, *A. pyogenes*, *Fusebacterium necrophorum*, *Bacterioids melaninogenias*, *Streptococcus* spp., and *Pasteurella multocida*. These results were concordant with those reported by Azawi and Taha (2002); Jadon et al. (2005); Azawi (2006). Retained foetal membranes diminish uterine ability to eliminate contaminated organisms. The exact causes of uterine infections during the postpartum period remain unknown (Lewis 1997 and Azawi, 2008.). The detection rate of bacteria and *A. pyogenes* were decreased at day 45 after parturition and were no longer significantly different from those of the control animals. From the previous results, it is clear that infection and to some extent the inflammation of the uterine wall during and after parturition must be accepted as a physiological process (Lewis, 1997; Stephen et al., 2008). *Lactobacillus* spp. was isolated only from the uterus of buffaloes after 15 and 45 days of calving in buffaloes without RFM (control groups). These bacteria were never isolated from buffaloes with RFM. This result suggests that the presence of *Lactobacillus* sp. in the uterus indicated a healthy uterus (Bondurant 1999).

In the cytological examination, the number of buffaloes with  $\geq 70\%$  PMNs or  $\leq 40\%$  lymphocytes cells was higher (24/25, 96%) in the 1<sup>st</sup> group (RFM) at 15 days than those in 2<sup>nd</sup> group (RFM) at 45 days post-calving. The number of buffaloes with  $\geq 70\%$  PMNs or  $\leq 40\%$  lymphocytes cells was also significantly ( $P<0.01$ ) higher in control group (17/25, 65%) at 15 days than those in control group (6/25,

24%) at 45 days (Table 3). The high percent of PMN in the uterus of RFM buffaloes suggests both direct and indirect effects of bacterial toxins to attract or stimulate PMN infiltration in the uterus. These observations were in agreement with the earlier observations of Zerbe et al. (2001). Others provided an evidence that placenta attracts PMN to uterine lumen (Hoedemaker et al. 1992). Moreover chemo-attractive properties of uterine fluid have been described in vitro and the uterus response quickly to an antigen with release of PMN-chemotactic mediators, which results in a rapid migration of PMNs into the uterine lumen (Pycock, 1994 and Watson et al., 1987). It could be suggested that the combined effect of RFM and bacterial infection and their toxins in the uterus attracts high number of PMN in uterine discharge of RP buffaloes. It appears that retained placenta does adversely affect the postpartum intrauterine environment but the injury is repaired at day 45 after parturition. Mechanical aspects of the uterine defense system are currently believed to be a major contributor in uterine clearance of a bacteria and inflammatory products (Troedsson & Liu, 1991; Troedsson et al., 1993; Stephen, 2008).

Retained placenta has been reported as risk factors to induce metritis and thereby to reduce subsequently fertility (Coleman et al., 1985; Dohoo & Martin, 1984; Erb et al., 1981; Halpern et al., 1985; Heinonen & Heinonen, 1989; Sheldon & Dobson, 2004). In this study, non significant difference in reproductive performance was found between the buffaloes with or without RFM. It has been reported that fertility was not affected in the buffaloes with retained placenta if metritis was not induced after placental retention or if the cattle had recovered from metritis by the time of an insemination (Stevenson & Call, 1988; and Werven et al., 1992 and Claire & Chery, 2007). *In conclusion*, as any system in the body, bacteria are regularly present in the genital tract of normal buffaloes during the different reproductive stages. These bacterial flora play an important role in genital tract protection against infection. Moreover, in most buffaloes, the retained fetal membranes without systemic involvement had no major effect on the postpartum reproductive performance.

**Abstract:** One hundred slaughtered goats (2-3 years old) were used for diagnosis of toxoplasmosis in naturally infected goats, and 12 healthy pregnant and nonpregnant goats were used to study the pattern of toxoplasmosis as experimental study. Prevalence of toxoplasmosis in 100 slaughtered goats revealed that 29 (29%) and 27 (27%) were seropositive by LAT and IHA tests, respectively. There was agreement between LAT and IHA 97.3% in seronegative and 93.1% in seropositive sera in goats. There was complete concordance between LAT and bioassay in cats and mice. While the agreement between IHA result and bioassay in cat and mice was 93.1% in goats. Clinical examination of experimentally infected goats revealed that all goats had slight rise of body temperature; depression, anorexia, cough, muscular hyperesthesia and diarrhea by day 5 and returned to normal by day 11. The age of fetus at the time of *T. gondii* infection is one of the known causes for the variability in clinical response. As infection of goats in early stage of pregnancy result in fetal reabsorption, while infection in mid pregnancy lead to abortion in one goat at 28 days post-infection and the other was aborted at 40 days post-infection. Moreover infections in late pregnancy resulted in delivery of viable kids. On the other hand controls goats were clinically normal and pregnant does were birth viable kids. LAT showed rapid response after 14 days post-infection, while IHA detected antibodies after 3 weeks post-infection. The antibody titers of both tests remained high until the end of experiment (48 weeks), while the titers were decreased around abortion or parturition and increased again after one week. Both LAT and IHA tests were insensitive in the pre-suckling kids from infected goats, whereas PCR gave positive results. In conclusion, PCR considered the most reliable tool for diagnosis of prenatal infection of toxoplasmosis, while LAT and IHA were considered unreliable tools for diagnosis of toxoplasmosis if they applied one week before or after kidding. **Keywords:** Prevalence, Toxoplasmosis, Goats, Abortion, Parturition.

### 1. Introduction

Improvement of goats breeding can be done through elimination of destructive factors affecting their productive potential. Toxoplasmosis is one of the most common zoonotic protozoal diseases caused by an obligatory intracellular apico-complexan protozoan. The disease is widely distributed affecting people worldwide. *Toxoplasma gondii* was firstly discovered by Nicolle & Manceaux (1908) in North Africa. *T. gondii* may be transmitted vertically by Tachyzoites to the fetus via placenta or horizontally through ingesting sporulated oocytes or tissue cysts of infected animals (Tenter et al., 2001). The infection of goats by *T. gondii* occurred through contaminated food and water by sporulated oocytes from infected cat feces (Dubey & Beattie, 1988). Therefore, toxoplasmosis in these animals was significantly associated with the presence of cats roaming in the farms. If the parasite is encountered during pregnancy, fetal infection, abortion and neonatal loss can occur, thus toxoplasma infection in goats has a major economic impact upon their farming (Dubey & Towle, 1986). The latent infected goats constitute potential source of human toxoplasmosis whose acquired infection mainly through ingesting of tissue cysts in undercooked meat

(Dubey & Beattie, 1988; El-On & Peiser, 2003). Several techniques employed for diagnosis of toxoplasmosis including coprological (feces), histological (tissues), bioassay (inoculation of cat and mice) and serological tests including dye test, IHA, LAT, ELISA and PCR (Hurtado et al., 2001; Pereira-Bueno et al., 2002; Pierglili-Fioretti, 2004). In view of the above argument, this work was planned to investigate the seroprevalence and pattern of toxoplasmosis in naturally infected and experimentally challenged goats with *T. gondii*.

### 2. Material and Methods

#### 2.1. Animals

2.1.1. Goats: One hundred goats (2-3 years old) that slaughtered at Cairo and Zagazig abattoirs were used for diagnosis of toxoplasmosis in naturally infected goats. Moreover, 12 healthy pregnant and nonpregnant goats (2-3 years old) were used to study the pattern of toxoplasmosis as experimental study. The experimental animals were proved to be free from parasitic infestation after clinical and parasitological examination (Radostits, 2007).

2.1.2. Cats: seventy four apparent normal cats 2-3 months age were used in this study at different

intervals. After parasitological examination, they proved free from; Nematodes, Cestodes, Isospora, Eimeria and *T. gondii* oocysts and serologically negative against *T. gondii* infection. They fed *ad libitum* diet according to Charles (1979). Cats were used for tissues bioassay.

**2.1.3. Mice:** one hundred and twenty three white Swiss laboratory mice, about 25 gm body weights were obtained from Unit of Laboratory Animals, Faculty of Veterinary Medicine, Zagazig University. They proved to be free from toxoplasmosis. They were used for blood bioassay.

## 2.2. Samples

**2.2.1. Blood Samples:** Ten ml of blood were collected in clean sterile dry screw capped bottle from examined goats and cats. The collected blood were left to clot at room temperature for one hour and centrifuged at 3000 rpm for 15 minutes. Sera were aspirated by Pasteur pipette in other clean dry crocked bottle which labeled in a serial number and stored at -20°C until used. Moreover, 10 ml of blood collected from goats one week post infection were put in a tube containing EDTA (ethylene diamine tetra acetic acid) and subsequently inoculated subcutaneous (S/C) into mice and also used for detection of *T. gondii* antigen by PCR.

**2.2.2. Faecal Samples:** The entire faeces from each cat were examined for oocysts as described by Dubey (2001). Moreover fecal samples from goats that used for experimental studies were examined before experiment according to Soulsby (1986).

**2.2.3. Tissue Samples:** Tissue specimens were obtained from skeletal muscles (diaphragm) of slaughtered goats; in addition to placenta and tissues of aborted fetuses. The tissue specimens were used for bioassay in mice and cats according to Dubey (2001).

## 2.3. Seroprevalence of toxoplasmosis in slaughtered and experimental goats

Serum samples were collected from slaughtered goats as well as from experimentally infected and control goats weekly interval. The serum samples were tested serologically by LAT and IHA according to (Jacob, 1973) and Camargo & Leser (1976), respectively. Blood samples on EDTA were taken one week post infection and tissue specimens from each aborted fetus and placenta examined by PCR according to Esteban-Redondo et al. (1999) and bioassay in mice according to Dubey et al. (1997).

**2.4. Polymerase chain reaction (PCR)<sup>1</sup>** according to Esteban-Redondo et al., (1999): Primer 1 corresponds to B1 gene nucleotides 694 to 714 (5' - GGAAGTGCATCCGTTCATGAG) and primer 2 is of the opposite sense and corresponds to nucleotides 887 to 868 (5' -TCTTTAAAGCGTCGTGGTC) on the antisense strand.

## 2.5. Diagnosis of toxoplasmosis in serologically positive slaughtered goats through bioassay:

Fifty gm of fresh meat (from diaphragm) were collected from serologically positive slaughtered goats (29) against toxoplasmosis. Twenty-five grams from each animal were taken and used for determination of infection by bioassay in mice through digestion technique (3 mice for each sample). Another 25gm were used for determination of infection by bioassay in cats (2 cats for each sample).

### 2.5.1. Determination of infection by digestion technique

Twenty five grams from each carcass were minced and digested in 250 ml of Pepsin hydrochloric acid; after one hour at 37°C, the suspension was filtrated via gauze and the filtrate was centrifuged for 15 min. at 2000 rpm. The supernatant was removed and the sediment was washed with sterile saline then centrifugation was repeated. To the final precipitate, 10ml of saline containing 500 units of penicillin and 0.5 mg of Streptomycin were added. Three ml of suspension were inoculated I/P into 3 mice. The mice were killed two weeks post-inoculation and their peritoneal exudates were examined microscopically for *T. gondii* tachyzoites (Dubey et al., 1997).

### 2.5.2. Determination of infection by bioassay in kittens

Twenty-five grams of diaphragms from each animal were minced and fed to 2 kittens. Entire feces of each cat were collected daily post infection and examined microscopically for the presence of *T. gondii* oocysts according to Dubey (2001). The sporulation and testing the infectivity of isolated oocysts were done according to Dubey & Beatlie (1988). These sporulated oocysts were used for experimental study. Before inoculation of infective sporulated oocysts in goats, H<sub>2</sub>So<sub>4</sub> was neutralized by 3.3% NaOH.

<sup>1</sup> Biotechnological Unit of Al Borg Lab, Elmouhandsein, 55 Abd Elmoneim Read St. Cairo

## 2.6. Ultrasonic pregnancy detection of goats

A real-time ultrasound scanner equipped with transrectal and transabdominal transducers (Pie-medical, Genus 240, Japan) was used for this study, and a well lubricated 6 MHz transducer with Carboxymethyl-cellulose conducted gel was introduced as described by Haibel (1990); Kaehn (1994) and Hesselink & Taverne (1994). Two methods of ultrasonographical examination (trans-rectal and trans-abdominal) were used to check pregnant goats

## 2.6. Disease pattern in experimental goats

Twelve goats were divided into 5 groups. Each animal (in group 1-4) was inoculated with 60,000 sporulated oocysts:

- Group-1 included 2 goats at early gestation (1-2 month).
- Group-2 included 2 goats at mid gestation (3 months).
- Group-3 included 2 goats at late gestation ( $\geq 4$  months).
- Group-4 included 2 goats (nonpregnant).
- Group-5 (control) included 4 goats (2 pregnant and 2 nonpregnant).

Daily observation of goats for any clinical manifestation was applied according to Radostits et al. (2007). Serum samples were collected from each animal in the experimental and control groups weekly (up to 48 weeks) for estimation of infection by toxoplasmosis by LAT and IHA, and another blood samples were collected on EDTA (Ethylene Diamine Tetra-acetic Acid) to detect infection by PCR and bioassay in mice.

## 2.7. Statistical analysis

The obtained data were analysed for significance using T-test (Selvin, 1996), and the variabilities were done by variant NOVA (SAS, 1996).

## 3. Results

### 3.1. Seroprevalence results

Out of 100 goats sera samples that collected from Cairo and Zagazig abattoir 29(29%) and 27 (27%) of goats were seropositive against toxoplasmosis by LAT and IHA tests. The seroprevalence was higher at Zagazig abattoir (28%) than that at Cairo abattoir (24.2%) (Table 1). The titer of LAT were ranged from 1/16 to 1/512, with the most frequency 1/32 to 1/256, while the titer of IHA were ranged from 1/80 to 1/1280 with the most frequently 1/160 (Table 2).

### 3.2. Disease pattern in goats

Daily investigation of all infected goats revealed slight rise of body temperature. The temperature started to rise at day 5, reached a peak of

41°C at day 6 and 7 and return to normal at day 11. All goats showed depression, anorexia, cough, muscular hyperesthesia, and diarrhea. Experimentally infections of goats in early stage of gestation (Group I) result in fetal reabsorption and were negative by ultrasonographical examination one-month post-infection (Image1a,b). While infection of 2 mid pregnant does (group II) result in one of these does was aborted at 28 days post-infection, whereas the other was aborted at 40 days post-infection. Moreover infection of 2 late pregnant does (Group III) were birth 4 normal viable kids their weight were 1.9 - 2 kg. The main gross lesions in the placenta were multiple focal areas of necrosis and calcification which were grayish white in color and firm in consistency (Image 2). On the other hand control does (Group V) were clinically normal and pregnant does were birth normal viable kids their weight ranged from 2 - 2.2 kg.

Tachyzoites of *T. gondii* were recovered from the blood of 5 out of 8 experimentally infected goats one week P.I. through blood bioassay in mice. Only 5 out of 24 mice injected with blood became infected (Image 3). *T. gondii* were isolated from all placenta and aborted fetuses of infected does using tissue bioassays in mice. There were 6 out of 12 mice

and 5 out of 6 mice injected with tissue of placenta and aborted fetuses became infected. Tissue bioassay in cats revealed *T. gondii* from all placenta and aborted fetuses of experimentally infected does. There were 7 out of 8 and 4 out of 4 cats became

infected and shed oocysts after feeding tissues of placenta and aborted fetuses of experimentally infected does (Image 3 and Image 4). Blood and tissues bioassay of non-infected control goats revealed no tachyzoites or tissue cysts (Table 3).

**Table 3. Bioassay results in goats infected with sporulated oocysts.**

Sporulated oocysts	Infected stage	Groups	No. of goats	Stages of gestation	Does for Each group	Bioassay in mice			Bioassay in cats

Serum samples collected from infected goats as well as control revealed that all goats were seronegative at the time of inoculation. LAT showed rapid response as antibody titer first appear after 10 days in one goat, while all infected does developed antibody titer of 1/32 or more after 12 days P.I. *T. gondii* serum antibodies peaked usually to a plateau level at 8 to 22 weeks after inoculation of the does and showing slight fluctuations until the end of experiment (48 weeks). Abortion or kidding coincided with or preceded these peak levels and antibodies titers of aborted does ranged from 1/64 – 1/128 (Table 4). Whereas IHA detected antibodies against *T. gondii* in some goats (2 does) on day 14 P.I. and all infected goats were seropositive after 3 weeks P.I. *T. gondii* serum antibodies peaked usually

to a plateau level at 9 to 26 weeks after inoculation of the does and showing slight fluctuations until the end of the experiment (48 weeks). Abortion or kidding preceded these peak levels and antibodies titers of aborted does ranged from 1/80-1/160 (Table 4). The results also revealed that antibody titer of either LAT or IHA were decreased around abortion or parturition and increase again after one week (Table 4). Both LAT and IHA were negative and insensitive in detection of congenital infection in pre-suckling kids. Whereas PCR gave positive results in the blood of all infected does one week P.I., but gave negative results in control group. Moreover, PCR gave positive results in the placenta and tissues of all aborted kids from infected does as well as in the blood of life congenitally infected kids (Table 4 and Image 5).

#### 4. Discussion

The sole source of infection of herbivore especially goats by *T.gondii* is sporulated oocysts in contaminated food and water from infected cat feces. Toxoplasmosis has a potential risk to human, in addition to its economic losses in goats. If the parasite is encountered during pregnancy, fetal infection; abortion and neonatal loss can occur (Buxton 1998; Bisson et al., 2000). Clinical symptoms of toxoplasmosis in goats are not specific especially in the early stage of infection. Therefore, the detection of specific toxoplasma antibodies appears to be an important tool for diagnosis of toxoplasmosis in ovine species.

Evaluation of serological tests becomes important in order to use sensitive and specific tests in serological surveys (Moreno et al., 1991). In the present study, out of 100 goats' sera slaughtered at Cairo and Zagazig abattoir, 29 (29%) and 27 (27%) of goats were seropositive against toxoplasmosis by LAT and IHA tests respectively. This percentage of infection among goats seems to be nearly similar to that reported by Pita-Gondim et al. (1999); Sharma et al. (2003) and Jittapalapong et al. (2005) using the same tests. Our result was different than those reported by Matsuo & Husin, (1996); Da Silva & Langoni (2001) and Mainardi et al. (2003). In the present study it was noticed that the percentage of infection varied from region to region. This variation may be attributed to the difference of the environmental and ecological condition, which affect the biology of the parasite or the system of breeding and hygienic measures inside farms.

Regarding the quantitative agreement in antibody titers obtained by IHA and LAT in 100 caprine serum samples examined for toxoplasmosis, it showed that out of 5 LAT positive sera at titers 1/16, 2 sera were IHA negative and all LAT result >1/32 was positive by IHA. This was in agreement with Chhabra et al. (1981), Dubey et al. (1987) and Tress et al. (1988) who found 100% correlation between LAT, IHA and dye test. They concluded that LAT is sensitive, reliable, rapidly responsive serological test and is efficient for screening purposes. Regarding to the comparison between serological results and the results of bioassay in mice and cats, the results revealed that there were complete concordance between LAT and bioassay in cats and mice, as all LAT positive sera samples of goats were positive by bioassay in cats and mice. While the agreement between IHA and bioassay in cat and mice were 93.1% in goats. These results reflect that LAT is more sensitive than IHA. This result agreed with that reported by Dubey et al. (1987); Tress et al. (1988); Figueiredo et al. (2001) and Lhafi et al. (2004) and Érica et al. (2010).

The results of clinical examination of experimentally infected goats revealed that all infected goats had slight rise of body temperature (41°C), depression, anorexia, cough, muscular hyperesthesia, and diarrhea by day 5 and returned to normal by day 11. These results were in agreement with Dubey et al. (1980) and Nishi et al. (2001). Goats in group (I), which infected at early stage of gestation revealed fetal reabsorption and negative ultrasonographical examination, one month post-infection. This result was in agreement with that recorded by Dubey (1981). Infection of 2 mid pregnant does (group II), result in abortion of one at 28 days post-infection, whereas the other was aborted at 40 days post-infection. This result was concordant with that of Buxton (1998). Moreover infections of 2 late pregnant does (Group III) were birth normal viable kids their weight were 1.9-2 kg. This result coincided with that reported by Dubey & Beattie (1988). The previous results indicate that age of fetus at the time of *T. gondii* infection in the goats is one of the known causes for this variability in clinical response. This concordant with that reported by Blewett and Watson (1983).

Blood bioassay in mice revealed *T. gondii* tachyzoites from the blood of 4 out of 8 experimentally infected goats one week P.I. only 4 out of 24 mice injected with blood became infected. These results were in agreement with that recorded by Dubey et al. (1980) and Freyre et al. (2008) who detected parasitaemia in 7 out of 7 goats that lasted 3 to 10 days, and Nishi et al. (2001) who detected parasitaemia in 50% of infected goats by mice bioassay from 7 to 14 days P.I. and isolated viable *T. gondii* from all infected goats which killed after 8 weeks P.I. Tissue bioassays in mice and cats revealed *T. gondii* from all placenta and aborted fetuses of infected does. This result was in agreement with that recorded by Dubey (1981) who isolated *T. gondii* from the fetal placenta of 6 out of 7 goats as early as 10 and as late as 15 days after inoculation. Regarding PCR results, *T. gondii* was detected from blood of life fetuses, all placenta and aborted fetuses of infected does. This result was coincided with that reported by Sreekumar et al. (2004) who found that lung, muscles and mesenteric lymph node aspirates of the doe and lung tissue of the aborted fetus were PCR positive.

With regard to the results of serological tests on experimentally infected goats LAT showed rapid response as all infected does developed antibody titer of 1/32 or more after 14 days P.I., while IHA detected antibodies after 3 weeks P.I. These results were in agreement with that reported by Vitor et al. (1999) who found that antibodies against *T. gondii* in

the sera of experimentally infected goats were ranged from 1:256 and 1:32000.

Our results revealed that both LAT and IHA tests were insensitive in detection of *T. gondii* antibodies in the post-suckling lambs from infected does. These results coincided with that reported by Dubey et al. (1987). The antibodies of LAT and IHA remained high until the end of experiment (at 48 weeks P.I.), this clarified that the high antibody titers are not necessarily diagnostic of recent infection. This result consensus with that recorded by Dubey (1985) who reported that the concentration of antibody may remain high, even into the next breeding season.

It could be concluded that, clinical symptoms of toxoplasmosis in goats are not specific; therefore serological tests appeared to be an important tool for diagnosis. Moreover, PCR considered the most reliable tool for diagnosis of prenatal infection of toxoplasmosis, while LAT and IHA were considered unreliable tools for diagnosis of toxoplasmosis if they applied one week before or after kidding.

# Photocatalytic Degradation of Monoazo and Diazo Dyes in Wastewater on Nanometer-Sized TiO<sub>2</sub>

S.A. Abo-Farha

Chemistry Department, Faculty of Science, Al-Azhar University (Girls), Naser City, Cairo, Egypt  
samiaelhosieny@yahoo.com

**Abstract :** Advanced oxidation processes (AOPs) have proved very effective in treatment of the various hazardous organic pollutants in water. The photocatalytic degradation of two azo dyes, monoazo dye Acid Orange 10(AO10) and diazo dye Acid Red114(AR114) present in wastewater were studied. Homogeneous photocatalytic degradation of the two azo dyes with UV/Visible/H<sub>2</sub>O<sub>2</sub> process was investigated. The rates of disappearance of the two azo dyes were monitored spectrophotometrically at the visible maximum absorption wavelengths. It was found that the rate of decolorization rises by increasing the initial dosage of H<sub>2</sub>O<sub>2</sub> up to a “critical” value at which it is maximum and beyond which it is inhibited. The rates of reactions follow pseudo-first-order kinetics. Also heterogeneous photocatalytic degradation of the two azo dyes with UV/Visible/TiO<sub>2</sub> (titanium dioxide) interface was investigated. The photocatalytic degradation rate depends on dye structure, dye concentration, TiO<sub>2</sub> loading and pH of the medium. The mechanism of the photodegradation process under UV-visible light illumination involves an electron excitation into the conduction band of the TiO<sub>2</sub> semiconductor leading to the generation of very active oxygenated species that attack the dye molecules leading to photodegradation .

Photocatalytic activity of TiO<sub>2</sub> was examined by focusing on its enhancement by electron scavengers in the photocatalytic decomposition of the two azo dyes. The electron scavenger employed was inorganic oxidant such as H<sub>2</sub>O<sub>2</sub>, adequate dose of H<sub>2</sub>O<sub>2</sub> led to a faster degradation of the two azo dyes in the TiO<sub>2</sub> photocatalytic system. The fast decolorization of monoazo dye (AO10) than diazo dye (AR114) is an indication that, the number of azo and sulphonate groups in the dye molecule may be a determining factor for increasing the degradation rates. TiO<sub>2</sub> can be recycled at least twice without significant change in its efficiency. The photodegradation rates of the two recycled catalysts RC-1 and RC-2 were examined. [ Journal of American Science. 2010; 6(11): 130-142]. (ISSN: : 1545-1003).

**Keywords:** Azo dyes; UV/H<sub>2</sub>O<sub>2</sub> oxidation, Titanium dioxide; Photodegradation; Semiconductor.

## 1. Introduction

Environmental pollution on a global scale, as well as the lack of sufficient clean energy sources, have drawn much attention to the need for developing ecologically clean chemical technology, materials, and process [1-4]. Azo dyes, being the largest group of synthetic dyes, constitute up to 70% of all the known commercial dyes produced. Highly substituted aromatic rings joined by one or more azo groups characterize their chemical structures. These substituted ring structures make the molecules recalcitrant which the conventional wastewater treatment processes do not degrade. Being released into the environment, these dyes not only impart colors to water sources but also damage living organisms by stopping the reoxygenation capacity of water, blocking sunlight, and therefore disturbing the natural growth activity of aquatic life [5,6]. Thus, the color removal of textile wastewater is a major environmental concern [7].

In recent years, research in new non-biological methods has led to processes which

actually destroy these pollutants in stead of simply extracting them from water (e.g., adsorption by active carbon, air stripping, etc.). It has been shown that the use of TiO<sub>2</sub>, O<sub>3</sub>, H<sub>2</sub>O<sub>2</sub>, and Fenton (a mixture of ferrous ion with H<sub>2</sub>O<sub>2</sub>) are more efficient in the photodegradation of organic pollutants in comparison to that of direct photolysis [8-10]. Among them, one of the common observations is that the enhancement of organic decomposition is due to the generation of powerful non-selective hydroxyl radical ( $\cdot$ OH) produced in the process of photodegradation.

The efficiency of advanced oxidation processes for the degradation of recalcitrant compounds has been extensively studied [11-16]. Photocatalytic process, which utilizes TiO<sub>2</sub> semiconductor photocatalyst, has received increasing attention because of its low cost, non-toxicity, relatively high chemical stability of the catalyst, and the possibility of using sunlight as a source of irradiation [5,8,11,14]. However, it has a limitation that the quantity of  $\cdot$ OH radicals cannot be increased infinitely because overdosing of TiO<sub>2</sub> scatters the light in the solution [8,17]. Therefore, new

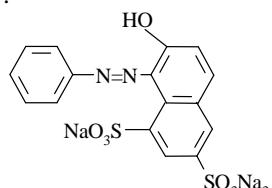

developments of these technologies have focused on searching for better oxidants to increase the generation of radicals or to optimize the photodegradation process.

It was reported that the use of inorganic oxidants, such as  $\text{H}_2\text{O}_2$ ,  $\text{ClO}_3^-$ ,  $\text{BrO}_3^-$ , and  $\text{S}_2\text{O}_8^{2-}$ , in  $\text{TiO}_2$  system increased the quantum efficiencies either by inhibiting electron-hole pair recombination through scavenging conduction band electrons at the surface of  $\text{TiO}_2$  or by offering additional oxygen atom as an electron acceptor to from the superoxide radical ion ( $\text{O}_2^\cdot$ ) [8,18]. According to the investigation on  $\text{H}_2\text{O}_2$ , adequate dose of  $\text{H}_2\text{O}_2$  led to a faster degradation of organic compounds in the  $\text{TiO}_2$  photocatalytic system [8,19]. However, the degradation was suppressed if excess  $\text{H}_2\text{O}_2$  was used. This is due to the undesirable consumption of  $\cdot\text{OH}$  radical that was previously formed in the solution by  $\text{H}_2\text{O}_2$ , leading to generation of less-reactive  $\text{HO}_2^\cdot$  radicals [8, 20]. Enhancement of  $\text{TiO}_2$ -catalyzed photodegradation of organic compounds by several inorganic oxidants was mainly attributed to the

## 2. Materials and Methods

### 2.1. Materials

Two azo dyes, monoazo dye Acid Orange 10 (AO10) and diazo dye Acid Red 114(AR114) were obtained from Lingxian Shine Coating and

C.I. Acid Orange 10

(Mol. wt. 452.376 g and  $\lambda_{\max}$  478 nm)

Hydrogen peroxide (30% w/w) was obtained from Merck. Titanium dioxide P-25 from Degussa Corporation (70% anatase, 99.8% purity, average particle size 30 nm and specific surface of 50  $\text{m}^2/\text{g}$ ). It was dissolved in deionised water using (New water purification system, Human RO 180. RO, product).

### 2.2. Physical measurements

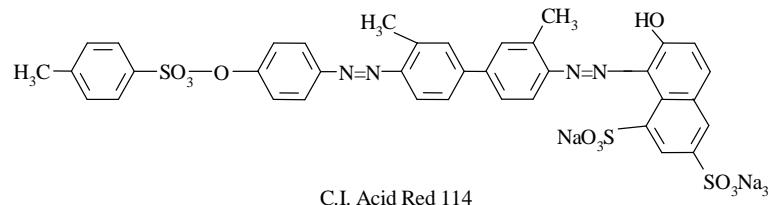

For the UV/Visible/ $\text{H}_2\text{O}_2$  and UV/Visible/ $\text{TiO}_2$  processes, irradiations were performed in a batch photoreactor. All experiments were conducted in a batch microsol light tester equipped with a pre-settable timer and water-cooling jacket (BS 1006 UK-TN) fitted with 400 W MB/U lamp show in Fig. (1) (made in England).

increased electron scavenging from the extra oxidant sources [8,21].

Several studies of photocatalytic degradation of dyes have been reported [8,22,23]. Factors influencing the photodegradation rate of aqueous system have been studied in the subjects such as the initial concentration of dyes, the effect of pH values, dissolved oxygen contents and amounts of photocatalyst added to the aqueous solution [24,25].

This paper describes the kinetics of the color removal for two dyes, monoazo dye Acid Orange 10(AO10) and diazo dye Acid Red 114 (AR114) by homogeneous photocatalytic degradation in presence of (UV/Visible/ $\text{H}_2\text{O}_2$ ), which is a 'friendly' oxidant and by heterogeneous photocatalytic degradation in presence of (UV/Visible/ $\text{TiO}_2$ ) and enhancing the photocatalytic activity of  $\text{TiO}_2$  by employing electron scavenger such as  $\text{H}_2\text{O}_2$ . Variable factors such as the initial dyes concentration,  $\text{H}_2\text{O}_2$  does,  $\text{TiO}_2$  loading and pH values have been studied. Moreover the efficiency of the recycled  $\text{TiO}_2$  was examined

auxiliaries Co. LTD. were used without further purification. Their structure are drawn.

C.I. Acid Red 114

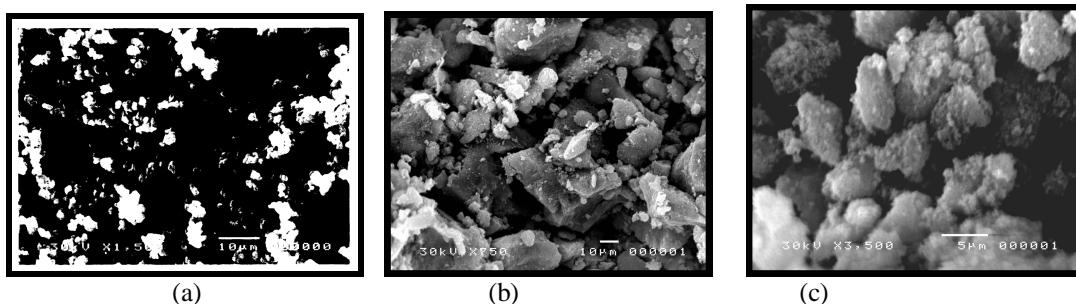

(Mol. wt. 830.8308g and  $\lambda_{\max}$  514 nm)

**Fig. (1):** Batch microsol photoreactor light tester

The pH values of the solution were adjusted, using microcomputer pH-vision DATALOGGER 6209; JENCO ELECTRONICS-LTD (made in U.S.A.). PH adjusted using dilute hydrochloric acid and sodium hydroxide solutions. Hydrochloric acid was chosen because its effected on the adsorption surface properties of the  $\text{TiO}_2$  is negligible [26]. The absorption spectra were recorded with JENWAY-6300 UV-Visible spectrophotometer. The absorbance of solutions measured using a 1cm quartz cell (made in U.K.).

### 2.3. SEM analysis

**Fig. (2):** SEM micrograph of (a)  $\text{TiO}_2$  and (b) (AO10) adsorbed on  $\text{TiO}_2$  (c) (AR114) adsorbed on  $\text{TiO}_2$

The SEM picture of pure  $\text{TiO}_2$  and (AO10) and (AR114) adsorbed on  $\text{TiO}_2$  are shown in Fig. (2). The SEM picture of pure  $\text{TiO}_2$  Fig. 2a shows that, the size of titanium dioxide particles are uniform and needle-like particles [9]. In case of (AO10) and (AR114) agglomeration (particle-particle interactions) is observed. The distribution of dye on the surface of  $\text{TiO}_2$  is not uniform and SEM pictures Fig. 2b,c show that, dyes contain irregular shaped particles which are the aggregation of tiny crystals. However, it cannot be ruled out, that some dye particles are too small to be observed at the resolution of the used microscope [4,18]. The image from Fig. 2b, c reveals that, the presence of great agglomerates with particle size of monoazo dye (AO10) than diazo dye (AR114). From this result, it is clear that the morphology has been strongly influenced by the type of acid dye [27].

### 2.4. Photocatalytic degradation experiments

#### 2.4.1. Homogeneous photocatalytic degradation

The experiments are carried out in a batch-type photoreactor.  $\text{H}_2\text{O}_2$  is acts as photocatalyst and UV/Visible/light as illuminating light source. Reaction system is setup by adding the photocatalysts into 250 ml dye solutions prepared in appropriate concentrations using deionized water. The pH is adjusted to the desired values with HCl and NaOH.

Centrifug model 800 of a maximum speed 4000r/min is used for complete separation for the semiconductor particles used ( $\text{TiO}_2$ ) from the sample solution. Scanning electron microscope (SEM) analysis is performed to identify the catalyst surface morphology using a JEOL-JSM-5400S scanning electron microscope (made in Japan). The SEM is measured in National Center for Radiation Research and Technology.

The dye solutions are stirred and divided to 5 ml samples and illuminated in a batch-type photoreactor. At regular time intervals the dye concentrations are measured spectrophotometrically.

#### 2.4.2. Heterogeneous photocatalytic degradation

Also the experiments are carried out in the same batch photoreactor. Pure  $\text{TiO}_2$  powder adding into 250 ml dye solutions prepared in appropriate concentrations using deionized water. The pH also is adjusted to the desired values. The dye solutions are stirred and divided to 5 ml samples and illuminated in batch photoreactor. At regular time intervals the samples centrifuged and dye concentrations are measured spectrophotometrically.

### 3. Results and Discussion

#### 3.1. Homogeneous photocatalytic degradation with $\text{H}_2\text{O}_2$

##### 3.1.1. Effect of initial dye concentration.

Initial dye concentrations  $C_0$  were set in the range  $1.0 \times 10^{-5}$  to  $1.0 \times 10^{-4}$  M for both two azo dyes Acid Orange 10 and Acid Red 114. Photocatalysis were occurred in presence of 5mM  $\text{H}_2\text{O}_2$  for both two azo dyes and pH 3.0. Initially, a large degree of removal is observed. This is due to fast decomposition of  $\text{H}_2\text{O}_2$  producing the hydroxyl radicals.

Degradation of the dye is due to the hydroxyl radicals generated upon photolysis of hydrogen peroxide [28-30], following the reaction:

This radical is a very powerful oxidizer, able to react with inorganic as well with aliphatic or aromatic organic compounds [31,32].

According to the results of Shu *et al.*, [28] the photooxidation reaction is pseudo-first-order with respect to azo dye concentration. This frequently occurs when the contaminant is very dilute in solutions. The kinetic constant can also be linked to the dye absorbance by Eq. (2).

$$\ln \frac{A}{A_0} = -kt \quad (2)$$

Where :  $A_0$  and  $A$  are the initial and final absorbance values of solution before and after irradiation [33].

Moreover, decolorization of dye is mainly due to hydroxyl radicals generated. Azo bonds are more active: AO10 contain one azo bond and AR114 contain two azo bonds and degradation of this dyes are due to the initial electrophilic cleavage of its chromophoric azo ( $-\text{N}=\text{N}-$ ) bond attached to naphthalene ring [34].

The values of photodegradation pseudo first order rate constants for different concentrations of dyes calculated from the linear plots of  $\ln A/A_0$  against irradiation time are given in Figs. (3,4). Taking into account that, the life-time of hydroxyl radical is very short (only few nanoseconds), they can only react where they are formed [35]. Increasing the concentrations of AO10 and AR114 lead to decrease in the degradation rates see Fig. 4 and Table 1. However, the molar extinction coefficient of the two dyes are high ( $\epsilon=16.9 \times 10^3$  and  $18.3 \times 10^3$  liter mole $^{-1}$  cm $^{-1}$  for AO10 and AR114 respectively), so that a rise in its concentration induce an inner filter effect, i.e., incident light would largely be wasted for dye excitation rather than for the hydroxyl radical precursor excitation. Consequently, the solution becomes more and more impermeable to UV radiation. As the rate of hydrogen peroxide photolysis directly depends on the fraction of incident light absorbed by  $\text{H}_2\text{O}_2$  molecules, the degradation rate slows down. The effect of direct UV/Visible irradiation was insignificant. The observed first order rate constants were  $5.2 \times 10^{-3}$  and  $4.7 \times 10^{-3}$  (min $^{-1}$ ) for AO10 and AR114 respectively. For reaction combined UV/Visible irradiation and hydrogen peroxide addition, the decolorization was extremely powerful than that of direct photolysis.

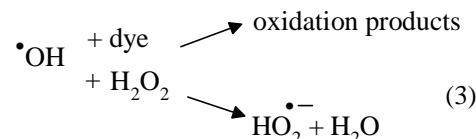

### 3.1.2. Effect of initial $\text{H}_2\text{O}_2$ concentration

The effect of varying the initial  $\text{H}_2\text{O}_2$  concentration increase from 5mM to 100 mM for dye

concentration  $1.0 \times 10^{-5}\text{M}$  at pH 3.0 for both the two azo dyes AO10 and AR114. A very large excess of  $\text{H}_2\text{O}_2$  in comparison to the dye was introduced in the solutions. Fig. 5, shows that, the initial hydrogen peroxide concentration strongly modifies the rates of degradation of the two azo dyes, Acid Orange 10 and Acid Red 114 in the UV/Visible/ $\text{H}_2\text{O}_2$  processes [19,29].

At low hydrogen peroxide concentrations, formation of  $\cdot\text{OH}$  is the kinetic determining step.  $\text{H}_2\text{O}_2$  cannot generate enough hydroxyl radicals and the oxidation rate is logically slow. Further, most of free radicals are directly consumed by the dye.

An increase of the hydrogen peroxide concentration up to 50 mM leads to an important rise in the solution discolouration rate (see Table (1)). On the other hand, further increase in the  $\text{H}_2\text{O}_2$  concentration partly inhibits the oxidation rate. This behaviour is proof of the existence of an optimal dosage in  $\text{H}_2\text{O}_2$ . We must underline the fact that hydroxyl radicals produced upon photolysis of hydrogen peroxide can react with dye molecules, but also with an excess of  $\text{H}_2\text{O}_2$ .

In the presence of high concentration of peroxide ( $>50$  mM), we could expect that more  $\cdot\text{OH}$  radicals would be produced. However these radicals preferentially react with the excess of  $\text{H}_2\text{O}_2$ . This undesirable reaction competes with the destruction of the dye chromophore [36,37].

### 3.1.3. Effect of initial pH

To study the effect of pH on photodegradation, experiments are conducted at  $1.0 \times 10^{-5}\text{M}$  dye concentration for the two azo dyes Acid Orange 10 and Acid Red 114 in presence of 50mM  $\text{H}_2\text{O}_2$  dose at different initial pH values ranges from 1.0 to 11.0, the calculated pseudo first-order rate constants (Fig. 6) are given in Table (1). The results show that, high degradation rate constant values are observed at pH 3.0 for both two azo dyes and decrease significantly in alkaline media. Similar results have already been reported for azo dyes [35,36].

The high rate constant value observed at lower pH can be explained by the change in the molecule structure. The presence of labile H atom makes the molecule of dye especially vulnerable toward attack of  $\cdot\text{OH}$  radicals [36].

In alkaline medium, hydrogen peroxide undergoes decomposition leading to dioxgen and water rather than producing hydroxyl radicals under UV/Visible/irradiation [38]. Therefore the instantaneous concentration in  $\cdot\text{OH}$  is lower than expected. The base-catalyzed decomposition involves the  $\text{HO}_2^-$  anion: the conjugated base of  $\text{H}_2\text{O}_2$  reacts with non-dissociated molecule of  $\text{H}_2\text{O}_2$  according to Eq. (4).

Furthermore, the deactivation of  $\cdot\text{OH}$  is greater when the pH of the solution is high (the reaction of  $\cdot\text{OH}$  with  $\text{HO}_2^-$  being approximately 100 times faster than its reaction with  $\text{H}_2\text{O}_2$  [30,38].

The reactivity of  $\text{HO}_2^-$  and its basic form  $\text{O}_2^-$  with organic compounds is very weak. They preferentially disproportionate producing some hydrogen peroxide and oxygen, according to the Eq. (7).

### 3.2. Heterogeneous photocatalytic degradation

#### 3.2.1. Photocatalysis of $\text{TiO}_2$ suspension containing azo dyes

##### 3.2.1.1 Photodegradability of the dyes

Initial control experiments are carried out in order to evaluate the photocatalysis viability in the degradation of the azo dyes AO10 and AR114 under the following conditions : (i) self photolysis of dye solution with UV/Visible/light and (ii) under irradiation of UV/Visible/light with photocatalyst. Fig. (7) shows the change in absorption intensity on irradiation of an aqueous solutions of AO10 and AR114, in the presence and absence of titanium dioxide.

From the obtained results it is clear that the dyes are small decolorization to (i) direct photolysis of UV/Visible/light. Simultaneous irradiation and aeration in the presence of  $\text{TiO}_2$  caused excellent decolorisation of the dyes [39,40]. This suggested that the photocatlytic activity of  $\text{TiO}_2$  degussa P-25 is remarkable, and the photocatalytic degradation of these dyes under UV/Visible/light is significant [41-43]. This is due to the fact that when  $\text{TiO}_2$  is illuminated with the light of  $\lambda < 390\text{nm}$ , conduction band electrons ( $e^-$ ) and valence band holes ( $h^+$ ) are generated.  $\text{TiO}_2$  suspension is irradiated with light energy greater than its band gap energy (Eg, 3.2 eV).

The photogenerated electrons could reduce the dyes or react with electron acceptors such as  $\text{O}_2$  adsorbed on the Ti(III) surface or dissolved in water, reducing it to superoxide radical anion  $\text{O}_2^-$ . The photo-generated holes can oxidize the organic molecule to form  $\text{R}^+$ , or react with  $\text{OH}^-$  or  $\text{H}_2\text{O}$  oxidizing them into  $\cdot\text{OH}$  radicals. Together with other highly oxidant species (peroxide radicals) they are reported to be responsible for the heterogeneous  $\text{TiO}_2$  photodecomposition of organic substrates as dyes. According to this, the relevant reactions at the semiconductor surface causing the degradation of dyes can be expressed as follows:

The resulting  $\cdot\text{OH}$  radicals, being a very strong oxidizing agent can oxidize most of azo dyes to the mineral end-products. Substrates not reactive toward hydroxyl radicals are degraded employing  $\text{TiO}_2$  photocatalysis with rates of decay highly influenced by the semiconductor valence band edge position [44]. The role of reduced pathway (Eq. (15)) in heterogeneous photocatalysis has been investigated also in the degradation of several dyes but in a minor extent than oxidation [43,45].

##### 3.2.1.2. Factors influencing the photocatalytic degradation

###### 3.2.1.2.1 Effect of initial dye concentration

The effect of initial concentration of the dyes on the rate of degradation was performed by varying the initial dye concentration from  $1.0 \times 10^{-5}$  to  $1.0 \times 10^{-4}\text{M}$  at  $\text{pH} = 3.0$  with constant loading of  $\text{TiO}_2(0.2\text{ g/l})$  for both two azo dyes AO10 and AR114.

The values of the first order rate constants calculated according to Eq. 2. are shown in Fig. (8) [15,43,45]. It is generally noted that the degradation rate reach to maximum level [ $1.0 \times 10^{-5}\text{M}$ ] for both two azo dyes and a further increase in dyes concentrations lead to decrease the degradation rate of the dyes [46,47]. The rate of degradation relates to the probability of  $\cdot\text{OH}$  radicals formation on the

catalyst surface and to the probability of  $\cdot\text{OH}$  radicals reacting with dye molecules. The degradation efficiency of the dye decreases as the dye concentration increases further. The presumed reason is that at high dye concentrations the generation of  $\cdot\text{OH}$  radicals on the surface of catalyst is reduced since the active sites are covered by dye ions. Another possible cause for such results is the UV/Visible screening effect of the dye itself. At a high dye concentration, a significant amount of UV/Visible may be absorbed by the dye molecules rather than the  $\text{TiO}_2$  particles and that reduce the efficiency of the catalytic reaction because the concentrations of  $\cdot\text{OH}$  and  $\text{O}_2^{\cdot-}$  decrease [40,48].

Moreover the major portion of degradation occurs in the region near to the irradiated side (termed as reaction zone) where the irradiation intensity is much higher than in the other side [49]. Thus at higher dye concentration, degradation decreases at sufficiently long distances from the light source or the reaction zone due to the retardation in the penetration of light.

Hence, it is concluded that as initial concentration of the dye increases, the requirement of catalyst surface needed for the degradation also increases [50].

### 3.2.1.2.2. Effect of $\text{TiO}_2$ loading

$\text{TiO}_2$  dosage is an important parameter that can affect the degradation rate. The initial reaction rates were found to be directly proportional to catalyst concentration indicating the heterogeneous regime. However, it was observed that, above a certain level of concentration the reaction rate decreases and becomes independent on the catalyst concentration.

In this work, the effect of  $\text{TiO}_2$  loading on the photodegradation rate of the two azo dyes AO10 and AR114 has been examined by varying its amount from 0.05 to 0.2 g/l ( $[\text{AO10}]=[\text{AR114}]=1.0 \times 10^{-5}\text{M}$ , pH = 3.0 for both two azo dyes). The linear plots of  $\ln A/A_0$  against irradiation time (Fig. 9) and photodegradation rate constants for both two azo dyes are given in Fig. (10). Fig. (10) shows that, the rate of photodegradation increase with catalyst loading up to 0.2 g/l. Above this loading, increase in turbidity of the solution reduces the light transmission through the solution, so this work stopped at this level. While below this level, it is assumed that the catalyst surface and absorption of light by the catalyst are the limiting factors. Many authors have investigated the reaction rate as a function of catalyst loading under different experimental conditions [51]. The enhancement of

the removal rate is due to (i) the increase in the amount of catalyst weight which increases the number of dye molecules adsorbed (ii) the increase in the density of particles in the area of illumination [34]. Thus higher amount of the catalyst may not be useful both in view of possible aggregation as well as reduced irradiation field due to increase in light scattering [52].

#### 3.2.1.2.3. Effect of pH

The interpretation of pH effects on the efficiency of dye photodegradation process is a very difficult task because of its multiple roles. First, is related to the ionization state of the surface according to the following reactions,

as well as to that of reactant dyes and products such as acids and amines. pH changes can be thus influence the adsorption of dye molecules onto the  $\text{TiO}_2$  surfaces, an important step for the photocatalytic oxidation to take place [53]. Bahnemann *et al.* [54] have already reviewed that acid-base properties of the metal oxide surfaces can have considerable implications upon their photocatalytic activity. The point of zero charge (PZC) of the  $\text{TiO}_2$  (Degussa P-25) is 6.8 [55]. Thus, the  $\text{TiO}_2$  surface is positively charged in acidic media ( $\text{pH} < 6.8$ ), whereas it is negatively charged under alkaline conditions ( $\text{pH} > 6.8$ ).

Second, hydroxyl radicals can be formed by the reaction between hydroxide ions and positive holes. The positive holes are considered as the major oxidation species at low pH whereas hydroxyl radicals are considered as the predominant species at neutral or high pH levels [48]. It was stated that in alkaline solution  $\cdot\text{OH}$  are easier to be generated by oxidizing more hydroxyl ions available on  $\text{TiO}_2$  surface, thus the efficiency of the process is logically enhanced [42]. Similar results are reported in the photocatalysed degradation of acidic azo dyes and triazine containing azo dyes [50], although it should be noted that in alkaline solution there is a coulombic repulsion between the negative charged surface of photocatalyst and the hydroxide anions. This fact could prevent the formation of  $\cdot\text{OH}$  and thus decrease the photoxidation. Very high pHs have been found favorable even when anionic azo dyes should hamper adsorption on the negatively charged surface [56]. At low pH, reduction by electrons in conduction band may play a very important role in the degradation of dyes due to the reductive cleavage of azo bonds.

Third the  $\text{TiO}_2$  particles tend to agglomerate under acidic condition and the surface area available

for dye adsorption and photon absorption would be reduced [53]. Hence, pH plays an important role both in the characteristics of textile waters and in the reaction mechanisms that can contribute to dye degradation, namely, hydroxyl radical attack, direct oxidation by the positive hole and direct reduction by the electron in the conducting band.

The wastewater from textile industries usually has a wide range of pH values. Generally, pH plays an important role both in the characteristics of textile wastes and generation of hydroxyl radicals [50]. Hence, attempts have been made to study the influence of pH in the degradation of the two azo dyes AO10 and AR114. The photocatalytic reactions are conducted at different pH values ranges from 1.0 to 11.0 and two dyes concentration [ $1.0 \times 10^{-5}$  M] at catalyst loading of 0.2 g/l. All reactions followed an apparent first-order kinetics confirmed by the linear transform of  $\ln(A/A_0) = f(t)$ . The rate constants of disappearance k in  $\text{min}^{-1}$  for two azo dyes AO10 and AR114 are illustrated in Fig. (11).

The results obtained in Fig. (11) indicated that, at  $\text{pH} < 6$  a strong adsorption of the two azo dyes on the  $\text{TiO}_2$  particles is observed as a result of the electrostatic attraction of the positively charged  $\text{TiO}_2$  with the dyes. At  $\text{pH} > 6.8$  as two azo dyes molecules are negatively charged in alkaline media, their adsorption is also expected to be affected by an increase in the density of  $\text{TiO}^-$  groups on the semiconductor surface. Thus, due to coulombic repulsion the dyes are scarcely adsorbed [42]. For the above reasons the photocatalytic activity of anionic dyes (mainly sulphonated dyes) reached a maximum in acidic conditions followed by a decrease in the pH range 7-11 [40,43,47].

Moreover, the higher degradation rate at acid pH is seen also for UV/Visible/ $\text{TiO}_2$  experiments due to the efficient electron-transfer process due to strong surface complex bond formation. This effect is less marked in neutral/basic pH solutions [57]. The inhibitory effect seems to be more pronounced in the alkaline range ( $\text{pH}=11-13$ ). At high pH values the hydroxyl radicals are rapidly scavenged and they do not have the opportunity to react with dyes [58].

Since the influence of the pH is dependent on dye type and on properties of  $\text{TiO}_2$  surface. This effect on the photocatalytic efficiency must be accurately checked before any application.

### 3.2.2. Photocatalysis of $\text{TiO}_2$ suspension with $\text{H}_2\text{O}_2$ containing azo dyes

It was observed that  $\text{H}_2\text{O}_2$  addition was beneficial for the photooxidation of the two azo dyes AO10 and AR114 [46]. The reactive radical

intermediate  $\cdot\text{OH}$  formed from  $\text{H}_2\text{O}_2$  by reactions with the photogenerated electrons can exert a dual function : as strong oxidant themselves and as electron scavengers, thus inhibiting the electron-hole recombination of the semiconductor surface [59] according to the following equations :

Moreover, the solution phase may at times be oxygen starved, because of either oxygen consumption or slow oxygen mass transfer. Peroxide addition thereby increases the rate towards what it would have been an adequate oxygen supply. However,  $\text{H}_2\text{O}_2$  can also become a scavenger of valence band holes and  $\cdot\text{OH}$ , when present at high concentration, [40].

As both  $\text{h}_{\text{VB}}^+$  and  $\cdot\text{OH}$  are strong oxidants for dyes, the photocatalytic oxidation will be inhibited when  $\text{H}_2\text{O}_2$  level gets too high. Furthermore, can be adsorbed onto  $\text{TiO}_2$  particles to modify their surfaces and subsequently decrease its catalytic activity.

In this work, the effect of varying dose of  $\text{H}_2\text{O}_2$  [5mM-100mM] in presence of constant weight of  $\text{TiO}_2$  (0.05 g/l) was also studied in the presence of the two azo dyes ([AO10] and [AR114] =  $1.0 \times 10^{-5}$  M) at constant  $\text{pH}=3.0$  Fig. (12). The results demonstrate that, the rate of photodegradation enhanced in presence of  $\text{H}_2\text{O}_2$  with  $\text{TiO}_2$  from 50mM  $\text{H}_2\text{O}_2$  without  $\text{TiO}_2$  (Fig. 5) to 10mM  $\text{H}_2\text{O}_2$  in presence of 0.05 g/l  $\text{TiO}_2$  for AO10 (Fig. 13), while the rate of photodegradation remain constant in both two cases at 50 mM  $\text{H}_2\text{O}_2$ , for AR 114 without  $\text{TiO}_2$  (Fig. 5) and in presence of 0.15 g/l  $\text{TiO}_2$  Fig. (13).

On the other hand, the effect of  $\text{TiO}_2$  loading on the photodegradation rates of AO10 and AR114 has been examined by varying its amount from 0.05 to 0.20 g/l, ([AO10] = [AR114] =  $1.0 \times 10^{-5}$  M),  $\text{pH}=3.0$ ,  $[\text{H}_2\text{O}_2]=10\text{mM}$ , 50mM for AO10 and AR114 respectively. The calculated photodegradation rate constants are given in Fig. (14). The results, demonstrate that the rate of photodegradation reached to maximum value, when loading by ([0.05 g/l  $\text{TiO}_2$ ] and in presence of 10 mM  $\text{H}_2\text{O}_2$  for AO10) compared to [0.20 g/l  $\text{TiO}_2$ ] without  $\text{H}_2\text{O}_2$  for the same dye Fig. (10). Also the rate of photodegradation of AR114 enhances in presence of  $\text{H}_2\text{O}_2$  with  $\text{TiO}_2$  from 0.20 g/l

TiO<sub>2</sub> without H<sub>2</sub>O<sub>2</sub> Fig. (10) to 0.15 g/l TiO<sub>2</sub> in presence of 50 mM H<sub>2</sub>O<sub>2</sub> Fig. (14).

Also the concentrations of the two azo dyes were increased in presence of H<sub>2</sub>O<sub>2</sub> with TiO<sub>2</sub> from [1.0 x 10<sup>-5</sup> M] to [5.0 x 10<sup>-5</sup> M] for (AO10) and [1.0 x 10<sup>-4</sup> M] for (AR114) in presence (0.05 g/l TiO<sub>2</sub> with 10 mM H<sub>2</sub>O<sub>2</sub> for (AO10) and 0.15 g/l TiO<sub>2</sub> with 50 mM H<sub>2</sub>O<sub>2</sub> for AR114) at pH 3.0. The photodegradation rates reached to maximum at 75.4x10<sup>-3</sup> (min<sup>-1</sup>) for (AO10) and 42.9x10<sup>-3</sup> (min<sup>-1</sup>) for (AR114) Fig. (15). The effect of use TiO<sub>2</sub> with H<sub>2</sub>O<sub>2</sub> on the pH values was fixed at pH 3.0 for both two azo dyes [1.0 x 10<sup>-5</sup> M].

From the above results it was found that, there were optimum conditions for each process to obtain excellent degradation for each dye. The optimum conditions in presence of UV/H<sub>2</sub>O<sub>2</sub> or UV/TiO<sub>2</sub> alone was 50 mM H<sub>2</sub>O<sub>2</sub> or 0.20 g/l TiO<sub>2</sub> for both two azo dyes. These conditions were reduced in presence of UV/H<sub>2</sub>O<sub>2</sub>/TiO<sub>2</sub> to (10mM H<sub>2</sub>O<sub>2</sub> and 0.05 g/l TiO<sub>2</sub> for AO10) and (50 mM H<sub>2</sub>O<sub>2</sub> and 0.15 g/l TiO<sub>2</sub> for AR114) Fig. (16).

### 3.2.3 Efficiency of the recycled TiO<sub>2</sub>

Photocatalysis is a clean technology, which normally dose not involve any waste disposal

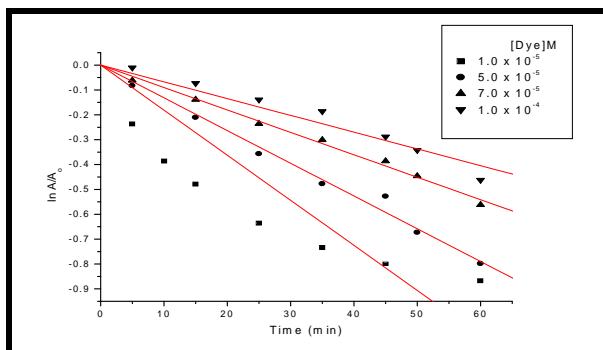

problem. The catalysts can be recycled. TiO<sub>2</sub> can be used at least twice without significant change in the efficiency [60]. The economy of the photocatalytic process depends upon how many times a catalyst can be reused without sacrificing its efficiency and the type of regeneration it requires.

The photodegradation rates of the two recycled catalysts RC-1 and RC-2 were examined . RC-1 achieved 50.4 x 10<sup>-3</sup> (min<sup>-1</sup>) for (AO10) and RC-2 achieved 43.8 x 10<sup>-3</sup> (min)<sup>-1</sup> for (AR114) compared to 73.2 x 10<sup>-3</sup> and 42.9 x 10<sup>-3</sup> (min)<sup>-1</sup> for (AO10) and (AR114) respectively obtained with the fresh catalyst under the same experimental conditions. The used catalyst was regenerated to get RC-1 first by treating with boiling distilled water till a colorless wash liquid was obtained and then by drying it in a hot air oven at a temperature of 90 to 100°C. RC-1 was heated in a muffle furnace at about 600°C to yield RC-2.

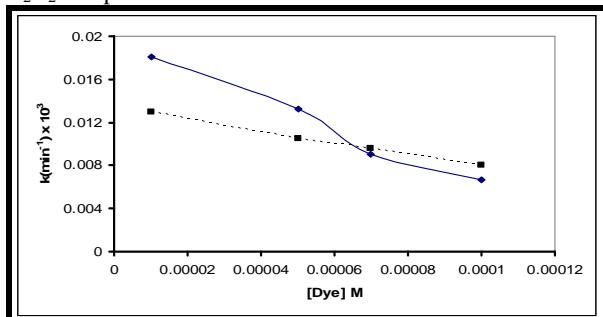

The decrease in the efficiency of the recycled catalyst may be attributed to the deposition of photoinsensitive hydroxides (Fouling) on the photocatalysts surface blocking its active sites.

**Table (1):** Photodegradation rates of (AO10) and (AR114) in presence of different parameters.

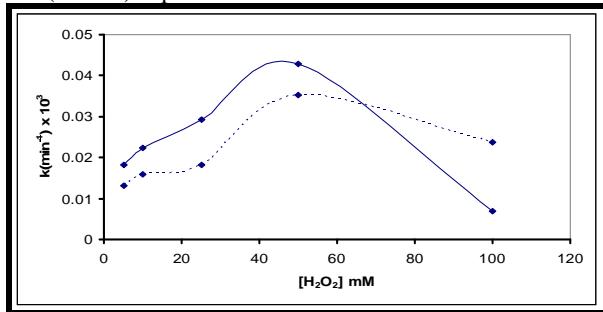

Parameters	k(min <sup>-1</sup> ) x 10 <sup>3</sup>	
	AO10	AR114
[Dye] M		
1.0 x 10 <sup>-5</sup>	18.1	13.0
5.0 x 10 <sup>-5</sup>	13.2	10.5
7.0 x 10 <sup>-5</sup>	9.0	9.6
1.0 x 10 <sup>-4</sup>	6.7	8.0
[H <sub>2</sub> O <sub>2</sub> ]mM		
5	18.1	13.2
10	22.4	15.8
25	29.3	18.3
50	42.9	35.2
100	6.8	23.8

#### 4. Conclusion

The impact of  $\text{H}_2\text{O}_2$  initial concentration in color removal kinetics under UV/ $\text{H}_2\text{O}_2$  process for two azo dyes (monoazo dye (AO10) and diazo dye (AR114)) was investigated. The results prove that the pseudo-first order kinetic model is in good agreement with the experimental data. A set of parameters for the model depicting this degradation were determined. These parameters, will naturally vary with the operating conditions, such as (dye concentration,  $\text{H}_2\text{O}_2$  dose, pH values). An increase in  $\text{H}_2\text{O}_2$  dose leads to a faster degradation up to a critical value; at a higher ratio the degradation process become slower.

The photodegradation of the two azo dyes catalyzed by UV/ $\text{TiO}_2$  was carried out with good results. Various parameters such as (dye concentration,  $\text{TiO}_2$  loading, pH values) were tested. The photocatalytic degradation rates for the two dyes were enhanced in presence of UV/ $\text{H}_2\text{O}_2/\text{TiO}_2$  at optimum conditions for each process and dye. The monoazo dye (AO10) was degraded faster than the diazo dye (AR114).

It may be postulated that, the dye color removal and degradation rates are proportional to the number of azo and sulphonic groups present in their molecules.

In summary, this work demonstrates that photocatalysis is a very effective technology for degrading Acid dyes with azo and sulphonic groups. Moreover, this technology can be utilized directly in dye baths before they are mixed with other textile effluents, which make their treatment difficult and costly due to dilution.

# Phenotypic and genetic trends for milk production in Egyptian buffaloes

Fooda, T. A.; Kawthar A. Mourad and Gebreel, I. A

Animal Production Research Institute-Buffalo Breeding Research Department- Dooki- Giza - Egypt

**Abstract:** A total of 3495 records collected from 904 buffalo cows progeny of 174 sires and 470 dams through period from 1990 to 2008 in all Stations belonging to Animal Production Research Institute, Ministry of Agriculture were used to estimate the phenotypic and genetic trends for total milk yield. LSM for total milk at different year of calving ranged between 1334 kg and 1692 kg, 1028 kg and 1561 kg, 1209 kg and 1633 kg, 1355 kg and 1415 kg and 1137 kg and 1355 kg for El-Nattafe El-Gidid (NG), El-Nattafe El-Kadim (NK), Mahalet Mousa (MM), Gemiza (G) and Sids (S) stations, respectively. Estimates of the positive breeding value (BV, %) at different year of calving ranged between 40 % and 52 %, 31 % and 52 %, 40 % and 56 %, 37 % and 55 % and 45 % and 59 % for NG, NK, MM, G and S stations, respectively. Annual phenotypic trend for milk production ranged between -11.7 kg and +36.7 kg for S and NK stations, respectively. While, the annual genetic trend ranged between -0.16 kg and +0.6 kg for G and NG stations, respectively. The results of the present study showed that there are increased of improvement of phenotypic and genetic trend in all MM farms from 1990 until now. [Journal of American Science. 2010;6(11):143-147]. (ISSN: 1545-1003).

**Keywords:** buffalo, phenotypic trend, genetic trend, breeding value and milk production

## 1. Introduction

The Egyptian buffaloes occupies an important role among the domestic animals as a provider of dairy produce beef. It contribution about 70 % of total country milk production, although the population of dairy animals (8.5 million) is almost equally divided between cows and buffaloes. Milk yield in buffaloes is affected by several genetic and non-genetic factors, that modulate the expression of the genetic merit (Khattab and Mourad, 1992 and Mourad *et al.*, 2005).

Since the productivity of the Egyptian buffaloes in nearly similar to that of other buffalo breeds, the introduction of foreign breed of buffalo will not contribute significantly in improving the genetic make up of the Egyptian buffaloes as in case of the native cattle. Therefore, improving the productivity of the buffalo done through selection. Open nucleus herd system (Steane, 1990) were applied from 1997 until now and established in El-Nattafe El-Gidid. Objectives of the present study were to estimate genetic and phenotypic trends in a five herds over 18 years and genetic evaluation of nucleus scheme.

## 2. Material and Methods

The data were collected from Stations : El-Nattafe El-Gidid, El-Nattafe El-Kadim, Mahalet Mousa (Kafr El-Sheikh Governorate), Sids (Bani Sewafe Governorate) and Gemiza (Gharbia Governorate) belonging to Animal Production Research Institute, Ministry of Agriculture. A total of 3495 records collected from 904 buffalo cows'

progeny of 174 sires and 470 dams and their sires having 5 progeny or more through period from 1990 to 2008 were used to estimate the phenotypic and genetic trend for total milk yield.

Buffaloes were kept in open sheds and grazed on berseem from December to May. They were hand-milked twice daily. Heifers were served for the first time when they reach 330 kg and / or 24 mo.. The cows should be dried off two months before the calving date, and they served not before two months after calving.

The Animal model (derivative - free restricted maximum likelihood: DFREML, Meyer, 1997) used to prediction of buffaloes breeding value for total milk yield according to the following model:

$$\mathbf{y} = \mathbf{X}\mathbf{b} + \mathbf{Z}_a \mathbf{a} + \mathbf{Z}_c \mathbf{c} + \mathbf{e}$$

where:  $\mathbf{y}$  = Vector of observations,  $\mathbf{X}$  = Incidence matrix relating fixed effects to  $\mathbf{y}$ ,  $\mathbf{b}$  = Vector of an overall mean and fixed effects (parity, year, season of calving and lactation period as a covariate),  $\mathbf{Z}_a$  = Incidence matrix relating direct additive genetic effects to  $\mathbf{y}$ ,  $\mathbf{a}$  = Vector of random effect (direct additive genetic associated with the incidence matrix  $\mathbf{Z}_a$ ,  $\mathbf{Z}_c$  = Incidence matrix for permanent environmental effect,  $\mathbf{c}$  = Vector of permanent environmental effect associated with the incidence matrix  $\mathbf{Z}_c$  and  $\mathbf{e}$  = Vector of random residual effects  $N(0, I\sigma^2_e)$ ;  $I$  is an identity matrix. The variance-covariance of the random effects was as follows

$$\text{Var} \begin{bmatrix} a \\ c \\ e \end{bmatrix} = \begin{bmatrix} A\sigma^2_a & 0 & 0 \\ 0 & I_c\sigma^2_c & 0 \\ 0 & 0 & I_n\sigma^2_e \end{bmatrix}$$

Where: A = Numerator relationship matrix,  $I_c$ ,  $I_n$  = Identity matrix with order equal to number of animals and number of records, respectively.

The phenotypic trends were measured as the regression of least squares means on calving years. Also, the genetic trends were measured as the regression of breeding value on calving years.

$$Y = a + Xb$$

Where: Y = total milk yield or breeding value, A = Intercept, X = Calving Year and b = the regression coefficient for Y on X.

### 3. Results and Discussion

Least square means for TMY, LP and BV (TMY) (mean, minimum, maximum and percentage of positive) are presented in Table 1. The present estimate of TMY is lower than those reported by Soliman *et al.* (1985) and Badran *et al.* (1991) (2159 and 2241 kg, respectively) on Egyptian buffaloes. But similar to those reported by Khattab *et al.* (1985) 1456 kg, otby *et al.* (1989) 1292 kg, Ashmawy (1991) 1564 kg, Khalil *et al.* (1992) 1249 kg, Khattab and Mourad (1992) 1309 kg, Khalil (1993) 1249 kg, Mansour *et al.* (1993) 1363 kg, Abd El-Raoof (1995) 1505 kg and Mourad *et al.* (2005) 1581 kg, on Egyptian buffaloes.

The differences between the estimates in present study and other studies may be attributed to the herds size, climatic and managerial conditions and / or different genetically make up. The percentage of positive for BV (TMY) ranged from 40 to 52 %, from 31 to 52 %, from 40 to 56 %, from 40 to 50 %, from 37 to 55 %, from 45 to 59 % and from 41 to 50 % in NG, NK, MM, All MM, G, S and All stations, respectively (Table 1).

Table (2) shows the intercept (a), regression coefficient (b) and accuracy ( $R^2$ ) for TMY and BV (TMY) on calving years. The accuracy ranged from

55 to 79 % for TMY and from 51 to 72 % for BV (TMY).

Table (3) showed the amount of phenotypic and genetic change for TMY. The annual phenotypic change ranged from -11.7 to +36.7 kg in S and NK farms, respectively. While, the annual genetic change ranged from -0.16 to +0.6 kg in G and NG farms, respectively. Also NK farm have a good annual phenotypic and genetic change (+36.7 and +0.57 kg, respectively). The experimental stations in all MM were best annual phenotypic change (+26.0 kg). But, different in Sids and Gemiza farms (-11.7 and +2.3 kg, respectively). While, the experimental stations in all MM and Sids farms were best annual genetic change (+0.58 and +0.54 kg, respectively). But, different in Gemiza farm (-0.16 kg). The differences between the experimental stations may be attributed to different nutritional level, climatic conditions and management practices in different herds.

Very limited literature on phenotypic and genetic trend for TMY in Egyptian buffaloes. Khattab and Mourad (1992) reported that the phenotypic and genetic trends for TMY in all MM farms from 1966 to 1987 were +16.2 and -1.6 kg, respectively. These results were lower than the estimates in this study. The results of the present study showed that there are increased of improvement of phenotypic and genetic trend in these farms from 1987 until now.

Fig. (1). showed the phenotypic and genetic trend for TMY in all farms. Increases of both trends for all farms except in Sids and Gemiza farms for phenotypic and genetic trend, respectively. This results explain clearly, the importance of genetic – environmentally interaction effect on milk yield traits.

From the present study we recommended that, construct selection indexes to increase genetic and phenotypic improvement of milk yield traits in Egyptian buffaloes. The importance of genetic – environmentally interaction effect in all milk production traits.

**Abstract:** A series of novel 9-anilinoacridines was designed and their molecular docking studies into the active site were examined as topoisomerase I inhibitor. Several compounds showed significant high simulation docking score. The designed compounds were synthesized and biologically evaluated against mammary carcinoma cell line (MCF-7), where compounds 8,11e,11f,13b,14b,14e and 14f showed significant inhibitory activity at a concentration 10 $\mu$ g/mL). It appears that the *in vitro* activity of compounds 8,11e,11f,13b,14b,14e and 14f were consistent with their molecular modeling results, and compound 14b showed the highest activity with IC<sub>50</sub> value of 7.8  $\mu$ g. [Journal of American Science. 2010;6(11):148-158]. (ISSN: 1545-1003).

**Keywords:** Molecular docking, Acridine derivatives, Antitumor

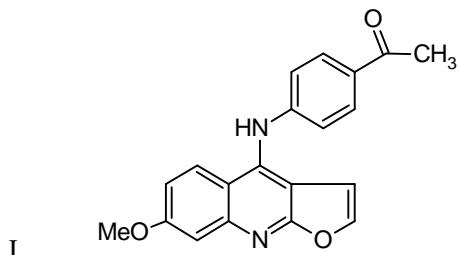

## 1. Introduction

Topoisomerase-targeting agents that stabilize the cleavable complex formed between the enzyme and DNA have proved to be effective in the treatment of cancer [1]. Topoisomerases are nuclear enzymes; there are two major subtypes, topoisomerase I (TOP1) and topoisomerase II (TOP2) based upon differences in their initial mechanisms wherein a single- or double-stranded DNA break is implicated [2-4]. Topoisomerase I participates in the control of the topological state of DNA, and as such this enzyme is essential for DNA transcription and replication as well as other vital processes including chromosome condensation/opening and mitosis [5, 6]. All topoisomerases act through a conserved active-site tyrosine residue to cleave the phosphodiester backbone and form a covalent phosphotyrosine intermediate with the DNA [7]. Human topoisomerase I (Top1) cleaves a single DNA strand through transesterification of Tyr723 and forms a 3'-phosphotyrosine linkage to the DNA. After cleavage, the broken (scissile) DNA strand can rotate around the unbroken (nonscissile) strand and remove DNA supercoils [8]. The enzyme allows both the rewinding of underwound negatively supercoiled DNA and the unwinding of overwound positively supercoiled DNA [9]. The DNA phosphodiester backbone is restored in a second transesterification reaction when the 5'-OH of the broken DNA strand attacks the 3'-phosphotyrosine bond. This religation reaction therefore liberates top1 for subsequent

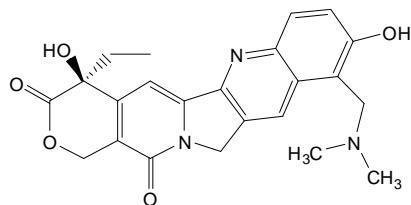

cleavage/unwinding reactions. Human topoisomerase I (TOP1) is the molecular target of a diverse set of anticancer compounds, including the camptothecins,

indolocarbazoles, indenoisoquinolines and 9-anilinoacridines [10]. Camptothecin was the first agent identified as a TOP1-targeting agent [11]. Irinotecan and topotecan are the only current Top1 inhibitors approved by the Food and Drug Administration (FDA) for the treatment of cancer, and they validate Top1 as a therapeutic target for anticancer drug development. However, these camptothecin derivatives are not ideal drug molecules. These compounds bind to a transient TOP1-DNA covalent complex and inhibit the resealing of a single-strand nick that the enzyme creates to relieve super helical tension in duplex DNA[12]. On the other hand, acridines are known to possess antitumor activity. They exert their antitumor activity through DNA intercalation, [13] inhibition of topoisomerase enzymes [14,15] or inhibition of telomerase[16]. 9-Anilinoacridines is an important class which attracted considerable attention as DNA intercalators[17]. Also, some acridines as the acridine derivative 3-(9-acridinylamino)-5-(hydroxymethyl) aniline (AHMA) were proved to be potent topoisomerase inhibitor[18]. Moreover, some methoxy derivatives of 4-anilinofuro[2,3-b]quinoline I (Fig.1), a bioisotere of 9-anilinoacridines, have been shown to exhibit excellent cytotoxicity against cancer cells [19]. Also, methoxy 2-phenylquinoline derivatives, another bioisosters of the acridine ring, as compound II (Fig.1) were found to be active against the growth of certain solid cancer such as NCI-H226 non small cell lung cancer, MDA-MB-231/ATCC breast cancer and Sf-295 CNS cancer [20]. Concerning the antitumor activity

many pyridine-2-one and 3-cyano-2-imino pyridine derivatives exhibit antiproliferative activity [21, 22]. Based on the pre-mentioned review and the urgent need to develop new potential antitumor agents, our current investigation is based on optimization of lead compound by molecular docking studies, using the enzyme bound crystal structure of the Top1 inhibitor topotecan (III)(Fig.1). This involves the synthesis of new substituted acridines such as 9-anilinoacridine;

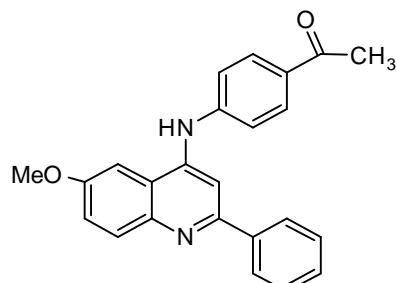

I

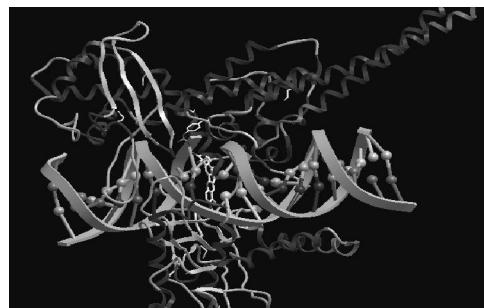

III (Topotecan)

9-anilinonitroacridines or 9-anilinomethoxy acridines combined to 4-aryl-3-cyanopyridine-6-yl-2-one or 4-aryl-3-cyanopyridine-2-imino-6-yl in order to combine the antitumor activity of both moieties aiming to increase the potency of the resulting hybrid compounds.

II

**Figure 1. TopI inhibitors and the crystal structure of compound III with the TopI complex**

In this work, molecular modeling simulation studies were performed in order to predict the biological activity of the proposed compounds. Docking Study using Molsoft ICM software was performed [23]. The crystal structure of Topotecan/topoisomerase I (Fig. 1) was obtained from protein data bank website (pdb). This regularized protein complex structure was used in determination of the active site that is mentioned in the literature. Docking process was carried out for the test set of compounds (10a-f -12a-f and 13a-f – 15a-f) using the enzyme-ligand interaction energy as scoring function [24].

## 2. Materials and Methods

All melting points are uncorrected and determined by the open capillary method using Gallenkamp melting point apparatus (MFB-595-010M; Weiss-Gallenkamp,London,UK). IR spectra were recorded on a Shimadzu 435 Spectrometer(IR-435;Shimadzu,Japan) using KBr disks. <sup>1</sup>H NMR spectra were recorded on a Perkin-Elmer NMR FXQ-

200 MHZ Spectrometer (Tokyo, Japan), using TMS as internal standard. Mass spectra were recorded on a GCMS-QP 1000 EX, Mass Spectrometer. Elemental analyses for C, H, and N were within  $\pm 0.4\%$  of the theoretical values and were performed at the Microanalytical Center, Cairo University, and they were of the theoretical values. Progress of the reactions was monitored by TLC using precoated aluminum sheets silica gel MERCK 60 F 254(Merck,Germany) and was visualized by UV lamp.

### 2.1. Chemistry

Diphenylamine-2-carboxylic acid 1 and 5-Nitro-diphenylamine-2-carboxylic acid 2 [25].

In this work, compounds 1 and 2 were prepared using "Ullmann reaction" via reaction of o-chlorobenzoic acid or its derivatives and aniline according to the reported method.

4'-Methoxydiphenylamine-2-carboxylic acid 3 [25].

It was prepared according to "Ullmann reaction" using o-chlorobenzoic acid and p-anisidine as reported.

9-Chloroacridine 4, 9-Chloro-3-nitroacridine 5 and 9-Chloro-2-methoxyacridine 6 [26].

They were prepared by reaction of compounds 1-3 with phosphorus oxychloride according to the reported method.

9-(4-Acetylaniino) acridine 7, 9-(4-Acetylaniino)-3-nitroacridine 8 and 9-(4-Acetylaniino)-2-methoxyacridine 9.

A mixture of 4, 5, or 6 (0.04 mol) and p-aminoacetophenone (5.40g, 0.04 mol) was dissolved in DMF (9 mL) and piperidine (2 drops). The mixture was refluxed for 3 hours. The formed precipitate was filtered and crystallized from ethanol. compound 8 Yield 75%; m.p. >300 °C. MS: m/z (%): 357 [M+](0.5) Anal. ## 2.2. Biological screening

MCF-7 breast cancer cells were plated in 96 multiwell plates (104 cells/well) for 24 hours before treatment with the compounds to allow attachment of cells to the wall of the plate. Different concentrations of the compound under test (0, 1, 2.5, 5 and 10 µg/ml) were added to the cell monolayer. Triplicate wells were prepared for each individual dose. Monolayer cells were incubated with the compounds for 48 hours at 37 °C and in atmosphere of 5% CO<sub>2</sub>. After 48 hours, cells were fixed, washed and stained with Sulforhodamie B stain. Excess stain was washed with acetic acid and attached stain was recovered with Tris EDTA buffer. Color intensity was measured in an ELISA reader.

## 3. Results and Discussion

### 3.1. Synthesis.

For the synthesis of the target compounds 10a-f - 15a-f the following straightforward pathway was pursued. Compounds 1-3 were prepared using Ullmann reaction according to the reported method [25]. Compounds 1-3 were used to prepare the intermediate compounds 4-6 respectively according to the reported method [26]. Compounds 7-9 were prepared from compounds 4-6, respectively [27]. The infrared spectrum of the compounds showed reappearance of NH and C=O groups. The final compounds were obtained as shown in scheme 1 using a combinatory chemistry model using multicomponent reaction (MCRs) [28, 29]. This type of reaction is preferred since it is easier to perform, gives higher yield and is less time consuming [30]. The time needed for completing the reaction was monitored by TLC using chloroform: methanol 9.5:0.5. The final compounds were prepared by refluxing an equimolar amount of compounds 7-9 and the appropriate aldehyde in the presence of excess ethylcyanoacetate or malononitrile to afford the corresponding compounds 10a-f -12a-f or compounds 13a-f -15a-f, respectively.

**Scheme 1**

### 3.2. Molecular docking studies of the new compounds with topoisomerase I

This technique is considered direct molecular modeling where the 3D structure of the enzyme is known and is used to know the detailed intermolecular interactions between the ligand and

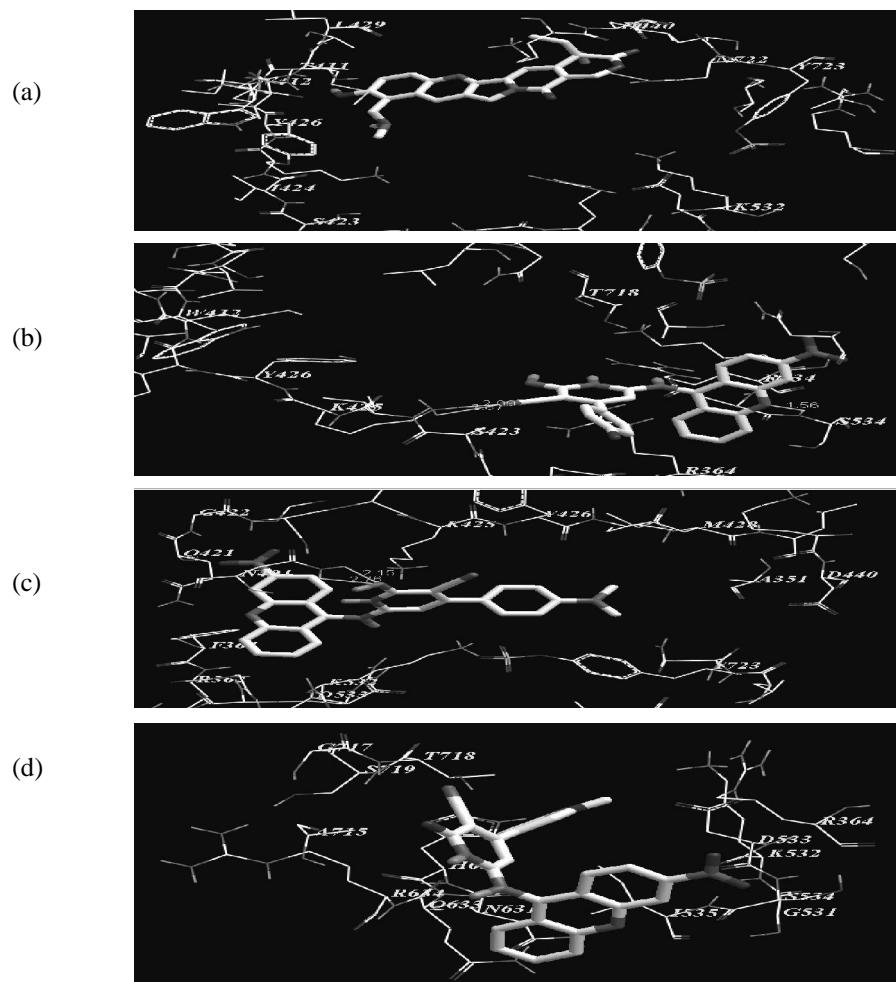

the target protein. An automated docking study was carried out using the crystal structure of inhibitor Topotecan/topoisomerase I complex obtained from protein data bank website (pdb) entry 1SC7; having resolution of 2.0 Å°. This regularized protein complex structure was used in determination of the enzyme active site that is mentioned in the literature. The performance of

the docking method on topoisomerase I inhibitors was evaluated and validated by re-docking the crystal ligand topotecan where RMSD value obtained was 0.00421. Docking process was carried out for the test set of compounds (10a-f -12a-f and 13a-f – 15a-f).

In the flexible-ligand-rigid enzyme docking, the enzyme was represented by six potential energy maps, namely, electrostatic, hydrogen bond, hydrophobic, and three van der Waals. Interactive docking using Mol table ligand was carried out for all the conformers of each compound of the test set to the selected active site of topoisomerase I. Each docked compound was assigned a score according to its fit in the ligand binding pocket (LBP).

The predicted binding energies of the new compounds are listed in Tables 1&2. The docking poses of Topotecan III and the three compounds possessing the lowest binding energies, 14b, 14e and 11e, into the active site of TopI is shown in Fig. 2.

Docking results provided useful information in understanding the structural features of the target and the necessary chemical features of the ligands. This was extended to the successful designing of our acridine derivatives where most analogs were highly active analogs against Top I.

**Figure 2;** (a), (b), (c) and (d) the proposed binding mode of Topotecan III, compound 14b, 14e and 11e inside the active site of TopI resulting from docking, respectively. The most important amino acids are shown together with their respective numbers. Compound 14b form two hydrogen bonds with Ser423.

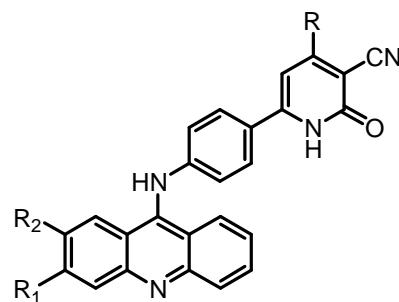

### 3.3. Anticancer screening

Measurement of potential cytotoxicity of the new compounds against breast cancer MCF-7 cell line by sulforhodamine B (SRB) assay: Potential cytotoxicity of the compounds against MCF-7 breast cancer cell line was tested using the method of skehan co-worker [31]. The relation between surviving fraction and drug concentration was plotted to get the survival curve for each compound. Also, IC<sub>50</sub> for each derivative was determined which is the dose of the compound reduces survival to 50%. Results are shown in Table 3. It can be seen from the data obtained that compounds 8, 11e, 11f, 13b, 14b,

14e and 14f showed activity at a concentration 10 µg or less. The most active one is 14b. Regarding the structure of the active compounds we can conclude that acridine derivatives substituted with nitro group showed higher activity compared to the unsubstituted or methoxy congeners as shown by 11e and 14b.

The p-substituted-3-cyano-2-iminopyridine derivatives exhibited higher antitumor activity than their 2-oxocongeners.

## Effect of Probiotic (*Saccharomyces cerevisiae*) Adding to Diets on Intestinal Microflora and Performance of Hy-Line Layers Hens

Saadia M. Hassanein<sup>1</sup> and Nagla K. Soliman<sup>2</sup>

<sup>1</sup>Microbiology Dept, Faculty of Science, <sup>2</sup>Poultry Production Dept., Faculty of Agriculture, Ain Shams University, Cairo, Egypt.

**Abstract:** An experiment was conducted to evaluate the effect of adding various levels of a live yeast to laying hen diets on their laying and feeding performance, egg shell, egg components and some blood constituents, as well as the intestinal microflora make-up. This was studied to validate the mode of a live yeast action in improving laying hens performance. For this purpose 75 Hy line (W-36) white layers were reared from 70 to 79 weeks of age in individual cages and randomly distributed into five experimental groups of 15 layers each. The individual hen was represented as an experimental unit. The five experimental groups were fed on five graded levels of a live yeast as 0.0% (control), 0.4%, 0.8%, 1.2% and 1.6%. The main results indicated an increase in egg production percentage of layers fed with 0.4% and 0.8% a live yeast which recorded 83.4% and 80.6% respectively compared with 74% of control which was similar to the groups of layers fed 1.2% (74.9%) and 1.6% (74.6%). Average egg weight was not influenced by adding yeast into diets. Egg mass results were parallel to these of egg production where the values of 46.7, 51.0, 50.2, 48.3 and 46.1 g egg/hen/day were recorded for the group of birds fed with 0%, 0.4%, 0.8%, 1.2% and 1.6% a live yeast respectively. Egg albumen and egg yolk were affected significantly. There was a slight improvement in egg shell thickness and percentage. Feed intake values were approximately similar within the different treatments. Feed conversion ratios (g feed/g egg) of layers fed yeast levels of 0.4% (2.08) and 0.8% (2.07) were better than the control group (2.27). Blood total protein levels of birds fed 0.4% (3.82), 0.8% (3.65) and 1.2% (3.97) yeast were lower than the control (4.16), while the value of 1.6% yeast (4.16) was slightly higher than control. Blood albumen levels were parallel to those of blood protein while blood globulin values were not affected. Blood cholesterol levels of layers fed yeast-supplemented diets were lower than the control. Blood total lipids were not affected by treatments. Ileal content pH of layers fed 0.8% and 1.2% yeast levels was lower than the control. Microbiological examination of ileal content indicated an obvious reduction in bacterial total count. While Lactobacilli bacterial count was increased. There were reductions in bacterial strains of *Escherichia coli* (*E.coli*), *Klebsiella sp.*, *Staphylococcus sp.*, *Micrococcus sp.*, *Campylobacter sp.*, and *Clostridium perfringens* of layers fed various yeast levels. The results of this study suggest adding live yeast at 0.4% or 0.8% into laying hen diets can enhance the productive performance and nutrients utilization via the inhibitory effect of yeast against pathogenic bacteria. [Journal of American Science. 2010;6(11):159-169]. (ISSN: 1545-1003).

**Keywords:** yeast level, laying hen, egg production, ileal microflora, blood constituents.

### 1. Introduction

Microorganisms used as probiotics in animal nutrition: Probiotics are live microorganisms that, when administered through the digestive tract, have a positive impact on the host's health. Microorganisms used in animal feed are mainly bacterial strains belonging to different genera, e.g. *Lactobacillus*, *Enterococcus*, *Pediococcus* and *Bacillus*. Other probiotics are microscopic fungi, including *Saccharomyces* yeasts. Some probiotic microorganisms are normal residents in the digestive tract, while others are not (Guillot, 2009). Different mechanisms of probiotic action have been suggested,

but most are only hypothetical. The positive effect can result either from a direct nutritional effect of the probiotic, or a "health" effect, with probiotics acting as

bioregulators of the intestinal microflora and reinforcing the host's natural defences (Fuller, 1977; Fuller, 2001).

Kabir (2004) indicated that the gut microflora forms with its host animal a complex ecosystem and microbial interactions ensure the stability of the ecosystem and the health of the host. In some cases the gut microflora is unbalanced and the biological defences against pathogenic agents less effective. The positive effect observed can be the result of either a direct nutritional effect, similar to the effect obtained with antibiotics, or a "health" or sanitary effect, where the probiotic acts as a bioregulator of the gut microflora and reinforces the natural defences.

The different mechanisms of action suggested are: (i) nutritional effect include: (1) Reduction of metabolic

reactions that produces toxic substances (2) Stimulation of indigenous enzymes (3) Production of vitamins or antimicrobial substances.

(ii) Sanitary effect include (1) Increase in colonization resistance. (2) Stimulation of the immune response. Some experiments have demonstrated in vitro the effects of strains of *Saccharomyces cerevisiae* on the activity of anaerobic rumen microorganisms. The addition of *S. cerevisiae* live cells to cultures of some cellulolytic fungal species stimulated zoospores germination and cellulose degradation. The addition of yeasts stimulates also the growth of some anaerobic bacteria, including the cellulolytic and the lactic acid utilising bacteria (Chaucheyras et al., 1995; Yoon and Stern, 1996).

Kizerwetter and Binek, (2009) reported that probiotics have reduced the incidence and duration of diseases. Probiotic strains have been shown to inhibit pathogenic bacteria both in vitro and in vivo through several different mechanisms. The mode of action of probiotics in poultry includes: (i) maintaining normal intestinal microflora by competitive exclusion and antagonism (ii) altering metabolism by increasing digestive enzyme activity and decreasing bacterial enzyme activity and ammonia production (iii) improving feed intake and digestion iv) stimulating the immune system (Apata 2008; Kabir, 2009).

Kabir et al. (2005) attempted to evaluate the effect of probiotics with regard to clearing bacterial infections and regulating intestinal flora by determining the total viable count (TVC) and total *lactobacillus* count (TLC) of the crop and cecum samples of probiotics and conventional fed groups at the 2<sup>nd</sup>, 4th and 6th week of age. Their result revealed competitive antagonism. The result of their study also evidenced that probiotic organisms inhibited some nonbeneficial pathogens by occupying intestinal wall space. They also demonstrated that broilers fed with probiotics had a tendency to display pronounced intestinal histological changes such as active impetus in cell mitosis and increased nuclear size of cells, than the controls. Recently, Mountzouris et al. (2007) demonstrated that probiotic species belonging to *lactobacillus*, *Streptococcus*, *Bacillus*, *Bifidobacterium*, *Enterococcus*, *Aspergillus*, *Candida*, and *Saccharomyces* have a potential effect on modulation of intestinal microflora and pathogen inhibition.

A few years ago active living yeast, has been documented as probiotic feed additive for poultry, due to its improvement effect on performance characteristics. Including a live yeast into laying hen diets improved egg production percentage (Kim et al., 2002 and Shivani et al., 2003), and egg weight (Han et

al., 1999; Park et al., 2001 and Park et al., 2002). Dumanovski (2000); Sharma et al. (2001); Kim et al. (2002) and Kabir (2009) reported that, adding a live yeast into laying hens diet improved feed intake and feed conversion ratio.

Inclusions of yeast into laying hen diets enhanced egg shell breaking strength (Park et al., 2002), and reduced soft or broken eggs (Park et al., 2001).

In Egypt, a very few studies have been conducted to investigate the effect of feeding yeast on performance of laying hens. Soliman (2003) studied the effect of supplementing a constant level of live yeast into laying hens diets, he observed an improvement in average egg weight, feed conversion values and nutrients utilization. The mode of beneficial action of yeast can be attributed to its antagonistic bacteria and altering gut microflora make up Line et al., 1998; Wakwak et al. (2003) and Kabir 2009) observed a sharp reduction in bacterial total count of ileum content, due to supplementing yeast into Japanese quail diets. In contrast ileal content of lactobacilli bacteria increased significantly due to adding yeast into laying hen diets (Kim et al., 2002; Hossain et al., 2005). Adding yeast to poultry diets leads to reduced bacterial counts of *E.coli* and *Clostridium perfringers* (Park et al., 2002; Nava et al., 2005), *Salmonella* and *Campylobacter* (Line et al., 1998). In this concern the research is still lacking under Egyptian conditions.

the objective of this study aimed to investigate the effect of enriching Hy line (W-36) laying hen diets with various levels of active a live yeast on their laying and feeding performance, egg shell, egg components and some blood constituents. As well as ileal bacterial make-up will be studied to validate the mode of yeast action in improving performance of laying hens.

This study provides a summary of the use of probiotic (*Saccharomyces cerevisiae*) for prevention of bacterial diseases in poultry as well as demonstrating the potential role of probiotics in the growth performance and immune response of poultry.

## 2. Materials and Methods

This study was carried out at (Layer Nutrition Research Unit), Faculty of Agriculture, Ain Shams University.

It was conducted using 75 Hy-Line (W-36) white layers which were randomly sited from 70 to 79 week of age in individual battery cages located in open sided laying house. The hens were randomly

distributed into five treatment groups of 15 layers each. The individual hen was represented as experimental unit. For nine weeks experimental period the hens were fed on a basal diet supplemented with five graded levels of active live yeast *Saccharomyces cerevisiae* (produced by Starch, Yeast and Clean Co., Alex.) as 0.0% (control) 0.4%, 0.8%, 1.2% and 1.6%.

The basal diet was formulated (Table 1) to meet all nutrient requirements of laying hens according to (Hy-Line 2000) management guide. Feed was provided ad lib in an individual feeders and water was supplied through automatic nipples. Lighting hours were 17 hours per day. Egg weight in grams was recorded daily for each hen throughout the experimental period. Average egg weight, egg production percentage and average egg mass (g/hen/day) were calculated for each

hen and treatment group. Feed consumption in grams per hen was recorded weekly and average feed consumption per treatment group was calculated. Feed conversion ratio was calculated as gram feed consumed per gram egg produce (g. feed/ g. egg). Body weight gain was calculated for each hen and treatment group by subtracting individual body weight of hen at 70 weeks from that at 79 weeks of age. Egg component percentages were assessed by using 12 eggs per treatment represent 6 hens as two consecutive eggs per hen. For this purpose, egg was individually weighted, broken, yolk and albumin was separated weighed and related as percentage to whole egg weight. Egg shell with membrane were cleaned, dried, weighed and related as percentage e to the whole egg.

**Table (1): Composition and calculated analysis of experimental diet.**

Feed Ingredient	Percentage (%)
Yellow corn	59.93
Soybean meal (48%)	24.23
Corn gluten meal	2.0
Calcium carbonate	9.16
di-calcium phosphate	1.84
Oil	2.0
Common salt	0.364

Premix*	0.4
<b>Total</b>	<b>100</b>
<i>Calculated analysis:</i>	
ME (kcal/kg)	2806
Protein (%)	17.39
Calcium (%)	3.97
Av. Phosphorus (%)	0.465
Meth. + Cyst (%)	0.66
Lysine (%)	0.86

\*: Vitamins and minerals Premix: each 1 kg supplied the following per kilogram of diet; vit. A: 12000 lu, vit. D3: 3000 lu, vit. E.: 12 mg.  
vit. B12 0.02 mg, vit. B1 1 mg, Choline chloride 0.16 mg, Copper 3 mg, Iron 30 mg.  
Manganese 40 mg, Zinc 45 mg and Selenium 3 mg according to NRC (1994).

Egg shell thickness (millimeter) was determined using a micrometer. Initial and final body weights of layers were recorded and average body weight gain was calculated.

#### Blood Analysis and Microbiological Examination:

At the end of the experiment five hens per experimental group were slaughtered, blood samples

were collected and centrifuged for 15 minutes. Plasma total protein was determined according to Biuret method (Henery, 1964), albumin according to Doumas et al. (1971). Plasma globulin was calculated by subtracting albumin from total protein. Then albumin to globulin ratio was calculated. Plasma total lipid was determined according to Knight et al. (1972) and total cholesterol according to Watson (1960).

For microbial experimentation, ileal content samples were collected by pressing the outer wall of cut ileal to push its content into clean, sterile glass bottle. The pH value of ileum content were determined using pH meter. Microbiological experimentation procedure was done as follows: One gram of ileal content was adjustely weighed and transferred into test tube containing 9 ml of 0.1 sterile peptone the samples were mixed well and serial dilutions were prepared.

#### Cultivation and Enumeration of Bacteria:

Bacterial total count was examined with nutrient agar medium composed of (per liter) yeast extract 2.5 g tryptone 5 g, glucose 1 g, agar 15 g and distilled water up to one liter (Swanson et al., 1992).

*Lactobacilli* bacteria was counted with M.R.S. agar medium which is composed of casein peptone 10 g meat extract 10 g, yeast extract 5 g, glucose 20 g, tween 80 1 g, K<sub>2</sub>hpo<sub>4</sub> 2 g, sodium acetate 5 g, diammonium citrate 2 g, Mnso<sub>4</sub> 0.2 g and distilled water up to 1 liter (Laner and Kandier, 1980)..

Coliforms bacteria were counted by using MacConkey agar medium that is composed as pancreatic digest of gelatin 17 g, pancreatic digest of casein 1.5 g, peptic of animal tissue 1.5 g, lactose 10 g, bile salts 1.5 g, sodium chloride 5 g, neutral red 0.03 g, crystal violet 0.001 g, agar 3.5 g, and distilled water up to 1 liter (Oxoid, 1992).

*Campylobacter* strains were grown in stationary cultures in 5 ml of Rosef broth without antibiotics for 48 hours in a microaerobic atmosphere created by using BBL gas pak plus anaerobic system envelopes without the palladium catalyst. Rosef broth contains (per liter) peptone 10g, lablemco (oxid) 8 g, yeast extract 1 g, Nacl 5 g, rezasurin solution (0.025% wt/vol) 1.6 g (Ryan and Ray, 2004).

*Colstridium perfringers* were grown in a stationary culture in an anaerobic atmosphere and subsequently diluted in sterile Rosef broth or sterile saline to concentrations of 10<sup>6</sup> to 10<sup>8</sup> CFU per ml, then PCR procedure was used for examination (Baumgart et al., 2007).

*Klebsiella* and *Proteus* gram negative *Enterobacteria* were grown in MacConkey agar medium and eosin/methylene blue agar medium composed (per liter) of peptone 10 g, lactose 5 g, dipotassium phosphate 2 g, eosin Y 0.4 g, methylene blue 0.065 g, and agar 13.5 g (Oxoid, 1992).

*Staphylococcus* sp. and *Micrococcus* sp. gram positive bacteria was grown in nutrient agar medium, MacConekay agar medium and *Staphylococcus*

medium (No. 110) that composed (per liter) yeast extract 2.5 g, tryptone 10 g, glateene 30 g, lactose 2 g, D/manitol 10 g, Nacl 75 g, dipotassium phosphate 5 g, agar 15 g, pH 7 ± 0.02 (Mathews et al., 1997).

#### Statistical Analysis:

Statistical analysis was carried out using statistical program SAS (1988). Dukan's multiple tests was used to separate means.

### 3. Results and Discussion

Shareef and Dabbagh (2009) reported that *Saccharomyces cerevisiae* supplementation of broilers, to the level of 1, 1.5 and 2%, were significantly, increase the body weight gain, feed consumption and feed conversion efficiency. The beneficial effect of *Saccharomyces cerevisiae* is attributed to the fact that it is a naturally rich source of proteins, minerals and B-complex vitamins.

It is well known that yeast culture, and its cell wall extract containing 1,3-1,6 D-glucan and Mannan oligosaccharide are the important natural growth promoters for modern livestock and poultry production (Van Leeuwen et al., 2005a). The advantages of these promoters over the traditional antibiotic growth promoters are 1) no withdrawal time, 2) no residual effect, and 3) no causes of microbial mutation (Gibson and Roberfroid, 2008). *Saccharomyces cerevisiae* is considered as one of the live microorganisms probiotic that, when administered through the digestive tract, have a positive impact on the hosts health through its direct nutritional effect. Field reports (Banday and Risam, 2002) have suggested that probiotic supplementation improved performance of broilers. The different mechanisms of probiotic action suggested are; nutritional effect by regulation of metabolic reactions that produces toxic substances; stimulation of endogenous enzymes and by production of vitamins or antimicrobial substances. Moreover, *Saccharomyces cerevisiae* could act as bioregulator of the intestinal micro flora and reinforcing the host natural defenses, through the sanitary effect by increasing the colonization resistance and stimulation of the immune response (Line et al., 1998). These effects were largely reflected by using mannan Oligosaccharide, the naturally derived extract from the cell wall of *Saccharomyces cerevisiae*. This oligosaccharide content is approxi-mately50% of the carbohydrate fraction and improved body weight gain in broiler chickens and that this effect can be attributed to the trophic effect of this product on the intestinal mucosa, because it increases villus height, particularly during the first 7 days of the chickens life (Santin et al., 2001).

Oligosaccharides used to control pathogenic scours of all kinds in livestock caused by *Salmonella*, and *E.coli* etc (Laegreid and Bauer, 2004). Mannan-oligosaccharides are thought- to block the attachment of pathogenic bacteria to the animal's intestine and colonization that may result in disease, while acting as a nutrient to other beneficial bacteria. It is also thought to stimulate the animal's immune system, thereby further reducing the risk of disease (Firon and Ofek, 1983). Oyofo et al. (1989) observed that the adherence of *Salmonella typhimurium* to enterocytes of the small intestine of chicks, in vitro, was inhibited in the presence of mannose. Later, they found that inclusion of mannose in the drinking water of chicks reduced *S. typhimurium* colonization of the cecum.

*Saccharomyces cerevisiae* Probiotic supplementation has been shown to reduce the

cholesterol concentration were reported in egg yolk by (Abdulrahim et al., 1996) and serum in chicken (Mohan et al., 1996). Recent report suggested that feeding of chicory beta fructans an oligosaccharide, a prebiotic, reduced the serum cholesterol and abdominal fat of broiler chicken (Yusrizal, 2003). Gilliland et al. (1985) suggested that the Prebiotic supplementation could have enhanced the lactobacilli count. Similar results have been reported by others (Mohan, 1996).

#### Laying Performance:

Egg production percentage of laying hens fed 0.4% (83.4%) and 0.8% (80.6%) live yeast was higher than the control value (74%) which was approximately similar to those fed with 1.2% (74.9%), 1.6% (74.6%) yeast in their diets. The differences between egg production percentages lacked significance (Table 2).

**Table (2): Effect of feeding different yeast levels on laying performance and egg components.**

Item	Yeast Level				
	0.0%	0.4%	0.8%	1.2%	1.6%
Egg production	74.0	83.4	80.6	74.9	74.6
Av. Egg weight (g)	63.1	61.2	62.7	64.5	61.8
Egg mass (g egg/hen/day)	46.7	51.0	50.2	48.3	46.1
<b>Egg component</b>					
Egg yolk (%)	27.3	28.1	28.8	27.6	27.7
Egg albumin (%)	63.7	62.6	61.7	63.1	62.9
Egg shell (%)	9.00	9.33	9.45	9.39	9.39
Egg shell thickness (mm)	0.396 <sup>b</sup>	0.425 <sup>ab</sup>	0.426 <sup>a</sup>	0.416 <sup>ab</sup>	0.420 <sup>ab</sup>

a, b: Means with different superscripts are significantly different (P<0.05).

The improvement in egg production due to low level of yeast inclusion is in agreement with the result of Kim et al., (2002); Shivani et al. (2003); Shareef and Al-Dabbagh (2009) who observed higher percentage of egg production for hens fed yeast-supplemented diets than the control hens.

Average egg weight was not influenced significantly by adding yeast into diets. Nursoy et al.

(2004) stated that, egg weight was not affected by adding yeast into diet. The improvement in egg production reflected on egg mass (g egg/hen/day) values which increased from 46.7 (control) to 51.0 and 50.2 by adding 0.4% and 0.8% yeast level respectively, while the high levels of yeast (1.2% and 1.6%) declined egg mass value to be 48.3 and 46.1 respectively.

The increment in egg production and egg mass with 0.4% and 0.8% yeast level may be attributed to the antagonistic effect of yeast against harmful enteric microflora which may cause mal-absorption of

nutrients. So that, adding yeast may enhance digestion, absorption and saving more nutrients for egg formation. Soliman (2003) attributed the best hen day egg production of hens fed dietary yeast to the decrease proliferation of pathogenic bacteria. The high inclusion of yeast level has an adverse effect on nutrient digestibility (Romashko, 1999). Thereby, laying performance was not improved due to adding of 1.2% or 1.6% live yeast into diet.

#### Feeding Performance and Body Weight Gain:

Feed intake values of different treated groups were approximately similar and lacked significance. Kim et al. (2002) stated that, feed intake values were not statistically different among yeast feeding groups and control.

Feed conversion ratios (g feed/g egg) of birds fed with 0.4% (2.08) and 0.8% (2.07) dietary yeast were better than that of control (2.22), while 1.2% (2.24) and 1.6% (2.25) yeast levels did not show any improvement compared to the control. Park et al. (2002); Soliman (2003) and Zhang et al., (2005)

observed an improvement in feed conversion ratio of laying hens fed yeast supplemented diets.

The slight improvement in feed conversion inherent with low inclusion levels of yeast (0.4% or 0.8%) may be attributed to the improvement in nutrients absorption and utilization associated with adding yeast which reduces the proliferation of enteric harmful bacteria that responsible of mal-absorption (Table 3). Bradle and Savag (1995) observed an improvement in energy utilization due to feeding

dietary yeast. Soliman (2003) reported that, supplementation of yeast into laying hen diets significantly improved digestion coefficient of crude protein.

Body weight gain values of layers fed different yeast levels were not significantly higher than control (Table 3). Sharma et al. (2001) stated that, the weight gain of egg type chicken fed yeast supplemented diet was higher than those fed control diet.

**Table (3): Effect of feeding various live yeast levels on feeding performance and body weight gain.**

Item	Yeast Level				
	0.0%	0.4%	0.8%	1.2%	1.6%
Feed intake (g/hen/day)	104.00	105.7	105.00	108.3	103.6
Feed conversion (g feed/g egg)	2.22	2.08	2.07	2.24	2.25
Initial body weight (g)	1475	1444	1480	1478	1481
Final body-weight (g)	1497	1494	1540	1555	1552
Body weight gain (g)	22	50	60	76.8	71.6

Non-significant differences.

#### Egg Component:

Incorporating of live yeast into laying hen diets did not influence egg albumin or egg yolk percentages and the difference; among treatments lacked significance (Table 2). Nursoy et al. (2004) did not find any affect on egg albumin or egg yolk of laying hens fed yeast-supplemented diet.

However, egg shell percentage and egg shell thickness values were improved due to feeding various yeast levels, especially at 0.8%, when compared to the control group (Table 2).

The improvement in egg shell percentage and egg shell thickness may be attributed to the enhancement of calcium absorption and retention associated with adding yeast into the diet (Bradly and Savage, 1995). Park et al. (2001) reported that, hens fed diets with yeast produced less soft shell and broken egg than control.

#### Blood Constituents:

Blood total protein values of birds fed on 0.4% (3.82), 0.8% (3.65), and 1.2% yeast (3.97) were lower than the control (4.16) (Table 4). However, the level of 1.6% yeast (4.33) was slightly higher than control. Similar results were recorded for blood albumin. There

was no effect on blood globulins due to adding yeast to the diet.

The results of blood protein did not agree with those obtained by Wakwak et al. (2003), who did not find any effect on blood protein or albumin due to adding yeast into growing quail diets.

The lower values of blood proteins of birds fed on 0.4%, 0.8% and 1.2% yeast than the control may be attributed to the inhibitory effect of yeast against harmful intestinal microflora because harmful enteric bacteria secretes inflammatory agents lead to increase protein synthesis in liver and accordingly increased blood content of protein. Klasing and Austic (1984) observed an increase in protein synthesis in liver of chickens infected with *Escherichia coli* bacteria. Similar explanation can be introduced for the higher blood protein value of layers fed 1.6% dietary yeast, that the high inclusion of active live yeast may induce an inflammation in the small intestine wall causing increase in blood protein level.

Blood cholesterol levels of layers fed yeast supplemented diets were lower than the control (Table 4). Victor et al. (1993) and Endo et al., (1999) found that cholesterol content was lower with inclusion of yeast into broiler chicks' diets. Blood total lipid was not affected by adding yeast into diets.

**Table (4): Effect of feeding various live yeast levels on blood constituents.**

Item	Yeast Level

#### Ileal pH and Intestinal Bacteria:

Ileal content pH was not affected by adding active yeast into laying hens diets (Table 5). However, there were a reduction in digesta pH of layers fed yeast level of 0.8% and 1.2% which recorded 6.00 and 6.31 respectively against 6.58 for control. Dawson et al. (1990) and Gibson and

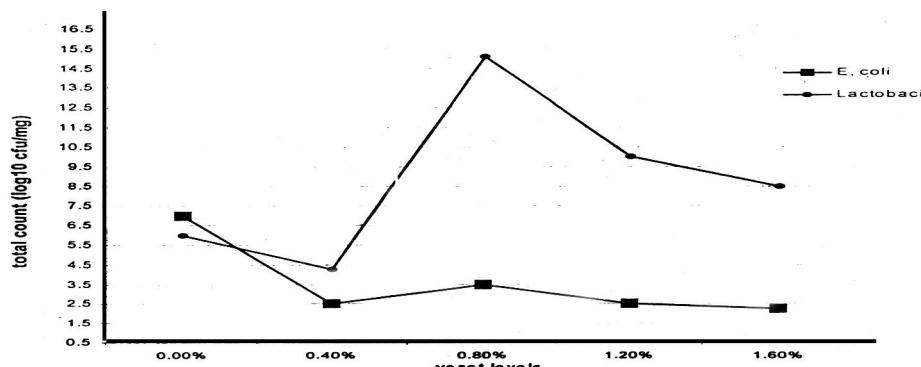

Roberfroid, (2008) observed a reduction in ruminal pH value of steers fed active yeast.

There was an effect yeast on bacterial total count which was sharply reduced when supplemented yeast level increased. The most reduction was recorded for the birds fed 1.6% live yeast (Table 5 and Fig. 1).

**Table (5): Effect of feeding active yeast levels on pH value of ileal content and intestinal bacteria make-up.**

<b>Microbial Strains</b>	<b>Yeast Level</b>

**Figure (1): Effect of yeast level on total count of *E.coli* and *lactobacilli sp.*.**

The inhibitory effect of yeast on intestinal microflora had been established by Line et al. (1998); Wakwak et al. (2003) and Nava et al., (2005), who reported that, yeast has a reduction effect against pathogenic gut microflora.

Count of *Lactobacilli* bacteria increased due to adding active live yeast at 0.8%, 1.2% and 1.6% into laying hens diets. This result confirms those of Kim et al. (2002), who added *Pichia farinose* yeast strain into laying hens' diets and Park et al. (2002) and Kabir (2009), who included *Saccharomyces cervisiae* into broiler diets. Their results indicated an increase in viable count of ileal lactobacilli's due to adding live yeast.

The viable counts of Lactobacilli are inversely related to the pH value of ileal digesta (Table 5), where the reduction in pH values is associated with increasing Lactobacilli count. This may confirm that Lactobacilli bacterial grow well in slightly acidic media (Fuller, 2001).

*Lactobacilli* bacteria secrete lactic acid which reduces digesta pH so the reduction in pH value may be due to direct action of intestinal bacilli bacteria or to indirect effect of yeast on increasing intestinal bacilli bacteria. Live yeast enriched diet led to a sharply reduction in pathogenic bacterial strains of *E.coli* and *Campylobacter sp.* These strains usually cause mild to moderate gastroenteritis, diarrhea and mal-absorption of nutrients in chickens.

The current results are in agreement with those of Park et al. (2002), who stated that the counts of *Clostridium perfringer* and *E.coli* bacteria were lower

due to adding *Saccharomyces cervisiae* yeast into broiler chicks' diets. The antagonistic effect of live yeast against intestinal microflora was elucidated by Line et al. (1998) and Laegreid and Bauery (2004) who stated that, several harmful pathogenic bacteria have been shown to exhibit a binding specific for the sugar mannose. A live yeast cells contain mannose in their wall. This mannose in the cell wall may cause the yeast to act as a decoy for the attachment of pathogens. Because yeast has been demonstrated not to permanently colonize animals, the yeast and any yeast-bound pathogens pass out in the bird excretion and bacterial colonization is diminished.

Kabir et al., (2004) reported that probiotic microorganisms, once established in the gut, may produce substances with bactericidal or bacteriostatic properties (bacteriocins) such as lactoferrin, lysozyme, hydrogen peroxide as well as several organic acids. These substances have a detrimental

impact on harmful bacteria, which is primarily due to a lowering of the gut pH. A decrease in PH may partially offset the low secretion of hydrochloric acid in the stomach. In addition, competition for energy and nutrients between probiotic and other bacteria may result in a suppression of pathogenic species. Numerous factors such as animal to animal variation, strain of yeast, and experimental procedures have contributed to the variation in results of yeast culture studies. However, the digestive advantages of enhanced nutrient digestibility, cecal fermentation and subsequent production parameters provide justification for nutritionists to continue to research yeast culture supplementation.

#### 4. Conclusion:

It can be concluded that adding live yeast *Saccharomyces cervisiae* can enhance the productive performance of laying hens and nutrients utilization via the inhibitory effect of yeast against pathogenic bacteria which may cause mild enteritis and mal-absorption of nutrients.

Probiotics constitutes now an important aspect of applied biotechnological research and therefore as opposed to antibiotics and chemotherapeutic agents can be employed for growth promotion in poultry. Scientists now are triggering effort to establish the delicate symbiotic relationship of poultry with their bacteria, especially in the digestive tract, where they are very important to the well being of man and poultry (Kabir, 2009). Since probiotics do not result in the development and spread of microbial resistance, they offer immense potential to become an alternative to antibiotics. The present study reveals that probiotics could be successfully used as nutritional tools in poultry feeds for promotion of growth, modulation of intestinal microflora and pathogen inhibition, immunomodulation and promoting meat quality of poultry.

[jeljakee@yahoo.com](mailto:jeljakee@yahoo.com)

**Abstract:** Enterotoxigenic *S. aureus* in milk posses a potential health hazard to consumers. In this paper 106 *S. aureus* isolated from cow and buffalo milk samples were investigated for production of enterotoxins. RPLA results showed high incidence of type C enterotoxin followed by type A and type B with incidence of 34 (32.1%), 19 (17.9%) and 15 (14.2%) respectively. Toxigenic *S. aureus* isolates produced golden yellow, creamy and white colonies on agar in percent of 69.11%, 27.94% and 2.94% respectively. Regarding to hemolytic activity on sheep blood agar, 92.65% of toxigenic *S. aureus* isolated from bovine milk samples were hemolytic. A correlation exists between toxigenic isolates and coagulase and DNase production. On crystal violet agar medium, 23.53% of the *S. aureus* isolates yielded yellow colonies, 64.71% yielded violet colonies, while 11.76% yielded white colonies from the toxigenic *S. aureus* isolates. It is clear that most of bovine isolates yielded violet colonies on the medium. Out of 68 isolates of toxigenic *S. aureus* isolates 51 (75%) showed SpA by agglutination test positive. Results obtained showed 100% agreement between RPLA and PCR techniques. [Journal of American Science. 2010;6(11):170-178]. (ISSN: 1545-1003).

**Keywords:** *S. aureus*, mastitis, enterotoxins, RPLA, PCR.

## 1. Introduction

Milk and its products can harbor a variety of microorganisms and can be important sources of food-borne pathogens. Livestock-associated *S. aureus* to be an underappreciated source of pathogenic strains (Bystron et al., 2010). Enterotoxigenic *S. aureus* in raw milk posses a potential health hazard to consumers, the identification of such strains should be used as part of a risk analysis of milk and milk products (Zouharova and Rysanek, 2008). Staphylococcal food poisoning is considered one of the leading food-borne illnesses in human worldwide and is associated with contaminated food of animal origin such as milk and dairy products (Tsegmed et al., 2007). *S. aureus* is a major causative agent of mastitis which is the most economically important diseases for the dairy industry so more effective therapeutic treatment and prophylactic approaches are surely needed (Chiang et al., 2007; Oviedo-Boyo et al., 2008).

Regarding the public health, *S. aureus* is a commensal organism and versatile pathogen in animals and human. It produces a broad spectrum of surface components (proteins and capsular polysaccharides) and exotoxins. Staphylococcal enterotoxins (SEs) are serologically grouped into five major classical types which are SEA, SEB, SEC, SED and SEE. Also new SEs such as SEG through SEM has recently been identified and characterized (Chiang et al., 2006). In addition to toxic shock syndrome toxin (TSST-1) which is the causative agent in toxic shock syndrome in human (Kenny et al., 1993). The direct detection of the

pathogen in the raw milk and dairy products by PCR technique can provide rapid results and highlight the presence of loads of *S. aureus* potentially representing the risk of intoxication (Ercolini et al., 2004). The analysis of the results obtained by SET-RPLA method for the productivity of classical enterotoxins A-D and the results obtained by PCR for the presence of *sea-sed* genes revealed the correlation between each other (Lawrynowicz-Paciorek et al., 2007). The present work aimed to determine the role of *Staphylococcus* species in bovine mastitis and study the most virulence factors associated with isolated strains using recent techniques for the detection of gene sequence concerned with toxin production as RPLA and PCR techniques.

## 2. Material and Methods

Milk samples:

A total Of 203 animals including 149 cows and 54 buffaloes from different farms in Egypt were examined for mastitis according to clinical observation (Schalm et al., 1971). A total of 554 individual quarter milk samples were collected from 406 quarters of lactating cows and 148 quarters of lactating buffaloes, distributed as shown in Table (1). The examined udders were thoroughly washed, dried with a clean towel and the teats were sprayed with 70% ethanol. After that the first few jets of milk were discarded and 10 ml of milk samples from each quarter were collected in a sterile McCartney bottle. All samples were kept at 4°C and transported immediately to the laboratory.

**Table (1):** Number of examined animals and quarters

Infected quarters	Cows		Buffaloes	
	No. of animals	No. of quarters	No. of animals	No. of quarters
One quarter	25	25	9	9
Two quarter	29	58	10	20
Three quarter	57	171	21	63
Four quarter	38	152	14	56
Total	149	406	54	148

#### Bacteriological examination:

The milk samples were activated by incubation for 18-24 hours at 37°C then the cream and supernatant fluids were discarded then milk samples were centrifuged at 3000 rpm for 20 minutes before bacteriological cultivation. The sediment was streaked on to the surface of nutrient agar (Difco) and Mannitol salt agar medium (Oxoid), then the inoculated plates were incubated for 24-48 hours at 37 °C after which they were examined for colony characters, cellular morphology and the purity of the culture. The suspected colonies were picked up and propagated on Baird-Parker agar (Oxoid) for further examination.

#### Identification and characterization of staphylococci isolates:

Pure cultures of the isolates were identified and characterized according to Cruickshank *et al.* (1975) and Mackie and MacCarteny (1996).-

Characteristics of coagulase positive staphylococci were identified according to Quinn *et al.* (2002) by: coagulase test using dry spot kit (staphy tect plus), acetoin production, pigment production on nutrient agar "Difco", hemolysis activity on blood agar base (Oxoid) plus 5% sheep blood, deoxyribonuclease activity using DNase agar (Oxoid), growth on Baird-

Parker medium (Oxoid) and crystal violet agar growth type (Rodgers *et al.*, 1999). Also SpA was detected using agglutination kits (welcome diagnostics) and latex slide agglutination test: Dry spot kit (staphy tect plus) (Oxoid, DR100M) was used for the identification of staphylococci which possess clumping factor.

#### Detection of staphylococcal enterotoxins by SET RPLA kit (Oxoid):

Using reversed passive latex agglutination (RPLA) the *S. aureus* isolates were examined for production of enterotoxins A, B, C and D.

#### Detection of enterotoxin by PCR

The DNA was extracted from *S. aureus* isolates using enzymatic method and the PCR products were visualized according to Sambrook *et al.* (1989) using primers synthesized by Metabion Company, Germany as described in Table (2). DNA molecular weight marker was supplied by Amers Co. Cleveland, Ohio, USA and standard *S. aureus* and *S. epidermidis* donated from Department of bacteriology, Navy American research Unit (NAMRU 3).

### 3. Results

Tables (3) demonstrate the distribution of affected quarters among mastitic cows and buffaloes. It is clear that affection in 3 quarters is higher than the others quarters affection (42.12 - 42.57%), followed by affection in 4 quarters (37.43 - 37.84%), then in 2 quarters (14.29 – 13.51%) and in one quarter (6.16 – 6.08%) respectively.

The distribution of staphylococcal species among the examined mastitic quarters was 23.29% as shown in Table (4). It is clear that 106 isolates were identified as *S. aureus* with an incidence of 19.13%, followed by 16 isolates (2.89%) identified as *S. intermedius* and 7 isolates (1.26%) were identified as *S. hyicus*.

Results obtained in Table (5) showed that 68 out of 106 *S. aureus* isolates were found to be toxicogenic with an incidence of 64.2% and distributed as follow: enterotoxin C were detected in 34 samples with an incidence of 32.1% , followed by enterotoxin A were isolated from 19 samples with an incidence of 17.9% and enterotoxin B were isolated from 15 samples with an incidence of 14.2%. It is clear from previous results that the enterotoxin C is the most predominant enterotoxin type than the others types.

*S. aureus* coagulase positive isolates produced endopigments when cultivated on nutrient agar. As shown in Table (6) toxicogenic *S. aureus* isolates produced golden yellow, creamy and white colonies on agar in percent of 69.1%, 27.94% and 2.94% respectively. Non toxicogenic *S. aureus* isolates produced golden yellow and creamy colonies on agar in percent

of 71.05% and 28.95% respectively. It is clear that golden yellow colony was the most predominant pigment among bovine *S. aureus* isolates.

In the present investigation sheep blood agar was used to determine types of hemolysis among the *S. aureus* isolates and the results were illustrated in Table (7). It is clear that 92.65% of toxigenic *S. aureus* isolates were hemolytic and 92.1% of non toxigenic *S. aureus* isolates were hemolytic.

Out of 68 toxigenic *S. aureus* isolates 46 (67.65%) were DNase positive as shown in Table (8). While out of 38 non toxigenic *S. aureus* isolates 26 (68.42%) were DNase positive.

As shown in Table (9), out of 68 toxigenic *S. aureus* isolates 66 were positive for tellurite reduction with an incidence of 97.06%, while all the 38 non toxigenic *S. aureus* isolates (100%) were positive.

Crystal violet agar medium was used as a selective medium for characterization of *S. aureus*. 3

characteristic appearances were recorded as shown in Table (10). Among toxigenic *S. aureus* isolates type A growth (yellow colonies) was detected in 23.53% of the isolates, and type C growth (violet colonies) was detected in 64.71% of the isolates, while type E (white colonies) was detected only in 11.76%. In non toxigenic *S. aureus* isolates Type A growth (yellow colonies) was detected in 23.68% of the isolates, and type C growth (violet colonies) was detected in 65.79% of the isolates, while type E (white colonies) was detected only in 10.53%. It is clear that most of bovine isolates had violet colonies on the medium.

Out of 68 isolates of toxigenic *S. aureus* isolates, 51 (75%) showed SpA agglutination test positive as shown in Table (11). Also out of 38 isolates of non toxigenic *S. aureus* isolates 27 (71.05%) were SpA positive.

#### 4. Discussion

*S. aureus* is involved in intramammary infections in bovine causing economic losses and milk-safety problems (Taverna *et al.*, 2007). Mastitis control is complex problem for which there are no simple solutions.

Bacteriological study of mastitic milk samples was carried out and results obtained revealed that staphylococcal species were isolated from 129 samples with the percentage of 23.29 % this percentage was calculated according to the total number of quarters (554) as cleared from Table (4). These results were nearly similar to those mentioned by Pankey *et al.* (1991) (25.4 %); Mahbub *et al.* (1996); Badia (2004) (27.21%) and Elgabry (2006) (21.2%). Among coagulase-positive *Staphylococcus* species: *S. aureus*, *S. hyicus* and *S. intermedius*. *S. aureus* is a major agent of bovine mastitis as mentioned by Schleifer (1986). The results obtained in Table (3) showed that 106 isolates were identified as *S. aureus* with an incidence of 19.13%, followed by 2.89% were identified as *S. intermedius* and 1.26% were identified as *S. hyicus*. These results goes in the direction which indicated that high incidence of staphylococcal mastitis was mainly due to *S. aureus*. The present results are in agreement

with Badia (2004); Ekman *et al.* (2004) and Elgabry (2006) who found that *S. aureus* isolates were of high incidence than the other types of *Staphylococcus*. High incidence of *S. aureus* may be attributed to that *S. aureus* has a wide spread during the different seasons of the year. Nickerson *et al.* (1995) recorded that *S. aureus* was known to be easily spread between animals so that one *S. aureus* case may lead to more cases. The invasion of *S. aureus* in the interstitial tissue of the mammary gland and the nature of capsular polysaccharide type 5 (CP5) probably help bacteria to withstand the host defense mechanism (Hensen *et al.* 2000).

A number of different phenotypic and genotypic techniques are available to classified *S. aureus* strains for epidemiological investigation (Wildemauwe *et al.*, 2010). One of the goals of this study was to explore the phenotypic characters including different virulence factors of *S. aureus* isolates. *S. aureus* is a major food borne pathogen due to its capability to produce a wide range of heat-stable enterotoxins (Peles *et al.*, 2007). Detection of staphylococcal enterotoxins is decisive for confirmation of an outbreak and determination of the enterotoxicogenicity of the strains. Since the recognition

of their antigenicity, large numbers of serological methods for the detection of enterotoxins in food and culture media have been proposed (Da Cunha *et al.*, 2007). Major virulence factors of *S. aureus* organism include enterotoxins (SEs) that cause both food poisoning and toxic shock syndrome. Recently, a novel SE tentatively designated SEL was identified in a bovine mastitis isolates, the toxin lacked emetic activity (Orwin *et al.*, 2003). A little as 0.1 µg of enterotoxins can be sufficient to produce food poisoning after incubation period which can be as short as 1 hour out of usually 4 - 6 hours (IASR, 2001).

Reverse passive latex agglutination test (RPLA) test was used in this study as a recent technique for detection of the presence of staphylococcal enterotoxins and this fact was in accordance with that mentioned by Schumacher *et al.* (1995) who confirmed the accuracy of commercial available RPLA for detection of enterotoxins. Results obtained in Table (5) showed that 68 out of 106 *S. aureus* isolates were found to be toxigenic with an incidence of 64.2% and distributed as follow: enterotoxin C were detected from 34 samples with an incidence of 32.1% followed by enterotoxin A from 19 samples with an incidence of 17.9% and enterotoxin B from 15 samples with an incidence of 14.2%. It is clear from previous results that the enterotoxin C is the predominant one, this observation were in agreement with that mentioned by Jorgensen *et al.* (2005) who found that SEC and sec were most common toxin detected in *S. aureus* isolates from bovine mastitis. Samah (2003) recorded that 16.6% isolates of 106 *S. aureus* isolates obtained from milk were enterotoxigenic type SEC producing isolates. In addition to that mentioned by Soriano *et al.* (2002) who found that obtained results showed the high incidence of the type C followed by type B and then type A.

*S. aureus* isolates were characterized as coagulase positive isolates produce endopigments when cultivated on nutrient agar. As shown in Table (6) toxigenic *S. aureus* isolates produced golden yellow, creamy and white colonies on agar, in percent of 69.11%, 27.94% and 2.94% respectively. Non toxigenic *S. aureus* isolates produced golden yellow and creamy colonies on agar in percent of 71.05% and 28.95% respectively. It is clear that golden yellow colony was the predominant pigment among *S. aureus* isolates. These results are in agreement with Elgabry (2006) who found that toxigenic *S. aureus* isolates produced golden yellow, creamy and white colonies on agar in percent of 64.1%, 29.5% and 6.4% respectively. 92.65% of toxigenic *S. aureus* isolates had hemolytic activity on sheep blood agar as shown in Table (7) and 92.1% of non toxigenic *S. aureus* isolates were hemolytic. Lam *et al.* (1995) and Aarestrup *et al.* (1999) showed that approximately 1/5 to 1/4 of the *S.*

*aureus* isolates of bovine mastitis do not present any detectable beta-hemolytic activity in primary cultures.

Out of 68 toxigenic *S. aureus* isolates 46 (67.65%) were DNase positive, while out of 38 non toxigenic *S. aureus* isolates 26 (68.42%) were DNase positive as shown in Table (8). Abd El-Salam (2003) recorded that all toxigenic strains of *Staphylococcus* were coagulase positive and DNase producers. Boerlin *et al.* (2003) illustrated that 71.8% of *S. aureus* isolates had DNase activity. It is clear from Table (9) that out of 68 isolates of toxigenic *S. aureus* isolates 66 (97.06%), were able to reduce tellurite to metallic tellurium producing a black coloration, and all non toxigenic *S. aureus* isolates (100%) were positive. *S. aureus* isolates was able to reduce tellurite to metallic tellurium with an incidence of 96.2% (Elgabry, 2006). Selective agars like modified Baird-Parker agar have been used successfully for the detection and identification of *S. aureus* and other coagulase-positive staphylococci (Roberson *et al.*, 1992). Three characteristic appearances were recorded among *S. aureus* isolates after having been grown on crystal violet agar medium, as shown in Table (10). Yellow colonies were detected in 23.53% of the isolates, and violet colonies were detected in 64.71% of the isolates, while white colonies were detected only in 11.76% from the toxigenic *S. aureus* isolates. It is clear that most of bovine isolates had violet colonies on the medium. The present results are in agreement with Wan *et al.* (1999).

Several rapid identification tests for *S. aureus* are commercially available and have been extensively in use. For instance, the slide staph plus kit from Bio-Merieux is an agglutination test used for the simultaneous demonstration of protein A, clumping factor and other surface antigens specific for *S. aureus* (Boerlin *et al.*, 2003). In the present study 51 out of 68 isolates of toxigenic *S. aureus* isolates (75%) showed SpA by agglutination test positive as shown in Table (11). Detection of toxigenic strains in *S. aureus* isolates using polymerase chain reaction technique (PCR) was illustrated in photo (1). The isolates proved to be toxigenic using RPLA were confirmed using PCR (detection of toxin C was not available) as recent technique. Results obtained showed that 100% agreement between the 2 tests RPLA & PCR. Zouharova and Rysanek (2008) found that the results of both methods were identical concerning SEB and SED. It was concluded that detection of SEs by PCR was a useful additional tool to support identification of Enterotoxigenic strains.

**Abstract:** Karun-1 dam safety was examined through carrying over a 3D finite elements analysis. The dam as well as its foundation and abutments have been modeled in a relatively exact manner. Furthermore, the vertical contraction joints were simulated in calculations. Hydrostatic, gravity and thermal effects have been taken into account as the load collections. 10m reduction of reservoir level from normal water level of the dam reservoir was applied in the modeling and the possibility of initiate and development of cracks in dam body was investigated by means of monitoring of principal stresses. The obtained results showed that mentioned possibility existed and the downstream face of the dam in vicinity of the abutments near to crest level probably experiences the tensile cracks. [Journal of American Science. 2010;6(11):179-184]. (ISSN: 1545-1003).

**Keywords:** Arch dam, Thermal, Contraction joints, Cracks, Dam safety

## 1. Introduction

Usually, after a service life of several decades, a considerable percentage of existing concrete dams, illustrate some kind of deterioration. Based on the studies performed examining the causes of this phenomenon, the ASR (Alkali-Silica Reaction) and unusual extreme loading such as earthquake excitations and reservoir level fluctuations are the main reasons of this dam stiffness and strength degradation (Swamy and Al-Asali, 1988; Ahmed et.al., 2003; Pedro, 1999). Sometimes mentioned degradation is concomitant with the occurrence of local cracks in dam body which can be a threat for the dam safety. Holding this issue in mind, the main objective of this paper is to investigate the possibility of damage occurrence in Karun-1 arch concrete dam due to unusual reduction in its reservoir level about to 10m from the normal water level. Karun-1 dam is a double curvature concrete dam located in northeastern of Khouzestan province of Iran in vicinity of Masjedsoleiman city which its construction were completed in 1976. The dam height is approximately 200m from the base level, its dam crest thickness is 6m and the thickness of the dam at base level is about 380m.

In this investigation, as well as the hydrostatic pressure of reservoir and dam weight, the thermal loads due to air temperature changes have been assessed in the modeling. Thermal loads has a major effects in arch concrete dam stability analysis (Sheibani and Ghaemian, 2006; Ardito, et. al, 2008; Léger and Leclerc 2007; Léger and Seydou 2009; Labibzadeh and Khajehdezfuly, 2010). Furthermore, for achieving the more and more accurate in analysis, the effect of vertical contraction joints in hydro-

thermal simulation of the dam was taken into account. Even though the latter issue was no major challenge for dam engineers in their analyses and designs, this factor can affect the dam safety analysis results significantly (Labibzadeh and Khajehdezfuly, 2010). In the past recent years, the amount of the rainfall has been decreased considerably in Iran specifically in Karun-1 dam water fall domain. Consequently, the reservoir volume of the dam has been reduced gradually. As the water level of the dam was decreasing, the safety control of Karun-1 dam became more highlighted due to the fact that the electrical energy generation of the dam has been increased recently thorough the development of the second phase of its power plant. It is the main reason of doing this research. The proposed study has been done by means of a relatively 3D exact simulation of the geometric, material behavior and boundary conditions of the dam. Principal stress tensors, displacement vectors were selected as stability indexes safety control and examined. It will be shown that under the reservoir level reduction up to 10m the possibility of initiate and development of cracks in downstream face of the dam exists.

## 2. Material and Methods

As it was mentioned in previous section, the hydrostatic, gravity and thermal loads have been simulated in the proposed model. The governing equation for heat transfer in three-dimensional region is (Reddy and Gartling, 2001):

$$\rho C \frac{\partial T}{\partial t} = \frac{\partial}{\partial x_i} \left( k_{ij} \frac{\partial T}{\partial x_j} \right) + Q \quad (1)$$

Where  $\rho$  = density  $\left(\frac{kg}{m^3}\right)$ ;  $C$  = specific heat  $\left(\frac{J}{kgK^0}\right)$ ;  $T$  = temperature of medium  $K^0$ ;  $t$  = time (s);  $k_{ij}$  = Cartesian components of conductivity tensor  $\left(\frac{W}{m^2 K^0}\right)$ ;  $Q$  = internal heat generation per unit volume  $\left(\frac{W}{m^3}\right)$  and ij summation on repeated subscripts (i,j=1,2,3).

The above mentioned equation with the following boundary conditions generates the mathematical model of heat transfer which in turn is the physical model:

$$T = T^* \text{ on } \Gamma_T \quad (2a)$$

$$- \left( k_{ij} \frac{\partial T}{\partial x_j} \right) n_i = -q_a + q_c + q_r \text{ on } \Gamma_q \quad (2b)$$

Where  $q_a$  = applied flux  $\left(\frac{W}{m^2}\right)$ ;  $q_c$  = convective flux  $\left(\frac{W}{m^2}\right)$ ;  $q_r$  = radiative flux  $\left(\frac{W}{m^2}\right)$  and  $n_i$  = Cartesian component of unit normal boundary vector.

In our problem the  $Q, \Gamma_T, \Gamma_q, T^*$  and  $q_a$  are illustrative of hydration, concrete-water interface, exposure surface, reservoir temperature and solar radiation flux respectively.

Implementing the thermal transfer equation (1) through the powerful numerical approximate method F.E.M results in:

$$M^e \dot{T} + K^e T = Q^e + q_a - CT + F_{hc} - RT + F_{hr} \quad (3)$$

Where  $\dot{T}$  denotes the rate of change of temperature with time and:

$$M^e = \oint_{\Omega_e} \rho C \psi \psi^T d\Omega \quad (4)$$

The equivalent thermal mass matrix of an element;

$$K^e = \oint_{\Omega_e} k \left( \frac{\partial \psi \partial \psi^T}{\partial x^2} + \frac{\partial \psi \partial \psi^T}{\partial y^2} + \frac{\partial \psi \partial \psi^T}{\partial z^2} \right) d\Omega \quad (5)$$

The equivalent thermal stiffness matrix of an element;

$$Q^e = \oint_{\Omega_e} \psi Q d\Omega \quad (6)$$

The equivalent internal heat generation vector of an element;

$$q_a = \int_{eq} \hat{\psi} q_a ds \quad (7)$$

The equivalent applied heat flux vector of an element;

$$C = \int_{eq} \hat{\psi} h_c ds \quad (8)$$

The equivalent convectional heat matrix of an element;

$$R = \int_{eq} \hat{\psi} h_r ds \quad (9)$$

The equivalent radiative heat matrix of an element;

$$F_{hc} = \int_{eq} \hat{\psi} h_c T_a ds \quad (10)$$

The equivalent convectional heat vector of an element;

$$F_{hr} = \int_{eq} \hat{\psi} h_r T_a ds \quad (11)$$

The equivalent radiative heat vector of an element;

In above equations:

$\psi$  is defined as the interpolation function in the element domain. The sign  $\wedge$  indicates the restriction of the interpolation function to an element face and the  $ds$  = element surface area.  $h_c$  is defined as the

convection coefficient  $\left(\frac{W}{m^2 K^0}\right)$  and implemented in

definition of the  $q_c$  (exchange of the heat by convection as a result of temperature differences between  $\Gamma_q$  and ambient temperature) through the Newton's cooling law:

$$q_c = h_c(T - T_a) \quad (12)$$

Where  $T$  = temperature of  $\Gamma_q$  boundaries and  $T_a$  = ambient temperature. These two temperatures are measured based on Kelvin degrees. In this paper,  $T_a$  is considered as the air temperature and  $T$  is the concrete temperature at the external surface of the dam.  $h_c$  was calculated in this study by the following relatively accurate formulation (Duffie and Beckman 1980):

$$h_c = 5.7 + 3.8V \quad (13)$$

$V$  = fluid speed (wind speed) (m/s).  $h_r$  represents the linearized radiation coefficient  $\left(\frac{W}{m^2}\right)$  and used in evaluating of exchange of the heat by the electromagnetic radiation (Stefan-Boltzman law) through the below manner:

$$q_r = eC_s(T^4 - T_a^4) \quad (14)$$

$e$  = emissivity of surface and  $C_s$  = Stefan-Boltzman constant  $[5.669 \times 10^{-8} \left(\frac{W}{m^2}\right)]$ . The relation (14) can be rewritten as follows to have a friendlier user form:

$$q_r = h_r(T - T_a) \quad (15)$$

Where  $h_r$  is defined as:

$$h_r = eC_s(T^2 + T_a^2)(T + T_a) \quad (16)$$

$q_a$  identifies the amount of absorbed solar energy by the body of system (in our study the dam) and described by the below equation:

$$q_a = aH \quad (17)$$

In which  $H$  = total amount of solar energy reaching the surface and  $a$  = solar absorptivity of the surface.

Rearranging and assembling the equation (3) over the entire domain yields the following tensorial form of the primarily ordinary differential equation (1):

$$MT\&+ \hat{K}T = \hat{F} \quad (18)$$

Where

$$\hat{K} = K + C + R \quad (19a)$$

$$\hat{F} = Q + q_a + F_{h_c} + F_{h_r} \quad (19b)$$

Equation (18) presents a system of nonlinear dependent differential equations because the components of tensor  $\hat{K}$  depends on the temperature values  $T$  and  $T_a$ . Since, in our study, the smallest period of considered time in calculation was set to a day (24 hours), so the variation of temperature with respect to time became very small value and therefore the first term of equation (18) was neglected. The sequence of solution has been summarized as in figure 1.

### 3. Results and Discussions

Following the method described in previous section, the Karun-1 arch concrete dam has been analyzed under the effect of 10m unusual reduction of its reservoir level from normal water level. The most dangerous situation which threatens the dam safety was obtained when the level of the lake came down to 480m from the free sea level. This means that the reservoir level reduces about to 10m from its normal water level. The counters of dam displacements at this level have been shown in figure 2.

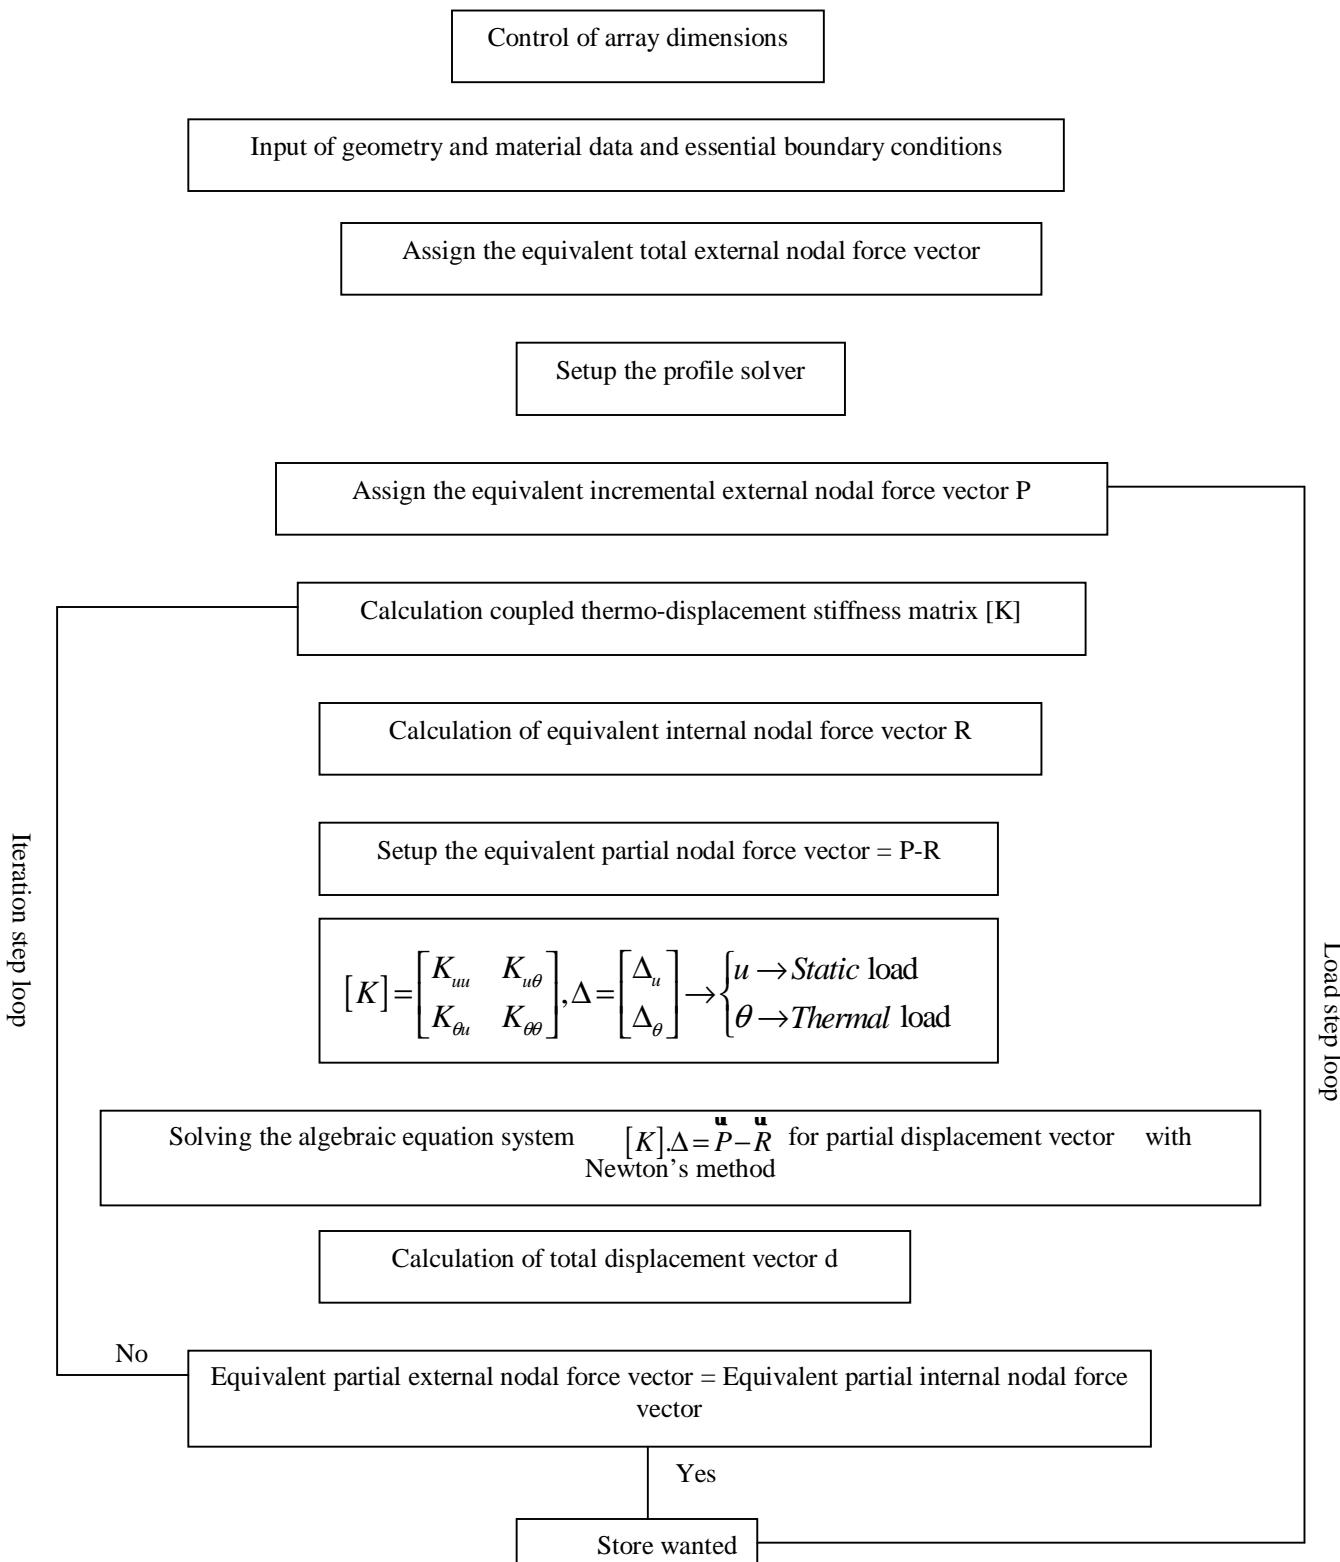

Figure1. The numerical solution of proposed problem

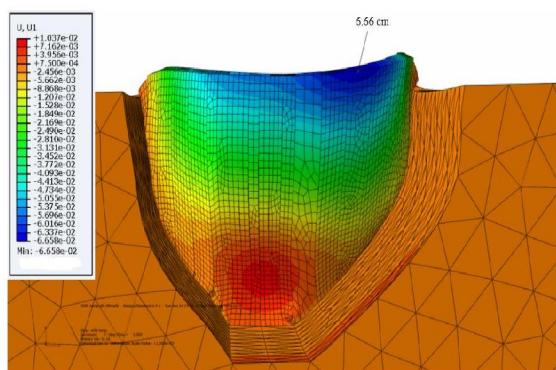

Figure 2. the Karun-1 dam deflections: the reservoir level= 480m

The face which is observed in figure 2 is the upstream face of the dam. As it can be seen from that picture, the largest displacement is about to 6.67 cm at crest level toward the upstream face. This value is not too large for the dam with the mentioned dimensions form the engineering point of view. In figure 3 the pattern of displacements at crest level of the dam was depicted.

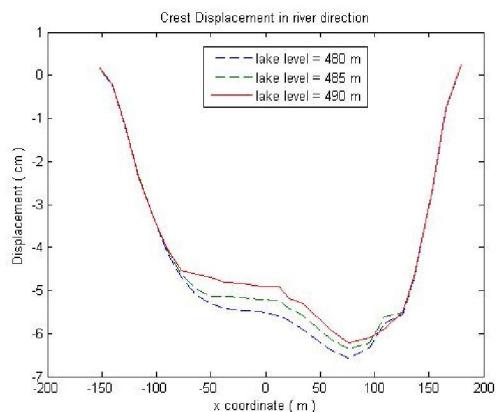

Figure 2. displacements in crown of dam

As it can be seen from figure 2 the displacements are not symmetric with respect to the middle of the crest. This is due to the fact that this arch dam has not the symmetric geometry and was designed with two different arch radius and centers at each level. Moreover, the biggest displacements obtained for the reservoir level equal to 480m. This confirms that the worse situation is occurred when the lake level of the dam decreased about 10m from the normal water level.

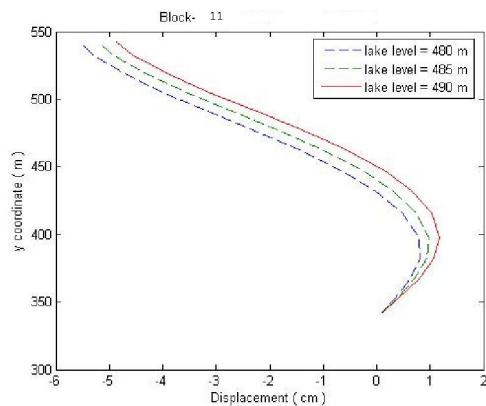

Figure 3. displacements along the height of the dam

The variation of deflections along the height of the block no.11 (the highest block of the dam) has been illustrated in figure 3. This picture verifies that under the reduction of reservoir water level, the lower parts of the dam deflect towards the downstream whereas the upper parts tend to move to upstream direction. This configuration of the dam cannot be captured in two dimensions and so in this study the three dimensional model has been used.

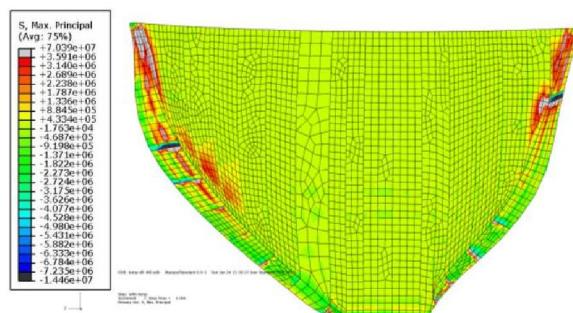

Figure 4. maximum principal stresses, downstream

For assessing the potential of cracking through the unusual reduction of water level, the attention should be focused on maximum and minimum stresses. The maximum stresses can inform us about the cracking due to tensile nature and minimum stresses can tell us about the cracking due to crushing of the concrete. The largest maximum stresses occurred on downstream face of the dam and has been shown in figure 4. From this graph it can be deduced that there are regions on downstream face near the abutments which tensile cracking can be occurred (the red color regions). It is worth to mention that the maximum allowable tensile strength of dam concrete can be considered as 3.5 MPa. So, author of this paper suggests that the operation of the dam should be organized in such a way that this amount of water

level reduction is avoided. The minimum principal stresses are depicted in the next figure. As it can be seen from it the crushing of concrete cannot be happen because the stress values are smaller than the compressive strength of mass concrete (40 MPa).

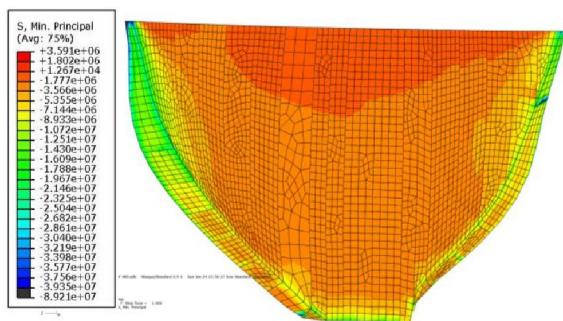

Figure 5. minimum principal stresses, downstream face.

#### 4. Conclusion

After reviewing the results of stress analysis of Karun-1 arch concrete dam it was cleared that the unusual reduction of the reservoir level dam can be the source of cracking on downstream face of the dam in tensile mode and such a reduction should be avoided by proper operation programming.

# Prevalence of HBV Genotypes in Egypt among Hepatitis Patients

Iman A.El Aziz Khaled <sup>\*</sup>1, Ola M. Mahmoud<sup>1</sup>, Abeya F.Saleh<sup>1</sup>, and Emad A. Baioumi<sup>2</sup>

<sup>1</sup>Haematology &Blood Bank, <sup>2</sup>Tropical Medicine, Theodor Bilharz Research Institute (TBRI).Cairo, Egypt  
<sup>\*</sup>iman\_khaled@yahoo.com

**Abstract:** Phylogenetic analysis has led to the classification of hepatitis B virus into eight genotypes, designated A to H. The genotypes have differences in biological properties and show heterogeneity in their global distribution. These attributes of the genotypes may account not only for differences in the prevalence of hepatitis B virus mutants in various geographic regions, but also makes them responsible for differences in the clinical outcome and response to antiviral treatment in different population groups. Africa is one of the highly endemic regions of HBV with five genotypes (A-E) identified. Almost all patients in the Mediterranean area are infected with genotype D. However, there is little information of genotype distribution in Egypt. A total of 140 Egyptian patients with hepatitis B surface antigen (HBsAg) positive were enrolled in this study. Of the 140 patients, only 100 patients were HBV DNA positive and only these were included in the study. They were classified into 20 patients with acute hepatitis (AH), 75 patients with chronic active hepatitis (CAH) and 5 patients with hepatocellular carcinoma (HCC)]. HBV genotypes were determined using INNO-LiPA methodology which is based on the reversed hybridization principle. Results: This study showed that genotype D constituted 87% of the total infections (75% CAH, 7% AH & 5% HCC). The other 13% showed mixed infections of D/F. Conclusion: These findings show that the most prevalent genotype in Egypt is genotype D especially in CAH and HCC patients while the mixed type D/F is mostly encountered in AH. [Journal of American Science. 2010;6(11):185-190]. (ISSN: 1545-1003).

**Keywords:** Phylogenetic, Genotypes , Hepatocellular

## 1. Introduction

It is estimated that 350 million individuals are chronically infected with hepatitis B virus (HBV) and that more than 1 million die from cirrhosis and hepatocellular carcinoma (HCC) each year [1-3]. Approximately 5-10% of infected adults and 80-90% of children become chronic carriers of HBV [4]. HBV has been classified into eight genotypes (A-H) based on the sequence divergence of > 8% in the entire genome, which consists of about 3200 base pairs [5-7]. Different HBV genotypes have distinct geographical distributions. Genotype A is found mainly in Northwest Europe, the United States, India, and Sub-Saharan Africa. Genotypes B and C prevail in East Asia, while genotype D is common in the Mediterranean countries. Genotype E is only found in Africa and genotype F is found mainly in Central and South America. The distribution of HBV genotypes G and H still needs to be determined [8]. Africa is one of the highly endemic regions of HBV with five genotypes (A-E) identified: genotype A in Kenya [9], genotype D in Tunisia [10], genotype (A-D) in South Africa [11] and genotype E in Nigeria [12]. Apart from these reports, however, there is little information of genotype distribution in Egypt despite the importance of HBV infection in this region of Africa. According to Egyptian studies [13, 14], the prevalence of HBsAg in Egypt is of intermediate endemicity (2-8%). Nearly 2-3 million Egyptians are

chronic carriers of HBV. Structural and functional differences between genotypes can influence the severity, course and likelihood of complications and hepatitis Be antigen (HBeAg) seroconversion. In addition, HBV genotypes may be associated with differences in response to antiviral therapy. Some studies indicate that HBV genotypes respond differently to interferon in patients with chronic hepatitis B [15].

Several technologies have been developed for genotyping of HBV. Including direct sequencing [16], restriction fragment length polymorphism analysis [17], line probe assay [18], PCR using type specific primers [19], colorimetric point mutation assay [20], ligase chain reaction assay [21] and enzyme linked immunosorbent assay for genotype-specific epitopes [22]. Our aim in this study was to use the line probe assay (INNO-LiPA HBV Genotyping assay; Innogenetics N.V., Ghent, Belgium) to detect the most prevalent genotypes of HBV among Egyptian hepatitis patients

## 2. Patients and Methods

The study was approved by the ethical committee of Theodor Bilharz Research Institute (TBRI) (No 52) and informed consents were obtained from patients participating in this study. A total of 140 patients with hepatitis B surface antigen (HBsAg) positivity were enrolled in this

study. Of the 140 patients, only 100 patients were HBV DNA positive and those were included in our study and classified into: 20 patients with active hepatitis (AH) diagnosed by HBsAg and HBc-IgM, 75 patients with chronic active hepatitis (CAH) characterized by presence of HBsAg with increased alanine aminotransferase (ALT) level for more than 6 months, and 5 patients with hepatocellular carcinoma (HCC) diagnosed by ultrasonography. HBV was diagnosed depending on clinical data, liver function tests done by (Hitachi 902), HBV serum markers done by ELISA technique (Abbott AxSYM® HBsAg Assay) and HBV DNA by real time PCR (Two step RT-PCR using Applied Biosystem). Patients were excluded if they were co-infected with hepatitis C virus (HCV) or human immunodeficiency virus (HIV).

#### DNA Extraction

The QIAamp DNA extraction kit (QIAGEN GmbH) was used for DNA extraction from serum samples according to the manual. The extracted DNA was used for amplification in the LiPA procedures. LiPA analysis was performed within approximately 5 days following DNA extraction. If DNA extracts were not used immediately, they were stored at -20°C.

#### LiPA amplification and detection

HBV genotyping was performed for all PCR-positive samples by a reverse hybridization line probe assay (INNO-LiPA HBV Genotyping assay; Innogenetics NV, Ghent, Belgium [available for research use only, not for use in diagnostic procedures]) [23]. The extracted DNA was amplified by nested PCR according to the instructions of the manufacturer (Innogenetics) for amplification of the HBsAg region to provide a biotinylated product. The HBV genomic region amplified extends from nucleotides 415 to 824 for the outer primers and nucleotides 456 to 798 for the nested inner primers (the numbering is based on the sequence with GenBank accession number AY128092). These procedures in brief includes initial denaturation of the biotinylated PCR products [24], which were then incubated with a test strip for hybridization of the denatured amplicon to genotype-specific probes immobilized as parallel lines on each strip. Following hybridization, the strips were stringently washed and incubated with a streptavidin conjugate to allow color development from the biotinylated DNA bound to the strip.

#### Statistical analysis

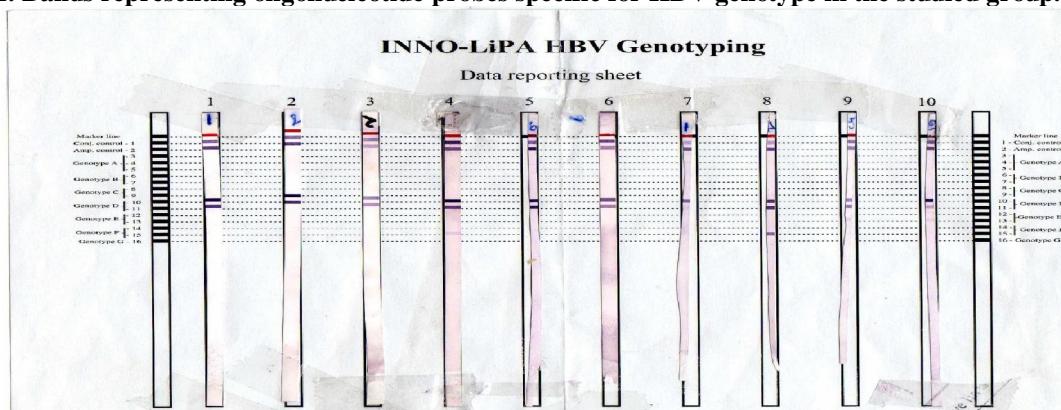

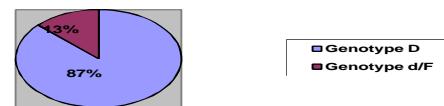

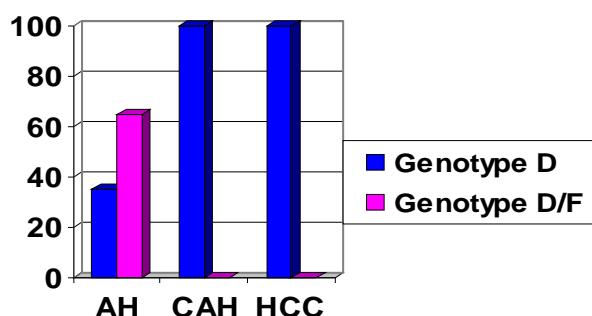

Analysis of data was carried out with the aid of SPSS package version 10.0 software (Chicago, Illions, USA) Parameters were compared using the Chi-square test. *P* values less than 0.05 were considered statistically significant.

### 3. Results

A total of 100 patients with a mean age of  $37.17 \pm 11.75$  years, including 25% females and 75% males, were enrolled in this HBV genotype study. Genotype detection by hybridization of the PCR products to the kit membrane strips was performed as described above. A representation of the membrane strip with all the immobilized control and genotype-specific oligonucleotide bands is shown in Figure 1. For all genotypes except genotype G, several reactive bands can indicate a specific genotype. Interpretation of the test strips was relatively straightforward; however, in certain cases faint bands appeared, and these made interpretation of the genotype unclear. The INNO-LiPA HBV genotyping strip contains 1 red marker line, 2 control lines, and 14 parallel probe lines. The conjugate control line is a control for the color development reaction and the amplification control line contains universal HBV probes to check for the presence of amplified HBV genomic material.

#### Distribution of HBV genotypes

This study showed that HBV infections in hepatitis patients are attributed predominantly to viral genotype D constituted 87% of the total infections. In addition, there was a relatively high prevalence of mixed infections (D/F) represented 13% among the studied group. No HBV genotypes A, B, C, E or G were found in our study (Figure 1,2). The Association between liver disease and the prevalence of HBV genotypes was as following: Genotype D was found significantly more often in patients with CAH and HCC than in patients with AH [75/75(100%), (5/5(100%) v (7/20 (35%)). Mixed infection (D/F) was only found in AH group [13/20 (65%)] (Figure 3).

**Figure 1.** Bands representing oligonucleotide probes specific for HBV genotype in the studied group.**Figure 2.** HBV genotype distribution in the studied group.**Figure 3.** The Association between liver disease and the prevalence of HBV genotypes.

#### 4. Discussion

Hepatitis B virus (HBV) infection is a global health problem with a continuously increasing burden in developing countries like Egypt. A greater demand for genotyping of patient strains of HBV is growing as specific clinical associations with each genotype becomes increasingly apparent

[25-27]. Presently, based on an intergroup divergence of 8% or more in the complete nucleotide sequence, HBV can be classified into eight genotypes A-H, and different HBV genotypes are dominant in various parts of the world [8]. Thus, it is imperative to collect more information on HBV genotypes from all over

the world to reach a decision concerning their clinical utility [28].

The most important finding in our results was the predominance of the genotype D as the predominant HBV genotype in the studied subjects (87%) followed by mixed genotype (D/F) that constituted 13%. These findings conform with other studies done in Egypt. Saudy et al (2003) studied the genotypes of HBV isolated from 100 serum samples of Egyptian carriers by sequencing and found that HBV genotype D was the most prevalent in Egypt [29], but did not detect mixed infection. Discrepancy may be correlated to the difference in sensitivity between the two methods used. In other words, sequence analysis provides information only on the majority strain, while LiPA appears to overcome this limitation by its sensitive detection of mixed genotypes [30]. On the other hand, Naito et al (2001) examined 2 serum samples positive for HBV DNA by primer specific to be of genotype D but they didn't find other genotypes as they only examined 2 serum samples [19]. A third study was done on 70 pediatric cancer patients suffering from hepatitis and were diagnosed as HBV infection. In this study, genotype D was reported as the predominant HBV genotype in the study subjects [31]. This study also concurs with previous studies, indicating that HBV genotype D prevails in the Mediterranean area, near and Middle East [32, 33, 34]. A similar study performed in Syria showed that 97% of the studied patients were of genotype D, and 72% were HBeAg negative [35]. Moreover, study in Turkey revealed that all 44 patients studied had genotype D [34]. Another study in Yemen demonstrated that genotype D was the dominant genotype in a settled population, while genotype A was found only in communities with continuing African links [36]. In addition, two studies in Iran revealed genotype D was the most prevalent HBV genotype [37, 38].

The clinical impact of HBV genotype D has been studied less extensively. However, initial studies have found that it may be associated with lower rates of sustained remission and HBsAg clearance and more severe liver disease compared with genotype A [39]. Emerging evidence suggests that patients with genotype D infection may develop fulminant hepatitis with high frequency [40]. A study from Syria and India indicated that genotype D is more often associated with HBeAg-negative chronic hepatitis B (CHB), more severe diseases and may predict the occurrence of HCC in young patients [35, 41, 42]. Several studies have reported lower response rates to interferon and pegylated interferon- therapy in patients with genotypes C and D than in those infected with

genotypes B and A [43,44]. Evidence suggests that the emergence of lamivudine resistance develop later and less frequent in patients with genotype D infection than in those with genotype A infection [45-47].

In this study, we reported a prevalence of mixed genotype infections D/F at an incidence of 65% in patients with AH. The existence of HBV genotype F in acute forms of liver disease suggests an association of genotype F with more severe and acute forms of liver disease. Mixed infection with two different HBV genotypes has been known since typing was done serologically [48, 49]. Mixed infection was accompanied by acute exacerbation of the chronic disease [31], and may be provoked by population migration [36, 50].

We therefore suggest that HBV genotyping become a routine exercise in clinical medicine and molecular epidemiology. As genotypes have different biological and epidemiological behavior, their detection and monitoring is more than just academic but also medically significant. Continued efforts for understanding HBV genotypes through international co-operation will reveal further virological differences of the genotypes and their clinical relevance. Furthermore, efforts to prevent mixed infections (super-infection or co-infections) in patients with chronic hepatitis B should not be overlooked, especially in areas endemic for HBV infection. Since a small number of subjects were employed in our investigation, we propose that large scale studies be conducted to substantiate our findings. Such studies could also provide more insight into the association between co-infection and disease exacerbations as well as shed light on the molecular, virological and host mechanisms underlying the pathogenesis of HBV-related disease

**Abstract:** Aim: This study has been made to determine the potential genotoxicity of *Schistosoma mansoni* on lymphocytes of infected patients using different mutagenic end points. The protective role of antioxidants pro vitamin -carotene and vitamin E in minimizing these genotoxic effect was also studied. The study focused on the effect of schistosomiasis on the induction of sister chromatid exchange (SCEs) and other chromosomal aberrations. Patients and Methods: This work was conducted on 24 *Schistosoma mansoni* infected patients and 10 healthy adults as a control group. Lymphocytes from peripheral blood of patients and control group were used for culture and subsequent cytogenetic studies. Results: The results indicated that schistosomiasis was genotoxic in all examined tests. It induced a significant increase in the percentage of structural chromosomal aberrations and the frequency of SCEs. It also inhibited cell division and caused cell cycle delay. Lymphocyte cultures of *S. mansoni* patients treated with 10 µg/ml -carotene or 20 mg/ml vitamin E showed a significant decrease in the percentage of structural chromosomal aberrations and the frequency of SCEs. Conclusion: Schistosomiasis has a genotoxic effect on peripheral blood lymphocytes. The use of the antioxidants -carotene and vitamin E can be considered a promising approach not only toward inhibiting the genetic damage of schistosomiasis but also as prophylactic agents against infection with *S mansoni*. Furthermore, higher doses of antioxidant drugs, -carotene and vitamin E, should be tried as an adjuvants to conventional therapy in a trial to improve treatment of schistosomiasis. [Journal of American Science. 2010;6(11):191-202]. (ISSN: 1545-1003).

**Key words:** Schistosomiasis, -carotene, vitamin E, chromosomal aberration

## 1. Introduction

Schistosomiasis is a common parasitic disease, affecting millions of people, mostly in tropical and developing countries. One of the causative agents of the disease is a trematode worm, *Schistosoma mansoni* [1]. *Schistosoma mansoni* infects over 83 million people in Africa and the Middle East [2]. Egypt represents one of the most highly infected populations with schistosomes in the world [3] with an estimated prevalence of (33.7%-57.7%) in Upper Egypt [4].

Schistosomiasis has been suspected as a risk factor for various types of cancers e.g., bladder cancer, colorectal cancer and hepatic cancer. However, the mechanisms of the carcinogenesis are still unclear [5]. The fact that Schistosomiasis is found to have a mutagenic effect [6] and a co-mutagenic effect [7] may be one of those mechanisms.

The mechanisms of chromosomal aberrations involve the concepts of clastogens directly acting on DNA to produce strand breaks, and subsequently, the survival of these directly caused DNA strand breaks - or misrepairs of them -up to metaphase when they appear as chromosomal breaks or translocations [8]. Enzymes that continually repair DNA damage – frequently cannot counteract all of the oxidative attack, and the resulting damage may lead to genetic mutations that could contribute to carcinogenesis [9].

Many diseases are associated with oxidative stress; this is why the use of antioxidant rich food or antioxidant food supplements has become immensely popular. These antioxidants include enzymes like superoxide dismutase, catalase, glutathione peroxidase and glutathione reductase, minerals such as selenium, manganese, copper, zinc and vitamins such as vitamins A, C and E beside compounds such as glutathione, uric

acid and flavonoids. These antioxidants protect, prevent or reduce the extent of oxidative destruction of cellular tissues. Elevated levels of lipid peroxidation products and the simultaneous decline of antioxidant defense mechanism has been suggested to be harmful through disruption of membrane lipid and damage of cellular organelles resulting in oxidative stress [10].

Carotenoids (provitamin A) and tocopherols (vitamin E) are lipid soluble antioxidants associated with decreased risk of several degenerative diseases [11].

Alpha tocopherol is the main form of vitamin E and this has been the most commonly studied dietary antioxidant supplement in clinical trials [12].

Vitamin E supplementation has been shown to take part in immunoregulation, antibody protection and resistance in planted tumor probably through increased tumourolytic effect of natural killer cells [13]. Also, it was reported that vitamin E protects against lipid peroxidation and prevents skin cancer [14, 15].

Dietary carotenoids play important roles in the promotion of human health as pro vitamin A, antioxidants and chemopreventive agents against certain types of cancers [16] and -carotene have gained prominence for their role against reactive oxygen species (ROS), protecting the organism against oxidative stress and consequently preventing damages and tissue lesions [17].

Sister chromatid exchange (SCEs) represents the interchange of DNA replication products at apparently homologous chromosomal loci. These exchanges involve DNA breakage and reunion. SCE technique affords the opportunity for cytological detection of DNA interchange. This technique is used as a sensitive means of monitoring DNA damage. It is useful for assessing the cytogenic impact of clastogenic agents on chromosomes. The increased resolution of SCE detection afforded by fluorescence or Giemsa technique has permitted localization of SCEs relative to chromosome-banding patterns. In human chromosomes, SCEs occur preferentially in Q-negative bands or at the junction of Q-positive and Q-negative regions [18].

Double stranded breaks (DSBs) are dangerous DNA lesions as they can lead to massive loss of genetic information and to chromosomal rearrangements [19]. In the past ten years, researchers in genome stability have observed that many kinds of cancer are associated with areas where human chromosomes break [20].

Chromosome fragmentation represents an efficient means of induced cell death and is a clinically relevant biomarker of mitotic cell death. Chromosome fragmentation serves as a method to eliminate genomically unstable cells. Paradoxically, this process could result in genome aberrations common in cancer [21].

Centric fission results when a metacentric or submetacentric chromosome splits at the centromere, giving rise to two stable telocentric products, isochromosomes, or ring chromosomes [22].

The aim of the present study was to investigate chromosomal aberrations and sister chromatid exchanges in peripheral blood lymphocytes of *Schistosoma* infected patients. The roles of -carotene and vitamin E as antimutagenic agents modulating the frequency of these chromosomal aberrations and sister chromatid exchange induced by schistosomiasis were also studied.

## 2. Materials and Methods

This study was conducted on 24 *schistosoma mansoni* infected patients (21 males and 3 females) with a mean age of 28.7 years who were submitted to Theodor Bilharz Research Institute, tropical medicine department. Lymphocytes from peripheral blood of patients were used for culture and subsequent cytogenetic studies. The results were compared to those of 10 healthy adults acting as a control group.

### Sample collection:

Ten ml of blood were collected, five of which were collected in a Na-heparin vacutainer for the performance of lymphocyte cultures and the other five ml were collected in gel containing vacutainer for IgG antischistosomal antibody titer detection and liver functions (ALT and AST).

### Stool analysis was also done.

For each culture, 25 metaphases were examined for chromosomal aberrations, 25 metaphases for sister chromatid exchanges, 100 metaphases for cell cycle kinetic and 1000 cells for mitotic index

### Cytogenetic parameters:

Chromosome preparation for human peripheral blood:

For each sample, six lymphocyte cultures were set up, two of them were treated with 10 µg/ml -carotene [13], another two were treated with 20 mg/ml vitamin E and the last two

cultures were used as controls. The two antioxidants were prepared as a suspension in 2% Cremophore-El under sterile conditions. Cultures were set up using whole heparinized venous blood.

One ml of blood was incubated in a culture medium consisting of 4 ml RPMI 1640 with L-glutamine + 1 ml fetal calf serum + 0.1 ml (penicillin + streptomycin) + 0.2 ml of phytohemagglutinin. The medium was also supplemented with 10 $\mu$ g/ml 5-bromodeoxyuridine (DrdU). Cultures were set up in 9 ml culture tubes for 72 hrs. The culture tubes were wrapped in aluminum foil, transferred to a thermostatically controlled incubator at 37°C, kept in a tilted position and shaken daily. All the materials used were sterile. Two hours prior to termination of the culture i.e. 70 hrs after initiation of culture, Colcemid (0.4  $\mu$ g/ml) was added and mixed thoroughly by shaking the tubes, then they were returned back to the incubator.

#### Harvesting and fixation of cells:

Each culture tube was centrifuged at 1000 rpm for 10 minutes. The supernatant was discarded and cell pellet disrupted by flicking the base of the tube. A hypotonic solution 0.075 M KCl (37°C) was added to give a light cloudy solution about (5-6 ml) and left to stand for (20-30) min. Half ml of fresh fixative (Methanol: glacial acetic acid (3:1) was added to each tube. The tube was centrifuged again at about 1000 rpm for 10 min. The supernatant was discarded and cell pellet was disrupted. The cells were then fixed in 4 ml methanol/glacial acetic acid (3:1) fixative for 10 minutes at room temperature. The fixative was changed twice and the cells were finally suspended in a small amount of fixative (0.5-1 ml). Two or three drops of the cell suspension were dropped onto a clean slide dipped in cold 70 % ethanol. The slides were flame dried.

#### Slide staining:

The principle of the fluorescent plus Giemsa (FPG) technique [23] with some modifications was followed for scoring SCEs. After complete drying, the slides were divided and marked into 2 parts; part stained in 50  $\mu$ g/ml of Hoechst 33258 dye for 15 minutes (protected from light). Slides were rinsed in distilled water, layered with 2 x SSC buffer (PH 7), cover slipped, immersed in clean wide Petri dishes full of 2 x SSC buffer (PH 7) and subjected to UV light e.g. predominantly 365 nm Hg line, 400 nm dichromic mirror for 90-120 minutes in a closed cabinet. Slides were rinsed in distilled water and immersed in 4 % Giemsa dye for 7 minutes. The second part was stained directly in 4% Giemsa stain for seven minutes as well as the 1st slides without

staining in Hoechst or exposed to U.V light for scoring of chromosomal aberrations.

#### Scoring of chromosomal aberrations:

For each patient or normal control, 25 metaphases were examined microscopically for chromosomal aberrations in -carotene, vitamin E treated tubes as well as in the untreated tubes. Only cells having well spread chromosomes with minimal overlapping were selected for scoring. Photographs were made of all types of abnormal metaphase Figures. Structural aberrations such as gaps, breaks, deletions, end to end association, centric fusion and centromeric attenuation were recorded. Also, metaphase spreads were examined for evident numerical aberrations including euploidy (endomitosis).

#### Scoring of sister chromatid exchanges:

For each patient or normal control the frequency of SCEs was recorded in 25 metaphase spreads in second division cells in -carotene, vitamin E treated tubes and untreated tubes. In some patients and because of the very low mitotic indices, we could not complete 25 metaphases and we calculated the mean of all found metaphases.

#### Mitotic activity:

The mitotic index was counted as the ratio of mitoses to interphase nuclei in 1000 cells.

#### Cell cycle kinetics:

Cell cycle analysis can be studied by calculating the replicative index (RI) [24], a derived index that reflects the relative contribution of each cell cycle to the sample population. In 100 consecutive metaphase cells, at each dose level, the number of first (M1), second (M2) and third or subsequent (M3) divisions were determined. The RI was calculated as follows: RI = 1M1 + 2M2 + 3M3 /100.

#### Stool examination and measurement of Schistosomal antibodies, ALT and AST:

Preparation and examination of patients stool specimens by saline stool smear was done according to (Haridy, 1979), and measurement of Schistosomal antibodies in human sera was done by ELISA technique using (*Schistosoma* IgG (EIA-3512) from DRG international inc., U.S.A.). ALT and AST were evaluated coloerimetrically in sera of patients and control by commercially available kits according to manufacturer's guidelines.

### Statistical analysis:

Statistical analysis was performed by using SPSS software for windows II version. Student (t) test was used to compare means of SCE, cell cycle kinetics while Chi square test was used for chromosomal changes and mitotic indices.

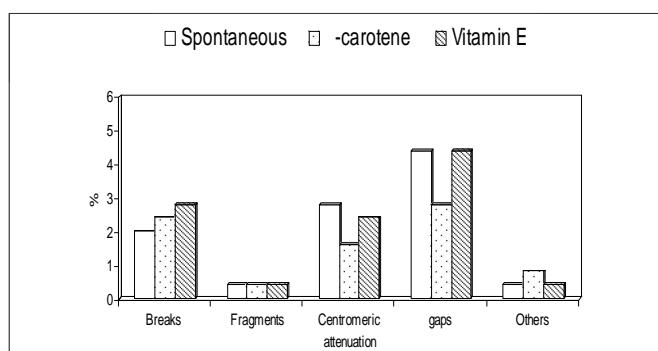

### 3. Results

The biochemical data (ALT level, AST level and antischistosomal antibody titer) of normal controls and patients are represented in Table 1.

**Table 1: Biochemical data (ALT level, AST level and antischistosomal antibody titer) of normal controls and patients.**

	Control group	Patient group
ALT	2.9+/- 0.57	6.1±1.26
AST	6.4+/- 1.19	13.85±1.99*
Serum level of specific IgG		2.77±0.34

\*P<0.05

**Figure (1): Effect of -carotene and vitamin E on the percentage of different types of structural chromosomal aberrations in peripheral blood lymphocytes of normal controls**

**Figure (2): illustrates a normal metaphase from peripheral blood lymphocytes.**

Chromosomal aberrations in peripheral blood lymphocytes:

Table 2 shows the effect of -carotene and vitamin E on the number and percentage of metaphases of different types of structural chromosomal aberrations, frequency of SCEs cell cycle kinetic (RI) and mitotic indices (MI) in peripheral blood lymphocytes of both normal controls and *Schistosoma mansoni*-infected patients.

The data of breaks and deletions were combined together as the two are related. Features of centric fusion, end to end association and ring chromosomes are combined together in one parameter and grouped under “other aberrations” category.

Only a chromosomal aberration of the structural type was found in patients’ cultures (Figs 3, 4,5,6)

The results point to the fact that infection with Schistosomiasis may induce structural chromosomal aberrations in peripheral blood lymphocytes. The number and percentage of different types of the induced chromosomal aberrations are recorded in Table 2.

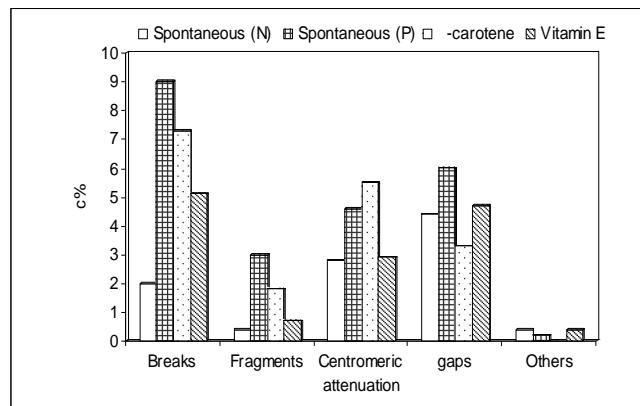

**Table 2: Effect of -carotene and vitamin E on the number and percentage of metaphases of different types of structural chromosomal aberrations, frequency of SCEs cell cycle kinetic (RI) and mitotic indices (MI) in peripheral blood lymphocytes of both normal controls and *Schistosoma mansoni*-infected patients.**

**Figure(6) : Metaphases with sister chromatid exchange from human peripheral blood lymphocytes.**

In peripheral blood lymphocyte cultures of *S. mansoni* patients, spontaneous human lymphocyte cultures showed a significant increase in the number of metaphases with chromosomal aberrations even after excluding gaps ( $p<0.01$ ) and the total number of aberrations with and without gaps showed significant increase ( $p<0.001$ ). Breaks and deletions constituted the major part of these aberrations. The total number of breaks and deletions was significant at  $P<0.01$ . These findings run in

#### 4. Discussion

Schistosomiasis is considered the most important of the human helminthiases in terms of both morbidity and mortality. Advances in molecular genetics and immunology hold the promise to control the spread of schistosomiasis and to guide development of new tools to combat this tropical disease [25].

parallel with other studies [6, 26, 27, 28, 29, and 30].

Although some studies reported a significant increase in the number of gaps in *S. mansoni* infected mice [27, 29 and 6], the present study did not reveal any significant increase in the number of gaps. This may be due to the fact that there is not a clear idea about the nature of gaps. While some authors consider gaps to be chromosome fragile sites that are especially prone to forming non-staining gaps, constrictions or breaks in one or both of the chromatids on metaphase chromosomes either spontaneously or following partial inhibition of DNA synthesis [31], others considered the scoring of gaps to be highly subjective and therefore unsuitable indicator for mutagenic potential [32, 33, 34]. It was reported that chromatid gaps occur as two morphologically indistinguishable types; the clastogenic (DNA damage) and the tubagenic (non DNA damage) types. Thus the importance of recording gaps in assessing the mutagenic potential of a compound has been controversial [34].

Four to five sister chromatid exchange is considered within the normal distribution, 14-100 exchanges is not normal and presents a danger to the organism. SCE may be related to tumors [35].

Spontaneous lymphocyte cultures of patients showed a significant increase in the mean frequency of SCEs  $p<0.01$ . This finding was similar to what was reported previously in *S. mansoni* patients [26]. Data presented in this study demonstrate that a significant decrease in the mitotic index ( $p<0.001$ ) was observed in spontaneous lymphocytic cultures of *S. mansoni* patients. These results are in agreement with other findings [26, 7]. Also, spontaneous lymphocyte cultures of patients showed a significant decrease in the replicative index (RI) ( $p<0.01$ ) results which run in agreement with previous studies [26, 36].

How may schistosomiasis cause this genotoxic effect? In fact, the results of this study and the previous studies showed that schistosomiasis causes increase in the induction of chromosomal aberrations and the frequency of SCEs. Also, schistosomiasis causes a decrease in the mitotic index and a cell cycle delay in human somatic cells but the mechanism involved in this abnormalities is not totally clear. Suggested explanation is that disordered tryptophan metabolism occurring in schistosomal infection leads to an increase in the production of carcinogenic metabolites known to be genotoxic [36 and 37]. A second explanation is that schistosomiasis is accompanied by elevated enzymatic activities in serum, such as -glucuronidase ( g) [38], an enzyme known to enhance the metabolic activation of procarcinogens such as 2-aminoanthracin [36] and 3, 3 -dichlorobenzidine [39]. It was reported that the

active forms of these chemicals are able to induce SCEs in human blood lymphocytes [40]. A third explanation is the possible role of the immunization process in changing the type of sample cells [36]. The cause of the variability in the results of patients is unknown, however many factors such as disease duration, severity and patient immunity could be implicated in chromosomal aberrations and SCEs elevation of this type of infection [36]. Another explanation is the presence of Schistosoma toxins in the blood of infected patients and these toxins may cause a reduction in the cell growth and proliferation [41]. The last and most important explanation is that oxidation of DNA may lead to mutation (and hence to carcinogenesis); Free radicals can also damage DNA and result in mutations, altered capacity of cells to produce critical factors and derangement of the capacity to proliferate [42].

Oxidative stress may contribute to the development of fibrosis in the liver either through direct stimulation or by promoting the production of profibrotic cytokines. Furthermore, oxidative stress may also promote polarization of T-cell differentiation toward T helper 2 phenotype. Using experimental models of the disease, it has been shown that the granulomatous inflammatory response to *S. mansoni* eggs entrapped in the liver induces hepatic oxidative stress, with production of reactive oxygen species (ROS) and reduced anti-oxidant status of the organ. The ultimate result of ROS generation is killing of the parasite eggs; however, the process is potentially harmful for the host as production of ROS may initiate a fibrogenesis cascade in the liver or modulate tissue and cellular events responsible for progression of liver fibrosis. Thus, the pathophysiologic effect of ROS production associated with inflammatory response depend on a balance between opposing mechanisms that can either terminate the oxidative process or lead to increased generation of potentially harmful oxidants. The latter condition may promote the development of liver fibrosis, particularly in subjects with suboptimal antioxidant micronutrients status. The finding of an inverse relationship between serum retinol and intensity of *S. mansoni* infection and the finding of high levels of periportal fibrosis occurring with low antioxidant micronutrient concentrations suggest that micronutrients may have important roles in the differential morbidity patterns observed among communities who, otherwise, have comparable levels and intensities of *S. mansoni* infection [43]. The metamorphosis of normal

liver tissue to fibrotic tissue might give the chance for these mutagenic changes.

Evidence is accumulating in support of a role for ROS in the etiology of cancer. Inflammatory cells, such as neutrophils, macrophages, and eosinophils, are an important endogenous source of oxygen radicals. Stimulation of these cells by tumor promoters or by foreign bodies (parasites, bacteria, etc.) causes the release of ROS. In this context, it was found that H<sub>2</sub>O<sub>2</sub>/ myeloperoxidase system, which is the corner stone of the anti-microbial defense associated with inflammation, is activated in close contact with parasite eggs. The process although contributes to egg killing in vivo, yet, it causes accumulation of H<sub>2</sub>O<sub>2</sub>, superoxide anions and hydroxyl radicals in the host's tissues. It was reported that schistosome infection might have had suppressive effects on the host glutathione peroxidase (GPX) and glutathione S- transferase (GST) thereby minimizing the consumption of GSH either in eliminating H<sub>2</sub>O<sub>2</sub>, a reaction catalyzed by GPX, or in the conjugation of schistosomal toxins, a reaction catalyzed by GST. Therefore, the accumulation of free radicals and toxins is augmented with *S. mansoni* infection. Under such condition, the need for antioxidants increase and their presence may be crucial to eliminate the products of oxidative reactions and keep the ongoing immunological operations leading to destruction of eggs [44].

Another question is raised: How do these genotoxic changes lead to carcinogenesis? Zalata et al, (2005) suggested that the genotoxic agents produced endogenously through the course of schistosomiasis mansoni may play a role in colorectal cancer associated with schistosoma mansoni pathogenesis through the dysregulation of apoptosis by altering the expression pattern of Bcl-2 protein differently from non schistosoma associated colorectal carcinoma suggesting a different biological behavior [45].

The second part of our study included the antimutagenic effect of -carotene and vitamin E against the genotoxic hazards occurred by schistosomiasis. The treatment of cultures of peripheral blood lymphocytes of normal controls did not induce any remarkable changes from spontaneous (non-treated) cultures in normal controls in any parameter.

Also, -carotene did not decrease the aberrations and SCEs significantly when incubated with cultures of peripheral blood lymphocytes of Schistosoma-infected patients. The total numbers of metaphases with structural chromosomal aberrations with or without gaps or with SCEs were still higher in comparison to the spontaneous cultures of normal controls.

On the contrary, vitamin E decreased the aberrations caused by schistosomiasis when incubated with spontaneous blood cultures of *S. mansoni*-infected patients. The total number of metaphases with structural chromosomal aberrations with or without gaps decreased significantly ( $p<0.05$ ) compared with spontaneous cultures of infected patients. The frequency of SCEs was not influenced by the presence of vitamin E.

The improvement in cultures after vitamin E treatment compared to -carotene could be explained by the fact that while -carotene can enter the cell and protect against strand breaks but not against oxidized DNA bases [46], vitamin E is effective in preventing chromosomal damage [47], reduction of DNA fragmentation [48] and micronuclei formation in blood lymphocytes [49].

The replicative indices in the case of the two vitamins revealed an improvement in cell cycle kinetic but the increase was not significant compared with either spontaneous cultures in normal controls or patients.

Neither -carotene nor vitamin E improved the mitotic indices. The mitotic indices decreased significantly at  $p<0.001$  in all patient cultures whether incubated with either of the vitamins or not.

In our experiments, although an improvement in the cell cycle kinetics had occurred, the mitotic indices were still low. This may be due to the elimination of highly aberrated cells.

A possible interpretation of the role of -carotene or vitamin E against schistosome worms may be attributed to the antioxidative properties of these antioxidants, their metabolic modulator effect on some oxidases and the ability of these antioxidants to modulate the DNA repair mechanism by elimination of highly aberrated cells [48] or by gap junction-enhanced intracellular communication [50].

The use of -carotene or vitamin E may inactivate or reduce the schistosome glutathione peroxidase (GPX) enzyme activity, which is an important antioxidant enzyme protecting *S. mansoni* by reducing hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) and peroxidized lipid [51, 52] thus damaging one key survival mechanism of the schistosomes.

As a conclusion to our study, -carotene and vitamin E have anti mutagenic effect. This anti mutagenic effect may be due to the antioxidant protection by scavenging DNA damaging free radicals or by acting as a modulator of the metabolism selectively inhibiting certain forms of

mixed function oxidases or lastly through modulation of DNA repair mechanism.

In conclusion, the present results indicates that schistosomiasis has a potential mutagenic effect, increases the level of chromosomal aberrations and SCEs, decreases the level of mitotic indices and causes cell cycle delay. The present results indicate that the investigated antioxidants pro-vitamin - carotene and vitamin E could improve the genetic damage induced by schistosomal pathogenesis.

We are thus justified to recommend giving antioxidant drugs like -carotene and vitamin E on regular basis to minimize the genotoxic hazards that may occur as a sequel of infection.

**Abstract:** Present experimental work aimed to show role of the molecular biology in diagnosis of hepatitis C liver disease (HCV) and acute lymphoblastic leukemia (ALL) which occur as a result of the disturbances of protein and enzymes fractions at the molecular level. The study carried out using vertical slab gel electrophoresis for detection of the protein pattern, catalase and peroxidase. Protein fractionation of the control samples produced 13 bands with Rf ranged between 0.17 and 0.96 and (amount, 3.14 - 7.24). Comparing hepatitis C with control one out of these 13 bands are completely disappeared at Rf 0.86 (amount 9.34). Ten bands appeared to be common bands in all HCV samples except one sample only nine common bands were produced while the band number ten was disappeared. The data showed that 5 characteristic bands were produced. One from these five bands determined at Rf 0.7 in all HCV sera samples except the first sample. Comparing leukemia samples with control only two were considered as common bands. These bands completely appeared in all sera samples. On the other side one band was completely disappeared in all leukemia samples. The rest bands distributed between different leukemia samples. 15 bands produced as characteristic bands. Electrophoresis pattern for catalase mentioned that six bands were produced in control samples. When hepatitis C compared with the control showed that two out these six bands were completely disappeared and other all HCV four bands considered as common bands. The amount of catalase enzyme completely decreased in all bands. In leukemia five common bands were produced with the appearance of one characteristic band, from the other side one band was disappeared. A documentation of peroxidase pattern data showed that tow common bands were appeared with Rf 0.1 and 0.33, the amount of these two bands were decreased when the amount of HCV compared with control in the same rows. In leukemia there is only one common band was produced with appearance of a three characteristic bands. [Journal of American Science. 2010;6(11):203-216]. (ISSN: 1545-1003).

### 1. Introduction

Hepatitis C virus (HCV) is a major human blood-borne pathogen that has infected almost 170 million people worldwide (Liu et al., 2010). Hepatitis C virus is a single positive stranded RNA virus, classified as family Flaviviridae, genus Hepacivirus. This virus can be differentiated by RNA sequence analysis in to at least 6 major genotypes and more than 100 subtypes Richter, (2002) and Ismail et al., (2004).

Hoofnagle, 1997 and Bièche et al., 2005 reviewed that the infection with HCV is often asymptomatic, but once established, chronic infection can cause inflammation of the liver (chronic hepatitis). This condition can progress to scarring (fibrosis), and advanced scarring (cirrhosis). In some cases, those with cirrhosis will go on to develop liver failure or other complications of cirrhosis, including liver cancer.

Egypt has the highest countrywide prevalence of hepatitis C virus in the world, with an estimated 8-

10 million among a population of 68 million having been exposed to the virus and 5–7 million active infections and the prevalence of antibodies to HCV is approximately 10-fold greater than in the United States and Europe (Ebeid and El-Bakry .., 2009). Frank et al., 2000 reported that HCV in Egypt associated with a high morbidity and mortality from chronic liver disease, cirrhosis, and hepatocellular carcinoma; the authors mentioned that Parenteral antischistosomal therapy had a major role in the spread of HCV throughout Egypt.

Leukemia originates from hematopoietic stem cells that lose their ability to differentiate normally for production of the mature blood cells (Battisti et al., 2008). The experimental studies reported that leukemia caused as a result of genetic changes include point mutations, gene deletions and rearrangements. This was able to cause disturbances in the gene expression without changing the DNA sequence (Melki and Clark, 2002). There were several types of leukemia. The acute lymphoblastic leukemia

(ALL) is a disease characterized by uncontrolled arrest in proliferation and maturation of lymphoid progenitor cells in bone marrow. This resulted in production of an excess of malignant cells (Battisti et al., 2008). The authors mentioned that the lymphoblasts replace the normal marrow elements, resulting in a marked decrease in the production of normal blood cells. Acute lymphoblastic leukemia (ALL) is the most common cancer found in the pediatric population and it accounts for more than 50% of the hematopoietic malignancies (Downing and Shannon, 2002 and Gaynon, 2005).

The present experimental work aimed to show role of the molecular biology in diagnosis of hepatitis C liver disease (HCV) and acute lymphoblastic leukemia (ALL) which occur as a result of the disturbances of protein and enzymes fractions at the molecular level. The study carried out using vertical slab gel electrophoresis for detection of protein, catalase and peroxidase patterns.

## 2. Material and Methods

This study was conducted in the nuclear research center, atomic energy authority, Inshas. Blood samples were taken as part of the experimental research. The study carried out on 29 cases divided into three groups. 10 patients diagnosed to have hepatitis C infection representing the HCV group, 9 diagnosed to have acute lymphoblastic leukemia representing the leukemia group and 10 were chosen from the same population and taken as control.

### Hepatitis C patients

Ten patients; (males) mean age  $30 \pm 6$  years, with hepatitis C infection. patients diagnosis depended completely on the historical review of each patient represented in elevation of serum transaminases, presence of anti-HCV antibodies. The patients with other autoimmune liver diseases were excluded from the study.

### Leukemia patients

Nine patients (males), mean age  $28 \pm 12$  years infected with acute lymphoblastic leukemia. The disease diagnosis depended completely on the historical review of each patient including clinical examination, complete blood picture, bone marrow aspiration . The patients with other diseases were excluded from the study.

### Control group

Ten healthy individuals (male), mean age  $27 \pm 7$  years. They were selected on the basis of general physical examination. They have no any disease of HCV, HBV and HIV. There was no previous history of hepatitis and/or blood related cancers in any

individual. They obey all the biochemical tests including liver functions (Alanine Transaminase (ALT), Aspartate Transaminase (AST) and Gamma Glutamyl Transferase (GGT), complete blood count and bone marrow examination, protein profile (Total protein and albumin) showing no evidence of any abnormal disturbances.

### Sample collection and assay:

Five milliliter blood samples were collected. Samples were collected on heparin (anti coagulant) in a sterile micro centrifuge tube and then centrifuged at  $400 \times g$  for five minutes. The relatively clear supernatant were divided into aliquots and frozen at  $-40^{\circ}\text{C}$  till the assay time.

Total protein was determined according to Bradford, 1976, then Protein electrophoresis methods and procedures were taken from the book Gel electrophoresis of proteins ( Hames, 1990). Resolving Gel (8%) solution were prepared for Native Poly acrylamide gel electrophoresis (PAGE) by mixing 14.4 ml distilled water, 8.1 ml of Acrylamide/Bis (30% T, 2.67% C) stock solution, and 7.5 ml Tris (1.5M, pH8.8). The total volume of the solution was 30 ml. To this solution 150 $\mu\text{l}$  of 10% APS, freshly prepared, and 30  $\mu\text{l}$  of TEMED were added prior to pouring into the gel plate assembly. Then proper comb was inserted into the assembly to form wells in which samples were loaded. Electric current of 50 mA was applied on Serum protein samples under cooling conditions at  $4^{\circ}\text{C}$  for about 4 hours. At the end of the run, electrical current was stopped and the gels were stained overnight then photographed after destaining.

Native protein gel was stained for catalase pattern depending on Gregory and Fridovich, (1974); Siciliano and Shaw, (1976) and Baker and Manwell, (1977). Peroxidase pattern was determined as Native protein gel then it was stained for using certain stain prepared according to Siciliano and Shaw, (1976) ; Misra and Fridovich, (1977) ; Shimoni, M. (1994) and Rescigno et al., (1997).

### Data analysis

Gel plate was photographed, scanned and then analyzed using a gel pro Analyzer (Version 3.1 Media Cybernetics USA) for the analysis of tested samples. This program is a comprehensive computer software application designed to determine the relative fragmentation, the molecular weights and the amounts of protein as well as scanned graphical presentation of the fractionated bands of each lane.

The similarity index (S.I.) compares patterns within, as well as, between Control, hepatitis C and leukemia samples using the formula:  $S.I. = (2 Nab/Na + Nb) / (Nei and Li, 1979)$ . Where, Na and Nb are the

number of bands in individuals a and b and Nab is the number of shared bands between a and b. The similarity values were converted into genetic distance (D) using the formula:  $D = 1 - S$ .

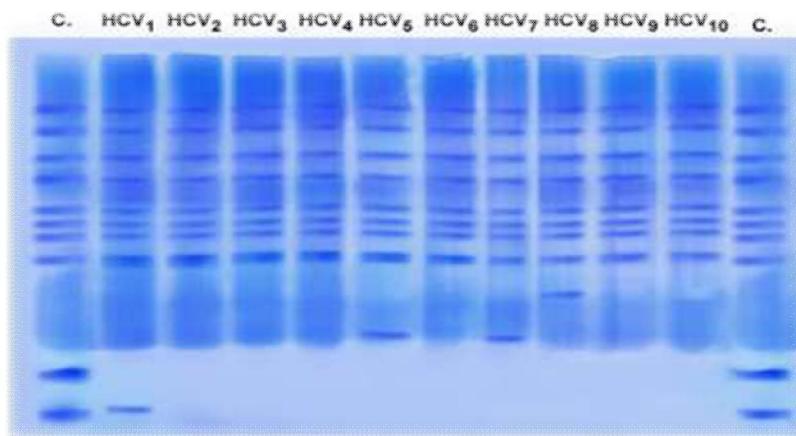

### 3. Results

I-Protein electrophoresis of control and hepatitis C liver disease:

The protein pattern in sera of the control and HCV patients was revealed in table (1) and graphically illustrated in Fig. (1). protein fractionation of the control samples produced 13 bands with Rf ranged between 0.17 and 0.96 and (amount, 3.14 - 7.24). Comparing hepatitis C with control one out of these 13 bands are completely disappeared at row r18 with Rf 0.86 (amount 6.39) while bands in row r19 were disappeared in all HCV sera samples except first one; appeared with low amount (4.63) when compared with control at Rf 0.95. A documentation of protein in HCV sera showed that ten bands appeared to be common bands

at rows r1, r3, r5, r6, r7, r8, r10, r11, r12, r13 and r17 in all HCV samples except HCV7 9 common bands were produced while the band number ten was disappeared at r8. The data showed that 5 characteristic bands were produced., HCV4 at r4 with Rf 0.26 (amount 3.39), HCV9 at r15 with Rf 0.68 (amount 4.24), HCV 10 at r2 and r14 at Rf 0.19 and 0.64 with amount 7.7 and 3.01 respectively, the five one appeared in r16 with Rf 0.7 and amount range (6.1 - 12.7) in all HCV sera samples except the first sample

The similarity indices between the control samples & hepatitis C samples (Table: 2) showed high value, S.I range (0.81- 0.96). from the other side, by comparing the infected sera samples with each other, the similarity index again recorded high values (range: 0.85-1).

**Fig. (1):** The protein pattern detected in sera of control and different HCV patients.

**Table (1):** protein pattern in human sera of Control and HCV samples

Lanes	Control Lane 1		HCV <sub>1</sub> Lane 2		HCV <sub>2</sub> Lane3		HCV <sub>3</sub> Lane4		HCV <sub>4</sub> Lane 5

## II. Protein electrophoresis of control and leukemia

Protein pattern in sera of the control and leukemia patients was revealed in table (3) and graphically illustrated in Fig. (2). Protein fractionation of the control samples produced 12 bands with Rf ranged between 0.08 and 0.73 and (amount, 3.46 - 15.2). Comparing leukemia samples

with control only two of these 12 bands were considered as common bands these bands completely appeared in all sera samples. On the other side one band was completely disappeared in all leukemia samples at row r3 with Rf 0.14 (amount, 8.59). The rest nine bands distributed between different leukemia samples. 15 bands produced as characteristic bands ; two characteristic bands were

produced at row r4 with Rf 0.18 (amount, 8.2 and 7.27) for samples number five and seven respectively, at row r7 only one was detected in the four sample of leukemia with Rf 0.25 (amount, 7.42), the same occurred at row r11 one band was determined with Rf 0.45 (amount, 10.1) for sample number 6, another two were appeared at row r12 with Rf 0.5 (amount, 8.74 and 8.3 ) in samples number five and seven respectively, while in the row r16 five characteristic bands were documented at Rf 0.7 (amount range: 5.2 and 7.82) for sera samples for patients number one, two, five, seven and nine. The rest four bands were fractionated at row r17 with Rf

0.78 and the bands mostly had the same amount (amount range: 5.71 And 6.27) in the first four samples.

The similarity indices between the control & acute lymphoblastic leukemia samples showed low value, S.I range (0.47-0.82) the data indicating to the severe effect of leukemia on the protein fractions (Table:4). From the other side, by comparing the infected sera samples of leukemic patients with each other, the similarity index again recorded (range: 0.33-0.95).

#### Catalase electrophoresis:

Catalase pattern of control serum, hepatitis C and leukemia were shown in Table (5) and Figures (3) Electrophoresis pattern for catalase mentioned that six bands were produced in control samples with Rf range (0.05, 0.58), (amount range: 6.88-25.2). When hepatitis C compared with the control showed that two out these six bands were completely disappeared in r3 and r6 and other all HCV four bands considered as common bands. The amount of catalase enzyme completely decreased in all bands with the respect of control ones.

In leukemia five common bands were produced at rows r1, r2, r3, r6 and r7 with the appearance of one characteristic band at r5 with Rf 0.33 (amount, 10.7), from the other side one band was disappeared completely at r4 when compared with control. Similar to hepatitis C all bands of acute lymphoblastic leukemia was decreased in its amount.

The similarity indices between the control samples & hepatitis C samples showed high value (SI=0.8) and control samples with leukemia showed the highest value (SI=0.83) indicating that low obvious effect of hepatitis C virus & leukemia in the catalase activity of human body.

### Peroxidase pattern

The peroxidase pattern of the serum isolated from control, hepatitis C and leukemia were shown in Table (7) and in Fig. (4). A documentation of peroxidase pattern data showed that the peroxidase fractionation in control appeared as three bands with Rf 0.1, 0.25 & 0.33 with amount (10.5, 12.8 & 11.1). When hepatitis C compared with the control, it was observed that two common bands were appeared at Rows (r<sub>2</sub>, & r<sub>5</sub>), with Rf 0.1 and 0.33 (amount, 4.37 and 6.2) respectively the amount of these two bands were decreased when the amount compared with control in the same rows.

When leukemia samples compared with the control, data showed there is only one common band was produced at r<sub>7</sub> with Rf 0.33 (amount 13.9), with appearance of a three characteristic bands in the rows r<sub>1</sub> at Rf 0.07 (amount, 8.06), r<sub>3</sub> at Rf 0.13 (amount 9.98) and r<sub>4</sub> at Rf 0.22 (amount, 12.4). On the other hand, the amount of the leukemia common band was higher than that of control.

The similarity index between the control, hepatitis C and leukemia recorded in the table (8). By comparing hepatitis C with control, the similarity index recorded values (SI=0.57). Also, comparing between the control and leukemia the similarity index recorded

values (SI=0.3).indicating the effect of hepatitis C virus & leukemia on the peroxidase fractions and failure in overcomes effect of this diseases.

### 3. Result

The proteome is the total complement of proteins expressed within a cell, a tissue or an organism. Proteins rather than genes or mRNAs represent the key players in the cell. Proteomics is the study of proteins, including their expression level, post-translational modification and interaction with other proteins, on a large scale. Expression levels of proteins determine the cellular phenotype and its plasticity in response to external signals. Since not all proteins are expressed at all times, but are dependent on physiological and environmental factors, proteomics can provide an excellent global view of disease processes at the protein level (Hütter et al., 2009 and Oie 2009).

#### I. Protein electrophoresis of control, HCV and leukemia patients

Data in the present study indicated that the specific protein bands of Hepatitis C and leukemia samples differed (through disappearance in some protein bands or appearance of new ones) after comparing with the control (there was a great difference in the effect of the leukemic disease among patients' sera samples themselves. While in HCV the data indicating that the viral infection had low mutagenic effect on the protein pattern and mostly no-significant differences appeared of the different

samples among themselves. The disappearance in certain protein bands of Hepatitis C & leukemia sera may be attributed to the effects of oxidative stress (translational modification and interaction with other proteins) which inhibit the synthesis and expression process of these deleted proteins (qualitative effect). In addition, even the bands remained it usually differs in the amount of protein and this may be explained as translational modification could not inhibit the synthesis of this protein type, but it may be affected only on the quantitative level. Protein is an essential nutrient made up of building-block chemicals called amino acids. Protein provides energy and is needed for the body to make new cells, to maintain and rebuild muscles, to carry other nutrients, to act as messengers in the body, and to support the immune system. Low levels may be seen in severe malnutrition and with conditions that cause malabsorption. Changes in total protein levels may be seen with chronic inflammation or infections such as viral hepatitis. They may be caused by bone marrow disorders such as different types of leukemia and multiple myeloma (Dhinaa, and Palanisamy, 2010).

Choi and James, 2006 reported that oxidative stress has emerged as a key player in the development and the progression of many pathological conditions,

including HCV-induced pathogenesis of liver. Oltra et al., 2001 and Al-Gayyar et al., 2007 mentioned that there was a relationship between leukemia and oxidative stress. Leukemic cells produce higher amounts oxidative stress (ROS) than non-leukemic cells.

Hawkins et al., 2009 and Rahmanto et al., 2010 described protein to be a major quantitative target for oxidative stress as a result of their abundance in cells (proteins compose ca. 70% of the dry mass of cells), plasma, and most tissues and their rapid rates of reaction with many oxidants.

Omar et al., 1995 founded that serum protein electrophoresis showed a significant decrease in albumin and increase in alpha-1, beta and gamma globulin levels in HCV infected group as compared to seronegative and anti-HCV positive groups, a finding that may reflect an increased burden on the liver. The significant increase in gamma globulins in the anti-HCV positive as well as the combined anti-HCV and HBsAg positive rous may be due to the increase in one or more of the immunoglobulins, necessitating immunoglobulin typing, an observation being currently investigated.

According to Battisti et al, 2008 Protein oxidation, determined by protein carbonyl content in serum of ALL patients observed that there was a significant difference between the patients and the controls. The protein carbonyl content was increased in the just diagnosed patients, when compared to the controls. These in the serum of patients with chronic leukemia and acute lymphoblastic leukemia and of bone marrow transplant recipients.

In acute lymphoblastic leukemia (ALL) show elevated levels of oxidatively modified DNA lesions. Supportive of the finding those oxidative events are largely responsible for spontaneous mutagenesis, and strongly implicating such damage in the etiology of cancer. Oxidative mechanisms have been shown to have a potential role in a cell becomes malignant by DNA mutation, activation of proto-oncogenes and inactivation or loss of tumor suppressor genes (Evans et al., 2004 and Kong et al., 2009).

## **II. Isozymes electrophoretic pattern of control, HCV and leukemia.**

### **II.I Catalases group**

Catalase is an enzyme present in the cells of plants, animals and aerobic (oxygen requiring) bacteria. Catalase is located in a cell organelle called the peroxisome. The enzyme very efficiently promotes the conversion of hydrogen peroxide to water and molecular oxygen. Catalase has one of the highest turnover rates for all enzymes: one molecule of catalase can convert 6 million molecules of hydrogen peroxide to water and oxygen each minute. The

significantly decreased capacity of a variety of tumours for detoxifying hydrogen peroxide is linked to a decreased level of catalase (Valko, et al., 2006).

Data in present study indicating that two bands were completely disappeared while, the amount of the enzyme completely decreased in all bands. In leukemia five common bands were produced with the appearance of one characteristic band, on the other hand one band was completely disappeared. In leukemia sera catalase amount appeared to be low when compared with control. Inhibition the synthesis and expression process of these deleted bands may refer to qualitative change. In addition, differs in the amount of the enzymes may be explained as translational modification could not inhibit the synthesis of this catalase type, but it may be affected only on the quantitative level.

There was a possible link between decreased catalase activity and increased levels of cellular alterations. The oxidative damage supported the idea that there was a persistence of oxidative stress in acute lymphoblastic leukemia (Battisti et al., 2008). Patients with chronic HCV infection are under the influence of oxidative stress associated with lower levels of antioxidant enzymes. Ebeid and El-Bakry., 2009 mentioned that the level of catalase was decreased in group of children with chronic hepatitis C, in comparison to the healthy children.

CAT activity in total blood of ALL patients just diagnosed was reduced when compared to controls. Battisti, et al 2008 suggested that oxidative damage accumulates in biological molecules during aging and that oxidative stress is relevant to the aging process. However, the antioxidant capacity of tissues decreases during aging. This phenomenon indicates a disturbance of the protective role of these enzymes against free radicals in ALL. These findings are in accordance with earlier studies of Oltra et al., 2001 confirmed decreased CAT activities in the lymphocytes of lymphocytic leukemia patients. The results are also in agreement with the reports of Sentürker et al., 1997, who demonstrated reduced CAT activities in the lymphocytes of ALL patients, and Madej et al. 1988 who found a decreased activity of these enzymes during the development of the leukemic process in mice.

### **ii.iii. Peroxidase group**

Glutathione peroxidase (GSH-Px) enzymes are the most important hydrogen peroxide ( $H_2O_2$ )-removing enzymes in mammalian cells ( Nagwa, et al., 2010). Valko et al., 2006 reviewed that GSH-Px acts in conjunction with the tripeptide glutathione (GSH), which is present in cells in high (micromolar) concentrations. The substrate for the catalytic reaction

of GSH-Px is H<sub>2</sub>O<sub>2</sub>, or organic peroxide ROOH. GSH-Px decomposes peroxides to water (or alcohol).

Data in present study indicating that oxidative stress seemed to have effect on peroxidase enzyme activity. This effect appeared on HCV and leukemia samples when compared with control. The data show disappearance in some bands in HCV samples and even the bands remained it usually differs in the amount and this may be explained as oxidative stress may be inhibit or decreases preoxidase enzyme activity. On the other hand appearance of some bands of peroxidase enzymes in leukemia samples when compared with control. The data may explain as the role of peroxidase enzymes in the protection of cell from oxidative damage.

In hepatitis C virus GSHPx depleted when compared to the control. The viral activity is enhanced by redox imbalance and peroxidation with virus expression in chronically infected cells. The increase in peroxidation appears to contribute to disease progression with reduction of antioxidant activity that favors further viral replication and potentiates carcinogenesis (Stehbens., 2004). The author founded that Antioxidants suppress viral infections. Therefore, large doses of primary antioxidants should be the initial therapy to restore and thereafter to maintain serum and tissue concentrations at high normal values. Optimal plasma and tissue levels of all antioxidants require review, because when under severe stress, are too low to prevent pathological cellular changes.

Levent, et al., 2006 reviewed that the reduction in the amount of superoxide dismutases (SOD), and GSH-Px reflects both a decrease in the synthesize capacity of liver, and the antioxidant defense power of the patients. It can be argued that increased lipid peroxidation is caused by the inflammation related to viral infection and decreased the antioxidant levels may be an early marker of the oxidative stress. Lipid peroxides formed can be chemotactic for the neutrophils causing increased inflammation, which further drives oxidant-mediated injury in the liver.

GSH-Px activities were significantly increased in ALL when compared to the controls. Devi et al., 2000 reported that antioxidant enzyme activities showed significant increased red cell GSH-PX activity in leukemia patients. These scavenging enzymes play an important role in the protection of cell from oxidative damage. The authors mentioned that GSH-Px is known to detoxify lipid peroxides and thereby inhibit lipid peroxidation, thus although the generation of superoxide anion was increased the observed normal malonaldehyde (MDA) levels in patients could be due to the increased protective response of antioxidant enzymes. Alternatively, increased GSH-PX activity could also maintain normal MDA levels through

utilization of lipid peroxide as substrates and produce alcohols as by products.

## Conclusions

Proteins and enzymes were involved in cell proliferation, invasion, angiogenesis, metastasis, inflammation, synthesis, energy and metabolism. We recommended using common and characteristic bands as an investigation diagnostic biomarker as these bands reflects the physiological and pathological state where many proteins and enzymes in the resistant cell lines were found to have increased or decreased abundances, reflecting changes in both gene expression/regulation and protein degradation for identifying more selective targets for therapeutic intervention. Also more studies in different etiologies and a larger number of subjects should be considered.

## Serum resistin levels and haemostatic changes in experimentally induced diabetic and high fat fed rats

Mohammad I. Hoseen, Mai M .Hassan, Dalia I. Abd-Alaleem and Eman M. Faragallah.

Department of physiology, Faculty of medicine, Zagazig University.

**Abstract:** Adipose tissue is considered as an active endocrine gland that affects many aspects of body homeostasis. Adipose tissue derived molecules “adipokines” regulate energy homeostasis, dietary behavior, as well as insulin sensitivity and immunity; it refers to leptin, adiponectin, resistin, apelin, visfatin and omentin.

Resistin is a cysteine-rich adipokine that is released by adipocytes and macrophages and has been involved in the development of insulin resistance in rodents. Moreover a strong link between diabetes, hypercoagulability and thrombogenesis, had been recognized for decades.

Aim: In a trial to identify any possible relationship between resistin levels and some haemostatic changes in streptozotocin-induced diabetic and high fat diet-fed rats (HFD); the present work had been carried out.

Design: A total number of 40 adult male albino rats were divided into 2 main groups: Group I (n= 24): To study the effect of streptozotocin-induced type 1 diabetes and was further divided into 3 equal subgroups (n= 8 in each) and survived for 30 days: Ia: (control group), Ib: (experimental diabetic non-treated group (by a single i.p. injection of streptozotocin (65mg/Kg B.W), Ic (experimental diabetic group treated with insulin).

Group II (n= 16) : To study the effect of high fat diet and was further divided into 2 equal subgroups (n= 8 in each) and survived for 7 weeks: IIa: (control group), IIb (high fat diet fed (58% fat).

In all groups, serum levels of glucose, insulin, resistin, total cholesterol(TC), triglycerides (TG), HDL, LDL, BT, WBCT, PT, aPTT, plasma fibrinogen level, plasma D-dimmers level and platelet count were measured.

Results: The results of this study showed a significant decrease in serum resistin levels ( $p<0.001$ ) in streptozotocin-induced diabetic group in comparison with its control group and insulin-treated group. Moreover, no significant correlation could be detected between resistin levels and any of measured parameters in these groups except the significant positive correlation with body weight at the end of experimental period.

In addition, our study revealed a significant increase in serum resistin levels ( $p<0.001$ ) in HFD-fed group in comparison with its controls, which was correlated positively and significantly with body weight, serum glucose levels, insulin levels and HOMA-IR index ( $p<0.001$ ), atherogenic lipid profile and markers of hyper-coagulability (except for platelet count)

Conclusion: No role for resistin in metabolic and haemostatic changes in type 1 diabetic rats was detected. Although, hyperresistinemia may represent a link between metabolic signals, atherosclerosis, and hypercoagulability in type 2 diabetic rats. However, further studies are needed to clarify this relationship in human cardiovascular diseases. [Journal of American Science. 2010;6(11):217-227]. (ISSN: 1545-1003).

### 1. Introduction

Obesity is associated with an array of health problems in adult and pediatric population. Understanding the pathogenesis of obesity and its metabolic sequelae has advanced rapidly over the past decades (American Diabetes Association, 2007).

Adipose tissue represents an active endocrine organ that, in addition to regulating fat mass and nutrient homeostasis, releases a large number of bioactive mediators (adipokines) that signal to organs of metabolic importance including brain, liver, skeletal muscle, and immune system, thereby modulating haemostasis, blood pressure, lipid and glucose metabolism, inflammation, and atherosclerosis (Rabe et al., 2008).

In (2001), Steppan et al. discovered a novel adipocyte-derived hormone called resistin, which was expressed exclusively in white adipose tissue as a member of a family of cysteine-rich proteins called resistin-like molecules.

Intra-peritoneally administered resistin augments blood glucose and plasma insulin levels and limits the hypoglycemic response to insulin infusion, furthermore, resistin suppresses insulin-stimulated glucose uptake in cultured adipocytes, and this effect is prevented by exposure to anti-resistin antibodies (steppan et al., 2001).

Hence, these data suggest that resistin could contribute to the insulin resistance observed in

obesity by decreasing insulin sensitivity (Rajala et al., 2003, Muse et al., 2007).

In fact, obese subjects show a reduced insulin-stimulated skeletal muscle glucose uptake as well as an impaired insulin-evoked vasodilatation (Baron, 1994) and these observations have suggested that the pathophysiological mechanisms linking obesity to the development of cardiovascular diseases could go beyond the classical metabolic derangements, so, much effort has been made to understand the interaction between insulin resistance and vascular function, with particular emphasis on adipocyte-derived hormones and their effects on vascular homeostasis (verma et al., 2003).

Resistin has been shown to selectively impair the effect of insulin on endothelial nitric oxide synthase (eNOS) enzymatic activity and through this mechanism resistin can reduce insulin-evoked vasorelaxation (Gentile et al., 2008). Moreover, in high fat-fed rats, resistin levels correlate negatively with vascular nitric oxide (NO) levels even after correction of insulin measurements, which suggests a direct inhibitory role of resistin on NO secretion (Li et al., 2007).

Also, plasma resistin levels were reported to be associated with many inflammatory markers including C-reactive protein, tumor necrosis factor-alpha (TNF- $\alpha$ ) and interleukin-6 (IL-6) (Silswal et al., 2005, Stofkova, 2010). Considering the crosstalk between inflammatory pathways and the insulin signaling cascade, resistin may represent a link between metabolic signals, inflammation and atherosclerosis (Lehrke et al., 2004, Daniel et al., 2010).

In general, diabetes is associated with an excessive risk of cardiovascular events (Williams et al., 2002), in that the coagulation system is switched towards a pro-thrombotic state involving, increased blood coagulation, decreased endothelial thrombo-resistance and pro-inflammatory state (Palomo et al., 2006), thereby increasing the risk of micro-vascular disease as well as macro-vascular diseases (Lender and Sysko, 2007).

So, this study was designed in a trial to clarify any possible relationship between resistin levels and some haemostatic changes in streptozotocin-induced diabetic rats and high fat diet-fed rats.

## **2. Material and Methods**

This study was conducted on 40 healthy, adult, male albino rats weighing 200–260 gm (animals were obtained from faculty of medicine animal house and the animal experiments were approved by the local ethics committee). The rats had free access to water and chow and are kept at room temperature. All rats received standard chow (25.8 % protein, 62.8 %

carbohydrate and 11.4 % fat (Ahren and Scheurink, 1998) except the rats in high fat-fed group, which received high-fat chow (16.4% protein, 25.6% carbohydrate, and 58.0% fat (a total 23.4 kJ/g) in the form of cotton seed oil added to the laboratory chow diet (Cha et al., 2000), (Diets were obtained from faculty of agriculture, Zagazig university).

The animals were divided into 2 main groups:

Group I: To study the effect of streptozotocin-induced type 1 diabetes on the measured parameters. This group was further divided into 3 equal subgroups and survived for 30 days:

Group Ia: "Control group (n=8)". Each rat was intra-peritoneally (i.p.) injected with 0.2 mmol/L Na citrate (0.1 mL).

Group Ib: "Experimental diabetic non-treated group (n=8)". Diabetes was induced by single intra-peritoneal injection of freshly prepared solution of streptozotocin (sigma) 65 mg/kg of body weight dissolved in 0.2 mmol/L sodium citrate, at PH 4.5 (Lutz and Pardridge, 1993) and maintained for 30 days (Toba et al., 2009).

Three days later, diabetes induction was confirmed through measurement of blood glucose level in each animal (from blood sampled from the tail vein) with the One Touch Ultra Glucometer (Yves and Theo, 2007) and rats with blood glucose levels more than 250 mg/dl were selected for experiments (Coskun et al., 2004). The rats were provided with 10% glucose solution after 6 hours of streptozotocin administration for the next 48 hours.

Group Ic: "Experimental diabetic group treated with insulin (n=8)". These animals were treated with regular (R) and NPH (N) insulin (2UR at diagnosis of diabetes and then 1R/3N at 6 P.M and 1R/1N at 9 A.M daily subcutaneously for 30 days after induction of diabetes (Sivitz et al., 1998).

Group II: To study the effect of high fat diet (HFD) on the measured parameters. This group was further divided into 2 equal subgroups:

Group IIa: "control group (n=8)", which was fed a standard chow for 7 weeks.

Group IIb: "High fat diet fed group (n=8)". These rats were fed a high-fat chow for 7 weeks.

For all groups, body weight was recorded per week, and at the end of the study period.

Haemostatic measurements:

-Determination of bleeding time (BT) according to Martin, (1981).

-Determination of whole blood clotting time (WBCT) according to Quick, (1966).

-Determination of prothrombin time (PT) according to Ansell, (1992).

-Determination of activated partial thromboplastin time (aPTT) according to Ansell, (1992).

-Estimation of plasma fibrinogen levels according to Cooper and Douglas, (1991).

-Estimation of plasma D-dimmers levels according to Declerck et al. (1987).

#### Biochemical and Hormonal measurements:

- Estimation of serum glucose levels according to Trinder, (1969).

- Estimation of serum insulin levels according to Reaven, (1991).

-Estimation of serum resistin levels: by enzyme-linked immunoassay kits from Linco Research Inc., (USA) according to Steppan and Lazar, (2004).

-Estimation of serum total cholesterol (TC) levels according to and Allain et al. (1974).

--Estimation of serum triglycerides (TG) levels according to Naito, (1989).

-Estimation of serum high density lipoproteins (HDL) levels according to Warnick et al. (1983)

#### Calculations:

The homeostasis model of assessment of insulin resistance (HOMA-IR) = fasting blood glucose (mmol/l) x fasting insulin (uIU/ml)/22.5 was calculated as an index of insulin resistance (Matthews et al., 1985) in group II.

#### Statistical analysis:

Data were presented as mean  $\pm$  SD. Statistical significance was determined by unpaired Student's "t" test, P values less than 0.05 were considered to be significant. The correlations between parameters were analyzed using Pearson,s correlation.

In statistical analysis, SPSS version 10.0 programs for Windows (SPSS Inc. Chicago, IL, USA) was used.

**Figure (1):** Correlation between serum resistin levels and HOMA IR index in group IIb.**Figure (2):** Correlation between serum resistin levels and serum levels of LDL in group IIb.

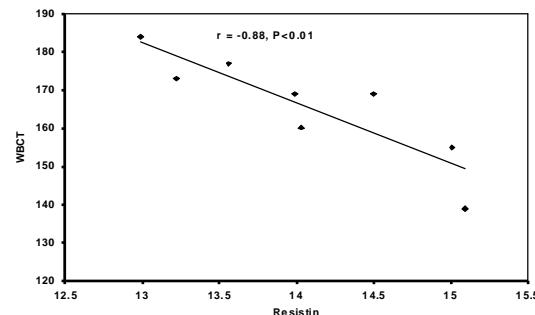

**Figure (3):** Correlation between serum resistin levels and bleeding time in group IIb.

The metabolic, hormonal and the haemostatic parameters of the groups are summarized in table 1&2, respectively. There was a significant positive correlation between the final body weight and serum resistin levels in all groups ( $p<0.05$ ,  $p<0.01$ ,  $p<0.05$ ,  $p<0.01$ ,  $p<0.001$ , respectively).

As regards group I, the results of this study showed a significant decrease in serum insulin and resistin ( $p<0.001$ ) levels in group Ib in comparison with that of control group (Ia) in association with increased blood glucose levels ( $p<0.001$ ). In addition, there was a significant increase ( $p<0.001$ ) in the serum levels of TC, TG and LDL while the serum levels of HDL were significantly decreased ( $p<0.001$ ) in the same group. Concerning the haemostatic parameters in group Ib, there was a significant decrease ( $p<0.001$ ) in BT, WBCT, PT, aPTT while plasma fibrinogen levels, D-dimmers and platelets count were significantly increased ( $p<0.001$ ). Moreover, all these metabolic and haemostatic disturbances were normalized in insulin treated group.

Finally, no significant correlation could be detected between serum resistin levels and metabolic, hormonal or haemostatic measured parameters in this group.

As regards group II, group IIb showed a significant increase ( $p<0.001$ ) in body weight, serum glucose levels, insulin levels, HOMA-IR, TC levels, TG levels, and LDL levels, in addition to the significant decrease ( $p<0.001$ ) in HDL levels in comparison with that of controls (IIa). Moreover, our study revealed a significant increase ( $p<0.001$ ) in serum resistin levels in this group in comparison with that of controls, which was correlated positively and significantly ( $p<0.001$ ) with body weight, serum glucose levels, insulin levels and HOMA-IR. Also, a significant positive correlation was found between serum resistin levels and serum levels of TC ( $p<0.05$ ), TG ( $p<0.01$ ) and LDL ( $p<0.01$ ) while a

**Figure (4):** Correlation between serum resistin levels and WBCT time in group IIb.

significant negative correlation ( $p<0.05$ ) between its levels and serum levels of HDL was reported.

Moreover, BT, WBCT, PT and aPTT were found to be significantly decreased ( $p<0.001$ ), while, plasma fibrinogen and D-dimmers levels were found to be significantly increased ( $p<0.001$ ). However, no significant difference in the platelets count was found. Furthermore, serum resistin levels were found to be correlated negatively and significantly with BT ( $p<0.001$ ), WBCT ( $p<0.01$ ), PT ( $p<0.05$ ), aPTT ( $p<0.01$ ) and positively with plasma fibrinogen ( $p<0.01$ ) and D-dimmers ( $p<0.05$ ) levels.

#### 4. Discussions

The results of this study showed a significant decrease in serum insulin and resistin levels in streptozotocin-induced diabetic group in comparison with that of control group and insulin-treated group, in association with increased blood glucose levels. This decrease in serum resistin levels could be attributed to the weight loss that occurs in type1 diabetes, as resistin levels were positively and significantly correlated with the body weight in this study, which is in agreement with that of Stroubini et al. (2009).

In addition, our results indicated that there was a significant increase in the serum levels of total cholesterol, triglycerides and LDL while the serum levels of HDL were significantly decreased in streptozotocin-induced type 1 diabetes which is defined as an atherogenic lipid profile (Vergè, 2009).

Concerning the haemostatic parameters in group Ib, there was a significant decrease in BT, WBCT, PT, aPTT while D-dimmers, platelets count and plasma fibrinogen levels were significantly increased, denoting a hyper-coagulable state (Khatun et al., 1999). Moreover, all these metabolic (Sivitz et al., 1998) and haemostatic (Sobel, 2003, Nishikawa et al., 2008) disturbances were normalized in insulin treated group.

In addition, no significant correlation could be detected between serum resistin levels and either metabolic or haemostatic measured parameters in this group.

So, it can be concluded that resistin has no role in type 1 diabetes as regards haemostatic changes, however, these changes could be attributed to the presence of high levels of LDL particles, as these particles have atherogenic properties (Skryme-Jones et al., 2000). Also, lowered HDL may play a role as HDL has antioxidative, anti-inflammatory, anti-thrombotic and vasorelaxant properties, all of which are potentially anti-atherogenic (Link et al., 2007). Therefore, it can be concluded that this dyslipidemia is associated with an increased cardiovascular risk in type 1 diabetes (Vergè, 2009).

As regards group HFD group, it was found to show marked increase in body weight, insulin resistance and dyslipidemia in rats. These results are in accordance with those of Willett, (2002) and Schaal et al. (2009).

Moreover, our study revealed a significant increase in serum resistin levels in this group in comparison with that of controls, which correlate positively and significantly with body weight, serum glucose levels, insulin levels and HOMA-IR index, while no significant correlation could be found between its levels and those measured parameters in controls except a significant positive correlation with body weight.

These results are supported by that of Azuma et al. (2003) and Silha et al. (2003) who reported that the mean circulating resistin levels in obese subjects is increased about four folds compared with lean subjects and by Stroubini et al. (2009), who reported that resistin levels were elevated in many experimental models of obesity and decreased after weight loss.

Moreover, de Luis et al. (2009) demonstrated that resistin concentrations were related to the total fat mass in patients with metabolic syndrome.

Concerning resistin-insulin relationship, our results are supported by those who concluded that, administration of antiresistin antibody improved insulin action and glucose metabolism in mice with diet-induced obesity (Steppan et al., 2001). While, infusion of recombinant resistin to rats rapidly induces hepatic IR and increases hepatic glucose production (Rajala et al., 2003). Also, ablation of the resistin gene in mice decreases fasting glucose through reducing gluconeogenesis, while resistin administration in these resistin-deficient mice increases hepatic glucose production (Banerjee et al., 2004).

Resistin primarily exerts its glucoregulatory effect by stimulating hepatic glucose output (Rangwala et al., 2004). As elevation of circulating resistin in rodents, either acutely (Muse et al., 2007) or chronically (as following diet-induced obesity) (Muse et al., 2004), leads to marked decreases in hepatic insulin sensitivity.

Moreover, the findings of this study are in line with that of Kushiyama et al. (2005), who found that transgenic mice with hepatic resistin over-expression exhibit significant hyperglycemia, hyperlipidemia, fatty liver, and pancreatic islet enlargement, when fed an HFD. These effects may be due to resistin-induced impairment of glucose homeostasis and insulin action, thus modulating one or more steps in the insulin signaling pathway and possibly playing a role in the pathogenesis of insulin resistance (Muse et al., 2004).

The majority of in vivo studies showed that resistin has a negative effect on insulin signaling in the liver (Qi et al., 2006).

In contrast with our results, no significant correlation was found between resistin levels and glucose levels in high fat-fed rats (Li et al., 2007), and also in patients with type 2 diabetes mellitus (T2DM) (Mojiminiyi and Abdella, 2007). Also, some studies have observed significant low resistin mRNA levels in adipose tissue in different obese mouse models, such as db/db, or high-fat-diet-induced obesity, and in rat models characterized by IR (Way et al., 2001).

The mechanism whereby resistin decreases insulin sensitivity involves several impacts. First, resistin reduces adenosine 5'-monophosphate-activated protein kinase activity in skeletal muscle, adipose tissue, and liver. In addition, insulin receptor substrate-1 (IRS-1) and IRS-2 protein levels and phosphorylation states, as well as protein kinase B activity, were decreased in hyperresistinemic animal tissues. These alterations decrease tissue insulin sensitivity that results in glucose intolerance, hyperinsulinemia, elevated free fatty acid (FFA) levels, and hypertriglyceridemia (Rajala et al., 2003).

Secondly, the resistin-induced reduction in IRS-1 and IRS-2 elevates mRNA levels of gluconeogenetic enzymes, such as glucose-6-phosphatase (G-6-Pase) and phosphoenolpyruvate carboxykinase, thus suggesting a direct resistin induction of insulin resistance in the liver (Moon et al., 2003).

Thirdly, it was found that resistin decreased glycogen synthase (GS) activity both in the presence or absence of insulin, this suggests that resistin directly down-regulates GS activity (Ferrer et al., 2003).

Insulin signaling in pancreatic islets plays an important role in the maintenance of -cell functions and glucose-induced insulin secretion in islets of pancreas (Otani et al., 2004). Therefore, the inhibition of insulin signaling could underlie the impairment of glucose-induced insulin secretion by resistin (Nakata et al., 2007).

Moreover, it was observed that there is a positive correlation between resistin levels and C-reactive protein (CRP) (Kunnari et al., 2006). Accordingly, the correlation between fasting glucose and resistin levels might be explained by this inflammatory state (Bo et al., 2005).

As regards the lipid profile in the high fat diet-fed group, our results revealed a significant increase in serum levels of total cholesterol, triglycerides and LDL, while serum levels of HDL were significantly decreased (atherogenic lipid profile). Also, a significant positive correlation was found between serum resistin levels and serum levels of total cholesterol, triglycerides and LDL while a significant negative correlation between its levels and serum levels of HDL was reported.

These results are supported by those of Mojiminiyi and Abdella (2007), who concluded that resistin was correlated positively and significantly with atherogenic lipid profile in type 2 diabetic patients, and in patients with metabolic syndrome (de Luis et al., 2009).

On the contrary to our results, Qi et al. (2008), found no significant correlation between resistin levels and lipid profile parameters except a negative correlation with HDL levels only in patients with metabolic syndrome.

Moreover, it was reported that resistin directly increases the endothelial expression of adhesion molecules, vascular wall adhesion molecule-1 (VCAM-1) and intracellular adhesion molecule-1 (ICAM-1) that play central roles in the early stage of the atherogenic processes (Burnett et al., 2005), it also promotes lipid accumulation in human macrophages by up-regulating CD36 cell surface expression, which is one of the scavenger receptors in macrophages involved in the uptake of modified LDL (Xu et al., 2006). Based on these data, resistin is supposed to induce atherosclerosis by mediating endothelial hyperactivity in response to the systematic inflammatory condition in human (Tsukahara et al., 2009).

At the cellular level, resistin has also been shown to exert potent pro-inflammatory properties by up-regulating pro-inflammatory cytokines, probably via the nuclear factor- $\kappa$ B (NF- $\kappa$ B) pathway, and resistin can induce inflammation in animal models (Stofkova, 2010). Besides this inflammatory induction, resistin also promotes proliferation and

activation of human smooth muscle cells and endothelial cells, (Calabro et al., 2004) and induces angiogenic responses in endothelial cells, in part via phosphorylation and activation of different phosphate-kinase pathways (Mu et al., 2006).

Accordingly, it was reported that resistin may influence angiogenesis, not only in adipose tissue but also at other sites, so that systemic concentrations of resistin may contribute to the development of vascular disease (Robertson et al., 2009).

Hence, considering the expression of resistin by mononuclear cells and that obesity and T2DM are states of low-grade inflammation with activated inflammatory cascades, resistin may indeed present a molecular link between metabolic signals, inflammation and atherosclerosis (Kadoglou et al., 2007).

As insulin resistance is associated not only with hyperinsulinemia and hyperglycemia but also with other disorders such as abnormal lipid profile (Ding et al., 2005). These findings indicate a link between lipid profile and insulin sensitivity, since systemic excess of FFAs impairs the ability of insulin to stimulate glucose metabolism, contributing to whole-body insulin resistance (Schaalan et al., 2009).

In addition, several studies reported that resistin is implicated in the control of lipolysis (Rae et al., 2007). Also, in the humanized resistin mice, resistin was found to increase hormone sensitive lipase (HSL) activity by inducing white adipose tissue (WAT) inflammation and enhance the phosphorylation of HSL at its activating protein kinase-A (PKA) site (Qatanani et al., 2009).

Taken together, it could be postulated that the significant relationship between serum resistin levels and atherogenic lipid profile may be due to a direct effect in addition to induction of insulin resistance.

In relation to the haemostatic changes in the same group (group IIb), BT, WBCT, PT and aPTT were found to be significantly decreased, while, plasma fibrinogen and D-dimers levels were found to be significantly increased (indicating hypercoagulable state). However, no significant difference in the platelets count was found. Furthermore, serum resistin levels were found to be correlated negatively and significantly with BT, WBCT, PT and aPTT and positively with plasma fibrinogen and D-dimmers levels.

Our findings are in line with those of other investigators who concluded that, resistin is an emerging cardiovascular risk factor implicated in T2DM (Kershaw and Flier, 2004). Furthermore, the patients with myocardial infarction showed higher plasma resistin levels especially those with coronary

heart disease (CHD) when compared with the controls (Burnett et al., 2006).

Hyperfibrinogenaemia is associated with an increased prevalence and incidence of primary and recurrent CHD and thrombosis (Mc Dermott et al., 2003) and correlates with measures of obesity in several studies (Woodward et al., 1997).

Also, Menzaghi et al. (2006) reported a significant positive correlation between resistin levels and fibrinogen levels in insulin resistant patients.

Furthermore, it was found that, resistin has been shown to selectively impair the effect of insulin on endothelial nitric oxide synthetase (eNOS) enzymatic activity and indicate a mechanism through which resistin can reduce insulin-evoked vasorelaxation (Gentile et al., 2008).

Moreover, resistin induces serine protease (Akt)-dependent endothelial NO dysfunction through the inhibition of IRS-1 signaling pathway and IRS-1 itself is present in a lower amount in cells challenged with insulin and pretreated with resistin suggesting that resistin interferes with the insulin-stimulated IRS-1-dependent signaling pathway, acting both on the IRS-1 protein and on its ability to activate phosphatidyl inositol tri-phosphate kinase (PI3K) (Palanivel et al., 2006).

Moreover, in high fat diet-fed rats, resistin levels correlate negatively with vascular NO levels even after correction of insulin levels, which suggests a direct inhibitory role of resistin on NO secretion (Li et al., 2007). And since endothelial NO has a crucial role not only in modulating vascular tone but also in anti-atherogenic protection (Myazaki et al., 2003) by inhibiting inflammation, oxidation, vascular smooth muscle cell proliferation and migration, it can be speculated that endothelial NO dysfunction induced by resistin could also participate to the enhanced atherosclerotic process that occurs in obese subjects (Gentile et al., 2008).

In vitro studies of Takahashi et al. (2006), who described that resistin activates endothelial cell directly by promoting endothelin-1 (ET-1) release and expression of ET Jung et al. (2006). In addition, Li et al. (2007) reported a significant positive correlation between resistin levels and ET levels in high fat-fed rats.

Furthermore, Li et al. (2007) concluded that chronic administration of resistin in rats produced a significant increase in plasminogen activator inhibitor-1 (PAI-1) and Von Wellebrand factor (VWF). Moreover, they also reported that, diet-induced hyperresistinemia in rats correlated positively with levels of PAI-1 and VWF even after correction of insulin levels. In addition, Qi et al. (2008) reported that, resistin was correlated positively with PAI-1 levels in women with

metabolic syndrome. In fact, the increased levels of PAI-1 found in obesity may predispose to micro- and macro-vascular, arterial and venous thrombosis (Lundgren et al., 1996).

## 5. Conclusion:

No role for resistin in metabolic and haemostatic changes in type 1 diabetic rats was detected. Although, hyperresistinemia may represent a novel link between metabolic signals, atherosclerosis, and hypercoagulability in type 2 diabetic rats. However, further studies are needed to clarify this relationship in human cardiovascular diseases.

**Abstract:** The biodynamic response behaviors of seated human body subject to whole-body vibration have been widely investigated. The biodynamic response characteristics of seated human subjects have been extensively reported in terms of apparent mass and driving-point mechanical impedance while seat-to-head vibration transmissibility has been widely used to characterize response behavior of the seated subjects exposed to vibration. These functions (apparent mass, driving-point mechanical impedance) describe "to-the-body" force-motion relationship at the human-seat interface, while the transmissibility function describes "through-the-body" vibration transmission properties. The current study proposed a 4-DOF analytic biomechanical model of the human body in a sitting posture without backrest in vertical vibration direction to investigate the biodynamic responses of different masses and stiffness. Following the analytical approach, numerical technique developed in the present paper to facilitate and rapid the analysis. The numerical analysis used here applies one of the artificial intelligence technique to simulate and predict the response behaviors of seated human body for different masses and stiffness without the need to go through the analytic solution every time. The Artificial Neural Network (ANN) technique is introduced in the current study to predict the response behaviors for different masses and stiffness rather than those used in the analytic solution. The results of the numerical study showed that the ANN method with less effort was very efficiently capable of simulating and predicting the response behaviors of seated human body subject to whole-body vibration. [Journal of American Science. 2010;6(11):228-239]. (ISSN: 1545-1003).

**Keywords:** Biodynamic response, Analytic seated human body model, Numerical simulation model, Artificial Neural Network.

## 1. Introduction

The biodynamic responses of seated human occupant exposed to vibration have been widely characterized to define frequency-weightings for assessment of exposure, to identify human sensitivity and perception of vibration, and to develop seated body models [1]. The biodynamic response of the human body exposed to vibration have been invariably characterized through measurement of force motion relationship at the point of entry of vibration "To-the-body response function", expressed as the driving-point mechanical impedance (DPMI) or the apparent mass (APMS) and transmission of vibration to different body segments "Through-the-body response function", generally termed as seat-to-head transmissibility (STHT) for the seated occupant. Considering that the human body is a complex biological system, the "To-the-body" response function is conveniently characterized through non-invasive measurements at the driving point alone.

The vast majority of the reported studies on biodynamic response to whole-body vibration have considered vibration along the vertical axis alone. In many of the early studied, such as those conducted by

Coermann [2], Vogt [3], and Suggs [4], the numbers of subjects was usually relatively small, and only sinusoidal excitation was used, not generally representative of the type of excitation and levels of vibration usually encountered in practice. In many of these studies, the feet of the subjects were either not supported or supported but not vibrated, a condition not common in most driving situations. Fairley and Griffin [5], reported the vertical apparent mass of 60 seated subjects including men, women and children, which revealed a large scatter of data presumably owing to large variations in the subject masses. Boileau et al. [6] investigated the relationships between driving point mechanical impedance and seat-to-head transmissibility functions based upon 11 reported one dimensional lumped parameter models.

The majority of the models showed differences in frequencies corresponding to peak magnitudes of the two functions, which were expressed as resonant frequencies. Toward [7], summarized that a support of the back caused higher resonance frequency and slightly lower peak magnitude of the APMS response for subjects sitting on a horizontal plane. Wang et al. [8], study the

vertical apparent mass and seat-to-head transmissibility response characteristics of seated subjects are derived through measurements of total biodynamic force at the seat pan, and motions of the seat pan and head along the applied input acceleration direction, using 12 male subjects. The data were acquired under three different back support conditions and two different hands positions representative of drivers and passengers-like postures. Steina et al.[9], analyzed apparent mass measurements in the y- direction with a group of 13 male test subjects exposed to three excitation intensities.

In early studies, various biodynamic models have been developed to depict human motion from single-DOF to multi-DOF models. These models can be divided as distributed (finite element) models, lumped parameter models and multi-body models. The distributed model treats the spine as a layered structure of rigid elements, representing the vertebral bodies, and deformable elements representing the intervertebral discs by the finite element method. Multi-body human models are made of several rigid bodies interconnected by pin (two-dimensional) or ball and socket (three-dimensional) joints, and can be further separated into kinetic and kinematic models. It is clear that the lumped-parameter model is probably one of the most popular analytical methods in the study of biodynamic responses of seated human subjects, though it is limited to one-directional analysis. However, vertical vibration exposure of the driver is our main concern. Therefore, this paper carries out a thorough survey of literature on the lumped-parameter models for seated human subjects exposed to vertical vibration.

The lumped parameter models consider the human body as several rigid bodies and spring-dampers. This type of model is simple to analyze and easy to validate with experiments. However, the disadvantage is the limitation to one-directional analysis. Coermann [2], measured the driving-point impedance of the human body and suggested 1-DOF model. Suggs et al. [4], developed a 2-DOF human body. It was modeled as a damped spring-mass system to build a standardized vehicle seat testing procedure. A 3-DOF analytical model for a tractor seat suspension system is presented by Tewari et al. [10]. It was observed that the model could be employed as a tool in selection of optimal suspension parameters for any other type of vehicles. Boileau et al. [11] used an optimization procedure to establish a 4-DOF human model based on test data.

It is quite clear from the literature mentioned previously the amount of effort (experimentally or analytically) required to accurately investigate and understand the biodynamic response behaviors of

seated human body subject to whole-body vibration of different types and magnitudes. This fact urged the need for utilizing new technology and techniques to facilitate this comprehensive effort and at the same time preserving high accuracy.

Artificial intelligence has proven its capability in simulating and predicting the behavior of the different physical phenomena in most of the engineering fields. Artificial Neural Network (ANN) is one of the artificial intelligence techniques that have been incorporated in various scientific disciplines. Ramanitharan and Li [12] utilized ANN with back-propagation algorithm for modeling ocean curves that were presented by wave height and period. Abdeen [13] developed neural network model for predicting flow depths and average flow velocities along the channel reach when the geometrical properties of the channel cross sections were measured or vice versa. Allam [14] used the artificial intelligence technique to predict the effect of tunnel construction on nearby buildings which is the main factor in choosing the tunnel route. Allam, in her thesis, predicted the maximum and minimum differential settlement necessary precautionary measures. Azmathullah et al. [15] presented a study for estimating the scour characteristics downstream of a ski-jump bucket using Neural Networks (NN). Abdeen [16] presented a study for the development of ANN models to simulate flow behavior in open channel infested by submerged aquatic weeds. Mohamed [17] proposed an artificial neural network for the selection of optimal lateral load-resisting system for multi-story steel frames. Mohamed, in her master thesis, proposed the neural network to reduce the computing time consumed in the design iterations. Abdeen [18] utilized ANN technique for the development of various models to simulate the impacts of different submerged weeds' densities, different flow discharges, and different distributaries operation scheduling on the water surface profile in an experimental main open channel that supplies water to different distributaries.

## 2. Problem Description

To investigate the biodynamic response behaviors of seated human body subject to whole-body vibration (sinusoidal wave with amplitude  $5 \text{ m/s}^2$ ), analytical and numerical techniques will be presented in this study. The analytical model and its results will be described in detail in the following sections. The numerical models presented in this study utilized Artificial Neural Network technique (ANN) using the data and the results of the analytical model to understand the biodynamic response behaviors and then can predict the behaviors for

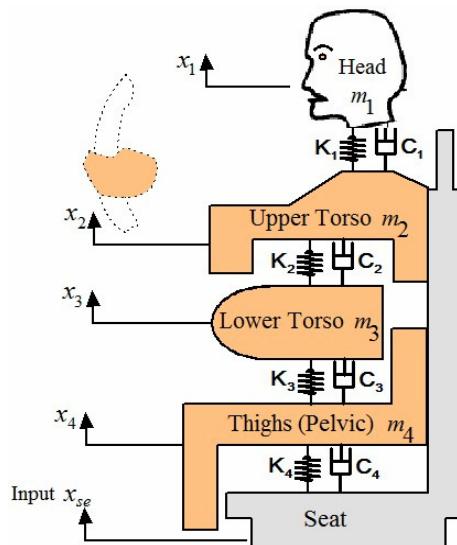

different data of the human body without the need to go through the analytical solution.

### 3. Analytical Model

#### 3.1 Biomechanical modeling

The human body in a sitting posture can be modeled as a mechanical system that is composed of several rigid bodies interconnected by springs and dampers. (Boileau and Rakheja [11]. This model as shown in Fig. 1 consists of four mass segments interconnected by four sets of springs and dampers. The four masses represent the following four body segments: the head and neck ( $m_1$ ), the chest and upper torso ( $m_2$ ), the lower torso ( $m_3$ ), and the thighs and pelvis in contact with the seat ( $m_4$ ). The mass due to lower legs and the feet is not included in this representation, assuming they have negligible contributions to the biodynamic response of the seated body. The stiffness and damping properties of thighs and pelvis are ( $k_4$ ) and ( $c_4$ ), the lower torso are ( $k_3$ ) and ( $c_3$ ), upper torsos are ( $k_2$ ) and ( $c_2$ ), and head are ( $k_1$ ) and ( $c_1$ ).

The equation of motion of the human body can be obtained as follows:

**Figure 1:** Biomechanical Boileau and Rakheja 4-DOF model.

$$\left\{ \begin{array}{l} m_1 \ddot{x}_1 = -c_1(\dot{x}_1 - \dot{x}_2) - k_1(x_1 - x_2), \\ m_2 \ddot{x}_2 = c_1(\dot{x}_1 - \dot{x}_2) + k_1(x_1 - x_2) \\ \quad - c_2(\dot{x}_2 - \dot{x}_3) - k_2(x_2 - x_3), \\ m_3 \ddot{x}_3 = c_2(\dot{x}_2 - \dot{x}_3) + k_2(x_2 - x_3) \\ \quad - c_3(\dot{x}_3 - \dot{x}_4) - k_3(x_3 - x_4), \\ m_4 \ddot{x}_4 = +c_3(\dot{x}_3 - \dot{x}_4) + k_3(x_3 - x_4) \\ \quad - c_4(\dot{x}_4 - \dot{x}_{se}) - k_4(x_4 - x_{se}). \end{array} \right. \quad (1)$$

The system equations of motion, equation (1), for the model can be expressed in matrix form as follows:

$$[\mathbf{M}]\{\ddot{\mathbf{x}}\} + [\mathbf{C}]\{\dot{\mathbf{x}}\} + [\mathbf{k}]\{\mathbf{x}\} = \{\mathbf{f}\} \quad (2)$$

Where  $[\mathbf{M}]$ ,  $[\mathbf{C}]$ , and  $[\mathbf{k}]$  are  $n \times n$  mass, damping, and stiffness matrices, respectively;  $\{\mathbf{f}\}$  is the force vector due to external excitation.

$$[\mathbf{M}] = \begin{bmatrix} m_1 & 0 & 0 & 0 \\ 0 & m_2 & 0 & 0 \\ 0 & 0 & m_3 & 0 \\ 0 & 0 & 0 & m_4 \end{bmatrix},$$

$$[\mathbf{C}] = \begin{bmatrix} c_1 & -c_1 & 0 & 0 \\ -c_1 & c_1 + c_2 & -c_2 & 0 \\ 0 & -c_2 & c_2 + c_3 & -c_3 \\ 0 & 0 & -c_3 & c_3 + c_4 \end{bmatrix},$$

$$[\mathbf{k}] = \begin{bmatrix} k_1 & -k_1 & 0 & 0 \\ -k_1 & k_1 + k_2 & -k_2 & 0 \\ 0 & -k_2 & k_2 + k_3 & -k_3 \\ 0 & 0 & -k_3 & k_3 + k_4 \end{bmatrix}.$$

And,

$$\{\mathbf{f}\} = \begin{Bmatrix} 0 \\ 0 \\ 0 \\ c_4 \dot{x}_{se} + k_4 x_{se} \end{Bmatrix}.$$

By taking the Fourier transformation of equation (2), the following matrix form of equation can be obtained:

$$\{X(j\omega)\} = [ [\mathbf{K}] - \omega^2 [\mathbf{M}] + j\omega [\mathbf{C}] ]^{-1} \{F(j\omega)\} \quad (3)$$

Where,  $\{X(j\omega)\}$  and  $\{F(j\omega)\}$  are the complex Fourier transformation vectors of

$\{x\}$  and  $\{f\}$ , respectively.  $\omega$  is the excitation frequency. Vector  $\{X(j\omega)\}$  contains complex displacement responses of n mass segments as a function of  $\omega$  ( $\{X_1(j\omega), X_2(j\omega), X_3(j\omega), \dots, X_n(j\omega)\}$ ).

$\{F(j\omega)\}$  consists of complex excitation forces on the mass segments as a function of  $\omega$  as well.

### 3.2 Biodynamic response of human body

The biodynamic response of a seated human body exposed to whole-body vibration can be broadly categorized into two types. The first category "To-the-body" force motion interrelation as a function of frequency at the human-seat interface, expressed as the driving-point mechanical impedance (DPMI) or the apparent mass (APMS). The second category "Through-the-body" response function, generally termed as seat-to-head transmissibility (STHT) for the seated occupant.

The DPMI relates the driving force and resulting velocity response at the driving point (the seat-buttocks interface), and is given by [1]:

$$Z(j\omega) = \frac{F(j\omega)}{V(j\omega)} = \frac{F(j\omega)}{\dot{X}(j\omega)} \quad (4)$$

Where,  $Z(j\omega)$  is the complex DPMI,  $F(j\omega)$  and  $V(j\omega)$  or  $\dot{X}(j\omega)$  are the driving force and response velocity at the driving point, respectively.  $\omega$  is the angular frequency in rad/s, and  $j = \sqrt{-1}$  is the complex phasor.

Accordingly, DPMI for the model can be represented as:

$$\text{DPMI}(j\omega) = \left| \left( c_4 + \frac{k_4}{j\omega} \right) \frac{X_4(j\omega)}{X_0(\omega)} - \left( c_4 + \frac{k_4}{j\omega} \right) \right| \quad (5)$$

In a similar manner, the apparent mass response relates the driving force to the resulting acceleration response, and is given by [19]:

$$\text{APMS}(j\omega) = \frac{F(j\omega)}{a(j\omega)} \quad (6)$$

Where,  $a(j\omega)$  is the acceleration response at the driving point

The magnitude of APMS offers a simple physical interpretation as it is equal to the static mass of the human body supported by the seat at very low frequencies, when the human body resembles that of a rigid mass. The above two functions are frequently used interchangeably, due to their direct relationship that given by:

$$\text{APMS}(j\omega) = \frac{\text{DPMI}(j\omega)}{j\omega} \quad (7)$$

APMS for the model can be represented as:

$$\begin{aligned} \text{APMS}(j\omega) &= \left| \frac{\text{DPMI}(j\omega)}{j\omega} \right| = \\ &\left| \left( c_4 + \frac{k_4}{-\omega^2} \right) \frac{X_4(j\omega)}{X_0(\omega)} - \left( c_4 + \frac{k_4}{-\omega^2} \right) \right| \end{aligned} \quad (8)$$

The biodynamic response characteristics of seated occupants exposed to whole body vibration can also be expressed in terms of seat-to-head transmissibility (STHT), which is termed as "through-the-body" response function. Unlike the force-motion relationship at the driving-point, the STHT function describes the transmission of vibration through the seated body. The STHT response function is expressed as:

$$H(j\omega) = \frac{a_H(j\omega)}{a(j\omega)} \quad (9)$$

Where,  $H(j\omega)$  is the complex STHT,  $a_H(j\omega)$  is the response acceleration measured at the head of seated occupant, and  $a(j\omega)$  is the acceleration response at the driving point. According to equation (9) seat-to-head transmissibility for the model is:

$$\text{STHT}(j\omega) = \frac{X_1(j\omega)}{X_0(\omega)} \quad (10)$$

The above three functions have been widely used to characterize the biodynamic responses of the seated human subjects exposed to whole body vibration.

### 4. Analytic Results and Discussions

On the basis of anthropometric Boileau data [19], the proportion of total body weight estimated for different body segments is 7.5% for the head and neck, 40.2% for the chest and upper torso, 12.2% for the lower torso, and 18.2% for the thighs and upper legs. For a seated driver with mean body mass, maintaining an erect back not supported posture, 78% of the weight was found to be supported by the seat. The biomechanical parameters of the human model (Stiffness, Damping) are listed in Table 1.

**Table 1:** The biomechanical parameters of the Boileau and Rakheja model.

Stiffness Coefficient (N/m)	Damping (N.s/m)	coefficient
$k_1 = 310000$	$c_1 = 400$	
$k_2 = 183000$	$c_2 = 4750$	
$k_3 = 162800$	$c_3 = 4585$	
$k_4 = 90000$	$c_4 = 2064$	

#### 4.1 Response behaviors of the human body

In the following subsections the effect of body's mass, stiffness coefficient, and damping coefficient on the response behaviors of the human body (STHT, DPMI, and APMS) will be investigated using the analytical solution presented in the current study.

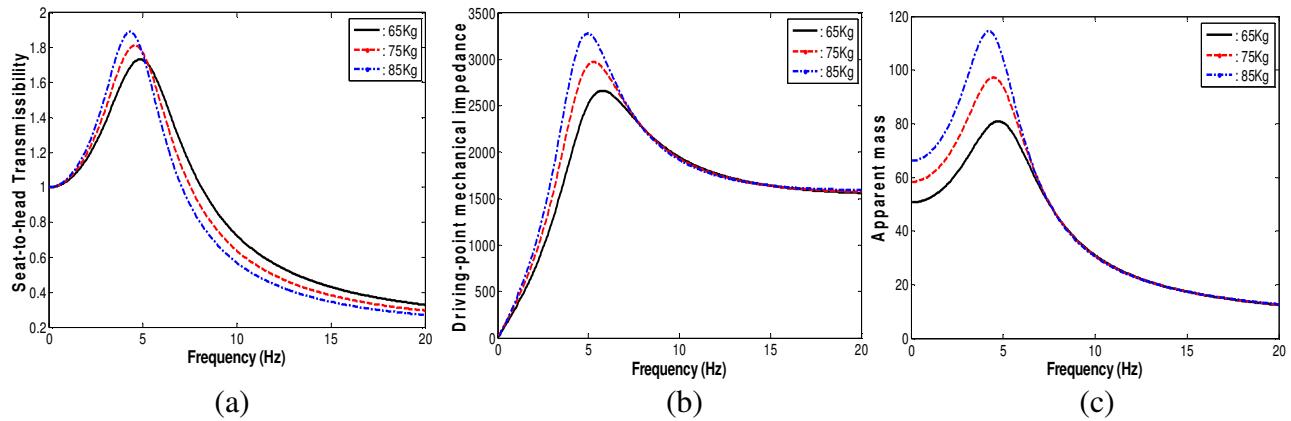

##### 4.1.1 Effect of human body's mass

Three different total body masses (65, 75, and 85 kg) are used to investigate the effect of mass on the response behaviors of human body (STHT, DPMI and APMS) as shown in Fig. 2 (a, b, and c) respectively. From these figures, one can see that by

increasing the human body mass, the biodynamic response characteristics of seated human body (STHT, DPMI, and APMS) are increased.

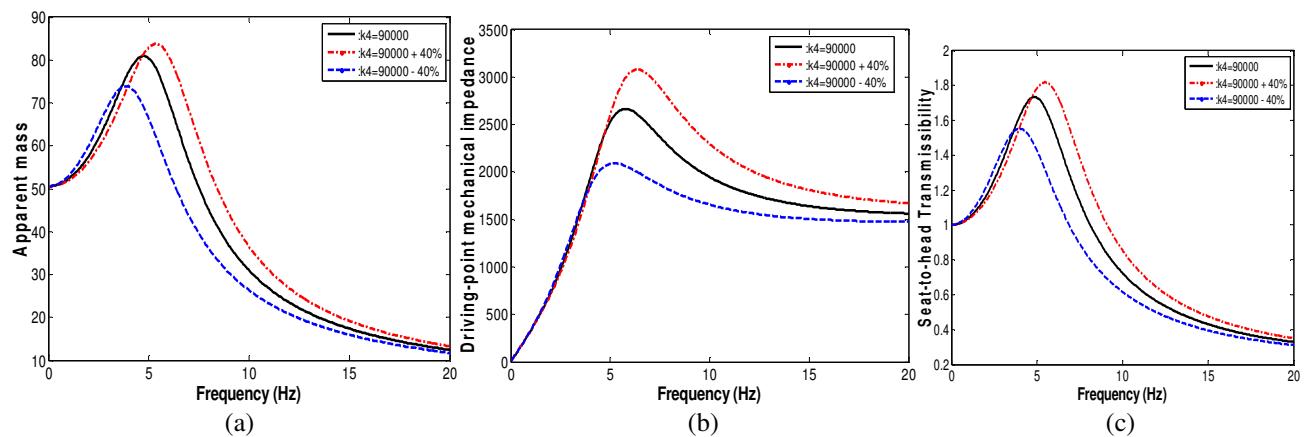

##### 4.1.2 Effect of stiffness coefficient

Three different values of pelvic stiffness  $k_4$  (Boileau value (B.V.), B.V. +40%, and B.V. -40%) are used to investigate the effect of pelvic stiffness on the response behaviors of human body (STHT, DPMI and APMS) as shown in Fig. 3 (a, b, and c) respectively. From these figures, it is clear that by increasing the pelvic stiffness, the biodynamic response characteristics of seated human body (STHT, DPMI, and APMS) are increased.

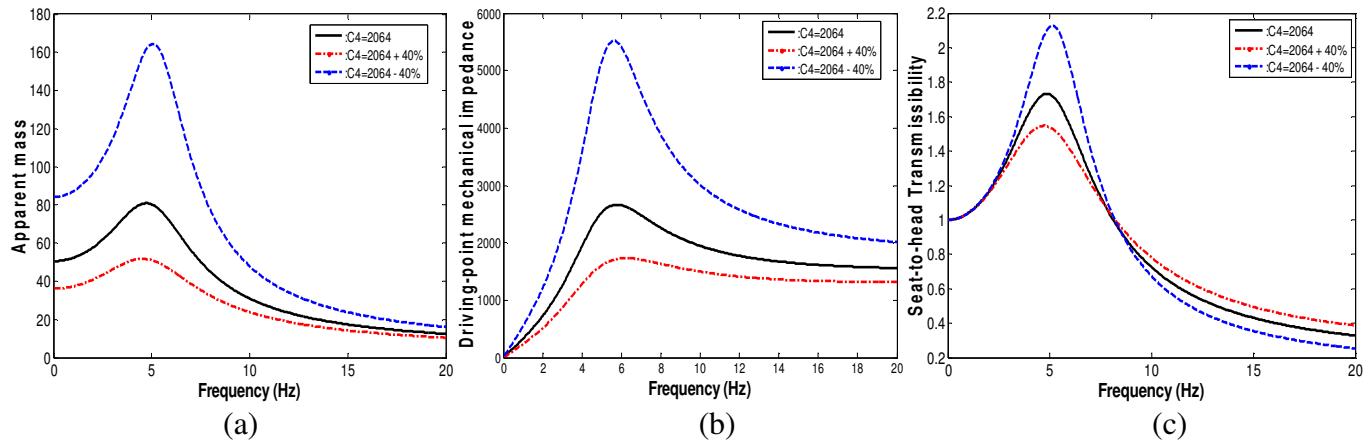

**Figure 2:** Effect of human body's mass on the biodynamic response behaviors (Analytic Results)

((a))STHT, (b) DPMI and (c) APMS)

**Figure 3:** Effect of stiffness coefficient on the biodynamic response behaviors (Analytic Results)

((a)) STHT, (b) DPMI and (c) APMS)

**Figure 4:** Effect of damping coefficient on the biodynamic response behaviors (Analytic Results)

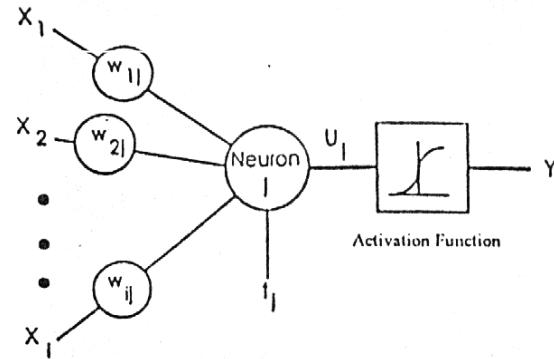

((a) STHT, (b) DPMI and (c) APMS)

#### 4.1.3 Effect of damping coefficient

Three different values of pelvic damping coefficient  $C_4$  (Boileau value (B.V.), B.V. +40%, and B.V. -40%) are used to investigate the effect of pelvic damping coefficient on the response behaviors of human body (STHT, DPMI and APMS) as shown in Fig. 4 (a, b, and c) respectively. From these figures, it is clear that by increasing pelvic damping coefficient, the biodynamic response characteristics of seated human body (STHT, DPMI, and APMS) are decreased.

#### 5. Numerical Model Structure

Neural networks are models of biological neural structures. Abdeen [13] described in a very detailed fashion the structure of any neural network. Briefly, the starting point for most networks is a model neuron as shown in Fig. 5. This neuron is connected to multiple inputs and produces a single output. Each input is modified by a weighting value ( $w$ ). The neuron will combine these weighted inputs with reference to a threshold value and an activation function, will determine its output. This behavior follows closely the real neurons work of the human's brain. In the network structure, the input layer is considered a distributor of the signals from the external world while hidden layers are considered to be feature detectors of such signals. On the other hand, the output layer is considered as a collector of the features detected and the producer of the response.

**Figure 5:** Typical picture of a model neuron that exists in every neural network

#### 5.1 Neural Network Operation

It is quite important for the reader to understand how the neural network operates to simulate different physical problems. The output of each neuron is a function of its inputs ( $X_i$ ). In more details, the output ( $Y_j$ ) of the  $j^{\text{th}}$  neuron in any layer is described by two sets of equations as follows:

$$U_j = \sum(X_i w_{ij}) \quad (11)$$

And

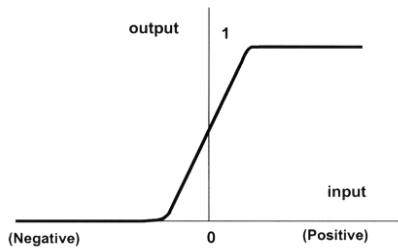

$$Y_j = F_{th}(U_j + t_j) \quad (12)$$

For every neuron,  $j$ , in a layer, each of the  $i$  inputs,  $X_i$ , to that layer is multiplied by a previously established weight,  $w_{ij}$ . These are all summed together, resulting in the internal value of this operation,  $U_j$ . This value is then biased by a

previously established threshold value,  $t_j$ , and sent through an activation function,  $F_{th}$ . This activation function can take several forms such as Step, Linear, Sigmoid, Hyperbolic, and Gaussian functions. The Hyperbolic function, used in this study, is shaped exactly as the Sigmoid one with the same mathematical representation, as in equation (13), but it ranges from  $-1$  to  $+1$  rather than from 0 to 1 as in the Sigmoid one (Fig. 6)

$$f(x) = \frac{1}{1 + e^{-x}} \quad (13)$$

The resulting output,  $Y_j$ , is an input to the next layer or it is a response of the neural network if it is the last layer. In applying the Neural Network technique, in this study, Neuralyst Software, Shin [20], was used.

**Figure 6:** The Sigmoid Activation Function

## 5.2 Neural Network Training

The next step in neural network procedure is the training operation. The main purpose of this operation is to tune up the network to what it should produce as a response. From the difference between the desired response and the actual response, the error is determined and a portion of it is back propagated through the network. At each neuron in the network, the error is used to adjust the weights and the threshold value of this neuron. Consequently, the error in the network will be less for the same inputs at the next iteration. This corrective procedure is applied continuously and repetitively for each set of inputs and corresponding set of outputs. This procedure will decrease the individual or total error in the responses to reach a desired tolerance.

Once the network reduces the total error to the satisfactory limit, the training process may stop. The error propagation in the network starts at the output layer with the following equations:

$$w_{ij} = w_{ij}^+ + LR(e_j X_i) \quad (14)$$

And,

$$e_j = Y_j (1 - Y_j) (d_j - Y_j) \quad (15)$$

Where,  $w_{ij}$  is the corrected weight,  $w_{ij}^+$  is the previous weight value, LR is the learning rate,  $e_j$  is the error term,  $X_i$  is the  $i^{th}$  input value,  $Y_j$  is the output, and  $d_j$  is the desired output.

## 6. Numerical Simulation Cases

To fully investigate numerically the biodynamic response behaviors of seated human body subject to whole body vibration, several simulation cases are considered in this study. These simulation cases can be divided into two groups to simulate the response behaviors due to changing of human body's mass and stiffness respectively. From the analytic investigation, it is clear that the effect of damping coefficient is opposite to the effect of stiffness coefficient on the response behaviors of the human body. So in the numerical analysis, the effect of stiffness coefficient will be studied only in addition with the effect of human body's mass.

### 6.1 Neural Network Design

To develop a neural network model to simulate the effect of mass and stiffness on the biodynamic response behaviors of seated human body, first input and output variables have to be determined. Input variables are chosen according to the nature of the problem and the type of data that would be collected. To clearly specify the key input variables for each neural network simulation group and their associated outputs, Tables 2 and 3 are designed to summarize all neural network key input and output variables for the first and second simulation groups respectively.

It can be noticed from Tables 2 and 3 that every simulation group consists of three simulation cases (three neural network models) to study the effect of mass and stiffness on the seat-to-head transmissibility (STHT), driving point mechanical impedance (DPMI) and apparent mass (APMS).

**Table 2:** Key input and output variables for the first neural network simulation group (effect of human body's mass)

Simulation Case	Input Variables					Output
STHT						STHT
DPMI	$m_1$	$m_2$	$m_3$	$m_4$	Frequency	DPMI
APMS						APMS

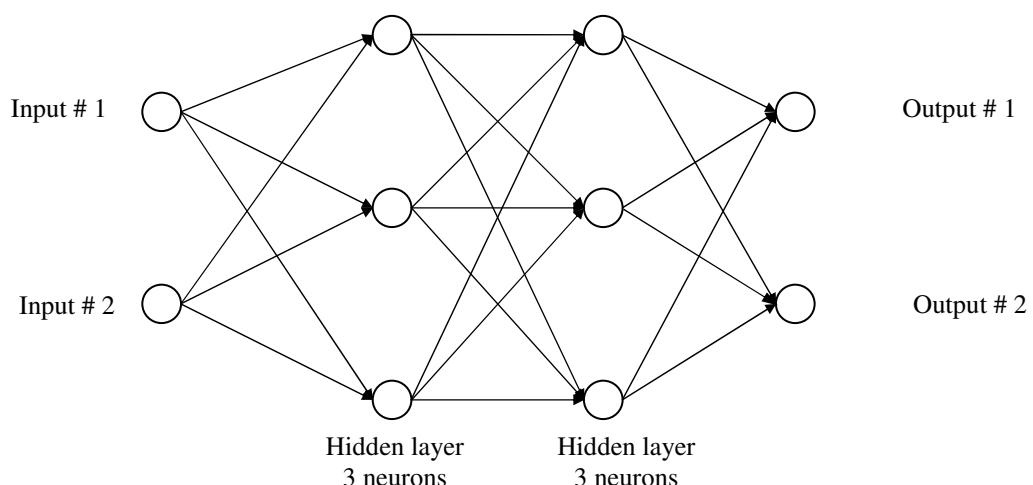

**Table 3:** Key input and output variables for the second neural network simulation group (effect of stiffness coefficient)

Simulation Case	Input Variables		Output
STHT	k <sub>4</sub>	Frequency	STHT
DPMI			DPMI
APMS			APMS

Several neural network architectures are designed and tested for all simulation cases investigated in this study to finally determine the best network models to simulate, very accurately, the effect of mass and stiffness based on minimizing the

Root Mean Square Error (RMS-Error). Fig. 7 shows a schematic diagram for a generic neural network. The training procedure for the developed ANN models, in the current study, uses the data from the results of the analytical model to let the ANN understands the behaviors. After fitting finally the ANN models, these models are used to predict the biodynamic response behaviors for different masses and stiffness rather than those used in the analytic solution.

Table 4 shows the final neural network models for the two simulation groups and their associate number of neurons. The input and output layers represent the key input and output variables described previously for each simulation group.

**Figure 7:** General schematic diagram of a simple generic neural network

**Table 4:** The developed neural network models for all the simulation cases

Simulation Group		No. of Layers	No. of Neurons in each Layer					
			Input Layer	First Hidden	Second Hidden	Third Hidden	Output Layer	
First Group (mass)	STHT	5	5	6	4	2	1	
	DPMI		5	6	4	-	1	
	APMS							
Second Group (Stiffness)	STHT	4	2	5	3	-	1	
	DPMI							
	APMS							

**Table 5:** Parameters used in the developed neural network models

Simulation Group		Training Epochs	MPRE	RMS-Error
First Group (mass)	STHT	45931	1.213	0.0015
	DPMI	7560	2.609	0.0022
	APMS	7174	3.743	0.0023
Second Group (Stiffness)	STHT	14012	3.449	0.0014
	DPMI	100185	3.938	0.002
	APMS	101463	1.644	0.0012

The parameters of the various network models developed in the current study for the different simulation models are presented in table 5. These parameters can be described with their tasks as follows:

Learning Rate (LR): determines the magnitude of the correction term applied to adjust each neuron's weights during training process = 1 in the current study.

Momentum (M): determines the "life time" of a correction term as the training process takes place = 0.9 in the current study.

Training Tolerance (TRT): defines the percentage error allowed in comparing the neural network output to the target value to be scored as "Right" during the training process = 0.001 in the current study.

Testing Tolerance (TST): it is similar to Training Tolerance, but it is applied to the neural network outputs and the target values only for the test data = 0.003 in the current study.

Input Noise (IN): provides a slight random variation to each input value for every training epoch = 0 in the current study.

Function Gain (FG): allows a change in the scaling or width of the selected function = 1 in the current study.

Scaling Margin (SM): adds additional headroom, as a percentage of range, to the rescaling computations used by Neuralyst Software, Shin (1994), in preparing data for the neural network or interpreting data from the neural network = 0.1 in the current study.

Training Epochs: number of trials to achieve the present accuracy.

Percentage Relative Error (PRR): percentage relative error between the numerical results and actual measured value and is computed according to equation (16) as follows:

$$\text{PRE} = \frac{(\text{Absolute Value (ANN\_PR}) - \text{AMV})}{\text{AMV}} * 100 \quad (16)$$

Where:

ANN\_PR: Predicted results using the developed ANN model

AMV : Actual Measured Value

MPRE: Maximum percentage relative error during the model results for the training step.

## 7. Numeric Results and Discussions

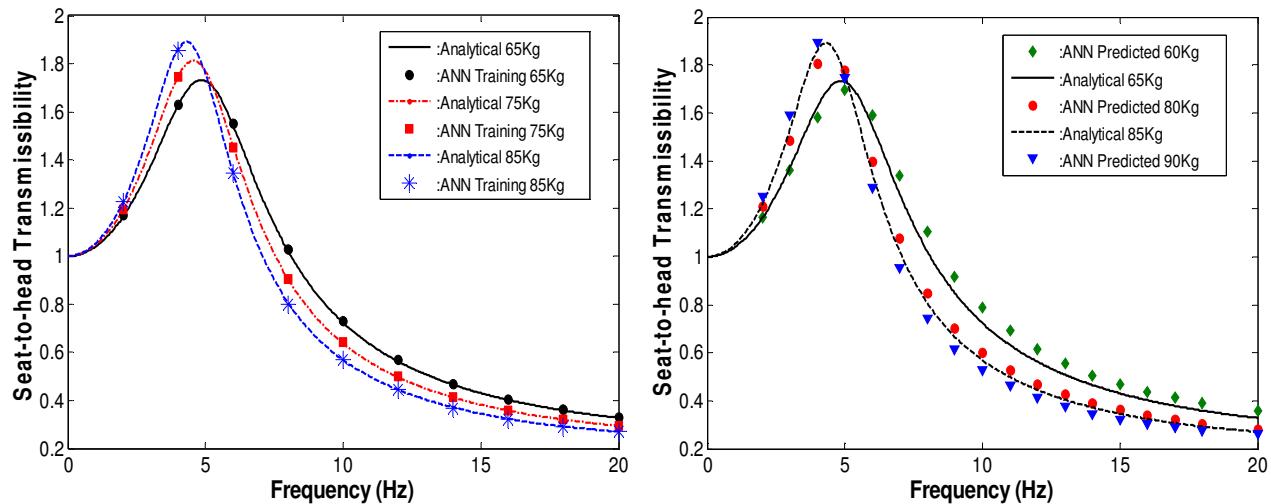

Numerical results using ANN technique will be presented in this section for the two groups (six models) to show the simulation and prediction powers of ANN technique for the effect of human body's mass and stiffness coefficient on the biodynamic response behaviors (STHT, DPMI and APMS) subject to whole-body vibration.

### 7.1 Effect of human body's mass

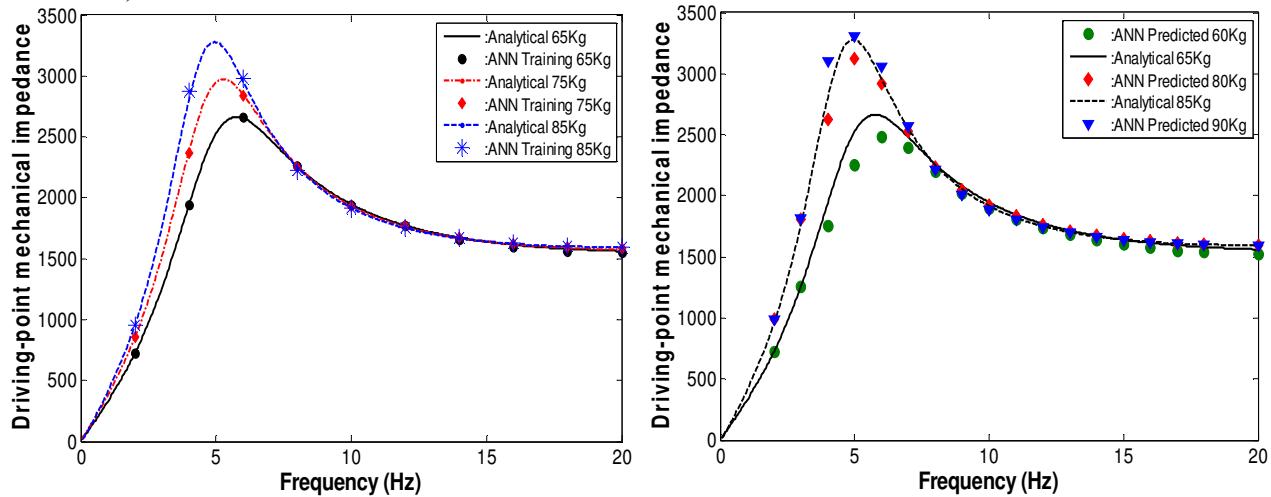

Three ANN models are developed to simulate and predict the effect of human body's mass on the biodynamic response behaviors (STHT, DPMI and APMS). Figures 8, 9, and 10 show the ANN results and analytical ones for different human body's masses. From ANN training figures (Left), it is very clear that ANN understands and simulates very well the biodynamic response behaviors. After that the developed ANN models used very successfully and efficiently to predict the response behaviors for different masses rather than those used in the analytic solution as shown in the predicted figures of ANN results (Right).

### 7.2 Effect of stiffness coefficient

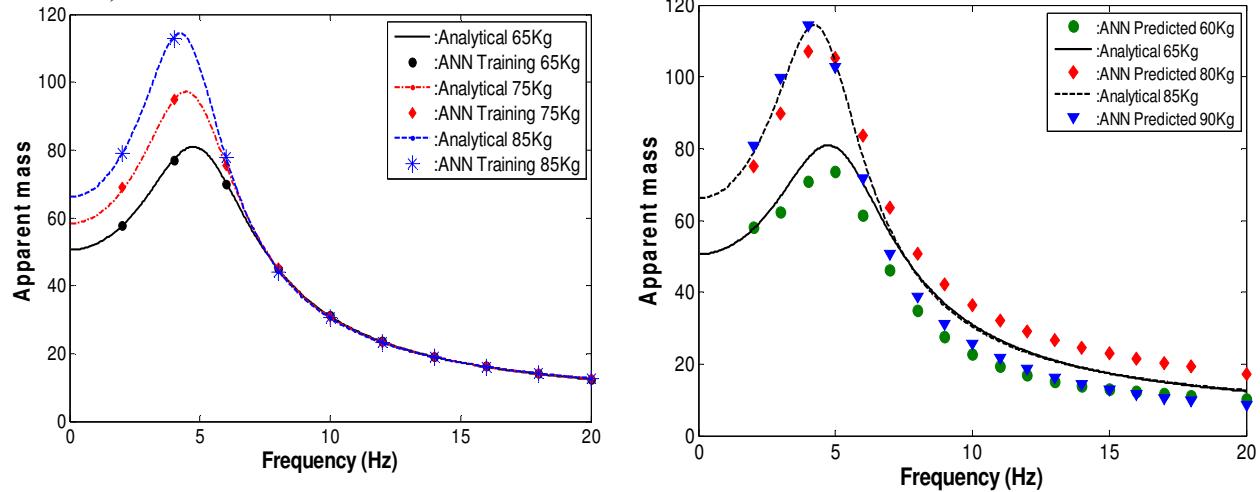

Another three ANN models are developed in this sub-section to simulate and predict the effect of stiffness coefficient ( $k_4$ ) on the biodynamic response behaviors (STHT, DPMI and APMS). Figures 11, 12, and 13 show the ANN results and analytical ones for different values of  $k_4$ . From ANN training figures (Left), it is very clear that ANN understands and simulates very well the biodynamic response behaviors. After that the developed ANN models used very successfully and efficiently to predict the response behaviors for different values of  $k_4$  rather than those used in the analytic solution as shown in the predicted figures of ANN results(Right).

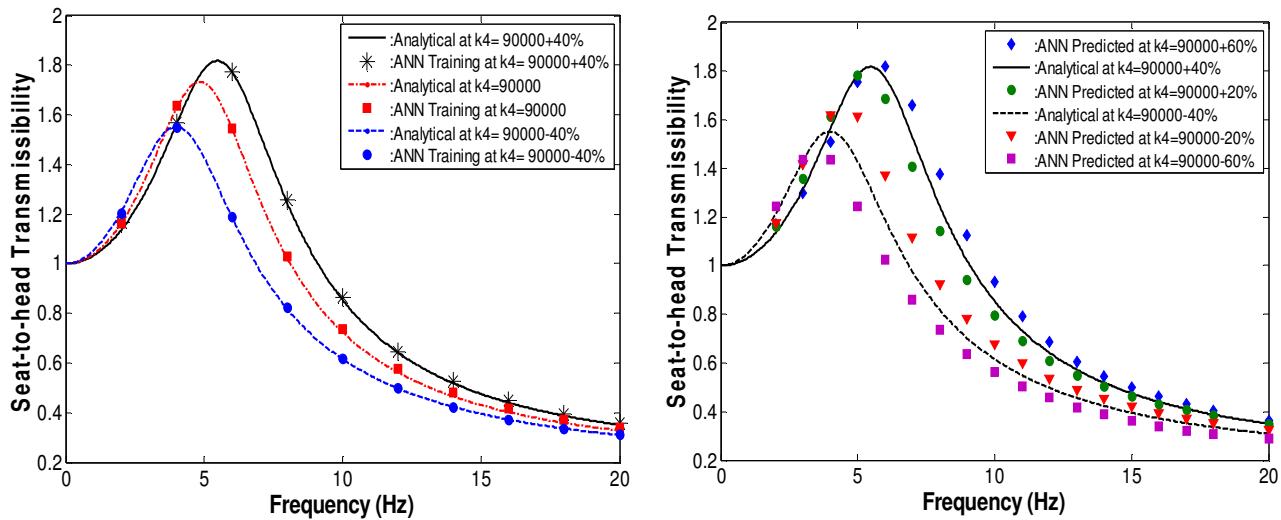

**Figure 8:** ANN results for the effect of human body's mass on STHT (Left : ANN Training, Right : ANN Prediction)

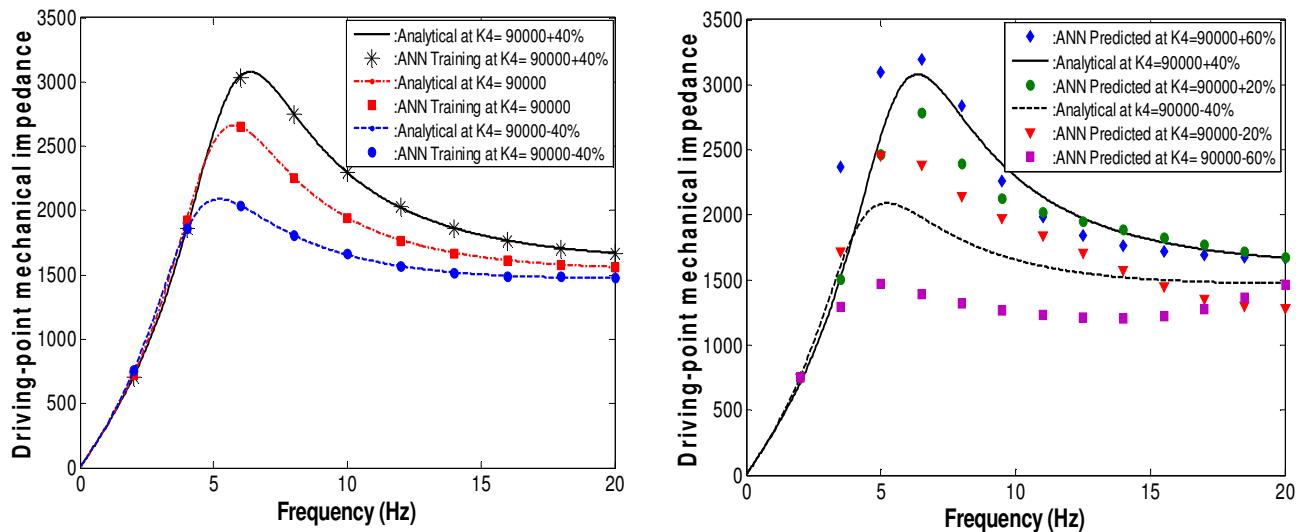

**Figure 9:** ANN results for the effect of human body's mass on DPMI(Left : ANN Training, Right : ANN Prediction)

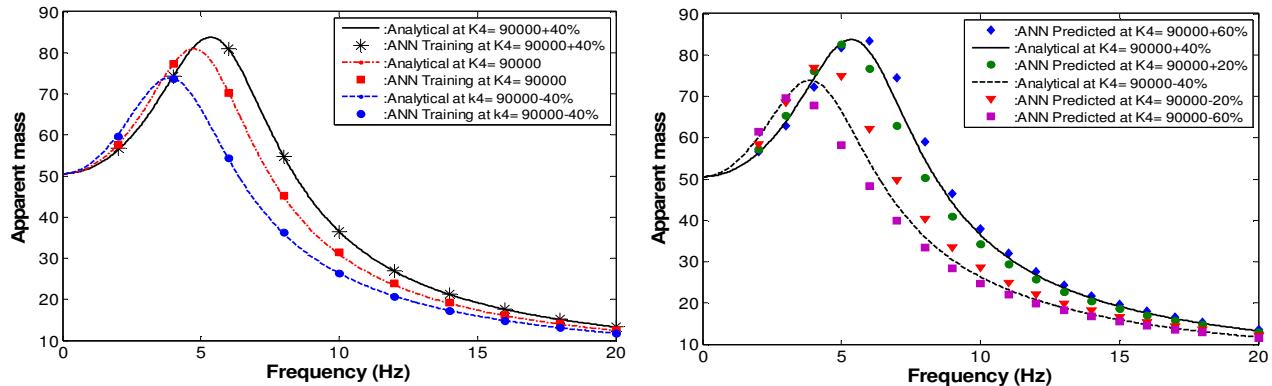

**Figure 10:** ANN results for the effect of human body's mass on APMS(Left : ANN Training, Right : ANN Prediction)

**Figure 11:** ANN results for the effect stiffness coefficient on STHT(Left : ANN Training, Right : ANN Prediction)

**Figure 12:** ANN results for the effect stiffness coefficient on DPMI(Left : ANN Training, Right : ANN Prediction)

**Figure 13:** ANN results for the effect stiffness coefficient on APMS(Left : ANN Training, Right : ANN Prediction)

## 8. Conclusions

Based on the analytical investigation conducted in the course of the current research, it could be concluded that the change in human body's mass, pelvic stiffness, and pelvic damping coefficient give a remarkable change in biodynamic response behaviors of seated human body (direct proportional for human body's mass and pelvic stiffness coefficient and inverse proportional for pelvic damping coefficient.)

Based on the results of implementing the ANN technique in this study, the following can be concluded:

1. The developed ANN models presented in this study are very successful in simulating the effect of human body's mass and stiffness on the biodynamic response behaviors under whole-body vibration.
2. The presented ANN models are very efficiently capable of predicting the response behaviors at different masses and stiffness rather than those used in the analytic solution.

# Design Synthesis of New Peptide Derivatives and Evaluated DNA Binding Activity, Anticancer and Antimicrobial Activity.

A. A. EL-HENAWY

Chemistry Department, Faculty of Science, Al-Azhar University, Nasr City, Cairo-Egypt.

**Abstract:** Recently, sulfonamides have been reported to show significant antitumor activity in vitro and/or in vivo. There are a variety of mechanisms for the anticancer activity. The present work reports the synthesis some novel peptide sulfadiazine derivatives using novel method, this may play a role in their anticancer activity. All the newly synthesized compounds were evaluated for DNA binding activity and antimicrobial activity, some synthesized compounds showed high DNA binding activity and antimicrobial activity. Some selected compounds were evaluated for anticancer activity against breast cancer cell line (MCF7) in vitro. All selected compounds showed interesting cytotoxic activities compared to a reference drug. [Journal of American Science. 2010;6(11):240-249]. (ISSN: 1545-1003).

**Keywords:** Peptide; Anticancer; Antimicrobial; DNA Binding

## 1. Introduction

Sulfonamides posses many types of biological activities and representatives of this class of pharmacological agents are widely used in clinic as antibacterial [1], antithyroid [2], diuretic [3,4], hypoglycaemic [5] and anti-carbonic anhydrase [3,6]. From other studies, Sulfadiazine derivatives have been reported to show considerable antitumor activity [7,8]. Also, aryl/heteroaryl sulfonamides may act as antitumor agents through several mechanisms, such as disruption of microtubule assembly, angiogenesis inhibition, perturbation in the G1 phase, functional suppression of the transcriptional activator NF-Y, and most important suggested mechanism by inhibition of carbonic anhydrase isozymes(CA) [9-13]. After wildly evaluation, Sulfonamides were found act as carbonic anhydrase (CA) inhibitors [14].

On other hand, the structural changes of DNA Based on the interaction of small molecular weight ligands with DNA (deoxyribonucleic acid) have attracted attention in the medicinal design of anticancer and anti-AIDS drugs [15-22]. Moreover, peptide derivatives pose anti tumour effect [23-25].

In the light of these facts, the present study aim to syntheses of peptides series of sulfadiazinylacetyl derivatives, and test the influence of these compounds toward the DNA binding affinity, anticancer activity and antimicrobial activity.

## 2. Results and discussion:

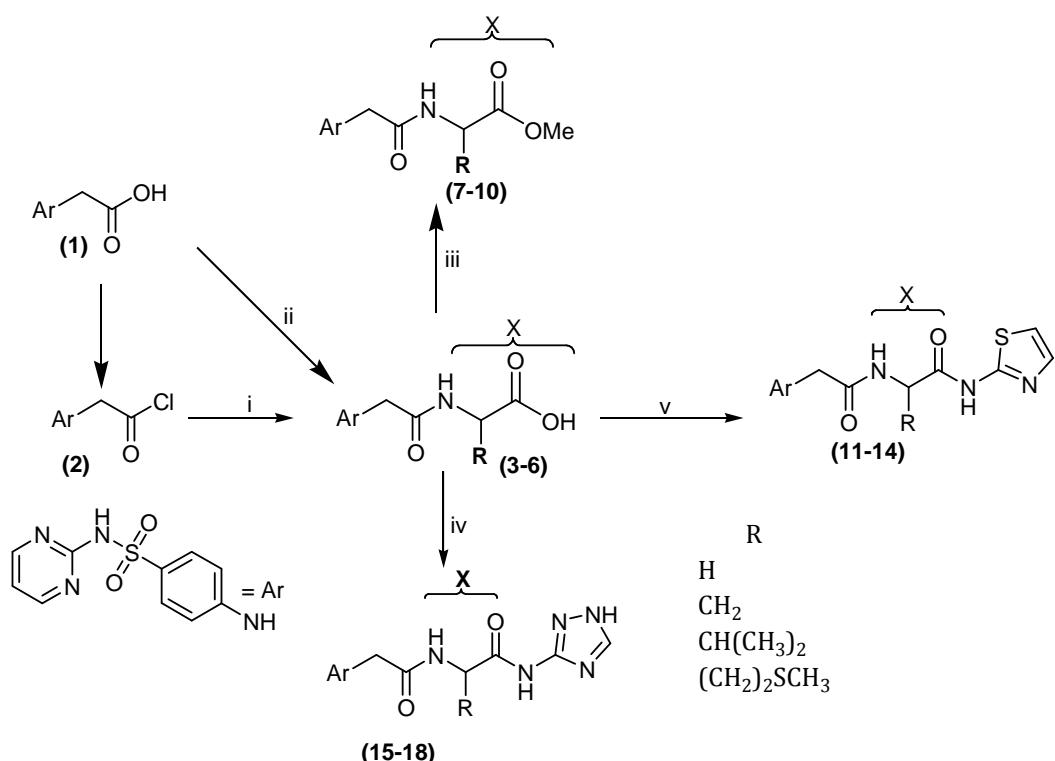

### 2.1. Chemistry:

In this paper, aimed to prepare bio peptide molecules contain sulfonamide moiety using novel method. This method is convenient, high yield, high purity and completing chemical reactions in short

time comparable with other methods which take several hours to days.

The synthetic route designed for the pseudo-peptide derivatives (**3-22**), was summarized in (Scheme 1,2). The reaction of acid chloride (**2**) with amino acids as nucleophiles, might seem hard to conduct. The reason might be due to characteristics of amino acids. Since, amino acids are amphoteric compounds, in solution a dipolar ion ( $\text{^NH}_3\text{CH}(\text{R})-\text{COO}^-$ ) is formed by a proton transformation from the carboxyl group to the nitrogen atom of amino group [26]. The amphoteric natures of amino acids decrease the electron density on nitrogen atom. Thus, the zwitterions amino acids possess lower nucleophilicity than amines and are difficult to react with acid chloride. In order to facilitate the reaction, adding an organic base such as triethylamine(TEA) to improve the reaction rate. The formations of sulfadiazinylacetyl dipeptides (**3-6, 19**) were achieved by the reaction of (**2**) with suitable type of amino acids (Scheme 1,2) in tetrahydrofuran (THF/ TEA) media, or by heating Sulfadiazinyl acetic (**1**) with amino acids at 250 °C (Scheme 1,2).

The IR spectra of dipeptide derivatives (**3-6,19**) displayed a broad bands for (NH) and (OH) absorption between  $\nu=3157-3382\text{cm}^{-1}$ . The (CO) group of carboxyl group occurred between  $\nu=1672-1698\text{ cm}^{-1}$ . Characteristic  $^1\text{H}\text{NMR}$  of dipeptide derivatives (**3-6,19**) were displayed peaks between  $\delta=11.82-12.65\text{ ppm}$  for the proton of the OH group, which disappeared immediately when treated with  $\text{D}_2\text{O}$ . Also, when compounds (**3-6,19**) were reacted with thionyl chloride (molar ratio) in methanol give the corresponding sulfadiazinylacetyl dipeptide methyl esters (**7-10** and **20**; Scheme 1,2).

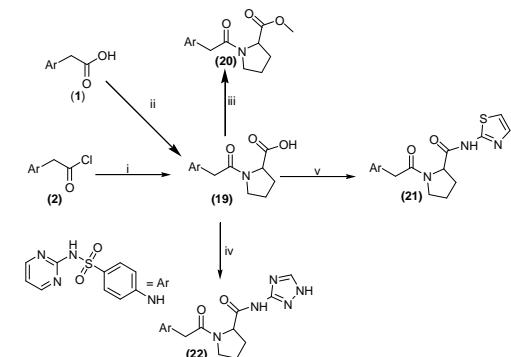

(SCHEME 1)

The IR spectra of dipeptide methyl esters derivatives (**7-10** and **20**) disappeared a bands for (OH) of carboxyl group. <sup>1</sup>H NMR characteristic of dipeptide methyl esters derivatives (**7-10** and **20**) were showed a peaks between  $\delta$ =3.59-3.76 ppm for a proton (CH<sub>3</sub>) of methoxy group. Sulfadiazinylacetyl dipeptidyl-N<sup>2</sup>-thiazol derivatives (**11-14** and **21**; Scheme 1,2) and Sulfadiazinylacetyl dipeptidyl-N<sup>3</sup>-4H-1,2,4-triazol derivatives (**15-18** and **22**; Scheme 1,2) were prepared by the reaction of compounds (**3-7** and **18**) with 2-aminothiazole and/or 3-amino-1,2,4-triazol in presence of dicyclohexylcarbodiimide (DCC/ THF) media. <sup>1</sup>H NMR spectra showed that, The imine protons (**NH**) of dipeptidyl-N<sup>2</sup>-thiazol derivatives (**11-14** and **21**), and dipeptidyl-N<sup>3</sup>-4H-1,2,4-triazol derivatives (**15-18** and **22**) were affected by the deshielding effect of CO group, and the chemical shift was  $\delta$ = 9.91-13.33 ppm, which disappeared immediately when treated with D<sub>2</sub>O. The results of chemical analyses of the synthesized compounds were summarized in Tables (1-3).

*Table (1): Showed physical data and elemental analysis of the synthesized compounds (3-22).*

*Table (2): Showed of <sup>1</sup>H-NMR in (CDCl<sub>3</sub>) results of synthesized compounds (3-22).*

*Table (3): Showed of IR and mass spectroscopy results of synthesized compounds (3-22).*

## 2.2. Biological activity:

### 2.2.1. DNA Binding Assay:

The mechanism of several antitumor compounds and antitumor antibiotics depend on their interaction with DNA. In this work, the antitumor activities of the newly synthesized compounds were determined using DNA binding assay and methyl green DNA displacement assay[27,28]. In this method, a fixed amount of the ligand is spotted on the RP-18 TLC plates, followed by addition of known amount of DNA on the same spot. The plate was then developed and the position of unbound DNA was determined by

spraying the plates with anisaldehyde reagent. The free DNA was detected as a blue spot ( $R_f$ , MeOH–H<sub>2</sub>O, 8:2) on RP-18 TLC. It was demonstrated that, when DNA was mixed with compounds known to interact with it, e.g. ethidium bromide, the complex was retained at the origin. Compounds with high binding affinity to DNA remained on the base line or migrated for a very short distance, while compounds with poor binding affinity did not cause DNA to be retained at the origin [27].

#### **2.2.2. Methyl Green-DNA Displacement Assay:**

Methyl green reversibly binds polymerized DNA forming a stable complex at neutral pH [28]. The maximum absorption for the DNA-methyl green complex is 642-645 nm. This colorimetric assay was used to measure the displacement of methyl green with DNA by compounds, which having the ability to bind with DNA. The degree of displacement was determined spectrophotometrically by measuring the change in the initial absorbance of the DNA-methyl green solution in the presence of reference compound.

Table (4): Showed DNA binding activity of compounds (3-22) using methyl green DNA displacements assay as IC<sub>50</sub> (concentration required for 50% decrease in the initial absorbance of the DNA/methyl green solution).

Results from (Table 4) indicate that, Compounds (3, 6, 7, 8 and 10) showed the highest affinity for DNA, which was demonstrated by retaining the complex at the origin or by migrating for a very short distances, and by measuring IC<sub>50</sub>. Compounds (5, 11, 18, 21 and 22) showed moderate affinity, while compound (12,14 and 15) showed weak affinity.

From these results, the following points can be concluded. The combination of some amino acids with acetylSulfadiazinyl (3-6 and 19), showed high to moderate activity, except that combined with  $\beta$ -alanine and proline residue gave inactive against DNA. Also, the esterification of C-terminal amino acids of the synthesized compounds (7-10, and 20) gave high activity compounds, except that combined with valine(9) and proline (20) residue gave inactive compounds. Moreover, when elongation of the peptide chain by introduced withdrawing moieties such as thiazoles (11-14 and 21) and\ or triazoles (15-18 and 22) showed moderate to week activity against DNA, except that contained  $\beta$ -alaninethiazole (11), valinetriazoles (16) and Methionintriazoles (17) residue gave inactive compounds.

#### **2.2.2. In vitro anticancer screening :**

In the present work, four newly synthesized compounds (3,10,12 and 17) were selected to evaluate their in vitro growth inhibitory activities

against breast cancer cell line (MCF7). Doxorubicin was used as the reference drug in this study. The response parameter calculated was IC<sub>50</sub> value (concentration required for 50% inhibition of cell viability).

The four selected compounds, were carefully selected to be representatives for all the twenty newly Synthesized compounds, which covering all structural variations in these work. These analogs, being of acetylsulfadiazinea attached to (i) Free amino acids "Sulfadiazinyl-acetyl glycine" (3) which represented Dipeptide series. (ii) Amino acid methyl esters "Sulfadiazinylacetyl-L-Methionine methyl ester" (10), which represented Dipeptide methyl ester series.(iii) Amino acid-N2-thiazols "Sulfadiazinyl-acetyl - $\beta$ -alaninyl-N2-thiazol" (12) and Amino acid-N3-4H-1,2,4-triazols "Sulfadiazinylacetyl -L-valinyl-N3-4H-1,2,4-triazol" (17), which represented Dipeptide series attached with withdrawing moieties.

*Table (5): showed the cytotoxic activity of the synthesized compounds in vitro as IC<sub>50</sub> (concentration required for 50% inhibition of cell viability) compared to the reference drug Doxorubicin.*

From Table (5), it was found that, all the tested compounds showed significant antitumor activities compared to reference compound. Also, variation in biological activity between the synthesized compounds was not very high. Moreover, dipeptide the most potent compound. furthurmore, dipeptide methyl ester more potent than those dipeptides has containing withdrawing moieties.

#### **2.2.3.Anti-microbial activity:**

All the synthesized compounds were screened for antimicrobial activities by paper disc diffusion technique (29-33). The tested micro-organism strains were: S. aureus (ATCC-9144), S. epidermidis (ATCC-155), E. coli (ATCC-25922), K. pneumoniae (ATCC-11298), A. niger (ATCC-9029), A. fumigatus (ATCC-46645).

Table (6): Showed the anti-microbial activity of the synthesized compounds and reference drug.

The result from (Table 6) showed that, most synthesized compounds were active against all tested micro-organisms with the range of MICs values for S. aureus(11.1-28.4  $\mu$ g /ml), S. epidermidis (15.1-28.2  $\mu$ /ml), K. pneumoniae (14.6-33.8  $\mu$ g /ml), E. coli (12.6-25.3  $\mu$ g/ml), A. niger (11.6-32.2  $\mu$ g /ml) and A. fumigates(13.4-32.3  $\mu$ g/ml). The compounds (3, 6, 7, 8, 9, 13, 15, 16, 20) were exhibit in vitro anti-microbial activity against all micro-organisms at MICs of (11.1 -33.8  $\mu$ g/ml). Compounds (10, 15 and 16) were exhibit in vitro anti-microbial activity

against most micro-organisms at MICs of (18.7-32.2 µg/ml).

From the previous results, it was concluded that, sulfadiazinylacetyl combined with amino acid residues have antimicrobial activity against all tested microorganisms (**3-6and19**). Moreover, esterification of C-terminal of amino acids, and/or when elongation of peptide chain by introducing withdrawing moieties gave biologically active compounds against all tested micro-organisms (**7-10 and20**), excepted that containing methionine methyl ester moiety (**10**), valinetriazol(**17**) and methionine triazol(**18**) moiety.

**In conclusion**, the present work was aimed to design sulphonamide peptide derivatives using novel method; it was clearly observed that the compounds containing free peptide moieties and peptide methyl ester moieties exhibit significant anticancer activity, DNA binding activity and antimicrobial activity. When these compounds attached with withdrawing group lead to decrease anticancer activity, DNA binding activity and antimicrobial activity. SO, the further modification of these compounds may be promising candidates for clinically useful drug agents.

### 3.EXPERMINTAL:

Melting points were taken on a Griffin melting point apparatus and are uncorrected. Thin layer chromatography (Rf) for analytical purposes was carried out on silica gel and developed with benzene-ethyl acetate (6:1) using iodine-KI (20%) solution as spraying agent. Benzidine, ninhydrin, and hydroxamate tests used for detection reactions. The IR spectra of the compounds were recorded on a Perkin-Elmer spectrophotometer model 1430 as potassium bromide pellets and frequencies are reported in cm-1. The <sup>1</sup>H NMR spectra were observed on a Varian Genini-300 MHz spectrometer and chemical shifts ( $\delta$ ) are in ppm. The mass spectra were recorded on a mass spectrometer HP model MS-QPLO00EX (Shimadzu) at 70 eV. Elemental analyses (C,H,N) were carried out at the Microanalytical Centre of Cairo University, Giza, Egypt.

#### 3.1. Synthesise:

##### 3.1.1.Preparation of Sulfadiazinylacetyl dipeptides (**3-6 and19**):

*General Procedures:*

##### *Mothed A:*

A mixture of amino acids (1.5 equiv) was dissolved in water (25 ml), THF (15 ml) mixture and triethylamine (2 ml) was added, followed by portionwise addition of sulfadiazinylacetyl chloride (**2**; 1 equiv) during 30 min. The temperature of the

reaction mixture during the addition was kept at 10°C. Stirring continued for 2 hrs. at 20°C. (THF) was removed by concentration of the reaction mixture under reduced pressure; water (30 ml) was added and acidified with 2 M HCl to pH=5. The crude products were filtered and recrystallized from Ethanol. All the products (**3-6 and 19**) were chromatographically homogeneous by iodine and benzidine development.

##### *Mothed B:*

A mixture of amino acids (0.01 mol) and sulfanadiazine (**1**, 0.01 mol) was fused at 250 °C in an oil bath for 15 min. Fused mass was dissolved in ethanol and poured onto cold water, the solid obtained was recrystallized from ethanol.

##### 3.1.2.Preparation Sulfadiazinylacetyl dipeptide methyl esters (**7-10 and 20**):-

*General Procedures:*

A suspension of coupling reaction products (**3-7**; 1 equiv) in absolute methanol (150 ml) was cooled to -10°C and pure thionylchlorid (1 equiv) was added dropwise during one hour. The reaction mixture was stirred for an additional 34 hrs. at room temperature, and then kept overnight when the solvent was removed by vacuum distillation. The residual solid material was recrystallized from Ethanol. All the products (**7-10 and 20**) were chromatographically homogeneous by iodine and benzidine development.

##### 3.1.3.Preparation of Sulfadiazinylacetyl dipeptidyl-N<sup>2</sup>-thiazol(**11-14and 21**):

*General Procedures:*

To a solution of 2-aminothiazol (1.5 equiv) was dissolved in THF, the solution was stirred for 30 min. at 20°C, and cooled to 0 °C, dipeptide (**3-6and 19**;1equiv) in THF (50 ml) and DCC (1 equiv) were added to the above mixture. The reaction mixture was stirred for 6 h. at 0°C and for another 12 hrs. at room temperature. The crude material is diluted with EtOAc and washed with sat. aq. Na<sub>2</sub>CO<sub>3</sub> ( $\times 2$ ) and brine ( $\times 1$ ), dried over sodium sulfate, evaporated, and purified by Ethanol to give desired products. The products (**11-14and 21**) were to be chromatographically homogeneous by iodine and benzidine development.

##### 3.1.4. Preparation of Sulfadiazinylacetyl dipeptidyl-N<sub>3</sub>-4H-1,2,4-triazol (**15-18 and 22**):

*General Procedures*

To a solution of 1H-1,2,4-triazol-3-amine (1.5 equiv) was dissolved in THF, the solution was stirred for 30 min. at 20°C, and cooled to 0°C, dipeptide (**3-6 and 19**;1equiv) in THF (50 ml) and DCC (1 equiv) were added to the above mixture. The reaction mixture was stirred for 6 hrs. at 0°C and for another 12 hrs. at room temperature. The crude material is diluted with EtOAc and washed with aqueous

Na<sub>2</sub>CO<sub>3</sub> ( $\times 2$ ) and brine ( $\times 1$ ), dried over sodium sulfate, evaporated, and purified by Ethanol to give desired products. The products (**15-18 and 22**) were to be chromatographically homogeneous by iodine and benzidine development.

### 3.2. Biological screening:

#### 3.2.1. Evaluation of the degree of DNA binding:

##### 3.2.1.1. DNA binding assay on TLC plates:

Analyses of the DNA binding affinity of the tested compounds were predeveloped first using methanol-water (8:2). The tested compounds were then applied (5 mg/ml in methanol) at the origin, followed by the spotting of DNA (1 mg/ml in methanol-water mixture (8:2) at the same positions at the origin. Ethidium bromide was used as a positive control. After complete spotting, the plates were developed with the same solvent system, and the positions of DNA were visualized by spraying the plates with anisaldehyde, which produces a blue colour with DNA. The intensity of the colour was proportional to the quantity of DNA added to the plate.

##### 3.2.1.2. Colorimetric assay for the degree of DNA binding:

DNA\methyl green complex (20 mg) was suspended in 100 ml of 0.05M tris-HCl buffer (pH 7.5) containing 7.5 mM MgSO<sub>4</sub> and stirred at 37 °C with a magnetic stirrer for 24 hrs. The calculated amounts of samples were placed in Eppendorf tubes, and (200  $\mu$ l) of the DNA-methyl green solution was added to each tube. The samples were incubated in dark at room temperature, and after 24 hrs. the final absorbance of each sample was determined at (642-645) nm. The results were recorded in form of the IC<sub>50</sub> for each compound, which is the sample concentration required to produce 50% decrease in the initial absorbance of the DNA-methyl green complex. Ethidium bromide was used as a positive control. The molar concentration required for 50% decrease in the initial absorbance of the DNA-methyl green complex was calculated and the results are given in Table 4.

### 3.3.2. Anticancer screening:

Antitumor screening was performed at the National Cancer Institute, Cancer Biology Department, Cairo, Egypt. Cytotoxic activity was measured *in vitro* for the selected synthesized compounds (3, 10, 15 and 18) using Skehan et al method(34). Cells were plated in 96-multiwellmicrotiter plate (104 cells/well) for 24 hrs. before treatment with the compounds to allow attachment of cell to the wall of the plate. Test compounds were dissolved in DMSO and diluted with saline to the appropriate volume.

Different concentrations of the compound under test (0, 1, 2.5, 5, and 10 mg/ml) were added to the cell monolayer. Triplicate wells were prepared for each individual dose. Monolayer cells were incubated with the compound(s) for 48 hrs. at 37 °C and in atmosphere of 5% CO<sub>2</sub>. After 48 hrs., cells were fixed, washed and stained with SRB (Sulfo-Rhodamine-B) stain. Excess stain was washed with 1% acetic acid and attached stain was recovered with Tris EDTA buffer. Colour intensity was measured in an ELISA reader. The relation between surviving fraction and drug concentration is plotted to get the survival curve for breast tumour cell line after the specified time. The molar concentration required for 50% inhibition of cell viability (IC<sub>50</sub>) was calculated and the results are given in Table 5.

### 3.3.3. Anti-microbial screening

Biological activities were carried out at the biogenetic engineering center, molecular biology unit, Al-Azhar University, Nasr city, Egypt. The anti-bacterial activity of the synthesized compounds was tested against two Gram- positive bacteria S. aureus (ATCC-9144) and S. epidermidis (ATCC-155), two Gram-negative bacteria E. coli (ATCC-25922), and K. pneumoniae (ATCC-11298) and two fungi namely A. niger (ATCC-9029)and A. fumigatus (ATCC-46645) using nutrient agar medium.

#### 3.3.3.1. Paper disc diffusion technique:

The sterilized (autoclaved at 120 °C for 30 min) medium (40-50° C) was incubated (1ml/100ml. of medium) with the suspension (105 cfu ml-1) of the micro-organism (matched to McFarland barium sulphate standard) and poured into a petridish to give a depth of 3-4 mm. The paper impregnated with the test compounds ( $\mu$ g/ml-1 in methanol) was placed on the solidified medium. The plates were pre-incubated for 1 h at room temperature and incubated at 37 °C for 24 and 48 hrs. for anti-bacterial and anti-fungal activities, respectively. Ciprofloxacin (100  $\mu$ g/disc) were used as standard for antibacterial and anti-fungal activity respectively. The observed zone of inhibition is presented in Table 6.

#### 4.3.3.3Minimum inhibitory concentration (MIC):

MIC of the compound was determined by agar streak dilution method (35). A stock solution of the synthesized compound (100  $\mu$ g/ml-1) in methanol was prepared and graded quantities of the test compounds were incorporated in specified quantity of molten sterile agar (nutrient agar for anti-bacterial activity and sabouraud dextrose agar medium for anti-fungal activity). A specified quantity of the medium (40-50 °C) containing the compound was poured into a Petri dish to give a depth of 3-4 mm and allowed to solidify. Suspension of the micro-organism was prepared to contain approximately (105cfu ml-1) and applied to plates with serially

diluted compounds in dimethyl formamide to be tested and incubated at 37°C for 24 and 48 hrs. for bacteria and fungi, respectively. The MIC was considered to be the lowest concentration of the test

substance exhibiting no visible growth of bacteria or fungi on the plate. The observed MIC is presented in (Table6).

**Table (1):** Physical data for the compounds (3-22):

# Amelioration Productivity of Sandy Soil by using Amino Acids, Sulphur and Micronutrients for Sesame Production

Salwa, A.I. Eisa; Mohsen. M. Abass and S.S. Behary

Soils, Water and Environment Research Institute, ARC, Egypt

**Abstract:** A field experiment was carried out at Ismailia Agricultural Research Station, Ismailia Governorate, Egypt for two successive summer seasons 2008 and 2009 using sesame (Giza 32) to study the effect of elemental sulphur as soil application, amino acids and micronutrients (Fe, Zn, Mn) as foliar spray and their interactions by concentration ( $A_0$ ) zero and ( $A_1$ ) 2 g/l, for amino acids, micronutrients Fe, Zn and Mn were added as mixture at rates of zero ( $T_0$ ) & 450, 225, 225  $\mu\text{g g}^{-1}$  ( $T_1$ ) and 900, 450, 450  $\mu\text{g g}^{-1}$  ( $T_2$ ). While elemental sulphur was added at the rates of zero ( $S_0$ ) & 0.5 Mg S/fed ( $S_1$ ) and 1.0 Mg S/fed ( $S_2$ ), on sesame yield, its components and seed quality. Data indicated that, plant height (cm) significantly affected by all applied treatments. The tallest plant height (213.3 cm) achieved upon treating by  $A_1 + 1.0 \text{ Mg S/fed} + 900, 450, 450 \mu\text{g g}^{-1}$  (Fe, Zn, Mn) by rate of increases 48.0% over control. Data also show that there were significantly increases in the whole plant weight with increasing application of sulphur as soil application and micronutrients as foliar spray. The highest plant weight were achieved upon treating by  $A_1 + 1.0 \text{ Mg S/fed} + 900, 450, 450 \mu\text{g g}^{-1}$  (Fe, Zn, Mn) by rate of increases 50.04% over control. A significantly increase in the seed sesame yields, the highest seed yields were achieved upon treating by  $A_0 + 1.0 \text{ Mg S/fed} + 900, 450, 450 \mu\text{g g}^{-1}$  (Fe, Zn, Mn) by rate of increases 89.80% over control. For seed quality data show that an increases in P and K%, Fe, Zn and Mn  $\mu\text{g g}^{-1}$ , oil and protein%, oil and protein yield upon treating by  $A_1 + 1.0 \text{ Mg S/fed} + 900, 450, 450 \mu\text{g g}^{-1}$  (Fe, Zn, Mn). Generally, a combined application of amino acid with micronutrient Fe, Zn, Mn in the presence of elemental sulphur significantly increased the sesame yield; improved nutrition and increased seed quality; except the seeds yield whither the highest amount for seeds yield occurred in absence of amino acids; it was probably related to the physiological actions of amino acids and micronutrients. [Journal of American Science. 2010;6(11):250-257]. (ISSN: 1545-1003).

**Key words:** Amino acids- sulphur-micronutrients-sesame-sandy soil.

## 1. Introduction

Micronutrients are elements which are essential for plant growth, but are required in quite smaller amounts than those of the primary nutrients, nitrogen, phosphorus and potassium. They play an indispensable role in cell division and development of meristematic tissues, stimulate photosynthesis, respiration, energy and nucleotide transfer reactions and fasten the plant maturity (Marschner, 1998). Although micronutrients are needed in relatively very small quantities for adequate plant growth and production, their deficiencies induce a great disturbance in the different physiological and metabolic processes inside the plant.

Amino acids can directly or indirectly influence the physiological activities of the plant. Functionally, amino acids especially L- amino acids rather than D- amino acids are involved in the enzymes responsible for the structural photosynthesis process. Also, amino acids have act as chelating effect on micronutrients, when applied together with micronutrients, the absorption and transportation of micronutrients inside the plant is easier (Ibrahim, 2007). The requirement of amino acids in essential quantities is well known as a mean to

increase yield and overall quality of crops. The application of amino acids for foliar spray is based on their requirement by plants in general and critical stages of growth in particular. Plants absorb amino acids through stomata and are proportionate to environment temperature that controls the opening mechanism of the plant stomata. Also amino acids are fundamentals ingredients in the process of protein synthesis. About 20 important amino acids are involved in the process of each function (Ewais *et al.*, 2005). Khalil *et al.*, (2008) found that foliar spray of both amino acids and micronutrients together on onion plants could improve the onion yield and its components.

In oil seeds, sulphur plays a significant role in the quality and development of the seeds. Therefore, crops of oil seeds require a higher quantity of sulphur for proper growth, development for high yields (Mandal *et al.*, 1993). Ceccotti (1996) recorded that sulphur plays an important role in the primary and secondary plant metabolism as a component of proteins, glucosinolates and other compounds that related to several parameter

determining the nutritive quality of crops. Moreover, sulphur is an integral part of acyl-coenzyme A that helps synthesis of more fatty acid (Lal *et al.*, 1995).

Sesame (*Sesamum indicum*, L) is one of the most important crops grown for oil production in Egypt. The crop is grown for its seeds, which contain 50-60% oil, 8% protein, 5.8% water, 3.2% crude fiber, 18% carbohydrate, 5.7% ash and it is very rich in minerals such as Ca, P and vitamin E Dasharath *et al.* (2007). Also, sesame oil has a very high level of unsaturated acids, which is assumed to have reducing effect on plasma cholesterol, as well as on coronary heart disease (Agboola, 1979). Sesame seeds have a positive amino-acid structure- high level of methionine and low level of lysine; this makes it an excellent protein complement to other plant proteins. Obiajunwa *et al.* (2005) reported that Nigerian sesame seeds are rich in essential minerals and trace elements that promote well being in humans. Minerals are unique nutrients because of their important role in metabolism. They are essential part of many important enzymes and they also play roles as catalysts and antioxidants. They added that at a daily consumption rate of 100 g, the values of all the elements in sesame seed fall within the US recommended Dietary Reference Intakes (DRIS) (National Academy of Sciences, 1998). Neelam Sharma *et al.*, (2007) found that sesame genotype contained high value of protein content in the range of 18.60 to 27.57 %. The moisture content was in the range of 3.14 to 4.40 % and ash content ranged from 4.20 to 6.20 %. Sesame seeds are good source of methionine (2.32 to 3.77 g / 16 g N) and tryptophan (1.03 to 1.95 g / 16 g N). Oxalate content varied from 475.32 to 987.19 mg / 100g, while the range of oil content was 32.00 to 50.36. In spite of its importance, little attention has been paid for its nutrient requirements, especially in newly reclaimed sandy soils. So the main target of the current investigation is to study the efficiency of amino acid, micronutrients Fe, Mn and Zn applied with different rates in the presence of sulphur on the yield, seed quality for sesames plant in sandy soils.

## 2. Materials and Methods

A field experiment was carried out at Ismailia Agricultural Research Station, for two successive summer seasons 2008 and 2009 using sesame (Giza 32) to study the effect of amino acids, micronutrients (Fe, Zn, Mn) and elemental sulphur and their interaction on sesame yield, its components and seed quality. Some physical and chemical characteristics of the studied soil are presented in Table (1) which, were determined according to Klute (1986) and Page *et.al.*, (1982) .The experimental design was a randomized complete block with four replicates. The plot area was 10.5 m<sup>2</sup> (3 m width and 3.5 m length). The plots were ploughed twice in two ways and received superphosphate (15% P<sub>2</sub>O<sub>5</sub>) at

rate 30 kg P<sub>2</sub>O<sub>5</sub>/fed and elemental sulphur at the rates (S<sub>0</sub>) zero, (S<sub>1</sub>) 0.5 Mg S/fed and (S<sub>2</sub>) 1.0 Mg S/fed. Nitrogen and potassium fertilizers were added to all plots in two equal doses during the growing period in the form of ammonium nitrate (33.5% N) and, potassium sulphate (48% K<sub>2</sub>O) at rates of 100 kg N/fed and 50 kg K<sub>2</sub>O/fed, respectively.

The treatments of amino acids were (A<sub>0</sub>) zero and (A<sub>1</sub>) 2 g/l, while micronutrients Fe, Zn and Mn were added as mixture at rates of zero (T<sub>0</sub>) & 450, 225, 225 µg g<sup>-1</sup> (T<sub>1</sub>) and 900, 450, 450 µg g<sup>-1</sup> (T<sub>2</sub>). They were added as foliar application at two times after 30 and 60 days from planting.

At harvest, plant samples were separated and seeds dried at 70 °C ground in a Willy mill and digested with H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>O<sub>2</sub> according to Parkinson and Allen (1975). The digested samples were analyzed for N, P and K; Fe, Zn, Mn by using Inductively Coupled Plasma Spectrometer (ICP) plasma 400 according to Cottenie *et al.*, (1982). Oil of sesame seeds was determined according to A.O.A.C (1975). The obtained data (average of two seasons) were statistically analyzed according to S.A.S (2001).

### 3. Results and Discussion

Plant height (cm) for sesame yield:

Data in Table (2) show the effect of amino acids, sulphur and micronutrients on plant height for sesame yield. Data indicated that there were increases in the plant height (cm) by sulphur application, foliar application of Fe, Mn, Zn and/or amino acids. Generally, these increases were more obvious with foliar application of amino acids. The tallest plant height (213.3 cm) were achieved upon treating by amino acids 2g/l + 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  Fe, Zn, Mn, by rate of increases 48.0% over control. The statistical analysis for the data indicated that plant height significantly affected by all applied treatments. Such results are in agreement with those recorded by Ibrahim *et al.* (2007) in faba bean found that foliar application of both amino acids and micronutrients significantly increased plant height, number of branches, leaf area as well as number of pods per plants and consequently the faba bean seed yield. This explained that foliar application of amino acids affects positively the plant growth and crop yield through :- 1) their role in quick nutrient absorption and systemic transportation through the aerial parts of plants. 2) rapidly metabolized with subsequent formation of biologically useful substances i.e. chlorophyll and plant growth regulators. 3) Nutritional and reconstituent function with formation of proteins and carbohydrates. 4) Catalyst and biostimulant action on the activities of main enzyme systems. 5) Hormone like action of equilibrium and synergistic action with endogenous plant growth regulators. 6) Better transport and use of micronutrients. 7) Regulation of water equilibrium.

Sesame yields:

Data in Table (3) show the effect of amino acids, sulphur and micronutrients on seed weight (Kg/ha) and whole plant weight (Mg/ha) for sesame yield. Data indicated that there were significantly increases in the seed weight with increasing application of sulphur and micronutrients as foliar spray. Increasing the addition rate of S from 0.5 to 1.0 Mg S/fed and Fe, Zn, Mn from 450, 225, 225  $\mu\text{g g}^{-1}$  to 900, 450, 450  $\mu\text{g g}^{-1}$  led to significantly increase the seed sesame yields. These increases were more obvious when amino acids sprayed in combination by rate of 2 g/l. The highest seed yields were achieved upon treating by A<sub>0</sub> + 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  (Fe, Zn, Mn) by rate of increases 89.80% over control Fig (1). The statistical analysis for the data indicated that seed weight significantly affected by all applied treatments. Data also show that there were significantly increases in the whole plant weight with increasing application of sulphur and micronutrients as foliar spray. The highest plant weight were achieved upon treating by A<sub>1</sub> + 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  (Fe, Zn, Mn) by rate of increases 50.04% over control Fig (1). The statistical analysis for the data indicated that plant weight significantly affected by S and micronutrients (Fe, Zn and Mn). The response of sesame yield to S application may be due to its effect on soil pH and increasing the availability of most of the nutrient elements, especially in sandy soil and presence of micronutrient and /or amino acids.

**Table (3): Sesame yield as affected by amino acids, sulphur and micronutrients**

Treatment	Seeds weight (Kg/ha)		Means	Whole plant weight (Mg/ha)		Means

N.S. Not significant \*\*highly significant \* significant

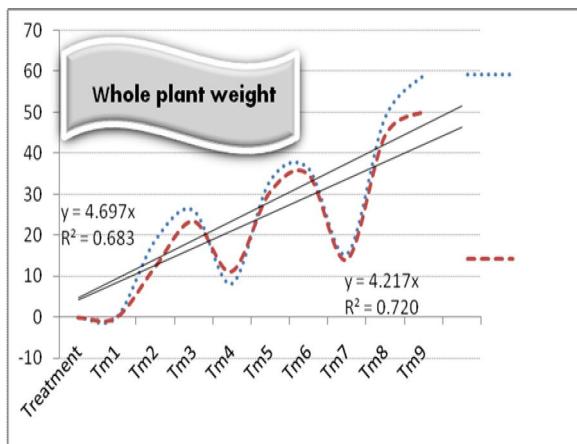

In this connection, Yadav *et al.* (1996) reported that S application significantly increased seed and straw yields of sesame. Fathi *et al.* (1999) observed that the application of elemental sulphur resulted in a significant increase in sesame yield. A positive response of sesame yield to S fertilization was associated with the rate of 1.0 ton S/fed. These results were confirmed with Salwa Eisa *et al.* (2009). On the other hand, Bekhetta (2004), on wheat who found that foliar application for both amino acids and micronutrients led to obvious increases of grain and straw. This is because amino acids help to increases chlorophyll concentration in plant leading to higher degree of photosynthesis. This makes crops mush green and leads to more accumulation of the dry matter and subsequently increases the crop yield.

#### Seed quality:

#### Macro and micronutrients contents:

The effect of sulphur application, amino acids and Fe, Zn, Mn on the contents of macro and micronutrients in the yield of sesame seeds was recorded in Table (4) and (5). Data showed that Increasing the addition rate of S from 0.5 to 1.0 Mg S/fed and Fe, Zn, Mn from 450, 225, 225  $\mu\text{g g}^{-1}$  to 900, 450, 450  $\mu\text{g g}^{-1}$  led to significantly increase in the P and K percentage and

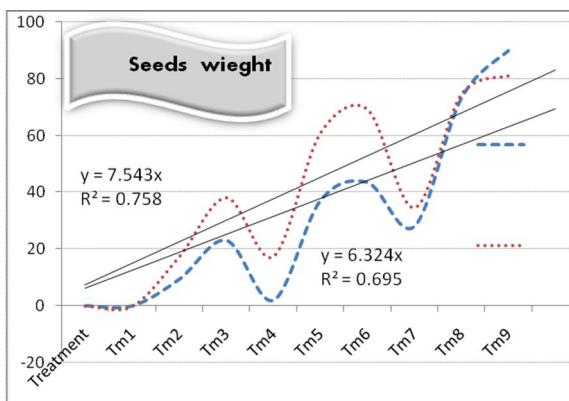

(Fe, Zn, Mn)  $\mu\text{g g}^{-1}$  in seed sesame yields. These increases were more obvious when amino acids sprayed in combination by rate of 2 g/l. The highest seed yields were achieved upon treating by A<sub>1</sub> + 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  (Fe, Zn, and Mn). The corresponding values were 0.56 and 2.45% for P and K. The corresponding values were 333, 78 and 33  $\mu\text{g g}^{-1}$  for Fe, Zn, and Mn. This is because the presence of acid form amendments as mineral sulphur, which improves the physical and chemical properties of soil, lowers soil PH, which well-known effects upon increasing the availability of elements in soil. Also, amino acids have act as chelating effect on micronutrients, when applied together with micronutrients, the absorption and transportation of micronutrients inside the plant is easier (Ibrahim, 2007). These results were confirmed with obtained by Khalil, *et al.* (2008) and Salwa Eisa *et al.* (2009). The statistical analysis for the data indicated that P% significantly affected by S and T& K% significantly affected by T treatments & Fe  $\mu\text{g g}^{-1}$  significantly affected by all treatments & Zn  $\mu\text{g g}^{-1}$  significantly affected by all treatments except A where Mn  $\mu\text{g g}^{-1}$  significantly affected by A, T and S treatments.

#### Oil and protein content:

The effect of sulphur application, amino acids and Fe, Zn, Mn on the oil and protein % and oil, protein yield contents of in the yield of sesame seeds was recorded in Table (6). Data showed that application of amino acids and micronutrients as foliar application in the absence of S led to a slight increase in seed oil % and oil yield content. In other words, applications of sulphur increase seed oil content, oil yield content either in the presence or absence of amino acid and micronutrients. Also, data show that, slight increases of oil % for all treatment over control, and there is no significant difference in oil % between the treatments. This mainly, because it is genetically controlled. The highest seed oil % content was obtained upon treating by 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  (Fe, Zn, and Mn) in the presence or absence of amino acids, where for oil yield the highest seed oil yield content was obtained upon treating by 1.0 Mg S/fed + 900, 450, 450  $\mu\text{g g}^{-1}$  (Fe, Zn, and Mn). This is because the addition of elemental sulphur plays a significant role in the quality and development of the oil seeds. With this respect, Fathi (1999) recorded that S application alone up to 1.0 ton S/fed, significantly increased seed oil content of sesame. Similar observation was obtained by Salwa Eisa *et.al.*(2009). Data also showed that Increasing the addition rate of S to 1.0 Mg S/fed and Fe, Zn, Mn to 900, 450, 450  $\mu\text{g g}^{-1}$  in the presence of amino acids led to increase in the protein % and protein yield contents. This is because plants make their proteins by synthesizing them from amino acids, which are produced by complex biochemical processes starting with the elements of nitrogen, carbon, oxygen and hydrogen. This process consumes biological and biochemical energy. Foliar application of pre-formed amino acids gives the plant its requirements and thereby saving biological energy (Ibrahim, 2007).

**Table (5): Micronutrients content of Sesame seeds**

C.V	2.37	1.79		0.69	2.18

N.S. Not significant    \*\*highly significant    \* significant

The statistical analysis for the data indicated that oil % significantly affected by micronutrients and elemental sulphur treatments & oil yield significantly affected by all treatments & protein % significantly affected by amino acids and micronutrients treatments and protein yield significantly affected by all treatments except amino acids + sulphure (A×S).

#### 4. Conclusion

From above mentioned, results and under the conditions of this experiment, a combined application of the amino acids and micronutrients in the presence of elemental sulphur increased significantly sesame yield and improved seed quality; except the seeds yield whither the highest amount for seeds yield occurred in absence of amino acids; was probably related to the physiological actions of amino acids and micronutrients. In addition to improving sesame nutrition and quality, reduction in the dose of amino acids and micronutrients applied by foliar spray is of economic importance and may also lead to ecological benefits.

# Comparative Study of Software Engineering Processes in Egyptian Cmmi Companies

Alaa El-Din Hamouda and Mohammad Abdрабو Elwahsh  
 Computers & Systems Engineering Dept., Al-Azhar University Cairo, Egypt.  
[Alaa\\_ham@giga.net](mailto:Alaa_ham@giga.net), [eng.md.elwahsh@gmail.com](mailto:eng.md.elwahsh@gmail.com)

**Abstract:** The Egyptian government has paid special attention to the software industry as Egypt to provide it with a competitive advantage that makes this emerging industry promising. Thus, the State has supported the Egyptian companies to make use of the Capability Maturity Model Integration (CMMI). Since 2009, more than thirty companies obtained the CMMI at different levels. However, these companies suffer from lack of a mechanism to exchange experience and information among themselves although they could be similar in the culture of their engineers and perhaps in the nature and size of their software projects. So, we provide in this research a survey to gauge the quality of methods, tools and processes used in these Egyptian companies winning the CMMI. Then we analyzed the results to reach the recommendations aimed at enriching the software industry in Egypt. [Journal of American Science. 2010;6(11):258-263]. (ISSN: 1545-1003).

**Keywords:** CMMI in Egypt, software engineering processes, survey.

## 1. Introduction

In 1993, the Software Engineering Institute (SEI) released the Capability Maturity Model Integration (CMMI) with five staged maturity levels as a means to both appraise maturity level and guide process improvement efforts for software organizations. This model has since been widely accepted around the world, especially in Egypt where the CMMI has helped many software companies [1, 2, 3, 4, and 5].

CMMI combines software engineering, systems engineering, integrated products and procurement to design and improve all types of processes. CMMI has become an international standard for devising software development processes and is credited with helping Egypt rise rapidly to become among the world's software exporters. CMMI provides guidance to improve organizations processes and ability to manage the development, acquisition, and maintenance of products or services. The process areas are grouped into four categories: Process Management, Project Management, Engineering, and Support [6, 7, 8, 9, and 10].

Around the world, there are fast growing CMMI companies. Many countries use the CMMI model extensively e.g. India, China, Japan, Australia, Russia, USA, S.Korea, France, Germany, Brazil, Argentine, Canada and Taiwan. For example in Taiwan seven companies hold Level 2 accreditation, two have Level 3 accreditation and one(IBM Taiwan) has already achieved Level 5 accreditation. In 2009 more than 500 companies in the U.S. were certified to CMMI standard [11, 12, and 14].

Today, use of CMMI in Software industry in Egypt has been increasing to improve software

processes. By June 2009, thirty-one software companies achieved CMMI accreditation levels, from Level 2 to Level 5. One of the problems that face CMMI companies in Egypt is lack of conferences that enable specialists to meet to share their experience about software engineering processes. Also, there is lack of researches that reflect the experiences and provides comparative studies. So, we made the CMMI Survey in 2009 to help organizations identify the best practices and enhance the maturity of their processes. By investigating most of the organizations that have been appraised, processes automation, success factors, keep performance indicator (KPI), benefits of CMMI implementation are identified [13].

## 2. Survey Design

We designed a Survey for CMMI companies in Egypt. The target of the survey is to make a comparative study of the process implementation, best practices, tools, and techniques used in these companies. The target of these questions is to give informative details about the CMMI companies to get clear and transparent information about the software industry in Egypt [13]. These survey requirements were divided into twelve sections, covering most areas of operations in the maturity model with the aim of measuring the capacity of the second and third division levels. The results were as follows: The first section was to get general information about the company characteristics in terms of size and structure, other sections of the survey focus on processes implementation and tools used for different process areas of levels two and three. Level two includes

Project Management, Requirement Management, Measurements and Analysis, Quality Assurance and Configuration Management. Level three includes Technical Solutions, Product Integration, Risks Management, Testing, Decision Analysis and Resolutions , Process Improvement, and CMMI satisfaction[3,9].

The survey was launched in 2009. Through Software Engineering Competence Center (SECC) in the Egyptian Ministry of Communications, the thirty-one Egyptian CMMI companies were requested to fill the survey to answer 65 questions addressing different sections of programming activities in Egypt. Then four experts from software engineering processes and CMMI section were contacted to define the key points which Egyptian companies need to relay their experience. Based on these needs we divided the survey as follows:

- 1) General Information
- 2) Individual Evaluation System
- 3) Engineering Processes Group
- 4) Project Management
- 5) Requirement Management
- 6) Measurements and Analysis
- 7) Quality Assurance
- 8) Technical Solution and Product Integration
- 9) Testing
- 10) Risks
- 11) Process Improvement
- 12) Satisfaction with CMMI based processes

### **3. Survey Implementation**

This survey was sent to 31 companies in Egypt that obtained the Capability Maturity Model Integration (CMMI) at different levels: eighteen companies were granted the second level (58.2%), ten received third level (32.3%), one got level four (3.2%), and two obtained the fifth level (5.6%).

From the results of the survey, we find that 14 companies participated as follows: 8 companies got the second level (57.1%) got the third level (28, 6%), and two got the fifth level (14.3%). most companies responded to all questions included in the survey. However, some vague points were not answered by few companies.

### **4. Results and Evaluations**

#### **A. General Information**

As a result of evaluation, the following rates were obtained from responding companies:

- ✓ A percent of 58.3 % have projectized structures, while 41.7 % are matrix organizations. This is striking if we bear in mind that most companies and projects are individual and small-scale projects. The importance of the adoption of the Matrix Organization is demonstrated when the

companies are large, including a multiplicity of departments and skills. But in a small institution, it is usually advisable to adopt a system of Projectized Organization, where the responsibilities and tasks are more specific and there is speed in decision-making, flexibility in management, and easy follow-up on the other hand. Please note that in medium-sized companies (where the number of employees is less than fifty) 50% of the employees use the matrix model. So we recommend that these medium-sized companies adopt a projectized system.

- ✓ 36% of the companies got the Capability Maturity Model Integration (CMMI) before 2006, 36.4% before 2007, and 27.6% by the year 2008.
- ✓ All companies on the second level have valid plans to get the third level in a year or two, which indicates:
  - a. Growing awareness of the importance of quality systems and the positive repercussions on companies.
  - b. Companies are satisfied with returns resulting from the application of quality systems (Return on Investment).
- ✓ All the companies that got the third level in re-evaluation (reappraisal) after expiry of the first evaluation aim at higher level of the CMMI Levels 4 and 5 but this is impaired by the financial constraints, as the Egyptian Government supports only the companies that plan to get the second and third levels.
- ✓ The ISO 9001 certification was a good start for Egyptian companies, as 43% of the participants, received the ISO certification before they got the CMMI. This can be explained as the required specifications in ISO 9001 focus on the administrative side, at the same time the CMMI standards focus on the specifications of the technical operations, especially in the third level and above. This is why we recommend the companies that got the ISO certification or wishing to start a quality journey to follow the experience gained and the methodology proposed by [Chanwoo, 2006].

#### **B. Individual Evaluation System**

Individual Evaluation is a key success factor for organization. Having good measures and processes for performance evaluation affects the employee's satisfaction and turn over rate. In 55% of the companies, where the individual survey system was applied the direct manager alone filled the survey. This reflects two facts:

- a. Companies need performance indicators which truly reflect the real level of performance of engineers.
- b. Companies need to design questionnaires on specific scientific basis which reflect the level of performance of software engineers from different points of view. For example, designing a system of individual performance appraisal method based on the Three-Hundred and Sixty Degrees method can be a good choice. Hence it is recommended that researchers in the field of software engineering would address this need and give it priority in their research.

#### C. Engineering Process Group (EPG)

At the beginning of the processes improvement initiative, there are usually some important questions, e.g. How many people are needed for the EPG? Should they be dedicated process engineers or normal software engineers who spend some time in processes? What are the criteria for EPG member selection? The paragraphs below help the decision maker through highlighting the actual performance.

- ✓ 83% of the companies that dealt with the survey are of small and medium SME.
- ✓ 53.8% of the companies prefer to have the engineering team dedicated to this work size (Static EPG), while in 46.2% of the companies, EPG members are originally working in software projects (such as a systems analyst, developer, tester) and those who deal with process improvement tasks would, take over these functions to complement their own tasks (Virtual EPG).

The average overall efforts to improve operations in companies have a monthly rate of 1.25 employees. This will be useful later to show the amount of spending on improving processes, calculate the resulting returns and consequently access the return on expenditure (Return on Investment, ROI).

#### D. Project Management (PM)

Project managers face challenges of selecting the suitable quick and detailed estimation techniques and the adopted software life cycle. They are also required to select the project management tools and decide about the meetings frequency. Challenge facing the project manager to select the appropriate method to estimate the size of the product backend forums and then estimate the cost and time, has emerged from the questionnaire which also revealed that:

- ✓ 42.9% of the companies use the Microsoft Professional project management (Microsoft Project Professional).

- ✓ 36% use the Microsoft Advanced Project Management (Microsoft Enterprise Project).
- ✓ 21.1% are using a spreadsheet (Excel sheet). These rates are consistent with the nature of projects which are based on dealing with the user.
- ✓ 53.8% Use Case Points (Use Case Point) as a tool to estimate the size of projects.
- ✓ 38.2% use point of the task (Function Point), and 8% use COSMIC tool.
- ∅ 78.6% have a preliminary technical assessment (Initial Estimation Technique), and 21.4% do not.

#### E. Requirement Management

A percent of 46.2% of the companies use spreadsheet software for management of requirements. However, complex software systems steadily increase the list of requirements which makes it difficult to manage and follow-up. It is also difficult to link design and test programs and schemes corresponding to each requirement (Traceability Matrix). Accordingly, we recommend, in such case, use of special programs to manage the requirements of software systems to enhance the efficiency of the management process requirements.

#### F. Measurements and Analysis (M&A)

The number of key performance indicators (KPI) in projects and institutions in general was great compared to company sizes. So as, each KPI has a cost for managing it (e.g. collecting KPI values, verifying their validity, and analyzing them), we recommend training specialists to calculate the cost of these indicators (cost/benefit analysis) in order to be able to take the right decision for selection of numbers and quality.

In 50% of the companies, key performance indicators for the (KPIs) are less than 4 and more than 7, and 33% less than 4, in 17% it is more than 4, this is compared to the number of key performance indicators where in 64.2% of companies the number of KPI is between 4 and 7, and in 30.8% the number of is less than 4, and in 23% is more than 7. We find that 85.7% of the companies take advantage of the actual analysis of performance indicators to improve operations.

#### G. Quality Assurance (QA)

How many process QA engineers are needed? Is it useful to get QA approval before a project is closure?

When should QA issues be escalated? The results below express the real situation in Egyptian CMMI Companies. The senior management support to a quality assurance is an essential element in the commitment of staff operations that are in line with quality systems. It has been found that 57.1% of the companies need to get the approval of the project manager of quality assurance team (QA approval) at the end of any project, and in 71.4% of the companies, the number of quality assurance engineers was more than three. These are good promising an indicator of the manager's concern to stress the value of the quality of operations and give it direct support.

#### H. Technical Solution and Product Integration

For developers, it is important to determine how unit testing is performed and to define dedicated positions for architecture, analysis, and design are used. It is equally important to define who is responsible for support documentation. The results of that survey are given below.

- ✓ 78.6% of the companies perform automatic unit testing, and 57.1% perform the testing manually. This reduces efficiency as much as it lowers the productivity of the developer/tester. These companies are recommended to adopt unit testing and general testing. We also recommend training developers on tools unit testing automatically, and training testers to use automated testing tools.
- ✓ 27.3% of the companies use dot-net (Dot Net) as a tool for program development. 27.3% use the Java language (Java), 9.1% use the Oracle (Oracle) language, while 36% use other languages such as Delphi (Delphi).
- ✓ There is no specialization in technical writing where developers and testers take the responsibility of preparing documents associated with the product code. This is, in most cases, not accomplished professionally which reduces companies' efficiency. So, we recommend that company's employee technical writer who would be responsible for documentation especially since the cost incurred may be less than the cost of employing a developer or tester.

#### I. Testing

- ✓ It is noted that the checking bugs (Bugs), and problem issues (Issues) are checked manually in 57.1% of the companies. Perhaps this makes it difficult to follow-up and may affect the quality of products and processes. Hence, we propose that companies automate this process, either through

their own software or through ready-made software.

- ✓ Manuscript rapid testing (rapid testing script) is very important to examine applications in a limited time. The importance of this testing is highlighted in the maintenance phase of software systems. However, we find that 71.4% of the companies do not have this facility. Therefore, we recommend its provision for testers and training them to use it.
- ✓ The rate of developers to testers in the companies was at an average of one laboratory for each 3.7 developers. This reflects the distribution of effort in software projects, where this ratio is severely limited if compared to the ratio of 1: 2 approximately [17] in COCOM I and COCOM II. This indicates a weak interest in testing the products adequately. So, it is recommended to invest more effort in testing products which would improve the quality and increase competitiveness of Egyptian software.
- ✓ 78% of the companies perform unit tests manually, and 57.1% do screening tests manually. This reduces efficiency as much as it reduces the productivity of the developer/tester. Thus, we recommend companies to adopt mechanical unit testing. We also recommend training developers to perform the Tools unit test automatically, and training examiners to use automated testing tools.

#### J. Risks

54.5% of the companies use spreadsheets to manage risks, 18.2% use radar (Radar), and 27.3% use other programs such as (Microsoft Project Server) for the management of risks.

#### K. Overall Satisfaction with CMMI

- ✓ Generally, the companies applying the CMMI are satisfied which is a good sign. However, there are complaints from the complexity of operations there is an urgent need to review the operations approved by each company in the system to alleviate any burden carried by these processes (Process overhead). To accomplish this, we recommend that companies work on some ideas inspired by the Agile Models and trying to integrate them in their quality system which is compatible with the CMMI, especially as most companies are small and thus need flexible and simple processes.
- ✓ 21% of the projects in the companies do not follow the processes set forth by the CMMI quality system. When these companies were asked, the answer was that pressure from

- customers to get the product forces them not to follow the internal CMMI quality systems. This in fact represents a threat to the quality of processes and then the quality of products in these projects. So, it is proposed that companies apply another Simple Process to speed the completion of work such as the Agile Model, and thus Subject all company projects whether complex processes or simple operations, to the internal quality system according to the standard set by the companies to follow the appropriate processes.
- ✓ The percentage of delay in software projects delivery date was 58% and the average percentage of projects costing more than the approved budget is estimated by 45.5%. This is consistent with global figures estimated by 75% and 50% respectively. It is observed that most international projects that suffer from delays and cost increase are large-scale projects, while the projects in the Egyptian companies are not huge. According to [18], the most important reasons at the global level are:
    - a. poor planning and management
    - b. changing objectives of projects during their implementation
    - c. Non-participation of senior management in the follow-up projects and consequently not giving enough support.

We find that the second and third reasons may not apply directly to the Egyptian companies which are relatively small in size. Also, the number of projects is limited, which reduces the likelihood of changing objectives and lack of support from senior management. Thus, the primary cause is the most influential and therefore it is recommended to raise the skills of project managers through training to use the specific and effective methods of project management software.

## 5. Conclusion

Through this paper we are providing the results of a questionnaire to investigate the processes and Tools used in CMMI software companies in Egypt. By analyzing the results and conclusion obtained, we recommend that:

1. Small and medium companies adopt a structural Projectized Organization process, where the responsibilities and tasks are more specific and there is speed in decision-making and flexibility in management and follow-up.
2. Training the responsible personal to estimate the cost of key performance indicators (analysis of the relationship between expenses and profit) in order to be able to reach a wise decision for selection of

performance indicators with respect to quality and quantity.

3. Carrying performance unit tests and general tests automatically. Also, training developers to perform the Tools unit tests automatically, and testers to automated testing tools.
4. Automation of the follow-up bugs (Bugs), and issues (Issues) either through their own software or through ready-made software's.
5. Training testers to prepare and implement rapid testing (rapid testing script) to support the maintenance of software products.
6. With the steady complexity of the code systems and growth of the list of requirements which is difficult to manage and follow-up, it becomes difficult to link it to design, test programs and plans corresponding to each requirement (Traceability Matrix). Preparation and use of special programs to manage the requirements of software systems, to enhance the efficiency of the management process requirements.
7. Exerting more effort in the work of a good testing of products in order to increase the quality and competitiveness of Egyptian software.
8. Companies employ a technical writer, especially since the cost incurred is less than that of employee a programmer or tester.
9. Enhancing skills of project managers through training on the unique and effective methods of project management software.
10. Companies prepare new classifications for simple operations (Simple Process) in order to be able to speed the completion of work by following the Agile model and thus subject all projects to their special quality system (both for complex or simple operations) according to the standard they set.
11. Companies holding ISO 9001 or wishing to start a trip to ISO quality should follow the experience gained and the methodology proposed in [19]. The ISO 9001 certification was a good start for many Egyptian companies. Forty-three percent of the participating companies received a certificate of the ISO before they got the Capability Maturity Model. This can be explained by the required specifications in both, where the ISO 9001 focuses on the administrative side, at the same time the Capability Maturity Model identifies standards of technical operations, notably in the third level and above.
12. There is an urgent need to review the operations approved by each company in its system, and for this process said companies try to make use of Agile models and integrate them in their quality system which is compatible with the CMMI to decrease the Process overhead,

especially as most companies are small and need to be flexible, and simple.

13. Researchers in the field of software engineering should study to find indications of a genuine performance which truly reflects the performance of engineers to design by questionnaires on the basis of special scientific programmed software which describe the performance of engineers from different points of view, for example, designing a system to assess individual performance depending on the method of Three Hundred and Sixty Degrees.

### **Future Work**

After publication of this paper we shall supply the participating companies with the results through the Egyptian Ministry of Communications represented by SECC. Through participation in Arab conferences we hope that government's private institutions Adopt these recommendations and spread them in their countries.

### **Acknowledgments**

We thank the Software Engineering Competence Center (SECC) especially Dr. Gamal Aly and Abeer Khedr for their support, and Dr. Mohammad Zaki for his valuable comments; we also thank all individuals who took the time to assist us in this survey. Finally, we thank Horizon Software Company as a sponsor of this work.

**Abstract:** Objectives: The aim of this study was to investigate the effect of different adhesive systems on the vertical marginal gap distance and the fracture resistance of lithium disilicate based crowns.

Methods: Forty premolars were prepared to receive forty e-max crowns. The crowns were divided into 4 groups (N=10 each) according to the adhesive luting systems. Group (U): using RelyX Unicem resin cement (self-adhesive system). Group (V): Variolink II (total-etch system). Group (GU) and group (GV): application of G-bond (self-etch) on dentin preceded previously used adhesive systems. A stereomicroscope was used to record the vertical marginal gap distance before and after cementation. The crowns were subjected to cyclic loading and fracture resistance test. Data were statistically analyzed using One-way Analysis of Variance (ANOVA) SPSS 15.0. A scanning electron microscope was used to qualitatively examine the dentin/resin interface. Results: Groups (GU) ( $67.6 \pm 5.8 \mu\text{m}$ ) and (GV) ( $68 \pm 6.4 \mu\text{m}$ ) recorded the significantly lowest vertical marginal gap, followed by group (V) ( $82 \pm 6.8 \mu\text{m}$ ). Group (U) showed the highest marginal inaccuracy ( $114 \pm 6.4 \mu\text{m}$ ). Group (GU) recorded the significantly highest fracture resistance ( $2840.5 \pm 3.8 \text{ N}$ ), followed by group (GV) ( $2411.3 \pm 3.3 \text{ N}$ ) and group (V) ( $2365.8 \pm 3.6 \text{ N}$ ). Group (U) showed the lowest results ( $2270.9 \pm 3.4 \text{ N}$ ). Conclusions: Ceramic restorations luted with total-etch system offer better vertical marginal gap distance and fracture resistance than restorations luted with self-adhesive system. Treatment of the dentin surface prior to the application of the bonding system is efficient. [Journal of American Science. 2010;6(11):264-273]. (ISSN: 1545-1003).

**Keywords:** Adhesives, marginal gap, fracture resistance, all-ceramics

## 1. Introduction

Success of any indirect dental restorations depends on many factors among them the cementation techniques and procedures. Dental cement must act as a barrier against microleakage, holding the tooth and restoration together mechanically and/or chemically. The behavior of the cement and bonding systems is complex and partly depends on the properties and quality of the component parts of each system.<sup>1</sup> An ideal dental adhesive should be able to wet, infiltrate dentin and provide a durable bond between the unhomogeneity of enamel and dentin and the restoration.<sup>2</sup> The permeability of dentin to adhesive agents depends on the resin infiltration of both dentinal tubules and intertubular dentin, however, resin infiltration into intertubular dentin can occur only if the mineral phase of dentin is removed by acid conditioners.<sup>3</sup> Knobloch et al 2007, reported a résumé of the modification done through the bonding agent generations.<sup>4</sup> Total-etch technique including dry and wet techniques, rely on etching the dentin and removal of the smear layer. This technique involves a separate etch and rinse step followed by priming and application of the bonding resin, it is said to be a time

consuming technique.<sup>5</sup> Self-etching technique rely on etching the dentin using non rinse acidic monomers that simultaneously condition and prime, in one step, incorporating the smear layer within the hybrid layer so that it becomes one single layer.<sup>6</sup> RelyX Unicem (3M ESPE, Seefeld, Germany) the self-adhesive, universal resin cement without surface pretreatment has been introduced. It is based on a novel initiation technology using new monomer and filler. The organic matrix consists of newly developed multifunctional phosphoric acid methacrylate, which, can react with the basic fillers in the luting cement and the hydroxyapatite of the hard tooth tissue. This cement quickly neutralizes during the curing process, to switch from a hydrophilic to a hydrophobic state. This unique switch allows the material to adapt to the tooth structure while in the hydrophilic state, yet provide for ongoing dimensional stability with the restoration after converting to the hydrophobic matrix.<sup>7</sup>

Today operators have the choice between water based and resin based cements, which can be used with or without adhesives.

They should however choose the most efficient system i.e. pretreatment of the dentin surface is advisable.<sup>8</sup> A strong bond has been reported to improve marginal adaptation and increases fracture resistance of the tooth and the restoration.<sup>9</sup>

An increased demand for aesthetic restorations makes ceramic the material of choice as anterior and posterior restorations. Consequently, all-ceramic crown may be considered an alternative restoration for highly esthetic areas.<sup>10</sup> Several types of all-ceramic materials have been developed for posterior crowns, including castable ceramics, leucite-reinforced ceramics, lithium disilicate, aluminum oxide ceramics, and zirconium oxide ceramics.<sup>11,12</sup> Several factors influence the compressive strength testing of a clinical ceramic crown, such as preparation design, ceramic material, crown thickness, method of luting, cyclic loading, and thermal cycling.<sup>13</sup> The majority of failures of all ceramic crowns are initiated at the inner surface of the crown where it is subjected to maximum tensile stress and this is intensified by the presence of flaws and cracks.<sup>14</sup> Resin luting agents providing durable resin bonds significantly strengthen ceramic materials by "healing" minor surface defects.<sup>15</sup> Adhesive resin cements must have the ability to bond to both tooth structure and restoration, otherwise, poor bond quality at either the ceramic-cement or dentin-cement interface can significantly reduce the fracture resistance.<sup>13</sup>

The purpose of this study was to investigate the effect of the adhesive bonding system (total-etch versus self-etch) on the vertical marginal gap distance and the fracture resistance of lithium disilicate based crowns and to evaluate the effect of dentin pre-treatment preceding each cement on the results.

## 2. Materials and Methods

### 1- Sample preparation:

Forty recently extracted caries free maxillary first premolars of similar size were collected and stored in water in a refrigerator to avoid dehydration until used. The teeth were embedded in acyclic resin blocks (Melioident, Bayer Dental, Newbury, UK) up to 2mm below the cemento-enamel junction. To secure the tooth in the resin block, a hole in the root was drilled where an orthodontic wire was placed and protruded for mechanical interlocking within the resin. Using an industrial lathe machine, the teeth were prepared for all ceramic preparation with standardized dimensions of 6 degrees angle of convergence.<sup>16</sup> The preparation had 5mm occluso-cervical height, 3mm occlusal diameter, 6mm cervical diameter, 1.2 mm shoulder finish line and 130 degrees occlusal angle.

### 2- Crowns construction:

A total number of forty crowns were constructed. For the purpose of standardization, two counter dies (stainless steel) were constructed, one counter die provided 0.8mm space for core construction and the other provided 1.2mm space for veneer application. Forty impressions of the prepared teeth were made with polyvinyl siloxane impression material (Imprint II, 3M, ESPE, Minnesota, USA) using custom made trays and poured into stone dies (Degussa, AG, Frankfurt, Germany). The stone dies were trimmed, and die spacer was applied (Vita zahnfabrik, Bad Sackingen, Germany) followed by separating medium application (Bego, Bremer, Bremen, Germany). Direct wax pattern (Schuler-dental, GmbH & Co, Kohn, Germany) was made on the stone dies. Waxed crown samples were constructed, and then the first counter die was applied to provide 0.8mm space for core construction. Verification of the thickness was performed using a caliper. Spruing, investing using E-max Press Vest Speed investment (Ivoclar, Vivadent, Schaan, Liechtenstein) and wax elimination following manufacturer's instructions was performed. E-max Press ingots medium opacity (Ivoclar, Vivadent, Schaan, Liechtenstein) were heat pressed in the EP 600 furnace (EP600 Combi, Ivoclar, Vivadent, AG FL-9494, Schaan, Liechtenstein) following manufacturer's instructions forming the full thickness core. The cores were replaced onto the dies for full thickness veneering application, using the second counter die which provides 1.2mm space for veneer application (0.4mm thickness). The E-max Ceram veneering (Ivoclar, Vivadent, Schaan, Liechtenstein) was mixed, then applied conventionally and fired according to the manufacturer's direction. Adjustment to the final 1.2mm thickness was verified prior to over glaze at 750°C. Finally, the samples were ultrasonically cleaned in an ultrasonic bath (Vitasonic, Vita Zahnfabrik, Bad Sackingen, Germany) for five minutes and then examined carefully for any crack or defect. The fitting surface of the E-max crowns was etched for 2 minutes with hydrofluoric acid (Ivoclar, Vivadent, Schaan, Liechtenstein) then silane treated (Monobond-S, Vivadent, Schaan, Liechtenstein) according to the manufacturer recommendation.

### 3- Samples assignment:

The forty crowns were assigned to 4 groups (N = 10 each) according to the adhesive luting systems employed. Table (1) shows the

different systems used, their main components and application protocols.

**Group (U): Self-etch system:**

The self-adhesive approach was employed using RelyX Unicem resin cement (U) according to the manufacturer's instruction to lute the ceramic crowns.

**Group (V): Total-etch system:**

The dentin was etched with 35% phosphoric acid for 15 seconds, rinsed, gently air dried, and followed by Excite DSC bonding agent application (Ivoclar, Vivadent, Schaan-Liechtenstein). Variolink II resin cement (Ivoclar, Vivadent, Schaan, Liechtenstein) was mixed according to the manufacturer's instructions and applied to the internal walls of the crowns for cementation.

**Group (GU):**

An application of G-bond (G) on untreated dentin preceded the use of RelyX Unicem resin cement (U) for luting the crowns.

**Group (GV):**

It consisted of the application of G-Bond (G), the self-etch adhesive, on untreated dentin according to the manufacturer's instructions, and then Variolink II resin cement was used for cementation of the crowns.

**4- Ultrasonic cementation of the crowns:**

An ultrasonic seating tip (Sonic Flex, KaVo, America Corporation, Lake Zurich, IL, USA) was used to seat the crowns on the dentin surface. The ultrasonic unit was set at a power 2 and was turned on each time for five seconds to minimize the up heating of the tip. The total ultrasonic seating time was 30 seconds,<sup>17</sup> where pressure was applied on several points of the surface. Then light curing was done multidirectional according to the manufacturer's instructions. The cemented crown samples were stored in distilled water for 24 hours at room temperature, and then subjected to 500 thermal cycles between 5°C and 55°C with dwell time of 30 seconds.

**Vertical marginal gap distance assessment before and after cementation:**

A stereomicroscope (SZ-PT-Olympus, Tokyo, Japan) was used to measure the vertical marginal gap in microns at the tooth/ceramic interface for the ceramic crowns being non-luted which recorded a mean marginal gap of 58 µm. The cemented crown samples were examined for vertical marginal gap distance after cementation, to monitor

the interfacial vertical marginal gap distance in microns at the tooth/ceramic interface multiple measurements were made at eight different regions of the crown circumference. This is done to compare between the 4 groups regarding the effect of different adhesive systems on the marginal gap.

**Fracture resistance test after cyclic loading:**

All samples were individually and vertically mounted in the lower fixed compartment of a computer operated materials testing machine (Model LRX-plus; Lloyd Instruments Ltd., Fareham, Hampshire, UK) with a load cell of 5 kN and data were recorded. The samples underwent pre-loading in a cyclic manner (10000 cycles).<sup>18</sup> The load was cycled between a specified minimum 30 N to prevent lateral dislocation of load applicator and a maximum 300 N, this reflects normal occlusal and chewing forces.<sup>19</sup> This testing protocol was based on previous reports of physiological load levels during chewing (clinical realistic). The rate of cyclic loading was a compromise between physiological chewing rates (masticatory cycle 0.8-1.0 , approximately 1 Hz).<sup>20</sup> A layer of rubber was placed between the loading tip and the occlusal surface of the crown samples to achieve homogenous stress distribution and minimization of the transmission of local force peaks.

After load cycling, the crowns were then statically compressively loaded until fracture at a cross head speed of 1mm/min with the same steel rod, which had been used in cyclic pre-loading procedure placed centrally at the occlusal surface of the crowns. The load-deflection curves were recorded with computer software (Nexgen; Lloyd Instruments Ltd). The compressive load required to cause fracture was recorded for each specimen in Newtons.

**Statistical analysis:**

Data were presented as mean and standard deviation (SD) values. Paired t test was used to compare vertical marginal gap before and after cementation. One-way Analysis of Variance (ANOVA) was used to compare between the 4 groups regarding the effect of different adhesive systems on the mean fracture resistance and marginal gap distance of the four groups. Tukey's post-hoc test was used for pair-wise comparison between the means when ANOVA test was significant. The significance level was set at P < 0.05. Statistical analysis was performed with SPSS 15.0 (Statistical Package for Scientific

Studies for Windows. SPSS, Inc., Chicago, IL, USA.)

Visual examination for the mode of fracture:  
All specimens were visually examined to determine the mode of fracture.

#### Scanning electron microscopic examination at dentin/resin interface:

For morphologic evaluation of the dentin/resin interfaces by SEM (Jeol, XL, Phillips, Holland), eight mandibular premolars were collected. The teeth were prepared by sectioning the crown perpendicular to the long axis of the tooth using a low speed diamond disc under water coolant to remove occlusal enamel and expose a flat dentinal surface. The teeth were then embedded in self-cured acrylic resin, using a cylindrical Teflon mold, such that the long axis of the tooth was perpendicular to the surface of the mold. The dentinal surfaces were abraded with 360/grit silicone carbide paper under running water to create a flat, uniform, smooth dentinal surface. The teeth were selected as representative samples for each group with its prementioned protocol of adhesive application to the dentin surface but without the crowns. A split Teflon mold was used (with a central hole of 3mm diameter and 2mm depth) for resin cement application. Representative samples (two teeth) for each of the 4 groups were sectioned longitudinally through the dentin-resin interface perpendicular to the bonded surface of each tooth, using a low speed rotary cutting machine under copious water coolant. After the surfaces were polished with soflext polishing discs, they were immersed in 6-mol/liter hydrochloric acid (HCl) for 30 seconds to demineralize any minerals within the hybrid layer that was not protected by resin infiltration. This was followed by rinsing the specimens with water for one minute. The specimens were then immersed in 1% sodium hypochlorite (NaOCl) for 10 minutes to dissolve all exposed collagen beneath the hybrid layer, and then thorough rinsing with water was performed for 5 minutes.<sup>21</sup> The specimens were dehydrated in ascending concentration of alcohol, subjected to critical point drying and then all specimens were gold sputtered. The hybrid layer and the resin tags at dentin/resin interfaces of these specimens were observed with SEM at magnification 1000 X.

### 3. Results

The means, standard deviation values and results of paired t-test presented in Table 2, revealed that there was a statistically significant increase in mean gap distance after cementation in all groups.

Vertical marginal gap distance after cementation for the four groups

The means, standard deviation values and results of ANOVA and Tukey's tests are presented in Table (3). Group (U) showed the statistically significant highest mean gap distance. This was followed by group (V). There was no statistically significant difference between group (GU) and group (GV), which showed the statistically significantly lowest means gap distance.

#### Fracture resistance

The means, standard deviation values and results of ANOVA and Tukey's tests are presented in Table (4). Group (GU) showed the statistically significantly highest mean fracture resistance. This was followed by group (GV) then group (V). Group (U) showed the statistically significantly lowest mean fracture resistance value.

#### Visual mode of failure

Visual examination of all groups showed a longitudinal fracture through the crown continuous with the tooth structure. Figure 1 is a representative sample showing the longitudinal fracture.

#### Scanning Electrons Micrograph

Scanning electron micrograph for self-etch adhesive approach group (U) presented in Figure 2a revealed indistinct resin tag formation. Typical well-formed resin tags were not prominent. G-bond application to dentin prior self-etch adhesive system in group (GU), presented in Figure 2b, resulted in increased resin tag formation which are connected with resin infiltrated dentin surface. Long, thick coagulated pattern was evident. Total-etch approach of group (V), Figure 2c, revealed the presence of hybrid layer with numerous long, tubular resin tags forming a bundler appearance. They are connected with resin infiltrated dentin surface in a rough pattern, resinous lateral branches connecting adjacent resin tags. A gap free attachment at the interface was evident. G-bond application to dentin prior to Variolink (GV), presented in Figure 2d, resulted in increased resin tag formation in a bundler appearance. They are connected with resin infiltrated dentin surface. Resinous branches with long, thick coagulated pattern were evident.

**Table 1: The components and application protocols of the dentin adhesive system**

<b>Adhesive system (Manufacturer)</b>	<b>Main component</b>	<b>Application protocol</b>
RelyX Unicem resin luting cement (3M ESPE, Seefeld, Germany)	Methacrylated phosphoric ester, dimethacrylates, inorganic fillers, fumed silica, stabilizers and initiators.	(Self-adhesive approach) the cement was supplied in a capsule, which was activated and mixed for 10 seconds using Rotomix (3 M ESPE )
Variolink II resin luting cement(Ivoclar, Vivadent, Schaan, Liechtenstein)	Urethan Dimethacrylate (UDMA) and Bis phenol Glycidial methacrylate (BisGMA), inorganic fillers barium glass filler and silicon dioxide filler, Ytterbium triflouride, catalysts stabilizers and pigments.	2 paste system (total-etch approach) Base: Urethane dimethacrylate, Catalyst: Dimethacrylates.
Exite (Ivoclar, Vivadent, AG FL-9494 Shaan/Liechtenstein )	2-Hydroxyethylmethacrylate (HEMA), dimethacrylates, phosphoric acid acrylate, silicon dioxide, initiators and stabilizers in an ethanol solution	Apply to moist dentin for 10 seconds. Dry gently for 1-3 seconds. Light cure for 20 seconds.
G-Bond (GC corporation, Tokyo, Japan)	Methacryloyloxyethyl Trimellitate (4-MET), phosphoric ester monomer, UDMA, acetone and camphorquinone	Apply to entire dried surface. Leave undisturbed for 10 seconds. Dry thoroughly under maximum air pressure for 5 seconds. Light cure for 10 seconds.

#### 4. Discussion:

Natural teeth have been used in this study, which are difficult in standardization as they show a large variation depending on age, and anatomy. Several studies used steel or resin dies for the fracture testing of crowns as they include standardized preparation and identical physical quality of materials used. However, prepared teeth made of steel or resins do not reproduce the real force distribution that occurs on crowns cemented on natural teeth. Dentin has a lower elastic modulus than steel; therefore, the inner crown surface shows a greater shear stress every time the tooth is subjected to deformation.<sup>10</sup> In natural teeth no uniform force distribution is expected between ceramic and tooth structure due to their different moduli of elasticity.<sup>22</sup> However if they are well bonded together they will act as one unit i.e. the stronger part strengthening the weaker part. This bonding is realized by the type and the efficiency of the bonding system. In this study, the bonding was done with several systems to investigate efficiency. To begin with, all crowns were silanated before cementation to improve the adhesion between the ceramic crowns and the luting systems.<sup>23</sup> Ultrasonic cementation technique was selected in this study to benefit from the acoustic energy applied to increase the flow of the luting cement with subsequent decrease in its viscosity (thixotropy). This acoustic energy results in decreasing the number and size of the voids in the luting cement, hence, increasing the adaptation of the material. Moreover, any medium or object in the path of an ultrasonic beam is subjected to a radiation force, which tends to push the luting cement in the direction of the propagating waves. This may cause redistribution and aggregation of the filler particles of the cement leading to optimum particle size distribution.<sup>17</sup> All the bonding systems used in this study were dual cured cements, their polymerization reaction is chemically and photo-initiated. This ensures higher conversion rate of curing, leading to better mechanical properties, i.e. the force will be distributed over a large area, as the whole assembly: the crown, the adhesive and the tooth structure would act as one unit.<sup>24</sup> This was confirmed by the visual mode of fracture where the failure was within the long axis of the crown and the tooth structure, which may demonstrate effective adhesive systems on the fracture resistance (Figure 1). From the limitation of this research, is that lateral forces were not duplicated. Axial loading was only applied in the testing method which interprets the presence of longitudinal failure mode. Actually, the forces existing in the clinical situation are multidirectional so by utilizing other testing method using chewing simulators, other fracture modes may be available.

The fracture resistance of the dentin-ceramic bonded system is affected by many factors among them are the composition of the restorative material, as well as the composition, the consistency and the flow properties of the bonding system. The used ceramic system is a new core glass ceramic material "E-max-press" containing lithium disilicate crystal as a strengthening agent. The ceramic crowns restoring the teeth showed a high fracture resistance values for all groups in varying degree. All groups had the same restorative material and were done with a similar controlled design. The only different parameter was the bonding system. The bonded interface can be the weakest area of tooth-colored restorations if it is exposed to the oral cavity i.e. increased marginal gap distance. Improving the bonding durability of luting resins to dentin and to the restoration leads to the reinforcement of brittle restorations and the longevity of bonded restorations in fixed prosthodontics.<sup>25</sup>

Comparing the results of the gap distance before cementation, all groups were insignificantly different from each other with an acceptable gap distance of approximately  $58 \pm 6.7 \mu\text{m}$ .<sup>26</sup>

After cementation, the magnitude of gap differed with the different groups i.e. the introduction of the bonding system and the cement. RelyX Unicem showed the highest gap distance ( $114 \pm 6.4 \mu\text{m}$ ) with the lowest fracture resistance ( $2270.9 \pm 3.4 \text{ N}$ ). This may be due to several factors: 1- the high viscosity of the RelyX Unicem noticed during application, due to the presence 9% amount of fillers, which lead to high film thickness. For effective chemical bonding, the distance between the adhesive and substrate must be less than few Angstroms. Increase in adhesive thickness is susceptible to large amount of voids preventing intimate contact between the tooth structure and the bonding system (Figure 2a), which may help in initiating crack. The bulk properties of the tooth substrates (dentin) and restorative substrate (ceramic) are much stronger than the bond strength of the cement/restorations. Therefore, cracks that form generally remain in the bonded interface zone. As cracks grow, they contribute to stress concentrations or stress redistributions within the substrates. The final failure may often extend for short distances through portions of tooth structure or restorative material explaining the accelerating failure rate.<sup>27,28</sup> In addition, the presence of voids at the interface can lead to bending of the restoration under force application, which will accelerate

failure of the restoration. The more the resin thickness the more contraction stresses of the bonding system, the less the maturing bond to walls. As long as the polymerizing material can flow before reaching the gel point, contraction stress can be dissipated. This suggests that a thin layer of resin bonded to the ceramic surface may, in some situations, act to reinforce the ceramic material, i.e. there will be no gap between the restoration/cement/tooth structure, the force induced is a compressive force. 2- RelyX Unicem is a self-etch adhesive maintaining the smear layer on the dentin preventing the adhesion between dentin and the adhesive (Figure 2a).<sup>29</sup> Since the self-etch approach uses acidic adhesive co-monomers, which dissolve the inorganic phase of dentin, and simultaneously primes and infiltrates the dentin matrix without removing the smear layer, it leads to fewer exposed collagen fibrils.<sup>30</sup> Adhesive stability is related to the effective coupling of the co-monomers with the infiltrated substrate.<sup>31</sup> 3- The pH of the acid used in any adhesive system is related to its success in bonding with dentin. RelyX Unicem contains phosphoric acid ester with higher pH than phosphoric acid acrylate used for the total-etch technique of the Variolink II and Excite system, as reported by the manufacturer, and therefore it has a lower bonding capacity.

Variolink II with Excite adhesive bonding system gave better vertical marginal gap distance and better fracture resistance than RelyX Unicem. Variolink II is a total-etch contributing to complete removal of the smear layer with dentin. Moreover, etch-and-rinse adhesive system is applied directly on the demineralized dentin collagen. The maintenance of the structural integrity of these structures during and after etching should greatly improve the final stability of the hybrid layer, as the collagen in the dentin matrix is preserved (Figure 2c).<sup>32</sup>

Treatment of dentin with G-bond improved the gap distance between the restoration, the tooth structure, and the fracture resistance. G bond was applied for groups GU and GV before the application of the RelyX Unicem and Variolink II. The values of fracture resistance were higher and significantly different for the pretreated groups than for the untreated groups (Table 4). This may be due to the presence of 4MET (methacryloyloxyethyl Trimellitate) formulated with fillers in the G-bond system .These components produce nano particles responsible for the formation of extremely thin layer of nano interaction zone containing insoluble calcium compound with dentin characterized by the exposure of little amount of collagen fibrils.<sup>33</sup> According to the adhesion-decalcification concept, the less soluble the calcium salt of an acidic molecule, the more intense

and stable the molecular adhesion to a hydroxyapatite-based substrate.<sup>34</sup> In addition, the absence of HEMA (Hydroxy Ethyl Methacrylic acid) in group (U) rendered the bonding system less sensitive to water uptake. HEMA creates a hydrogel within the hybrid layer and adhesive resin in some cases. The hydrogel may provide a channel for water permeation that has the potential to affect the durability of bonds. Thus, HEMA free adhesives have been proposed as RelyX Unicem and G-Bond. The omission of HEMA from the adhesive blends has been considered advantageous in removing water, separating it from the other components upon solvent evaporation.<sup>35</sup> Figures 2b and 2d for the treated dentin with G-bond, showed increased resin tags formation in a bundler appearance, which are connected with resin infiltrated dentin surface. Resinous branches with long, thick coagulated pattern were evident after the application of the G-bond system. Although the present investigation may be rather close to the clinical situation, the prospective clinical trial remains the final instrument to definitely answer the raised question regarding the appropriate adhesive system to enhance the fracture resistance and marginal fidelity of E-max crowns.

**CLINICAL IMPLICATIONS:** Within the limitation of this study total-etch adhesives are more preferred than self-etch adhesives for luting all -ceramic crowns. However, treatment of dentin surface prior to the application of any bonding agent is of great importance to enhance the fracture resistance and marginal fidelity of E-max ceramic crowns.

## 5. Conclusion

From the present study, the following can be concluded:

- 1- Bonded ceramic restorations with total-etch system offer better vertical marginal gap distance and fracture resistance than bonded restorations with self-adhesive system.
- 2- Treatment of the dentin surface, with all in one self-etch adhesive, prior to the application of the bonding system is very efficient.
- 3- The bonding system affects the vertical marginal gap distance and the fracture resistance of all- ceramic restorations.

**Abstract:** Objectives: This study aimed to investigate the effect of different desensitizers on the retention of short and over-converged preparations. Methods: Eighty molars were prepared with 3mm occluso-cervical height and 24 degrees convergence angle. Nickel-chromium copings were cast with a loop at the occlusal surface for tensile loading after cementation. The copings were assigned to two groups (N=40 each) according to the cement used. Group 1: resin cement (Duolink). Group 2: glass-ionomer (Ketac-Cem). Each group was assigned to four subgroups (N=10 each) according to desensitizers used prior each cement. Subgroup I: control (untreated), subgroup II: Gluma Comfort + Desensitizer, subgroup III: Oxalate (Bisblock) and subgroup IV: Fluoride varnish (Flor-Opal). The retention was determined by uniaxial tensile mode of force. Two-way Analysis of Variance (ANOVA) SPSS 16.0 was used to assess cements, desensitizers and their interactions on copings retention. Results: Resin group: Oxalate ( $212.10 \pm 7.41$ N) showed the significant highest mean of retention, followed by Gluma ( $201.52 \pm 6.93$ N), then control ( $177.52 \pm 6.14$ N). Fluoride ( $153.80 \pm 6.03$ N) recorded the lowest mean. Glass-ionomer group: control ( $135.54 \pm 4.58$ N) and Oxalate ( $132.62 \pm 4.84$ N) recorded the significant highest mean, followed by Gluma ( $126.84 \pm 4.75$ N). Fluoride ( $101.96 \pm 6.34$ N) recorded the lowest mean values. Conclusions: With questionable preparations, fluoride desensitizer drastically affected the retention of both cements. Oxalate and Gluma enhanced the retention with resin cement. Oxalate desensitizer can be efficiently used with glass-ionomer. [Journal of American Science. 2010;6(11):274-283]. (ISSN: 1545-1003).

## 1. Introduction

Several factors play role in the maintenance of fixed prosthesis in service, such as the retentive and resistive capacity of the prepared tooth, the characteristic properties of the luting cements and sealing of dentin prior to cementation of cast restorations to decrease post-cementation sensitivity.<sup>1,2</sup>

The retentive capacity of the prepared tooth is influenced by many features including; the angle of occlusal convergence and the occluso-gingival (OG) height of the preparation. According to Tylman, the angle of convergence for ideal fixed partial denture preparation should be between 2-5 degrees.<sup>3</sup> Clinically, this ideal taper is seldom achieved. In a previous study, the mean angle of convergence of crown preparations made by final-year dental students was reported to be of 21 degrees.<sup>4</sup> In another study, the mean angle of convergence of crown preparations made by general dental practitioners and by specialists was reported to be 20 degrees.<sup>5</sup> However, in some situations such as mal-aligned teeth, near parallelism of the preparation walls is difficult to achieve without over cutting of the mal-aligned tooth to align its proximal walls with those of other abutments. As for teeth with short clinical

crowns, short preparation will result in relative reduction of crown retention. Clinically, a short crown may require lengthening before preparation. This lengthening procedure involves periodontal surgery and adds to the total cost and complexity of the treatment.<sup>6</sup>

Dental luting cements form the link between fixed restorations and the supporting tooth structure. Mechanical interlocking and chemical bonding are desirable factors in the fixation mechanisms of luting cements, and are critical for achieving suitable retention for metallic cast crowns.<sup>1</sup> Luting cements play a pivotal role in sealing the margins and overcoming preparation design errors.<sup>7</sup> The introduction of new strong forms of dental cements represents one of the most important changes in materials that relates to retention of fixed prosthesis.<sup>8</sup> When abutment tooth preparations have questionable retentive potential the use of an appropriate resin cementing medium in conjunction with a reliable bonding procedure can help to overcome retention problems.<sup>3</sup>

Dentin reduction and exposure of prepared tooth surface can lead to increased dentin permeability and subsequent pulpal irritation. Richardson et al, reported that approximately 1 to 2

million dentinal tubules are exposed during an average tooth preparation for a posterior crown.<sup>9</sup> Bränström's hydrodynamic theory speculated that any dentin stimulus can be transmitted back to nerve receptors resulting in fluid movement in the dentinal tubules with stimulation of the odontoblasts, which elicited a response by nerve fibers and resulted in pain.<sup>10</sup> During crown cementation, the luting agent is forced into the patent tubules before it sets and displaces an equal amount of dentinal fluid, leading to excessive hydrostatic pressure and irritation of pulpal tissues.<sup>11</sup> The smear layer evident after tooth preparation was also demonstrated to be in effective against luting agent irritation.<sup>12</sup>

Therefore the use of various dentin desensitizing agents after crown preparation or before cementation has been shown to be an effective clinical treatment in reducing sensitivity.<sup>13</sup> Desensitizers obturate exposed dentinal tubules with a resinous material and block tubular fluid flow thus reducing pain sensation.<sup>14</sup> Although the application of desensitizing has gained popularity, but unfortunately their effect on crown retention is still somewhat unclear and contradictory.

The purpose of this study was to investigate the effect of different desensitizers on the retention of short and over-converged preparations of crowns cemented with two adhesive luting agents.

## 2. Materials and Methods

### Teeth preparation:

Eighty caries free mandibular molars of similar sizes were collected and stored in water in a refrigerator to avoid dehydration until used. The teeth were embedded in acrylic resin blocks up to 2 mm below the cemento-enamel junction. To secure the tooth in the resin blocks, a hole in the root was drilled where an orthodontic wire was placed and protruded for mechanical interlocking within the resin. Using an industrial lathe machine the teeth were prepared for full veneer preparation with standardized dimensions of 24 degrees angle of convergence (wall angle of 12 degrees) as the convergence angle equals the sum of the taper of two opposing preparation walls.<sup>5</sup> The preparation had 3 mm occluso-cervical height, 3 mm occlusal diameter, 6 mm cervical diameter, 1 mm shoulder finish line and flat occlusal plane.

### Cast coping construction:

Eighty impressions for the prepared teeth were made with polyether impression material (Impergum, 3M ESPE, Germany) using custom made trays, Figure 1, and poured into stone die (Moldaroc, Bayer dental Lever Kusen, W Germany). The stone dies were trimmed, and die spacer was applied (Isocera BEGO). Direct wax pattern (Kerr, Mfg Co.

Rommelus, Mich) was made in the form of coping with a loop attached to the occlusal surface to allow tensile load testing after cementation. The wax patterns were cast in nickel chromium (Ni-Cr) alloys (Wiron 99, BEGO Bremer, Germany); according to the manufacturer's instructions, then were sprued and invested with Begoral phosphate bonded investment specific for the Ni-Cr alloy (BEGO Bermer, Germany). Wax burn out was carried out and casting was completed using an induction casting machine (Fornax 35 casting machine, BEGO Bremer, Germany). To simulate the construction conditions for ceramo-metallic restorations, after casting and divesting, the copings were subjected to the ceramic firing cycles recommended for the Vita VMK95 ceramics in the porcelain furnace. The fitting surface of the copings was sandblasted with 50 µm aluminum oxide particles for 15 seconds under a pressure of 60 PSI at a standard distance of 1cm away from the nozzle of the sandblasting machine (BEGO, Bremer, Germany). Before cementation, it was verified that the castings were not retentive as the copings were separated from the tooth preparations without any resistance when the samples were held upside down.

### Coping cementation:

The 80 copings were assigned to 2 groups (N=40 each) according to the adhesive luting cement presented in Table 1. Group 1 (R): Resin cement (Duolink).

Group 2 (G): Glass-ionomer cement (Ketac-Cem). Each group was then divided into 4 subgroups (N=10 each) according to desensitizers used prior each cement, Table 1.

Subgroup I: Untreated control (CON).  
 Subgroup II: Gluma comfort + Desensitizer (GLU).  
 Subgroup III: Oxalate (OXA). Subgroup IV: Flor-Opal (FLU).

### RCON

The dentin was etched with Uni-Etch etchant followed by One-step Plus bonding agent application. Duolink resin cement was mixed according to the manufacturers instructions and applied to the internal walls of the copings for cementation.

### R GLU

The dentin was etched with Gluma Etch followed by Gluma Comfort Bond + Desensitizer application following the manufacturers instructions, then Duolink resin cement was used for copings cementation.

### R OXA

The dentin was etched with Uni-Etch etchant, followed by Bisblock application following the manufacturers instructions. The adhesive One-step Plus was then applied followed by Duolink resin cement.

#### R FLU

Flor-Opal varnish was applied to the prepared dentin surface following the manufacturers instructions, then Duolink resin cement was used for copings, cementation.

#### G CON

Glass-ionomer cement (Ketec-Cem) was mixed according to the manufactures instructions and applied to the internal walls of the copings for cementation.

#### G (GLU,OXA and FLU)

Desensitizers were applied to the prepared tooth surface in a similar way as with the resin groups, and then Ketec-Cem glass- ionomer cement was used for copings cementation.

Each coping was first placed onto its corresponding tooth with finger pressure, and then a standardized static load of 5 kgN was applied with a specially fabricated loading device, Figure 2. The excess cement was removed while loading was maintained for 15 minutes to ensure complete setting of the cement. The eighty cemented samples were stored in water at 37°C in an incubator (Torre Picenardi, Italy) for 48 hours. To simulate the oral conditions thermocycling of the cemented samples was performed for 500 cycles between 5°C to 55°C + 2°C with a dwell time of 30 seconds in each water bath.<sup>15</sup>

#### **Coping Retention Test Procedure:**

The assembled teeth and copings were mounted on a computer controlled materials testing machine (Model LRX-Plus; Lloyd instruments Ltd., Fareham, UK) with a load cell of 5KN (Kilo Newton), and data were recorded using computer software (Nxygen-MT; Lloyd Instruments). Samples were secured to the lower fixed compartment of the testing machine by tightening screws. Coping retention was determined by uniaxial tensile mode of force using a specially fabricated attachment with a rigid metallic hook attached to the upper movable compartment of testing machine traveling at cross-head speed of 5mm/min. The hook was designed to grip the loop of the copings, Figure 3. The tensile load required to dislodge the cemented copings was recorded in Newton (N). The mean values and standard deviations for each group of both tested alloys were calculated and statistically analyzed.

#### **Statistical Analysis**

Tensile strength data were presented as mean and standard deviation (SD) values. Data were explored for normality using Kolmogorov – Smirnov test, and no significant departures from normality were observed (all P-values > 0.05). Homogeneity of variances among the groups was tested using Levene test, and the variances were found to be homogenous (P-value > 0.05).

Regression model with Two-way Analysis of Variance (ANOVA) was used in testing significance for the effect of cement, desensitizers and their interaction on mean retention. Tukey's post-hoc test was used for pair-wise comparison between the means when ANOVA test was significant. The lack of Fit test revealed P-value = 0.524 which means that the model adequately fits to describe the relationship between dependent and independent variables. Residual plots (Observed Predicted standardized residuals) for the dependent variable were produced. The points representing the residuals lie close to a line indicating a normal probability plot of the residuals. The significance level was set at P = 0.05. Statistical analysis was performed with SPSS 16.0® (Statistical Package for Scientific Studies) for Windows.

#### **3. Results**

The results showed that the regression model is fit to describe the relationship between the studied variables. Cement, desensitizers and their interaction had a statistically significant effect on mean retention, Table 2.

The means, standard deviation (SD) values and results of ANOVA test presented in Table 3, revealed that there was a statistically significant difference between the different interactions. Tukey's test showed that group resin (R) subgroup oxalate (OXA) showed the statistically significant highest mean of retention, followed by (R) subgroup Gluma (GLU), (R) subgroup control (CON) then (R) subgroup fluoride (FLU) that showed the lowest mean retention values. There was no statistically significant difference between group glass-ionomer (G) subgroup control (CON) and (G) subgroup oxalate (OXA), which showed high retention values, followed by (G) subgroup Gluma (GLU). Group glass-ionomer (G) subgroup fluoride (FLU) showed the statistically significant lowest mean retention. Resin cement showed statistically significant higher mean of retention than glass-ionomer cement, Table 4.

**Table (1): Different cements and desensitizers used in the study.**

Materials (Manufacturer)	Ingredients	Application protocol
Bisco, Inc, IL 60193 Schaumburg, U.S.A	<b>Uni-Etch</b> Phosphoric acid (32% Benzalkonium chloride (BAC) (0.1-1%)	Apply for 15 seconds washing with water, then gentle air drying for 2-3 seconds
Biso, Inc, IL 60193 Schaumburg, U.S.A	<b>One step plus:</b> Bisphenyle dimethacrylate (15-40%) Hydroxyethyl methacrylate (15-40%). Acetone (40-70%) Dental glass (1-10%).	Apply to the prepared tooth surface; use gentle air stream to evaporate the solvent. Light cure for 10 seconds.
Duolink resin luting cement (Bisco, Inc, IL 60193 Schaumburg) U.S.A	<b>Base:</b> - Bisphenol A.diglycidyl methacrylate (5-30%). - Triethylene glycol dimethacrylate (5-20%). - Glass filler (50-80%) - Urethane dimethacrylate (5-15%). <b>Catalyst:</b> - Bis-GMA (<31%). - Triethylene glycol Dimethacrylate (<21%) - Glass filler (<65%)	A dual-syringe delivery system is used for dispensing of equal amounts of base and catalyst. Light cure for 40 seconds
Ketac-Cem glass – ionomer cement (ESPE – Seefeld W. Germany).	<b>Powder:</b> - Glass powder - poly carboxylic - pigments <b>Liquid:</b> - Water - tartaric acid - conservation agents.	Mix a full one scope of powder to two drops of liquid for 30 seconds.
Gluma Comfort Bond + Desensitizer (Heraeus Kulzer, Inc 10504 Armonk, NY USA)	<b>Etchant:</b> 20%, phosphoric acid, blue dye: <b>Matrix:</b> UDMA HEMA 4-META Maleic acid polycarboxylic acid ester gluteraldehyde <b>Filler:</b> None	Etch the tooth surface for 20 seconds then wash with water. Use gentle air stream to remove excess moisture for 1-2 seconds. Leave dentin surface moist and shiny apply Gluma Comfort + Desensitizer with a brush in copious amount. Leave undisturbed for 15 seconds then use gentle air blast to evaporate the solvents. Light cure for 20 seconds.
Bisblock desensitizer (Bisco, Inc. IL 60193 Schaumburg, U.S.A).	Oxalic acid (1-4%)	Apply on etched tooth surface and leave for 30 seconds to allow calcium oxalate crystals formation Wash with water and leave the surface slightly moist for wet bonding.
Flor-Opal varnish desensitizer (Ultradent Products, Inc, 505 West 10200 South, South Jordan Utah 84095, U.S.A).	50 mg sodium fluoride in alcohol and natural resin suspension.	Supplied in the form of two syringes inter connected together for mixing their contents. Air drying the tooth surface their express a small bead of varnish from Fx Flex tip. Brush the varnish on the tooth surface then spray with water to harden.

#### 4. Discussion:

In the oral environment, failure of retention of crowns and fixed partial dentures occurs under a combination of masticatory forces repeated over time. These are mainly direct compressive forces and some resultant shear lateral forces. In addition, there is a small component of tensile force. Most laboratories testing for crown retention, however, uses direct tensile force.<sup>6,8</sup> Consequently, one may state that the findings of this study, which used direct tensile loading, can be considered to relate directly to the clinical situation.

In the present study, prepared teeth with 24 degrees occlusal convergence angle and 3mm occluso-cervical height, were selected to approximate certain clinical situations. In this manner, the contribution of the cement to retention of the crown was better assessed.

Our study shows that with questionable retentive preparations oxalate and Gluma enhanced the retention of copings luted with resin cement. Only oxalate desensitizer can be efficiently used with glass-ionomer.

In this study the high values of retention recorded for group (R) subgroup (OXA) were attributed to the unique application technique and mechanism of action of BisBlock which is designed to prevent intra-tubular fluid movement causing dentinal sensitivity. BisBlock was applied on the dentin after surface decalcification by acid etching and rinsing, where the top 5-10 $\mu$ m of the matrix became depleted from calcium. Thus the oxalic acid was privileged to diffuse deeper into the dentinal tubules till reaching the calcium ions of dentin (mineralized

matrix) and dentinal fluid forming insoluble calcium oxalate crystals.<sup>16</sup> This caused blockage of dentinal fluid movement thus eliminating sensitivity and reducing outward fluid movement during the subsequent bonding procedure. This "subsurface tubular occlusion" left the dentin surface unobstructed for the infiltration of the adhesive into the demineralized collagen matrix (the top 5-10 $\mu$ m). The adhesive penetrated inbetween the calcium oxalate crystals and entrapped them during its polymerization. Thus, preventing dislodgment of these crystals and prepared the surface for bonding. This unique mechanism of action might have provided tubular occlusion, plus formation of resin tags inside the dentinal tubules and subsequently enhanced the retention.

These results were consistent with Pashley et al 2001, and Jalalian et al 2009, who found that different formulations of potassium oxalate produced significant reduction in hydraulic conductance resulting in less permeable and acid resistant dentin surface.<sup>16,17</sup>

In this study, oxalate was incorporated into a compatible system (Uni Etch etchant and one step plus adhesive) to obtain the best performance. Uni Etch is a 32% phosphoric acid ( $H_3PO_4$ ) supplied as semi-gel etchant. It has the advantage of leaving no silica debris on the etched surface that impede the flow of primer and/or resin over the surface or into the dentinal tubules.<sup>18</sup> The percentage of phosphoric acid also represented a major contributing factor for the success of Bisblock because if the content has exceeded 32% this might have reduced the oxalate affectivity by additional etching, leading to hydrolytic degradation of the resin dentin bond and oxalate crystals.<sup>19</sup>

One step plus is a total etch two step bonding agent (Etch and Rinse) containing Bisphenol dimethacrylate (BPDM) with some hydrophilicity that enhances the wettability of the adhesive. Hydroxyethyl methacrylate (HEMA) being a wetting agent and promoter for the infiltration of the adhesive into the tooth structure, allowed intimate contact between the adhesive and the collagen fibers.<sup>20</sup> It also contains acetone as organic solvent that displaced water from the dentin surface and from the moist collagen network, thus promoting the infiltration of the polymerizable monomers into the open dentinal tubules and the nanospaces in the collagen network.<sup>21,22</sup> The organic solvent being volatile was easily eliminated by air jet so that only the polymerizable monomer remained.<sup>23</sup> However, this study is inconsistent with the findings of Abou El Dahab, 2007, who declared that oxalate treatment decreased

the bond strength of resin cement. The author attributed the results to the incompatibility between the oxalate desensitizers and adhesives used in the study, which had a low pH and high fluoride content.<sup>24</sup> The Low pH values might have increased the solubility of calcium oxalate crystals in the dentinal tubules and transformed them into calcium and oxalate ions. This was according to le Chatelier's principle that once calcium oxalate crystals are exposed to high  $H_3O^+$ , more calcium oxalate dissolves into calcium and oxalate ions to compensate for the depletion of oxalate ions and maintain the equilibrium constant.<sup>25</sup> The free fluoride ions from the adhesives might have also interacted with calcium and phosphate ions on dentin surfaces to form spherical globules of calcium fluoride ( $CaF_2$ ). The presence of these spherical globules at the bonded interface and in the adhesive layer acted as stress raisers that would create debonding at lower stresses than would occur in their absence and will hinder the adhesive infiltration and hybridization of demineralized dentin.<sup>26</sup> In the present study the adhesive used (One Step Plus) was with almost pH 4.6 and low fluoride content (70 ppm). The results of our study is also contradictory to the findings of Nadu, who reported that oxalate has a low occlusive effect due to its solubility in oral fluids.<sup>27</sup> However One Step Plus adhesive used penetrated in between the oxalate crystals and entrapped them during polymerization and thus prevented their dislodgment.

The high values of retention recorded of group (R) subgroup (GLU) could be attributed to the unique mechanism of action of Gluma Comfort Bond + Desensitizer as explained by Dijkman et al and Schupbach et al. They postulated that the Gluteraldehyde compound of Gluma was responsible for the intrinsic blockage of dentinal tubules. It reacted with serum albumin present in the dentinal fluid by coagulation, causing setting up of multiple septa [walls] that blocked the flow of fluids in the tubules which is referred to as interdental sealing and thus counteracting the hydrodynamic mechanism of dentin hypersensitivity.<sup>28,29,30</sup>

Another possible explanation of these results can be related to gluteraldehyde as a naturally occurring cross-linker that bonds covalently to collagen fibers and straightens the collapsed ones. This efficiently stabilized the dentin collagen, helped in its rewetting, reduced its marginal contraction gap and subsequently improved the adhesive strength.<sup>31</sup>

The Combination of a resin adhesive with a desensitizing agent seems to be contradictory at first sight, since effective adhesives are expected to seal the etched dentin surface by inter-peritubular hybridization and by resin tag formation in the opened dentinal tubules. However Jacobsen and Finger when examined the resin tags formed with Gluma bonding system postulated that the occluding protein precipitates were apparently not tight, but permeable for monomers.<sup>32</sup> It might be speculated that a similar combined sealing effect of protein precipitation and resin penetration might occur to the adhesive Gluma Comfort Bond + Desensitizer on the etched dentin surface producing a regular dentin surface sealing. The high retention values can be also attributed to 4-methacryloyloxyethyl-trimellitate anhydride (4-META) which is a wetting agent contained in adhesive Gluma Comfort Bond + Desensitizer and has the ability to chemically adhere to metal and calcium ions producing good bond with tooth structure.<sup>33</sup> The combined water and ethanol solvents might have served to the deep penetrating action of the Gluma. The ethanol being a water chaser and solvents for monomers ensures a good infiltration of the adhesive, better sealing and good bond strength. Also it doesn't evaporate too quickly, which might affect the bond strength, while the water act as a re-wetting agent that prevents the collapse of collagen fibers.<sup>34</sup>

However, contradictory findings were demonstrated by, Assis et al, 2006 who declared that Gluma desensitizer caused reduction of bond strength of resin cement.<sup>35</sup> But in their studies they used Gluma desensitizer which is a non polymerizable desensitizer that is not capable of forming a bond with the resin cement. While, in our study we used Gluma Comfort bond + Desensitizer which is an adhesive bonding agent with desensitizing effect that reacted with resin and even enhanced retention.

Surprisingly, the low retention values of fluoride group, maybe attributed to the superficial mechanism of action of fluoride varnish where it reacted with calcium of hydroxyapatite and formed CaF<sub>2</sub> crystals, which are loosely bound spherical crystals. The presence of these CaF<sub>2</sub> crystals at the bonded interface and within the adhesive layer, might have acted as stress raisers that would create debonding at lower stresses than would occur in their absence.<sup>24,26</sup>

The low retention values can be also related to the fact that fluoride varnish doesn't polymerize with the cement to increase bond strength. Yim et al, explained that a non polymerizable desensitizer would fill in the surface irregularities of dentin and

prevent mechanical interlocking of the cement, thus decreasing the bond strength.<sup>36</sup>

Sodium fluoride varnish being a non polymerizable desensitizer it might have negatively affected the glass-ionomer bond strength. This postulation is in agreement with Yim et al, who explained that a non polymerizable desensitizer might have filled in and smoothed the surface irregularities, thus precluding any ability of glass-ionomer to lock into surface irregularities and form chelation bonding.<sup>36</sup> The interaction of sodium fluoride with dentin surface and formation of CaF<sub>2</sub>, might have also deprived glass-ionomer from calcium ions needed for chelation.<sup>37</sup>

The significant higher tensile loads obtained for Ni-Cr crowns cemented with resin cements ( $186.24 \pm 23.70$  N) compared to that with glass-ionomer luting agent ( $124.24 \pm 14.30$  N) were attributed to the ability of dentin desensitizers to polymerize with resin cement and subsequently enhancing the crowns retention. This finding is in agreement with Yim et al, who declared that, crown retention was not enhanced when using glass-ionomer cement and polymerizable dentin desensitizer, and was lowered when a non polymerizable one was used. While the use of resin cement with desensitizing agent capable of polymerizing to the cement provides the greatest retentive strength.<sup>36</sup>

## 5. Conclusion

Within the limitations of this study, it was concluded that teeth with questionable retentive preparations, fluoride desensitizer drastically affected the retention of copings luted with both resin and glass-ionomer cements. The use of oxalate and Gluma enhanced the retention of copings luted with resin cement. Oxalate desensitizer can be efficiently used with glass-ionomer cement.

## Accuracy of working casts and dies produced by fast-setting polyvinyl siloxane impressions

Mona El-Agroudi MD DDS<sup>1</sup> and Eman Essam, MD DDS<sup>2</sup>

<sup>1</sup> Assistant professor of Fixed Prosthodontics, Faculty of Oral and Dental Medicine, Cairo University. , Egypt.

<sup>2</sup> Lecturer of Fixed Prosthodontics, Faculty of Oral and Dental Medicine, Al Azhar University. , Egypt.

**Abstract:** Purpose: This study aimed to evaluate the effect of spacer on the accuracy of working casts and dies produced from fast-setting polyvinyl siloxane impressions.

Materials and Methods: Twenty Impressions of the mandibular arch of a modified Dentoform master model incorporating a stainless steel circular crown preparation were made, using a fast-set Polyvinyl siloxane (Affinis perfect impressions Coltene/Whaladent AG) using 2-step impression technique with and without a spacer. Gypsum working casts and dies were produced from the poured impressions. Measurements of the master model and working casts were carried out including anteroposterior (AP) and cross-arch (CA) dimensions. The stainless steel circular crown preparation incorporated within the master model was also measured in buccolingual (BL), mesiodistal (MD), and occlusogingival (OG) dimensions and compared to measurements from recovered gypsum dies. Linear measurements were made using a measuring stereomicroscope. Results: Double impression technique without spacer showed statistically significant higher mean percent relative change than double impression technique with spacer. With each technique, the means percent relative change in die measurements showed statistically significant higher mean values than cast measurements. There was no statistically significant difference between means percent relative change in the BL and MD dimensions which showed the statistically significant highest mean values. The means percent relative change in the OG dimension showed the statistically significant lowest mean value. Conclusion: Accuracy of fast-setting polyvinyl siloxane impression material was favorably affected with the use of spacer, as the space resulted from contraction of the putty material was not enough to produce accurate detail reproduction by the light material. The working dies; from the fast- setting polyvinyl siloxane impression material without spacer demonstrated an increase in (mesio-distal and bucco-lingual) dimensions, while for cast dimensions, there was no difference between the two techniques. [Journal of American Science. 2010;6(11):284-292]. (ISSN: 1545-1003).

### 1. Introduction

Understanding accuracy of impression materials is required. Impressions register and reproduce the prepared tooth form and the surrounding oral tissues<sup>1</sup>. Elastomers were developed as a replacement of natural rubbers during world war II then they were modified chemically and physically for dental use. At first Polysulfide rubbers existed exclusively followed by condensation silicones, Polyether, and then Polyvinyl siloxane. It is relative to clinical<sup>2,3</sup> and laboratory factors<sup>4,5</sup>. Elastomers are subjected to dimensional changes. Polymerization involving cross linking of the polymer chain can result in reduction of the spatial volume<sup>5</sup>. The reaction continues for some time after the final set clinically<sup>5</sup>. Effect of temperature is another variable<sup>6</sup>.

Impression techniques have been categorized as monophase and dual phase. Techniques using monophase materials are made in a single step using a medium viscosity material. Techniques that use dual phase materials such as

putty and light body wash method may be accomplished in 1-step or in 2-step (1-step and 2-step putty/light body techniques). In the one step technique the putty and wash material are mixed in the same time. The light body material is syringed around the prepared teeth and the tray containing the putty is seated and stabilized with minimal pressure until the impression materials are set and polymerized. In the 2-step putty/light body technique a stock tray is painted with adhesive and the putty material produces a tray similar to that of acrylic resin. One precaution is to select a tray closely fitting the arch form thus reducing the amount of impression material and facilitate seating of the loaded tray intraorally. Another method is to make a preliminary putty impression intraorally and selectively relieve the putty and details are recorded by the light body only.

There is a potential difficulty with this technique as it is practically impossible to control the bulk and even amount of wash material. Moreover, further modifications to this technique include the use

of polyethylene spacer. The addition type silicones have been reported to be the most accurate and dimensionally stable<sup>7, 8</sup>. Some authors claim that the impression materials has improved to such an extent that accuracy can be controlled by the technique rather than the material itself.<sup>9, 10</sup> Others report that the technique does not affect accuracy.<sup>11, 12</sup> Several techniques have been proposed. The Putty/wash 1 step technique, Putty/ wash 2 step and the Putty/wash with polyethylene spacer<sup>[13-15]</sup> or a resin spacer<sup>16</sup>. Nissan et al reported that the polyvinyl siloxane 2 step Putty/wash impression technique is the most accurate, as a uniform cross sectional bulk of 2mm is provided.<sup>13</sup> Nissan et al<sup>13</sup> and Lee et al<sup>17</sup> used different quantitative analysis, moreover in the 1/step and the2/step the light body should cover the entire preparation but this cannot be accomplished clinically<sup>11</sup>. The 2/step technique has been reported to be more accurate than the 1/step technique<sup>13</sup>. With the 2/step technique the impression with the light body is made after the putty has polymerized and contracted therefore any further contraction in the light body results in minimal dimensional change<sup>13</sup>. The 1/step putty/light body technique has been criticized because of the uncontrolled bulk of the light body material<sup>14</sup>, by diminishing the volume of the polymerizing material at each stage the final contraction will be reduced and the accuracy of the impression can be improved .The impression techniques and the different protocols used to asses the accuracy of Impression materials explain the contradictory results reported in the literature.

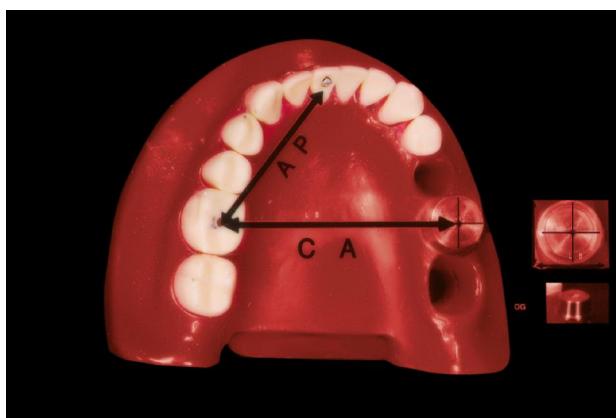

When clinical circumstances necessitate the use of fast-setting elastomeric impression materials; patients, practitioners, and dental office staff can benefit from the shorter setting times,<sup>18</sup> as time saving usually relates to reduced costs and increased patient comfort. Also, impression making is generally an uncomfortable procedure, and for some patients with a strong gag reflex, it presents a severe problem. Reducing the time the impression material remains intraorally is an improvement from the patient's perspective. The purpose of this study was to assess the effect of vacuum-formed resin sheet spacer on the accuracy of fast-setting polyvinyl siloxane impression material. Impressions were taken with and without spacer. Different methods of accuracy assessment were also used and compared. Thus, the research hypotheses were that no differences existed in accuracy among the two techniques which are with and without spacer, and secondly, no differences were existed between the two assessments.

## 2. Material and Methods

This study evaluated the accuracy of a polyvinyl siloxane rubber base impression material (Affinis perfect impressions Coltene/Whaledent AG), indirectly through recovered gypsum casts from impressions made on a master model. The tested variables included the use of double impression technique with a spacer and double impression technique without a spacer. (Table 1). The master model utilized was similar to that used in previous studies,<sup>[18-20]</sup> consisting of a Dentoform mandibular arch (Model 1362; Columbia Dentoform, Long Island City, NY) with some modifications. It contained a removable stainless steel complete crown preparation in the position of the mandibular right first molar (Figure 1). The complete crown preparation was machined with 12-degree angle of convergence with a gingival shoulder finish line. In addition two stainless steel inserts were placed, one on the central fossa of the occlusal surface of the left first molar, and one on the lingual surface of the mandibular left central incisor to provide reference points for measuring cross-arch(CA) and anteroposterior(AP) dimensions. Thus, reference mark 1 is placed on the lingual surface of the mandibular left central incisor; reference mark 2 on the central fossa of the left first molar; and reference mark 3 on the center of diameter of the stainless steel prepared crown representing the mandibular right first molar.

**Table [1]:** Variables tested

Tested variables	
Group 1	Double impression technique with spacer [n=10]
Group 2	Double impression technique without spacer[n=10]

**Figure 1:** Dentoform mandibular arch with removable stainless steel complete crown preparation

**Figure 2:** Spacer pressed onto the model

A total of twenty impressions were taken, and divided into two equal groups according to the selected variables, each consisting of 10 impressions.

Group 1: Ten casts were made from individual impressions of the master arch form, using the double step impression technique. A large, mandibular, disposable plastic impression tray (President Disposable Impression Tray; Coltene Whaledent, Cuyahoga Falls, Ohio) was used for all impressions. This was a rigid, perforated tray with the ability to resist distortion expected during seating and removal of the tray. A soft clear ethyl vinyl acetate spacer of thickness 1mm (Pro-Form; Dental Resources Inc, Delano, Minn) was pressed onto the master model using vacuum formed machine (Figure 2). For retention of the impression material the tray adhesive provided by the manufacturer was painted in the fitting surface of the tray. To standardize the seating position and centering of the tray during impression making on the master model, positioning guides were constructed with light polymerized acrylic resin material (Triad Tru Tray, VLC; Dentsply Intl, York, Pa). [Table 2] The type I high viscosity polyvinyl siloxane impression material [Affinis perfect impressions] was used according to manufacture instructions to make the impressions. The trays were loaded with the material then seated over the master model , centered according to the positioning guides, and left to polymerize [for 2.20 minutes at 37 0c in 100% humidity]. After the putty impression material is completely polymerized, the impression and the spacer were removed from the cast, and then the

spacer was removed from the putty impression. The light body polyvinyl siloxane material [Affinis fast light body] was then injected onto the complete crown preparation and occlusal reference points, and Syringed into the impressions evenly and the tray was reseated over the master model again and left for polymerization. Once removed, the impression was visually inspected to determine the reproduction of the details, rinsed for 10 seconds under running water to simulate the removal of saliva and other contaminants and then air dried. To form the working casts, type IV stone (Prima-Rock; Whip mix, Louisville, Ky) in the form of 70 gm packages was used. The stone was mixed using 14 ml of distilled water, first by hand for 15 seconds, and then vacuum-mixed for an additional 30 seconds (Combi-Mix; Whip mix). The stone was vibrated into the impression, filled to the level of the tray borders, and the excess material utilized to provide mechanical retention. The cast was allowed to set at room temperature in air for 60 minutes. To enable ease of separation of the stone working die, a stone separator (Super-Sep; Kerr Lab, Orange, Calif) was painted over the site. The cast was boxed and then a base was added using a type III dental stone (Microstone; Whip Mix). The base was allowed to bench set for one hour. The recorded stone cast with base was separated from the impression and left to set for 24 hours in ambient air for measurement.

Group 2: Ten casts were produced from individual impressions of the master model using the double step impression technique without a spacer, following the previously mentioned steps.

#### Measurements of casts' accuracy:

The master model and each recovered cast were measured in an ordered sequence, namely dimension A, the distance between reference marks 1 and 2; dimension B, the distance between reference marks 1 and 3; and dimension C, the distance between reference marks 2 and 3. The A, B, and C dimension measurements were made using a binocular measuring microscope (Nikon Measurescope 20; Nikon, Tokyo, Japan) capable of measuring to 0.001 mm. These measurements were repeated three times to determine the mean for each dimension. All measurements were made by the same investigator. The measurements were carried out at ambient room temperature and humidity ( $22.1^{\circ} 0 \pm 0.2^{\circ} \text{C}$  and 60% -10 %).

#### Measurements of dies accuracy:

The stainless steel and working dies were positioned on a custom fabricated stainless steel device, to assess the BL, MD, and OG dimensions. The cross-arch (CA) dimension was assessed by measuring the distance from the mandibular left first molar to the mandibular right first molar, the

anteroposterior (AP) distance from mandibular left first molar to central incisor; the mesiodistal (MD) and buccolingual (BL) dimension across the gingival shoulder of the simulated complete crown preparation and the occlusogingival (OG) measurement of the preparation from the gingival shoulder to the occlusal surface. The same five dimensions were measured on

working casts and die retrieved from impressions of the master model. Specimens were examined on a Zeiss stereomicroscope and pictures were taken using an Olympus Camedia C-5060 digital camera fitted on the microscope using a fixed magnification of x6.3.

**Table [2]:** Impression material tested: Morphometric measurements were done on an IBM compatible personal computer (PC). The image analysis software used was the “Image Tool for Windows version 3”. A graph paper was photographed using the same magnification of x6.3, for the purpose of calibrating the image analysis software, after the software is calibrated. The data obtained were then subjected to statistical analysis.

Product	Type	Working/Setting time (min:sec)	Batch no.	Manufacturer
Affinis perfect impressions	Polyvinyl Siloxane Rubber base material (Addition type) Putty Soft Fast base, Fast catalyst	Affinis fast regular body/ fast light body Mixing time (15 ml): 0:15 min Total working time: 1:15 min Oral setting time: 1:20 min	putty consistency ISO 4823, type 0 light consistency ISO 4823:2000	Coltene/Whaledent AG

#### Statistical analysis

Data were presented as mean and standard deviation (SD) values. ANOVA test was used to compare between master model and experimental models. Tukey's post-hoc test was used for pair-wise comparison between the means when ANOVA test is significant. Mann-Whiney U test was used to compare between the differences and percent relative changes from master model of the two groups. The significance level was set at  $P < 0.05$ . Statistical analysis was performed with SPSS 15.0® (Statistical Package for Scientific Studies) for Windows

### 3. Results

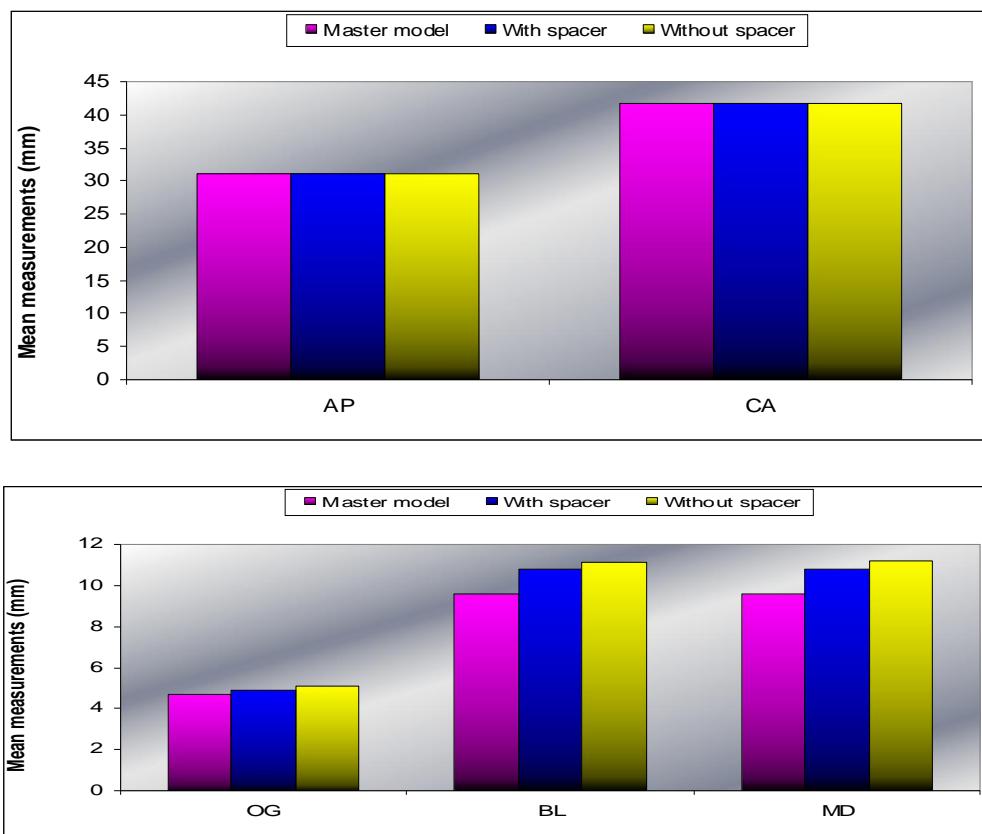

Comparison between cast and die measurements in the two techniques and master model

Dimension	Master model	With spacer		Without spacer		P-value		
		Mean	SD	Mean	SD			
	AP	31.1	0.1	31.1	0.1	31.1	0.2	0.966
Cast	CA	41.8	0.1	41.8	0.2	41.8	0.2	0.882
Die	OG	4.7 <sup>c</sup>	0.05	4.9 <sup>b</sup>	0.06	5.1 <sup>a</sup>	0.07	<0.001*
	BL	9.6 <sup>c</sup>	0.03	10.8 <sup>b</sup>	0.03	11.1 <sup>a</sup>	0.08	<0.001*
	MD	9.6 <sup>c</sup>	0.03	10.8 <sup>b</sup>	0.04	11.2 <sup>a</sup>	0.1	<0.001*

\*: Significant at  $P < 0.05$ , Means with different letters are statistically significantly different according to Tukey's test

As regards cast measurements, there was no statistically significant difference between double impression with spacer, without spacer and master model dimensions.

As regards die measurements in all dimensions, both techniques showed significant difference from master model measurements. Double impression without spacer showed statistically significantly higher mean measurement than double impression with spacer technique.

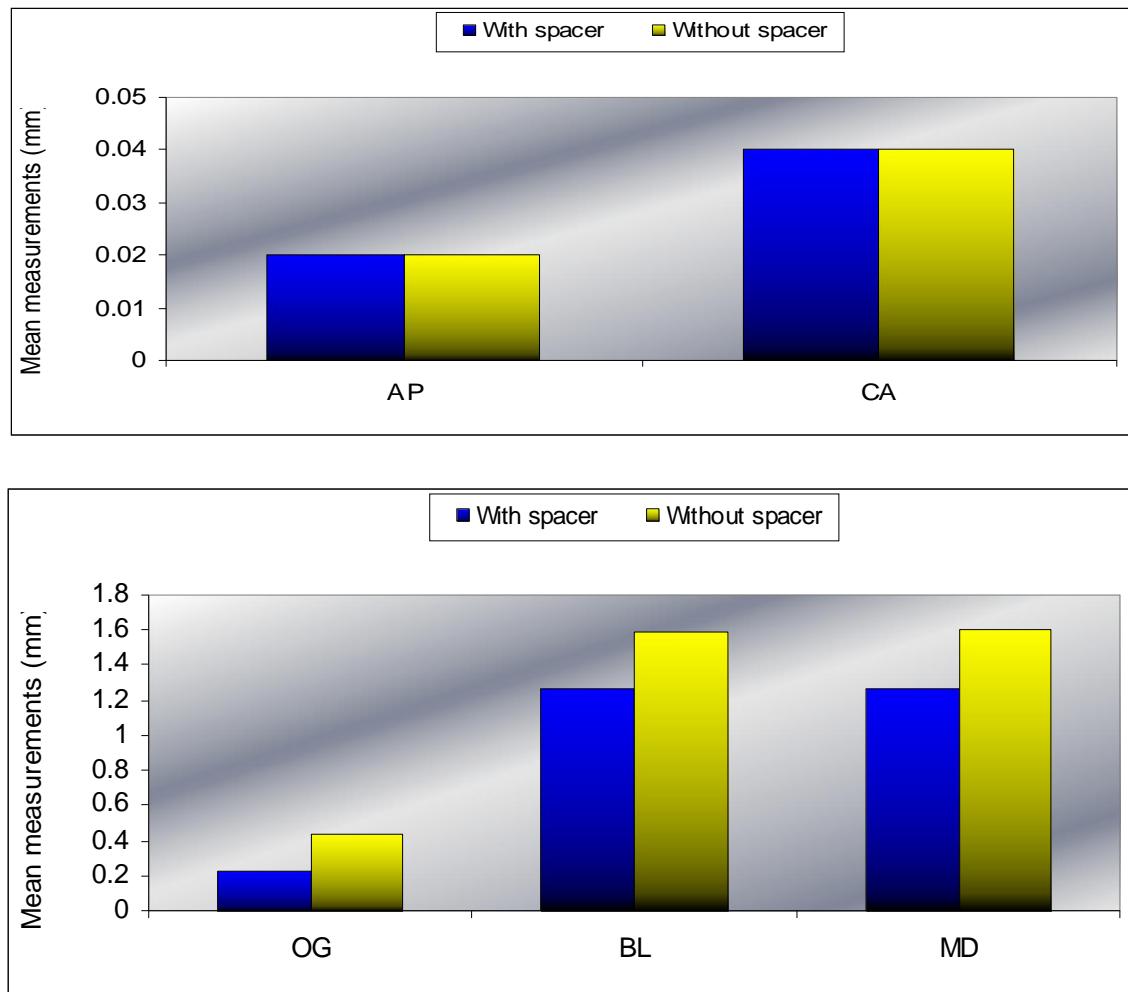

Comparison between differences from master model in cast and dies measurements

Die	OG	0.22	0.10	0.44	0.11	0.028*
	BL	1.26	0.05	1.59	0.06	0.009*
	MD	1.26	0.05	1.61	0.08	0.009*

\*: Significant at P < 0.05

As regards cast measurements, there was no statistically significant difference between double impression with spacer and double impression without spacer.

As regards die measurements in all dimensions, double impression without spacer showed statistically significantly higher mean difference than double impression with spacer technique.

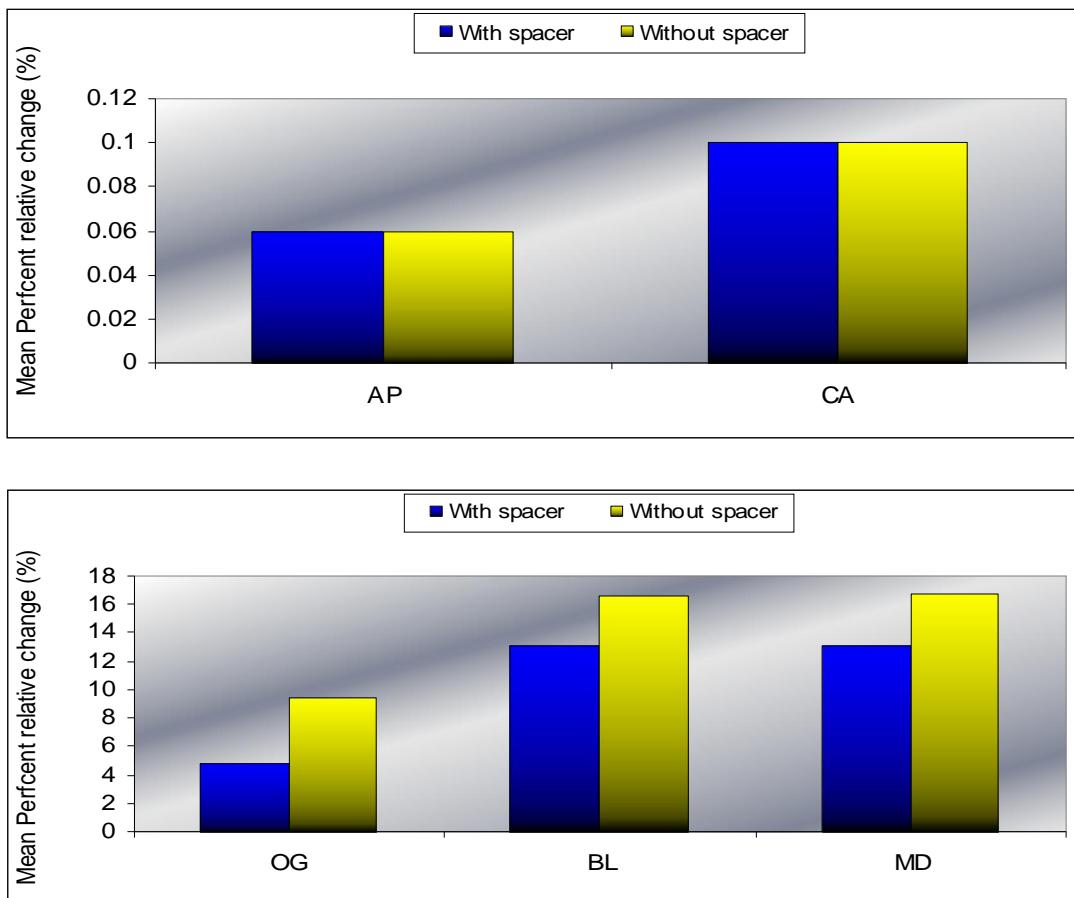

Comparison between percent relative changes from master model in cast and dies measurements

	Dimension	With spacer		Without spacer		P-value
		Mean	SD	Mean	SD	
Cast	AP	0.06	0.12	0.06	0.14	1.000
	CA	0.10	0.21	0.10	0.27	1.000
Die	OG	4.8	2.2	9.4	2.4	0.028*
	BL	13.1	0.5	16.6	0.6	0.009*
	MD	13.1	0.6	16.8	0.8	0.009*

\*: Significant at P < 0.05

As regards cast measurements, there was no statistically significant difference between double impression with spacer and double impression without spacer.

As regards die measurements in all dimensions, double impression without spacer showed statistically significantly higher mean percent relative changes than double impression with spacer technique.

There was no statistically significant difference between means percent relative change in the BL and MD dimensions which showed the statistically significant highest mean values. The means percent relative change in the OG dimension showed the statistically significant lowest mean value.

#### 4. Discussions

Distortion is a 3-dimensional problem that is inherent in all of the steps involved in fabricating an indirect dental restoration. Dimensional accuracy when making impressions is crucial to the quality of fixed prosthodontic treatment, and the impression technique is a critical factor affecting this accuracy<sup>21</sup>. As elastomeric impression materials have been reformulated to achieve a faster set, the accuracy of fast-setting elastomeric impression materials should be confirmed<sup>18</sup>. Accuracy of impression resulting from the 1-step putty-wash technique is controversial<sup>15</sup>. Some authors found that there was no difference in accuracy between techniques,<sup>11,12</sup> while others criticized several potential disadvantages with this

approach<sup>15</sup>. These disadvantages include lack of control of the bulk of wash material and the high risk of capturing portions of the prepared margin in putty material rather than lower viscosity material<sup>22</sup>. Most putty viscosity materials have inadequate fine detail reproduction for this purpose. In our study, it seems that this was the primary reason for the discrepancies in die dimensions resulted from double impression technique without spacer rather than double impression technique with spacer. An advantage of the 2-step double impression technique is that the impression of the teeth can be captured with the wash material<sup>11</sup>. The 2-step putty / light-body technique has been reported to be more accurate than the one-step putty/ light body technique<sup>11</sup>. With the 2-step technique, the impression with the light-body material is made after the putty has polymerized and contracted. Therefore, any further contraction of the light-body material results in minimal dimensional change<sup>13</sup>. This is in agreement with our study, where there was no statistically significant difference between the two techniques in accordance to cast dimensions. The 1-step putty/light-body technique

has also been criticized because of the uncontrolled bulk of the light-body material<sup>14</sup>. By diminishing the volume of the polymerizing material at each stage, the final contraction will also be reduced, and the accuracy of the impression can be improved<sup>23</sup>. Therefore, careful control of the bulk of the light-body impression material has been advocated because it affects the accuracies of the stone cast's<sup>24</sup>. The distortion of the die in a mesiodistal, buccolingual, and occlusogingival direction was investigated in this study. The machined stainless steel standard used in this investigation provided certain advantages in obtaining the measurements over that of a prepared plastic typodont tooth. The well-defined line angles of the stainless steel standard were clearly observed under the microscope, thereby reducing measurement error. The circular nature of the standard allowed observation of the relationship between the change in buccolingual and mesiodistal dimensions of the gypsum dies<sup>26</sup>. Dental elastomeric impression materials are subject to several factors that can result in dimensional changes<sup>18</sup>. For example, the process of polymerization, which involves cross-linking of the polymer chains, can result in a reduction of spatial volume<sup>5</sup>. Polymerization reactions have been shown to continue for a considerable period of time, beyond the achievement of what is considered a final clinical set, and continue after removal of the impression from the mouth<sup>5,6</sup>. Moreover, the lower viscosity of the material, the greater the contraction after polymerization<sup>12</sup>.

In the current study, the space resulted from contraction of the fast-setting putty material, was not enough to produce accurate detail reproduction by the light material. This ensures the necessity of using a spacer to provide enough room for the light-body to record fine details. The direction of dimensional change of impression materials has been reported to be dependent upon the bonding of the material to the impression tray<sup>8,25</sup>. Also; more rigid trays reduce the possibility of distortion in the impression<sup>26</sup>. In our study, a large mandibular disposable plastic impression tray was used for all impressions. This was a rigid, perforated tray with the ability to resist distortion expected during seating and removal of the tray. With a rigid tray and good adhesion to the tray; the material shrinks toward the tray, producing a larger die<sup>5</sup>. While when bonding to the tray may not be sufficient to constrain the material, shrinkage causes movement away from the tray and results in smaller dies. Eames et al<sup>25</sup> reported that the material may adhere to the adhesive of the tray, causing the negative image of the master die (the prepared tooth) to enlarge. In our study, the means percent relative changes in die measurements have also shown

statistically significant higher mean values than cast measurements. Nissan et al<sup>13</sup> studied the accuracy of three polyvinyl siloxane putty-wash impression techniques. When stone casts and the master model were compared, it was found that changes in the vertical dimension were greater than the horizontal. This phenomenon was attributed to the contraction of the impression toward the tray walls, making the stone dies wider in the horizontal aspect and shorter in the vertical one. In another study, Nissan et al<sup>14</sup> attributed the changes in the vertical dimensions (occlusogingival) to the same reason. It was concluded that wash thickness of 1 to 2 mm are most accurate for fabricating stone dies, when using polyvinyl siloxane impression materials with the 2-step putty/wash impression technique. Contrary, in the present study, there was no statistically significant difference between means percent relative change in the bucco-lingual and mesio-distal dimensions which showed the statistically significant highest mean values, while the means percent relative changes in the occluso-gingival dimension showed the statistically significant lowest mean values. This may be attributed to the fact that the amount of impression contraction on the expense of the horizontal aspect (mesio-distal and bucco-lingual), was not high enough to result in changes in the vertical (occlusogingival) direction. Hence, fast setting impression contraction has been greatly compensated for by the use of double step impression technique together with the use of a suitable spacer.

## 5. Conclusion

Within the conditions of this study, it was found that:

- Accuracy of fast-setting polyvinyl siloxane impression material was favorably affected with the use of spacer, as the space resulted from contraction of the putty material was not enough to produce accurate detail reproduction by the light material.
- The working dies; from the fast-setting polyvinyl siloxane impression material without spacer demonstrated an increase in (mesio-distal and bucco-lingual) dimensions, while for cast dimensions there was no difference between the two techniques.

# Kinetics and Thermodynamics of Oil Extraction from Jatropha Curcas in Aqueous Acidic Hexane Solutions

Sh. K. Amin, S. Hawash, G. El Diwani\*, and S. El Rafei

Chemical Engineering and Pilot Plant Department, National Research Center, Cairo, Egypt.

\*geldiwani@yahoo.com

**Abstract:** Jatropha oil curcas (JOC) extraction was performed in aqueous HCl, H<sub>2</sub>SO<sub>4</sub>, and H<sub>3</sub>PO<sub>4</sub> solutions with n-hexane (C<sub>6</sub>H<sub>14</sub>) at 30, 40, 50, and 60 °C using 10 gm of Jatropha seeds over 1 hours with 10 minutes sampling intervals. The optimum acid concentration was 15 % by weight for each acid, and the highest oil yield was obtained in the extraction procedure with n-hexane containing HCl. The extraction process was observed with regard to the percent oil yield versus time, and the reaction order was found to be first-order kinetics by the differential method. The activation energy for the oil extraction kinetics of Jatropha seeds with 15 % HCl was E<sub>a</sub> = 26.6763 kJ/mol, and the activation thermodynamic parameters at 60 °C were H = 23.908 kJ/mol, S = - 239.927 J/mol.K, and G = 103.803 kJ/mol. The enthalpy value was H = 0.1586 kJ/mol, and the other thermodynamic parameters at 60 °C were calculated to be S = 15.275 J/mol.K, and G = - 4.928 kJ/mol. [Journal of American Science. 2010;6(11):293-300]. (ISSN: 1545-1003).

**Key words:** kinetics, thermodynamics, oil extraction, Jatropha curcas.

## 1. Introduction

Jatropha is a genus of over 170 plants from the Euphorbiaceae family, native to the Central America but commonly found and utilized across most of the tropical and subtropical regions of the world. It has a yield per hectare of more than four times that of soybean and ten times that of corn <sup>(1)</sup>. Jatropha curcas is a wonder plant with a variety of applications and enormous economic potentials <sup>(2)</sup>.

Extracts from this species have been shown to have anti-tumor activity <sup>(3)</sup>, the leaves can be used as a remedy for malaria and high fever <sup>(4, 5)</sup>, the seeds can be used in treatment of constipation and the sap was found effective in accelerating wound healing procedure <sup>(4)</sup>. Moreover, this plant can be used as an ornamental plant, raw material for dye, potential feed stock, pesticide, soil enrichment manure and more importantly as an alternative for biodiesel production <sup>(6, 7)</sup>.

Oilseeds are extracted in two ways, by squeezing or mechanical pressing and with chemical solvents. Prior to the 1940's, mechanical pressing was the primary method used, but it had its limits in terms of oil recovery. By mechanical pressing, only 5–6 % of the oil was difficult to achieve <sup>(8)</sup>, and also pressing generates high temperatures which damage both oil and meal <sup>(8)</sup>.

Solid liquid extraction is a common and efficient technique in producing oil for biodiesel production. Solid liquid extraction, sometimes called

leaching, involves the transfer of a soluble fraction (the solute or leachant) from a solid material to a liquid solvent <sup>(9)</sup>. Solvent extraction was developed because it allows more complete extraction at lower temperatures. Extraction using supercritical fluid <sup>(10)</sup>, the oil produced has very high purity; however the operating and investment cost is high <sup>(10)</sup>. Solvent extraction has several advantages, it gives higher yield and less turbid oil than mechanical extraction, and relative low operating cost compared with supercritical fluid extraction <sup>(11)</sup>. For many years, commercial grade hexane was been the solvent of choice for the extraction of oil from oilseeds. Alternative hydrocarbon solvents for cottonseed extraction was recommended <sup>(12)</sup>, heptane and iso-hexane as potential replacements for hexane.

In the present investigation, oil extraction from Jatropha seeds in aqueous hydrochloric acid (HCl), sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) and ortho-phosphoric acid (H<sub>3</sub>PO<sub>4</sub>) solution with n-hexane (C<sub>6</sub>H<sub>14</sub>) was studied. The aim of the study was to find the optimum acid concentration and most effective acid from HCl, H<sub>2</sub>SO<sub>4</sub> and H<sub>3</sub>PO<sub>4</sub>, and, in physicochemical terms, to determine the kinetic and thermodynamic parameters of oil extraction from Jatropha seeds.

## 2. Materials and Experimental

### 2.1. Materials used:

### 2.1.1 Jatropha seeds:

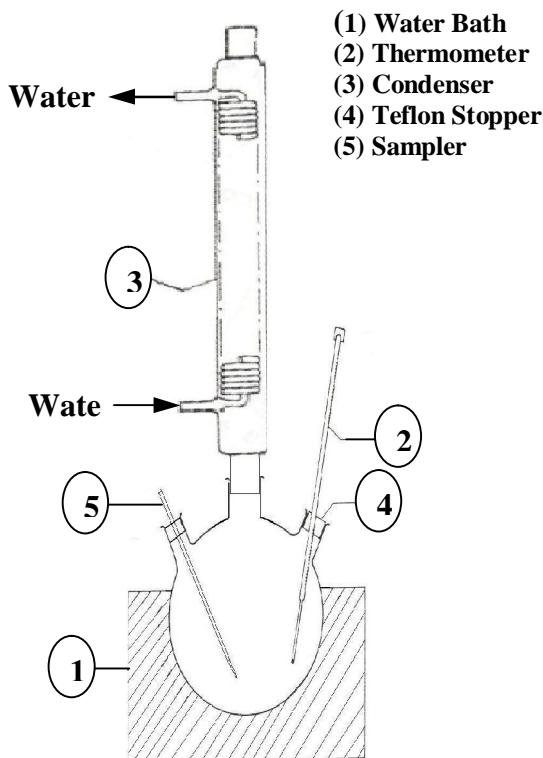

Jatropha seeds were purchased from local market "Ministry of Agriculture". For the extraction process, the seeds were shelled, and then ground to a mesh size of 40 (425  $\mu\text{m}$ ). The moisture content of the ground Jatropha seeds was 7.48 %.

### 2.1.2 Solvent acid solutions:

The normal hexane ( $C_6H_{14}$ ), hydrochloric acid (HCl), sulfuric acid ( $H_2SO_4$ ), and orthophosphoric acid ( $H_3PO_4$ ), were used to prepare aqueous acid solution as wt. 0 % (without acid only hexane with distilled water), 5 %, 10 %, 15 %, 20 %, 25 %, and 30 %.

### 2.2. Experimental Set-Up:

Figure (1) illustrates a schematic diagram of a bench scale extraction set-up which consists mainly of a three necked flask (250 mL) with a round bottom. The large neck in the middle of the flask was connected to a reflux condenser, a thermometer was placed in one of the two side necks, and the third neck was used for taken samples during the extraction process period. The flask was submerged in a temperature controlled water bath with magnetic stirrer.

**Fig. (1): Bench Scale Extraction Set-Up**

### 2.3. Procedure and Experimental Conditions:

#### 2.3.1. Laboratory Scale:

Ground Jatropha seeds (10 gm) was put in a three-necked flask (250 mL) with a round bottom containing 76 ml of hexane and 76 ml of acid solution (for each acid solution), and the following temperatures were used 30, 40, 50, and 60 °C. The total extraction time was 60 minutes. Miscella batch samples were collected in reweighed beakers at time intervals 10 minutes of extraction. The amount of oil extracted in each time interval was determined gravimetrically by measuring the weight of the residue after filtration and drying by recovering solvent.

#### 2.3.2. Bench Scale:

100 gm of ground Jatropha seeds were extracted using 760 ml of hexane and 760 ml of acid solution at 60 °C for 3 hours. Miscella obtained after filtration was collected in a separating funnel in which the upper clear layer is a mixture of oil and solvent. The amount of oil extracted was determined gravimetrically by weighing the oil after drying for solvent recovery.

## 3. Results and Discussion

### 3.1 Laboratory Scale Results:

#### 3.1.1 Effect of Acid's Types and Concentrations:

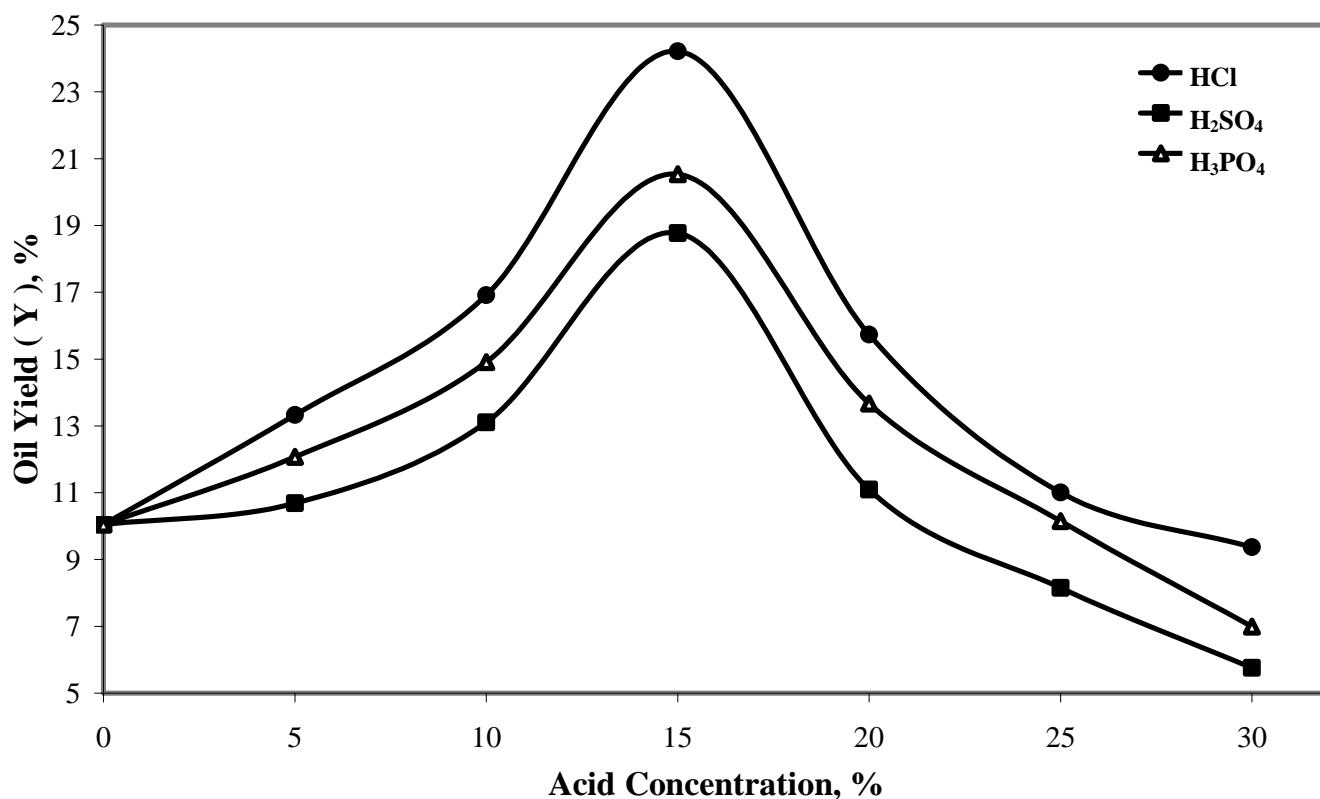

The percent oil yield values for the different acid solutions at 60 °C and 60 min time extraction are shown in figure (2) for oil extraction from Jatropha seeds. As seen in figure (2), the oil yields peaked (optimum value) at the 15 % concentration for each acid and decreased inversely to acid concentration after this optimum value. At this optimum acid value, it decreased the hexane penetration path lengths and resulted in an increase in the amount of oil extracted<sup>(13)</sup>.

Since the highest oil yield was obtained with HCl over  $H_3PO_4$  and  $H_2SO_4$ , then the most effective acid was HCl. The kinetic and thermodynamic parameters were calculated according to the values at a 15 % acid concentration. The percent oil yields for 15 % HCl at various temperatures are given in table (1) for Jatropha seed oil extraction.

From these results, it is obvious that maximum oil extracted reached 24.216 % of seeds at 60 °C, (i.e) the extracted oil is 85.569 % from the available oil which is 28.3 %, because the oil source was Jatropha trees only of two years old<sup>(14)</sup>.

**Table (1): Percent of JOC at various extraction temperatures for 15 % HCl containing n-hexane**

Time , min	Oil Yield ( % ), Y			
	30	40	50	60
10	12.578	14.211	16.112	16.948
20	13.263	15.148	17.201	18.201
30	13.976	16.113	18.438	19.552
40	14.782	17.145	19.713	21.048
50	15.578	18.321	21.172	22.536
60	16.481	19.518	22.602	24.216

**Fig. (2): Effect of Acid Concentration on Percent JOC ( Y ) at 60 °C and 60 min**

### 3.1.2 Extraction Kinetics:

A reaction rate equation for oil extraction from Jatropha seeds can be written as <sup>(13, 15)</sup>:

$$\frac{dY}{dt} = kY^n \quad (1)$$

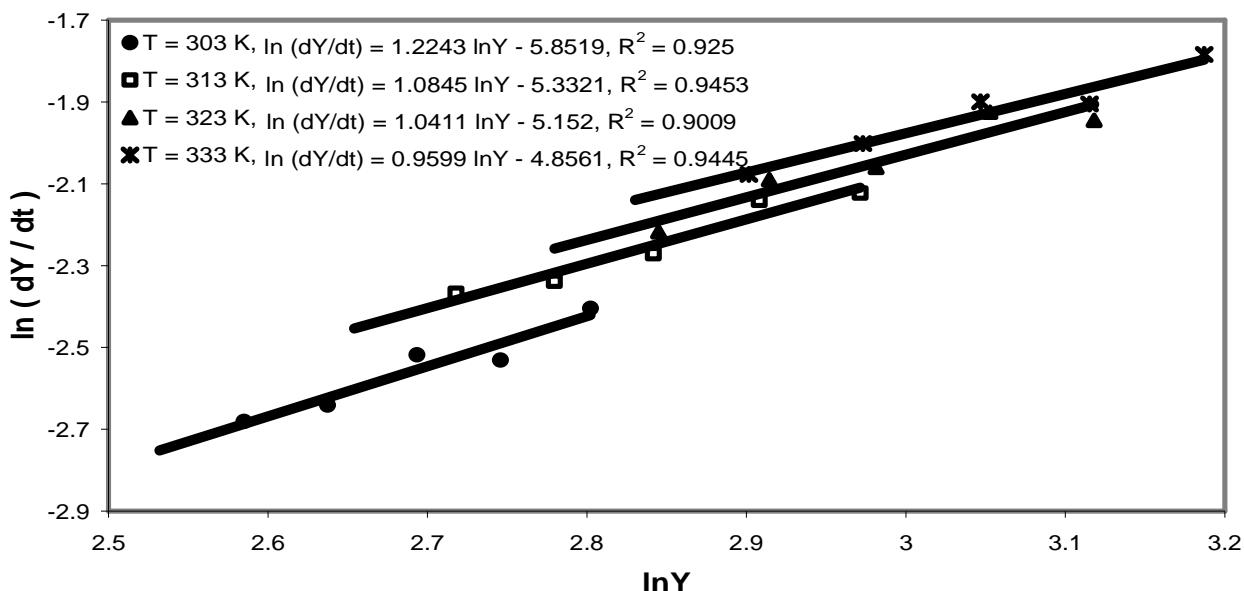

where Y is the percent oil yield, t is the time of extraction (min), k is the extraction constant, and n is the reaction order. Since the percent oil yield

increased in the course of time, the terms dY/dt have a positive sign <sup>(13)</sup>.

Using the values in table (1) and applying the Differential Method, plots of ln ( dY/dt ) versus ln Y for 15 % HCl were drawn and were found to be linear according to equation (1). A first-order kinetics was found from the values of n obtained, with average R<sup>2</sup> = 0.93, from the slopes of the straight lines in figure (3), and the reaction rate constants were calculated from the slopes (Table 2).

**Table (2): Values of the reaction rate constants for JOC extraction with 15 % HCl containing n-hexane at various temperatures**

T (°C)	k (min <sup>-1</sup> )
30	2.8744*10 <sup>-3</sup>
40	4.834*10 <sup>-3</sup>
50	5.7878*10 <sup>-3</sup>
60	7.781*10 <sup>-3</sup>

**Fig. (3): A Plot of [ ln (dY/dt) ] versus [ ln Y ] at Different Temperatures for JOC Extraction with 15 % HCl Containing n-Hexane**

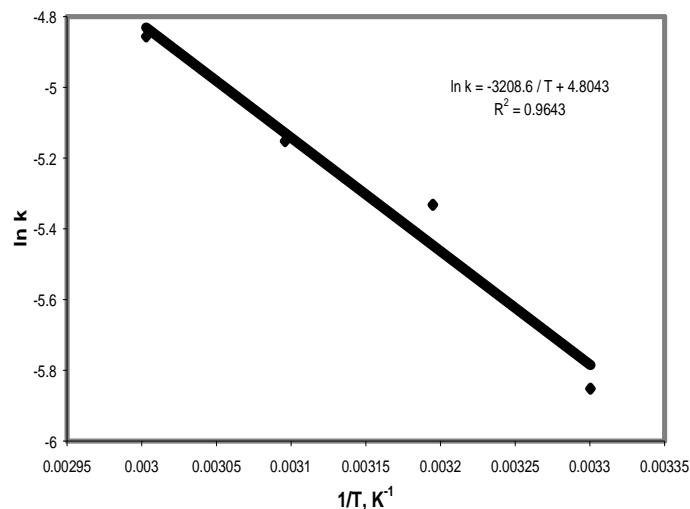

### 3.1.3 Calculation of Activation Energy:

The rate constant k increases with increasing temperature, and this trend is obvious in table (2). The changes can be described by the Arrhenius Equation (2, 13, 15):

$$k = Ae^{-Ea/RT} \quad (2)$$

where k is the reaction rate constant, A is the Arrhenius constant or frequency factor, Ea is the activation energy, R is the universal gas constant, and T is the absolute temperature.

A plot of ln k vs. 1/T gives a straight line whose slope represents the activation energy of extraction,  $-Ea/R$ , and whose intercept is the Arrhenius constant, ln A (Figure 4). Thus, the activation energy and the Arrhenius constant were calculated. These were  $Ea = 26.6763 \text{ kJ/mol}$  and  $A = 2.0339 \text{ s}^{-1}$ , respectively (2, 13, 15).

**Fig. (4): A Plot of [ ln k ] versus [ 1/T ] for JOC Extraction with 15 % HCl Containing n-Hexane**

### 3.1.4 Calculation of Activation Thermodynamic Parameters:

The activation thermodynamic parameters were calculated in the following equations according to the transition state theory<sup>(2, 13, 15)</sup>:

$$A = \frac{RT}{Nh} e^{\Delta S^\ddagger / R} \quad (3)$$

**Table (3): The activation thermodynamic parameters for JOC extraction with 15 % HCl containing n-hexane**

T, K	H , kJ/mol	S , J/mol.K	G , kJ/mol
303	24.157158	-239.1416839	96.61708823
313	24.074018	-239.4116427	99.00986217
323	23.990878	-239.6731108	101.4052928
333	23.907738	-239.9266061	103.8032978

### 3.1.5 Calculation of Thermodynamic Parameters:

Thermodynamic parameters (H, S, and G) for the extraction of Jatropha oil using n-hexane and 15 % HCl as solvents can be estimated using following equations<sup>(11, 13, 16)</sup>:

$$K = \frac{Y_T}{Y_u} \quad (6)$$

$$\ln K = -\frac{\Delta G}{R} \frac{1}{T} = -\frac{\Delta H}{R} \frac{1}{T} + \frac{\Delta S}{R} \quad (7)$$

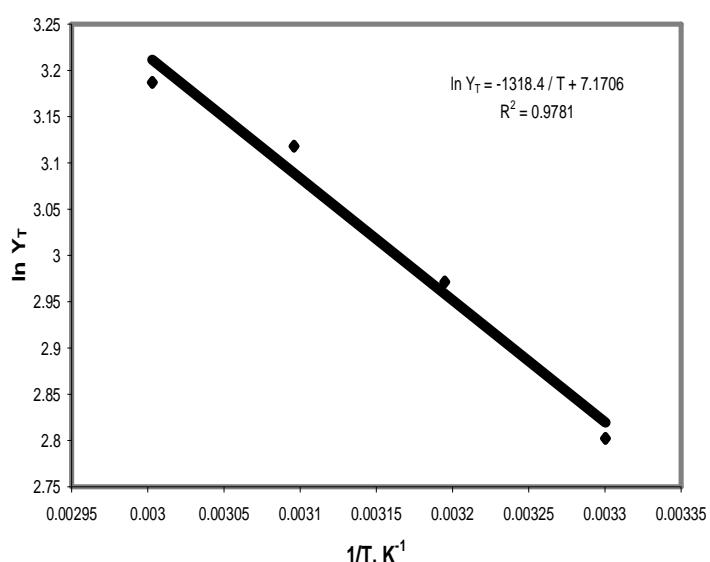

where K is the equilibrium constant, Y<sub>T</sub> is the percent oil yield at temperature T, Y<sub>u</sub> is the percent unextracted oil, H is the enthalpy change, S is the entropy change, and G is the free energy or Gibb's energy.

A plot of ln Y<sub>T</sub> vs. 1/T at 60 min, gives a straight line whose slope represents the enthalpy change of extraction, - H.R. Thus, the enthalpy change was calculated to be H = 0.1586 kJ/mol for Jatropha seed oil extraction with 15 % HCl (Figure 5). The H value obtained was indicating the physicochemical nature of the oil extraction process<sup>(11, 13, 16)</sup>.

$$\Delta H^\ddagger = Ea - RT \quad (4)$$

$$\Delta G^\ddagger = \Delta H^\ddagger - T\Delta S^\ddagger \quad (5)$$

where N is the Avogadro's constant, h is the Planck's constant, S is the activation entropy, H is the activation enthalpy, and G is the activation free energy or Gibb's energy. These activation thermodynamic parameters are shown in table (3) for each temperature.

**Fig. (5): A Plot of [ ln Y<sub>T</sub> ] versus [ 1/T ] for JOC Extraction with 15 % HCl Containing n-Hexane**

Other thermodynamic parameters (S and G) and the equilibrium constant values for Jatropha seed oil extraction with 15 % HCl at 60 min, are given in table (4) for each temperature.

**Table (4): The equilibrium constants (K) and the thermodynamic parameters ( S and G) for JOC extraction with 15 % HCl containing n-hexane**

T (K)	K	S (mol <sup>-1</sup> .K <sup>-1</sup> )	G (kJ/mol)
303	1.394449615	3.287756441	-0.837614202
313	2.222500569	7.146466889	-2.078268136
323	3.966654967	11.94700054	-3.700305173
333	5.929480901	15.27459769	-4.927865031

According to these results, the positive value of enthalpy indicates that the process is endothermic and requires energy during process. In addition, the negative value of G ( G < 0) at 60 °C indicates that there is a decrease in the free energy, that is, the extraction process of Jatropha oil using n-hexane and 15 % HCl at 60 °C is spontaneous process, which is in agreement with previous investigations <sup>(11, 13, 16)</sup>.

The reaction system initially consists of the ground Jatropha seed, aqueous acid solution and n-hexane, whereas the oil molecules are extracted from the Jatropha seeds during the extraction process, and

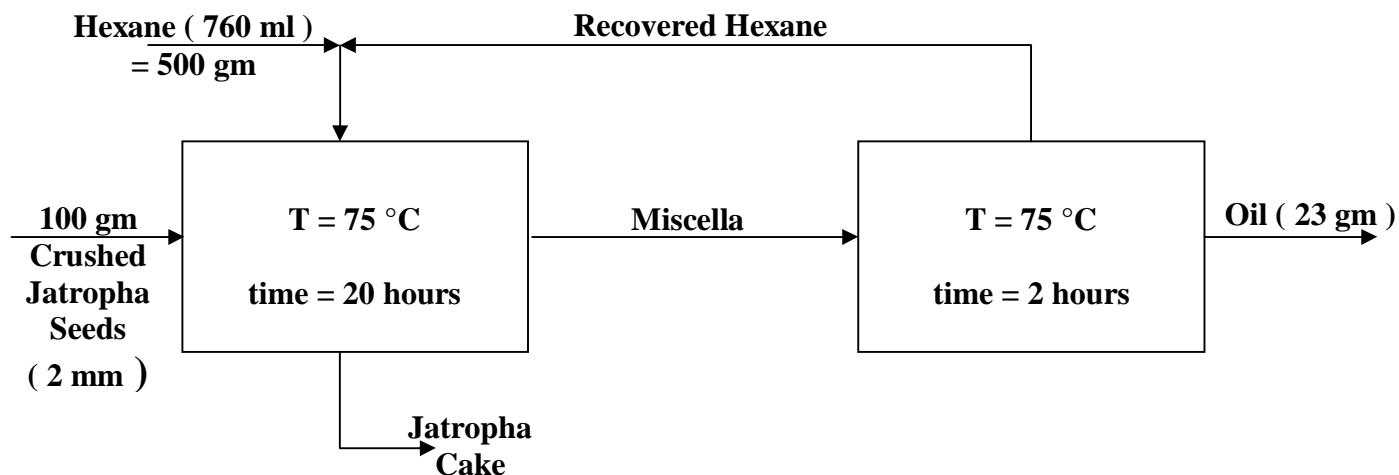

therefore, the entropy of the mixture increases in the course of the extraction, that is the positive value of entropy change ( S > 0) at 60 °C indicates that the process is irreversible <sup>(11, 13, 16)</sup>, while at temperatures less than 60 °C the reaction is reversible.

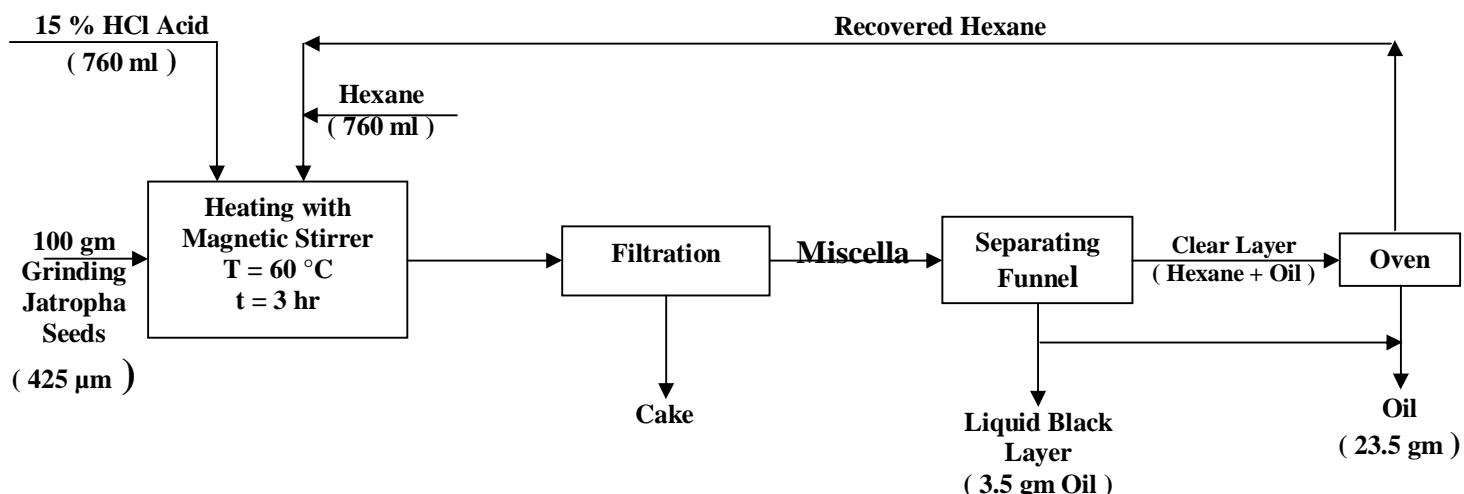

### 3.2. Bench Scale Results:

Flow sheets representing the mass balance at optimum conditions for acid extraction (Figure 6), compared with conventional solvent extraction (Figure 7), and mechanical pressing extraction (Figure 8). Table (5) illustrates differences in the three extraction procedures.

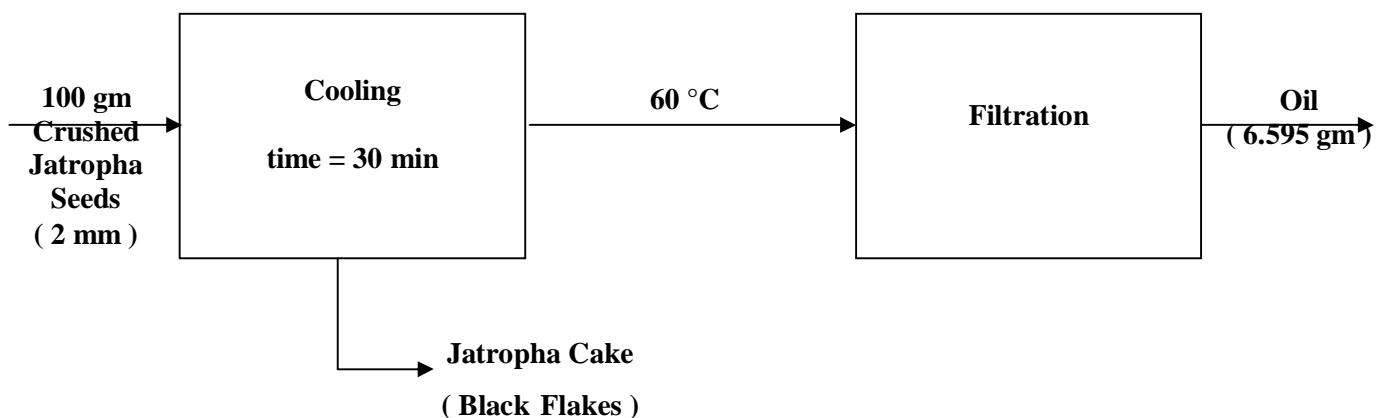

**Table (5): Comparison between different extraction procedures**

Extraction Procedure	Time of Extraction, ( hrs )	Temperature, ( °C )	Produced Oil, ( % )
Conventional hexane	20	75	23
Aqueous acidic hexane	3	60	23.5
Mechanical pressing	0.5	60	6.595

**Fig. (6): Solvent Extraction of Jatropha Curcas Oil**

**Fig. (7): Developed Oil Extraction from Jatropha Curcas Using Aqueous Acidic Hexane Solution**

**Fig. (8): Mechanical Pressing**

#### 4. Conclusion

It was found that Hydrochloric acid, HCl, was more effective and more suitable than  $H_2SO_4$  and  $H_3PO_4$  in the presence of n-hexane for oil extraction from Jatropha seeds. The optimum acid concentration was 15 %.

The Jatropha seed oil extraction process, using 15 % HCl containing n-hexane, has a first order kinetics.

The activation energy was  $E_a = 26.6763$  kJ/mol, and the activation thermodynamic parameters at 60 °C were  $H = 23.908$  kJ/mol,  $S = -239.927$  J/mol.K, and  $G = 103.803$  kJ/mol. The enthalpy value was  $H = 0.1586$  kJ/mol, and the other thermodynamic parameters at 60 °C were

calculated to be  $S = 15.275$  J/mol.K, and  $G = -4.928$  kJ/mol.

It also found that  $H$  is positive,  $S$  is positive, and  $G$  is negative indicating that this process are endothermic, irreversible, and spontaneous.

It is concluded from table (5) that extraction time with hexane in 15 % HCl is reduced to the seventh of that with hexane pure which corresponds to less energy required and in consecutively to less cost.

[\\*geldiwani@yahoo.com](mailto:geldiwani@yahoo.com)

**Abstract:** The recovery of lithium as lithium aluminate from Egyptian bitterns was investigated. Studies were performed on synthetic  $\text{Li}^+$  solution and on three high – salinity end brines which contain  $\text{Li}^+$  of concentrations varying between 5.5- 19.5 ppm. Pretreatment with a mixture of  $\text{Na}_2\text{SO}_4$ -  $\text{Na}_2\text{CO}_3$  is achieved to precipitate  $\text{BaSO}_4$ ,  $\text{SrCO}_3$ ,  $\text{CaCO}_3$  and possibly  $\text{MgCO}_3$ . A co-precipitation method was employed using aluminum salt as ( $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ ). Lithium ion is adsorbed onto aluminum hydroxide, which is freshly produced by adding  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  and Na OH to the brines at  $\text{Al}^{3+} / \text{Li}^+$  molar ratio 5-7. Results obtained indicate that high  $\text{Li}^+$  adsorption was performed at pH = 6-7 for Alexandria-Arish and Emissal salines, even for small concentration of aluminum salt added. Also, Lithium ions uptake decreased with increasing adsorption temperature from 10°C to 30°C but over 30°C increase in temperature does not affect lithium uptake on  $\text{Al(OH)}_3$ , which proved that the process is physical adsorption. Equilibrium isotherms have been determined for the adsorption of  $\text{Li}^+$  onto  $\text{Al(OH)}_3$  at 30°C and pH= values (5 to 9), the maximum adsorption capacity of  $\text{Al(OH)}_3$  at 30°C and pH = 9 is 123 mg/gm. The results indicated that applied isotherms were shown to be "favorable" and were fitted with Langmuir and Freundlich isotherms.  $\text{Li}^+$  desorption from  $\text{Al(OH)}_3$  was investigated using hydrofluoric acid (HF) or sulphuric acid ( $\text{H}_2\text{SO}_4$ ) with different concentrations, and results obtained showed that HF is more efficient than  $\text{H}_2\text{SO}_4$  concerning  $\text{Li}^+$  desorption. From the obtained results, Li ion can be recovered successfully from bittern and saline solutions. [Journal of American Science. 2010;6(11):301-309]. (ISSN: 1545-1003).

**Keywords:** lithium; lithium aluminate; hydrofluoric acid (HF); sulphuric acid ( $\text{H}_2\text{SO}_4$ ); saline solution

### 1. Introduction

Lithium importance has been increasingly recognized being in wide range of industrial applications such as:

- Blanket material in fusion reactors.<sup>(1,2)</sup>
- Important ingredient in the production of organolithium compounds as an alloying addition to  $\text{Al}^{3+}$  and  $\text{Mg}^{2+}$  and as the anode in rechargeable lithium ion batteries due to its high electrochemical potential.<sup>(3,4)</sup>
- In heat transfer application because of its specific heat is the largest of any solid.
- Reducing agent in organic chemistry applications.
- In treatment of bipolar disorder.<sup>(3)</sup>
- Manufacturing certain kinds of glass and ceramic.

The world production of lithium amounts to 12,500 tons per year, the high unit price of the metal translates into annual sales of approximately \$ 1 billion.<sup>(5)</sup> In general, sources of hard water tend to be highest in  $\text{Li}^+$  concentrations, in sea water lithium is found at concentration of 11 ppm, and the presence of lithium in surface soils is fairly uniform and can vary between 1.2 ppm in light organic soils to 98 ppm in alluvial soils.<sup>(6)</sup> Bittern solutions have been subjected to several studies aiming extraction of other valuable salts.

However, there is no much studies on lithium ions, the present actual study was conceived to shed more light on lithium extraction.

There are many techniques to extract lithium from a lithium containing solutions. Main methods of lithium extraction are considered to be:

- Solvent extraction, or it is known as liquid-liquid extraction in which the separation of the components of a liquid mixture by treatment with a solvent in which one or more of the desired components is preferentially soluble.<sup>(7,8)</sup>
- Electro- deposition technique which can be used to obtain metals in very pure form, a dilute solution may be concentrated by evaporation and then placed in electrolytic cell. Also electro- chemical treatment consider to be rapid process and effective for certain metals.<sup>(9)</sup>
- Ion exchange method by which ions of a given species is displaced from an insoluble exchange material by ions of a different species in solution. Ion exchange is good mean for removal in a wide for heavy metals and dyes but the adsorbent requires regeneration or disposal.<sup>(9)</sup>
- Liquid membrane method which was introduced as an alternative separation technique to the liquid – liquid extraction and

- to the separation by means of solid polymer membrane.<sup>(10)</sup>
- Co- precipitation method which involves the conversion of soluble metal salts to insoluble salts by means of pH adjustment.<sup>(11)</sup>

This article investigation is trying to look into the possibility of lithium extraction by adsorption onto aluminum hydroxide which is the simplest, easier and most economical method for Li<sup>+</sup> adsorption. The selective coprecipitation of Li ions was vaguely explained as adsorption on alumina<sup>(12)</sup>. It is significant that no other common adsorbant expect alumina was found to be suitable for selective Li extraction. The study has also covered the experimental steps for Li<sup>+</sup> adsorption from synthetic solutions and studies the factors affecting the adsorption process such as : pH, temperature, Al<sup>3+</sup> / Li<sup>+</sup> molar ratio, stirring time and stirring rate. The adsorption isotherms constants of Li<sup>+</sup> onto polymeric Al(OH)<sub>3</sub> have been determined at different pH values. Optimum conditions obtained for Li<sup>+</sup> adsorption from synthetic solutions were applied to evaluate Li<sup>+</sup> extraction from local bitters: El-Nasr Salines in Alexandria-Arish and Emissal at Quaroon lake. The recovery of lithium from Egyptian brines is difficult due to their low concentrations<sup>(13)</sup> from 5.5ppm to 19.5 ppm and also due to the presence of high content of other salts.<sup>(13)</sup> The aim of this work is to evaluate the efficiency of different lithium concentration solutions recovery from Egyptian sources such as sea and lake water applying the co-precipitation procedure.

Also maximum adsorption capacity of Li<sup>+</sup> onto polymeric Al(OH)<sub>3</sub> was determined by the applicability of two mathematical models, Langmuir<sup>(14)</sup> and Freundlich<sup>(15)</sup> isotherms which were represented by the two following equations respectively :-

$$\begin{aligned} C_e/q_e &= 1 / K_{L+}(a_L / K_L) Ce \\ \text{Log } q_e &= \text{Log } K_f + (1/n) \text{ Log } Ce \end{aligned}$$

## 2. Materials and Experimental

### Experimental set-up

A bench scale apparatus is constructed to carry out the adsorption of lithium onto polymeric Aluminum III hydroxide. The apparatus consists mainly of a glass reactor (2L capacity) provided with electrical stirrer, its speed ranges from 0-2500 r.p.m. The whole reaction vessel was heated onto a hot plate and the temperature was measured using a thermometer dipped in the reaction mixture. Fig (1) represents the schematic diagram of the experimental apparatus.

### 2.2. Raw Materials:

The raw material used for bench scale experiments were synthetic solutions, natural brines and pure chemicals.

#### 2.2.1. Synthetic Solution

Standard lithium solution (1000 ppm Li<sup>+</sup>) from Li<sub>2</sub>CO<sub>3</sub> which was diluted to different Li<sup>+</sup> concentrations (10, 20, 30, ..., 100, 200 ppm) to form the synthetic solutions.

#### 2.2.2. Actual lithium solutions from El-Nasr company after salt production:

##### a) El-Max factory in Alexandria.

Residual brine left after the production of table salt is used for experimental work. The brine is of specific gravity 1.28 gm / cm<sup>3</sup> i.e. 31.72° Be.

##### b) El-Arish factory:

Residual brine left after the table salt production, which specific gravity is 1.23 gm/cm<sup>3</sup> i.e. 27.1° Be.

#### 2.2.3. Actual lithium solution from Emissal factory

A concentrated brine had been collected from "Emissal company" after the production of sodium sulphate, its specific gravity is 1.17gm/cm<sup>3</sup> i.e. 21.1° Be'.

Table (1) illustrates the concentrations of different ions and solids in the three used solutions used from three different locations in Egypt.

**Table (1) Concentrations of Different Ions in Actual Brines and Total Solids**

Element Conc. (gm/L)	El-Nasr (Alexandria El-Max)	El-Nasr (Arish El-Bardawel)	Emissal (Qaroun Lake)
Ca <sup>++</sup>	2.6	2	0.8
Mg <sup>++</sup>	64.39	29.7	15.8
Cl <sup>-</sup>	284	213	156.2
Li <sup>+</sup>	0.0195	0.0055	0.0088
T.S.	793.9	465.14	358.8

#### 2.2.4. Chemicals used

All chemicals used in experimental work are of chemically pure grade.

### 2.3. Procedure

About 70 experimental runs have been used to study the effects of reaction temperature and time, pH, Molar Al<sup>3+</sup> / Li<sup>+</sup> ratio and stirring rate on Li<sup>+</sup> adsorption. Synthetic solutions of different Li<sup>+</sup> concentrations were prepared in which aluminum chloride is added at a certain dose to adjust molar ratio of aluminum ions to Lithium ions from about 2.5 to 20. Different amounts of sodium hyd 3

are added dropwise to the reaction mixture to reach different pH values from 5 (to prevent use of large amount of NaOH) to 9, at different reaction temperature (from 10 to 70°C), so that to improve Li<sup>+</sup> adsorption on the precipitated Al(OH)<sub>3</sub> in alkaline medium.

The precipitated aluminum hydroxide after different reaction time (from 5 to 240 minutes) containing the adsorbed Lithium ions is filtered spontaneously, and the Lithium ions unadsorbed in the filtrate is determined by Atomic Adsorption Spectrophotometer to evaluate the efficiency of adsorption.

The real solutions containing Li salts from sea bitters collected from El-Nasr Salines factory, Emissal company, have been tested by the same procedure at optimum conditions obtained from synthetic solutions. Desorption step was also achieved using both hydrofluoric acid and sulfuric acids and desorption efficiency for different studied conditions were evaluated by measuring Li<sup>+</sup> concentration in the eluting solution.

To study the effect of pH on Lithium adsorption, diluted solutions with different pH solutions containing Li<sup>+</sup> of different alkalinity were checked. Experiments at pH ranging from 5-12 were conducted. Aluminum hydroxide is precipitated from acidic aluminum chloride solution (pH 3) by adding sodium hydroxide solution (1N). If base is added to an acidic solution, precipitation will occur because the solubility of Al(OH)<sub>3</sub> is very low between pH 4 and pH 9.5.<sup>(17)</sup> The precipitation of aluminum hydroxide is a dynamic process that depends on many parameters, e.g. stirring rate and base addition rate.

#### 2.4. Adsorption Isotherms

Adsorption isotherms were determined by dissolving a constant mass of AlCl<sub>3</sub>.6H<sub>2</sub>O(4.47g) in constant volume and different initial Li<sup>+</sup> ion concentrations (40,60,80,100,200 mg/L)

The equilibrium data from each experiment represents one point on the adsorption isotherm, where the difference between the initial concentration (C<sub>0</sub>) and the equilibrium concentration (C<sub>e</sub>) was used to compute the amount of Li<sup>+</sup> adsorbed (q<sub>e</sub>) from the solution as follows.

$$q_e = \frac{[C_0 - C_e] V}{M}$$

q<sub>e</sub> was plotted against C<sub>e</sub> to give isotherm curves. The linear plot of C<sub>e</sub> / q<sub>e</sub> vs C<sub>e</sub> at different pH values are used for testing the applicability of Langmuir and Frendlich isotherms.

#### 2.5. Lithium desorption from solid phase:

Recovery of Lithium at steady state during experiments conducted on saline brines under constant conditions of pH, initial Al<sup>3+</sup>/Li<sup>+</sup> MR, temperature, adsorption time and stirring rate were investigated according to the following steps<sup>(15)</sup>.

- a. Washing thoroughly with distilled water for 30 minutes (60ml).
- b. Leaching with sulphuric acid or hydrofluoric acid for another 30 minutes (40ml).
- c. After two steps of washing distilled water and leaching with acid solution of different concentrations (three different concentrations), Lithium content in filtrate was determined using atomic absorption technique.

The solid phase was analyzed to check the presence Al<sup>+</sup>, Li<sup>+</sup>, Ca<sup>++</sup>, Mg<sup>++</sup>, and Cl<sup>-</sup>.

### 3. Results and Discussion

#### 3.1. Effect of different operating conditions

The influence of pH, Al<sup>3+</sup> / Li<sup>+</sup> molar ratio, adsorption time, temperature, initial lithium concentration and stirring rate on lithium adsorption from both synthetic and real bittern solutions were investigated.

##### 3.1.1. Effect of adsorption time on lithium adsorption.

Figure(2) shows the dependence of lithium ion recovery on adsorption time intervals, from which it is observed that maximum lithium adsorption is reached after three hours. This result is in accordance with most of previous studies<sup>(16,18)</sup> but differs from other<sup>(19)</sup> which get best results after one hour.

##### 3.1.2. Effect of pH on Lithium adsorption

It was seen that the recovery lithium from synthetic solution is increased (up to about 88%) in parallel to increase in pH till pH= 9 as illustrated in figure(3). While for real brine solution containing Mg<sup>2+</sup>, Ca<sup>2+</sup>, Cl<sup>-</sup> besides other cations and anions, as mentioned before, maximum lithium adsorption were 80.1 % 64.5% and 69.4% at pH 6.5,7 and 6.9 respectively as shown in figure (4).

These results are in accordance to those obtained from previous studies<sup>(20)</sup> which were carried out on lithium adsorption from dead sea brine and end brine remaining after potash production while in other investigations increasing the pH from 3.5 to 10.8 improves the adsorption<sup>(15)</sup>

##### 3.1.3. Effect of temperature on Lithium adsorption

Results seen in figure(5) illustrated that, the higher the temperature the lower was the lithium yield. The highest yield (89.7%) was obtained at 10°C while above 30°C, the yield decreased.

Another factor increases this fact is that Lithium compound are unstable<sup>(20,24)</sup>. This fact assures that process of Li<sup>+</sup> removal at high temperatures (>30°C) is a physical adsorption process not chemical adsorption.

### 3.1.4. Effect of initial concentration on Lithium adsorption.

From experimental results showed in figure (6) it is obvious that: Lithium adsorption is more efficient with increasing initial lithium ion concentration in treated solutions and these results are in accordance with previous studies<sup>(25)</sup>.

### 3.1.5. Effect of stirring rate on percent lithium adsorption

Results of studying the effect of stirring rate on lithium adsorption are shown in figure (7) from which it is clear that : above stirring rate of 300 rpm there is no sensible increase in lithium adsorption efficiency.

### 3.1.6. Effect of Al<sup>3+</sup> / Li<sup>+</sup> molar ratio on percent Lithium adsorption.

A series of experiments at different Al<sup>3+</sup> / Li<sup>+</sup> molar ratios were carried on to study the effect of different molar ratios on Lithium yield, figure (8). It is observed that highest lithium adsorbed from synthetic solution (88.1%) was obtained at Al<sup>3+</sup>/Li<sup>+</sup> molar ratio of 5.1 while above and under this ratio, there is gradual decrease in lithium adsorption which can be explained: at higher molar ratio that aluminum hydroxide precipitate is transformed from g to crystalline form which decreases the adsorption. For real brine solutions, maximum lithium adsorption 80.1%, 64.5% and 69.4% were obtained at Al<sup>3+</sup> / Li<sup>+</sup> molar ratios of 5.3, 7 & 5.8 respectively, figure (8). These results are in agreement with the results obtained in the

literature<sup>(21)</sup>. In other situations lithium recovery requires larger Al<sup>3+</sup> / Li<sup>+</sup> molar ratios.

### 3.2. Adsorption Capacity

The capacity of Al(OH)<sub>3</sub> for Li<sup>+</sup> adsorption may be determined by plotting q<sub>e</sub> against C<sub>e</sub> at different pH values (5.4, 6.3, 7.4, 8.5 & 9) to give the isotherm curves. These isotherms are shown in figure (9).

The correlation coefficient (R) represents the standard deviation between real experimental Lithium ion concentration (x) values obtained by chemical analysis and the calculated values through the model (y), at the different number (n) of experiments, which is calculated by the following equation.

$$R = \frac{n \sum xy - (\sum x)(\sum y)}{\sqrt{n(\sum x^2)(\sum x)^2} \sqrt{n(\sum y^2) - (\sum y)^2}}$$

### 3.3. Analysis of Isotherm Data

Analysis of isotherms data is important to develop an equation which accurately represents the results and could be used for design purposes. In this study two of these isotherms are selected:

Langmuir and Freundlich isotherms.

#### 3.3.1. Langmuir Isotherm

A series of straight lines have been obtained by plotting C<sub>e</sub>/q<sub>e</sub> against C<sub>e</sub> for different pH, which indicates that the adsorption process confirms with Langmuir isotherm.

Langmuir parameters, K<sub>L</sub>, a<sub>L</sub> and K<sub>L</sub> / a<sub>L</sub> at different pH values have been calculated and tabulated in Table (2)

**Table(2): Parameters in the Langmuir adsorption model at different pH:**

Parameters pH	K <sub>L</sub> L/g	a <sub>L</sub> L/mg	q <sub>max</sub> mg/gm	R'	Correlation Coefficient
5.4	6.66	0.019	120	0.21	0.703
6.3	7	0.018	121.2	0.22	0.773
7.4	7.65	0.019	122.2	0.20	0.928
8.5	8.8	0.030	122.8	0.12	0.997
9	9	0.034	123.5	0.12	0.989

It is to be noted that K<sub>L</sub> increases with pH increase which means that adsorption of Li<sup>+</sup> is more favorable by increasing the alkali added to the solution.

Since value of R'(dimensionless constant separation factor) for Li – Al(OH)<sub>3</sub> system have been found between zero and 1, so this indicate that Li<sup>+</sup> – Al(OH)<sub>3</sub> system at different pH possesses favorable adsorption.

Lithium adsorption on polymeric Al(OH)<sub>3</sub> is a monolayer process because the results were fitted with Langmuir isotherm which is valid for monolayer adsorption

#### 3.3.2. Freundlich Isotherm

The experimental results have been plotted as log q<sub>e</sub> vs log C<sub>e</sub> where a series of straight lines have been obtained.

The Freundlich parameters  $K_f$  and  $n$ , for the adsorption of  $\text{Li}^+$  onto  $\text{Al(OH)}_3$  have been calculated

using the least square method and are illustrated in Table (3).

**Table (3): Freundlich adsorption model parameters at different pH.**

Parameter pH	$K_f$ (L/gm)	n	Correlation Coefficient
5.4	7.8	1.18	0.9602
6.3	9.4	1.18	0.974
7.4	9.4	1.23	0.979
8.5	10.2	1.28	0.982
9	11.14	1.28	0.9783

Values of Freundlich exponent,  $n$ , is greater than 1 indicating that  $\text{Li}^+$  is favorably adsorbed by  $\text{Al(OH)}_3$ .<sup>(24)</sup>

The Langmuir isotherm's correlation coefficient values ( $R^2$ ) for  $\text{Li}^+$  adsorption were ranged between 0.70 – 0.99 suggesting that Langmuir isotherm provides a good model for the process. According to Freundlich the ( $R^2$ ) values ranged between 0.96 – 0.98 which fit fairly well with the obtained experimental results. So regarding to the equilibrium isotherm's models applicability follows the order Freundlich > Langmuir.

### 3.4 Lithium desorption from solid phase.

Leaching of  $\text{Al}^{3+}$  precipitate using two different acids ( $\text{H}_2\text{SO}_4$  & HF) with different concentrations (0.05N, 0.1N, 0.2N&0.25N) was investigated. It was found that using different concentrations of  $\text{H}_2\text{SO}_4$  solution (0.05 , 0.1 , 0.2,0.25 N) gave us slight increase in  $\text{Li}^+$  recovery which means leaching of Al precipitate with  $\text{H}_2\text{SO}_4$  causing only a slight decrease in desorption of  $\text{Li}^+$  from the surface of  $\text{Al(OH)}_3$  as shown in table (4), because leaching of  $\text{Li}^+$  is also accompanied by leaching of  $\text{Al}^{3+}$  so that no complete separation is obtained.

**Table (4)  $\text{Li}^+$  and  $\text{AL}^{3+}$  contents in the solid phase after different – leaching processes**

Stage	El- Max Brine			
	$\text{Li}^+$ (mg)	% removal	$\text{Al}^{3+}$ (mg)	% removal
No washing	1.56	0	39.8	0
$\text{H}_2\text{O}$	1.46	6.41	37	7.04
0.05 N $\text{H}_2\text{SO}_4$	1.42	8.97	24.1	39.45
0.1 N $\text{H}_2\text{SO}_4$	1.25	19.87	24	39.7
0.2N $\text{H}_2\text{SO}_4$	0.23	85.26	1.9	95.23
0.25 N $\text{H}_2\text{SO}_4$	0.2	87.18	1.6	95.98

$\text{H}_2\text{SO}_4$  is reacted with  $\text{Al}^{3+}$  to form  $\text{Al}_2(\text{SO}_4)_3$  which is soluble in cold water<sup>(26)</sup>.

While using hydrofluoric acid (HF) as leaching agent, it was found that HF (0.2N) is more efficient than  $\text{H}_2\text{SO}_4$  in desorption from the solid phase, the results are illustrated in tables (5&6).

**Table (5) Decrease of  $\text{Li}^+$  from solid phase by different – leaching solutions**

Stage	El - Max		El- Bardawel		Qaroun	
	$\text{Li}^+$ mg	Removal %	$\text{Li}^+$ mg	Removal %	$\text{Li}^+$ mg	Removal %
No washing	1.527	-----	0.347	-----	0.604	-----
$\text{H}_2\text{O}$	1.444	5.44	0.305	12.10	0.521	13.74
0.1N HF	1.152	24.56	0.215	38.04	0.187	69.04
0.2 N HF	0.105	93.12	0.0068	98.04	0.0097	98.39
0.25N HF	0.104	93.19	0.0068	98.04	0.0097	98.39

**Table (6) Decrease of Al<sup>3+</sup> from solid phase by different – leaching solutions**

Stage	El - Max		El- Bardaweeel		Qaroun	
	Al <sup>3+</sup> mg	Removal %	Al <sup>3+</sup> mg	Removal %	Al <sup>3+</sup> mg	Removal %
No washing	39.646	-----	14.024	-----	18.340	-----
H <sub>2</sub> O	36.949	6.80	9.440	32.69	16.182	11.77
0.1N HF	32.094	19.05	8.630	38.46	10.249	44.12
0.2 N HF	29.667	25.17	6.743	51.92	8.091	55.88
0.25N HF	24.273	38.78	6.473	53.84	7.821	57.36

HF is reacted with Al<sup>3+</sup> to form two complexes, the first is Al<sub>2</sub>F<sub>6</sub>.7H<sub>2</sub>O which is insoluble<sup>(26)</sup> and AlF<sub>3</sub>.3H<sub>2</sub>O which is slightly soluble in water<sup>(26)</sup>. And Li<sup>+</sup> is leached from Li AlO<sub>2</sub> which was previously precipitated as LiOH.H<sub>2</sub>O which is completely soluble in water. So in this case leaching is more efficient, 93% of Li<sup>+</sup> is recovered in pure form, but still some is combined with Al<sup>3+</sup>.

#### 4. Conclusions

The promising results obtained for Li<sup>+</sup> adsorption from synthetic solution and representative samples obtained from local natural sources from El-Max, El-Bardaweeel and Qaroun lake, by studying the effects of different optimum conditions affecting Li<sup>+</sup> adsorption are summarized in the following points:-

- It is possible to extract lithium in three hours at temperature less than 30°C and pH slightly alkaline at a molar ratio of Al<sup>3+</sup> /Li<sup>+</sup> 5.1 which reached 89.7%,using moderate amount of aluminum chloride .
- Differences between obtained results for El-Max, El-Bardaweeel and Qaroun brine through the presented study are due to the difference in chemical composition of each brine. Chemical composition of each brine solution influences Li<sup>+</sup> adsorption rate, due to the changes at the surface of the precipitated phase. These changes lead to variations in electrostatic properties.
- Lithium extraction rate from El-Max was greater than that of El-Bardweel & Quaroun due to the difference in initial Li<sup>+</sup> concentration in each of them.
- Leaching of adsorbed Li<sup>+</sup> on Al(OH)<sub>3</sub> precipitate can be achieved successfully using Hydrofluoric acid 0.25N 93% as pure Li<sup>+</sup>.
- It has been demonstrated that hydrofluoric acid gave better results for Li<sup>+</sup> desorption from solid phase than sulphuric acid.
- Experimental results showed the possibility of minimizing concentration of elements, other than aluminum and lithium that remain in contact with the precipitate, by washing with water improved Li<sup>+</sup> desorption either using H<sub>2</sub>SO<sub>4</sub> or HF.

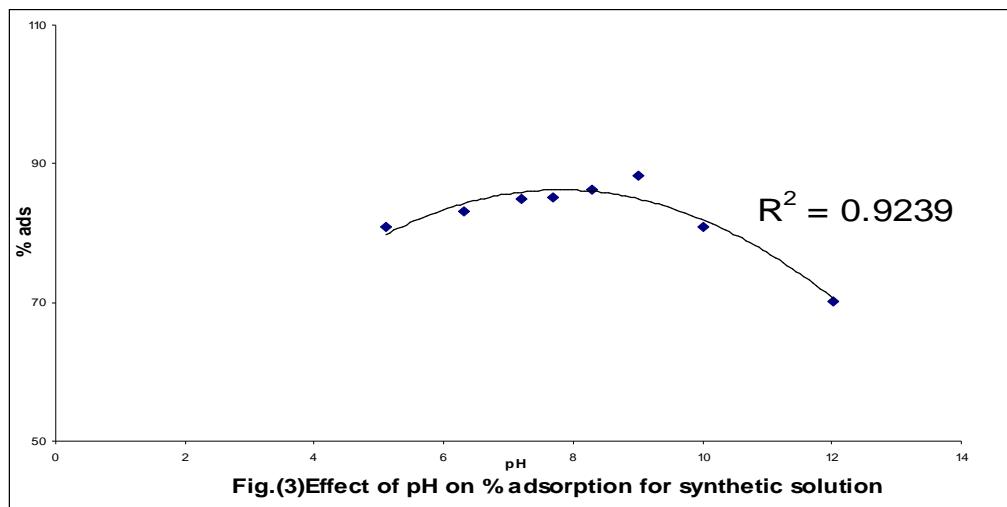

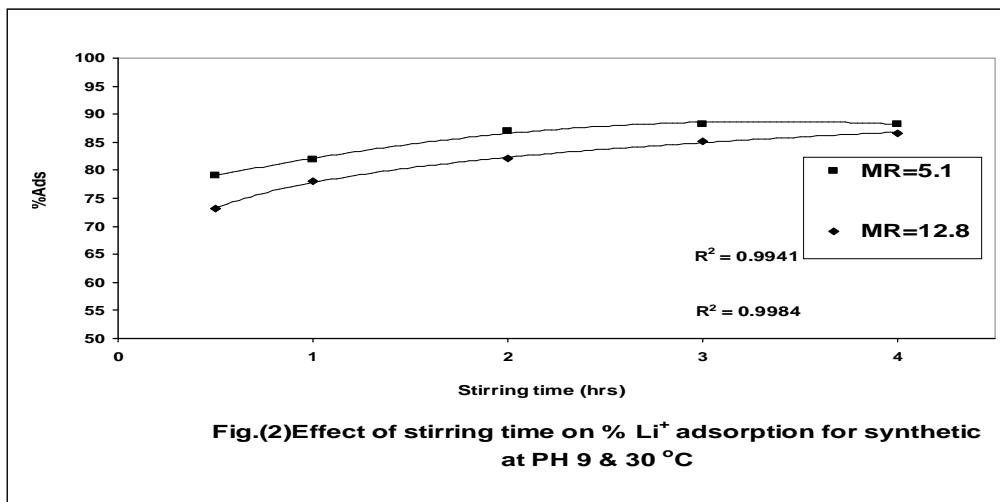

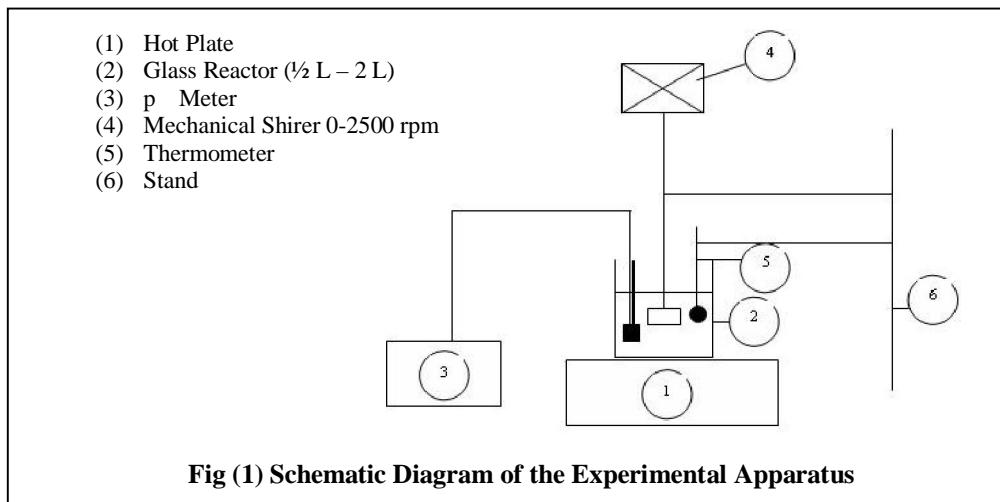

The values of equilibrium parameter (R) for Langmuir isotherm is less than 1 and the Freundlich exponent (n) is greater than 1 indicating that lithium is favorably adsorbed by Al(OH)<sub>3</sub>.

# The Effects of Dietary Egyptian Propolis and Bee Pollen Supplementation against Toxicity if Sodium Fluoride in Rats

Fatma A. Khalil and Nora M. El-Sheikh

Biochemistry and Nutrition Department, Women's College, Ain Shams University, Cairo, Egypt.

**Abstract:** Propolis and bee pollen are substances produced by honey bees its components are strong antioxidant and free radical scavengers. The present study aimed to study the protective effects of propolis and bee pollen supplementation against toxicity of sodium fluoride in rats. After the end of experimental period, the rats sacrificed and biochemical analysis were carried out. The results showed that the administration of fluoride (F) alone causes significant increase of malondialdehyde (MDA) level and significant decrease of antioxidant system as erythrocyte superoxide dismutase (SOD) activity and reduced glutathione (GSH) levels in blood and brain. Also F causes significant increase alkaline phosphatase (ALP) activity, urea, creatinine, sodium and potassium levels. And significant decrease total protein, calcium, magnesium and phosphorus levels as compared to control group ( $P < 0.05$ ). Whereas administration of propolis or bee pollen with F led to significant decrease in MDA level and significant increase in SOD activity, GSH levels in blood and brain. And significant decrease ALP activity, urea, creatinine, sodium and potassium levels in serum. The propolis or bee pollen enhanced total protein, calcium, magnesium and phosphorus levels in serum as compared to F group alone.

In conclusion; supplementation of natural antioxidant (propolis or bee pollen) during Fluoride administration, facilitate reduction of the toxic effects and enhanced the antioxidant system, the levels of minerals is serum. [Journal of American Science. 2010;6(11):310-316]. (ISSN: 1545-1003).

**Keywords:** Propolis, bee pollen, sodium fluoride, rats, antioxidant system minerals.

## 1. Introduction

Fluoride (F) is highly electronegative anion with cumulative toxic effects, from prolonged ingestion that can lead to the pathogenesis known as fluorosis a condition especially persistent in third world countries, where populations have little choice as to the main source of their often times-F-contaminated drinking, other sources include private water supplies, dietary ingredients, dental products, industrial emissions, and/or occupational exposure, which can cause an individual's total F intake to exceed safe dose (Ozsvath, 2009).

Fluoride crosses the cell membrane very rapidly and distributed from the plasma to all tissue and organs (Bouaziz et al., 2006).

Propolis and bee pollen are natural substances collected by honey bees from buds and trees. Propolis a sticky substance that have bees manufacture by mixing their own waxes with resinous sap (Yoshimi et al., 2009). The main chemical classes found in propolis are flavanoids, phenolic and various aromatic compound. However, propolis contains many of B-complex vitamins, important mineral and trace elements, caffeic acid phenethyl ester (CAPE), an active component of propolis, exhibits antioxidant properties.

Nowadays propolis is used in many medical formulas and food supplements for improving health, preventing and treating infections, inflammatory

diseases and effects of toxic substances (Attalla and Ayman, 2008).

Bee pollen is rich in carotenoids, flavonoid and phytosterols. The exact profile varies depending on the plant sources and growing conditions, however, beta-carotene, beta sitosterol, isohammetin, kaempferol, lycopene, quercetin and rutin are consistently (Campos et al., 2003). The antioxidant activity of flavanoides present in propolis and bee pollen has been shown to be capable of scavenging free radical (Survswaran et al., 2007).

The aim of this study was to evaluate the antioxidant effects of dietary Egyptian propolis and bee pollen supplementation against toxicity of sodium fluoride in rats.

## 2. Materials and Methods

### Materials

Sodium fluoride (AR, BDH) was used as the source of fluoride. The sodium fluoride was added to the standard diet at 1 g/kg diet (Bellack and Schoube, 1968).

The propolis and bee pollen used in the present study originated from the hive in Cairo, Egypt. These samples were harvested in September 2009. Bee pollen was obtained as yellow granules, while propolis was derived in the form of yellow-brown powder.

**Experimental animals:**

Adult male albino rats weighing ( $130 \pm 13.9$  g) were kept in [12:12 h (light:dark) photo period] and temperature ( $22 \pm 0.5^\circ\text{C}$ ) controlled room maintained at constant relative humidity of 65-70% and fed standard diet and water *ad libitum*.

**Diet:**

The standard diet was prepared according to (Reeves et al., 1993).

**Experimental design:**

All animals fed on the standard diet and the animals were divided into 6 groups (10 animals in each group):

Group (1): Control rats (without any treatment).

Group (2): Rats administrated with sodium fluoride alone 1 g/kg diet (F groups).

Group (3): Rats administrated F and treated with propolis powder in diet 0.1%.

Group (4): Rats administrated F and treated with propolis powder in diet 0.2%.

Group (5): Rats administrated F and treated with bee pollen in diet 1%.

Group (6): Rats administrated F and treated with bee pollen in diet 2%.

After the end of the experimental period (42 days), all animals were fasted overnight and sacrificed. The two blood samples were collected from each animal, with and without anticoagulant for the following biochemical analysis. Reduced glutathione (GSH) was measured in blood and brain homogenate according to the method of Beutler et al. (1963). Malondialdehyde (MDA) level was measured in brain according to Satoh (1978).

Erythrocyte superoxide dismutase activity was determined in accordance with the method described by Sun et al. (1988). ALP activity in serum was determined by the method of Anon (1974), serum total protein level was determined by the method of Gornall et al. (1949). Serum creatinine and urea were determined by the methods of Bonsens and Taussky (1984) and Patton and Crouch (1977), respectively.

Serum sodium, potassium, calcium, magnesium and phosphorus were estimated by the colorimetric method of Berry et al. (1988), Sunderman and Sunderman (1958), Sarkar and

Chauvan (1967), Teitz (1983) and Drewes (1972), respectively.

**Statistical analysis:**

Results are expressed as mean  $\pm$  SD. The data were statistically analyzed following the one way analysis of variance [ANOVA, F test and least significant difference (L.S.D)] at ( $P < 0.05$ ) were carried out using SPSS version 11.5 (2002) SPSS Chicago / L, USA.

### 3. Results

From the results of Table (1) obtained it is evident that fluoride administration alone in group (2), caused significant increase of MDA level in brain and significant decrease in GSH levels in blood and brain, erythrocyte SOD activity as compared to control group ( $P < 0.05$ ). But the administration of propolis or bee pollen with fluoride significant decrease the MDA level in brain and significant increase GSH levels in blood and brain, erythrocyte SOD activity as compared to F group ( $P < 0.05$ ).

Table (2) shows that there was a significant increase in ALP activity, urea and creatinine. And significant decrease in total protein in F group as compared to control group ( $P < 0.05$ ). But the propolis or bee pollen enhanced the toxic effect of fluoride by a significant decrease in ALP activity, urea and creatinine. And significant increase in total protein in treated groups as compared to F group.

Table (3) and Figs. (1-5) shows the levels of serum cations in control group (G 1), fluoride group (G 2) and treated group (G 3 - G 6).

There was a significant increase in serum sodium and potassium levels and significant decrease in serum calcium, magnesium and phosphorus in F group as compared to control group ( $P < 0.05$ ). Whereas the administration of propolis and bee pollen improved the levels of cations in treated group as compared to F group ( $P < 0.05$ ).

**Table (1): Effects of propolis and bee pollen on lipid peroxide as (MDA) and antioxidant system in fluorotic rats.**

Parameters Groups	Brain MDA (nmol/ mg tissue)	Blood GSH (mg/dL)	Brain GSH (mg/g tissue)	Erythrocyte SOD activity (U/mL)

#### 4. Discussion

Reactive oxygen species (ROS) play key roles in many physiologic and pathogenic processes. In fact, many ophthalmologic and neurodegenerative diseases seem to be mediated, at least in part, by oxidative stress (Finkel and Halbrook, 2000). The generation of free radicals constitute one of the underlying mechanisms of the fluoride intoxication (Birkner et al., 2000).

In the present study, the elevated level of MDA in brain and reduction of SOD activity and glutathione level in blood and brain in F group as compared to control group. Since the generation of free radicals also causes red blood cell damage occurs in tissues.

Chinoy and Shah (2004) have reported, fluoride can pass through in the blood brain barrier and accumulates in brain tissue and causes impaired antioxidant defense system. Furthermore, the other researchers have obtained similar results Kumari and Rao (1991) have reported an increase in MDA level in chronic fluoride intoxication.

In the present study, the results revealed that decrease in total protein and increase in ALP activity, urea and creatinine in F group as compared to control group. Fluoride is known to inhibit protein synthesis, mainly due to impairment of peptide chain initiation and by interfering with peptide chains on ribosomes (Michael et al., 1996).

Eraslan et al. (2007) have also reported ALP activity increase of the damage of hepatic cells and the obstruction of bile ducts. ALP is the marker enzyme of fluoride toxicosis and bone pathology increase in serum ALP activity in animals treated with fluoride has been reported (Shanthakumari and Subramanian, 2007), it may be due to fluoride induced cell injury in both osteoblast and osteocytes initiates a repair response. Birkner et al. (2000) have also reported increase in the serum urea level of rats

with acute fluoride intoxication. The administration of fluoride suggests failure of excretion in the kidney. In the present study, the F group showed the serum potassium and sodium levels increased significantly, calcium, magnesium and phosphorus decreased significantly as compared to control group. The results are similar to Chinoy et al. (1993) have reported that demonstrated rats with sodium fluoride, it may be due to change to alteration in adrenergic function. Fluoride interacts and alters the metabolism of calcium and magnesium, the decrease in serum calcium related to decrease of intestinal absorption of calcium by fluoride (Xin et al., 2006).

Propolis and bee pollen are opicultural products which are composed of nutritionally valuable substances and contain considerable amounts of polyphenol substances which may act as potent antioxidant (Teixeira et al., 2008). Flavonoids and phenolic acids are major classes of polyphenolic compounds, whose structure-antioxidant activity (Gardjeva et al., 2007). Mechanisms of antioxidant action may include suppression of ROS formation, removal or inactivation of oxygen reactive species and up-regulation or protection of antioxidant defenses (Montoro et al., 2005).

The results of the present study revealed that, administration of propolis or bee pollen with F led to significant decrease in MDA level in brain and significant increase in antioxidant system as SOD activity and GSH levels. The propolis or bee pollen significant decrease the ALP activity, urea, creatinine, potassium and sodium levels. Also propolis or bee pollen enhanced total protein, calcium, magnesium and phosphorus levels.

Caffeic acid phenethyl ester (CAPE) is an active component of propolis and has been used in traditional medicine to treat a number of diseases, CAPE treatment have been shown to protect tissues from ROS mediated oxidative stress and reduce lipid peroxidation in ischemia and toxic injuries. The antioxidant activity of CAPE is due to the presence of two hydroxyl groups in its structure (Sud'ina et al., 1993).

Twelve different flavonoids, pinocembrin, acacetin, chrysins, rutin, catechin, naringenin, galangin, luteolin, kaemferol, a pigenin, myricetin and quercetin, two phenolic acids, cinnamic and caffeic acid present in propolis (Volpi, 2004). Propolis contain acid derivatives such as benzoic-4-hydroxy benzoic which improves the digestive utilization of calcium, phosphorus and magnesium (Haro et al., 2000).

Propolis has an anabolic effect and bee pollens are rich in essential amino acids, protein, unsaturated fatty acids and also contains many

vitamins, minerals and trace elements which contribute to the health effects (Campos et al., 2003). Pollen is extremely rich in rutin and may have highest content of any source. Bee pollen has been shown to improve immune system and remove toxins from our bodies (Campos et al., 1997).

The recent investigations indicated that bee pollen contain significant amount of polyphenolic substances, mainly flavonoids. The polyphenols also have metal chelation properties and free radical scavenging activity (Abdella et al., 2009).

The conclusion of the present study suggests that the propolis or bee pollen its components, are strong antioxidants and free radical scavengers. Ameliorated the liver, kidney and brain from toxicity with sodium fluoride and enhanced the levels of minerals in serum.

# Diet Selection, Feed Intake Capacity and Performance of Growing Female Camels: Effects of Type of Roughage and Level of Concentrates Offered

M.F.A. Farid, A.M. Abdel-Wahed, Safinaz M. Shawket\* and N.I. Hassan

Animal Nutrition Department, Desert Research Centre, Al-Matareya, Cairo, Egypt.  
drsafinazshawket@hotmail.com\*

**Abstract:** The feeding trials were intended to investigate diet selection, feed intake capacity (FIC) and animal performance when concentrates (corn grains and commercial concentrates mixture) and roughages (*Atriplex*, clover hay or rice straw) were fed ad lib free-choice in a cafeteria feeding system, and also the effect of restricting concentrates offered. The roughages were selected to represent different grazing conditions prevailing in arid rangelands. Eighteen growing she-camels were randomly allotted to three groups. Each group was assigned one of the three roughages offered ad lib for the duration of the whole experiment. Results indicated that type of roughage and concentrate levels, and their interaction, affected ( $P<0.05$ ) FIC and diet selection, and consequently live weight gain. Average total and roughage DMI were 78.9 and 16.1, 83.9 and 22.5, 96.4 and 33.4 g DM/day/Kg<sup>0.75</sup> for straw, hay and *Atriplex* groups, respectively. Irrespective of the roughage fed, growing camels consumed three-times as much corn grains as that from the cottonseed meal. Limiting concentrates offered to 75% or 50% of ad lib intake, decreased FIC, while the proportion of roughages in DMI increased significantly, total OMI and total protein decreased and crude fibres intake increased, more so in the straw fed camels. The *Atriplex* fed camels recorded the higher ADG, followed by the hay fed ones and the straw fed mates grew the least, 516, 429 and 240 g/d, respectively. Restricting the level of concentrates offered decreased significantly ( $P<0.05$ ) the ADG (691, 305 and 189 g/d in camels fed 100, 75 and 50% of ad lib concentrate intake. These results tend to indicate that growing camels having free choice to select their diets from both concentrates and roughages were capable of regulating their voluntary food intake predominantly through physiological mechanisms to satisfy energy requirements. This was true for the *Atriplex* and hay groups but not for the straw group or when concentrates offered was limited. [Journal of American Science. 2010;6(11):317-326]. (ISSN: 1545-1003).

**Key words:** camels, diet selection, feed intake capacity, weight gain

## 1. Introduction

Camels are famed for their peculiar adaptation to the harsh conditions prevailing in arid zones. They possess distinct behavioral, physiological and nutritional adaptive mechanisms that enable them withstand extreme direct and indirect environmental stresses (Schmidt-Nielsen 1964, Farid et al. 1979, 1997, Gauthier-Pilters 1979, Gauthier-Pilters and Dagg 1981). These animals, like other herbivores grazing arid rangelands, are seasonally challenged with feed and water deficiencies, both in quantity and quality.

Earlier studies indicated that yearling and older camels can be maintained and even fattened on clover hay, grain straws or native halophytes (e.g. *Atriplex* sp. and *Acacia saligna*) supplemented with different levels of grains as energy sources (Shawket 1999, Shawket and Ahmed 2001, Shawket et al. 2005). Similar experiments on pregnant and lactating

camels were conducted (Shawket et al. 2009). Results were encouraging in terms of the overall performance realized. It seems that performance was largely dependent both on the type of roughage constituting the basal diet and the concentrate supplement. Differences between species, camels vs. sheep or goats, were also recorded (Farid et al. 1979, Farid et al. 1997). Camels were found to out-perform other species in utilizing nutritionally lower quality or imbalanced diets. However, differences between species were minimal when receiving adequate and better balanced diets.

The present investigation was intended to study, in growing female dromedaries, feed intake capacity, diet selection and live weight changes in relation to the type of roughage offered and the effect thereon of concentrate supplementation. The roughages used were

intended to represent different grazing conditions typically prevailing in arid rangelands. Free choice cafeteria feeding was employed to facilitate the study of diet selection and to assess the animals' feed intake capacity. Results are discussed in relation to the practice of supplementary feeding of grazing herbivores in arid rangelands, and in the light of factors affecting voluntary food intake.

## 2. Materials and Methods

### 2.1. Animals and management

Eighteen healthy growing she-camels were used in the present experiment to study diet selection and feed intake capacity, as well as their live weight changes under simulated grazing conditions and the effect of supplementary feeding. They were 24-30 months old and their live body weight averaged  $393.1 \pm 27.02$  kg (range: 349.5-445.0 kg). Animals were housed individually in shaded floor pens for the duration of the experiment. They were weighed every two weeks after overnight fast and on two consecutive days. Their average daily gain was calculated for each period.

### 2.2. Feeds and feeding

The different grazing conditions prevailing in arid rangelands were represented by the three roughages used. Those were Egyptian clover hay to represent optimum grazing conditions, rice straw to represent dry season grazing and *Atriplex halimus* to represent arid rangelands dominated by halophytes. The concentrates used were corn grains and cottonseed meal selected as the commonly used energy and protein supplements, respectively. Roughage feeding was ad lib throughout and offered twice daily at 8:00 and 16:00 hours. Refusals, if any, were weighed the following morning and daily intake was recorded on dry matter basis. Concentrates, when fed ad lib, were restricted to only 10 hours daily, from 8:00 to 18:00 hours daily, in an attempt to control anticipated excessive soluble carbohydrates intake and possible adverse effects on rumen function and feed utilization (Farid et al. 2005a, 2005b). Water was made available free choice once daily at the morning feeding time. The proximate composition of feed ingredients is presented in Table 1.

**Table 1. Proximate composition of feed ingredients, % DM basis.**

Proximate constituents	Egyptian Clover hay	Rice Straw	Atriplex <i>halimus</i> <sup>2</sup>	Corn grains	Cottonseed meal <sup>1</sup>
Dry matter	86.08	87.43	34.98	86.65	90.88
Ash	13.35	21.68	25.01	1.71	24.73
Organic matter	86.85	78.32	74.99	98.29	75.27
Total (crude) protein	14.26	4.55	11.70	10.76	15.84
Crude fibres	34.23	28.86	28.62	3.77	19.30
Ether extract	4.40	2.52	2.94	3.92	10.86
N-free extract	33.76	42.39	31.37	79.84	29.27

1. Un-decorticated, heat treated and mechanically pressed CSM, produced in a traditional mill,  
2. Leaves and succulent branches typically consumed by grazing animals,

### 2.3. Cafeteria feeding trials

The feeding trials were intended to investigate diet selection and feed intake capacity when roughages and concentrates were fed ad lib, and the effect on roughage intake and animal performance when concentrates were restricted. In order to achieve this goal, a free-choice cafeteria feeding system was used. Feeders were divided to allow for the separate offering of feed ingredients and hence the recording of daily intake from each.

The animals were randomly allotted to three groups, six animals each. Each group was assigned one of

the three roughages offered ad lib for the duration of the whole experiment.

The feeding trials lasted 100 days in four consecutive periods. The first period (14 days) was intended to gradually introduce the animals to full free-choice roughage and concentrate intake. This was followed by a second period (33 days) where individual intakes were recorded daily when all roughage and concentrate ingredients were fed ad lib. During the third period (22 days) roughages were fed ad

lib but concentrates offered were reduced to 75% of average ad lib intake recorded during the second period. Concentrates offered were further limited to only 50% of ad lib during the fourth period (31 days). Daily intake from each ingredient was recorded separately for each animal throughout the experiment.

#### 2.4. Analytical procedures and calculations

Determination of the proximate composition of feeds (Table 1) was carried out according to official procedures (A.O.A.C. 1990). Nutrients intake were calculated from feed ingredients intake recorded daily and their determined organic matter, total protein and crude fibres contents.

#### 2.5. Statistical analysis

Main effects and interactions were evaluated using the GLM repeated-measures analysis of variance procedures of the NCSS statistical package (Hintze, 2007). The type of roughage and concentrate levels were the independent variables, and concentrate levels were repeated within roughages. Duncan's multiple-range test was applied to the means of the main effects and to the two-way interactions (Duncan, 1955).

### 3. Results

#### 3.1. Dry matter intake

Average daily feed intake data for the 100-day experimental period are illustrated in Figure 1. During the two-week adaptation period, as the amount of concentrates offered increased roughage intake decreased but total DM intake increased. Thereafter, and during the following 33 days when all roughage and concentrate ingredients were offered free-choice, grain intake continued to increase whereas cottonseed meal and roughages decreased, and total DMI decreased as well. This lasted for about two weeks only. Grains intake then tended to decrease and cottonseed meal and the roughage increased but only slightly. Total DMI exhibited a gradually decreasing trend especially in the straw-fed group. Similar patterns of probable rhythmic responses were observed earlier in camels, sheep and goats (Farid et al. 1997).

Limiting the concentrates offered to 75% and 50% of ad lib intake in the hay and straw fed groups increased roughage intake but total DMI decreased. However, in the atriplex-fed group the increase in roughage intake was substantial and total DMI was not practically different from that when concentrates offered were not limited.

#### 3.2. Diet selection and feed intake capacity

When both roughages and concentrates were

offered free-choice, total DMI was regarded as the animal's most favorable feed intake capacity (FIC). The results (Table 2) indicated that the type of roughage and concentrate levels, and their interaction, significantly affected FIC and diet selection. Camels offered the rice straw consumed the least total and roughage DM (78.9 and 16.1 g DM /day/kg<sup>0.73</sup>, respectively), and the roughage proportion in the consumed diet was low (20.6%). When fed the better quality clover hay, on the other hand, camels consumed more total and roughage DM (83.9 and 22.5 g DM /day/kg<sup>0.73</sup>, respectively), and the roughage proportion in the consumed diet increased to (26.9%). Noteworthy, feeding the native saltbush *Atriplex halimus* promoted better DMI, both total and from the roughage (96.4 and 33.4 g DM /day/kg<sup>0.73</sup>, respectively), and the roughage proportion in the consumed diet was practically optimum at 34.7%.

Irrespective of the roughage fed, camels consumed, on average, three-times as much corn grains as that from the cottonseed meal, 47.2 vs. 15.1 g DM /day/kg<sup>0.73</sup>, respectively. Between roughages, Atriplex promoted more grain and less meal intake than hay, and straw was intermediate. This might indicate that grains as a source of available carbohydrates were preferred when total and soluble nitrogen contents were higher in the roughage.

#### 3.3. Effects of limiting concentrate intake on total and roughage intake

On average, when concentrates offered were limited to 75% and 50% of respective ad lib intake in the three roughage groups (Table 2), roughage DMI as well as the roughage proportion in total DMI increased significantly, whereas total DMI decreased. The atriplex-fed camels appeared at advantage when concentrate feeding was limited. When fed the 50% concentrate supplements their total DMI amounted to 100.0 g/day/kg<sup>0.73</sup>, and a high 71% of which came from the roughage. Their straw-fed mates, on the other hand, were only able to consume half as much total DMI (56.2 g/day/kg<sup>0.73</sup>), only half of it came from straw (48.8%). Although clover hay is considered good dry roughage, results from the hay-fed camels were intermediate but more like that from the straw-fed mates. Their total DMI was 64.2 g/day/kg<sup>0.73</sup> and hay comprised a satisfactory 55.4% of it.

#### 3.4. Nutrients intake

Organic matter (OM), total protein (TP) and crude fibres (CF) intakes were calculated

from the proximate composition of ingredients and the ingredients' DM intake (Table 3). On average, restricting concentrate feeding to 75% and 50% of ad lib intake decreased organic matter and total protein intake and increased crude fibres intake per unit metabolic size, kg<sup>0.73</sup>. Between the three roughage groups, and irrespective of the level of concentrate offered, the atriplex-fed camels consumed significantly more of the three nutrients, OM, TP and CF, than camels in the other two roughage groups. The straw-fed camels consumed the least and those fed hay were intermediate.

The decrease in total OM intake as concentrates offered were restricted to 50% ad lib

amounted to only 4.4% in the atriplex-fed camels, whereas it was 24.6% and 32.1% in the hay- and straw-fed camels, respectively.

Total protein (TP) intake increased slightly (3.5%) in camels fed the atriplex, but decreased 20.1% and 43.2% in their hay- and straw-fed mates when concentrates offered were limited to 50% of ad lib. On the other hand, crude fibres intake increased in all three roughage groups, more so (61.3%) in the atriplex-fed camels which experienced the least decrease in total OM intake. The increased CF intake amounted to 13.6% and 7.7% in the hay- and straw-fed camels, respectively.

### 3.5. Animal performance

Data on average daily weight gain (ADG) of the growing female dromedaries in response to changing the type of roughage and the level of concentrate supplementation are presented in Table 3. Overall, between and within variation were great as indicated by the substantial pooled SEM value. However, the lack of statistical significance of differences between roughage means should not mask the biological significance of the observed results.

On average, the atriplex-fed animals gained the most, followed by the hay-fed ones and the straw-fed mates grew the least. Observed ADG values were 516, 429 and 240 g/d, respectively. The effect of the level of concentrate feeding on ADG was also evident. It amounted, on average, to 691, 305 and 189 g/d in camels fed 100, 75 and 50 percent of ad lib concentrate intake. The roughage-concentrate interaction was not significant.

As indicated above, decreasing the level of concentrate supplementation decreased organic matter and total protein intake and increased that of crude fibres. Atriplex feeding promoted better intake of all three nutrients as compared to hay-feeding, whereas straw-feeding resulted in the least intake. These are in accord with observed effects on performance.

### 4. Discussion

Ruminant herbivores are characterized by their multi-compartmented stomach. This anatomical structure and the microorganisms inhabiting the rumen-reticulum allow for longer retention of ingested food and the anaerobic microbial digestion of cellulosic material, and hence the production of volatile fatty acids and the synthesis of microbial protein, all are for the benefit of the host animal. The camel is a

pseudo-ruminant. It also has a multi-compartmented stomach but the two compartments, omasum and abomasum, are fused together into one 'tubiform' compartment. Nevertheless, it is functionally and metabolically a ruminant herbivore.

Voluntary food intake and the selection between foods when offered free choice for ad lib feeding are important issues of continued interest. High levels of voluntary intake are required for efficient production, in general, because the more the animal eats the more it produces. Selection between foods is how the animal attempts to acquire a 'balanced' diet to supply essential nutrients commensurate with its basic needs for maintenance and potential production, and including continued fat deposition in the adult. Grazing herbivores have been known to select diets that are richer in nutrients and lower in toxins than the average composition of available vegetation (Fontenot and Blaser, 1965, Arnold, 1970).

In natural environments the availability and composition of foods vary both spatially and temporally. In arid rangelands there are distinct grazing and dry seasons. In addition, animals also graze halophytes dominant in certain areas and depressions. Under these conditions grazing ruminants, camels included, are challenged with seasonal shortage of food and water, both in quantity and quality. Supplementary feeding is then not an uncommon practice. Properly practiced, and in addition to economic considerations and the fact that achieving the full production potential may not be the realistic objective under certain conditions, the following, among other things, need to receive appropriate consideration: (a) supplementation should be an addition to what the animal is able to acquire from the available pasture and not to replace it, (b) to compliment and balance nutrients needed by the animal but deficient in the pasture, (c) does not restrict the mobility of the animal on the range, (d) does not increase the need for free drinking water usually in short supply under these conditions even when the animals are adapted to intermittent water intake and (e) expected total intake not to exceed the animal's expected feed intake capacity, otherwise the objectives and benefits of supplementation would not be realized.

The present experiment addressed some of these topics as related to the supplementary feeding of growing she camels in arid rangelands. The roughages used were chosen to represent different arid grazing conditions. They were clover hay to represent optimum quality grazing, straw to represent dry season grazing and atriplex to represent grazing in areas dominated by halophytes. The results are foreseen to be of value when attempting to develop appropriate supplementary feeding system for camels inhabiting

such environments.

Although not experimentally demonstrated in the present study, it is acknowledged that the three roughages used and the liberal concentrate ingredients offered imposed different sets of factors known to affect the regulation of voluntary food intake of the animals. In all three roughage groups, liberal intake of corn grains especially when offered ad lib might have increased rumen acidity and osmolality and intensified the effect of propionate in the liver and impair fiber digestion (Hoover 1986, Nsahlai and Umunna 1996 and Faverdin 1999). Long term adjustment to liberal corn feeding was observed as of about day 30 and beyond (Fig. 1) where corn grains intake started to decrease, roughage and cottonseed meal intake increased and total DMI decreased.

In the atriplex fed animals, the high content of sodium chloride and soluble proteins might have resulted in increased rumen osmolality and ammonia concentration, both known to negatively affect VFI (Kyriazakis and Oldham 1993 and Stevens et al. 2004). However, since fresh drinking water was freely available, along with that available from the lush plant, it seems that the anticipated negative effect on VFI was counter-balanced. Similar results were reported by Konig (1993) and Alicata et al. (2002). In the straw fed group, its poor digestibility, longer retention time in the GIT and low nutritive value (Cianci et al. 2004) did limit the VFI and adversely affected animal performance.

Ad lib feeding of concentrates along with ad lib roughages resulted in similar intakes of total concentrates, the sum of corn grains and cottonseed meal, amounting to 61-63 g DM/d/kg<sup>0.73</sup> irrespective of the roughage offered and the different ratio of grains to meal. Roughage intake differed, however. It was greatest in the atriplex group, least in the straw group and the hay group was intermediate: 33.4, 16.1 and 22.5 g DM/d/kg<sup>0.73</sup>. This was reflected upon total DM intake, i.e. the feed intake capacity, and the proportion of the roughage in total DMI.

Maximum feed intake capacity at free choice ad lib feeding amounted to 84, 96 and 79 g DM/d/kg<sup>0.73</sup> for camels fed hay, atriplex and straw, respectively. The present VFI capacity values of hay and straw were close to those indicated by Farid et al. (1997), being 87 and 79 g DM/Kg<sup>0.75</sup> for adult camels fed free choice ad lib concentrate mixture and barley grains with either clover hay or rice straw, respectively. When concentrates offered were only 50% of ad lib (28 g DM/d/kg<sup>0.73</sup>), and although roughage intake increased some, feed

intake capacity (total DMI) decreased to 64 and 56 g DM/d/kg<sup>0.73</sup>, in camels fed hay and straw, respectively. Noteworthy, it was not affected in the *triplex* fed camels where it amounted to 100 g DM/d/kg<sup>0.73</sup>. This may be due to the positive response of camels to *triplex* feeding which is attributed to two principal factors (Shawket et al. 2010). First, camels appear to need more salt, probably more than other herbivores, which is in higher proportion in this plant. This fact was demonstrated previously by Chamberlain (1989) that camel requires six to eight times the amount of salt required by other livestock, and camels without regular access to salty feed require about 140 g of salt per day. So, these findings explain the higher ( $P<0.05$ ) intake of DM, OM, TP and CF when camels fed *triplex* in comparison to their mates fed either hay or straw. Second, in comparison to bovines, camel saliva contain a varying content of high molecular weight mucin-glycoprotein (MGP) that confers protection to the mucosa of the digestive tract from mechanical injuries and fixes the plant tannins preventing their negative effects on protein metabolism in the rumen (Schmidt-Witty et al. 1994). In addition, *triplex* being a lush green plant was more palatable and preferred by camels in comparison to the dry long clover hay.

When concentrates offered were limited, dry matter intake from roughages increased to 35.5, 71.2 and 27.4 g DM/d/kg<sup>0.73</sup> in hay, *triplex* and straw fed animals, respectively, an increase of 58, 113 and 70 percent. Reflecting upon the concept of supplementary feeding, these percentages represent reduction of pasture intake when concentrate supplementation increase from about 28 to 63 g DM/d/kg<sup>0.73</sup>. The same trend, it was found by Jakhmola and Roy (1992) when growing camels were fed ad lib on a local Indian roughage (moth chara) with three levels of protein concentrate supplements (HPN, MPN and LPN). When concentrate supplementation increased from 0, to 18 and 28 g DM/d/Kg<sup>0.75</sup>, roughage intake decreased significantly by 22% and 12% in the HPN group less than that of MPN and LPN, respectively. The authors indicated that this decrease may be due to changes in the rumen fermentation pattern. Whereas feeding low levels of concentrates stimulated cellulolytic fermentation in the rumen, high levels of concentrates tend to change fermentation pattern from typical cellulolytic to amylolytic. Thus rumen retention time of roughage in the ad lib grains treatments as well as in the HNP group of Jakhmola and Roy (1992) might have been increased and hence, reducing the intake of roughages. In comparison, Shawket and Ahmed (2001) reported that intake of adult camels from *Atriplex nummularia*, which is nutritionally superior to *A. halimus*, increased from 53.7 g DM/d/kg<sup>0.75</sup> when fed alone to 69.6 g DM/d/kg<sup>0.75</sup> when a supplement of corn grains was offered to supply only 40% of the ME

required for maintenance (Farid 1995). The corn grains supplement amounted to 13.5 g DM/d/kg<sup>0.75</sup>, equal to 21% of ad lib concentrate supplement realized in the present experiment. The present result of feed preference by camels is supported by the finding of Rutagwanda et al. (1990) that camels are superior to other species in selecting plants and feeds of better quality. It was concluded that animals have developed mechanisms, behavioral and else, that allow them to recognize foods on the basis of their nutritional as well as other properties (Kyriazakis et al., 1999).

Decreasing the level of concentrate supplementation to 75% and 50% decreased the ADG by 56% and 73%, respectively less than that of ad lib concentrate supplementation. The same trend was reported by Jakhmola and Roy (1992), for growing camels. It is noticeable that *triplex*-feeding with ad lib concentrate supplementation or when limited to 75% and 50% of ad lib, recorded the highest DMI capacity in comparison to hay or straw-feeding. These reflected the camel preference to salty roughages as discussed above. Irrespective of the level of concentrate offered, *triplex* feeding promoted better intake of all three nutrients, OM, TP and CF, as compared to hay or straw-feeding resulting in the highest observed ADG. Similar results were reported earlier by Shawket et al. (2010) who indicated that growing camels fed *triplex* supplemented with crushed barley grains (100% of their growth energy requirements, Wardeh and Farid 1990) recorded higher ( $P<0.05$ ) ADG than their mates fed hay, 560 g/d vs. 421 g/d, respectively.

## 5. Implications

Supplementation during optimum grazing season is practiced only if the pasture is over-stocked, animal movement is restricted or nutrient requirements are high during demanding physiological or productive states. On the other hand, supplementary feeding during the dry season or when grazing halophytes is practiced to rectify deficiencies and imbalances of nutrients in the available pasture, frequently at or below the maintenance level of feeding to minimize losses in life and condition.

Developing supplementary feeding schemes for camels, like other ruminant herbivores, require knowledge of their requirements especially at maintenance (Farid et al. 1990, Farid, 1995). These were translated into provisional requirements for different physiological and productive states (Wardeh and Farid 1990). Secondly, it was essential to evaluate in growing she camels, the present

experiment, diet selection and the maximum feed intake capacity under ad lib cafeteria feeding conditions, and the effect thereon of restricting the concentrate supplements, while using three roughages to simulate the different arid grazing conditions indicated above. The study under these controlled conditions was not expected to deviate much from natural conditions. Kyriazakis et al. (1999) stated that even under partly artificial conditions the diet selected will follow from the general adaptive nature of the animal's feeding behavior.

The present results provide preliminary guidelines to the supplementary feeding of camels under different grazing conditions. Of paramount importance, the camel's preference for concentrates and the reduction of their intake from roughages, i.e. the pasture, when supplements are abundant. The results are supported by the findings of Yacout and El-Badawy (2001) and taking into consideration the fact that responses of ruminants to energy and protein intake are not independent (Blaxter 1975). However, it seems that camels are more sensitive to energy than protein deficiency and supplementation and they can utilize poor quality roughages if forced to use exclusively on it (Holler et al. 1986, Lechner and Englehardt 1989).

# Application of Proposed Distribution Network Planning Rules on Fast Developing Countries

Salem M. Elkhodary<sup>1</sup>, and M. Khafagy<sup>2</sup>

<sup>1</sup> Faculty of Engineering, Ain Shams University,, Cairo, Egypt,<sup>2</sup> Saudi Electricity Company, KSA.

**Abstract:** With the ever increasing need to electric energy and the fast development of loads in many countries especially in the fast developing ones such as the GULF countries, the load growth as well as the forecasted loads, are highly increased depending on new and arising factors and conditions. In turn, Electricity Companies build rapidly generating plants, transmission and distribution networks to meet the rapid load demand. Usually, power system expansion follows the load growth which may exist at random locations. This adds to the absence of prior proper planning, especially medium and long term planning, resulting in network configurations that do not match with optimum siting and sizing planning rules. Operation of such networks faces several problems that may sacrifice the power quality. Thus, proper planning of new networks, expansion or rehabilitation of existing ones should be based on most accurate and proper planning rules. This calls for the investigation of a new exact cost function for optimum sizing and siting of network substations, and hence the H.V. feeds (incoming) and the M.V. distribution (outgoing) feeders. Therefore, this paper presents a newly proposed methodology that takes into consideration the capital costs of all electrical components, losses in these components, operation and maintenance costs. The inflation rate can be also taken into consideration. This methodology gives important results, which conclude that the optimum distance between substations and hence the optimum number of substations, greatly depends on different factors that were not taken into consideration before, for example : the kWh price, cost of the HV incoming feeders (66-110 kV feeders) besides the cost of the MV outgoing feeders (6.6-22 kV feeders), cost of the distribution substations (MV/LV), cost of losses in transformers, cost of losses in all feeders, incoming and outgoing, Operation and maintenance costs ....etc. [Journal of American Science. 2010;6(11):327-]. (ISSN: 1545-1003).

**Keywords:** Cost function. Objective function., Distribution network planning. Optimum siting and sizing of substation

## 1- Introduction:

On the application of the proposed cost function to re-plan, expand and rehabilitate the network of Jeddah City, as an example of a fast developing network, the obtained results in this paper present the most important conclusion that the today number of substations in a fast developing network can be kept optimally the same without increase till year 2023, but only needs the increase of the substation capacity, and the enforcement of the H.V. and M.V. lines, according to the forecasted loads and the given rate of load growth.

In the planning of transmission, sub-transmission and distribution networks of an electric power system, cost plays a major role and is a main deciding factor. From the technical point of view, there are always several alternative designs that can satisfactorily fulfill the objectives of the system, namely; continuity, voltage level and power losses. Then, the cost will be the deciding factor on differentiating between the best technically selected plans [1], hence deciding the optimum sites and sizes of the network elements, especially the network substations.

Therefore, since early of the second half of the 20<sup>th</sup> century, investigations of cost functions supporting

the appropriate system plans have been attempted [1-11]. In this respect, authors considered only the capital costs of the network elements, believed to be most effective, and ignored those thoughts to be non-effective. This rendered most of the previously proposed cost functions to be approximate. This becomes very clear when dealing with fast growing loads in fast growing countries and with heavy load densities, where, on application, can lead to misleading plans. Therefore, this paper has been devoted to propose an accurate cost function that takes all cost factors into consideration. Comparing with the results obtained using previous approximate formulae, important results are obtained.

## 2- Review of Previous Related Investigations :

Ponnavaienko [2] proposed an optimal planning solution aimed at optimizing the substation feed area, load carrying limit of the feeders and the conductor size for feeders. Pannavaienko considered that the substation cost is a function of the substation size and the number of feeder bays provided at the substation.

From the point of view of energy conservation, Swedan [3] suggested that the system network, which is required to be built in such a way that the power distributed to the load center can take place at minimum cost, may be achieved by evaluating an

objective function in terms of the annual energy losses costs.

Considering that the best distribution system planning could be achieved using the best size and location of substations, EBASCO [4] proposed that such achievement could be realized by finding the least annual cost of the sum of the fixed, charges on substations and feeders. Operation, maintenance and losses costs were neglected.

Since the formula presented by EBASCO [4] is believed to be commonly used for optimum siting and sizing of network substations, however being approximate, it is worthy to present here in some details, and to be compared with the present proposed cost function.

Increasing the number of substations for a given load density tends to increase total cost. However, increasing the number of substations reduces the cost of feeders. Clearly then, the least total annual cost is a function of substation and feeder costs, capacity of feeder and load density.

The total cost of substations and feeders/ unit area is :

$$C_T = \text{feeders Cost/ Unit Area (km}^2\text{)} + s/s \text{ Cost} \\ = \left( a + \frac{bS}{2} \right) \frac{D}{kVA_f} + \frac{c}{S^2} + dD \quad (1)$$

Minimizing the above equation with respect to S results in the optimum substation size and site (represented by the distance between substations S) as follows:

$$S = 1.59 \left[ \frac{kVA_f \cdot c}{bD} \right]^{0.333} \text{ km} \quad (2)$$

and the corresponding optimum substation size would be :

$$kVA_s = S^2 D = 2.52 D^{0.333} \left[ \frac{kVA_f \cdot c}{b} \right]^{0.666} \quad (3)$$

Where :

**D** is the Load density in kVA per square kilometer ( $\text{km}^2$ ).

**kVA<sub>s</sub>** is the substation kVA capacity.

**kVA<sub>f</sub>** is the feeder kVA capacity.

**S** is the distance in km between substations.

**a** is the fixed charges on feeder equipment and regulators in dollars per year.

**b** is the cost of feeders in US\$ per km.

**c** is the part of substation cost not proportional to substation capacity.

**d** is the cost per kVA of the substation capacity required to carry the load in the area  $S^2$ .

**C<sub>T</sub>** is the total cost of substations and feeders per square km.

K.S. Hindi et al [5,6], Harley et al [7] and Adler et al [8] confined their investigations to problems related with low voltage networks, namely to radial layout of a distribution network [5,6], replacement of the transformers (dynamic design) with the growth of the load demands [7] and to a model focusing on the treatment of residential and light commercial service areas with time-varying load characteristics, including customer load profile changes, per customer load growth and service area population growth. Clearly, such investigations for related low voltage plans cannot be of effective use for HV/MV distribution network planning, where optimum siting and sizing of substations and hence HV incoming and MV outgoing feeders are the main objective.

Further, M. Kaplan, and A. Braunstein, [9] presented a contribution to the determination of the optimum site for substations. The method enables to limit the number of possible solutions and by using grapho-analytical methods to home on the optimum solution. The optimum site for a substation is the location which will result in minimum construction and operation costs.

Furthermore, G.L. Thompson, and D.L. Wall, [10] formulated a distribution planning model which considers existing and potential substation locations, their capacities and cost, together with the primary feeder network represented by small area demand locations to represent non-uniform loads, and feeder segments having variable distribution costs and limited capacities.

Ibraheim et al [11] presented an economic comparison between two suggested technical alternatives for an integrated network (composite distribution system comprising primary substations, distributions points, primary feeders connecting the distribution points, distribution transformers (kiosks) and feeder sections tying these kiosks (normally in the form of loops)). All such costs have been added by computation for various alternative plans of a distribution district. The most economical variant was recommended. To fulfill this, extensive data was necessary to be provided, arranged in tables and laborious computations were carried out, other than using a simple objective function.

Thus, it is thought that anyone of the preceding formulae has selected only several factors thought to be the effective ones, but ignored other factors that may be of cost effectiveness in planning. This called for the present investigation. The proposed cost function presented in this paper has taken into consideration even every minor factor of the many that have been ignored in the previous proposed cost functions, such as; the kWh price to account properly for the cost of losses, the main fixed charges on substations and feeders, the operation and maintenance costs, losses

cost in all system elements, substation cost and the substation loading.

### 3- Proposed Cost Function:

In the present work it has been aimed to investigate a cost function that considers all affecting factors, including capital cost, costs of losses, operation and maintenance costs with only basic data required, where none of the factors, even having slight effect, is neglected such as done before [e.g. 2,3,4].

Since the loads of distribution networks in fast developing countries are characterized by high densities and high growth rates, distribution substations are fed by elevated voltages e.g. up to 110 kV, such as in Saudi Arabia networks, where the distribution substations are 110/13.8 kV substations. This means that the distribution networks in such countries comprises the 110 kV feeding network. This agrees with same generally accepted classifications of networks voltages. This calls to consider the cost of the substations incoming feeders. Consequently, in the presently suggested formula, all of the following factors are considered for optimizing the locations and capacities of the substations and hence, the incoming and outgoing feeders lengths and sizes defining the basic network plan. Thus, the taken factors are :

- Cost of the HV incoming feeders (66-110 kV feeders).
- Cost of the MV outgoing feeders (6.6-22 kV feeders).
- Cost of the HV/MV substations equipment (part of substation cost depending on its capacity).
- Cost of the HV/MV substation land, civil work, public works ...etc (fixed part of substation cost).
- Cost of losses in transformers.
- Cost of losses in all feeders, incoming and outgoing.
- Operation and maintenance costs ....etc.

The following symbols will be used to determine the relationship of the above factors in deriving the equation of the total cost.

**D** is the load density in kVA/km<sup>2</sup>.

**kVA<sub>s</sub>** is the substation MVA capacity.

**kVA<sub>fi</sub>** is the incoming feeder kVA capacity.

**kVA<sub>fo</sub>** is the outgoing feeder kVA capacity.

**S** is the distance in km between substations.

**a<sub>i</sub>** is the fixed charges on incoming feeders equipment and regulators (cable ends, feeder cells, ....etc.).

**a<sub>o</sub>** is the fixed charges on outgoing feeders equipment and regulators.

**b<sub>i</sub>** is the cost of incoming feeder/km.

**b<sub>o</sub>** is the cost of outgoing feeder/km.

<b>c</b>	is the part of substation cost not proportional to substation capacity (land, civil work, building, ....etc.).
<b>d</b>	is the cost per kVA of the capacity required to carry the load in the area S2
<b>n<sub>fi</sub></b>	is the number of incoming feeders required/ km2.
<b>n<sub>fo</sub></b>	is the number of outgoing feeders required/ km2.
<b>C<sub>s</sub></b>	is the substation cost / km2.
<b>C<sub>TC</sub></b>	is the total construction costs or expenses / km2.
<b>x</b>	is the ratio between the value of power losses at full load of the substation transformer and its rating.
<b>I<sub>f</sub></b>	is the loss factor of a substation transformer.
<b>C<sub>tr</sub></b>	is the cost of losses in substation transformers/ unit area.
<b>I<sub>i</sub></b>	is the rated current of incoming HV feeder.
<b>I<sub>o</sub></b>	is the rated current of outgoing MV feeder.
<b>C<sub>o&amp;m</sub></b>	is the expenses of substations operation and maintenance/ unit area.

To investigate the total costs and hence the cost function that is optimized to get the optimum spacing between substations and hence their sizes and feeder lengths, Using One Square km As a Unit Area, calculations have been carried out as follows :

#### 3-1- Cost of incoming and outgoing feeders [12]:

No. of incoming feeders/ substation is normally 4 to 6 as a substation is usually fed from two or three different sources via double circuit lines or cables. The most common practice, a HV/MV substation is fed from two double circuit feeders.

So, the No. of incoming feeders per substation is equal to 4.

$$n_{fi} \text{ is the No. of incoming HV feeders/km}^2 = \frac{4}{S^2}$$

$$\text{Cost / incoming feeder is given by : } a_i + b_i \frac{S}{2}$$

Cost of incoming feeders to HV/MV substations / Unit area = n<sub>fi</sub> \* Cost / incoming feeder

$$= \frac{4}{S^2} \left( a_i + b_i \frac{S}{2} \right) \quad (4)$$

Similarly, the cost of outgoing feeders required/km<sup>2</sup>

$$= n_{fo} \left( a_o + b_o \frac{S}{2} \right) = \frac{D}{kVA_{fo}} \left( a_o + b_o \frac{S}{2} \right) \quad (5)$$

#### 3-3- Cost of substations:

The cost of a substation comprises that part of cost that does not depend on the substation capacity (c) which includes the land, the building and civil work and as such in addition to the part that depends on the substation capacity which is given by d\*kVA<sub>s</sub>.

Where :

**d** is the cost/ kVA of the capacity required to carry the load in the area  $S^2$ .

**kVA<sub>s</sub>** is the substation capacity or size=  $S^2 \cdot D$

Using one square km as a unit area for calculations.

$$C_s = \text{substation cost/ km}^2 = \frac{c}{S^2} + dD \quad (6)$$

### 3-3- Cost of losses [12]:

#### 3-3-1- Losses in substation transformers [12]:

Let the ratio between the value of power losses of the substation transformer and its rating be x, where x, i.e.

$$x = (1 - )$$

where :

is the transformer efficiency percentage/100.

Transformer losses in a substation at full load=

$$x(kVA)_s$$

and transformer losses in substations/ unit area ( $\text{km}^2$ )

$$= \frac{x(kVA)_s}{S^2}$$

Then, the cost of losses in substation transformers per unit area is equal to:

$$\frac{x(kVA)_s}{S^2} * \text{transformer operation age} * \text{loss factor (lf)} * \text{PF} * \text{cost of energy/kW}H$$

where the loss factor is the ratio between the averaged value of power losses of a transformer and its rating which depends on its load curve.

$$\text{Loss Factor (lf)} = \sum_{\text{hour}1}^{\text{Hour}24} \frac{(kVA_{actual})^2}{(kVA_{rating})^2} / 24$$

∴ Cost of losses in substation transformers/  $\text{km}^2$  is :

$$\frac{x(kVA)_s}{S^2} * 25 (\text{years}) * 8760 (\text{hours/ year}) * \text{loss factor (lf)} * \text{PF} * \frac{k_s (kVA)_s}{S^2} / \text{kW}H$$

Where :

$$k_s = x * 25 * 8760 * \text{loss factor (lf)} * \text{PF} * \frac{\$/kW}{\$/\text{kW}H} \quad (7)$$

$x = 1\% = 0.01$

Cost of losses in substation transformers/  $\text{km}^2$  ( $C_{tr}$ ) is :

$$\frac{k_s (kVA)_s}{S^2} = \frac{k_s * S^2 D}{S^2} = k_s D \quad (8)$$

### 3-3-2- losses in H.V. incoming and outgoing feeders [12]:

Similarly, cost of losses in incoming feeders = Losses cost = loss/ feeder at rated current \* No. of incoming feeders/ unit area \* loss factor \* life duration

in hours \* cost/ kWh

$$= \frac{I_i^2 (R_i / \text{km})}{1000} * \frac{S}{2} * \frac{4}{S^2} * 25 * 8760 * lf * \frac{\$/kW}{\$/\text{kW}H}$$

$$= \frac{I_i^2 (R_i / \text{km})}{1000} * \frac{2}{S} * 25 * 8760 * lf * \frac{\$/kW}{\$/\text{kW}H} \quad (9)$$

Also, energy losses in the MV outgoing feeders and their cost over the life time of cables (assumed 25 year)/ unit area can be calculated as follows [12] :

Energy Losses cost in MV outgoing feeder = loss/ feeder at rated current \* No. of outgoing feeders/ unit area \* loss factor \* life duration in hours \* cost/ kWh =

$$= \frac{I_o^2 (R_o / \text{km})}{1000} * \frac{S}{2} * n_{fo} * 25 * 8760 * lf * \frac{\$/kW}{\$/\text{kW}H}$$

$$= \frac{I_o^2 (R_o / \text{km})}{1000} * \frac{S}{2} * \frac{D}{(kVA)_{fo}} * 25 * 8760 * lf * \frac{\$/kW}{\$/\text{kW}H} \quad (10)$$

### 3-4- Operation and maintenance costs :

The expenses of operation and maintenance of substation equipment may considerably affect the cost function and hence the optimization of the substations sites and sizes. In an independent study of the operation and maintenance expenses of a substation, the authors could conclude that these costs over the substation life add to approximately the total substation capital (construction) costs [12].

Therefore, the cost of operation and maintenance/ unit area can be estimated as:

$$C_{o\&m} = \frac{s / s \text{ cost}}{S^2} \quad (11)$$

### 3-5- Suggested exact cost function:

From the above detailed analysis of the costs of a system including substations, incoming feeders, outgoing feeders, system energy losses, operation and maintenance costs, the believed most exact cost function suggested in the present work can be formulated by the additions of costs given in equations (4) to (11) as follows :

$$C_T = \left( \frac{c}{S^2} + dD \right) + \frac{4}{S^2} \left( a_i + b_i \frac{S}{2} \right) + \frac{D}{(kVA)_{fo}} \left( a_o + b_o \frac{S}{2} \right) + (12)$$

$$k_s D + k_f \frac{2I_i^2 R_i / km}{1000 S} + k_f \frac{2I_o^2 R_o S}{2000} * \frac{D}{(kVA)_{fo}} + \frac{s / s \cos t}{S^2}$$

Where :

$$k_s = 25 * 8760 * lf * PF * \$ / kWh$$

$$= 2.19 \times 10^5 * lf * PF * \$ / kWh$$

and

$$k_f = 25 * 8760 * lf * \$ / kWh$$

$$= 2.19 \times 10^5 * lf * \$ / kWh$$

In order to minimize the total cost :  $\frac{dC_T}{dS} = 0$

$$\frac{dC_T}{dS} = \frac{-2c}{S^3} + 0 - \frac{8a_i}{S^3} - \frac{4b_i}{2S^2} + 0 + \frac{b_o D}{2(kVA)_{fo}} + 0$$

$$- \frac{2k_f I_i^2 R_i / km}{1000 S^2} + k_f \frac{I_o^2 R_o}{2000 (kVA)_{fo}} - \frac{2x(s / s \cos t)}{S^3} = 0$$

$$\frac{dC_T}{dS} = \frac{-1}{S^3} (2c + 8a_i + 2 * (s / s \cos t))$$

$$- \frac{1}{S^2} \left( 2b_i + \frac{2k_f I_i^2 R_i / km}{1000} \right) + \left( \frac{b_o D}{2(kVA)_{fo}} + k_f \frac{I_o^2 R_o}{2000 (kVA)_{fo}} \right) = 0$$

Multiply by  $S^3$

$$S^3 \left( \frac{b_o D}{2(kVA)_{fo}} + k_f \frac{I_o^2 R_o}{2000 (kVA)_{fo}} - \frac{D}{(kVA)_{fo}} \right) - S \left( 2b_i + \frac{2k_f I_i^2 R_i / km}{1000} \right) - (2c + 8a_i + 2 * (s / s \cos t)) = 0$$

or

$$\alpha S^3 - \beta S - \gamma = 0 \quad (13)$$

Where :

$$\alpha = \frac{b_o D}{2(kVA)_{fo}} + \frac{k_f I_o^2 R_o}{2000 (kVA)_{fo}} - \frac{D}{(kVA)_{fo}}$$

$$\beta = 2b_i + \frac{2k_f I_i^2 R_i}{1000}$$

$$\gamma = 2c + 8a_i + 2 * (s / s \cos t)$$

Solving equation (13) for S gives the optimum distance between substations and feeders length for minimum cost.

Then, the optimum substation size is given by

$$(kVA)_s = S^2 D$$

Solving equ. (13); S and (kVA)<sub>s</sub> are obtained :

#### 4- Sample Results of Application of the Proposed Cost Function to the Planning of an Actual Network In A Fast Growing Country And Analysis of Results:

In order to verify the benefits from using the proposed cost function, calculations have been carried out to obtain the optimum sites and sizes of the 110/13.8 kV substations and incoming and outgoing feeders of Jeddah 110/13.8 kV networks, for the sake of optimum networks planning and/or rehabilitation. Calculations were also carried out for the same network using the simplified approximate cost function [4] commonly used, for comparison, where high economical and technical benefits will be shown by using the proposed cost function in the present work.

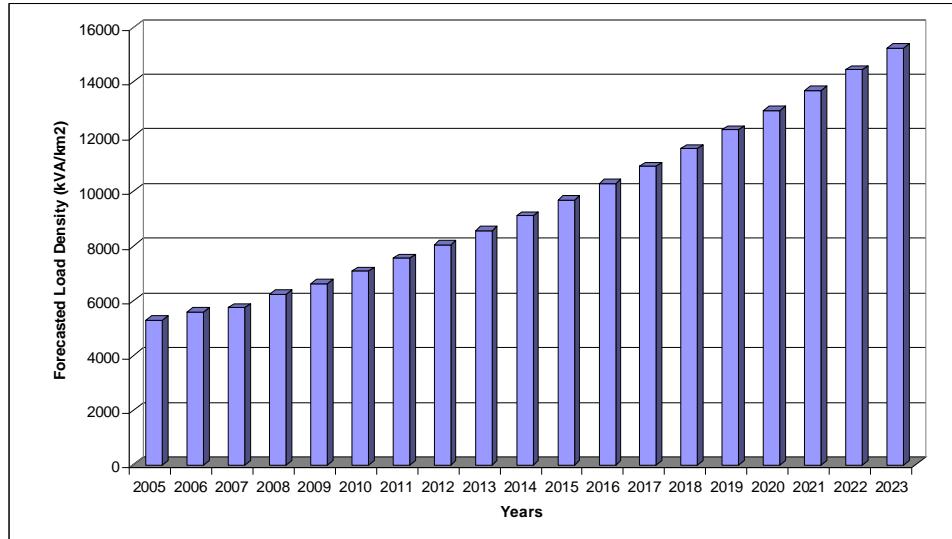

Load forecast for Jeddah area based on a new approach for load forecast in fast developing countries is presented in the authors' paper [13]. Considering the forecasted load density over the years, as presented in Figure (1), sample results are presented in figure (2) for the variation of the optimum distance (S) between substations with the years under the given otherwise conditions. These are compared with the results obtained by the approximate formula. Fig. (2), shows that the optimum distance between substations that decrease with the years (as the load and load density increase, Fig. (1)), is larger when using the investigated (proposed) cost function than using the approximate one, while, the number of required substations is less. Thus, it is required to use less number of substations but with larger capacities. This is an excellent advantage in fast growing countries since at the beginning, substations are built everywhere to meet the loads at various locations. Just increasing the capacities of the existing substations will meet the future loads (up to year 2023 in the studied case). This will save high costs of building new substations (as given by the approximate formula) where the cost of land becomes excessively high as well as saving new routes for the feeding (HV incoming) feeders and the distribution (MV outgoing) feeders.

Further, Figs. (3) presents the same as in Figs. (2), but increasing the cost of energy \$/kWh. Figures (2), (3) indicate that as the cost of electric energy/kWh increases i.e. as the costs of feeders losses increase, it is appropriate to increase the number of substations i.e., decrease the distance between substations. The losses of feeders here play an effective role.

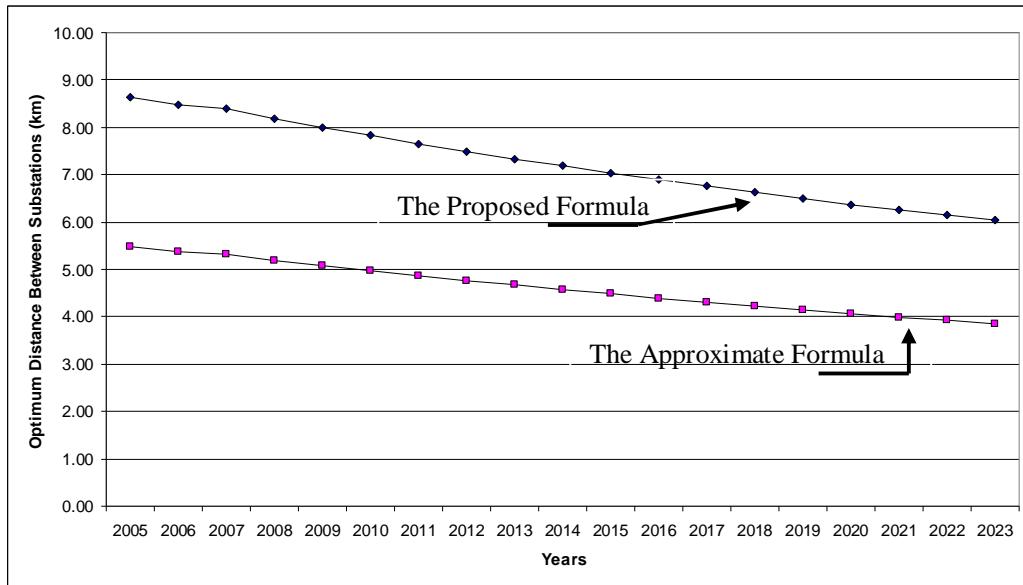

Furthermore, expressive results are shown in Fig. (4), where the calculated optimum distances between substations are presented when varying the fixed part of the substation cost (c) using the proposed cost function compared with the approximate one, under the given conditions. Figure shows clear dependence of the optimum distance between substations on the fixed part of the substation cost.

More and above Figure (5), shows the comparison between the calculated distance between substations dependence on the kWh prices (0.05, 0.08, 0.11, 0.2, 0.27 \$), When  $I_o = 300$  Amp,  $I_i = 600$  Amp, and  $c = 6.7$  M \$, with the use of the newly investigated (proposed) methodology compared with the approximate one. It can be seen that the increase of the

kWh price decreases the distance between substations with the use of the exact proposed formula while no effect is seen when using the approximate formula. This is quite clear as being due to ignoring the losses costs in the approximate formula.

**Fig. 1:** The forecasted load density for Jeddah area.

**Fig. 2:** The calculated distance between substations dependence on the different calculated methodologies, When the  $I_o = 200$  Amp,  $I_i = 400$  Amp, the kWh price is 0.05 \$, and the fixed part of substation cost ( $c$ ) is 4M \$.

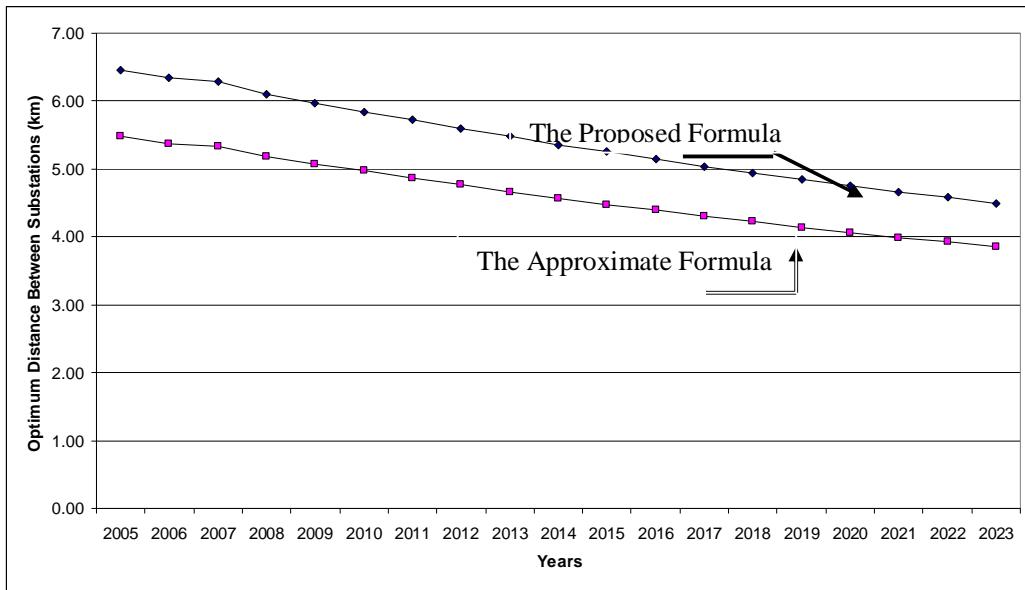

Fig. 3: The calculated distance between substations dependence on the different calculated methodologies, When the  $I_o = 200$  Amp,  $I_i = 400$  Amp, the kWh price is 0.27 \$, and the fixed part of the substation cost ( $c$ ) is 4M \$.

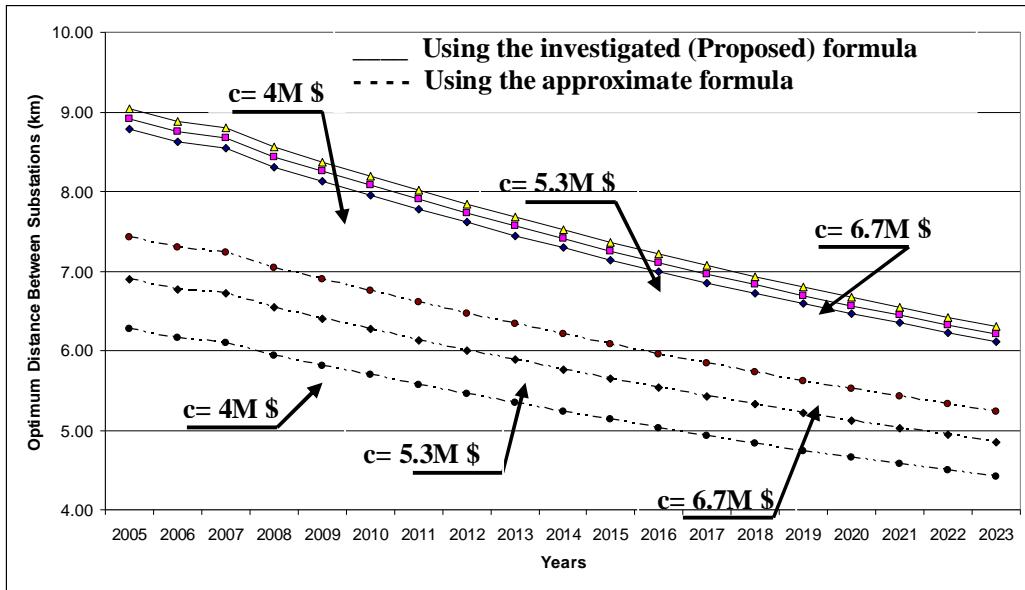

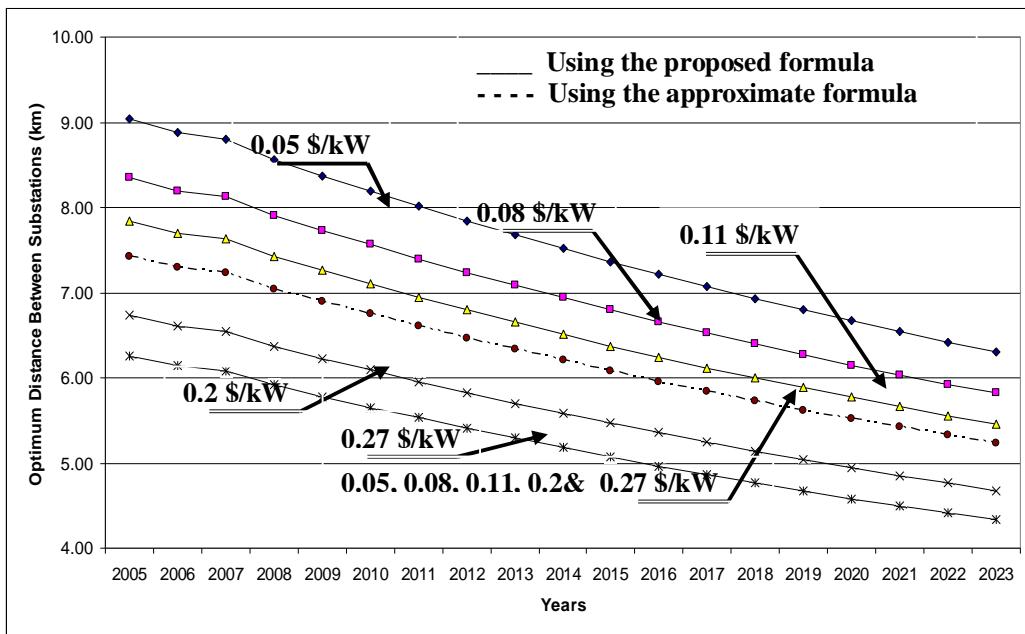

Fig. 4, Comparison between the calculated distance between substations dependence on the fixed part of substation cost ( $c = 4, 5.3, 6.7$  M \$), When the  $I_o = 300$  Amp,  $I_i = 600$  Amp, the kWh price is 0.05 \$, using the proposed cost function compared with the approximate one.

**Fig. 5, Comparison between the calculated distance between substations dependence on the kWh prices (0.05, 0.08, 0.11, 0.2, 0.27 \$/kWh),**  
When the  $I_o = 300$  Amp, and the fixed part of substation cost  $c = 6.7$  M \$, using the proposed cost function compared with those using the approximate formula.

### 5. Conclusions and Recommendations:

The main conclusions of this paper can be summarized as follows:

- 1- The approximate cost functions commonly used nowadays may lead to misleading results for good network planning. The use of different methodologies will result in different distances between substations and hence different number of substations.
- 2- The proposed cost function in the present work yields realistic results, compatible with the best of experience in network planning, where the centers of loads are well served. It does take the costs of all the electrical components into consideration, their losses and their operation and maintenance costs.
- 3- For fast developing countries, where the loads are rapidly increasing and the load densities are high, the high voltage of the substations between 66 kV and 110 kV, actually and effectively serves as distribution voltage, as the high number of substations will consequently serve the load

centers directly.

- 4- An important and vital recommendation for the rehabilitation and development of the 110/13.8 kV networks in fast developing countries, such as Jeddah Region Network, is to increase the capacity of the existing 110/13.8 kV substations, strengthen the 110 kV network by more 110 kV circuits between the substation to meet the growing loads, other than increasing the number of substations accompanied with so many difficulties, thus saving much cost of land and other costs.
- 5- The increase of the kWh cost results in decreasing the distance between substations (increasing the number of substations). The higher the substation cost the higher is the distance between substations.

## New Proposed Method of Damping Temporary Overvoltages on Power System Interconnections

Salem M. Elkhodary<sup>1</sup>, and Ali S. Abd El-Munem<sup>2</sup>

<sup>1</sup> Faculty of Engineering, Ain Shams University , <sup>2</sup>Egyptian Electricity Holding Company, Cairo, Egypt

**Abstract:** The interconnection between countries links different networks. These interconnections may be exposed to several disturbances. These disturbances (such as transient and temporary overvoltages phenomena, faults ...etc.) threaten the interconnection security and reliability. This paper presents actual field measurements of transient and temporary overvoltages appearing on the Egyptian – Libyan system interconnection as an example. These overvoltages were recorded for different cases of operation. These cases were modeled and simulated using the most recent version of Alternative Transient Program (ATP) computer package to compare the results of the computational method with the actual field measurements. The comparison between the ATP output results and the actual field measurements were found less than  $\pm 4\%$ . Within the research activities of the Egyptian Electricity Holding Company (EEHC) temporary overvoltage phenomena on the Egyptian – Libyan interconnection network were detected. EEHC carried field measurements of the temporary overvoltage by using a special transient mobile test laboratory. This detected temporary overvoltage was due to the generated reactive power along the line on switching, in spite of this leading reactive power was compensated by connecting number of reactors at different nodes. The economical aspect has been taken into consideration to reduce the number of reactors to the network, which showed the best effect on damping the temporary overvoltage. This paper, thus, presents a proposed technique to damp the temporary overvoltage and keep the system voltage within the permissible limits by estimating the optimum number and location of reactors that must be connected to the network. [Journal of American Science. 2010;6(11):336-342]. (ISSN: 1545-1003).

### 1. Introduction

Due to the very fast progress and development in the different sectors of the electrical power system all over the world, the electrical interconnection between neighboring countries have been an important goal for most countries. These interconnections are exposed to many disturbances that threaten their security, such as overvoltage phenomena and earth faults ...etc.

As the Egyptian unified electrical network interconnected with the Jordan electrical network through 500/400 kV interconnection system, overvoltage studies were carried out. The overvoltage studies decided to use shunt reactors at different locations to compensate the generated reactive power of the long transmission line from Cairo to Naqab [1]. This study was based on the field measurements and EMTP output results.

Adding shunt reactors are used on many high voltage transmission lines as a means of shunt compensation to improve the performance of the line. They have the additional advantage of reducing the energization surge magnitudes. This is accomplished mainly by the reduction in temporary overvoltage [2]. All these effort were done to keep the voltage profile within the permissible level to protect the electrical equipments in the network.

Therefore, when the Egyptian – Libyan power systems were interconnected, the appearing disturbance should have been studied and treated. This paper is, thus, devoted to this objective.

### 2. The Egyptian–Libyan Interconnection Configuration:

The Egyptian – Libyan electrical interconnection network, of 613 km from Borg Al-arab in Egypt to Tobrouk in Libya, consists of double circuit transmission line of 220 kV passing through a number of 220/66 kV sub-stations (S/S), as shown in Fig.(1).

This transmission line consists of different sectors between sub-stations. These sectors have the following lengths:

**Table (1)**

Sector No.	From	To	Distance (km)
1	Borg Al-Arab	Omayed	35
2	Omayed	Matrouh	215
3	Matrouh	Saloum	198
4	Saloum	Tobrouk	165

The numbers of reactors already connected to the sub-stations are as follows:

**Table (2)**

No	S/S	No. of reactors	Reactor rating (MVAR )	Connected to
1	Borg Al-Arab	-----	-----	-----
2	Omayed	-----	-----	-----
3	Matrouh	2	25	Bus Bar
4	Saloum	2	25	Transmission line (Saloum-Matrouh)
5	Tobruk	2	25	Bus Bar

The reactors are not switchable; they are solidly connected to the bus bar or to the transmission line.

The Thevenin equivalent circuit of the Egyptian and Libyan Unified electrical power network, and the different sub-stations were calculated and simulated in Fig. (2).

### 3. Field Measurements and ATP Results:

Due to the long length of the Egyptian – Libyan electrical interconnection network (613 km) and the light loading nature of the sub-stations along the line, a leading reactive power is generated along the line. This leading reactive power distorts the voltage profile along the line.

The field measurements require advanced technology with high sensitivity and accuracy. A mobile test laboratory for overvoltage measurements in EEHC has been used for this purpose. This laboratory includes PC programmable sequence controller, computer assisted measuring and data acquisition system for registration and analysis of the test results [3].

Field measurements were carried out by the EEHC to measure the transient and temporary overvoltages for five different cases. These cases are as follows:

- 1- Disconnecting Tobrok 220/66 kV s/s bus coupler with two reactors connected to its bus bar.
- 2- Disconnecting Tobrok 220/66 kV s/s bus coupler with no reactors connected to its bus bar.
- 3- Disconnecting Saloum 220/66 kV s/s bus coupler.
- 4- Disconnecting Matrouh 220/66 kV s/s bus coupler.
- 5- Disconnecting Omayed 220/66 kV s/s bus coupler.

The field measurements record that the most severe case was (Case 5). Case 5 shows unacceptable temporary overvoltage due to switching off the interconnection network from Omayed 220/66 kV substation. The network configuration shown in Fig. (1). This case was modeled, simulated in Fig. (2) and studied by the ATP program.

Table (3) shows the system voltage before disconnection, the maximum transient overvoltage, the temporary overvoltage and the error percentage between actual field measurements and output results of ATP.

Table (3) shows the measured voltage at different sub-stations, there voltages are as follows:

- Saloum sub-station records a maximum transient overvoltage of 1.17 p.u. and temporary overvoltage of 1.12 p.u.
- The maximum transient overvoltage at Matrouh sub-station reaches 1.25 p.u. damped to 1.2 p.u. as temporary overvoltage.
- While Omayed sub-station measuring points records 1.25 p.u. for maximum transient overvoltage and temporary overvoltage.

The average error between the actual filed measurements and output results of ATP for the system voltage before disconnection was  $\pm 1.79\%$ , while for the maximum transient overvoltage the error was  $\pm 3.26\%$  and for the temporary overvoltage the error percentage was  $\pm 3.91\%$ . This emphasizes the reasonable accuracy, in such cases, of the computations of ATP output results compared to the field measurements.

### 4. Effect of Adding Reactors:

A sensitive node analysis was done to find the more sensitive bus for reactive power compensation. In this bus a number of reactors were added one by one. A 220 kV reactor of capacity 25 MVAR was added to the most sensitive nodes. The sensitive node analysis shows that Saloum, Matrouh and Omayed sub-stations were the most sensitive buses.

Optimization studies were done to find the optimum number of reactors at sensitive buses. The output results of the optimization studies are shown in Fig. (3, 4 and 5). These figures show the system voltage, the maximum transient overvoltage and the temporary overvoltage with the number of reactors. The maximum and minimum permissible limits ( $\pm 10\%$  of the nominal voltage) assign the optimum number of reactors that gives the most acceptable temporary overvoltage. [4]

**Table (3). The percentage error between the field measurements and ATP computation with the disconnection of 220kv bus coupler at Omayed 220/66kV S/S**

No.	Measuring point	Phase	System Voltage Before Disconnect (kV)			Max. Transient O.V. (kV)			Ovvoltage (kV)

Fig (3) shows that the optimum number of reactors at Saloum sub-station will be 2 reactors of 25 MVAR (already exist)

Fig (4) shows that the optimum number of reactors at Matrouh sub-station will be 4 reactors of 25 MVAR (2 reactors already exist and 2 reactors are to be necessarily added to damp the temporary overvoltage at this bus)

Fig (5) shows that the optimum number of reactors at Omayed sub-station will be 2 reactors of 25 MVAR (no reactors connected to this bus and 2 reactors are to be added to damp the temporary overvoltage at this bus). Adding 3 reactors will give better results for the voltage profile, but from the economical point of view adding 2 reactors is good enough.

The output results of the ATP program shown in Figs. (6, 7, 8, 9 and 10). These figures show the system voltage before disconnection, maximum transient overvoltage and temporary overvoltage after disconnection along the line (at Sloum, Matrouh and Omayed sub-stations).

Fig (6) (**solution 1**) comprises the implementation of the output results from fig (4) at Matrouh sub-station by adding 4 reactors by capacity 25 MVAR (adding 2 extra reactors to the already existing reactors). This figure shows that the temporary overvoltage was reduced from 246 kV to 232.58kV at Saloum sub-station. This means that adding 2 extra reactors reduced the temporary overvoltage by 5.46 %. This figure also shows that the temporary overvoltage was reduced from 263kV to 237.23 kV at Matrouh sub-station. This means that the temporary overvoltage was reduced by 9.8 %. This figure also shows that the temporary overvoltage was reduced from 276 kV to 245.32kV at Omayed sub-station with a reduction percentage of the temporary overvoltage by 11.12 %. Solution (1) is still considered to result in overvoltage values are over the maximum permissible limits at Omayed sub-station.

Figs. (7 and 8) were the implementation of the output results from Fig (5). Fig (7) (**solution 2**) shows the effect of adding 2 reactors of capacity 25 MVAR at Omayed sub-station. This

will reduce the temporary overvoltage from 246 kV to 232.13 kV at Saloum sub-station with reduction percentage of 5.64 %. While the temporary overvoltage at Matrouh sub-station was reduced from 263 kV to 236.52 kV which means a reduction percentage of 10.07 %. Where, at Omayed sub-station temporary overvoltage decreased from 276 kV to 235.35 kV, this means that the reduction percentage at Omayed S/S is 14.73 %.

On the other hand, Fig (8) (**solution 3**) shows the best performance of voltage profile along the interconnection line due to adding 3 reactors of 25 MVAR at Omayed sub-station. There is no fluctuation between the system voltage before disconnection, transient overvoltage and temporary overvoltage. At Saloum sub-station the temporary overvoltage reached to 224.62 kV with reduction percentage of 8.69 %. While at Matrouh sub-station temporary overvoltage reached to 224.99 kV. This means that the reduction percentage is 14.45 %. At Omayed sub-station the temporary overvoltage decreased to 219.63 kV. This means that the reduction percentage 20.42 %.

Fig (9) (**solution 4**) shows the effect of adding 4 reactors at Matrouh sub-station and 2 reactors at Omayed sub-station of capacity 25 MVAR. Solution (4) reduces the temporary overvoltage from 246 kV to 217.33 kV at Saloum sub-station. This means that the reduction percentage is 11.65 %. While the temporary overvoltage at Matrouh reduced from 263 kV to 213.8 kV which means a reduction percentage of 18.71 %. At Omayed S/S temporary overvoltage decreased from 276 kV to 212.74 kV, which means reduction percentage of 22.92 %.

Fig (10) (**solution 5**) shows the effect of adding 4 reactors at Matrouh sub-station and 3 reactors at Omayed sub-station of capacity 25 MVAR. Solution (5) reduces the temporary overvoltage from 246 kV to 211.15 kV at Saloum sub-station with reduction percentage 14.17 %. While the temporary overvoltage at Matrouh reduced from 263 kV to 204.29 kV which means a reduction percentage of 22.32 %. At Omayed temporary overvoltage decreased from 276 kV to 199.51 kV by reduction percentage 27.71 %.

The output results of the ATP for the five proposed solutions, which clarify the calculated temporary overvoltages (T.O.V) and the reduction percentage (%) from the actual field measurements at Saloum S/S (246 kV), Matrouh S/S (263 kV) and Omayed S/S (276 kV) are shown in table (4).

**Table (4)**

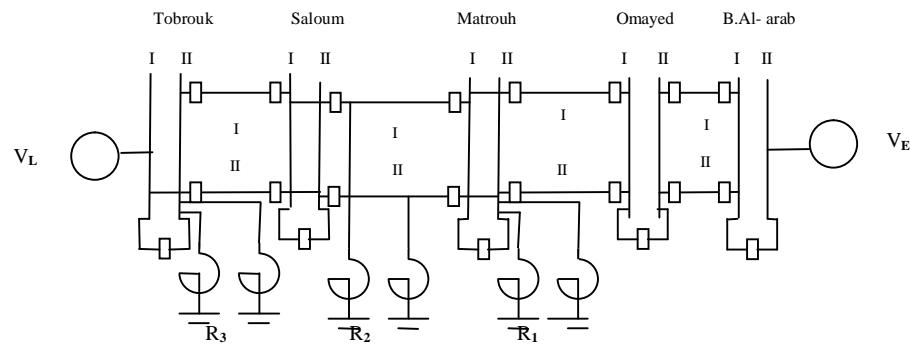

Proposed solution	Saloum		Matouh		Omayed	
	T.O.V	%	T.O.V	%	T.O.V	%
Sol. 1	232.58	5.46	237.23	9.8	245.32	11.12
Sol. 2	232.13	5.64	236.52	10.07	235.35	14.73
Sol. 3	224.62	8.69	224.99	14.45	219.63	20.42
Sol. 4	217.33	11.65	213.8	18.71	212.74	22.92
Sol. 5	211.15	14.17	204.29	22.32	199.51	27.71

#### 5. Conclusions and Recommendations:

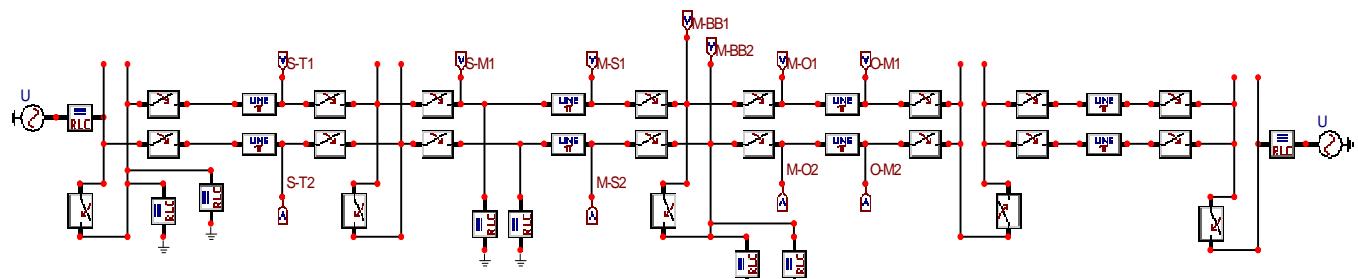

- 1) Interconnection between various countries power systems can suffer from various disturbing problems, especially temporary overvoltage during operation due to the differing nature of the systems and loading conditions.
- 2) The performance of systems interconnection could be predicted by computations as well as by field measurements with a reasonable degree of accuracy.
- 3) Suggestion are presented to improve the performance of the interconnected systems, for example, which can be extended to other systems interconnections.
- 4) The sensitive node analysis helps to find the most effective bus for the reactive power compensation.
- 5) This paper shows that adding a certain number of reactors at a certain sensitive bus greatly reduces the maximum transient overvoltage, temporary overvoltage and improves the system voltage profile. This protects the electrical equipment in the network and secures the system reliability and prevents system outage.
- 6) Optimization technique was done to find the most optimum number of reactors at the sensitive bus. The optimum number of reactors was regulated by economical considerations. The economical considerations show that the most effective and economical solution were solutions (2 and 3) as detailed in section (4).

**Abstract:** *Corynebacterium variabile* sp. Sh42 is used to investigate the biodegradation potentials and metabolic pathways of different poly aromatic compounds (PACs) in batch flasks. Effects of PACs size, molecular weight, alkylation and their presence individually or in mixture on biodegradation potentials of Sh42 were studied; Naphthalene (Nap) as a model compound for di-aromatic ring; Anthracene (Ant) and Phenanthrene (Phe) as model compounds for tri-aromatic ring; while Pyrene (Pyr) as a model compound for four-aromatic ring compounds were used as representatives for different PAHs. Dibenzothiophene (DBT), 4-methyldibenzothiophene (4-MDBT) and 4,6-dimethyldibenzothiophene (4,6-DMDBT) were taken as representative models for PASHs compounds. While, 2-hydroxybiphenyl (2-HBP) and 2, 2'-bhydroxybiphenyl (2, 2'-BHPB) were taken as models for phenolic compounds. The experimental results show that biodegradation rate decrease with increase ring size, alkylation's group within homologous series and Sh42 has the highest capability to biodegradation of toxic phenolic compounds either in single (BD% ≈ 90%) or mixed substrates cultures (BD% ≈ 48%). To ensure detoxification and mineralization of these toxic PACs; metabolic pathways of representative model compounds (Pyr, DBT and 2,2'-BHPB) were elucidated by GC/MS analysis which confirmed that, Sh42 completely metabolized all representative compounds to CO<sub>2</sub> and H<sub>2</sub>O. [Journal of American Science. 2010;6(11):343-356]. (ISSN: 1545-1003).

**Keywords:** Polynuclear aromatic compounds, Biodegradation, Metabolic pathways.

### 1. Introduction

Contamination by poly aromatic compounds (PACs); i.e. polynuclear aromatic hydrocarbons (PAHs) and poly aromatic sulfur heterocycles (PASHs) are of great environmental concern because of their toxic, mutagenic and carcinogenic properties (Hirano et al., 2004 and Perugini et al., 2007). These PAHs and PASHs are actually persistent compounds in the environment. Nevertheless, various bacteria and fungi are reported for their ability to degrade different PAHs and PASHs (Cheung and Kinkle, 2001; El-Gendy, 2006; Valentin et al., 2007; El-Gendy and Abo-State, 2008 and Seo et al., 2009).

Phenol and phenolic compounds are hazardous pollutants that can be found in waste waters from oil refineries, petrochemical plants, coal gasification plants, coking plants and dyes industry (Martíková et al., 2009). Phenolic compounds are known to affect microbial growth and degradation activities even in low concentrations (Vincenza and Liliana, 2007).

Dibenzothiophene (DBT) which is a typical PASH in crude oil is used as a model compound for biodesulfurization and biodegradation studies of

PASHs (Chen et al., 2008). Biodegradation of DBT can be classified into three independent categories, among which; complete mineralization, Kodama and the sulfur-specific cleavage, i.e. 4S

pathway, which is the most extensively studied (Xu et al., 2006). In "4S" pathway, DBT is first oxidized to DBT sulfoxide, then DBT sulfone and finally to sulfinate, followed by hydrolytic cleavage to free sulfur product, 2-HBP or 2, 2'-BHPB and subsequently release of sulfite or sulfate (Chen et al., 2008). 2-HBP and 2,2'-BHPB were reported to be furtherly metabolized to benzoic acid and salicylic acid, respectively in complete mineralization pathway (Kohler et al., 1988 and El-Gendy, 2004). Previously mentioned hydroxylated biphenyls are reported to be also produced through the bio-transformation reactions precede via hydroxylation of the aromatic rings in biodegradation of different studied PACs (Kohler et al., 1993 and Sondossi et al., 2004). Some previous studies have indicated that the final metabolite 2-HBP or 2,2'-BHPB of DBT biodegradation via 4S pathway could inhibit the microbial growth and DBT biodegradation (Lee et al., 1995 and Chen et al., 2008). Consequently, knowledge of microbial metabolism and environmental fate of these compounds is desired because they are by-products which have been identified as contaminants in almost every component of the global ecosystem and because they constitute a severe environmental hazard because of their high toxicity. Thus obtaining of microbial isolates with the ability to utilize several PACs is of

great interest from the stand point of understanding the principles of PACs utilization and their use in bioremediation technologies.

It is rather unusual for environments to be polluted by a single poly aromatic compound (PACs) (Tang et al., 2005; Seo et al., 2009 and Wei et al., 2009).

Therefore, the aim of this study is to investigate the potentiality of *Corynebacterium variabilis* sp. Sh42 to metabolize different PACs as single or mixture substrates; Naphthalene (Nap) as a model compound for di-aromatic ring; Anthracene (Ant) and Phenanthrene (Phe) as model compounds for tri-aromatic ring; while Pyrene (Pyr) as a model compound for four-aromatic ring compounds were used as representatives for different PAHs. Dibenzothiophene (DBT), 4-methyldibenzothiophene (4-MDBT) and 4,6-dimethyldibenzothiophene (4,6-DMDBT) were taken as representative models for PASHs compounds. While, 2-hydroxybiphenyl (2-HBP) and 2,2'-bhydroxybiphenyl (2,2'-BHPB) were taken as models for phenolic compounds. Also, elucidation of the possible metabolic pathways for a model compound representative to each PACs group has been done to ensure the metabolism of these toxic compounds to non-toxic ones.

## 2. Material and Methods

### Chemical reagents

All 9 PACs and other chemical reagents employed in this study were of analytical grade and purchased from Sigma Chemical Company, USA.

Acetonitrile (Ace) and Water (W) used for HPLC analysis were of HPLC grade and purchased from Aldrich.

### Microorganism

*Corynebacterium variabilis* sp. Sh42 was isolated from hydrocarbon polluted waster sample collected from El-Lessan Area of Damietta River Nile Branch in Egypt during year 2008 for its ability to degrade and tolerate high concentration of 2, 2'-BHPB.

### Media:

#### Tryptone glucose yeast extracts (TGY)

This media was used for preparation of inocula and monitoring of total viable count, TCFU (cells/mL) and was prepared according to Benson (1994).

#### Basal salts medium (BSM)

This media was used for studying BD capabilities of *C. variabilis* sp. Sh42 and was prepared according to Piddington et al. (1995).

### Analytical tools:

Bacterial growth was monitored by count the total viable colony (cells/mL) on TGY-agar plates.

### High Performance Liquid Chromatographic (HPLC) analysis

Liquid-liquid extraction for quantitative analysis of residual PACs was carried out by using ethyl acetate as the extractant. After the extraction, ethyl acetate layer was analyzed using HPLC model Waters 600E equipped with a UV detector model Waters 2487 (set at 254 nm) and C18 reversed phase column (4.6x250 mm, 300 $\text{\AA}$ , 5 $\mu$ ). The mobile phase was Ace: W (40:60 v/v), and the flow rate was 1 mL/minute, injection volume 2  $\mu$ L. Standard curves were established for each of the studied PACs from 5 to 1000 mg/L.

### Gas Chromatography/Mass Spectroscopy (GC/MS) analysis

GC/MS Perkin Elmer Clarus 500 with mass-selective detector was used to monitor the BD of mixture of PACs; the tested mixtures of nine poly aromatic compounds (PACs) were analyzed using GC/MS (system-1) to quantify percent removal. Identification of expected pathway for metabolism of different studied PACs (phenolic, PAHs and PASHs compounds) by *C. variabilis* sp. Sh42 GC/MS (system-2) was used (Table 1).

### Preparation of samples

For GC/MS analysis, ethyl-acetate extracts of the studied mixture were dehydrated over anhydrous  $\text{Na}_2\text{SO}_4$  and concentrated by evaporation at 60 °C before injection.

The GC/MS was equipped with HP-1 column, polymethyl siloxane (capillary 60 m x 0.32 mm x I.D. 0.25  $\mu$ m film thickness), mass-selective detector with ionization mode, E.I. ev 70, source temperature 250 °C; the carrier gas was helium with flow rate 1.5 mL/minute. Sample size was 1  $\mu$ L.

### Preparation of inoculum

Cells were incubated at 30 °C in TGY broth medium for 24 hours in a shaking incubator (150 rpm). Cells were harvested by centrifugation at 5000 rpm for 15 minutes and then washed three times with BSM then re-suspended in BSM free of any C-source to be used as inoculum.

**Table (1):** Programmable methods

programmable method	System (1)	System (2)
Injector temperature	Start from 60 °C held (0.1 minute) to 250 °C at fixed rate 200 °C/minute. Split (1:50)	Start from 80 °C held (0.1 minute) to 250 °C at fixed rate 200 °C/minute. Split (1:50)
Oven temperature	Start from 60 °C held for 1 minute, followed by 7 °C/minute ramp rate to 200 °C held to 5 minute, followed by 4 °C/minute ramp rate to a final temperature 280 °C which was held to another 15 minutes.	Start from 50 °C held for 1 minute, followed by 8 °C/minute ramp rate to a final temperature 280 °C which was held to another 15 minutes.
Run Time	50 minutes	60 minutes
	Standard calibration for mixture of the studied 9 PACs was established for their identification and quantification.	Possible structure assignments of metabolites were confirmed using NIST library and/or from the available literature data.

Identification of biodegradation pathway of different PACs using *C. variabilis* sp. Sh42

This was done using GC/MS analysis system (2) of the ethyl acetate extract of different PACs compounds; Pyrene as a model for PAHs; DBT as a model for PASHs and 2,2'-BHPB as a model for phenolic compounds after incubation at 30 °C for 10 days in shaking incubator (150 rpm).

Study of the biodegradation capabilities of *Corynebacterium Variabilis* sp. Sh42 on different individual PACs

This was used for studying the ability of Sh42 to utilize different PACs as sole source of carbon and energy for growth. Washed cells were inoculated into BSM that contained 1000 mg/L of each of the studied PACs and mixture of all. The growth and concentration of PACs were monitored at prescribed time intervals of (1- 4 weeks). Changes in pH values were also recorded. All steps were done in duplicates.

### 3. Results and discussion

Biodegradation capabilities of *Corynebacterium Variabilis* sp. Sh42 on different PACs:

Losses due to abiotic processes were calculated; recorded average ranged between ≈ 6%, 4% and 2.6 for phenolic, PAHs and PASHs compounds after 4 weeks, respectively. Any observed loss exceeding these values in the inoculated flasks can be attributed to biodegradation processes.

The experimental results show that pH decrease with incubation period up to 3 weeks for all cultures but increase with further incubation period. This decrease in pH might be due to the formation of acidic metabolites from biodegradation of these PACs in the cultures while the increase of pH again might be due to the further degradation of the acidic metabolites or due to the production of intermediates

that might increase the pH.

Generally, Figures (1 and 2) show that the maximum growth and biodegradation (BD) potential were observed after 2 weeks for all representative model compounds of PACs in single substrate cultures, it was observed that there was no difference in growth and BD% within further incubation period. While in mixed substrates cultures, it showed good increasing growth and BD% throughout the whole incubation period reaching its maximum at the end of incubation period.

This observation is in agreement with other reports where, the removal of PACs was directly related to the cell density and growth potential. Hong et al. (2008) reported that; the removal of Phe and Flu in mixture by *Nitzschia* sp. increase by increasing its cell density in the medium.

It was observed that, the average rate of biodegradation can be ranked in the following decreasing order; phenolic > PAHs > PASHs in either single or mixed substrates cultures at the end of incubation period. This might be attributed to the enrichment of *C. variabilis* sp. Sh42 on phenolic compounds showing higher BD efficiency and high resistance of hetero-PAH (PASHs) to biodegradation which have the lowest aqueous solubility.

It is obvious that phenolic compounds and Nap show nearly similar and highest BD% in single substrate cultures with average BD% ≈ 90% after 4 weeks. This might be due to the high capability of Sh42 to utilize phenolic compounds as it was enriched and isolated on 2, 2'-BHPB in addition to the high evaporation and assimilation rate of Nap than other PACs compounds or due to the higher specificity of Sh42 towards Nap biodegradation. While in mixed substrates culture only Nap show the highest biodegradation efficiency (BD% of 100% after 1 week of incubation). This might be due to the

high capabilities of Sh42 to utilize Nap over phenolic compounds or the mixture might have enhanced the metabolic rate of Nap over phenolic compounds.

Also, the BD rate of 2,2'-BHPB is higher than that of 2-HBP (Figures 1 and 2) in both single and mixed substrate cultures which might be due to the enrichment and isolation of Sh42 on 2,2'-BHPB, therefore, it would have higher capabilities towards 2,2'-BHPB biodegradation than 2-HBP, the higher toxicity of 2-HBP than 2,2'-BHPB or the difference in activity of enzymatic system required for biodegradation of 2,2'-BHPB and 2-HBP. Hiraoka et al. (2002) reported that; monohydroxylated biphenyl (2-HBP or 3-HBP) inhibited cell division of biphenyl biodegrader strain *Comamonas testosteroni* TK102, but the effect was not observed with 2,3-dihydroxybiphenyl which confirm that 2-HBP was more toxic than 2,2'-BHPB.

Generally, Figures (1 and 2) show that, the biodegradation efficiency for all tested PAHs compounds follow the same trend in either single or mixed substrate cultures which can be ranked in the following decreasing order; Nap > Ant ≈ Phe > Pyr. This observation is in agreement with other reports where low molecular weights PAHs are more biodegradable than high molecular weights PAHs. The same trend was observed for PASHs compounds; where the biodegradation efficiency for all tested PASHs compounds can be ranked in the following decreasing order; DBT > 4-MDBT > 4,6-DMDBT.

Hong et al. (2008) reported that; the molecular weight, water solubility and lipophobicity of a compound would affect its bioaccumulation and degradation by microorganisms. Yu et al. (2005) reported that; PAHs with low molecular weights such as 2-rings, naphthalene and 3- rings, phenanthrene and anthracene are more susceptible to bacterial degradation and more extensive than high molecular weights PAHs having more than 3-rings, pyrene.

On the other hand, by comparing the results in Tables (2 and 3) and represented in Figure (3) it is observed that; there are high significant differences in biodegradation efficiencies of all tested 9 PACs in single and mixed substrates cultures. Where, BD% for each substrate in a mixture is lower than that in single substrate culture except for Nap which shows no significant difference.

The average BD% recorded ≈ 90%, 70% and 64% for phenolic, PAHs and PASHs in single culture after 4 weeks, respectively while in mixed substrate culture the BD% reached ≈ 48%, 42% and 31%, respectively. This might be due to one or all of the following reasons;

First, the interactions between PACs in mixture might influence biodegradation rate and led

to negative or positive effect on its biodegradation efficiency and this agrees with Stringfellow and Attken (1995); Yuan et al. (2000); Johnsen et al. (2002) and Wei et al. (2009). Wei et al. (2009) reported that, there were inhibitory effects from interactions between the three PAHs mixture (Phe, Pyr and Flu) on *Mycobacterium* sp. MEBIC 5140 which led to a negative effect on the biodegradation of PAHs.

Second, different studies in culture media have shown that hetero-PAHs (NSO-PAHs) can have a significant inhibiting effect on the biodegradation of PAHs and mono aromatic hydrocarbons (Arcangeli and Arvin, 1995; Dyreborg et al., 1996 and Lantz et al., 1997). Meyer and Steinhart (2000) reported that; degradation of two- to five-ring PAHs was inhibited by the presence of hetero-PAHs, whereas degradation of just some hetero-PAHs was inhibited by the presence of PAHs.

Third, there may be another reason for the decrease in biodegradation of different studied PACs in a mixture reported by Bastiaens (1998) and Herwijnen et al. (2003); the toxic effect caused by produced metabolites during biodegradation processes.

Fourth, the order of biodegradability of single substrates in complex mixtures is determined by their polarity and bioavailability. Consequently, as the Molecular weight of PAHs and number of alkyl group of PASHs increase the aqueous solubility and bioavailability decrease and therefore exhibits a protective function against biodegradation.

There is no observed significant difference between growth potential for *C. variabilis* sp. Sh42 in single or mixed substrate cultures of PACs, this might indicate that mixtures of PACs may not have any significant effect on cell growth but might have a significant effect on the biodegradation enzymatic system for *C. variabilis* sp. Sh42. Where, the negative effects might be due to competitive inhibition of multiple substrates or other means, retarding the degradation of one substrate in the presence of another. Similar or identical enzyme systems may catalyze the degradation of compound(s) which are structurally similar (Bauer and Capone, 1988).

Hong et al. (2008) reported that, when two or more PACs are present together, one PAC has the capacity to influence the rate and extent of biodegradation of the other.

Seo et al. (2009) reported that, alkylated and hetero PACs are more resistant to be biodegraded than the parent PACs where, alkyl- and hetero-PACs are among common substituted PACs and have substantial toxicities. The ability of PACs dioxygenase to remove the substitutions is currently

the subject of debate and probably requires additional steps to be removed. Also, their presence may inhibit proper orientation and accessibility of the PACs into dioxygenases.

In general, our results are in agreement with other reports where, the rate of polycyclic aromatic compound biodegradation in the mixed substrates culture decreases with increasing ring size and within a homologous series, decreases with increasing alkylation (Neff, 1979; Douglas et al., 1994; Elmendorf et al., 1994).

Fedorak and Westlake (1983) and (1984) reported that; microbial degradation of organic sulfur compounds in Prudhoe Bay crude oil revealed that the order of susceptibility of the sulfur heterocycles in homologous series was; DBT > C1-DBTs > C2-DBTs > C3-DBTs.

Nagata et al. (1978) reported the degradation of crude oil by *Corynebacterium* sp. isolated from sea water in the harbor of Kobe showing good biodegradation capabilities on diaromatic and polyaromatic hydrocarbons than monoaromatic ones.

In general, *C. variabilis* sp. Sh42 expressed the highest ability to utilize PACs mixture especially the toxic phenolic compounds and because of its metabolic versatility, this bacterium has been thought to be a potential candidate for bioremediation of PACs-contaminated areas.

#### Metabolic pathway study:

##### Study of 2, 2'-BHP metabolic pathway using *Corynebacterium variabilis* sp. Sh42

Data obtained from GC/MS analysis system (2) of ethyl-acetate extracte of 2, 2'-BHP cultures with *Corynebacterium variabilis* sp. Sh42 suggesting the biodegradation pathway illusterated in Figure (4) which is a meta-cleavage pathway. This pathway is similar to that reported by Kohler et al. (1993) and Sondossi et al. (2004) for biodegradation of 2,2'-BHP with *Pseudomonas* sp. Strain HB1 and *Comamonas testosterone* B-356, respectively. The obtained suggested pathway in this study suggesting that aromatic ring of 2, 2'-BHP is degraded via a site-specific monooxygenase that hydroxylates aromatic compounds at the C-3 position where there is a hydroxyl group at C-2 and alkyl or phenyl rest at C-1. Interestingly, 2, 2', 3-trihydroxybiphenyl also serves as a substrate for the monooxygenase activity producing 2, 2', 3, 3'-tetrahydroxybiphenyl. Therefore, the monooxygenase also hydroxylates the C-3' postion of 2, 2', 3- trihydroxybiphenyl. This finding provides additional evidence for the previously suggested relaxed specificity of the monooxygenase with respect to the molecular rest at

the C-1 position of the aromatic backbone structure reported by Kohler et al. (1988).

There was a yellow colouration observed in phenolic cultures inoculated with Sh42 which might be due to the production of 2,2',3,3'-tetrahydroxybiphenyl.

Kohler et al. (1993) reported the formation of yellow meta-cleavage compounds from 2,2',3-trihydroxybiphenyl (2-hydroxy-6-(2-hydroxyphenyl)-6-oxo-2,4-hexadienoic acid) and 2,2',3,3'-tetrahydroxybiphenyl (2-hydroxy-6-(2,3-dihydroxyphenyl)-6-oxo-2,4-hexadienoic acid) which did not remain stable in an aqueous solution. They also reported the formation of yellow meta-celavage metabolite 2-hydroxymuconic semialdehyde from catechol produced from salicylate monooxygenases of salicylic acid produced through the biodegradation of 2,2',3-trihydroxybiphenyl which was produced from monooxygenase of 2,2'-biphenol.

The proposed pathway for the metabolism of 2,2'-biphenol presented in Figure (4) indicate that the first intermediate; 2,2',3-trihydroxybiphenyl, may be metabolized via two different routes. On one hand, it serves as a substrate to the extradiol ring cleavage dioxygenase, and on the other hand, it can be turned over by the monooxygenase.

The conversion of produced catechol and pyrogallol to 2-hydroxymuconic semialdehyde and 2-hydroxymuconic acid, respectively; indicate that the extradiol ring cleavage dioxygenase activity from strain Sh42 is a broad-spectrum meta-cleavage dioxygenase because it is able to turn over various 2,2',3-trihydroxy- and 2,2',3,3'-tetrahydroxybiphenyl, catechol and pyrogallol.

##### Study of DBT metabolic pathway using *Corynebacterium variabilis* sp. Sh42

Data obtained from GC/MS analysis system (2) of ethyl acetate extracte of DBT cultures inoculated with *Corynebacterium variabilis* sp. Sh42 suggest the biodegradation pathway illusterated in Figure (5) which is complete mineralization pathway. Where DBT was first oxidized through 4S-pathway to DBT-sulfoxide, DBT-sulfone then to 2'-HBP-2-sulfonic acid and 2'-HBP-2-sulfonic acid which leads to the production of 2-HBP and 2,2'-BHP, respectively and which were furtherly degraded through meta-cleavage pathway as illustrated before. 2-HBP can be also degraded by dioxygenation of vicinal ortho-meta carbons of the un-substituted ring producing 2,2'-BHP and then 2,2',3-trihydroxybiphenyl which is furtherly degraded through meta-cleavage pathway as discussed before.

Sondossi et al. (2004) reported that *Comamonas testosterone* B-356 is able to metabolize

monohydroxybiphenyls through the biphenyl catabolic pathway leading to the production of benzoic acid and 2-hydroxypentanoate.

Omori et al. (1992) reported that, the soil isolate, *Corynebacterium* sp. strain SY1, utilized DBT and a wide range of organic and inorganic sulfur compounds as sole source of sulfur, such as DBT sulfone, dimethyl sulfide, dimethyl sulfoxide, dimethyl sulfone, CS<sub>2</sub>, FeS<sub>2</sub> and even elemental sulfur. Strain SY1; metabolize DBT to DBT sulfoxide and DBT sulfone and 2-HBP, which subsequently nitrate to produce at least two different hydroxynitobiphenyls during cultivation.

Also, Constanti et al. (1996) reported that, *Corynebacterium* sp. MC401 and *Corynebacterium* sp. MC402 isolated from a coal mine area by enrichment culture with DBT. Both cultures were able to use DBT, DBTO<sub>2</sub> as sole source of sulfur for growth. These compounds were metabolized to 2-HBP and sulfate.

#### Study of Pyrene metabolic pathway using *Corynebacterium variabilis* sp. Sh42

Data obtained from GC/MS analysis system (2) of ethyl acetate extracte of Pyrene cultures inoculated with *Corynebacterium variabilis* sp. Sh42 suggest the proposed Pyrene biodegradation pathway illustrated in Figure (6) which also involve phenanthrene, naphthalene and o-phthalate degradation pathways.

This pathway was similar to that proposed by Liang et al. (2006) for biodegradation of Pyrene by *Mycobacterium* sp. Strain KMS. According to the literature review, at least 15 enzymes are involved in the degradation of Pyrene and the o-phthalate degradation from phenanthrene, with some enzymes being common to the degradation of both PAHs. Pyrene is first oxidized in the K region by a dioxygenase to form cis-4, 5-pyrene-dihydrodiol, which is rearomatized to form 4, 5-dihydroxy-pyrene by dihydrodiol dehydrogenase. 4, 5-Dihydroxy-pyrene is subsequently cleaved to yield phenanthrene-4, 5-dicarboxylic acid by intradiol dioxygenase, followed by loss of a carboxyl group by decarboxylase and 4-phenanthroic acid is formed. Oxidation of 4-phenanthroic acid by ring-hydroxylating dioxygenase produces 3,4-phenanthrene dihydrodiol-4-carboxylic acid, which is further transformed to 3,4-dihydroxyphenanthrene by dehydrogenase/decarboxylase. Once 3,4-dihydroxyphenanthrene is formed, it enters the phenanthrene degradation pathway (Krivobok et al., 2003). Where it is metabolized to 1-hydroxy-2-naphthoic acid and then mineralized through two different pathways (Figure 6), in one pathway, 1-hydroxy-2-naphthoic acid is oxidized to 1, 2-

dihydroxy naphthalene, which is furtherly metabolized via salicylic acid. In the other pathway (Figure 6), 1-hydroxy-2-naphthoic acid undergoes ring cleavage and furtherly metabolize via o-phthalic acid and protocatichic acid. Similar pathway was reported by Pinyakong et al. (2000) for biodegradation of Phenanthrene by *Sphingomonas* sp. P2. It has been demonstrated that a common set of enzymes is responsible for the conversion of Phe to 1-hydroxy-2-naphthoic acid as well as that of naphthalene to salicylic acid (Yang et al., 1994).

Due to the known reported toxicity of pyrene-4,5-dione, it is important to identify this metabolite and determine its fate during Pyrene metabolism. It was observed as an end product in some gram negative cultures (Kazunga and Aitken, 2000) and may result in an increase in toxicity during in situ bioremediation (Guthrie et al., 2003).

Identification of Pyrene-4, 5-dione in the GC/MS chromatogram of the studied culture *Corynebacterium variabilis* sp. Sh42 might indicate the presence of dioxygenase gene in the obtained bacterial isolate *Corynebacterium variabilis* sp. Sh42. As according to Khan et al. (2001), Pyrene-4,5-dione was identified to be Pyrene metabolite in the phagemid clone My6-pBK-CMV, which contain a dioxygenase gene when it was incubated with Pyrene.

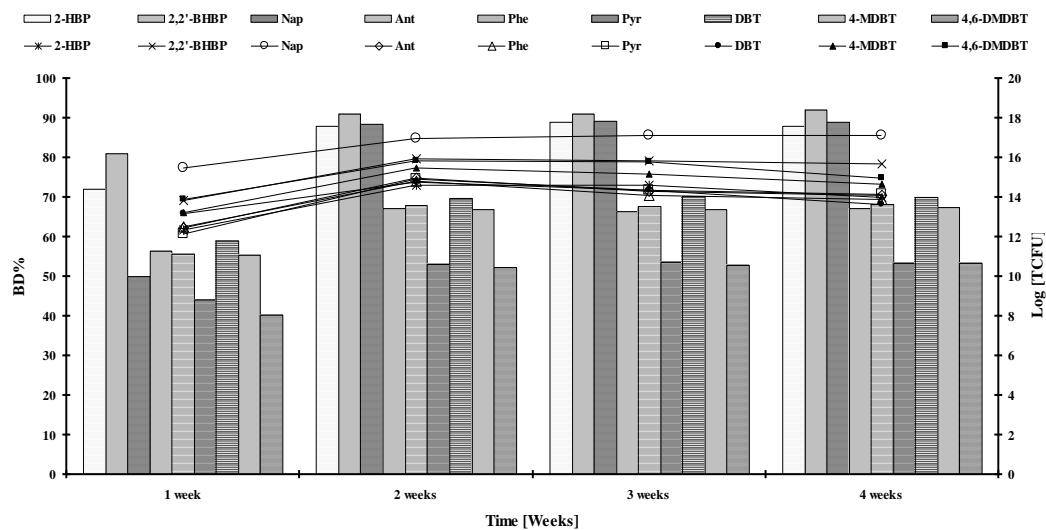

The quinone, Pyrene-4, 5-dione can be also formed following the non-enzymatic autoxidation of 4, 5-dihydroxypyrene.

Pyrene-4,5-dione may be reduced back to 4,5-dihydroxypyrene by quinone reductase (PQR), as reported for *Mycobacterium* sp.( Kim et al., 2004 and Liang et al., 2006). This might explain the abundance of 4, 5-dihydroxypyrene and pyrene-4, 5-dione peaks, respectively in the GC/MS chromatogram. The presence of the quinone, pyrene-4,5-dione might explain the observed pink coloration occurred in the cultures.

#### 4. Conclusion

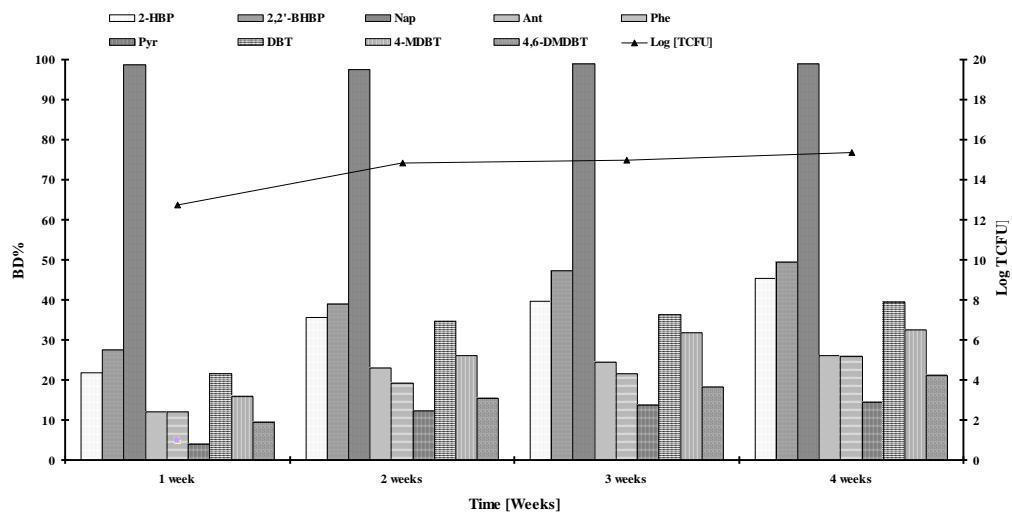

*Corynebacterium variabilis* Sh42 isolated from El-Lessen Area of Damietta River Nile Branch in Egypt has a high capability to metabolism of different PACs (phenolic, PAHs and PASHs) and utilizes them as a carbon and energy source for its growth either in single or mixed substrates cultures. While the biodegradation rate decreased in mixed substrate culture than single substrate cultures for all PACs, this might attribute to inhibition effect of metabolic enzymatic system. Also, BD% decrease with increasing ring size, within homologous series and BD potentials can be ranked in the following decreasing order; phenolic > PAHs > PASHs. In addition, *C. variabilis* Sh42 has capability to completely metabolism of 2,2'-BHP through meta-

cleavage pathway, DBT through 4S pathway and pyrene which also involve phenanthrene, naphthalene and o-phthalate metabolic pathways.

# In vitro assessment of gastrointestinal viability of potentially probiotic Lactobacilli

Kawther, EL-Shafei, N.F.Tawfik, Nadia, M.A.Dabiza, O.M.Sharaf, and B.A.Effat  
Dairy Science Department, National Research Center Dokki, Cairo, Egypt.

**Abstract:** The objectives of this study were to assess the potential of four probiotic lactobacillus strains, *Lactobacillus bulgaricus*, *Lactobacillus johnsonii* B-2178, *Lactobacillus gasseri* B-14168 and *Lactobacillus salivarius* B-1950 in human upper gastrointestinal tract in vitro and evaluate the effect of milk proteins addition on viability of these strains in simulated gastric juices and in yoghurt during storage for 15 days at 4°C. The viability of lactobacilli strains in simulated gastric transit conditions (pH 2.0, pH 3.0 and pH 4.0) gastric juices with or without milk proteins singly or in combination with starch was tested. All the treatments were determined with three replicates. The simulated gastric transit tolerance of *L. johnsonii*, *L. gasseri* and *L. salivarius* strains was pH-dependent and correspondingly showed lower viability at pH 2.0 after 180 min compared with pH 3.0 and pH 4.0. The addition of milk proteins singly or in combination with starch enhanced the survival of probiotic lactobacilli strains in simulated gastric juices different tested pH values. Results showed that addition of milk proteins in combination with starch improved the viability of *L. johnsonii* B-2178, *L. gasseri* B-14168 and *L. salivarius* B-1950 in yoghurt during storage. Sensory evaluation showed that yoghurt fortified with milk proteins plus starch recorded the highest score for and overall acceptability than the other treatments. However, yoghurt manufactured with *L. johnsonii* and *L. gasseri* and fortified with sodium caseinate plus starch showed the highest organoleptic score. It is suggested that the yoghurt of acceptable quality and high total probiotic bacterial count during storage can be made from milk supplemented with 0.5% (w/v) starch plus 0.5% (w/v) sodium caseinate. [Journal of American Science. 2010;6(11):357-367. (ISSN: 1545-1003)].

## 1. Introduction

In the last decades consumer demands in the field of food production has changed considerably. Consumers more and more believe that foods contribute directly to their health (Qiang *et al*, 2009). Today foods are not intended to only satisfy hunger and to provide necessary nutrients for humans but to prevent nutrition-related diseases and improve physical and mental well-being of consumers (Siro *et al*, 2008). In this regard, functional foods play an outstanding role. The increasing demand on such foods can be explained by the increasing cost of healthcare, the steady increase in life expectancy, and desire of old people for improved quality of their later years (Kotilainen *et al*, 2006). In addition, functional dairy products offer requirements, benefits to health that are strengthened by the addition of probiotics as well as by certain types of soluble fibers known as prebiotics.

Probiotics for human consumption, generally either lactobacilli or bifidobacteria, are of increasing interest due to the growing evidence of health benefits associated with their use. Probiotic bacteria that are delivered through food systems have to firstly survive during the transit through the upper gastrointestinal tract, and then persist in the gut to provide beneficial effects for the host (Huang and Adams 2004). In order to be used as potential probiotics, lactobacillus strains need to be screened

for their capacity of transit tolerance to the upper gastrointestinal tract conditions.

The low pH of the stomach and the antimicrobial action of pepsin are known to provide an effective barrier against entry of bacteria into the intestinal tract (Holzapfel *et al*, 1998). The pH of the stomach could be as low pH 1.5 or as high as pH 6.0 or above after food intake (Jonhson, 1977), but generally ranges from pH 2.5 to pH 3.5 (Holzapfel *et al*, 1998). There are no agreed rules for the screening of acid tolerance of potential probiotic strains. A range of pH values, from pH 1.0 to pH 5.0 has been used to screen in vitro acid tolerance of *Lactobacillus* and *Bifidobacterium* (Chung *et al*, 1999 and Zarate *et al*, 2000).

Food and food ingredients have been shown to protect probiotic bacteria from acid conditions and enhance gastric survival. Milk has been reported to increase the viability of acid sensitive *Lactobacillus* and *Bifidobacterium* strains during simulated gastric tract transit (Huang and Adams, 2004). The protective effect may be due to the increase of gut pH after milk addition. Maize starch granules at pH 3.5 have also been found to increase the viability of the more sensitive *Bifidobacterium* strains (Wang *et al*, 1999). Currently, orally ingested probiotic bacteria for humans are mainly prepared in conjunction with dairy products (Huang and Adams, 2004).

Ice cream, yoghurt and cheese have been found to be carriers of probiotic organisms (Madureira *et al*, 2005); another potential food vector is whey cheese- on which, unfortunately very little (if any) research has been performed to date. Whey is the aqueous portion of milk that obtained following acid-or rennet -driven coagulation (i.e. precipitation of caseins) in cheesemaking and is still disposed of in significant overall volumes, especially by small dairy industries, to public sewage systems (Pintado *et al*, 2001).

Yoghurts fortified with casein based ingredients (SMP, Na-caseinate or Ca-caseinate) showed an increase in firmness (or viscosity) and a reduction in syneresis compared with unfortified yoghurt (Amatayakul *et al*, 2006). On the other hand, there were no consistent trends between the physical characteristics of yoghurts and the addition of whey protein-based ingredients. Therefore, the objectives of this study were to test the viability of four strains of lactobacilli in simulated gastric transit conditions (PH 2.0, pH 3.0 and pH 4.0 gastric juices). In addition, the effects of milk proteins in combination with starch on viability of probiotic lactobacilli in simulated gastric juices and in yoghurt during storage were determined.

## 2. Material and Methods

### Bacterial Strains:

Three *Lactobacillus* strains were obtained from Northern Regional Research Lab., Illinois, USA (NRRL). These organisms are *Lactobacillus johnsonii* B-2178, *Lactobacillus gasseri* B-14168 and *Lactobacillus salivarius* B-1950. All strains had previously been shown to possess properties required of probiotic microorganisms including bile salt tolerance, tolerance to low pH values and antagonistic activity (Amin *et al*, 2002). Additionally, *Streptococcus thermophilus* and *Lactobacillus bulgaricus* were provided from Dairy Microbiology Lab., National Research Centre, Dokki, Cairo, Egypt.

### Preparation of simulated gastric juice:

Simulated gastric juice was prepared fresh daily as described by Huang and Adams (2004). It prepared by suspending pepsin (obtained from Sigma, BDH Chemicals Ltd., Poole, England) (1:1000, ICN) in sterile saline (0.5% w/v) to a final concentration of 3g<sup>-1</sup> and adjusting the pH to 2.0, 3.0 and 4.0 with concentrated HCl or sterile 0.1mol l<sup>-1</sup> NaOH using a pH meter (Model 8417N, Hanna Instrument, Singapore). Effect of different components in simulated gastric juice on viability of lactobacilli:

Sodium caseinate (Listowel, Co. Kerry, Ireland) whey protein (El-Masserin Milk products Co., Egypt) and Hi-maize starch (National Starch, Melbourne, Victoria, Australia) were used in this investigation. The solutions of these components were prepared fresh

daily by suspending each singly in sterile saline (0.5% w/v) at a concentration of 1g<sup>-1</sup>.

In order to analyze the effects of various components of simulated gastric juice on viability of lactobacilli, an aliquot (0.2ml) of each washed cell suspension was transferred to a 2.0 ml capacity screw-cap tube and then mixed with 0.3ml of NaCl (0.5% w/v) and 1.0ml of simulated gastric (pH 2.0, pH 3.0 or pH 4.0) and this treatment served as a control. Solutions of various components were replaced the sterile saline addition and added as follows:

- 1- Treatment I: Sodium caseinate at 1% concentration.
- 2- Treatment II: Whey protein at 1% concentration.
- 3-Treatment III: Sodium caseinate and starch (each, at 0.5% concentration).
- 4- Treatment (IV): Whey protein and starch (each, at 0.5% concentration).

These mixtures were then vortexed at maximum setting for 10s and incubated at 37°C. When screening gastric transit tolerance, aliquots of 0.1 ml were removed after 0, 60, 120 and 180 min for determination the viability of lactobacilli. Viability was assessed in three repeat experiments.

Viability of probiotics in yoghurt supplemented with prebiotics Yoghurt was manufactured in triplicate according to (Donkor *et al*, 2007) from standardized fresh cow's milk (3% fat). Milk was divided into three main portions. The first portion was applied as a control (C), without addition of prebiotics. The other two yoghurt base was supplemented with 0.5% (w/v) starch (I) and then whey protein (TI) or sodium caseinate (TII)(each,0.5 w/v) were individually incorporated.

Each mix and control were then pasteurized at 85°C /30min and cooled to approximately 40°C. Then, each portion was divided into three equal portions. Starters were added as follows:

- 1-Treatment *S.thermophilus*, *L. bulgaricus* and *L.johnsonii* B-2178 (TI<sub>1</sub>&TII<sub>1</sub> C<sub>1</sub>).
- 2-Treatment (TI<sub>2</sub> &TII<sub>2</sub> &C<sub>2</sub>) *S.thermophilus*, *L.bulgaricus* and *L. gasseri* B-14168.
- 3-Treatment (TI<sub>3</sub>&TII<sub>3</sub>&C<sub>3</sub>) *S.thermophilus*, *L. bulgaricus* and *L.salivarius* B-1950.

All starters were added at level of 3%. Inoculated yoghurt bases were then poured into 70ml sterile plastic cups and incubated at 42°C until pH reached 4.5, followed by cooling to 4°C and storing for two weeks.

### Analytical procedures:

Yoghurt was sampled when fresh and after 15days of storage.

### Microbiological analysis:

Viability of lactobacillus strains was monitored after production (zero time) and 15days of storage. To

this end, 10g portions of duplicate yoghurt samples were blended with 90ml of simulated gastric juice prepared as described above and enumerated after incubation at 37°C for 2h, reflecting the time spent by food in the stomach. Then samples were submitted to serial dilutions of peptone water. Viability of *L. johnsonii*, *L. gasseri* and *L. salivarius* were determined on MRS-raffinose agar (Abd El-Khalek *et al.*, 2004), MRS agar (Salem *et al.*, 2006) and MRS mannitol agar (Salem *et al.*, 2007) respectively. The plate's incubation was done at 37°C for 72h, in an anaerobic environment (BBL Gas Pak Becton Dickinson, Cockeysville MA, USA) for all lactobacilli.

#### Sensory evaluation of yoghurts:

Sensory evaluation of yoghurts was carried out when fresh and after 15 days of storage at 4°C. A panel consisting of 20 members evaluated the yoghurt samples presented in cooled cups in individual booths at room temperature. Samples were evaluated for flavour (50 points), body and texture (40 points) and appearance (10 points) according to (Abd El-Khalek *et al.*, 2004).

### 3. Results

Comparative survival of probiotic lactobacilli in simulated gastric juice containing protective nutrients:

The effects of simulated gastric juice containing protective materials in vitro on viability of tested probiotic lactobacilli strains are presented in Figs (1, 2, 3, &4).

In general, each strain showed lower viability in simulated gastric juice either in control or containing protective materials at pH 2.0 than in simulated gastric juice with pH 3.0 or pH 4.0.

When the simulated gastric juice was at pH 2.0, all the strains showed progressive reduction in viability during 180 min of simulated gastric transit, especially *L. bulgaricus*, which lost total viability after 180 min of simulated gastric transit in control (Fig.1.a.).

When the simulated gastric juice was at pH 3.0, *L. salivarius* had the highest survival rate over the 180 min of exposure to simulated gastric juice for control treatments. While the poorest survivor was *L. bulgaricus*, whose concentration declined to undetectable levels after 180 min of exposure (Fig 1.b).

When the simulated gastric juice was at pH 4.0, all of the tested four strains retained the same level of viability during 180 min of simulated gastric juice

transit in the absence of a protective matrix, such as sodium caseinate, whey protein or starch (Fig.1c.).

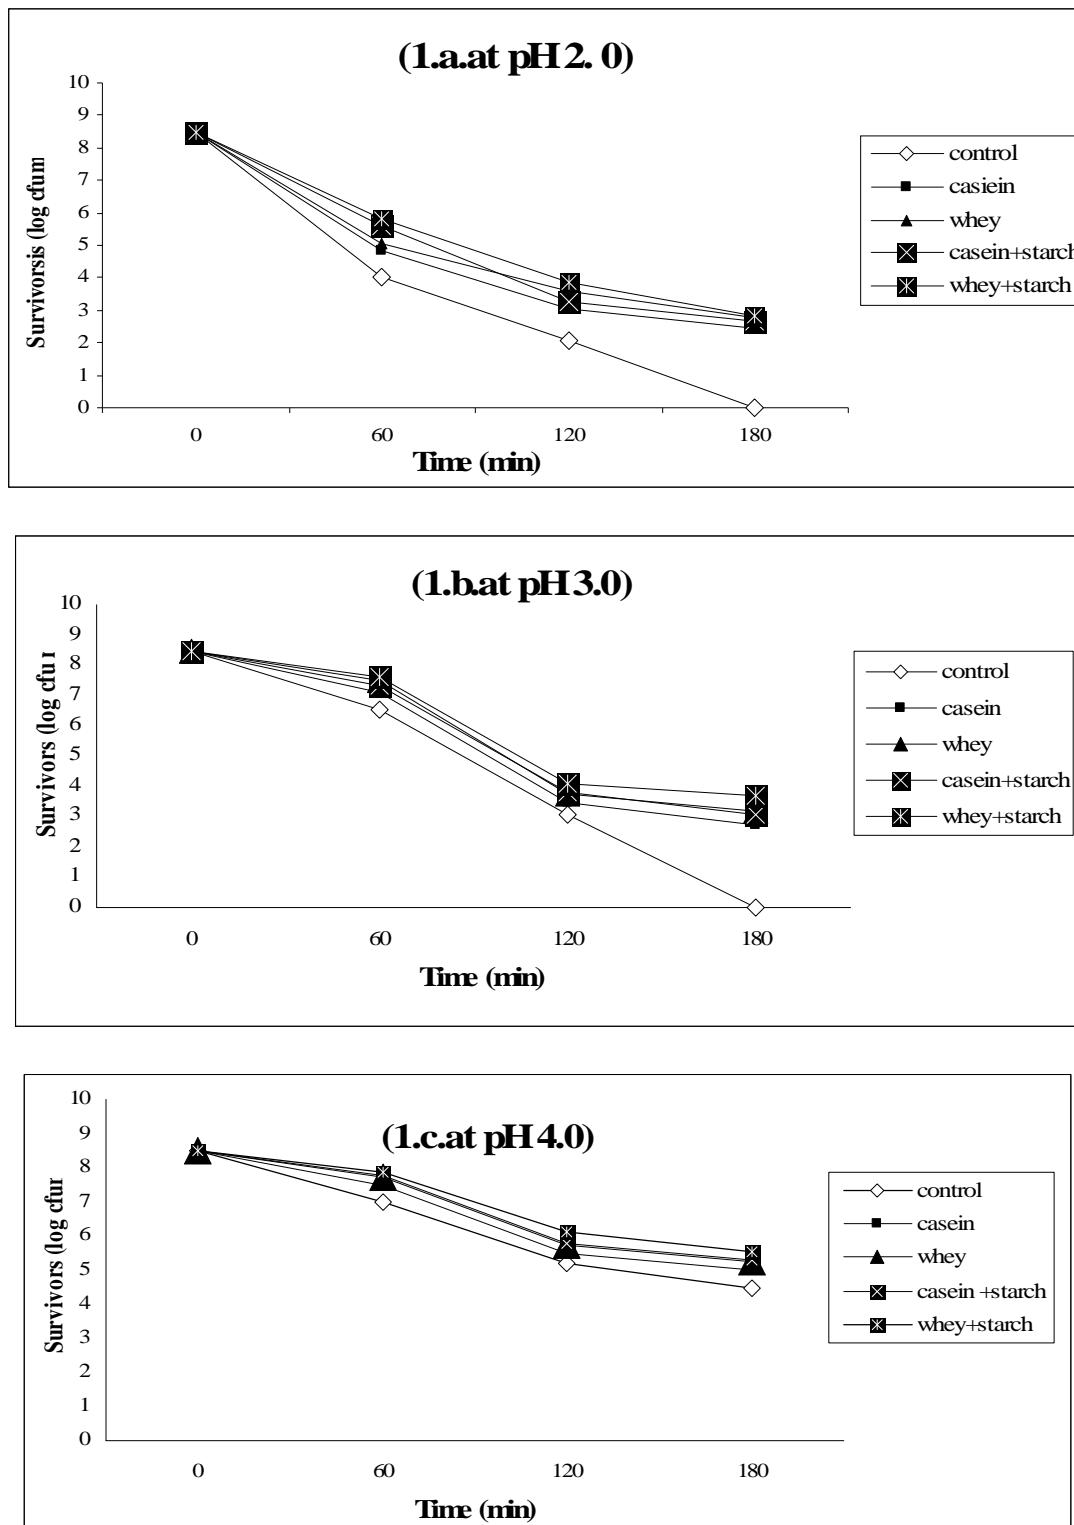

The effect of sodium caseinate and whey protein addition, singly and in combination with starch on viability during simulated gastric transit with pH 2.0, 3.0 and 4.0 simulated gastric juice is presented in Figs(1,2,3 and 4). In general, sodium caseinate and whey protein addition improved simulated gastric transit tolerance. In this regard, all tested strains exhibited complete tolerance to simulated gastric transit in the presence of sodium caseinate or whey protein singly and in combination with starch. The results showed that the greatest survival effect attributable to sodium caseinate plus starch occurred in *L. salivarius* followed by *L. johnsonii* at pH 4.0.

The strain of *L. bulgaricus* had a poor survival during 180 min at pH 2.0 and 3.0.

The intrinsic resistance to acid of *L. bulgaricus* is poor (Conway *et al.*, 1987 and Charteris, *et al.*, 1998). In this study, intrinsic resistance to gastric transit tolerance was observed to be rare probiotic property among the strains examined and to be influenced by the presence of milk proteins (sodium caseinate and whey protein, singly and in combination with starch).

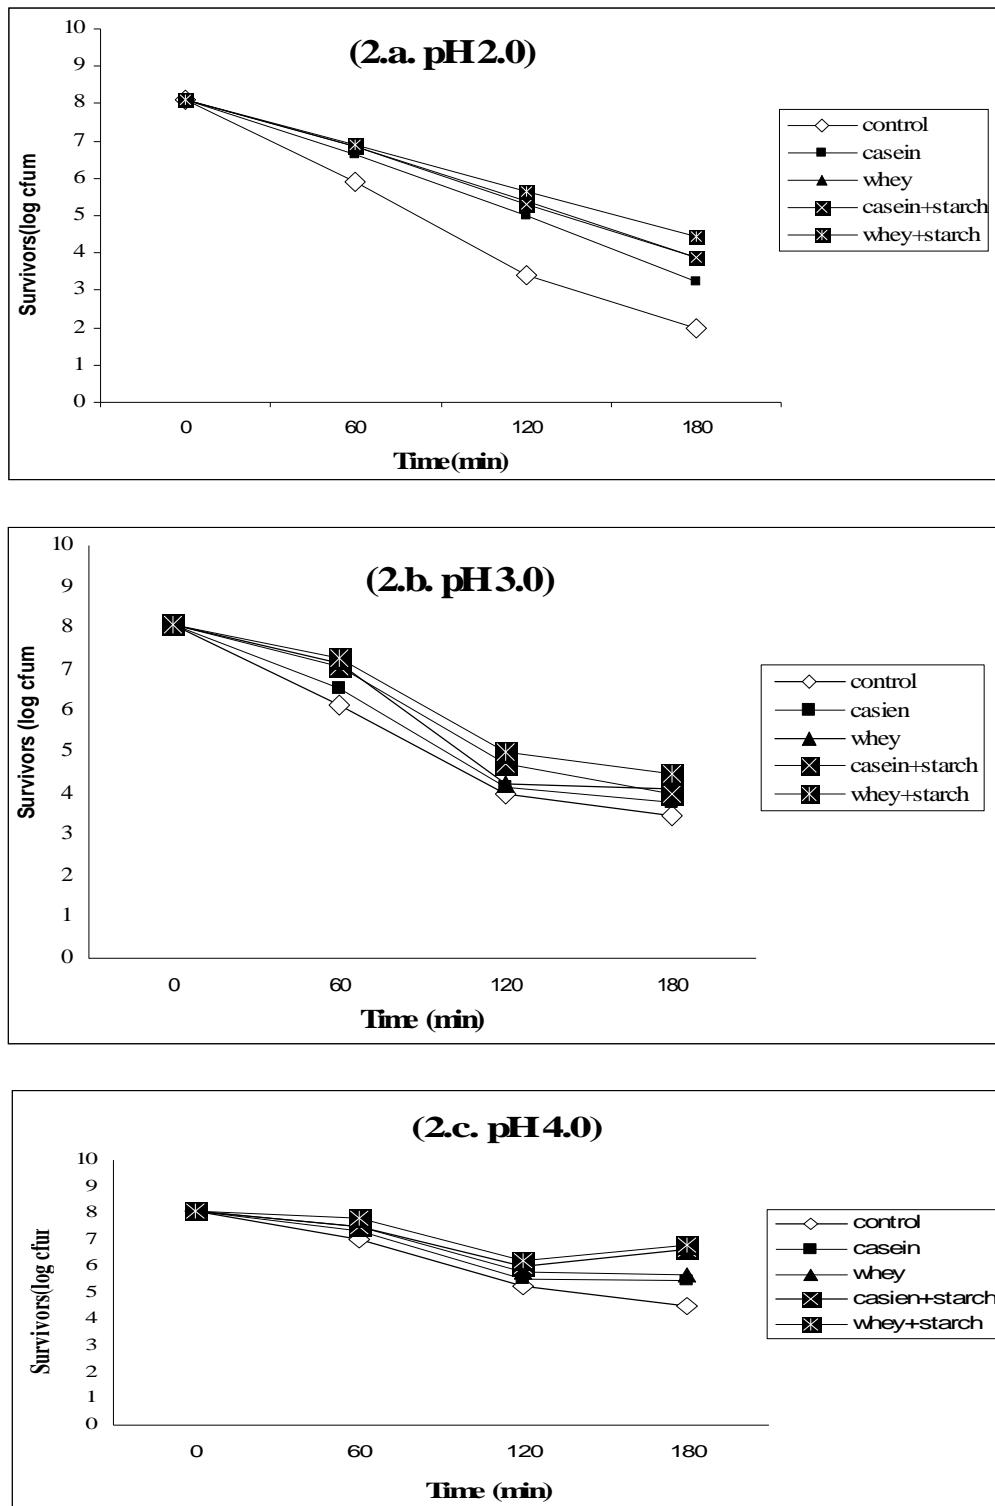

Although pH could be used as, a suitable direct measure for selection of probiotic strains, most probiotics are consumed in food products. The presence of food and food ingredients has been reported to improve viability of microorganisms during gastric transit (Huang and Adams, 2004). The suggested mechanism for the beneficial effect of food ingredients is the pH increase of the gastric contents resulting from the addition of the food (Zarate *et al.*, 2000). In the current study, the presence of milk proteins, singly and in combination with starch at pH 2.0 and pH 3.0, exerted a major effect on the gastric tolerance of some strains but not others. In this regard, *L. johnsonii*, *L. gasseri* and *L. salivarius* were capable of undiminished survival during simulated gastric transit in the presence of sodium caseinate, whey protein and their combination with starch. These data indicate that some strains of lactobacillus species may survive passage through the human stomach, particularly when ingested with milk products or milk protein-based foodstuffs.

Survival of lactic acid bacteria in human gastric juice adjusted to low pH has been previously shown to be enhanced by the addition sodium caseinate, whey protein and skim milk (Conway *et al.*, 1987 and Charteris *et al.*, 1998).

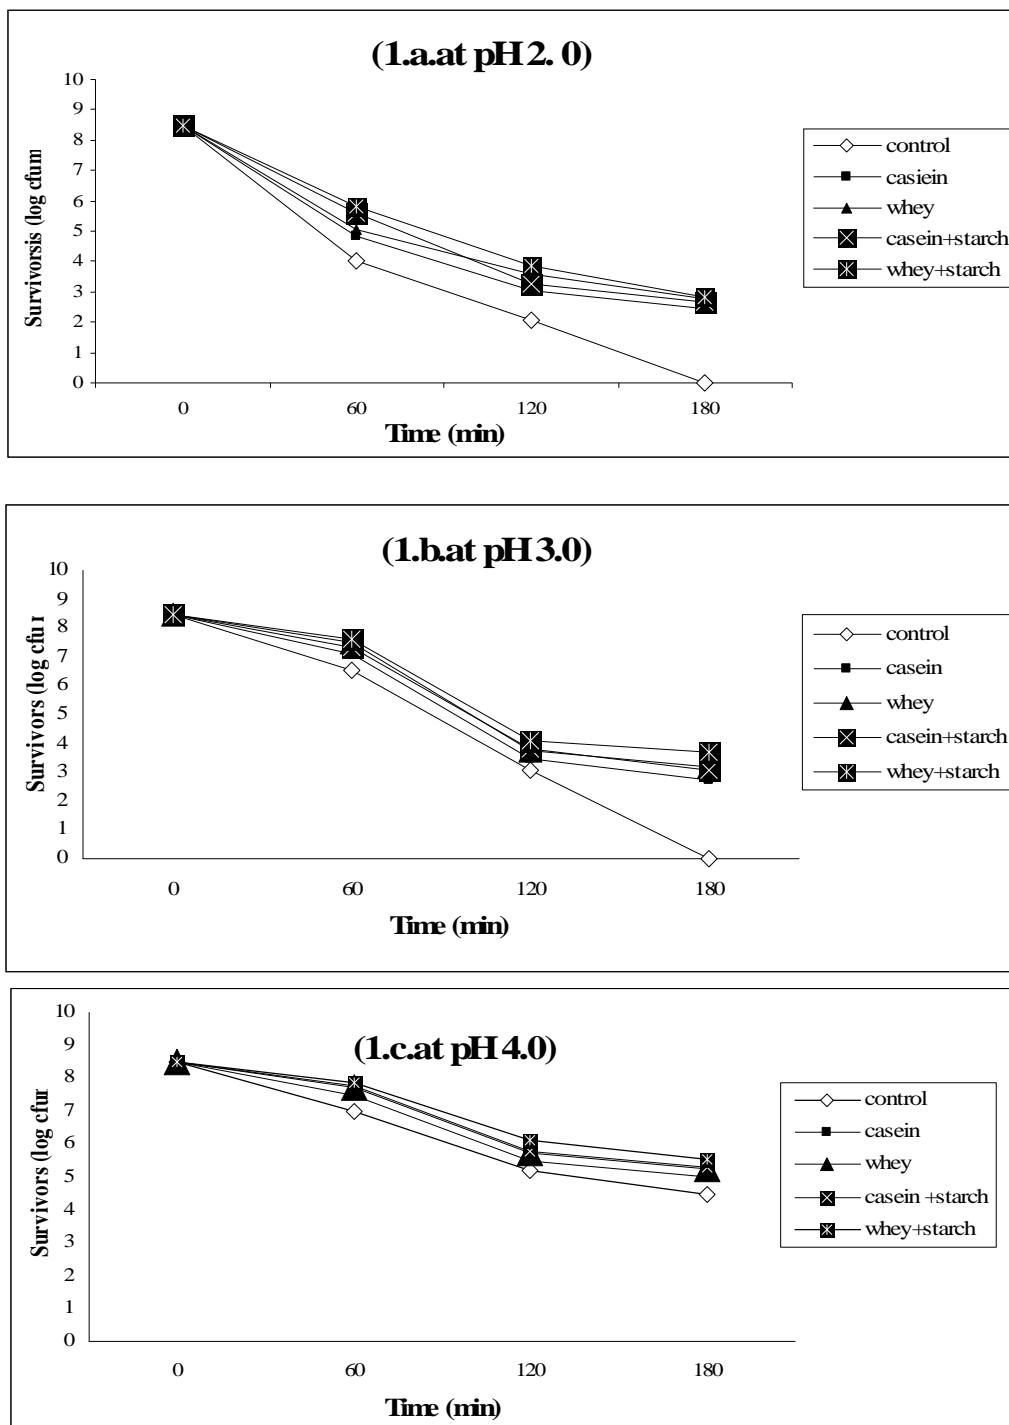

The data are the means of triplicate experiment

**Fig(1):** Survival of *L.bulgaricus* in simulated gastric juice containing sodium caseinate, whey Protein, (sodium caseinate and starch) and (whey protein and starch) at pH 2.0, pH 3.0 and pH 4.0.

Viability of probiotic lactobacillus strains in yoghurt supplemented with prebiotics :

The viability of the three strains *L. johnsonii*, *L. gasseri* and *L. salivarius* in yoghurt containing milk proteins (whey protein or sodium caseinate) in combination with starch stored at a refrigerator ( $\sim 4^{\circ}\text{C}$ ) for two week is shown in Table (1). In general, the viability of all three strains decreased during storage. However, the viability was in many cases higher than that of the control, without protective materials. On an average, best viability was observed with whey protein plus starch.

The highest viability of 84.04% was recorded for *L. johnsonii* with whey protein plus starch. Overall, sodium caseinate plus starch was the least effective in maintaining viability, with average viabilities of 60.6%, 52.27 and 59.37%. The lowest

viability was recorded by *L. gasseri* with an average viability of 52.27 %.

The control samples containing no protective materials had average survival rate of 34.32%, 22.69 % and 40% for *L. johnsonii*, *L. gasseri* and *L. salivarius*, respectively. Sodium caseinate and whey protein plus Hi-maize starch were only helpful in improving viability of probiotic organisms in yoghurt during storage (Table 1).The improved viability is possibly due to prebiotics providing extra solids, which tend to protect cells from injury (Capela *et al*, 2006).

Viability of lactobacilli is affected because of several factors including acid produced during fermentation, oxygen content in the product and oxygen permeation through the packaging material (Desai *et al*, 2004).

**Table (1):** Viability of Lactobacillus strains in yoghurt supplemented with milk proteins plus starch during storageat  $4^{\circ}\text{C}$  for days.

Lactobacillus strains	Reading interval	Control	Whey + starch	Casein +starch
		Count cfu/m		
<i>L. johnsonii</i>	Zero time	$6.7 \times 10^8$	$9.4 \times 10^8$	$8.6 \times 10^8$

TII<sub>3</sub>: *S. thermophilus*, *L.bulgaricus* and *L. salivarius* B-1950 containing starch & sodium caseinate (each 0.5% w/v).

### Sensory evaluation

In recent years, per capita consumption of yoghurt has increased drastically because many consumers associate yoghurt with good health (Hekmat and Reid 2006). Yoghurt is characterized as a fermented milk product with a refreshing flavor, a smooth viscous gel and a slight sour taste (Bodyfelt *et al.*, 1988). These sensory properties offer quality control criteria, and therefore, yoghurt should be evaluated for appearance, flavor, texture and overall quality.

Data presented in Table (2) show that the addition of starch in combination with whey or casein did not alter the mean appearance score of all samples of probiotic yoghurt either when fresh or after 15 days of storage. There were no flavor differences among T<sub>I1</sub>,T<sub>I1</sub>,T<sub>I2</sub>,T<sub>I2</sub> and T<sub>I3</sub>,T<sub>I3</sub> Table (2).These results indicate that the addition of *L. johnsonii*, *L. gasseri* and *L. salivarius* did not affect the flavor of the yoghurt. Yoghurt flavor is influenced by the presence of lactic acid and other flavoring compounds produced by culture bacteria during fermentation process.

The three probiotic strains did not inhibit the standard yoghurt cultures or overtly contribute to acid production from conversion of lactose to lactic acid.

The addition of starch in combination with casein did not alter texture of T<sub>4</sub> and T<sub>5</sub> in comparison to other treatments and control samples. The texture of yoghurt is affected by the rate of acid production during the fermentation process. Also, the heating processes of the mix at 85°C for 30 minutes affect the texture of the yoghurt. Heating the mix denatures whey protein, increases the water holding capacity of milk protein and reduces syneresis in yoghurt. Panelists rated the texture of T<sub>4</sub> and T<sub>5</sub> samples higher than other treatments.

This current study has demonstrated that although the viability of lactobacilli is affected by pH 2.0, most of the tested strains survived well at pH 3.0 and pH 4.0.

Furthermore, survival of lactobacilli in simulated gastric juice at pH 2.0 is enhanced by the addition of milk proteins singly or in combination with starch. Moreover, this study indicates that there are potential benefits of adding starch (0.5% w/v) plus sodium caseinate (0.5%w/v) to milk-based media aimed to preparing probiotics

**ABSTRACT:** In this work extraction oil from canola (*Brassica Napus*) seed with supercritical CO<sub>2</sub> extraction at pressure of 1500 to 2750 Psi , temperature of 308 to 333 k, and particles size 0.08 to 0.2 mm in flow rate 5 Lit/hr was investigated in a bench scale apparatus, The extraction was modeled by the sovova extended lack's model. The fluid phase mass transfer coefficient (k<sub>f</sub>), solid phase mass transfer coefficient (k<sub>s</sub>), and hardly accessible solute (x<sub>k</sub>) were a just able parameter of Models. The broken and intact cells model fit the experimental data, quite well, showing the applicability of the model to the supercritical extraction system studied here. [Journal of American Science. 2010;6(11):368-373. (ISSN: 1545-1003)].

**Keywords:** supercritical fluid extraction, canola oil, mathematical modeling, sovova model

### Introduction

Supercritical carbon dioxide (SC-CO<sub>2</sub>) extraction of oil from seed is alternative process to solvent extraction, hydro distillation and steam distillation because of certain advantage of SC-CO<sub>2</sub> with low critical temperature. The extraction of vegetable oils using supercritical carbon dioxide has been studied as a potential alternative to the current industrial process of expeller pressing, prepress solvent extraction and straight liquid solvent extraction. Hexane is widely used as solvent in the processing of vegetables oils; however, the limitation of this extraction method development of alternative extraction procedures such as supercritical fluid extraction with carbon dioxide. This solvent has advantages such as nontoxicity, non explosive, non flammability, low cost, availability and ease of removed from extract oils. Compared to the liquid extraction the investment costs are higher but operating costs are lower due to simple solvent regeneration. SFE of seed oil has been studied by several works (Brunner, 1985; Goodarznia, & Bikini, 1998). Mathematical models used for extraction of solute from natural matrixes are classified as (1) empirical models (Esquivel, 1999; McHugh & Krakens, 1986), (2) models based on heat transfer analogue (Mgyesy, 1993; Nayyar, 1992), (3) models based on differential mass balance (Nolting, 1988; Papamichail et al., 2000; Reversion, 1993), since the scale up of the equipment and the evaluation of the cost of a process cannot be done without mass transfer rate data in a convenient form.

### Material and methods

For taking the extract oil out of Canola seeds by supercritical fluid, a thermodynamic machine is required to extract the high pressure. The designed method of SCFE has been presented by different researchers such as Van Leer, Paulaititis, Kurnik, Hollow, Red Krukonis, Eckert and Johnson, and Praunits(10, 11, 12). This pilot can be used for separation and extraction of oil out of canola seeds by SCFE laboratory pilot used in this research. As it can be seen in the FIG 1, this system can function in static and dynamic states. In this system two specially designed Transfer Vessel are used provide system pressure by Nitrogen gas. The possibility of establishing of flow of Co<sub>2</sub> gas in the machine in two separate, different directions by fixing the existing valve in the machine, are the characteristics of the system. The extraction vessels are made of stainless steel like other parts of the system. It also resists against 10000 Psi pressure. The container has a side glass made of silicon material, and can withstand high pressure, so seeing the contents of internal compartment, and the process of formation of fluids by machine is made possible. The ability of the designed pump for rotating the supercritical fluid within the system is another unique feature of this machine comparing to other devices. the mechanical part this pump are designed and made manually and has the ability of two phase fluid in thermal range up to 100 degrees Celsius and with Flow Rate between 2 liters to 8 liters regardless of creation of Cavitations in the system, can be tuned by operator. This device uses air bath system to provide temperature. The designed air bath is able to provide temperature of 100 degrees Celsius uniformly.

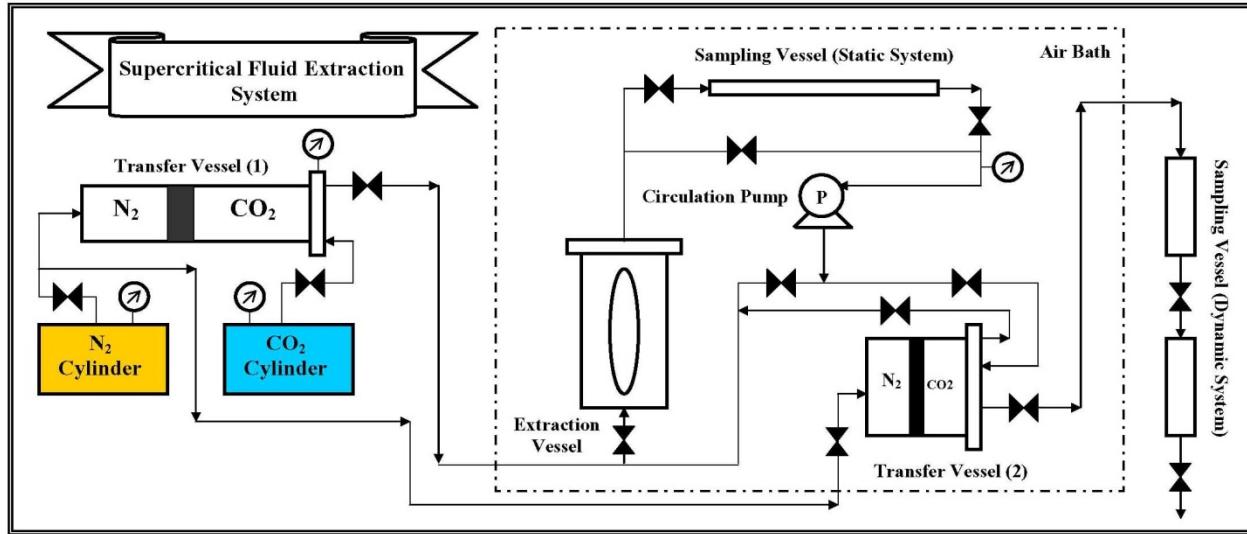

Fig1. Schematic diagram of the Supercritical Fluid Extraction System (SCFE) for Extraction of oil from canola seed with supercritical carbon dioxide

### Mathematical and Modeling

The broken and intact cells model was employed for correlating the experimental data (Papamichail et al., 2000; Reversion, 1993). This model based on differential mass balance equation in a fixed bed. Assuming plug flow and negligible axial dispersion. The pressure and temperature and bed void fraction ( $\varepsilon$ ) are constant during the extraction in the bed, the solute accumulation in the solvent is negligible. In this model the extraction process is divided into three periods. During the first period extraction precedes a constant rate determined by the oils solubility in sc-co<sub>2</sub>. The second period is transition period, in these periods easily accessible solute is completely depleted at the extractor's entrance the diffusion mechanism starts. In the last period mass transfer occurs only by the diffusion in the bed and inside the solid substratum particles. Sovova (1994) obtained analytically the equation for the overall extraction curve (Eq. (1)).

$$e = m_{extr} = \begin{cases} qy_r [1 - \exp(-z)] & q < q_m \\ y_r [q - q_m \exp(z_w - z)] & q_m \leq q < q_n \\ x_0 - \frac{y_r}{w} \ln \left\{ 1 + \left[ \exp \left( \frac{wx_0}{y_r} \right) - 1 \right] \exp [w(q_m - q)] \frac{x_k}{x_0} \right\} & q \geq q_n \end{cases} \quad (1)$$

Where:

$$q_n = q_m + \frac{1}{w} \ln \frac{x_k + (x_0 - x_k) \exp \left( \frac{wx_0}{y_r} \right)}{x_0}$$

$$\frac{z_w}{z} = \frac{y_r}{wx_0} \ln \frac{x_0 \exp [w(q - q_m)] - x_k}{(x_0 - x_k)}$$

$$q_m = \frac{(x_0 - x_k)}{y_r z}$$

Parameter z and w are directly proportional to the fluid phase and to the solid-phase mass transfer coefficients respectively and are given below:

$$z = k_f a_0 \rho / [q(1-\varepsilon) \rho_s]$$

$$w = k_s a_0 / [q(1-\varepsilon)]$$

In the present work, the parameters,  $k_f$ ,  $k_s$ ,  $x_k$ , and  $y_r$  were adjustable and determined by minimizing the errors:

$$\text{AAD (\%)} = \frac{1}{n} \sum_{i=1}^n \frac{|y_{\text{exp}} - y_{\text{cal}}|}{y_{\text{exp}}} \times 100$$

## Results and discussion

The operational conditions for each experiment are given in Table 1. The measured yield of oil extraction (Y) is defined by the following equation:

$$\text{Yield of oil extraction (\%)} = \frac{\text{Mass of oil extracted}}{\text{Mass of oil in seeds}} \times 100$$

Table 1. Yield of oil extracted under different extraction process conditions

Run	Pressure (Psi)	Temperature (K)	particle size (mm)	Yield (gr/gr)
1	1500	308	0.2	20.14
2	1750	318	0.18	34.32
3	2000	323	0.16	48.25
4	2250	308	0.14	55.09
5	2250	328	0.12	58.45
6	2500	318	0.1	58.25
7	2750	323	0.08	57.81

### Effect of pressure

Fig. 2 shows the effect of pressure on yield at temperature of 328 K and particle size 0.12 mm. with pressure increase, Co<sub>2</sub> density increases significantly, due to the increase of the solubility of the oil components. A faster extraction rate at low extraction times was observed when pressure increases. The volume mass transfer coefficient in the fluid phase,  $k_f$ , decreased with pressure increased. Consequently the mass transfer resistance increases contrast the mass transfer coefficient in the solid phase  $k_s$ , increases as pressure increase and the resistance in the solid decreases (Table 2).

### Effect of temperature

As it is shown in Fig. 3 temperature increases, the extraction rate decreases, the solubility of oil directly affects the extraction rate and it is controlled by a balance between the SC-Co<sub>2</sub> density and the oil vapor pressure. The overall mass transfer coefficient in the fluid phase increased with increase temperature. In contrast the overall mass transfer coefficient in the solid phase increased with temperature at 2250 Psi. (Table 2)

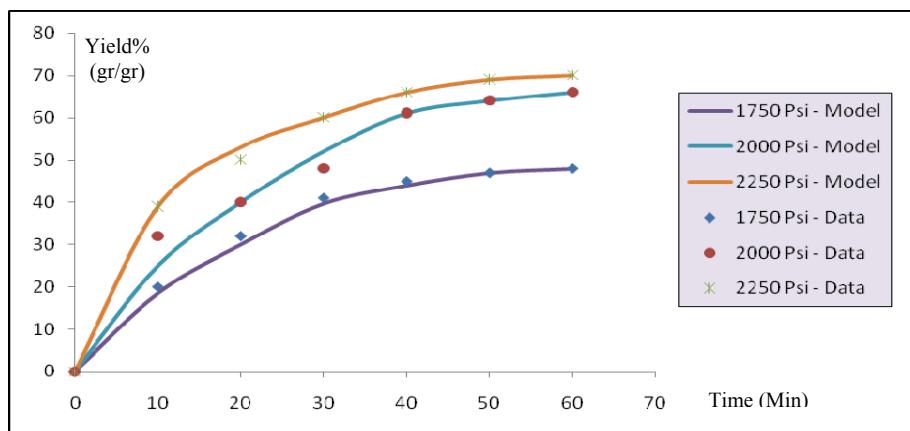

Fig 2. Effect of pressure on the extraction yield of oil at T= 328 K and dp= 0.12 mm

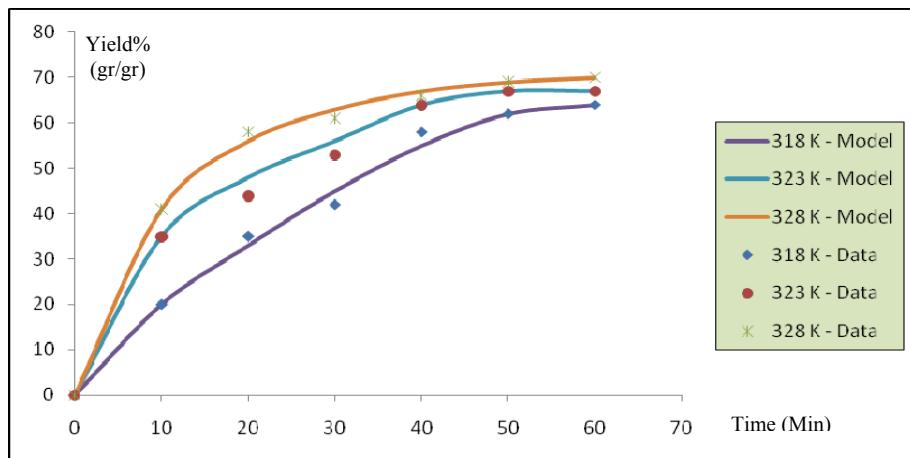

Fig 3. Effect of temperature on the extraction yield of oil at P= 2250 Psi and dp= 0.12 mm

Table 2. Calculated values of parameters and AAD (%) in BIC model.

Run	X <sub>0</sub>	Y <sub>P</sub>	X <sub>H</sub>	k <sub>PA</sub>	k <sub>ea</sub> *10 <sup>5</sup>	% AAD
1	0.54	0.00974	0.463	0.0079	3.01	5.03
2	0.54	0.00583	0.462	0.008	0.104	7.1
3	0.54	0.003	0.5	0.0155	1.157	5.43
4	0.54	0.00967	0.47	0.0056	1.58	3.85
5	0.54	0.00948	0.472	0.00486	1.356	4.01
6	0.54	0.00953	0.4805	0.00756	1.597	5.25
7	0.54	0.00298	0.52	0.0159	1.52	4.87

## Effect of particle size

At 2250 Psi pressure and 328 K, the yield increases with decreasing particle size (Fig 4), grinding of canola before extraction not only increase the interfacial area but also releases oil from the broken cells, results indicated that extraction rate is high if the oil is released on the surface of particle, and it is comparable very slow if it is embedded in the kernel particles. More ever, after milling the diffusion paths in the solid matrix become shorter results in a smaller intra particles resistance to diffusion. But production of very small particles could produce bed caking with formation of channels along the bed in which supercritical fluid can preferentially flow, thus reducing the extraction efficiency in the fluid phase,  $k_f a$ , and solid phase,  $k_s a$ , increased (Table 2).

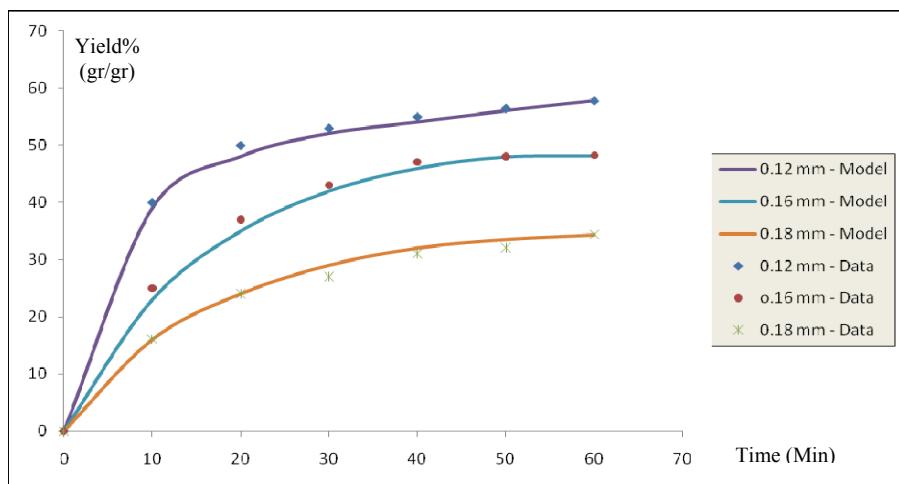

Fig 4. Effect of particle size on the extraction yield of oil at P= 2250 Psi and T= 328 K

## Conclusion:

The results indicated that the extraction curves in a plot of extraction yield versus time are significantly affected by the extraction pressure and particle size. But temperature has a slight effect on the extraction curves. Model of sovova represented canola oil extraction well. A theoretical model based on the evidence that part of the oil is freely available to the solvent after pre-treatment of the seeds was successfully used to fit the experimental extraction curves.

## Nomenclature

- a specific interfacial area ( $\text{m}^2/\text{m}^3$ )
- e Mass of extract ( $\text{kg}$ )
- $k_f a$  fluid-phase mass transfer coefficient ( $\text{s}^{-1}$ )
- $k_s a$  solid-phase mass transfer coefficient ( $\text{s}^{-1}$ )
- n number of data point
- q Mass of solvent ( $\text{kg}$ )
- $q_m$  q value at start of the extraction of difficult Accessible oil ( $\text{kg}/\text{kg}$ )
- $q_n$  q value at end of the extraction of easily Accessible ( $\text{kg}/\text{kg}$ )
- $q'$  specific flow rate ( $\text{kg}/\text{s}$ )
- W parameter of solid-phase mass transfer
- $\rho_s$  density of solid phase

$\rho$  density of solvent ( $\text{kg}/\text{m}^3$ )

$\varepsilon$  bed voidage

Z parameter of fluid phase mass transfer

$y_r$  oil solubility in the supercritical fluid

$x_k$  hardly accessible solute ( $\text{g/g}$ )

$x_0$  initial oil concentration in the solid ( $\text{g/g}$ )

# Biochemical Significance of Proinflammatory Cytokines in Psoriasis vulgaris among Egyptian Patients

Halla M. Ragab\*, Nabilah Abd El Maksoud\* and Mohamed M. Farid Roaiah\*\*

\*Department of Biochemistry, Genetic Engineering and Biotechnology Division, National Research Centre, Dokki, Giza, Egypt. \*\* Dermatology & Andrology and S. T. D.S, Kasr El Aini Hospital, Cairo university.

## Abstract

**Background:** Psoriasis has been characterized by hyperproliferation accompanied by acanthosis and aberrant differentiation of keratinocytes. Several growth factors and cytokines, are assumed to be important. Recent studies indicate that various cytokines including tumor necrosis factor -  $\alpha$  ( TNF -  $\alpha$  ), IL - 2R and IL - 6 play an essential role in the induction and maintenance of psoriatic lesion.

**Objectives:** To analyse relevant inflammatory mediators in the serum of patients with active psoriasis ( Psoriasis vulgaris ) of mild-to-moderate and severe psoriasis compared to healthy controls.

**Patients / Methods:** Forty psoriasis patients were recruited from the dermatology outpatient clinic of Cairo University Hospital. Patients body mass index ( BMI ), waist circumference and psoriasis area and severity index ( PASI ) were recorded. Fasting serum samples were obtained on enrolment. All the patients did not receive any treatment ( locally or systemically ), for at least four weeks before enrolment. Age, sex and ( BMI ) matched with forty healthy controls were also recruited. Serum TNF -  $\alpha$ , IL - 2R and IL - 6 levels were estimated using an Enzyme-Linked Immunosorbent Assay ( ELISA ) technique. The patients group were subdivided to two groups according to the diseases severity, PASI , into, mild-to-moderate psoriasis group and severe psoriasis group.

**Results:** Serum TNF -  $\alpha$ , IL - 2R and IL - 6 were all statistically significant elevated in the patients group compared to healthy controls (  $p < 0.05$  ). Also they were all statistically significant increased in severe psoriasis compared to mild-to-moderate psoriasis (  $p < 0.05$  ).

**Conclusions:** These data support the view that serum TNF -  $\alpha$ , IL - 2R and IL - 6 are involved in the pathogenesis of psoriasis, possibly by induction and maintenance of psoriatic lesion. We recommend a use of an array of these cytokines as a useful follow-up marker for monitoring of psoriatic patients and optimizing therapeutic strategies. Also we suggest the study of antisense therapy using the antibody of these cytokines in psoriatic patients.

## 1. Introduction

Psoriasis is relatively common, chronic, inflammatory and hyperproliferative skin disease that may appear at any age and affect any part of the skin. It affects 1.4 % to 2.0 % of the population and comprises 2.6% of skin related visits to primary care physicians, or between 0.3% and 1.6% of all visits to family physicians. It is a very troublesome disease with a high economic impact ( **Ulrich and Kristian 2009** ). The disease often persists for life, and the patient has an increased risk of cardiovascular diseases and their complications. One out of five patients develops psoriatic arthritis. The clinical picture of psoriasis is highly variable with regard to lesional characteristics and the severity of disease ( **Batya et al. 2010** ).

Psoriasis vulgaris is a multifactorial heritable disease characterized by severe inflammation resulting in poorly differentiated, hyperproliferative keratinocytes. It is including genetic background, environmental factors, and vascular and immune system disturbances. Current research is dominated by the hypothesis that an immunological disorder with inflammatory reaction, mediated through T-

lymphocytes, plays a key role in the pathogenesis of psoriasis ( **Nograles et al. 2010** ).

The characteristic histological features of the disease are epidermal hyperproliferation and infiltration of both dermis and epidermis by inflammatory cells including neutrophils, lymphocytes, macrophages and mast cells. Interactions between infiltrating T cells and skin resident cells (keratinocytes, fibroblasts, endothelial cells) are often mediated by the synthesis and release of different proinflammatory cytokines ( **Krueger and Ellis 2005** ).

Recently, much attention has been directed towards the influence of cytokines in psoriasis, as they play an important role in inflammatory diseases. In addition, a number of studies have suggested that various cytokines released by keratinocytes and inflammatory leucocytes could contribute to the induction or persistence of the inflammatory processes in psoriasis; however, the precise mechanism of their involvement in psoriasis remains unclear. Few studies have been reported on serum cytokine levels that may be expected to alter if they are involved in the pathogenesis of psoriasis ( **Kristina and Krueger 2009** ).

Although the cytokine mediated response is an essential part of the natural protective mechanism, excessive production of pro-inflammatory cytokines, or production of cytokines in the wrong biological context are associated with the pathology in a wide range of diseases including psoriasis. At the present time, one of the main areas of research in the psoriasis field concerns the role of cytokines in the pathogenesis of this disease. Different cytokines play a part in sustaining the two main characteristics of a psoriatic lesion; keratinocyte hyperproliferation and inflammation (**Stephen and Gelfand 2008**).

Interleukin - 2 ( IL - 2 ), interleukin - 6 ( IL - 6 ), and tumor necrosis factor alpha ( TNF -  $\alpha$  ) are the hallmark cytokines in a psoriatic cytokine network. Several investigators have suggested the possible use of TNF -  $\alpha$  , IL - 6 , IL - 8 and soluble interleukin - 2 receptor ( IL - 2R ) as markers of disease severity in psoriasis. The interleukin - 2 receptor ( IL - 2R ) is a heterotrimeric protein expressed on the surface of certain immune cells, such as lymphocytes, that binds and responds to a cytokine called interleukin 2 (**Hidetoshi et al. 2009** ).

Recent studies indicate that various cytokines including tumor necrosis factor alpha ( TNF -  $\alpha$  ) play an essential role in the induction and maintenance of psoriatic lesion. TNF -  $\alpha$  is a 17 - k D polypeptide that plays a central role in the regulation of innate immune responses. It is involved in stimulating the production of inflammatory cytokines, inducing the expression of cell surface adhesion molecules, enhancing the phagocytic/bactericidal properties of macrophages, and activating apoptotic pathways. TNF -  $\alpha$  is produced by a wide variety of cells, ranging from lymphocytes and monocytes, to keratinocytes, mast cells and antigen presenting cells in the skin. It is believed to contribute to the pathogenesis of psoriasis through its ability to both promote immune cell trafficking to the skin and induce keratinocyte proliferation (**Gottlieb et al. 2003** ).

Overexpression of IL - 6 has been implicated in the pathology of numerous autoimmune and chronic inflammatory diseases, including psoriasis (**Kristina and Krueger 2009** ). Cytokine IL - 6 is a multifunctional immunoinflammatory mediator with a MW of 25 to 30 kDa protein (**Kawano et al. 1988** ). It is produced by a number of different cell types including keratinocytes (**Kupper et al. 1989** ) and leukocytes (**Baumann et al. 1984** ). It also stimulates the proliferation of human keratinocytes in culture (**Krueger et al. 1991** ) and this proliferative effects are suggested to be mediated indirectly via the epidermal growth factor/transforming growth factor alpha receptor (**Elder et al. 1992** ). Thus IL - 6 has been speculated to play an important role in the pathogenesis of psoriasis, and in fact, its enhanced expression was demonstrated in the psoriatic lesional skin (**Ohta et al. 1991** ), together with the reports of its increased production by monocytes and of its

elevated circulating levels (**Neuner et al. 1991** ). Overexpression of IL - 6 has been implicated in the pathology of numerous autoimmune and chronic inflammatory diseases, including psoriasis (**Wojciech et al. 2008** ).

## 2. Aim of the work

This study aimed to evaluate the association of a panel of some proinflammatory cytokines (TNF -  $\alpha$  , IL - 6 , and soluble interleukin - 2 receptor ( IL - 2R ), in the serum of patients with active psoriasis ( Psoriasis vulgaris ) and compare them to healthy controls.

Also, to investigate which would be an attractive, patient-independent, and observer-independent marker of disease severity. And, to determine the use of these cytokines as markers of disease severity in patients of mild – to - moderate and severe psoriasis.

## 3. Material and Methods

### 3.1. Subjects

This study comprised forty consecutive patients of psoriasis were recruited from the dermatology outpatient clinic of Cairo University Hospital. All the patients were subjected to detailed examination including the elicitation of dermatological and psychiatric complaints. The diagnosis was made clinically, based on the presence of characteristic plaque-type psoriatic lesions. All the patients were asked to provide socio-demographic data, medical history, and family history. Other questions included the duration of disease, age of onset of the disease, any treatment taken and use of psychotropic drugs. Dermatological examination, hairs, mucosal involvement and nail changes were recorded. The patients group were subclassified to two groups according to the diseases severity, severity index ( PASI ) into, mild-to-moderate psoriasis group and severe psoriasis group. Forty healthy age and sex matched volunteers with no family history of psoriasis were included in the study as a control group. The purpose and nature of the study were explained to all subjects. All included subjects have consented to be enrolled in this study.

### 3.2. Exclusion Criteria

Obese subjects with history of acute or chronic infections, liver disease, renal disease, recent history of cardiovascular disorder, hypertension, neurological disease, or diabetes mellitus were excluded from the study. Moreover, patients who had received oral or topical antipsoriatic therapy within four weeks were not included in the study.

### 3.3 Methods

#### 3.3.1. Clinical Assessment

Disease severity was monitored by assessing the psoriasis area and severity index ( PASI ). It includes assessment and recording of erythema, infiltration, desquamation and extent of the disease ( area % ) by using numerical rating of 0 - 4 for each of the parameter:

0 for absent; 1 for slight (light pink, rare scales, no elevation with area involvement < 10 % ); 2 for moderate ( light red, poorly defined scales, slight elevation with area involvement 10 - 30 %); 3 for severe ( red, defined scales, moderate elevation with area involvement 30 - 50 % ); and 4 for very severe (very red, heavy scales, marked elevation with area involvement 50 - 70 % ). Accordingly, mild-moderate psoriasis and severe psoriasis were defined as PASI < 15 and PASI >15, respectively.

#### 3.3.2. Blood Sampling

Blood samples (10 ml) were collected from patients and control subjects in serum separator vacutainers ( BD Vacutainer Systems, Plymouth, UK). Sera were separated and immediately stored at - 80° C until analysis.

#### 3.3.3. Laboratory Investigations

Major laboratory parameters, including blood sedimentation rate, liver and renal function tests, blood cell counts; random blood sugar, were evaluated at the same time points for all participants to exclude any organic disease or inflammation.

#### 3.3.4. Serum Cytokines Measurements

The quantitative determination of TNF -  $\alpha$ , IL - 2R and IL - 6 levels were conducted by an Enzyme-Linked Immunosorbant Assay ( ELISA ) technique, using a commercial available kit. Every sample was run in duplicate, measurements differed by less than 10 %, and the mean value was calculated and used for statistical analysis.

**Assessment of plasma TNF-alpha :** Analysis was performed by TNF- alpha ELISA Kit, Diaclone research, (URS) - France (Catalog Number 850.090.096) .

**Assessment of human sIL-2R: Human sIL-2R** levels were measured using commercially available kit (ELISA) based on the sandwich principle, manufactured by T-Cell diagnostics (Endogen Inc., Cambridge, CA). The human sIL-2R concentrations were determined from the standard curve after being run concurrently with the standards .

**Assessment of plasma IL-6:** Analysis was performed using commercially available kit (IL-6 ELISA Kit), Diaclone Research, (URS), - France (Catalog Number 850.030.096).

The minimum detectable dose of IL-6 is less than 2pg/ml. Intra and Inter - Assay coefficients of

variation of the assay were 0.83-3.86% and 1.89-5.84%.

#### 3.3.5. Statistical analysis

All data were coded and entered using the program statistical package for social sciences (SPSS) version 15 under windows XP. Descriptive data was summarized using mean, standard deviation (SD). Linear regression analysis was done to test for significant predictors for psoriasis severity as measured by PASI score. P values < 0.05 were considered statistically significant.

### 4. Results

#### 4. 1. Clinical Data

Forty patients with psoriasis vulgaris were included in this study. Twenty of the patients had mild to moderate psoriasis (PASI <15), while the other twenty had severe psoriasis (PASI > 15). Of the forty patients, 26 were females (65%) and 14 were males (35%). Their age ranged between 18 – 62 years. The mean age and standard deviation (SD) was  $38.50 \pm 12.83$  years. The duration of the disease ranged between 4 months to 180 months, with a mean  $\pm$  SD  $57.05 \pm 54.08$ . The PASI score for clinical assessment ranged between 3.5 - 28.5, the mean  $\pm$  SD was  $14.61 \pm 6.6$ . The control group included 29 females (74.5%) and 11 males (25.5%). Their age ranged between 18 - 54 years with mean  $\pm$  SD  $35.70 \pm 9.09$ . Controls were age and sex matched.

#### 4. 2. Estimation of serum cytokines levels by ELISA technique

The demographic, clinical and biochemical data of the studied subjects are showed in Table ( 1, 2 ).

In this study we compare the serum levels of TNF -  $\alpha$ , IL - 2R and IL - 6 between forty psoriasis patients and forty age- and sex-matched healthy controls from the Egyptian population. All the patients were untreated, both locally and systemically, for at least four weeks before enrolment. It was also ensured that control subjects had no medication during the 4 weeks before blood sampling.

The mean value ( mean  $\pm$  SD ) of serum TNF -  $\alpha$  level estimated in patients with mild to moderate psoriasis was (  $121.24 \pm 59.35$  pg/ml ) and controls (  $30.85 \pm 25.45$  pg / ml ). A statistically significant difference was found in the serum TNF-  $\alpha$  level between patients and controls (  $P < 0.05$  ). However, when patients were evaluated according to disease severity, serum TNF -  $\alpha$  level was significantly higher in patients with severe psoriasis (  $173.23 \pm 70.45$  pg/ml ) than patients with mild to moderate psoriasis and controls (  $p < 0.05$  ) ( fig.1 ).

The mean value (mean  $\pm$  SD) of serum s IL - 2R level estimated in patients with mild to moderate psoriasis was (  $355.32 \pm 104.21$  pg/ml ) and controls (  $144.65 \pm 69.44$  pg / ml). A statistically significant difference was found in the serum s IL - 2R level between patients and controls (  $P < 0.05$  ). However,

when patients were evaluated according to disease severity, serum s IL - 2R level was significantly higher in patients with severe psoriasis ( $475.45 \pm 111.45$  pg/ml) than patients with mild to moderate psoriasis and controls ( $p < 0.05$ ) (fig.2).

The mean value (mean  $\pm$  SD) of serum IL - 6 level estimated in patients with mild to moderate psoriasis was ( $15.24 \pm 8.58$  pg/ml) and controls ( $5.99 \pm 1.34$  pg/ml). A statistically significant difference

was found in the serum IL - 6 levels between patients and controls ( $P < 0.05$ ). However, when patients were evaluated according to disease severity, serum IL - 6 level was significantly higher in patients with severe psoriasis

( $33.76 \pm 11.34$  pg/ml) than patients with mild to moderate psoriasis and controls ( $p < 0.05$ ) (fig.3).

**Table (1): The demographic data of the studied subjects**

## 5. Discussion

Psoriasis is a common inflammatory disease of the skin and joints. Its aetiology remains unknown, however, it has been linked to complex interactions between predisposing genes and the environment. The pathophysiology of psoriasis is characterized by epidermal hyperproliferation, enhanced antigen presentation, T helper ( Th - 1 ) cytokine production, T cell expansion, and angiogenesis. Tremendous advances in understanding of this disorder has led to the development of novel therapeutics and the FDA approval of more systemic agents for its treatment in the last 5 years than in the previous 50 years combined. Improved understanding of the pathogenesis of psoriasis has led to epidemiologic studies that have contributed towards further characterizing its natural history ( **Stephen and Gelfand 2008** ). In this study we focused on the impact of serum levels of proinflammatory cytokines (TNF -  $\alpha$ , IL - 2R and IL - 6 ) in psoriasis vulgaris In

Egyptian patients which are of major clinical relevance to the clinician.

**Sagawa et al. ( 1993 )** pointed out that TNF -  $\alpha$  in combination with other cytokines like IL-6 may be highly injurious due to complex interactions between these cytokines, suggesting a rationale for monitoring of multiple cytokines in the sera of psoriatic patients. Moreover, the cytokine assay results may vary due to the clinical stage and type of disease, methods used for cytokines detection and their sensitivities, lesion activity, interferences due to different drugs used, demographic differences in the patient groups, and the effect of concomitant pathologies.

We evaluated the association of serum levels of some proinflammatory cytokines *in vivo* and their correlation with severity of psoriasis. The serum levels of cytokines levels were determined with the use of the ELISA method. All mean values of patients were significantly higher than those of controls. There was a significant relation between serum levels of TNF -  $\alpha$ , IL - 2R and IL - 6 and the severity of the disease.

The clinical severity and activity of psoriasis, and those measurements of serum levels of these cytokines may be objective parameters for the disease severity.

In an earlier studies that was performed by **Ameglio et al., in 1994**, they shown that there was an observed significant reduction in IL - 6, IL - 8, IL - 2R and TNF -  $\alpha$  levels following effective therapies in psoriasis patients. Also, **Deeva et al. in 2010** had investigated in their study patients affected by very severe forms of psoriasis and they were characterized by increased plasma levels of IL - 4, IL - 6, MCP - 1, VEGF. Also, in mild to moderate psoriasis patients, they had showed higher levels of IL - 4, IL - 6, IL - 10, and IL - 13 when compared to healthy controls.

In our results the increment of the investigated cytokines, showed a significant increase in severe psoriasis than in mild-to-moderate ones which are not in agreement to the results obtained by **Deeva et al. in 2010** who found that there is no correlation between psoriasis severity assessed by PASI ( Psoriasis Area and Severity Index ) and levels of these mediators.

Our results are in agreement with earlier studies demonstrated by **Mohammad in 2005**, who showed a significant increase in levels of serum IL-6, IL-8, IL-2R and TNF-  $\alpha$  in Saudi psoriasis patients as compared with healthy controls. And he has been suggested that proinflammatory cytokines not only play a fundamental role in the worsening of the disease or activating its pathogenetic mechanisms, but are also directly related to the clinical symptoms and disease evolution after effective therapy.

**Eiko et al. in 2006** had shown that psoriatic lesions showed elevated mRNA expression for type 1 cytokines ( IFN - gamma, IL - 2, and TNF-  $\alpha$  ), compared with lesion-free psoriatic skin and normal skin, without a significant component of type 2 cytokines ( IL - 4, IL - 5, and IL - 10 ) which confirm our results in the increment of the studied serum cytokines .

Also, similar to our results **Ozer et al. in 2005** have demonstrated that, serum TNF -[alpha], IFN -[gamma], IL - 6, IL - 8, IL - 12, and IL - 18 levels were significantly higher in active psoriatic patients than in controls. Furthermore, high levels of these parameters have been correlated with the clinical severity and activity of psoriasis, and they concluded that measurements of serum levels of these cytokines may be objective parameters for the disease severity.

in Japanese patients with psoriasis, **Takahashi et al. in 2009** have shown that serum levels of tumour necrosis factor ( TNF )-alpha, interferon ( IFN ) - gamma, interleukin IL-2, IL - 6, IL - 7, IL - 8, IL - 12, IL - 17, IL - 18 and vascular endothelial growth factor ( VEGF ) were significantly increased in patients with

psoriasis compared with those of healthy controls. And, increased serum levels of these cytokines were correlated with PASI. Furthermore, these cytokine levels were decreased after psoriasis treatment.

As we gain further insight into the immunopathogenesis of psoriasis, we hope it will provide the basis for the development of safer, more efficacious, and more durable therapeutics in the future. Given its enormous toll on patient health and quality of life, steps should be taken to prevent or decrease the risk of psoriasis associated comorbidities.

## 6. Conclusion

Psoriasis is a common chronic relapsing and remitting papulosquamous skin disease that may appear at any age and affect any part of the skin. The systemic overexpression of a variety of proinflammatory cytokines such as TNF -  $\alpha$ , IL - 2 and IL - 6 have been evaluated in this study. We found that these cytokines are significantly elevated in patients suffering from psoriasis when compared to control. With increase of the severity of the disease, these cytokines are significantly elevated in severe psoriasis patients than in mild to moderate one which is attributed to the role of these cytokines in the pathogenesis and progress of psoriasis and their elevation is responsible for the development, maintenance and resolution of psoriatic lesions.

We suggest that, a use of an array of these cytokines may be considered as a useful follow-up marker for monitoring of psoriatic patients and optimizing therapeutic strategies. However, detailed time-course studies on sequential analysis of these cytokines in relation to disease severity and / or treatment modalities are warranted to ascertain its real application. Finally, we recommend the study of the effectiveness of use of antisense therapy using the antibody of these cytokines in psoriatic patients, in particular anti - TNF therapy.

**Abstract:** Food derived antioxidants have a strong potential for long term use as chemopreventive agents in disease states involving oxidative stress, such as hepatitis and alcoholic liver diseases. This study aimed to investigate the effect of different extracts of *Eruca Sativa* in ethanol induced liver injury in rats. Eighty eight male albino rats were divided into 3 main groups included control, prophylactic and treated groups using different extracts of *Eruca sativa*. Serum liver functions tests, lipid profile and oxidants/antioxidants profile were estimated. The results showed that *Eruca sativa* extracts improved liver functions, Lipid profile and antioxidants parameters. We concluded that, *Eruca sativa* extracts may exert their prophylactic and treatment role against oxidative stress produced by ethanol by increasing/maintaining the levels of antioxidant molecules and antioxidant enzymes. [Journal of American Science 2010;6(11):381-389]. (ISSN: 1545-1003).

**Key words:** *Eruca sativa*, Ethanol, Liver, Ethanolic extract, Antioxidants, Oxidative stress.

## 1. Introduction

Liver is the first organ to metabolize all foreign compounds and hence it is susceptible to many different diseases (Sakar et al., 2005). Alcohol administration is one of the most common causes of chronic liver disease in the world and it was found that alcohol affects the liver, through not only nutritional disturbances but also its direct toxicity, because its predominant metabolism in the liver is associated with oxidation-reduction changes and oxidative stress (Lieber, 2004). The body's natural defenses against free radicals (e.g. antioxidants) are inhibited by alcohol consumption resulting in the increasing of liver damage (Augustyniak et al., 2005).

There has been a great deal of interest in the role of complementary and alternative medicines for the treatment of various acute and chronic diseases. Several hundreds of plants have been examined for use in a wide variety of liver disorders including *Eruca sativa* (Family: *Cruciferae*) that modulate oxidative stress due to its antioxidant properties. Fresh *Eruca sativa* has a characteristic pungent flavor that is thought to be related to the presence of glucosinolates and their breakdown products, e.g: isothiocyanates (Bennett et al., 2006) which have several biological activities including anticarcinogenic, antifungal, antibacterial and antioxidant effects (Kim et al., 2004).

Alam et al., (2007) indicated that *Eruca sativa* seeds and leaves possessed a potent free radical scavenging antioxidants and protected against oxidative damage by increasing /maintaining the levels of antioxidant molecules and antioxidant enzymes.

Thus, the aim of this study is to evaluate the prophylactic and treatment effects of petroleum ether extract of *Eruca sativa* seeds (oil) and ethanolic extracts of both seeds and leaves on alcohol induced hepatotoxicity in rats.

## 2. Materials and Methods

Male albino rats weighting 160-180 g and mice of both sexes weighting 25-28 g were purchased from the animal house of National Research Center (NRC), Giza, Egypt and *Eruca sativa* (seeds and leaves) was purchased from the local market.

Ethanolic and petroleum ether extracts were prepared according to the method of Harborne (Harborne, 1988).

LD<sub>50</sub> of ethanolic extracts of *Eruca sativa* leaves and seeds were determined according to Behrens & Karber (1970).

The guidelines of the ethical care and treatment of the animals followed the regulations of the ethical committee of NRC.

Eighty eight healthy male albino rats were used in this study and randomly divided into 3 main groups , the 1<sup>st</sup> group is the control group and included 1-Normal control rats received saline 2-Ethanol group: normal rats received oral dose of 20% (v/v) ethanol 5ml/100g body weight daily for four weeks .Oil control group: normal rats received oral dose of *Eruca sativa* oil (0.06 ml / kg B.wt / day) for twelve weeks .Seed control group: normal rats received oral dose of *Eruca sativa* seeds ethanol extract (0.5 g/Kg B.wt /day) for twelve weeks (according to LD<sub>50</sub>).Leaf control group: normal rats received oral dose of *Eruca sativa* leaves ethanol extract (0.5 g/Kg B.wt /day) for twelve weeks (according to LD<sub>50</sub>).

The 2<sup>nd</sup> group is the Prophylactic groups and included 1- Oil prophylactic group: rats received oral dose of *Eruca sativa* oil (0.06 ml/Kg B.wt / day) together with 20% ethanol (5ml/100g B.wt./day) for four weeks 2- Seed prophylactic group: rats received oral dose of *Eruca sativa* seeds ethanol extract (0.5 g/Kg B.wt / day) together with 20% ethanol (5ml/100g B.wt./day) for four weeks. 3- Leaf prophylactic group: rats received daily oral dose of *Eruca sativa* leaves ethanol extract (0.5 g/Kg B.wt / day) together with 20% ethanol (5ml/100g B.wt./day) for four weeks.

The 3<sup>rd</sup> group is the treated group ad included 1- Oil treated group: rats received oral dose of 20% ethanol (5ml/100g B.wt./day) for four weeks followed by *Eruca sativa* oil (0.06ml/Kg B.wt / day) for twelve weeks.2-Seed treated group: rats received oral dose of 20% ethanol (5ml/100g B.wt./day)for four weeks followed by *Eruca sativa* seeds ethanol extract (0.5 g/Kg B.wt / day) for twelve weeks.3-Leaf treated group: rats received oral dose of 20% ethanol (5ml/100g B.wt./day) for four weeks followed by *Eruca sativa* leaves ethanol extract (0.5 g/Kg B.wt / day) for twelve weeks.

At the end of the experimental period, animals were kept fasting, subjected to light ether anaesthesia, blood was collected from retro orbital venous plexus and sera were separated by centrifugation and kept at -20°C until used.

Serum Aspartate amino transferase (AST) and Alanine amino transferase (ALT) were assayed by using commercial kits purchased from BioMed Diagnostics.  $\gamma$  glutamile transferase ( $\gamma$ GT) was estimated kinetically by using Linear Laboratories kit. Serum total protein (TP) and serum albumin (Alb) were estimated by Centronic GmbH-Germany kit . Lipid profile was determined by assaying serum total cholesterol (TC), triglycerides (TG) and High

Density Lipoprotein Cholesterol (HDL-C) using commercial kits purchased from BioMed Diagnostics. Lipid according to the method of Uchimaya and Mihara (1978). Total antioxidants (TA) were measured kinetically using commercial kits purchased from Biodiagnostic. Nitric oxide (NO) was determined by the method of Miranda et al., (2001). Superoxid dismutase activity was determined according to Ming Sun and Zigman (1978).

Data were analyzed by one way analysis of variance (ANOVA) followed by LSD test. Results were expressed as mean  $\pm$ S.E, p-values <0.05 were regarded as statistically significant.

### 3. Results

Administration of *Eruca sativa* extracts had no effect on the all studied parameters compared to control group indicating its safe administration (Table 1).

The mean values of serum liver enzymes ALT, AST and  $\gamma$ GT were significantly increased, while the mean values of TP, Alb and A/G ratio were significantly decreased in ethanol group compared to control group. Oil, seeds and leaves prophylactic groups and seeds treated group showed a significant decrease in the mean values of serum ALT, AST and  $\gamma$ GT and a significant increase in TP, Alb and A/G ratio compared to ethanol group (Table 2).

The mean values of serum lipid profile TC, TG and Low Density Lipoprotein Cholesterol (LDL-C) were significantly increased, while the mean values of HDL-C and HDL-C/LDL-C ratio were significantly decreased in ethanol group compared to control group. Oil, seeds and leaves prophylactic groups and seeds treated group showed a significant decrease in the mean values of serum TC, TG and LDL-C and a significant increase in HDL-C and HDL-C /LDL-C ratio compared to ethanol group (Table 3).

The mean values of serum (TBARS) and NO were significantly increased, while the mean values of serum SOD and TA were significantly decreased in ethanol group compared to control group. All prophylactic groups showed a significant decrease in the mean values of serum TBARS and NO and a significant increase in SOD and TA compared to ethanol group but seeds treated group showed a significant decrease in NO only (Table 4).

#### 4. Discussion

In this study, alcohol intake increased the mean values of liver enzymes (ALT, AST and  $\gamma$  GT). These results were in agreement with Rajakrishnan and Menon (2001) who indicated that exposure of hepatocytes to ethanol alters the membrane structure and functions by increasing the leakage of enzymes into the circulation. Also, Das et al., (2005) reported that excess alcohol consumption has been linked with altered liver metabolism and liver damage, with leakage of cytoplasmic liver enzyme  $\gamma$ GT into blood.

In all prophylactic groups and *Eruca sativa* seeds ethanolic extracts treated group, liver enzymes (AST, ALT and  $\gamma$ GT) were significantly decreased compared to ethanol group. These results were in agreement with El-Nattat and El-Kady (2007) who indicated that administration of rocket caused improving in AST, ALT and  $\gamma$ GT activities in male rabbits, which may be due to the high content of sulfur in *Eruca sativa* that works as a cleansing of body wastes, clearing congestion like sinusitis and assisting liver and immune function.

In the present study, there was a significant decrease in serum total proteins, albumin and A/G ratio in ethanol group. These results were in agreement with Ahmed et al (2002) who found a decrease in serum total proteins and albumin in ethanol-administered rats and he suggested that was due to the decrease in the functional ability of liver in ethanol-administered rats. Also, the decrease in A/G ratio is a predictor of a bad out come and poor health.

In the current study, serum total proteins, albumin and A/G ratio were significantly increased in all prophylactic groups and also in treated group of *Eruca sativa* seeds ethanolic extracts compared to ethanol group. In the same line, El-Missiry and El-Gindy (2000) indicated the ability of *Eruca sativa* oil to stimulate the regeneration of hepatic tissue which increased protein synthesis in damaged liver and improved the functional statuses of the liver cells.

Several studies demonstrated that alcohol intake is associated with changes in serum lipid concentrations and whole-body lipid balance (Siler et al., 1999). In the present study, there was a significant increase in the mean values of serum TC, TG and LDL-cholesterol and a significant decrease in the mean values of serum HDL-C and HDL-C / LDL-C ratio in ethanol group. These results were in agreement with kumar et al. (2002) who reported that ethanol blocks fat oxidation and favors fat accumulation. The accumulation of fat in liver acts as a stimulus for the secretion of lipoproteins into the blood stream and the development of hyperlipidemia.

In prophylactic groups, *Eruca sativa* significantly decreased serum cholesterol, triglycerides and low density lipoprotein cholesterol levels while the mean values of high density lipoprotein cholesterol and HDL-C/LDL-C ratio were significantly increased. These results were in agreement with El-Gengaihi et al., (2004) who reported that *Eruca sativa* induced a marked decrease in different lipid parameters values.

It was found that the inflammatory reactions and oxidative stress play a major role in alcohol hepatotoxicity (Albano et al., 2002). In this investigation, there was a significant increase in serum MDA concentration in ethanol treated rats; these results were in agreement with Saravanan et al., ( 2006) who observed a significant increase in MDA concentration in ethanol-treated rats and he suggested that reactive oxygen intermediates, generated during the metabolism of ethanol, these free radicals attack the polyunsaturated fatty acids in membranes and organelles to produce lipid peroxides leading to decrease in the membrane permeability, and ultimately cellular necrosis and death.

Free radicals are involved in various human diseases that can possibly be prevented by antioxidants (Chatterjee et al., 2005). Exposure of living organisms to a constant generation of reactive oxygen species (ROS) resulting in the development of antioxidative defense systems which protect cells and tissues against their harmful effects. The

efficiency of enzymatic and non-enzymatic antioxidative systems could be detected by the determination of single components of this system or by so-called total antioxidant capacity (TAC) (Kankofer et al., 2005) In the present study, a significant decrease in serum total antioxidants in ethanol treated rats was observed. In agreement, Masalkar et al., (2005) found a decrease in antioxidant status in alcoholic patients and showed that increased generation of free radicals and deficiencies of dietary antioxidants can be important etiological factor in alcoholic liver disease.

In this study, NO level was significantly elevated in alcohol -treated rats. In agreement, Li et al., (2004) showed an elevation of NO level with the increased volume of alcohol infusion.

In the present study, the activity of superoxide dismutase was significantly decreased in ethanol -treated rats. In agreement, Puntarula et al., (1999) reported that superoxide dismutase and other antioxidative enzymes may be inactivated by ethanol.

All prophylactic groups showed a significant decrease in malondialdehyde (MDA) and nitric oxide (NO) levels and a significant increase in total antioxidants levels and superoxide dismutase activity. El-Gindy & El-missiry (2000) indicated that oil of *Eruca sativa* seed extract (ESS) induced an increase in hepatic GSH content which might enhance the GSH/GSSG ratio and decrease hepatic lipid peroxidation and hence aldehydic concentration. Parallel to these events, hepatic SOD activity was increased in rats supplemented with ESS. That is may be due to the fact that *Eruca sativa* seeds possess a potent free radical scavenging, antioxidants activities.

From the current study we noticed that, *Eruca sativa* leaves extract is consider the best hepatoprotective extract in prophylactic groups and *Eruca sativa* seeds extract is consider the best treated extract in treated groups. That's may be related to the fact that, *Eruca sativa* seeds ethanolic extract have a potent antioxidant activity and protect against ethanol induced hepatotoxicity. Several studies on phytochemical analysis of *Eruca sativa* seeds has shown the presence of many compounds to which antioxidant activity may be ascribed, these include glucosinolate, flavonoids (Quercetin,Kaempferol and isohamnetin),Carotenoids, Vitamine C (Barillari et al., 2005). The main compound that exerts antioxidant activity in *Eruca sativa* seeds extract is glucoerucin, unlike other glucosinolates (GLS) (e.g. glucoraphanin, the bio-precursor of sulforaphane), glucoerucin (GER) possesses good direct as well as indirect antioxidant activity (Alam et al., 2007). The antioxidant activity of glucoerucin, the bio-precursor of erucin (ERN) implicates free radical scavenging activity and an ability to induce phase II

metabolizing enzymes (e.g. glutathione transferases, GSTs; NAD-(P) H: Quinone reductase (QR),epoxide hydrolase and heme oxygenase)which are important in the detoxification of electrophiles. Reactions of glucoerucin and erucin with free radicals (hydroperoxides) produce glucoraphanin (GRP) and sulphoraphane, respectively (Barillari et al., 2005).

In contrast, Perocco et al., ( 2006) reported that glucoraphanin only slightly affects glutathione-S-trasferase, which was the selected marker of phase II detoxifying enzymes, and also found that, GRP powerfully induces phase -I bioactivating enzymes(e.g.CYP1A which activates polycyclic aromatic hydrocarbons,CYP3A1 that activates aflatoxin and CYP2E1 activates ethanol). CYP2E1 metabolizes and activates many toxicological substrates, including ethanol, to more toxic products and it generates superoxide anion radical ( $O_2^-$ ) and hydrogen peroxide ( $H_2O_2$ ). This effect on the redox status of the liver can cause activation of Kupffer cells and subsequently, hepatic cells, and thus contributing to the generation of alcoholic liver disease (Kessova and Cederbaum, 2003).

So, this extract (ethanolic extract of seeds) induced the beneficial effect in treatment study and not in prophylactic one. On the other hand, Bennett et al. (2002) indicated that leaves of *Eruca sativa* contain 4-mercaptopbutyl GL as the major GL among nine, while GER is present only in small amounts. In addition Kim et al., (2004) isolated 4-(B-D-Glucopyranosyldisulfanyl) butyl a new glucosinolate from leaves of rocket and reported that this new glucosinolate has antioxidant activity in vitro..Rocket seeds and sprouts contain glucoerucin(GER) as main glucosinolates ,in large amounts in comparison to leaves (mature plants which contain 4-mercaptopbutyl GL in large amount beside 4-(B-D-Glucopyranosyldisulfanyl) butyl and a small amount of GER ( Weckerle et al., 2001).From these results we concluded that, *Eruca sativa* ethanolic extract of leaves was better than ethanolic extract of seeds and petroleum ether extract of seed (oil) in the prophylactic study. Since in prophylactic study glucoraphanine(produced by glucoerucin) which found in *Eruca sativa* seeds activates phase 1 enzyme (CYP2E1) which in turn activates ethanol metabolism to produce free radicals and more toxic products, despite giving a beneficial effect in treatment study. Regarding the present study it could be concluded that *Eruca sativa* extracts possessed both prophylactic and therapeutic effects against experimentally induced liver injury in rats. However, the prophylactic role of these extracts was more potent than their treatment capacity.

**ABSTRACT:** *In vivo* and *in vitro* extracted cardiac glycosides of immature seeds (IS) cultures of *Thevetia nerifolia* Jussieu. and *T. thevetioides* Kunth. were chemically identified. Calli were grown on modified Murashige & Skoog (MS) medium supplemented with 1mg/l 2,4-dichlorophenoxyacetic acid (2,4-D) +3mg/l kinetin (Kin). The content of cardiac glycosides in IS cultures of *T. nerifolia* and *T. thevetioides* were monitored by HPLC. Two major compounds were detected and isolated from IS extracts i.e. digitoxigenin and thevetin B. The different structures of the *in vivo* and *in vitro* isolated compounds were verified by means of MS and NMR spectral analysis, as well as those compounds were identified and determined using HPLC technique. [Journal of American Science 2010;6(11):390-395]. (ISSN: 1545-1003).

**Key words:** Cardiac glycosides, callus, *Thevetia spp.*, HPLC, MS medium, immature seed cultures

### INTRODUCTION

*Thevetia nerifolia* Juss. and *T. thevetioides* Kunth. belonging to Apocynaceae family, which are commonly known as the dogbane or oleander family (Omino and Kokwaro, 1993). Apocynaceae plants are distributed in tropical America and the West Indies and widely grown in various parts of the world for ornamental purpose (Rizk and Al-Nowaihi, 1989; Sabira *et al.* 1993). It has been used in folk medicine as a purgative, emetics, and a remedy for intermittent fever (Githens, 1948). Moreover, It is having cardiotonic activity (Aleshkina and Berezhinskaya, 1962), anticancer (Cardellina *et al.* 1993), neuroprotection against ischemic stroke, as well as insecticidal properties (James *et al.* 2006). The toxicity of *Thevetia* species attributed to their cardenolide content in their tissues (Goncalves *et al.* 2003; Gaillard *et al.* 2004; Gaillard *et al.* 2004). Cardiac glycosides Cerberin (monoacetylnerifolin), ruvoside and perusitin were isolated from the seeds of *Thevetia peruviana* (Siddiqui *et al.* 1992). Abe *et al.*, (1994) isolated sixteen cardenolide glycosides and one pregnane glycoside from the frozen fresh leaves of *Thevetia nerifolia*. Siddiqui *et al* (1992) isolated nerifoside from the fresh uncrushed leaves of *Thevetia nerifolia*, in addition to four triterpenes; oleanolic acid, ursolic acid,  $\alpha$ -amyrin acetate and  $\beta$ -amyrin acetate. Also, cerberoside, 2-O-acetylcerberoside, nerifolin, thevetin A&B, peruvoside, digitoxigenin were isolated (Balsam and

Kufner 1971; Seitz and Riphahn 1975; Said, 1985; Decosterd *et al.* 1994). The triterpenes, sterol, Fatty acids and flavonoid constituents of *Thevetia peruviana* fruit pericarp and flowers were also studied (Qazi *et al.* 1973; Rao *et al.* 1975; Schum-Obasi *et al.* 1990).

*In vitro* culture technology has been proven to be effective in some cases for the production of secondary metabolites such as taxol (Oksman-Caldentey and Inzé 2004). Moreover, Dantas *et al.* (1994) studied six strain of *T. nerifolia* cell suspension cultures for cardenolides production. Even after two years of subculture, cardenolides proved to be present in all these strains. The cardenolides content varied from one strain to another according to the nature of the original explants. Furthermore, Lopes *et al.* (2001) reported that some compounds found in the intact plant could accumulate in cultured cells. Cardenolides of *T. nerifolia*, were accumulated in cultured cells during one year of cultivation.

In the present work, cardiac glycoside in seed cultures of *T. nerifolia* and *T. thevetioides* were identified and compared qualitatively and quantitatively with those isolated previously from *in vivo* seeds of the same plants.

### MATERIALS AND METHODS

#### *General procedures*

<sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>OD) and <sup>13</sup>C NMR (125 MHz, CD<sub>3</sub>OD) were recorded on a JEOL LA500 MHz, Germany spectrometer with TMS as an internal standard. The FAB-MS spectrum was taken on a JEOL JMS\_AX500 mass spectrometer MS-FAB09A positive. HPLC was carried out on Agilent a series 1100 interface with stationary phase (RP18), injection volume (10 µl), oven temperature (25°C), diode array detector (254 nm), flow rate (1ml / min) and mobile phase: MeOH/H<sub>2</sub>O (1:1) under gradient conditions. Column chromatography was carried out on silica gel 60 (Merck; 230 - 400 mesh). TLC: pre-coated silica gel 60F<sub>254</sub> plates (Merck); CC: silica gel type 60 (Merck). MS: Murashige and Skoog medium (Duchefa Biochemie The Netherlands).

#### Plant materials

Immature seeds (IS) of *T. nerifolia* Juss. and *T. thevetioides* Kunth were collected from Al-Orman garden, Giza, Egypt in March 2006. They were identified by Prof. Dr. K. H. El-Batanouny, Botany Department, Faculty of Science, Cairo University. Voucher specimens are deposited at the Herbarium of NRC, Dokki, Cairo, Egypt.

#### Authentic compounds

The reference of cardiac glycosides (peruvoside and nerifolin) were purchased from Sigma Chemicals Co., St. Louis Mo. USA. Thevetin B and digitoxigenin were separated and identified throughout this work.

#### Initiation of IS calli cultures

Calli cultures of *T. nerifolia* and *T. thevetioides* derived IS were performed as described by Taha *et al.* (2010).

#### Extraction and isolation of cardiac glycosides

In vitro derived calli of *T. nerifolia* and *T. thevetioides* and *in vivo* IS were lyophilized and powdered. Then they were percolated in methanol (3x3L) at room temperature for 24 hrs and filtered. The percolation was repeated three times and the methanolic extracts for each plant were combined and evaporated *in vacuo* at 45 °C. The dry crude extract was defatted with petroleum ether. The residue was dissolved in MeOH/H<sub>2</sub>O (1:1) and extracted with chloroform. The chloroform extracts were combined together, dehydrated and the solvent distilled of *in vacuo* at 45 °C to give total cardenolides (Fried and Sherma, 1994 and Abdel-Azim *et al.*, 1996).

#### Identification of the isolated compounds

All isolated compounds were identified by FAB-MS, <sup>1</sup>H-NMR and <sup>13</sup>C NMR spectroscopy. Furthermore, the determination of cardiac glycosides was carried out using co-chromatography TLC and HPLC techniques with samples of reference compounds.

#### HPLC analysis

One gram each of air-dried powdered of *in vivo* and *in vitro* derived calli of IS of *T. nerifolia* and *T. thevetioides* was accurately weighed. Each sample was extracted with 50 ml 70% MeOH till exhaustion. The obtained methanolic extract was evaporated till dryness. The residue was re-dissolved in 1 mL methanol and filtered. The filtrate was used for quantitative determination of the isolated compounds using HPLC (10 µL was injected). Which, then they were performed on RP18 column using water (A) and methanol (B) as solvents and detected at the wave length of 220 nm. The following gradient was employed: 10% B for 25 minutes, 100% B within 30 minutes, then isocratic elution at 20% B for 20 minutes. Standard curves of authentic compounds and calculations of unknown amounts of cardiac glycosides in calli and regenerated culture samples were done using routine protocols as described by Scott (1996).

#### Statistical analysis of data

All experiments were statistically analyzed using the F-test according to Steel and Torrie (1960). ANOVA was determined and the LSD was calculated at P=0.05. The data presented are the means of five replicates ± standard error (SE).

## RESULTS AND DISCUSSION

#### Isolation and structure elucidation

The crude cardenolides extract (5 g) were applied onto the top of a silica gel column 50x5 cm. Elution was carried out using CHCl<sub>3</sub> followed by gradual increasing of the proportions of MeOH till 100% MeOH. The course of the chromatographic fractions (100 ml each) was monitored by silica gel for TLC and developed using solvent system CHCl<sub>3</sub>: MeOH (8:2). The chromatoplates were visualized using Kedde's reagent (Wagner and Bladt 1995), which give violet colour with cardiac glycosides. Similar fractions were combined and concentrated to dryness under reduced pressure. Thevetin B (compound I) was isolated in a pure form *T. nerifolia* and having R<sub>f</sub> values 0.12. Also digitoxigenin (compound II) was isolated from *T. thevetioides* and having R<sub>f</sub> values 0.81.

### Compound (I)

Compound I was identified as thevetin B (**Fig. 1**) by comparing its spectroscopic measurements with that published with Rodrigo *et al.* (2005). Its FAB-MS (positive mode) spectrum showed a molecular ion peak at  $m/z$  858 (calcd. 858.96), which is corresponding to the molecular formula  $C_{42}H_{66}O_{18}$ .  $^1H$ -NMR spectrum ( $CD_3OD$ ), showed two methyl protons at  $\delta$  0.8 and 0.9 corresponding to  $C_{18}$  and  $C_{19}$ , respectively. Signals due to the cardenolides ring were identified at  $\delta$  5.00 ( $H_{21\alpha}$ ), 4.8 ( $H_{21\beta}$ ) and 5.8 ( $H_{22}$ ). In addition to the signal detected at  $\delta$  2.7, which is corresponding to  $H_{17}$ . The three anomeric protons of the three sugar units were identified at  $\delta$  4.3, 4.5 and 5.11, respectively. The oxygenated methines were also identified at  $\delta$  3.54 for  $H_3$  and  $\delta$  3.54 for C-3'-OMe.

### Compound (II)

Compound II was identified as digitoxigenin (**Fig. 1**) by comparing its spectroscopic measurements with that published with Rodrigo *et al.* (2005). Its FAB-MS (positive mode) showed a fragment ion peak at  $m/z$  374.25 (calcd 374.51), which is corresponding to the molecular formula  $C_{23}H_{34}O_3$ .  $^1H$ -NMR spectrum ( $CD_3OD$ ), showed two methyl signals at  $\delta$  1.05 and 0.99 corresponding to  $H_{18}$  and  $H_{19}$ , respectively. Signals due to the cardenolides ring were identified at  $\delta$  6.15 ( $H_{22}$ ), 5.06 ( $H_{21\alpha}$ ) and 4.67 ( $H_{21\beta}$ ), in addition to  $H_{17}$  at  $\delta$  2.84.  $^{13}C$ -NMR spectrum ( $CD_3OD$ ), showed an ester carbonyl at  $\delta$  172.1 ( $C_{23}$ ) and the vinylic carbons were identified at  $\delta$  117.7 ( $C_{22}$ ) and 172.0 ( $C_{20}$ ). Additional oxygenated carbons were observed for  $C_{14}$  ( $\delta$  86.0) and  $C_{21}$  ( $\delta$  75.8). Also, the two methyl carbons were identified at  $\delta$  16.4 ( $C_{18}$ ) and  $\delta$  24.1 ( $C_{19}$ ).

The results obtained are in agreement with those reported by Mahran *et al.* (1971), who isolated thevetin B from seeds of *T. nerifolia*, and Perez *et al.* (1993), who isolated digitoxigenin from seeds of *T. thevetioides*.

### Initiation of IS calli cultures

The highest value of IS calli of *T. nerifolia* and *T. thevetioides* (Fig. 2 A and B) was recorded with MS+ 1mg/l 2,4-D + 3mg/l Kin as described by Taha *et al.* (2010).

## Qualitative and quantitative determination of cardenolides

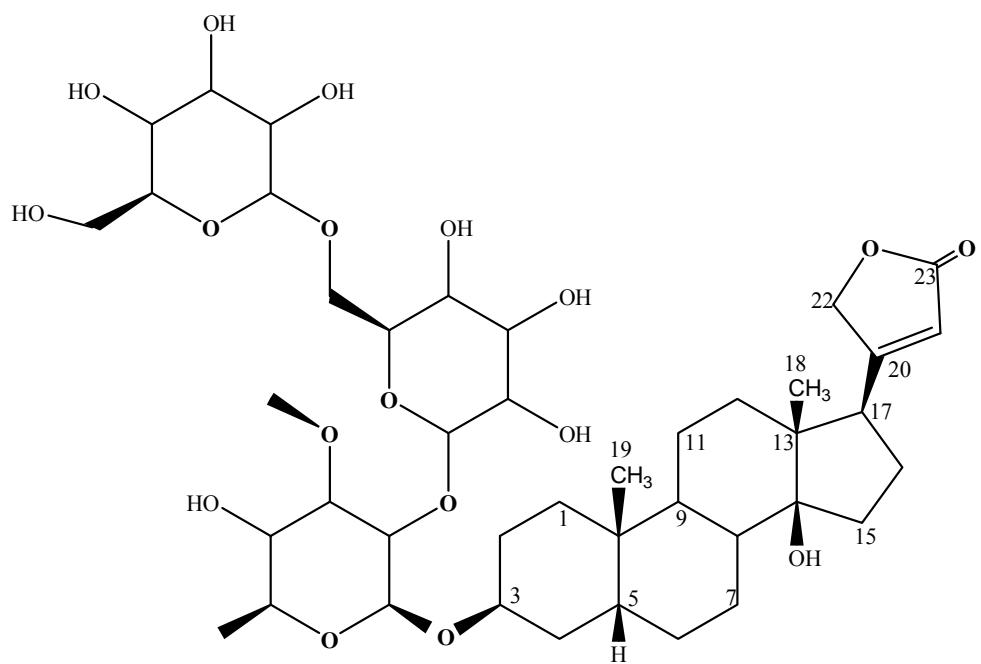

### 1. Qualitative determination

TLC chromatoplates as a preliminary screening to check the presence of the examined cardenolids compounds in calli and regenerated shootlet extracts. The chloroform extracts were compared with authentic samples using system solvent chloform/methanol (8:2) and visualized with Kedde's reagent. The spots corresponding to  $R_f$  values 0.12, 0.60, 0.67 and 0.81 were referred to thevetin B, nerifolin, peruvoside and, digitoxigenin, respectively. The four compounds were detected in all the examined calli and regenerated shootlet extracts.

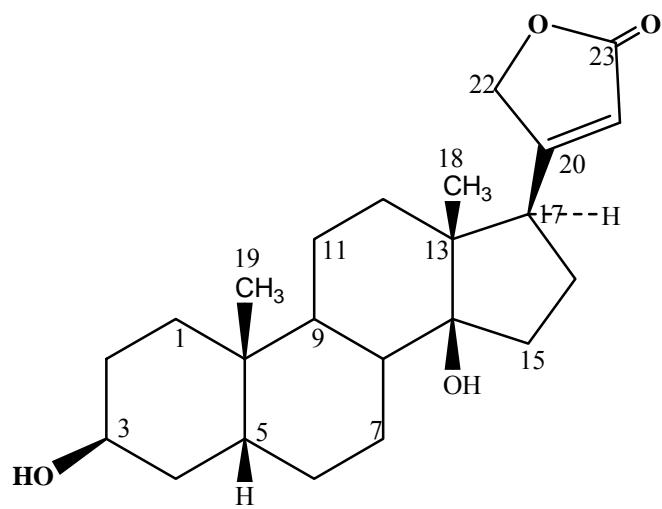

### 2. Quantitative determination (HPLC technique)

As shown in Table 1 thevetin B, digitoxigenin, peruvoside and nerifolin *in vivo* and *in vitro* seeds cultures of *T. nerifolia* and *T. thevetioides* were illustrated in (Table 1). The amount of thevetin B, digitoxigenin, peruvoside and nerifolin of *in vivo* seeds of *T. nerifolia* plant were 0.19, 0.11, 0.39 and 0.25 mg/g DW, respectively. On the other hand, the amount of these compounds of *in vivo* seeds of *T. thevetioides* plant were 0.99, 0.15, 0.24 and 0.39 mg/g DW, respectively. The highest concentration of thevetin B (85 mg/g DW) and digitoxigenin (0.028 mg/g DW) was recorded in *T. nerifolia* IS calli cultures and that of peruvoside (0.017 mg/g DW) and nerifolin (0.032 mg/g DW) was found in *T. thevetioides*.

Concerning, the accumulation of cardenolides in *T. nerifolia* calli cultures and in close of our obtained results Dantas *et al.* 1994 and Lopes *et al.* 2001 reported that some compounds of cardenolides were accumulated in cultured cells of *T. nerifolia*. Morevor, some studies by Fett-Netto *et al.* (1992) reported that 2,4-D and Kin combination were more effective in accumulation of secondary metabolites *viz.* taxol and related taxanes in cell suspension of *Taxus* species. It is interesting to note that the technique used in this experiment, together with other reported techniques e.g. callus and cell suspension cultures (Stuhlemmer *et al.* 1993) can be offered alternative sources for large scale production of cardiac glycosides.

**Fig. 1** Thevetin B = (Compound I )

**Fig. 2** Digitoxigenin = (Compound II)

**Table 1: Concentrations of the cardiac glycosides (mg/g DW)**

Extract	Thevetin B	Digitoxigenin	Peruvoside	Neriifolin
In vivo seeds*	0.19	0.12	0.39	0.25
In vivo seeds**	0.99	0.15	0.24	0.39
IS calli cultures*	0.085	0.028	0.013	0.019
IS calli cultures **	0.047	0.027	0.017	0.032

where:

Thevetin B ( $R_t = 9.48$ ), digitoxigenin ( $R_t = 11.01$ ), peruvoside ( $R_t = 11.32$ ) and neriifolin ( $R_t = 12.72$ ).

## Comparative Analysis Of Resource Use Efficiency In Rice Production Systems In Abia State Of Nigeria

Nwaru, J. C. and O. R. Iheke

Department of Agricultural Economics  
Michael Okpara University of Agriculture, Umudike  
PMB 7267 Umuahia, Abia State, Nigeria  
E-mail: [nwaruj@yahoo.com](mailto:nwaruj@yahoo.com)

**ABSTRACT:** Arresting the observed low productivity and continued decline in the output of rice especially in the face of rising population and the concomitant escalating increases demand has been a lingering socioeconomic problem. Continued increase in rice production through a number of options including expansion into high potential areas especially the inland valleys has been proposed. This study was designed to examine resource use efficiency in rice production systems in Abia State of Nigeria. Primary data collected from a sample of 142 farmers consisting of 46 inland valley, 41 upland and 55 swamp rice farmers were analysed by the ordinary least squares multiple regression analysis and analysis of variance (ANOVA). Results indicate that the upland rice farmers are technically more efficient than the swamp and inland rice farmers and that there is no difference in technical efficiency between the swamp and inland rice farmers. None of the farmer groups achieved absolute allocative efficiency. The upland rice farmers achieved least allocative efficiency ( $W_{ij}$  is farther from unity), underutilized all farm resources ( $W_{ij} > 1$ ) while both the inland valley and the swamp rice farmers under utilized farmland, other inputs and capital and over utilised ( $W_{ij} < 1$ ) family labour and hired labour. There was no significant difference in the mean output of rice from the production systems; upland, inland valley and swamp while each operated in region one on the production surface indicating that overall, resource levels could be increased to achieve higher levels of productivity in each system. Economic policies and programmes that could encourage the reallocation and if possible the redistribution of farm production inputs for increased farm productivity and efficiency were recommended. [Journal of American Science 2010;6(11):396-408]. (ISSN: 1545-1003).

**Key words:** Resource use efficiency, rice production systems, Nigeria.

### INTRODUCTION

The struggle for food is desperate for the 240 million people of West Africa: one of every three of who is a Nigerian (WARDA, 2002). Nigeria has experienced rapid growth in per capita rice consumption during the last three decades from 5Kg in the 1960s, 11Kg in the 1980s to 25 Kg in the 1990s (IBRD, 1994; WARDA, 2003). An estimated 2.1 million tonnes of rice are consumed annually in Nigeria; this has increased since the mid 1980s at an average annual rate of 11 percent of which only 3 percent can be explained by

population growth while the remaining percentage represents a shift in diet towards rice at the expense of the coarse grains (millet and sorghum) and wheat (WARDA, 2003). Erenstein and Lancon (2002) noted this shift and posited that the most important contributory factors are rapid urbanization and the associated changes in family occupational structures. The resultant increases in the opportunity cost of family members' time makes convenience foods such as rice to rise in prominence in the family menu.

Unfortunately, Nigerian rice output is low and declining by 3.4 percent in 1997 (CBN, 1998). Odii and Nwosu (1996) noted that the decline is traceable to inefficient use of farm resources, labour shortages and severe scarcity of resources, poor crop management practices and poor capital base. Moreover, WARDA (2002) opined that inconsistency, shifting between open and protectionist trade policy characterize rice policy in Nigeria. As a result yield potential are not fully achieved on rice farms although high yielding varieties and the associated technologies exist and are already being used by the farmers (Nwaru, 2002). Consequently, Nigeria has depended heavily on imported rice to meet her consumption needs and has become the World's largest importer of rice (WARDA, 2003). That Nigeria has remained a net importer of rice with well over 150.15 billion naira spent annually (FOS, 2000) is indicative of the declining self-sufficiency.

Continued increase in rice production has been proposed through a number of options. Carsky (1992) posited that it would be possible through continued expansion into high potential areas especially the inland valley bottoms in the Midwest and Southeast and the alluvial lowlands along the Niger and Benue Rivers. Iheke (2006) noted that additional gains could be achieved through investment in water control particularly small-scale systems in inland valleys. In deed, rice-growing environments in Nigeria are usually classified into rain fed, upland, rain fed lowland, irrigated lowland, deep water and swamp (Cobley, 1976; WARDA, 1999). Inland valleys are potential agro ecosystems that have substantial impact on African food production especially rice. IITA (1988), Izac, et al, (1991) and Windmeijer and Andriesse (1993) noted that substantial increases in rice production in Sub Sahara Africa would come from inland valleys as they have the potential for increased rice productivity.

Carsky (1992) described inland valleys as small valleys that are located near the coast and do not have long flood plains. They are in the upper reaches of watersheds having no large flood plains typical of large rivers or salinity and sulphur problems typical of coastal valleys (Carsky and Masajo, 1992). According to Andriesse (1986) an inland valley starts at a water source as a stream flow valley, which further downstream becomes a river over flow valley. WARDA (1978) and Carsky (1992) noted that though a substantial amount of research has been conducted on rice, there have been fewer studies on rice production in the inland valleys; placing rice production efforts in the inland valleys at less than 10 percent while between 14 to 22 percent was concentrated on each of the other rice ecosystems; upland and lowland. For instance, in a recent study on rice production, (Idiong, 2006) only categorized rice-growing environments into upland or lowland (swamps) rain fed or irrigated, neglecting inland valleys.

Therefore, the objective of this study is to compare the technical and allocative efficiencies as well as the mean output and the returns to scale of the rice farmers in Abia State of Nigeria according to the upland, lowland and inland valley production systems. Technical efficiency refers to the ability of production units to produce maximum outputs from a given set of inputs. It indicates all the undisputed gains obtainable by simply gingering up the management (Farrel, 1957; Iheke, 2006). Observed differentials in technical efficiency may be due to the differences in managerial ability, employment of different levels of technology as indicated by the quality and type of resources used, differences in environmental conditions such as soil quality, rainfall, temperature, solar radiations and precipitation or non technical and non economic factors such as sicknesses which

may prevent the user of the resources from working hard enough, thus failing to achieve the best level of output (Nwaru, 1993). Allocative efficiency refers to the ability of the resource user to choose the optimum combination of inputs consistent with the relative factor prices (Onyenweaku, 1994). It has to do with the extent to which farmers make efficient decisions by using inputs up to the level at which their marginal contribution to the value of production is equal to the factor costs. The product of technical and allocative efficiencies is production efficiency, which measures the success of the production unit in choosing an optimal set of inputs and the gains that can be obtained by varying the input ratios on certain assumptions about the future price structure.

It is believed that the productivity of the farmers in general and rice farmers in particular could be enhanced through enhancing their technical and allocative efficiency in response to better information and education (Idiong, 2006). With the difficulties encountered by farmers in developing countries for developing and adopting improved technologies due to resource poverty, efficiency has become a very significant factor in increasing productivity (Ali and Chandry, 1990). The drive is for the farmers to allocate their resources to those productive ventures that earn higher returns for each unit of resource spent. There might be re-allocation of available resources if they expect to benefit more from such economic actions. Idiong (2006) observed that a few published empirical works have attempted to compare efficiency between or among rice production systems in Nigeria generally and in Cross River State of Nigeria in particular. This he attempted to do but stopped only at the comparison of upland and lowland rice production systems leaving out the inland valleys. This study sought to fill this gap.

## MATERIALS AND METHODS

The study was carried out in Abia State of Nigeria. The State lies between latitude 5° 25' North and Longitude 7° 30' East. It is divided into Ohafia, Umuahia and Aba Agricultural Zones. The predominant soil of the area is sandy loam while the natural vegetation is the tropical rainforest (Iheke, 2006) and is characterized by two distinct seasons; dry and wet seasons. The dry season lasts from November to March while the wet season lasts from April to October.

The settlement pattern in most part of Abia State is still rural and farming is the predominant occupation of the inhabitants. Most families are involved in one farming activity or the other as a primary or secondary occupation. The region is blessed with favourable warm climate and sufficient moisture ideal for the growing of tree crops, root and tuber crops, cereals, vegetables, nuts and food crops including rice. Livestock are also kept especially on a smallholder basis. The crops are typically grown on smallholder plots. Most crops are grown in mixtures. Rice stands out as a crop essentially grown sole.

Ohafia Agricultural Zone is well noted as the major area of rice production in Abia State of Nigeria. Men and women are involved in the production, processing and marketing of rice in the Zone. The production systems are inland valleys, upland and swamp. The inland valleys are small valleys that do not have long flood plains, located in the upper breaches of watersheds. They usually start at a water source like a stream flow valley, which further down stream becomes a river overflow valley. Swampland arises due to water logging as a result of the topography of the soil and the soil characteristics. The uplands are rain fed or irrigated lands not prone to water logging. They are ideal for the growing of such arable

crops as maize, cassava, yam and upland rice that does not tolerate water logged soils.

A multi-stage sampling technique was used in choosing the sample. Ohafia Agricultural Zone was purposively selected for being the major rice production area in the State. Two Local Government Areas in the Zone, based on performance in rice production, were purposively selected for the study. From each of the chosen LGAs, 3 blocks were randomly selected from which 6 ADP cycles were randomly chosen. Five villages in each cycle were randomly selected. A rapid appraisal of the study area was undertaken and questions posed to village heads, resident agricultural extension agents and key informants helped in preparing the list of rice farmers in each chosen village. This list formed the sampling frame from which a sample of rice farmers was selected using simple random sampling procedure. In all, 142 rice farmers comprising of 46 inland valley, 41 upland and 55 swamp rice farmers were selected.

Preliminary visits were made to the study locations before commencing actual data collection. The visits helped the researchers familiarize themselves with the study locations and establish helpful public relations with village heads, resident agricultural extension agents, key informants and field guides. At this stage, field enumerators were recruited, trained and assigned to the study locations. Also data collection instruments consisting of well-structured questionnaire and interview schedule were pre-tested to standardize them and to give the enumerators adequate orientation. This made for easy understanding by the respondents and easy administration by the field enumerators.

The cost route approach was used in data collection for the entire production period from April to December 2005. By this method, contacts were made with the respondents forth nightly. At each contact,

efforts were made to determine and record relevant pieces of information from the respondents. The research instruments found useful at the end of the fieldwork were used for further analysis. Data collected were those on socio-economic characteristics of the respondents such as age, sex, household size, educational background and farming experience. Others were on farm inputs like fertilizer, labour use, farm size, capital assets, paddy prices, credit and extension services, costs and returns (input and output) arising from rice production in the production systems.

For the technical efficiency, the additive multiplicative dummy variable approach suggested by Gujarati (1970) and Maddala (1988), which has been used widely by researchers (Baggi, 1982; Onyenweaku, 1994; Nwaru, 2003; Iheke, 2006) was used rather than the traditional method of fitting separate models and testing the equality of coefficients between them. Although some studies in agriculture have expressed the production function in many ways such as the linear, semi-log, exponential and cobb-douglas forms, the cobb-douglas function appears to be in greater use than the other functional forms because in most cases, it satisfies statistical, economic and econometric conditions better (Sankhayan, 1998). Moreover, it has been found by economists to be most suitable in analyzing production problems of industries and agriculture. It is hence used in this study.

The implicit functional form of the model is (Onyenweaku, 1994):

$$Y = f(X_1 X_2, X_3, X_4, X_5, D, ei) \quad (1)$$

The log linear cobb-douglas functional form is given by:

$$\ln Y = \ln A_0 + B_0 D + A_1 \ln X_1 + B_1 D \ln X_1 + A_2 \ln X_2 + B_2 D \ln X_2 + A_3 \ln X_3 + B_3 D \ln X_3 + A_4 \ln X_4 + B_4 D \ln X_4 + A_5 \ln X_5 + B_5 D \ln X_5 + ei \quad (2)$$

Where in equations (1) and (2), Y is the output of rice (Kg); In is the natural Logarithm, Ao is the intercept or constant term; Bo is the coefficient of the intercept shift dummy or neutral technical efficiency parameter and D is the dummy variable which takes the value of unity for inland valley and zero for upland; unity for inland valley and zero for swamp and unity for upland and zero for swamp. X1 is size of farmland (ha); X2 is family labour (mandays); X3 is hired labour (mandays); X4 is other inputs (N) (planting materials and other expenses like seeds, fertilizer, agro chemicals, etc); X5 is capital inputs (N) (depreciation charges on farm machinery, implements and tools, interest on loan, land rent); X1D, X2D, X3D, X4D, X5D are the slope shift dummies for farmland, family labour, hired labour, other inputs and capital inputs respectively. Ai ( $i = 1, 2, \dots, 5$ ) is the coefficient of the ith variable and ei is the stochastic error term assumed to satisfy all the assumptions of the classical linear regression model.

If the coefficient of the dummy variable, D (in the additive form) is significant, it means that there is a difference in the technical efficiency of the farmer groups. If it is positive, this implies that the production function for rice farmer groups denoted as unity has larger intercept term denoting a higher level of technical efficiency than the group denoted as zero and vice versa. If  $B_0 = 0$  and all  $B_i (i = 1, 2, \dots, 5) = 0$ , then the two farmer groups are represented by the same production function. If  $B_i = 0$  but  $B_0 \neq 0$ , the two groups of farmers face neutral production function. If at least one  $B_i \neq 0$ , the two groups of farmers are facing factor biased or non-neutral production function (Onyenweaku, 1994).

For the allocative efficiency, the Cobb-Douglas functional form was estimated for each production system. The logarithmic form of the function is given by:

$$\ln Y = b_0 + b_1 \ln X_1 + b_2 \ln X_2 + b_3 \ln X_3 + b_4 \ln X_4 + b_5 \ln X_5 + e_i \quad (3)$$

Where all factors are as previously defined in equations (1 and 2).

The cobb-douglas functional form of equation (3) was estimated for deriving the allocative efficiency, determined by equating the marginal value product (MVP) of the ith input to its price or marginal factor cost (MFC). That is (Onyenweaku, 1994),  $MVP_{xi} = P_{xi}$  (4)

$MVP_{xi} (i = 1, 2, \dots, 5)$  = the marginal value product of the ith input =  $PY_{fi}$ .

$f_i = \delta Q / \delta X_i$  = Marginal physical product (MPP) of the ith input. The marginal physical product (MPP) based on the double log functional form is given by

$$MPP = b_i (\bar{Y} / \bar{X}) \quad (5)$$

Where  $b_i$  is the coefficient of the ith variable,  $\bar{Y}$  is the geometric mean of output and  $\bar{X}$  is the geometric mean of the ith variable;  $P_{xi} (i = 1, 2, \dots, 5)$  is the unit price or marginal factor cost of the ith input and PY is unit price of output. According to Onyenweaku (1994) and Nwaru (2003), for all the resources measured in physical terms, the allocative efficiency index,  $W_{ij}$ , for each farmer type is given as:

$$MVP_{xi} = PY_{fi} = W_{ij} \quad (6)$$

$$P_{xi} \quad P_{xi}$$

Where  $i$ , is a particular resource,  $j$  is the farmer group and all other variables are as previously defined. For any resource that is measured in monetary or value terms, the unit input price becomes irrelevant and equation (5) translates to:

$$MVP_{xi} = PY_{fi} = W_{ij} \quad (7)$$

In this study, the dependent variable, Y, was measured in physical terms while other inputs and capital inputs were measured in value or monetary terms. Accordingly, the marginal value products of the resources measured in value terms are directly equal to their allocative efficiency indices. This is because the marginal value products were already deflated by the unit

factor prices since the value of these factors are the products of the quantity employed and the unit factor prices.

Maximum or absolute allocative efficiency for a particular farmer group is confirmed with respect to a given resource if  $W_{ij} = 1$ . The resource is over-utilized if  $W_{ij} < 1$  and under-utilized if  $W_{ij} > 1$ . The farmer groups would have achieved equal allocative efficiency if  $W_{i1} = W_{i2}$ . To show the extent to which a particular resource should be increased or reduced from the current level of use in order to achieve maximum allocative efficiency, we evaluate the following formula:  $K_{ij} = (1-W_{ij})100$  (8)

Where  $K_{ij}$  is the percentage by which the level of use of a particular resource should be increased or decreased to achieve the objective of maximum allocative efficiency. A negative  $K_{ij}$  implies that an increased employment of the resource is required and vice versa. If  $K_{ij} = 0$ , then absolute allocative efficiency has been achieved.

The analysis of variance was used to test the significance for the mean output of rice from the production systems. It is given by:

$$F_{cal} = \frac{\{\sum n_j (\bar{Y}_j - \bar{Y})^2\} / (K-1)}{\{\sum \sum (Y_{ji} - \bar{Y}_j)^2\} / (N-k)} \quad (9)$$

where,  $\{\sum n_j (\bar{Y}_j - \bar{Y})^2\} / (K-1)$  = estimated variance from "between" the mean,

$\{\sum (Y_{ji} - \bar{Y}_j)^2\} / (N-k)$  = estimated variance from "within" the samples,  $\bar{Y}$  = mean output from the  $j$ th production system

$\bar{Y}$  = mean output from the production systems (pooled sample mean)

$Y_{ij}$  = individual output of the farmers in the  $j$ th production system

$K$  = number of production systems

$n_j$  = number of farmers in the  $j$ th production system

$N = \sum n_j$  = total number of farmers

Decision rule: If  $F_{cal} < F_{tab}$ , accept the null hypothesis i.e we accept that the means are not significantly different, otherwise reject the null hypothesis.

## RESULTS AND DISCUSSION

### Technical efficiency of upland and swamp rice farmers

The estimated production function of the upland and swamp rice farmers is presented in Table 1. The intercept, hired labour, other inputs, capital inputs, intercept shift dummy, slope shift dummies for farmland and capital are significant at 1 percent; farmland is significant at 5 percent while slope dummies for other inputs and hired labour are significant at 10 percent. It has an R<sup>2</sup> value of 0.9525 which implies that 95.25 percent of the variation in output is explained by the independent variables.

That the coefficient of the intercept shift dummy is statistically significant at 1 percent implies that a shift in technology exists between the upland and swamp rice farmers. The positive sign of this coefficient implies that there is a shift in neutral technical efficiency parameter to a higher level for the upland rice farmers. This group of farmers has therefore achieved higher technical efficiency. This conclusion conforms to the findings from Onyenweaku (1994) and Nwaru (2003).

The slope shift dummies for farmland, hired labour, other inputs and capital inputs are statistically significant, implying a difference in the slope shift coefficients of these resources. This means that the upland and swamp farmers are characterized by factor-biased or non neutral production functions. Hence, both groups of farmers are characterized by different production functions. Furthermore, the slope shift dummies for other inputs and capital inputs are negative which implies a higher level of use intensities of these resources by the swamp rice farmers while those for

farmland, family labour and hired labour are positive indicating lower use intensities of the resources by the swamp rice farmers. The implication is that the swamp farmers can improve on their performance by increasing their level of use intensities of other inputs and capital inputs and reducing their level of use intensities of farmland, family labour and hired labour.

### **Technical efficiency inland valley and swamp rice farmers**

The estimated production function for the inland valley and swamp rice farmers are summarized and presented in Table 2. The coefficient of multiple determination ( $R^2$ )

was 0.9146 which implies that 91.46 percent of the variation in rice output, is accounted for by the independent variables. The F-ratio is significant at 1 percent which attests to the overall significance of this estimated function. Farmland, hired labour, other inputs and capital inputs were significant and positive. The implication is that increase in their utilization would lead to increase in rice output. The intercept dummy is statistically insignificant implying that no shift in technology exists between the inland and swamp rice farmers. Both groups of farmers have equal technical efficiency and have the same production function.

### Technical efficiency inland valley and upland rice farmers

The estimated production function for the inland and upland rice farmers is presented in Table 3. The intercept shift dummy is statistically significant at 1 percent implying that a shift in technology exists between the inland valley and upland rice farmers. Moreover, the intercept dummy has a negative coefficient.

Table 3: Estimated production function for upland and inland valley farmers

Variable	Parameter	Coefficient	t-value
Intercept	A0	6.047	5.14***
Farmland	A1	0.840	5.99***

\*\*\*, \*\*, \* statistically significant at 1, 5 and 10 percent respectively.

The slope dummies for farmland and other inputs are statistically significant at 1 percent. This means that the inland and upland farmers are characterized by factor biased or non neutral production functions. There is a lower level of use intensity of farmland by the inland valley farmers and higher use intensities of family labour, hired labour, other inputs and capital inputs by them. The result shows that ample opportunities exist for the farmers to increase their productivity and income through improvements on their technical efficiency. This can be achieved by putting in place policies that will enable them to increase their use of those resources currently at lower levels of use intensities and vice versa.

### Allocative efficiency of the farmers in the production systems

The estimated production functions of the inland valley, upland and swamp farmers were summarized and presented in Table 4. This Table indicates that 84.69 percent, 96.10 percent and 94.71 percent of the variations in rice output in inland valleys, upland swamp farms respectively were explained or accounted for by the independent variables. The F – ratio is significant which attests to the overall significance of the regression result. This implies that the data fit the model and that the independent variables are important explanatory factors of the variations in rice output. All the variables were significant for the upland farm while farmland, other inputs and capital were significant for the inland valley rice farmers. Only hired labour was insignificant for the swamp rice farmers.

\*\*\*, \*\*, \* = Statistically significant at 1, 5 and 10 percent respectively.

From the coefficients in Table 4, the allocative efficiency indices were derived and presented in Table 5. This Table depicts that none of the three farmer groups achieved absolute allocative efficiency in the use of farm resources. The upland farmers are the least allocatively efficient with respect to all the farm resources. This farmer group under-utilized all the farm resources; that is they used less than the profit maximizing level. The inland valley rice farmers achieved their best allocative efficiency in the use capital inputs while the swamp farmers achieved their best allocative efficiency in the use of hired labour. The inland and swamp rice farmers under-utilized farmland, other inputs and capital. The swamp rice farmers over-utilized hired labour. To achieve maximum allocative efficiency and hence maximum profit, policies and programmes that would enable the inland farmers increase their use of farmland, other inputs and capital inputs by 978.3 percent, 655.0 percent and 188.9 percent respectively should be put in place. Such policies and programmes should help the upland farmers to increase their use of farmland, family labour, hired labour, other inputs and capital inputs by 3097.2 percent, 186950.6 percent, 497751.6 percent, 734588.9 percent and 9257077.5 percent respectively. It

should equally enable the swamp farmers to increase their use of farmland, other inputs and capital inputs by 163.9 percent, 159.2 percent and 2424.8 percent respectively and reduce their use of family and hired labour by 107.5 and 152 percents respectively.

Table 5: Allocative efficiency indices of the farmer groups

NS = not significant

### Returns to scale of the farmers in the production systems

The elasticity of production for the farmers in the production systems from which their returns to scale were derived are presented in Table 6. It shows that none of the defined farmer groups is operating at constant returns to scale. Farmers in the different production systems are operating at increasing return to scale ( $\sum E_p > 1$ ), suggesting that they are operating in region one of the total product curve which is an irrational region to rest production. The implication is that they can improve on their productivity by increasing their overall employment of farm resources.

Table 6: Elasticity of production of the farmers based on the production systems

Variable	Inland	Upland	Swamp
Farmland	0.273	0.840	0.068
Family labour	0.040	277.641	-0.011
Hired labour	0.044	645.651	0.106
Other inputs	0.671	735.412	0.221
Capital inputs	0.112	3386.920	0.764
$\sum E_p$	1.14	5046.464	1.148

Source: computed from survey data, 2005

### Mean output of rice from the production systems

The test of significance in the mean output of rice from the production systems was realized through analysis of variance (ANOVA) and the result is presented in Table 7. The table revealed the calculated F – value was 2.074 and the tabulated value, 3.00. Therefore, since the calculated F- value was less than the tabulated value ( $F_{cal} < F_{tab}$ ), the null hypothesis is accepted. Hence there is no significant difference in the mean output of rice from the various production systems.

Table 7: ANOVA test of significance in the output of rice by production systems

### CONCLUSION

Results indicate that the upland rice farmers are technically more efficient than the swamp and inland rice farmers and that there is no difference in technical efficiency between the swamp and inland rice farmers. Furthermore, resources were poorly allocated by these rice farmers in each of the production systems: inland valleys, upland and swamp environments. None of the farmer groups achieved absolute allocative efficiency. There was no significant difference in the mean output of rice from the production systems; upland, inland valley and swamp while each operated in region one on the production surface indicating that overall, resource levels could be increased to achieve higher levels of productivity in each system.

Therefore, economic policies and programmes that could encourage the reallocation and if possible the redistribution of farm production inputs for increased farm productivity and efficiency should be put in place. Such policies should be appropriate enough to grant rice farmers increased access to farmland. They should enable them employ the use of more farm resources since there is increasing return to scale, be targeted more at the upland rice farmers and seek opportunities for exploring the swamp and inland valleys more.

**Abstract:** Machine Learning and Data Mining are applied to language datasets in order to discover patterns for English and other European languages; Arabic language belongs to the Semitic family of languages which differs from European languages in syntax, semantic and morphology. One of the difficulties in Arabic language is that it has a complex morphological structure and orthographic variations. This study is conducted to examine knowledge discovery from AL-Hadith through classification algorithm in order to classify AL-Hadith to one of predefined classes (books), where AL-Hadith is the saying of Prophet Mohammed (peace and blessings of Allah be upon him) and the second religious source for all Muslims, so because of its importance for Muslims all over the word knowledge discovery from AL-Hadith will make AL-Hadith more understandable for both Muslims and nonmuslims. [Journal of American Science 2010;6(11):409-419]. (ISSN: 1545-1003).

**Keywords:** AL-Hadith, classification, stem, feature, class, expansion, training set.

## 1. Introduction

Information Retrieval (IR) is the discipline that deals with retrieval of unstructured data, especially textual documents, in response to a query, which may itself be unstructured like sentence or structured like Boolean expression. The need for effective methods of automated IR has grown in the last years because of tremendous explosion of the amount of unstructured data (Greengrass, 2000).

Text mining is a class of what is called nontraditional (IR) strategies (Kroeze, et al., 2003). The goal of these strategies is to reduce the required effort from users to obtain useful information from large computerized text data sources. Also text classifications is a subfield of data mining which refers generally to the process of deriving high quality of information from a text, which is typically derived through the dividing of patterns and trends through methods such as statistical pattern learning.

However; text classification is one of the most important topics in the field of natural language processing, where the purpose of its Algorithm is to assign each document of text dataset to one or more pre-specified classes. More formally if  $d_i$  is a document of set of documents D and  $\{c_1, c_2, \dots, c_n\}$  is The set of all classes, then text classification assigns one category  $c_j$  to a document  $d_i$  and in multi-subjects classification  $d_i$  can be assigned to more than one class from a set of classes.

Text classification techniques are used in many applications, including e-mail filtering, mail routing, spam filtering, news monitoring, sorting

through digitized paper archives, automated indexing of scientific articles, classification of news stories and searching for interesting information on the web (Khreisat, 2006).

Also, an important research topic appears in this field called Automatic text classification (ATC) because of the inception of the digital documents. Today, ATC is a necessity due to the large amount of text documents that users have to deal with (Duwairi, 2006).

According to the growth of text documents and Arabic document sources on the web, information retrieval becomes an important task to satisfy the needs of different end users; while automatic text (or document) categorization becomes an important attempt to save human effort required in performing manual categorization.

In this paper, a knowledge discovery algorithm for AL-Hadith is proposed in order to classify it to one of predefined classes (books), this algorithm consists of two major phases; the training phase and Classification phase. Experiments will be conducted on a selected set of AL-Hadith from Al-Bukhari book, where thirteen books were chosen as classes in order to run these experiments. The evaluation of the proposed algorithm is carried out by comparing its results to Al-Bukhari classification.

This paper is organized as follows; related work is represented in section 2, while section 3 represents the proposed classification system, and section 4 analyze experiments and results, finally section 5 demonstrates conclusion.

## 2. Related Work

Most of nowadays classifiers were built for English or European languages. For example, Zhang (2004) builds a Naïve Bayes (NB) classifier, which calculates the posterior probability for classes then the estimation is based on the training set that consists of pre-classified documents, in his system testing phase the posterior probability for each class is computed then the document is classified to the class that has the maximum posterior probability.

Isa, et al. (2008) explore the benefits of using enhanced hybrid classification method through the utilization of the NB classifier and Support Vector Machine (SVM). While Lam, et al. (1999) built a neural network classifier addressing the classifier drawbacks and how to improve its performance.

Bellot, et al. (2003) propose an approach that combines a named entity recognition system and an answer retrieval system based on Vector Space model that uses some knowledge bases, while Liu, et al. (2004) focus on solving the problem of using training data set to find representative words for each class, also (Lukui, et al. 2007) explore how to improve the executing efficiency for classification methods.

On the other hand, Yu-ping, et al. (2007) propose a multi-subject text classification algorithm based on fuzzy support vector machines (MFSVM).

In the Arabic language field, AL-Kabi, et al. (2007) present a comparative study that represents the efficiency of different measures to classify Arabic documents. Their experiments show that NB method slightly outperforms the other methods, while AL-Mesleh (2007) proposes a classification system based on Support Vector Machines (SVMs), where his classifier uses CHI square as a feature selection method in the pre-processing step of text classification system procedure.

El-Halees (2006) introduces a system called ArabCat based on maximum entropy model to classify Arabic documents, and Saleem et al. (2004) present an approach that combines shallow parsing and information extraction techniques with conventional information retrieval, while Khreisat (2006) conducts a comprehensive study for the behavior of the N-Gram Frequency Statistics technique for classifying Arabic text document.

Hammo, et al. (2002) design and implement a Question Answering system called QARAB.EL-Kourdi, et al. (2004) build an Arabic document classification system to classify non-vocalized Arabic web documents based on NB algorithm, while AL-Kabi, et al. (2005) represent an automatic classifier to classify the verses of Fatiha and Yaseen Chapters to predefined themes, where the system is based on

linear classification function (score function), and (Hammo, et al. 2008) discuss the enhancement of Arabic passage retrieval for both diacritized and non-diacritized text, they propose a passage retrieval approach to search for diacritic and diacritic-less text through query expansion to match user's query.

## 3. Proposed Classification System

The proposed system consists of four phases; first one is the preprocessing phase. Second phase is the training phase where the learning database is constructed which contains the weights of features representing a class. The input for this phase is a set of pre-classified documents. Third phase is the classification phase in which the resulted training database of previous phase is used with the classification method to classify targeted Hadith, also a query expansion occurs in this phase. Finally, data analyzing and evaluation phase. These phases are shown in figure 1.

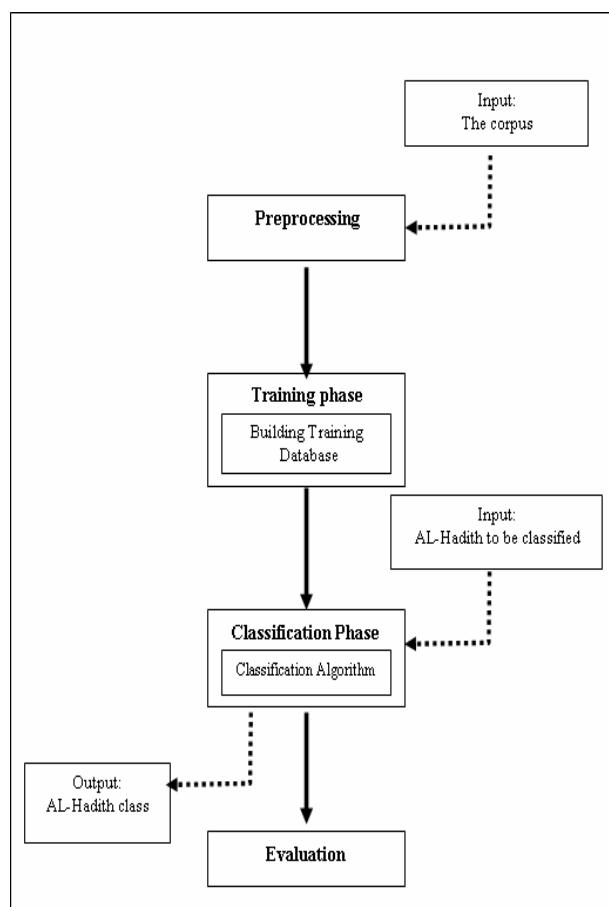

Figure 1. An overview of proposed system phases.

We can define the corpus that contains a set of Ahadith (plural of AL-Hadith) as in definition 1. Figure 2 shows an example of Hadith from the book of food that will be used in the illustration of each step of the proposed system.

## **Definition 1: Corpus Definition**

Suppose corpus  $\mathbf{C} = \{H_1, H_2, H_3, \dots, H_n\}$ . Where  $H_i$  represents the  $i$ th tested Hadith in  $\mathbf{C}$ ,  $n$  is the number of tested Hadith in the  $\mathbf{C}$  and  $i: 1.....n$ .

Suppose  $\mathbf{H}_j = \{w_1, w_2, w_3, \dots, w_m\}$ . Where  $w_d$  represents the  $d$ th word in AL-Hadith  $\mathbf{H}_j$ ,  $m$  is the number of words in  $\mathbf{H}_j$  and  $d: 1 \dots m$ .

حدثى إسحاق بن إبراهيم: أخبرنا روح بن عبادة: حدثنا ابن أبي ذئب، عن سعيد المقيرى، عن أبي هريرة رضى الله عنه:

انه من بقوم بين ابييهم شاه مصلينه، قد عوه، فابي ان يأكل و قال:  
خرج رسول الله صلى الله عليه وسلم من الدنيا ولم يشبع من خبر  
الشاعر.

Figure 2. Example of AL-Hadith from the book of food.

### 3.1 Preprocessing Phase

In this section the preprocessing techniques are introduced, preprocessing will be conducted on each Hadith used in the training and testing sets. This stage is necessary before the classification phase can be applied to discover knowledge from AL-Hadith and it consists of several sub phases:

1. **Removing Sanad:** this process is done manually and aims to remove Sanad which is a part of

AL\_Hadith that refers to the chain of names of persons who have transmitted AL-Hadith.

2. **Tokenization:** which aims to divide AL\_Hadith into tokens (words); AL-Hadith tokenization was easily resolved since each token can be identified as a string of letters between white spaces.
  3. **Removing punctuation and diacritical marks:** removing diacritical and punctuation marks is important since those marks are prevalent in Ahadith and have no effect on determining AL\_Hadith class.
  4. **Removing stop words:** Stop words are words that found in AL-Hadith and have no discriminative meaning (AL-Kabi, et al., 2005). In the proposed system a list of stop words is built manually, it consists of Arabic pronouns, prepositions, names of people (companions of Prophet Mohammed) and places were mentioned in AL-Hadith corpus. After removing stop words from AL\_Hadith, the remaining words (terms) are considered as features.
  5. **Stemming:** In this step the stems of features are extracted, stem extraction implemented is considered as light stem extraction which depends on removing some prefixes or suffixes from the word to relate the word to its stems, we used the stemming algorithm proposed by (Al-Serhan, et al., 2003). The result of stem extraction was filtered to eliminate the incorrect stems (roots less than three characters). The resulted stems will be used in the query expansion process which will be discussed in details in section 3.3.2, Table 1 shows all steps of preprocessing for AL-Hadith that is presented in figure 2.

Table1. Results of preprocessing phase steps for AL-Hadith in figure 2

Step	Result of the step
Removing Sanad	أنه من بقوم بين أيديهم شاة مصلية، فدعوه، فلبي أن يأكل وقال: خرج رسول الله صلى الله عليه وسلم من الدنيا ولم يشبع من خيز الشعير.
Tokenization	{“أنه”, “من”, “يقوم”, “بين”, “أيديهم”, “شاة”, “مصلية”, “،”, “فدعوه”, “،”, “فلبي”, “أن”, “يأكل”, “وقال”, “:”, “خرج”, “رسول”, “الله”, “صلى”, “الله”, “عليه”, “ وسلم”, “من”, “الدنيا”, “ولم”, “يشبع”, “من”, “خيز”, “الشعير”, “.”}.
Removing Punctuation and Diacritical Marks	{ انه ، من ، بقوم ، بين ، ايديهم ، شاة ، مصلية ، فدعوه ، فابي ، ان ، يأكل ، وقال ، خرج ، رسول ، الله ، صلى ، الله ، عليه ، وسلم ، من ، الدنيا ، ولم ، يشبع ، من ، خيز ، الشعير }
Removing Stop Words	{ من ، بقوم ، ايديهم ، شاة ، مصلية ، فدعوه ، فابي ، يأكل ، خرج ، الله ، صلى ، عليه ، وسلم ، الدنيا ، يشبع ، خيز ، الشعير }
Stemming (valid stems)	{ ايدي ، دنيا ، شعير }

### 3.2 Training Phase

Supervised classification exploits the predefined training documents that belong to specific class to extract the features which represent a class. Therefore, every class will have a feature vector representing it, and then these features will be reduced using one of the features selection techniques. Feature vectors will be used later by the classification algorithm in the testing phase.

Supervised classification has its difficulties; one main problem is how to be sure that trained document actually belongs to a specific class. In this study this problem is resolved by conducting it on a set of Ahadith that has been classified by the famous AL-Hadith scientist AL-Bukhari who gave us a good base to evaluate the proposed algorithm.

Training phase consists of two main stages; first one is executed once to produce Inverse Document Frequency (IDF) matrix for the corpus while the second one is executed for each training set.

#### 3.2.1 Corpus IDF Matrix

After conducting the preprocessing phase a list of features for each Hadith in the corpus is

produced that will be used in the classification process. Building the IDF matrix for AL-Hadith corpus is done only one time and it will be used in the classification process every time the IDF value for a feature is needed. The IDF value for a given feature is computed according to equation (1).

$$\text{IDF}_i = \log \left( \frac{N}{DF_i} \right) \quad (1)$$

Where

N: number of Ahadith in the corpus.

DF<sub>i</sub>: Number of Ahadith in the corpus containing feature i.

Fewer documents containing a given feature will produce a larger IDF value and if every document in the collection contains a given feature, feature IDF will be zero, in other words the feature which occurs in every document in a given collection is not likely to be useful for distinguishing relevant from non-relevant documents. Table 2 shows the IDF matrix structure.

Table 2. Corpus IDF matrix.

Feature	Pre-defined Classes(Books)					
	Book1	Book2	Book3	....	Bookc	Feature redundancy
Feature1	Log (N/DF <sub>1</sub> )	log (N/DF <sub>1</sub> )	log (N/DF <sub>1</sub> )	.....	log (N/DF <sub>1</sub> )	([DF <sub>1</sub> ]/N)*100
Feature2	Log (N/DF <sub>2</sub> )	log (N/DF <sub>2</sub> )	log (N/DF <sub>2</sub> )	.....	log (N/DF <sub>2</sub> )	([DF <sub>2</sub> ]/N)*100
Feature3	Log (N/DF <sub>3</sub> )	log (N/DF <sub>3</sub> )	log (N/DF <sub>3</sub> )	.....		
Feature4	Log (N/DF <sub>4</sub> )	log (N/DF <sub>4</sub> )	log (N/DF <sub>4</sub> )	.....		
Feature5	Log (N/DF <sub>5</sub> )	log (N/DF <sub>5</sub> )	log (N/DF <sub>5</sub> )	.....		
.....				.....		
.....				.....		
.....				.....		
.....				.....		
Feature <sub>n</sub>	Log (N/DF <sub>N</sub> )	log (N/DF <sub>N</sub> )	log (N/DF <sub>N</sub> )	.....	log (N/DFc)	([DF <sub>n</sub> ]/N)*100

#### 3.2.2 Weight calculations for training sets features

The proposed system depends on using a set of Ahadith as training documents to extract representative words for each book (class) and compute their weights. The weight of a given feature in a given document is calculated as (TF×IDF) because this weighting schema combines the importance of TF and IDF at the same time, and the features training weights is computed according to equation (2).

$$TW_{bi} = TF_{bi} \times IDF_i \quad (2)$$

Where:

TW<sub>bi</sub>: feature i training weight in training set b.

TF<sub>bi</sub> : feature i frequency in training set b.

IDF<sub>i</sub>: feature i inverse document frequency calculated earlier (IDF matrix).

Features that will be considered to include their weights in training weights must satisfy the feature redundancy threshold 45, that's mean that feature redundancy must be less than 45.

Table 3 shows training weights for features in the training set b in general, while Table 4 shows training weights for features in a training set from the book of food.

Table3.Training weights for features in training set b.

Feature	IDF	TF	Bookb
			TW
Feature1	IDF1	TF <sub>b1</sub>	$TW_{b1} = TF_{b1} * IDF1$
Feature2	IDF2	TF <sub>b2</sub>	$TW_{b2} = TF_{b2} * IDF2$
Feature3	IDF3	TF <sub>b3</sub>	$TW_{b3} = TF_{b3} * IDF3$
Feature4	IDF4	TF <sub>b4</sub>	$TW_{b4} = TF_{b4} * IDF4$
.....			
Feature n			$TW_{bn} = TF_{bn} * IDF_n$

Table 4. Training weights for features in a training set from the book of food.

The book of food (training set No.1)			
Feature	IDF	TF	TW
يأكل	1.80	8	14.39
الدنيا	1.84	1	1.84
شاة	1.97	4	7.90
مر	2.12	1	2.12
ابدفهم	2.22	1	2.22
خنز	2.34	4	9.37
فألى	2.42	1	2.42
الشعير	2.52	2	5.04

### 3.3 Classification Process

The classification process consists of four steps as shown in Figure 3. First step is computing query weights where feature's weight in targeted AL-Hadith is found. Second step is the expansion process where the stems are used to expand the query. Third step is calculating the similarity coefficient for each feature in AL-Hadith to be classified, and the final step is finding the cumulative similarity for AL-Hadith over the predefined classes (books).

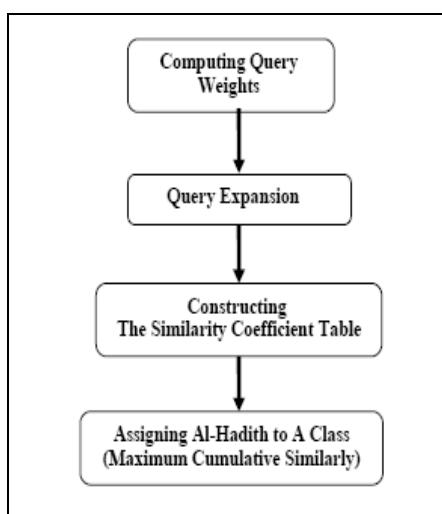

Figure 3.Classification process steps

#### 3.3.1 Computing Query Weights

A feature weight in the query (specific Hadith) is calculated according to equation (3) :

$$Q_h W_i = T F_{hi} \times I D F_i \quad (3)$$

Where:

$Q_h W_i$ : feature i weight in AL-Hadith h (Hadith to be classified).

$T F_{hi}$  : feature i frequency in AL-Hadith h

$I D F_i$  : inverse document frequency calculated by equation (1).

Query weights as shown in Table 5 will be computed for each feature in AL-Hadith to be classified. Feature frequency (TF) depends on AL-Hadith features occurrence while Inverse document frequency (IDF) is a global value referenced from IDF matrix.

Table 5. Query weights table for mined Hadith

#	Feature	IDF	Feature Redundancy	TF	QW
1	الدنيا	1.84	1.44	1	1.84
2	الشعير	2.52	0.30	1	2.52
3	الله	Feature redundancy >45	80.02	2	0
4	ابدفهم		0.61	1	2.22
5	يقوم	2.64	0.23	1	2.64
6	خنز	2.34	0.45	1	2.34
7	خرج	1.53	2.95	1	1.53
8	شاة	1.97	1.06	1	1.97
9	صلى	Feature redundancy >45	68.89	1	0
10	فابى		0.38	1	2.42
11	فدعوه	3.12	0.08	1	3.12
12	مر	2.12	0.76	1	2.12
13	مصلبة	3.12	0.08	1	3.12
14	وسلم	Feature redundancy >45	68.58	1	0
15	يأكل		1.59	1	1.80
16	يسبع	2.64	0.23	1	2.64

#### 3.3.2 Query Expansion

The process of query expansion depends mainly on using the stems of features to expand the searching area. The stems for all features in the training set and AL-Hadith to be classified were produced in the preprocessing phase.

In the expansion process the newly added stems in the expanded training set will have the same weights for its origin feature. In other words, if we have the couple  $\{(W, S), (W, TW)\}$  where S is the stem of word W and TW is the training weight for W

from the training weights Table then the weight for stem S will be the same weight of W.

The same procedure is applied to stems in expanding the query set where stem S will have the same weight of its origin word W from the query weight Table. The extended query weights for AL-Hadith sample are shown in Table 6.

Table 6. Extended query weights table for mined Al-Hadith

#	Feature	IDF	Feature Redundancy	TF	QW
1	الدنيا	1.84	1.44	1	1.84
2	الشاعر	2.52	0.30	1	2.52
3	الله		Feature redundancy >45	80.02	0
4	ابدیهم	2.22		0.61	1
5	بقوم	2.64		0.23	1
6	خنز	2.34		0.45	1
7	خرج	1.53		2.95	1
8	شاة	1.97		1.06	1
9	صلی		Feature redundancy >45	68.89	0
10	فابی	2.42		0.38	1
11	福德عوه	3.12		0.08	1
12	مر	2.12		0.76	1
13	مصلیة	3.12		0.08	1
14	وسلم		Feature redundancy >45	68.58	0
15	باکل	1.80		1.59	1
16	پشیع	2.64		0.23	1
17	دنیا		Feature No. 1		1.84
18	شاعر		Feature No. 2		2.52
19	ابدی		Feature No. 4		2.22

### 3.3.3 Constructing the Similarity Coefficient Table

In the proposed system the cosine similarity coefficient is used, where the similarity between two documents (document (D) & query (Q)) is actually the cosine of the angle (in N-dimensions) between the 2 vectors and can be calculated according to equation (4) (Baarah, 2007):

$$\text{sim}(D, Q) = \sum_{i=1}^n (w_{di} \times w_{qi}) \quad (4)$$

Where i denote the query feature and n is the number of feature in the query Hadith.

Table 7 shows similarity coefficient for features in the mined AL-Hadith in general, while Table 8 shows the similarity coefficient for features in AL-Hadith illustrated in figure 2 against the training set from the book of food shown in section 3.2.2.

Table 7: Similarity coefficient for features for mined Hadith in general.

Feature	Pre-defined Themes			
	Book1	Book2	...	Book13
Feature1	Sim1=Q <sub>b</sub> W <sub>1</sub> *T <sub>1</sub> W <sub>1</sub>			QbW <sub>1</sub> *T <sub>13</sub> W <sub>1</sub>
Feature2	Sim2=Q <sub>b</sub> W <sub>2</sub> *T <sub>1</sub> W <sub>2</sub>			QbW <sub>2</sub> *T <sub>13</sub> W <sub>2</sub>
Feature3	Sim3=Q <sub>b</sub> W <sub>3</sub> *T <sub>1</sub> W <sub>3</sub>			QbW <sub>3</sub> *T <sub>13</sub> W <sub>3</sub>
Feature4	Sim4=Q <sub>b</sub> W <sub>4</sub> *T <sub>1</sub> W <sub>4</sub>			QbW <sub>4</sub> *T <sub>13</sub> W <sub>4</sub>
Feature5	Sim5=Q <sub>b</sub> W <sub>5</sub> *T <sub>1</sub> W <sub>5</sub>			QbW <sub>5</sub> *T <sub>13</sub> W <sub>5</sub>
Feature <sub>n</sub>	Sim n=Q <sub>b</sub> W <sub>n</sub> *T <sub>1</sub> W <sub>n</sub>			
	$\sum_{i=1}^n \text{Sim}$			

### 3.3.4 Assigning AL\_Hadith to a class

After constructing the similarity coefficient table for AL-Hadith to be classified against the predefined classes, the cumulative similarity weights for mined Hadith will be found against each of those classes. The cumulative similarity values indicate common features between AL\_Hadith to be classified and the predefined books.

After finding the cumulative weight for the mined Hadith with correspondence to each predefined book (class), AL-Hadith will be assigned to the book with the maximum cumulative weight, because maximum cumulative weight is an indication of larger common features between the training set and the mined AL-Hadith feature set.

Table 8. Similarity coefficient for features in the example Hadith against training set from the book of food.

#	Feature	Similarity coefficient

#### 4. Experiments and Results

In this section, an overview is given for AL-Hadith corpus content that is used in this study to run the experiments of the proposed classifying algorithm, and details of experiments are also illustrated.

##### 4.1 Content of AL-Hadith Corpus

AL-Hadith corpus that is used in running the experiments consist of thirteen books (classes). Ahadith were taken from Sahih AL-Bukhari which is the most well known Hadith book all over the Islamic world and the most trusted Hadith book for researchers in this field. Twelve of those books were included in AL\_Kabi (2007) study while the Book of the (Virtues of the Prophet and His Companions) is added to the experiment in this study with 143 additional Ahadith.

Table 9 shows statistical information of books included in the experiments along with its name in English and Arabic as it was used by AL-Bukhari in his Sahih. The testing corpus has 1321 Hadith distributed over 13 books (classes).

##### 4.2 Classification Methods Applied to AL-Hadith Corpus

One of the researches in AL-Hadith classification field is done by (AL-Kabi, et al., 2007), in which AL-Kabi did not mention an accurate description of AL-Hadith corpus or the stop words they used in their experiments. Therefore , in this study an implementation for their classification algorithms was done also.

The following subsections represents in details the three methods have been implemented in this study.

**4.2.1.AL-Kabi method :** this method was proposed by AL-Kabi and his Colleagues on AL-Hadith classification(AL-Kabi, et al., 2007). This method is based mainly on using the stems of Ahadith words to calculate the IDF, the weighting of the feature in training phase and the classification phase.

**4.2.2. Word based classification (WBC):** this method uses the words of AL-Hadith after going through the preprocessing phase without stemming stage. The words occurrences after preprocessing are used in the calculation of IDF and in the weighting process. Stems of the words are not used in this method neither in building the training database nor in applying the classification algorithm.

**4.2.3. Stem expansion classification (SEC):** It is the proposed method in this study. In which words and stems are used. Words are used in IDF and features weight calculations for both training and query sets, but stems are used in query expanding process, the expansion process was discussed in details in section 3.3.2.

Table 9. List of books in AL-Hadith corpus

Book (Class)Name	اسم الكتاب	Doc No.	No. of distinct features after stop words removal
The Book of Faith	كتاب الإيمان	38	938
The Book of Knowledge	كتاب العلم	76	1946
The Book of Praying	كتاب الصلاه	115	2137
The Book of Call to Praying	كتاب الأذان	38	574
The Book of the Eclipse Prayer	كتاب الكسوف	24	715
The Book of Almsgiving	كتاب الزكاه	91	2267
The Book of Good Manners	كتاب الأدب	225	5258
The Book of Fasting	كتاب الصوم	107	1905
The Book of medicine	كتاب الطب	92	1895
The Book of Food	كتاب الطعام	91	1894
The Book of Pilgrimage (Hajj)	كتاب الحج	231	4885
The Book of Grievance	كتاب المظالم	40	906
The Book of the Virtues of the Prophet and His Companions	كتاب المناقب	143	3410

##### 4.3 Experiments Specifications

Hadith corpus that is used in this study consists of 1321 Hadith distributed over thirteen books (classes). The system is considered as supervised classification since training sets are used to apply learning algorithm to build the leaning database which will be used for the classification algorithm.

In the experiments author uses (90%) of each Ahadith class as training set while the rest (10%) of each class is used as testing set for the classification system. Of course, for each class the (10%) Ahadith in the testing set are not included in the training set or training phase calculations.

For each class five training - testing sets combination are chosen to run SEC algorithm, which means that for each class five separable experiments will be run, which gives variation for system testing.

It is important to mention that the same training - testing sets combination is used with the other two classification methods (AL-Kabi's,WBC) which is an important aspect to insure fair comparison among different methods against the proposed one.

#### 4.4 Performance Measurements

In order to demonstrate the efficiency of any classification algorithm measurements are needed to compare the proposed system's outcome with others. The most popular measurements in text classification algorithm are recall, precision and F-measure that are used in this study.

Recall and precision based on the concept of relevance. Precision is defined as the ratio of relevant documents retrieved to all documents retrieved while Recall is defined as the ratio of relevant items retrieved to all relevant items in a corpus.

There are obvious trade-off between recall and Precision. If the system retrieves all the documents in a corpus then the system will retrieve all relevant documents in the corpus, in this case the recall will be perfect.

On the other hand, since there are only small proportions of documents in a collection that are truly relevant to the given query, retrieving everything will give a very low precision (Greengrass, 2000).

Because of this trade-off between recall and precision a combination of good precision and good recall is needed. In the best case we would like to retrieve all the relevant documents and to discard non-relevant documents, this combination of recall and precision is found in F-measure (Harmonic mean).Precision, recall and F-measure are calculated according to equation presented by (Al-Mesleh, 2007) as follows

$$\text{Precision (P)} = A / (A + B).$$

$$\text{Recall (R)} = A / (A + C).$$

$$\text{F-measure (Harmonic mean)} = (2 \times P \times R) / (P + R)$$

The meaning of parameters used in recall and precision calculations are shown in Table 10.

Table 10. Recall and Precision Parameters.

System says...	In reality, the document is...	
	Relevant	Irrelevant
document is relevant	A	B
document is irrelevant	C	D

#### 4.5 Comparisons and Results Analysis

In this section we introduce the comparisons between SEC and the other two methods (AL-Kabi's and WBC), in order to show the preference of the proposed system over AL-Kabi's and WBC method.

##### 4.5.1 Stem Expansion vs. Word based classification

The proposed system (SEC) outperform WBC for 11 out of 13 books in precision, while WBS achieve better precision for The Book of Grievance and the book of Knowledge as shown in Figure 4 . This result is predicted because using the stem expansion phase gives a large morphology variation for the words that can resulted in retrieving more documents that belong in reality to other classes.

The proposed algorithm (SEC) overcomes the side effect of expanding the query using stemming, by the weighting strategy adopted, where stems in the expansion phase are giving the same weights of its original word in AL-Hadith.

SEC achieved precision value of 1 for The Book of Call to Praying and enhances the precision of 11 classes by 45% in average.

As shown in Figure 5 SEC achieves better F\_measure values for all classes against WBS method and enhances the F\_measure by 49% in average.

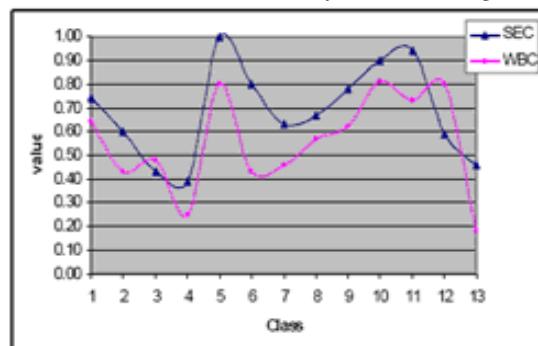

Figure 4. Precision comparison for stem expansion vs. word based classification.

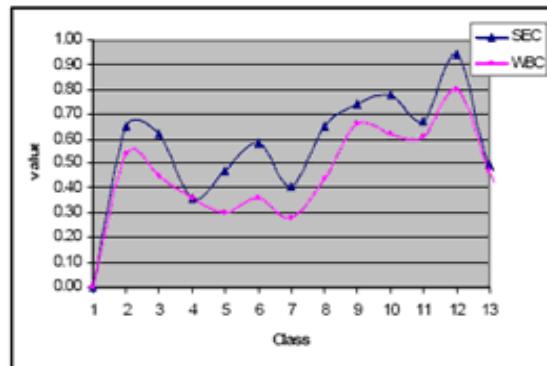

Figure 5. F\_measure comparison for stem expansion vs. word based classification.

#### 4.5.2 Stem Expansion vs. AL-Kabi Classification

After implementing AL-Kabi's method for the same training - testing sets used to examine SEC, comparisons are conducted as shown in Figure 6 and 7.

Figure 6 represents the precision graph of the two methods, where AL-Kabi's method achieved better precision for The Book of Knowledge and The Book of Grievance, while SEC out performed AL-Kabi's method in 11 out of 13 classes.

This behavior can be justified by the fact that those two books have small number of Ahadith and since the experiments are conducted on Ahadith in a closed domain (Sahih AL\_Bukhari), author believes that if those classes have a larger number of Ahadith the superb of SEC will appear.

In addition AL-Kabi used stems of words for term weighting in the preprocessing phase, which means that term frequency used in the training process was the number of the stems occurrence in the training set. In contrary, in SEC the words occurrences were used for the weighting process in preprocessing phase while the stems were used in the expansion process for both training and testing sets.

Since stem expansion is used for both training and testing sets in the proposed system, more non-related documents are presented to be retrieved, which justifying AL-Kabi's method achieves better precision for two classes out of thirteen classes . As Shown in Figure 7, SEC method outperformed AL-Kabi F\_Measure in all the 13 classes.

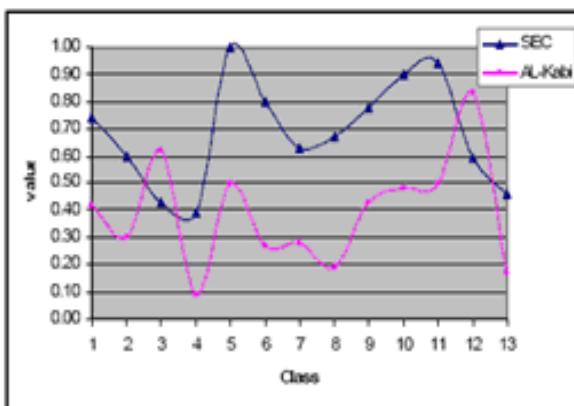

Figure 6. Precision Comparison for Stem expansion vs. AL-Kabi's classification

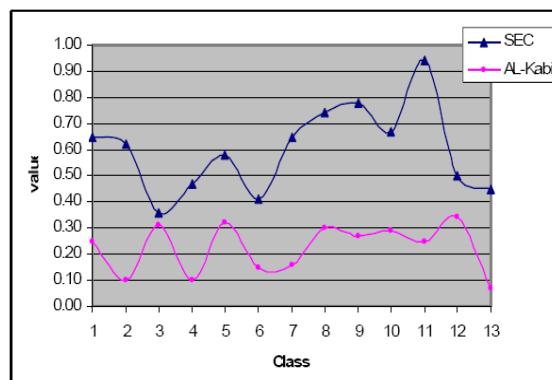

Figure 7. F\_Measure comparison for stem expansion vs. Al-kabi's classification.

#### 5. Conclusions

Arabic language is considered as one of the languages that will never distinguish and few researches were made on Arabic corpus linguistics. However, it is the official language of twenty Middle Eastern and African countries and is the religious language of all Muslims, regardless of their origin.

A classification method called Stem Expansion is proposed in this study, in order to discover knowledge from AL-Hadith by assigning each Hadith to one book (class) of predefined classes. SEC is considered as supervised classification method.

In this study a corpus containing 1321 ahadith from thirteen books from Sahih AL-Bukhari is selected and each Hadith is assigned to one class. Sahih AL-Bukhari is used as the base for deciding the correctness of classification results.

The results of the proposed system (SEC) are compared with the results of two other methods; one proposed by AL-Kabi and the other is word based classification technique (WBC). The comparison shows that SEC was better against WBC and AL-Kabi in recall for all classes while WBC and AL-Kabi achieve better precision for only two out of thirteen classes, and SEC achieves better F\_Measure for all the thirteen classes against the other two methods (WBC and AL-Kabi).

The results show that SEC performed better in classifying AL\_Hadith against existing classifications methods (WBC and AL-Kabi) according to the most reliable measurements (recall, precision, and F\_Measure) in text classification field.

**Abstract:** Field experiment was conducted in 2005/06 cropping season in Kombolcha to understand the comparative effect of organic and inorganic sources of soil ameliorant for managing surface soil crust under basin and furrow irrigation practices to boost potato production. A factorial experiment was conducted on plots of 12 m<sup>2</sup> (4 m x 3 m) and arranged in RCBD with three replicates, which combine irrigation methods and soil amendments. The treatments were the control (no amendment), FYM, *chat* residue (decayed leaves of *Chata edulis*) and sediment (sub surface inorganic material locally known as ‘decay dimma’). Results have, therefore, revealed that FYM and *chat* made compost significantly ( $p \leq 0.05$ ) improved moisture content, bulk density, porosity and infiltration rate over the sediment amended plot and the control. However, yield harvested from plots, which were amended with *chat*-made compost was significantly ( $p \leq 0.05$ ) lower than FYM under furrow irrigation practice. [Journal of American Science 2010;6(11):420-425]. (ISSN: 1545-1003).

**Keywords:** Chata edulis, decay dimma, organic amendment, potatoes, soil properties, irrigation

## Introduction

The total area of land under *chat* cultivation in Ethiopia, in the year 1997/98 was estimated at 78,570 hectare (Central Statistics Authority, 1997/98). In Oromiya region, mainly East and West Hararghe zones are the most important centres of *chat* production (East Hararghe zone alone contributes 53.4% of the total production area) in Ethiopia (Dechassa, 2001). It can be grown rain fed and/or irrigated and the crop could be planted both in home garden and in the field. Tremendous quantity of the *chat* residue is left after consumption as solid waste material, which is readily available in various states of decomposition at dumping site near farmlands, around homestead and along the roadside on the way from Aweday town to Harer.

Continuous harvesting of *chat* exhausts and debilitates the mother plant unless fertilizer is used to maintain soil fertility. Manure is applied on *chat* every year based on the availability of manure or compost. Farmers prefer organic fertilizers (manure and compost) as compared to inorganic (chemical) fertilizers. The volume of manure available is limited and too scarce to satisfy the needs of farmers. Thus, farmers in Hararghe prepare their own compost and use this to improve soil fertility. Farmers usually use both organic and inorganic fertilizers to improve the soil fertility status whenever they grow cash crops. In addition, subsurface sediment, which is unintentionally added into irrigated land, is regarded by farmers as soil ameliorant. This ameliorant is

formed from as alluvial deposition at the sub-surface soil layer. It is mainly drawn from hand dug wells in the form of water suspension while pumping is taking place. Based on the farmers' experience the sediment has improved fertility of the soil as well as the structure of the soil (Pers. Comm.).

## Materials and Methods

The study was conducted in 2005/6 in Kombolcha, which is located 542 km east of Addis Ababa with an altitude between 1200 and 2460 masl, Latitude 42° 07' 0" E and Longitude of 9° 25' 60" N.

### 3.1 Bulk density, porosity and moisture content determination

Determination of dry bulk density and porosity was made for the profile pit, which was opened on the irrigated at the depths (0-15, 15-30, 30-45 and 45-60 cm) by using core samplers (diameter = 3.75 cm; height = 5 cm). Similarly, samples were taken in treatment-wise from depth plowing depth (0-30 cm) using the same core samplers to check the treatment effect on bulk density and total porosity. And the soil moisture content was determined using gravimetric method.

### 3.2 Experimental design and layout

The field experiment was conducted in 2005/6 during the normal growing season (Jan – mid April) for potato under irrigation practice and treatments were arranged in RCBD, with three replicate and eight treatments ( $4 \times 2$  factorial experiments). Each form of treatment was applied on plot size of  $12 \text{ m}^2$  [3

$\text{m} \times 4 \text{ m}]$  and the inter block and between plot spacing was 1 m and 0.5 m, respectively (Fig 1). All plots were also designed for methods of basin and furrow irrigation practices. The experimental site was chosen as the land has been irrigated for more than a decade (Pers. comm.). It also represents the major soil type of the study area where vegetables are mainly grown.

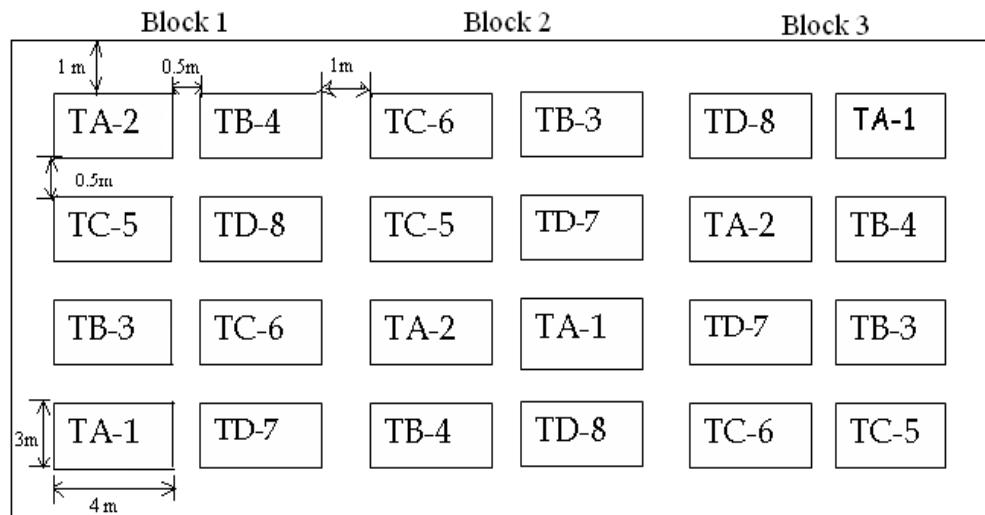

Fig 1. Layout of the field experiment

Under this experiment, two forms of organic compost were used as soil ameliorant (Farm Yard Manure (FYM) and *Chat* residue or decomposed leaves of *Catha edulis F.*) and sediment (inorganic material from subsurface soil, locally called ‘dicay dimma’ to mean ‘qey afer’). The latter was manually collected from hand dug-well, which is located at a distance of 75 m from the experimental site and is different from the source of irrigation water for the experiment. They were incorporated into the surface soil with rate (dry mass) of 1.5 ton/ha, 2.5 ton/ha and 1.3 ton/ha, respectively. The method of soil amendment was partly adopted from the existing farmers’ knowledge and experience. Description of the treatments is summarized in Table 1.

Table 1. Descriptions of treatment combinations

Treatment ID	Treatment combination	
	Surface soil crust management practices	Irrigation practices
TA-1	Control	Furrow
TA-2	Control	Basin
TB-3	FYM [chopped wheat straw and cattle dung]	Furrow
TB-4	FYM [chopped wheat straw and cattle dung]	Basin
TC-5	Residue of <i>chat</i> ( <i>Catha edulis F.</i> )	Furrow
TC-6	Residue of <i>chat</i> ( <i>Catha edulis F.</i> )	Basin
TD-7	Sediment [decay dimma]	Furrow
TD-8	Sediment [decay dimma]	Basin

All plots have also received equal amount of mineral fertilizer: DAP and urea with rate of 100 and 150 kg/ha, respectively; and half of the urea and full dose of DAP was applied at the time of sowing while the remaining amount of urea was top dressed just before the 3<sup>rd</sup> irrigation cycle.

On the field experimental plots, tuber seed of same variety (*Solanum tuberosum L.*) was sown with rate of 2 and 1.67 ton/ha under the basin and furrow irrigation practices, respectively. Each furrow plots had four ridges and sowing was done along the shoulders of two rows of the middle ridges in staggered arrangements while the remained were planted up on the inward side of the two border ridges. In both cases the planting was made at 0.4 m spacing. On the other hand, the basin plots were sub-divided into two equal sections for ease of water management. The main water channel, which is 0.5 m wide, was designed in a row along with the replication where as inlet channels between the experimental plots. The mode of water application and the amount of water was based on the existing irrigation practices by using engine pump as water lifting device from the hand dug well. At each irrigation cycle, roughly flow rate of 2.25 lit/sec that usually preferred by farmers, was allowed to irrigate both the furrow and basin plots for equal time (105 sec per plot). In the case of furrow irrigation practice, the furrow-flow was diked at the end to check the outflow.

## Results and Discussions

### 4.1 Growth response

Both the soil amendment and irrigation practices have a significant effect on the average plant height when measured at the flowering stage. Based on mean comparison, plants grown over plots, which were amended with FYM and *chat* residues, were significantly taller than those from the control plots under basin irrigation practices. The shortest average plant height was recorded from the control plot under furrow irrigation practice (Fig. 2). However, no significant difference was obtained from plots, which were amended with sediment and *chat* residues under the same irrigation practice. Similarly, those which have been raised over FYM amended plots were significantly taller than those from the other treatments under furrow irrigation practices.

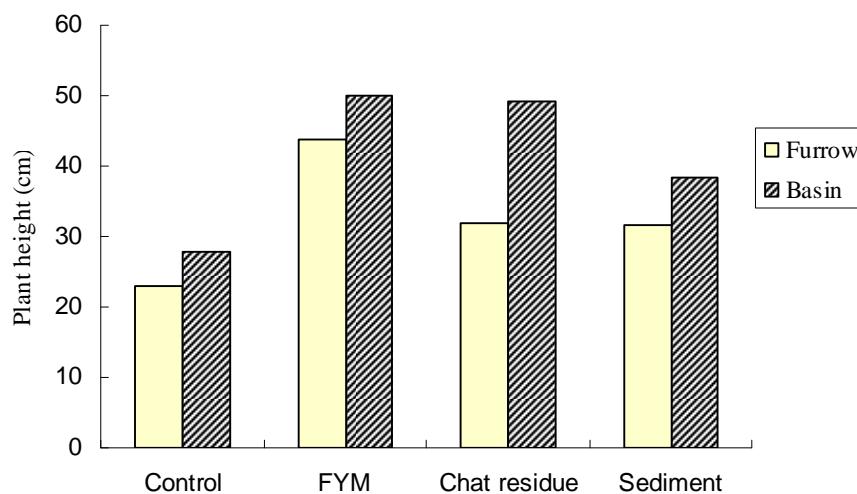

Fig 2. Treatment effect on growth of plant height

In general, those plants which have been grown under basin irrigation practices were more vigorous than plants from furrow irrigation. This may be due to the fact that plants over the furrow ridges relatively bears more roots than shoots in search of soil moisture as more proportion of the applied water is deep percolated (FAO, 1985).

The number of tubers per plant was not affected by the irrigation practices as well as the soil ameliorants. Based on mean comparison, all the treatment combinations had no any significant effect on the number of tubers per plant. Similarly, the mean comparison revealed that soil amendment practice has no significant effect on individual tuber weight with in each irrigation practice while more tuber weight was obtained from FYM amended plots. On the other hand, the irrigation practice had significant effect on individual tuber weight from which more weight was recorded from plots, which were managed under basin irrigation practices. The crops which have been grown under basin irrigation practices produce larger tubers than those from furrow irrigation practices while considering all the management practices.

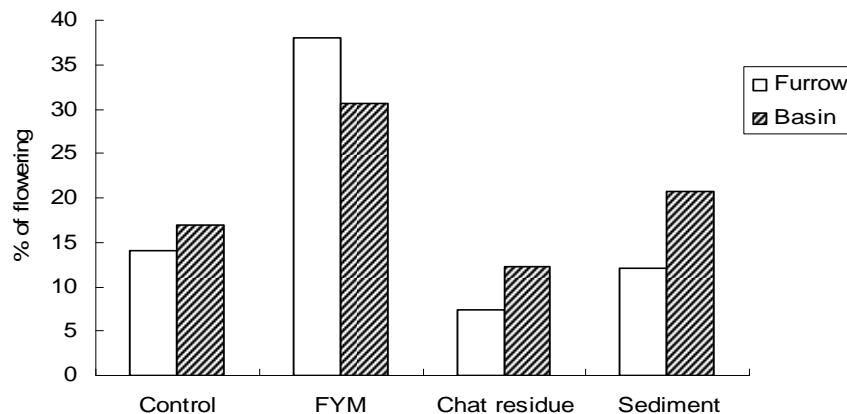

Fig 3. Effect of soil amendment on percent of flowering

Unlike the type of irrigation practice, the crust management practices have a significant effect on the rate of flowering. Based on mean comparison, plants raised over FYM amended plots were significantly effective to bear flower under both irrigation practices (Fig 3). They bear 80 to 60 % more flowering than those which have grown over plots amended with *chat* residue under the furrow and basin irrigation practices, respectively. However, there was no significant difference among the control, sediment and *chat* residue under both irrigation practices. In spite of the fast growth in height of plants which were grown under *chat* amended plots, rate of flowering was relatively late as compared to the FYM. This may be due to the oversized height growth on cost of tuber formation through excess irrigation water application (Khurana et. al. 2003).

#### 4.2 Yield response

Both soil amendments and irrigation practices have significant effect on tuber yield. Based on mean comparison (Table 2), yield obtained from plots amended with FYM was significantly different from the treatment of *chat* residue under basin irrigation while maximum records on yield harvested over the other treatments. The yield from FYM amended plots was significantly higher than the remaining amendments under furrow irrigation practices.

Table 2. Growth and yield response of potato (*Solanum tuberosum*) to different soil amendments under furrow and basin irrigation practices

Treatment combination	Plant height (cm)	Flower (%)	No. of tuber per plant	Tuber wt.* (gram)	Tuber wt. per plant (kg)	Total yield (tones/ha)

Levels not connected by same letter are significantly different at 5 % level

\* Average of individual tuber weight

Based on mean comparison, significantly higher yield was harvested from FYM amended plots under the furrow irrigation practice (Table 2). Moreover, there was no significant difference on yield due to amendment under the basin irrigation practice while the highest yield was harvested from FYM amended plots. Similarly, there was no significant difference on yields from the control, sediment and *chat* residue amended plots under both irrigation practices, while more yield was obtained from the last two soil ameliorants.

Unlike comparison of the maximum yield, mean comparison has shown that relatively low yields were harvested from *chat* amended plot, while it is significantly lower as compared to the FYM amended plot under furrow irrigation practices. This may be due to the effect of excess soil moisture condition together with the sealing effect of the crust, which further deteriorates the hydrologic condition of the soil with in the rooting zone, where tuber is normally formed. This in turn could affect the crop to be more vulnerable with blight and cut worm attack (Khurana et al. 2003). In contrast, maximum yield was gained from plots, which were amended with *chat* made compost have received less suspension load than the other.

Being acquainted with the already existing irrigation practice, farmers are mainly preferring basin irrigation practice to cultivate the crop, which is locally known as '*Ketare*'. Results have also shown that higher yield was harvested from plots, which were managed under basin irrigation practices than furrow irrigation practices in each soil amendment.

In addition, highest yield was harvested from FYM amended plots under both irrigation practices over the others. The yield reduction can be explained by the effect of pronounced moisture stress under the furrow irrigation practice. This may be explained by the lower bulk density of the furrow ridges, which allows the soil water to escape from the ridges. In general, it has been indicated that optimum supply of water is the key factor in production of the potato; both over supply and deficiency of water are harmful as the crop requires readily available water throughout the growing season (Khurana et. al. 2003).

#### **4.3 Effects of compost and sediment on some physical and chemical properties of the amended soil**

As is shown in Table 3, soils treated with *chat* residue and FYM have significant effect on infiltration rate. Based on mean comparison there was no significant difference between soil amendment with *chat* residue and FYM while higher rate of infiltration was recorded from plots treated with *chat* residue. Treatments of FYM and *chat* residue have a significant effect on infiltration rate over the control and sediment treated soil. However, there was no significant difference between the two forms of compost. The results agreed with several studies that soil particle aggregation, water holding capacity, drainage, nutrient retention, and plant root growth were all increased when organic compost was incorporated (Keith, 1997; Wayne et. al., 1999). Soil amended with *chat* residue has significantly lower bulk density than the remaining treatment under basin irrigation practices, and similarly soils amended with *chat* residues and FYM have shown lower bulk density than the control and sediment under furrow irrigation practices. Records of initial moisture content (v/v) within the depth of 0-30 cm were found as 38.1 %, 38.4 %, 35 % and 38.2 % that measured under the control, FYM, *chat* residue and sediment amended plots, respectively. The total time required to attain the basic infiltration rate for each measurement was ranged from 140 up to 200 minutes.

Table 3. Effect of soil amendment on soil physical properties under furrow and basin irrigation

Treatment combination	Bulk density (g/cm <sup>3</sup> )	Porosity (%)	% moisture content (v/v)		In. rate (cm/hr)	Basic In. rate (mm/hr)
			0-15 cm	15-30 cm		
Control +Furrow	1.27bc	51.9bc	13.1c	22.4b	-	-
Control +Basin	1.42a	46.5d	25.8b	24.5bc	10.8b	2.2a

Levels not connected by same letter are significantly different at 0.05 levels

### Conclusions

This experiment has tried to demonstrate that *chat* residue can benefit potato production by virtue of its soil moisture conservation and improvement in soil organic matters thereby reduce the risk of soil encrustation as frequent abstraction of suspension laden irrigation water from the hand dug well is minimized. It also indicated that production of potato under basin irrigation practice is better than the furrow irrigation practice, in terms of tuber yields. Although, the yield obtained from *chat* amended plot has shown to be less, addition of *chat* residue on crusted surface soil has shown improvement up on similar soil physical properties, which play a key role to suppress soil encrustation. The yield obtained from would rather imply the need to conduct further research by integrating the surface crust management options with improved irrigation water management. Although, the yield obtained from *chat* amended plot has shown to be less, addition of *chat* residue on crusted surface soil has shown improvement up on similar soil physical properties, which play a key role to suppress soil encrustation.

**Abstract:** Reports on ethnobotanical surveys reveal that a good number of plant species are being used by various tribal communities as emergency food. The present work deals with some parameters regarding nutritive value of leaves of *Oxalis corniculata*. L. used as alternative vegetable during emergency by some tribes of central India. The leaves have been found to be rich in moisture ( $82.42 \pm 0.5\%$ ), total carbohydrate ( $24.67 \pm 0.4\%$ ), crude protein ( $22.28 \pm 0.5\%$ ), crude lipid ( $23.7 \pm 0.5\%$ ), sodium ( $1.12 \pm 0.02\%$ ), potassium ( $2.17 \pm 0.31\%$ ), calcium ( $2.5 \pm 0.08\%$ ), nitrogen ( $3.56 \pm 0.70\%$ ) and magnesium ( $0.25 \pm 0.03\%$ ). [Journal of American Science 2010;6(11):435-437]. (ISSN: 1545-1003).

**Key words:** Nutritive status; *Oxalis corniculata*; Tribes; Scarcity of food.

### 1. Introduction

Analysis of the work done all over the world on survey among aboriginal societies, and scrutiny of ethnobotanical literature had brought about the record of several hundred wild edible plants, which not only satisfy hunger of the people but have been proved nutritious too. It has been noticed that several tribal communities, who still live in undisturbed forest areas possess the traditional food habit. This probably emphasizes on sound nutritional status of wild edible plants, consumed by tribals as regular food or supplementary food. Seeds of certain indigenous species rich in protein are more or less equal to that of almonds (Oommachan and Masih, 1998). It was observed that during adverse conditions when food is not available due to drought, flood or other calamities, these tribes go for consuming other herbal edibles. The nutritional composition of a large number of Plants used in emergency by various tribes in different parts of the world has been evaluated. Kundaji and Rao (1954), Barrau (1959), Mai *et al.*, (1960), Rajaram and Janardanan (1991), Vadivel and Janardanan (2000), Lockett *et al.*, (2000), Ogle *et al.*, (2001), Rehman *et al* (2006). .

Madhya Pradesh is a tribal rich

state where a large number of tribal communities are living in various forest pockets. Reports on ethnobotanical surveys reveal that tribal communities use a good number of plant species as emergency food. Patole and Jain (2002) enumerated nearly 45 plant species consumed by tribals and other rural people residing in Pachmarhi Biosphere Reserve of Madhya Pradesh. It includes the species of *Bauhinia*, *Cassia*, *Phoenix*, *Ficus*, *Polygonum*, *Rhus*, *Amaranthus*, *Oxalis* etc. Nutritional value of several such species has now been estimated and their consumption seems to be beneficial to tribals. The present work deals with analysis of nutritive value of leaves of *Oxalis corniculata*.L, consumed during emergency by some tribal communities of central India.

*Oxalis corniculata* L. commonly known as Amboti, Indian sorrel, (Family Oxalidaceae) is a herb with creeping stem, rooting at nodes. Leaves long petioled, Leaflets with white hairs on margins and lower portion of the middle vein, petioles pubescent 2-4 cm long. Its leaves serve as the major means of food for the tribals during emergency since long back, and proven to save the life of tribals during severe famine and extreme scarcity. The leaves of the plant are eaten both raw as salad and cooked. Leaves

are also used for making sandwiches; chutney pickles and is considered as cooking refrigerant by the Sahariya tribe of central India. Its leaves are used to cure fever, piles, Scurvy and dysentery (Kirtikar and Basu, 1975).

## 2. Material and Methods

The plant material of *Oxalis corniculata* was collected from various tribal inhabited forest localities of central India and identified with the help of floras, authentic literature and herbarium of School of Studies in Botany, Jiwaji University Gwalior (M.P). The parts of plants, used by tribals for edible purposes were analyzed for the estimation of various components. Moisture content, crude protein, total carbohydrates, crude lipids were estimated following the standard methods (AOAC 1990). Total nitrogen was estimated by modified Kjelhdal method (Isvaran and Marwaha 1980).

### Estimation of Potassium, Sodium and Calcium (Flame photometer method)

One gm of powdered plant material was taken in a conical flask and digested in tri acid mixture i.e. Sulphuric acid ( $H_2SO_4$ ), Nitric acid ( $HNO_3$ ) and Per Chloric acid ( $HClO_4$ ) in the ratio of 9:3:1. The white colourless digested material was filtered and was made up to 100 ml by adding distilled water, 10 ml of aliquot was taken and diluted to 25 ml with distilled water and analyzed on digital Flame Photometer by using filters of potassium, sodium and calcium separately.

### Estimation of Magnesium (Flame atomization technique)

One gm of crushed powdered plant sample was kept in 15 ml hot water for infusion for 1 hr, then 10 ml Per Chloric acid ( $HClO_4$ ) and Nitric acid ( $HNO_3$ ) in 1:4 ratio were added to sample to dissolve the Magnesium present in the plant material. The sample was filtered and made up to 50ml by adding distilled water to the filtrate and aspirated by atomic absorption spectrophotometer model 2380 P.E. USA. Under condition of current operating maxima 15 Am, Lamp Mg, bulb Parkin Elmer. Readings were taken at 285.4 nm.

## 3. Results

Nutritional composition of leaves of *Oxalis corniculata* (Table -1) shows that it contains high moisture content ( $82.42 \pm 0.5\%$ ), which is in conformity with earlier reported range of 81.4 - 90.3% in some Nigerian green leafy vegetables (Ifon and Bassir 1980).

**Table.1: Nutritional composition (per 100g dry sample) of *O. corniculata* leaves**

Nutritional component	Concentration %
Moisture	$82.42 \pm 0.5$
Carbohydrates	$24.67 \pm 0.4$
Crude proteins	$22.28 \pm 0.5$
Crude Lipids	$23.75 \pm 0.5$
Sodium	$1.12 \pm 0.02$
Potassium	$2.17 \pm 0.31$
Calcium	$2.5 \pm 0.08$
Nitrogen	$3.56 \pm 0.70$
Magnesium	$0.25 \pm 0.03$

The data comprise the mean value  $\pm$  SD of three replicates

The crude protein content in leaves of *Oxalis corniculata* ( $28\% \pm 0.5$ ) was found more than *Ipomoea aquatica* leaves i.e. 17.84% (Vishwakarma and Dubey 2009). The crude lipid content ( $23.75 \pm 0.5\%$ ) was observed more in comparison to the previously reported values 13.4-17.6% in non-conventional leafy vegetables in Maharashtra (Kulkarni et al., 2003). The carbohydrate Content was found to be ( $24.67 \pm 0.4\%$ ), which is less in comparison to *Ipomoea batatas* leaves 82.85% and *Corchorus tridens* 75.00% (Asibey et al., 1999). The leaves of *Oxalis corniculata* exhibit rich in mineral contents like Sodium ( $1.12 \pm 0.02\%$ ), Potassium ( $2.17 \pm 0.31\%$ ), Calcium ( $2.5 \pm 0.08\%$ ), Nitrogen ( $3.56 \pm 0.70\%$ ) and Magnesium ( $0.25 \pm 0.03\%$ ), these mineral components are vital in regulating various metabolic pathways in human body. Thus observations indicate that consuming *oxalis corniculata* during scarcity of food probes to be neutracentric. The species grow in wild thus can be collected easily. Tribals also store its dried parts so that it can be consumed at any time. Mineral composition of leaves also indicates that all required mineral

## 4. Discussions

The present study indicates that the leaves of *Oxalis corniculata* are rich from nutritional point of view and can be used as supplementary food source to deal with the problems of limited food production in the tribal areas during emergency. As such there is a treasure of knowledge with the various tribal communities of world regarding the multifarious use of wild plants. There are several other wild plant

species used by the tribal which are edible and easily accessible during adverse conditions like drought, famine etc. Some such species of Central India are *Rhus parviflora*, *Achyranthes aspera*, *Amaranthus viridis* and *Boerhaavia diffusa*. When such wild species are accepted by the people as edibles like other cultivated ones they can play an important role in solving the various food problems world over.

**Abstract:** The aim of this study was to investigate the effects of sports participation on the psychological stress levels of female students 15-18 years old. Psychological stress is defined as a collection of nonspecific reactions against organisms in reflections and exposure to any factor that should be faced. Stress control includes several factors, and, in particular, sports participation is thought to be effective. This quasi-experimental research was performed using pre-test plan-test, after-test, and control groups. Research subjects for the control group were 30 people chosen randomly. The subjects of stress were tested by a 40-item stress questionnaire and then tested in step independent variable "Sports participation" included volleyball education and skills training for three months and three weekly sessions of 75-90 minutes. This was carried out to investigate its effect on the dependent variable "stress." We did not observe any statistically meaningful difference between the mean scores of stress-control group and experiment group scores at pre-test in  $p<0.05$ ; however, statistically meaningful differences were observed between the mean scores of stress control group and experiment group scores on the post test stage ( $p<0.05$ ) and between the mean scores of stress in the control group pre-test and post-test in ( $p<0.05$ ). In addition, A statistically meaningful difference was observed statistically meaningful differences were observed between the mean scores of stress in the experiment group pre-test and post-test ( $p<0.05$ ). [Journal of American Science 2010;x(x):xx-xx]. (ISSN: 1545-1003). [Journal of American Science 2010;6(11):438-441]. (ISSN: 1545-1003).

**Keywords:** Sports Participation; Psychological stress; Students

### 1. Introduction

Although advances in science, technology, and industrialization have brought valuable improvements to society, they have also presented numerous complications. One complication is decreased mobility and physical activity. Sedentary lifestyles can lead to physical and mental health issues and impairments. Mental energy cannot be separated from physical energy. Fatigue, disappointment, lack of exercise, and the inability to make decisions are related. The opposite theorem is also true: with suitable condition, progress is possible and leads to excellence. Skills steadily lead to confidence and physical fitness is a big step toward having a psychological fitness.

Participation in sports often has therapeutic effects on children and adolescents suffering from emotional or developmental disabilities. Children, teenagers, and even adults gain the opportunity through sports to strengthen their physical, psychological, and social faculties. On this basis, the study seeks to evaluate whether participation in a relatively long-term physical activity changes the stress on student athletes. The researchers chose

volleyball as the sport, since it is a preferred activity for students in Kermanshah.

Low mobility, especially in girls, can cause many mental disorders and vice versa; mental illness can cause physical symptoms. Therefore, sports participation can be therapeutic for children and youngsters. For this reason, many groups spend leisure hours on such activities after tedious days of work. Even in subjects who suffer from depression, sports can reduce psychological discomfort through exercise. Low mobility and immobility have been forcibly imposed on human beings parallel to the development of technology. Thus their physical and mental health is subject to this sensitive position. With exercise periods, they can revive their physical conditions and reestablish mental balance (Tondnevis, 1992).

The aim of this study is to evaluate the effects of exercise participation on stress levels in female athletes. Specific objectives include:

- Evaluating pre-participation stress levels in subjects before volleyball training and practice.

- Measuring post-participation stress levels in subjects after volleyball training and practice.
- Determining whether participation in sports (volleyball) reduces stress in subjects.

To achieve the objectives, the following research hypothesis was proposed:

“Sports participation (volleyball) has a meaningful effect on the reduction of subjects stress.”

## 2. Material and Methods

This study examines the effect of sport participation on the mental stress levels of students. Therefore, it was conducted as a quasi-experimental study and consisted of two groups - control and experiment - with pre-participation and post-participation measurements. Thirty subjects in the control group were selected randomly from 120 Esteghlal High School students. They were ages 15-18 years with a mean age of 16.53. Thirty subjects were also selected at random from the same population to be in the experiment group. The experiment group (mean age 16.26) participated in girls volleyball classes at Kermanshah City Azadi Stadium. Measurement instruments in this study included two questionnaires:

- Personal information questionnaire
- Personal stress questionnaire

Information was captured via the questionnaire from June-September 2003. Researchers collected the pre-test questionnaire after the first meeting with the control and experiment groups. However, before distributing the questionnaires, they did interviews to ensure none of the students had participated in regular exercises before. The experiment group participated in volleyball skills training within 32 sessions, each lasting 70-90 minutes. At the last session, post-test questionnaires were distributed to the two groups and were collected after completion by the examinees

## 3. Results

This study was done as a quasi-experimental research using control and experiment groups with pre-participation and post-participation questionnaires. Information from questionnaires regarding stress levels was analyzed and quantitatively converted using descriptive statistics (mean and standard deviation) and inferential statistics (student t-test).

Table 1. Pre-participation in the control and experiment groups

Evidence Groups	XΣ	N	$\bar{X}$	S	T
Control	293	30	9/77	3/52	
Experiment	278	30	9/27	4/27	0/495

As shown in Table 1, since the t value (0.495) is less than table critical value (1.671) at 5% alpha level, it will not reject the zero assumption; the study hypothesis based on differences between the pre-participation mean scores of control and experiment groups is not confirmed. The differences observed between the control and experiment groups' mean scores of stress during the pre-participation phase are not statistically significant.

Table 2. Post-participation measurements of control and experiment groups

Evidence	XΣ	N	$\bar{X}$	S	T
Control	281	30	9/37	3/39	
Experiment	217	30	7/23	3/67	2/338

As shown in Table 2, since the t value (2.338) was more than the table critical value (1.671) at 5% alpha level, it rejects the zero assumption; the study hypothesis based on differences between the post-participation mean scores of control and experiment groups is confirmed. The differences observed between the control and experiment groups' mean scores of stress during post-participation testing are statistically meaningful.

As shown in Table 3, since the t value (0.747) is less than the table critical value (1.671) at 5% alpha level, it will not reject the zero assumption; the study hypothesis based on differences between the pre-participation and post-participation mean scores of control and experiment groups is not confirmed. The differences observed between the control and experiment groups' pre-participation and post-participation mean scores are not statistically meaningful.

Table 3. Results of the control and experiment groups at pre-participation and post-participation

Evidence	XΣ	N	$\bar{X}$	S	T
Pre test	293	30	9/77	3/52	
Post test	281	30	9/37	3/39	0/747

As shown in Table 4, since the t value (4.169) was more than the table critical value (1.671) at 5% alpha level, it will reject the zero assumption; the study hypothesis based on differences between the pre-participation and post-participation mean scores of experiment groups is confirmed. The

differences observed between the pre-participation and post-participation mean scores of experiment groups are statistically meaningful

Table 4 - Experiment group pre-participation and post-participation test results

Evidence	$X\Sigma$	N	$\bar{X}$	S	T
Pre test	278	30	9/27	4/27	
Post test	217	30	7/23	3/67	4/169

Finally, the mean scores of stress in the control group's pre-participation and post-participation phases are 9.77 and 9.37 respectively, and for experiment group are 9.27 and 7.23 respectively

#### 4. Discussions

Mc Mahan (1990) conducted many studies of the benefits of exercise and concluded that intense aerobic exercise can improve the development of self-esteem and reduce depression (quoting from Habibian, 2000). Skeleton et al. (1991) studied the role of tae kwon do belt ranks on the level of aggression in children 9-11 years old. The results showed that as students progressed through rising levels of combat, aggression levels reduced. The reason for this was found during the taekwondo exercises. Brook and Heim (1996) performed a preliminary study of 16 children with asthma. They found those who participated in sports had more positive self perceptions and were less anxious and dealt better with their illness than individuals who did not participate in sports (quoting Shamlu, 1999). Nora et al. (1995) found increases of 13-14 percent in aerobic power, decreased joint pain, and improved levels of anxiety and depression after 12 weeks of aerobic training. In another study (1997) they reported 10-20 percent cardio-respiratory improvements along with effective reductions of depression, anxiety, fatigue, and stress after subjects participated in an aerobic fitness program.

Cooks and Colin (1998) reported a linear relationship between confidence and motor skills performance; with higher motor skills, confidence increases (quoting from Namazizade and Naghavi, 2002). Zibery (1993) has compared the mood status of a selected group of elite athletes to non-athletes. The results showed meaningful differences in anger, hostility, power, activity, and fatigue between the two groups but there was no meaningful difference between the groups in terms of tension, anxiety, and confusion. Saheb Alzamani (1995) divided students aged 13-15 into two groups and trained the control group in karate instruction for three months. After

practicing karate for three months, students showed reduced levels of aggression.

Mozayeni (1374) studied female athletes and non-athletes and found that depression was higher in non-athletes than athletes. Exercise is a very effective antidepressant. Qoli Allah Poor (1997) compared the aggression of athletes competing in basketball, karate and boxing with non-athletes and found meaningful differences between athletes and non athletes. Habibian (2000) in a study entitled "Comparison of stress between athlete and non-athlete female students" concluded that female athletes have less stress than non-athletes. Ali Faiz Khademi (2005) in "Loneliness and source of control (internal-external) in male athletes of 18-12 years for group and solo sports in city of Kermanshah" reported that the mean of loneliness feelings is higher in solo-sport athletes than in group-sport athletes. Group-sports athletes have more external sources of control than solo-sports athletes. Also there was a meaningful difference between individual athletes and team athletes in reported feelings of loneliness and sources of control (internal-external).

This study examined the effects of sports participation on stress in female students. Analysis of the results and mean scores of the stress levels of subjects by t-test shows that female students' sports participation (specifically in volleyball) has a meaningful effect in reducing incidence of stress and can be 95% confirmed. Participation in sports is closely related to mental health, especially the prevention of disorders, and is a valuable tool to improve physical health. It seems the cause of stress reduction in the experiment group of students is regular physical activity that led to adjusted physical and psychological characteristics. Exercise causes excitement and joy and is a special vitality that can be a factor in reducing psychological disorders.

**ABSTRACT:** The effect of atmospheric turbulence on the diffraction-limited imaging of celestial bodies is one of the major problems in observational astronomy. The speckle interferometric technique was introduced in the 1970s to solve this problem. The technique is used to decode the diffraction-limited spatial Fourier spectrum and image features of the celestial objects, using a series of short-exposure (< 20 ms) images. Since most common binary orbit periods vary from 10 to 30 years, a large number of these binary systems, studied using the speckle data, completed one or two revolutions. In this study, an algorithm developed by the Indian Institute of Astrophysics (IIA) and an algorithm developed by Hartkopf's group at Georgia State University were used to plot the orbits of two binary systems, 00122+5337=Bu 1026AB and WDS 04136+0743 = A1938. The orbital parameters of these binary systems have been calculated using speckle data and other interferometric data. The former algorithm is based on standard least square technique with iterative improvement of the orbital parameters. Unlike the latter algorithm, the former algorithm does not require any previous knowledge of the period and the eccentricity of the binary systems. The results of this comparative study have shown that both algorithms generate almost the same orbital parameters. However, the algorithm developed by the IIA requires fewer steps to calculate the orbital parameters of these binary systems. [Journal of American Science 2010;6(11):442-448]. (ISSN: 1545-1003).

**Key words:** close binaries: visual stars: Speckle interferometric technique

## 1. Introduction

One of the major problems in observational astronomy is atmospheric seeing, blurring and twinkling of celestial objects. The light from these objects is significantly affected by the micro-thermal fluctuations in the atmosphere, which is highly turbulent and optically inhomogeneous. The resolution of the images of these objects is reduced by a factor of 20 due to the effects of atmospheric seeing (Saha 2000). To reduce the effects of atmospheric seeing, Labeyrie (1970) introduced a new observational technique, speckle interferometry, which is based on taking short exposure (less than 20 ms) images, specklegrams. Speckle interferometry freezes the atmosphere, but produces an instantaneously distorted image. The specklegrams produced are then processed using Fourier-domain methods, which allow regaining the true diffraction-limited image of the object. In this study, orbits of two binary systems, 00122+5337=Bu 1026AB and WDS 04136+0743 = A1938, have been plotted using a computer program, developed by the Indian Institute of Astrophysics (IIA). The orbital

parameters of these binary stars have been compared to the orbital parameters generated by another computer program developed by Hartkopf et al. (1989, 1996) at Georgia State University.

The most well-known advantage of speckle interferometry is probably its ability to resolve binary stars at or near the diffraction limit of telescopes. This has resulted in a powerful synergy between short-period visual and long-period spectroscopic binaries, leading to stellar masses and more effective characterization of the empirical mass-luminosity relation for stars. In addition to the ability to reach the diffraction limit of a telescope, interferometry has provided the possibility of significant improvement of precision of measurement, yielding typical errors of 0.5° in position angle and 0.5% in separation.

The time base of routine speckle interferometric observations of binary stars is now in excess of 30 years. As a result of this long series of observations, which are of exceptional accuracy and precision, are now being further refined, often resulting in significant changes in the orbital elements.

Improvements to the orbital elements based on these data, coupled with the parallaxes (primarily from the *Hipparcos* program), has yielded masses for these binaries with smaller errors. Orbital elements, ephemerides, predicted radial velocity curves, and model-dependent masses have been calculated and presented for two binary systems. Also elements and ephemerides for an additional two systems are presented. These two orbits, while better than previously published determinations, are still be regarded as provisional.

The effect of atmospheric turbulence on the diffraction-limited imaging of celestial bodies is one of the major problems in observational astronomy. The speckle interferometric technique was introduced in the 1970s to solve this problem. The technique is being used to decode the diffraction-limited spatial Fourier spectrum and image features of the celestial objects, using a series of short-exposure (< 20 ms) images. Since most common binary orbit periods vary from 10 to 30 years, a large number of these binary systems, studied using the speckle data, have already completed one or two revolutions. Now let us give a brief account of collection of data.

## 1 Speckle Formation

When observing a point source and a continuum of wave components pass through a telescope's aperture, the superposition of these components leads to a pattern of constructive and destructive interference. In telescopes, the incoming light is approximately a plane wave since the source of the light is so far away. The intensity pattern of these constructive and destructive interference rings is known as the Airy diffraction pattern (Figure 1).

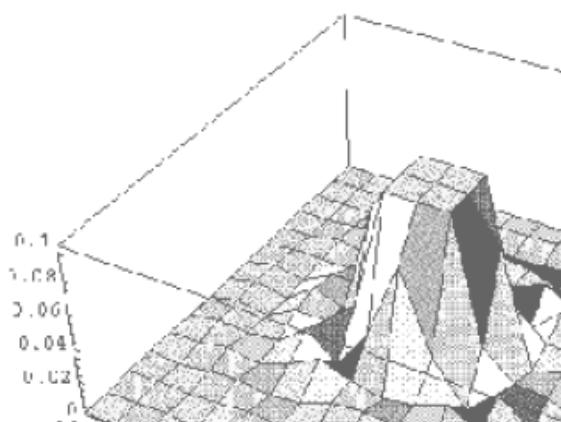

Figure 1. The airy diffraction pattern.

All telescopes have an inherent limitation to their angular resolution due to the diffraction of light at the telescope's aperture. The resolution of a telescope is characterized by the width of the Point Spread Function (PSF), which is the order of,

$$1.22 \lambda / r_o \quad (1.1)$$

Where  $\lambda$  is the wavelength of light and  $r_o$  is the average size of the turbulence cell, which is the order of 10 cm.

A wave plane propagating through the atmosphere of Earth is distorted by the Bmicro structures of refractive index inhomogeneity, called eddies. This plane wave reaches the pupil of the telescope with random patches of uniform phases. Each patch phase of the plane wave with a diameter  $r_o$ , known as *Fried's parameter* or *atmospheric coherence diameter*, is independent of the rest of the patch phases of the plane wave. Thus, the aperture of the telescope is subdivided into a set of sub-apertures. The resultant interference patterns produced by all patch phases of the plane wave consists the speckle image of the object. The measurement of the atmospheric coherence diameter is crucial to estimate the seeing at any astronomical site. This diameter can be calculated using speckle interferometric technique and the following equation,

$$\sigma = 0.342 (r_o/\lambda)^2 \quad (1.2)$$

Where  $T\sigma$  is wave plane coherence area calculated by ratioing the area of telescope aperture to the estimated number of speckles. Generally, the effective resolution of a telescope is affected by two factors, the PSF of the atmosphere and the telescope's aperture. If the telescope's diameter,  $D$ , is smaller than the atmospheric coherence diameter,  $r_o$ , the resolution will be the true diffraction limited resolution,  $1.22 \lambda/D$ . On the other hand, if  $D$  is larger than  $r_o$ , the resolution of the telescope will be affected by the atmospheric turbulence, which suppresses the telescope diameters. The seeing disc in a large telescope is equal to  $1.22\lambda/r_o$ .

## 2. Data Collection

Most of the data used in these calculations are tabulated in the Washington Double Star Catalog (WDS; [Worley & Douglass](#))<sup>[1]</sup> Database and the Third Catalog of Interferometric Measures of Binary Stars ([Hartkopf, McAlister, & Mason](#))<sup>[2]</sup>. The US Naval Observatory (USNO) speckle camera, initially described by [Douglass, Hindsley, & Worley \(1997\)](#)<sup>[3]</sup>, has been upgraded with a new intensified CCD and reduction software package as described by Germain et al [4][5]. All data taken with the 0.7 m

telescope at the USNO produced real-time directed vector autocorrelations (DVA; see Bagnulo et al.)[6] and were reduced in the manner described in Douglass et al. Speckle data from CHARA taken with the 4.0, 3.8, and 2.5 m telescopes have been taken with the CHARA speckle camera (McAlister et al.)[7]; these data were postprocessed using the DVA algorithm. USNO speckle data from the McDonald 2.1 m telescope were taken with the USNO speckle camera and also post processed with the DVA algorithm.

### 3. Speckle Interferometry Applications To Binary Stars

Binary stars are systems of two close stars gravitationally bound together and moving around each other. Generally, the two stars of the system have unequal brightness. The brighter star is more massive called the primary, while the fainter is less massive called the secondary or the companion. Binary systems can be classified into four types based on the techniques used for their discoveries- visual, spectroscopic, eclipsing, and astrometric. The relative positions of the visual binary stars can be plotted from long-term observations to determine their orbits. Due to their gravitational boundness, the relative positions of these binaries change over the years. [10][11]Baize; Saha et al.) [12][13]. This technique allows accurate astrometric study of close visual binary stars. It has revolutionized the field of binary star astronomy. The Center for High Angular Resolution Astronomy (CHARA) of the Georgia State University has been a major contributor of the interferometric measurements of thousands of binary stars since it begun by McAlister (1976). Some binary stars data used for this study are from CHARA. The interferometric measurements of binary stars allow deducing the apparent orbit of these binaries, using Kepler's third law,

$$4\pi^2 a^3 = G (m_1 + m_2) T^2 \quad (1.3)$$

where  $a$  is the semi-axis of the orbit,  $G$  is the gravitational constant,  $T$  is the period, and  $m_1$  and  $m_2$  are the masses of the stars. These stars's masses, as well as their orbital parallax, can also be identified using other spectroscopic elements.

The position of the companion of a binary system vis-à-vis the primary is determined by two coordinates, the angular separation  $\theta$ , and the position angle,  $\rho$  (fig-2). Due to the mutual gravitational boundness, both stars move around the mass of the system, barycenter. The motion of the secondary star with respect to the primary describes the true elliptic orbit. Using Kepler's laws, the orbital elements of a binary system can be identified. These elements are

crucial in determining the masses and the parallax of the individual stars.

The projection of the true orbit on the plane of the sky, the tangent plane to celestial sphere, is referred to as the apparent orbit. The apparent orbit can be determined using the semi-axis, eccentricity, position angle of the major axis, and the two coordinates of the center of the ellipse with respect to the primary star. (fig-3) We know that the general equation of the ellipse of the orbit can be expressed by,

$$Ax^2 + 2 Hxy + By^2 + 2Gx + 2Fy + 1 = 0 \quad (1.4)$$

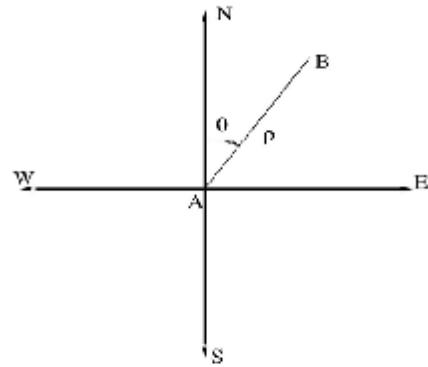

Figure 2. Part of the celestial sphere where A is the primary and B is the companion. AN defines the direction of the north celestial pole.

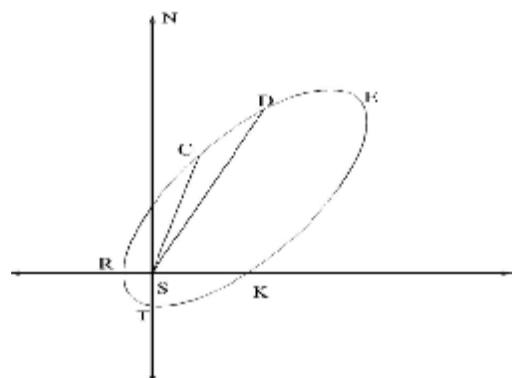

Figure 3. Apparent orbit of a binary star. where S represents the primary star.

The above equation 1.4, has five independent constants,  $A$ ,  $H$ ,  $B$ ,  $G$ , and  $F$ . If the companion is at  $C$ , the angular separation,  $\rho$ , and the position angle,  $\theta$ , can be determined using the observation measurements. Finding these parameters allows identifying the rectangular coordinates  $x$  and  $y$  of  $C$  according to,

$$x = \rho \cos \theta \text{ and } y = \rho \sin \theta \quad (1.5)$$

Theoretically, five observations spread over the orbit are sufficient to determine the five constants,  $A$ ,  $H$ ,  $B$ ,  $G$ , and  $F$ . However, a large number of observations spread over many years are required to determine accurate orbit.

### 3 Algorithms For Plotting The Orbits of Binary Stars

Various algorithms have been used to determine the elements of the orbit of a binary system. Hartkopf et al. [10][11] utilized a method based on 3-D grid search technique and visual measurements along with the interferometric data to calculate and plot the orbits of binary system. If the period,  $T$ , eccentricity,  $e$ , and the time of the periastron passing,  $\tau$ , are given, the four Thiele-Innes elements,  $A$ ,  $F$ ,  $B$ , and  $G$ , semimajor axis,  $a$ , orbital inclination,  $i$ , the longitude of ascending node,  $\Omega$ , the argument of periastron passage,  $\omega$ , can be determined by the least square method. Given  $(T, e, \tau)$  and a set of observations  $(t, x_i, y_i)$ , the eccentric anomaly  $E$  is found using the following equation,

$$M = E - e \sin E \quad (1.6)$$

Where  $M = 2\pi/T(t - \tau)$  is the mean anomaly of the companion at a time  $t$ .

The normalized rectangular coordinates  $X_i$ ,  $Y_i$ , are determined by the following equations,

$$\begin{aligned} X_i &= \cos(E) - e \\ Y_i &= \sqrt{1 - e^2} \sin E \end{aligned} \quad (1.7)$$

The four Thiele-Innes elements  $A$ ,  $F$ ,  $B$ , and  $G$  are found by a least squares solution of the equations,

$$\begin{aligned} X &= AX_i + FY_i \\ Y &= BX_i + GY_i \end{aligned} \quad (1.8)$$

The orbital elements are then deduced from these Thiele-Innes elements.

However, Hartkopf's[10] method requires a previous knowledge of the period of the binary system. (Saha et al. )[14] used another algorithm based on least square method to obtain the plots and orbital calculations. The normal equations are solved using

cracovian matrix elimination technique. This algorithm produces results similar to the results produced by the Kowalsky's algorithm, the inversion method, but it involves a fewer numbers of steps. This algorithm is based on minimizing the sum of squares of residual with respect to each constant and obtaining five equations.

The algorithm used by Saha et al. [14] is the first algorithm to use cracovian matrix elimination technique in an orbital program. This program was written by Dr. A. V. Raveendran from the Indian Institute of Astrophysics. The method has a system of giving different weightage to data obtained from different sources. This algorithm eliminates high residues data.

### 4. Method Of Orbital Calculation

Orbital elements are determined using a "three-dimensional adaptive grid search" technique, as described in [Hartkopf et.al.\[10\]](#). The routine for the determination of formal errors has been changed to one adapted from the analysis programs of [Tokovinin \[15\]](#) and yields more reliable errors leading to relatively accurate result. Many of the systems presented here have extensive histories of visual observation that, although of lower accuracy than the interferometric data, provide crucial information in the determination of the orbital period. Given a set of elements  $P$ ,  $T$ , and  $e$ , the four Thiele-Innes elements ( $A$ ,  $F$ ,  $B$ , and  $G$ ) hence the four remaining geometric elements ( $a$ ,  $i$ ,  $\Omega$ , and  $\omega$ ) can be determined by the method of least squares.

Relative weights are assigned to each astrometric observation based on the telescope aperture and observing technique. Visual observations made with larger telescopes are found to be more accurate than those made using smaller instruments. A weight of 1.0 is assigned to a visual observation made with a "large" (aperture 45 cm) telescope, while a weight of 0.5 is given to visual observations made with a "small" (aperture < 45 cm) telescope. Relative weights of interferometric versus visual measures were initially determined by [Hartkopf et al. \[10\]](#) based on rms residuals for eight very well-observed binaries. These relative weights have been born out in subsequent orbital analyses as well. A Center for High Angular Resolution Astronomy (CHARA) interferometric measure made using a 4 m class telescope is therefore given an initial weight of 20, while CHARA or USNO measures made with 2 m class telescopes and *Hipparcos* measures are given one-half this weight. Other interferometric measures are given weights of 5 (a more multidimensional weighting scheme is currently under consideration).

Weights for measures averaged from several nights' data are scaled by  $\sqrt{n}$  and weights for measures noted as being of poor quality are reduced by 50%.

## 5. Result and Discussion

### Plotting Orbits of Binary Systems

In this study, two binary systems orbits have been plotted, 00122+5337=Bu 1026AB and WDS04136+0743 = A1938. The data were obtained from the Fourth Catalog of Interferometric Measurements of Binary Stars, which began in 1982 as an internal database at the Georgia State University Center for High Angular Resolution Astronomy (CHARA). These orbits were compared to the ones obtained by Hartkopf's team (Hartkopf et al. 1989, 1996).

**00122+5337=Bu 1026AB (HD761).** Speckle data for this system date back to 1975, so they cover about  $\frac{1}{2}$  revolution and define the period well. For this system, 36 interferometric measurements, from 1975 to 2000, have been used for the orbit calculations. Most of these observations are speckle measurements. The data shows almost uniform variation of  $\rho$  and  $\theta$ . This system is found to have a period of about 60 years. The system's approaching periastron is around 1986. Figure 4 illustrates the apparent orbit of HD761 and Figure 5 represents the radial velocity curves of the same system.

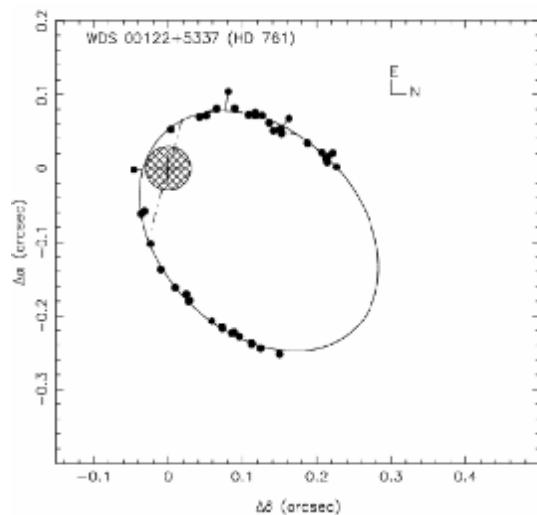

Figure 4. The apparent orbit of HD761 generated by IIA's program

In Figure 4, the x and y scales are in arsecs. The dot-dash line denotes the line of nodes. The shaded circle centered in the orbit represents the Rayleigh limit of the telescope. Figure 6 illustrates the

plot of the mean anomaly (radian) vs. the epoch. The orbital parameters of HD761 generated by IIA's program and Hartkopf's program are given in table 1.

Both programs generate slightly different orbital parameters for HD761. The slight difference between these results can be explained by the fact that Hartkopf's team used more visual and speckle measurements in their orbits calculations.

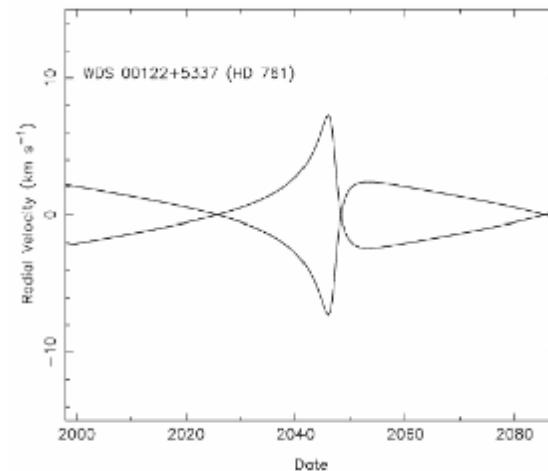

Figure 5. Radial velocity curves of HD781 generated by IIA's Program

IIA's Algorithm	59.78	0.2266	34.57	47.50	1986.9626	0.7491	103.49

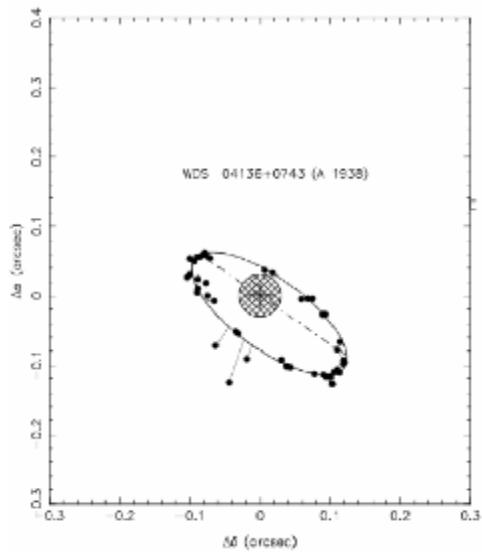

Figure 7. The Apparent orbit of HD26690 generated by IIA's program

*WDS 04136+0743 = A1938 (HD26690).* The speckle data for this system date back to 1975, so they cover about 3/2 revolution and define the period very well. For this system, 36 interferometric measurements, from 1975 to 1995, have been used for the calculation of orbits.

Most of these observations are speckle measurements. The data shows almost uniform variation of  $\rho$  and  $\theta$ . This system was found to have a period of about 7.18 years. The system's approaching periastron3 is around 1990. Figure 7 illustrates the apparent orbit of HD26690 and Figure 8 represents the radial velocity curves of the same system.

The orbital parameters of HD 26690 generated by IIA's program and Hartkopf's program are given in table 2.

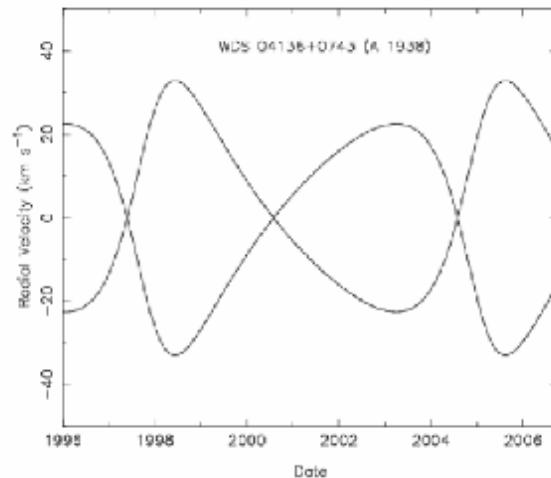

Figure 8. Radial velocity curves of HD 26690 generated by IIA's program.

## 6. Conclusion and Future Work

In this study, an algorithm developed by the IIA and another algorithm developed by hartkopf's group have been used to plot the orbits of four binary systems, 00122+5337=Bu 1026AB AND WDS 04136+0743 = A1938. The orbital parameters of these binary systems have been calculated using speckle data and other interferometric data. Both programs generate slightly different orbital parameters for the four binary systems. This slight difference can be explained by the fact that Hartkopf's team used more visual and speckle measurements in their orbits calculations. It is needless to mention that more speckle data are crucial to calculate the orbital parameters of binary systems with more accuracy.

Table 2. Orbital parameters of HD 26690. Both programs generated almost similar results

**Abstract:** Ethnomedically genus *Origanum* L. is one of the most commonly used herb in many countries as a stimulant, analgesic, antitussive, expectorant, sedative, anti-inflammatory and antihelminthic agent. The hepatoprotective and therapeutic effects of *Origanum syriacum* aqueous methanolic extract on paracetamol induced liver cell damage in mice with respect to antioxidant status was investigated. Mice were treated with extract and sylimarin in recommended dose after or before paracetamol administration (400mg/ kg/ day). Lipid peroxides concentration was considerably decreased due to the elevation of reduced glutathione concentration(GSH) and enhancing of glutathione reductase(GR), glutathione transferase(GST), glutathione peroxidase (GPx)and superoxide dismutase(SOD) activities as compared to paracetamol or sylimarin treated mice. Liver function parameters are still in the normal levels in extract treated mice as compared to control. Using extract as a treating agent after subjecting mice to paracetamol gave better results, the liver tissue showing a nearly normal liver tissue except for a little cellular infiltrate around main blood vessels while sylimarin showing a noticeable dilatation of blood vessels that are surrounded by fibrosis and cellular infiltration. Liver tissue from mouse received *Origanum* extract and then paracetamol showing mild dilatation of blood sinusoids and cellular infiltration around main blood vessels while sylimarin treated mice showed marked dilatation of blood sinusoids, vacuolar degeneration in many of the hepatocytes and focal necrotic areas among the hepatocytes. In conclusion, *Origanum syriacum* extract has potent therapeutic activity than hepatoprotective activity and it is more effective than sylimarin in two cases. The plant extract was screened for its phytochemical constitutions.

**Key words:** Hepatoprotective, Antioxidant, Oregano, Paracetamol, Therapeutic

## 1. Introduction

As the etiology and pathogenesis for many diseases are unclear, there has been increasing interest in the potential therapeutic and protective agents. Antioxidant compounds are usually employed in the food industry to prevent undesirable changes due to oxidation reactions. In recent years, there is a wide interest in finding natural compounds that could replace synthetic antioxidants. Herbs and spices are employed as food ingredient to flavour sausages, meats and salads; some studies have reported that they contain a wide variety of compounds that have shown to have beneficial health effects. It has recently become clear that one of the values of many spices is that they contain natural antioxidants, which provide protection against harmful free radicals. Oregano is an herbaceous plant native to the Mediterranean regions (Baytop, 1999) used as a medicinal plant with healthy properties like its powerful anti-bacterial and anti-fungal properties ( Elgayyar et al., 2001& Sokovic et al., 2002), antihelminthic agent ( Khanna et al., 2007) and anti-inflammatory ( Robledo

et al., 2005). Cervato et al.(2000) have found some antiradical activity in aqueous and methanolic extracts of *Oregano* leaves also Bendini et al. (2002) reported that ethanolic extracts under selected conditions showed antioxidant activity. *Origanum* species are traditionally used as sedative, diuretic, degasifier, sweater and antiseptic also in the treatment of gastrointestinal diseases and constipation (Baytop, 1999). Drug-induced liver injury is a potential complication of virtually every prescribed medication, because the liver occupies a central role in the metabolic disposition of all drugs and foreign substances. Most of the hepatotoxic chemicals damage liver cells mainly by lipid peroxidation and other oxidative damages and this applies also to paracetamol which is a widely used analgesic/antipyretic agent regarded as generally safe when used at therapeutic levels (Danque et al., 1993) while representing the drug of choice in children. However, paracetamol hepatotoxicity is the leading cause of drug-induced liver failure in the western countries and an acute or cumulative overdose can

cause severe liver injury with the potential to progress to liver failure (Lee, 2004). The main toxicity mechanism advocated for include the Cyp2E1 metabolic activation of the reactive metabolite, N-acetyl-p-benzoquinone imine which depletes cellular glutathione and then covalently binds to critical cellular proteins and macromolecules (Cohen and Khairallah, 1997, Paglia and Valentine, 1967) followed by proteins alkylation, namely mitochondrial proteins on its turn, triggers (Park et al., 2005), then formation of reactive oxygen species into the mitochondria (Knight et al., 2001). These events are primarily based on the dysfunction of the cellular  $\text{Ca}^{2+}$  homeostasis, with enhancement of the cytosolic  $\text{Ca}^{2+}$  concentration, noxious translocation of Bax and Bid to the mitochondria and peroxynitrite formation too. Superoxide anions insofar generated can dismutate to form molecular oxygen and hydrogen peroxide, which then require electrons from GSH molecules to be reduced to water by glutathione peroxidase enzyme and brings about a significant increase of mitochondrial glutathione disulfide (GSSG) levels (Griffith, 1980, Habig et al., 1974). The present study aims to investigate hepatoprotective and therapeutic effects of *Origanum syriacum* aqueous methanolic extract on paracetamol induced liver cell damage in mice with respect to antioxidant status in liver tissue.

## 2. Material & Methods:

### Plants extract preparation

The aerial parts of *Origanum syriacum* were defatted using petroleum ether then the defatted powder was extracted with 20% aqueous methanol. The crude methanolic extract was concentrated using rotary evaporator under reduced pressure then the concentrated extract was used in phytochemical screening and biological studies.

### Animals

Male albino mice weighing  $30\pm 35\text{g}$  were housed in polypropylene cages, each cage was contained ten mice in case of  $\text{LD}_{50}$  assessment while it was contained eight mice in case of hepatoprotective study. Animals were fed on standard diet, temperature through the housing was controlled at  $24^\circ\text{C}$ , relative humidity  $65\pm 5\%$  and light/dark cycles (12/12hrs). This study was approved by Medical Research Ethics Committee, National Research Center, Egypt, under registration no. 10 033

### Experimental design

Male albino mice (25-30g) were obtained from animal house of national Research Centre. Animals were kept for one day under the condition of experiment then they were intraperitoneally injected with 0.5ml of different solution used in experiment using infantile syringe. Animals were divided into three main groups includes negative control group, normal group treated with extract or sylimarin and treated group. Each subgroup and control group was contained eight mice. The

control group was injected with saline solution (0.5ml/day/ 5 days). The second main group is healthy normal group which was divided into three subgroups, the first one was injected with extract of medicinal plant prepared in saline solution (0.5ml of 1/10 extract  $\text{LD}_{50}/\text{day}/5\text{days}$ ), the second was injected with silymarin in a recommended dose (25mg/kg) for 5days prepared in 0.5ml saline solution while the third group was injected with paracetamol as a super saturated solution in 0.9 % saline at the dose of 500mg/ kg body weight. The third main group was treated group which contain four subgroups, the first one was treated with medicinal plant extract( 0.5ml of 1/10 extract  $\text{LD}_{50}/\text{day}/5\text{days}$ ) then was injected with paracetamol at a dose as mentioned above, blood samples, livers were collected after 48hrs of paracetamol injection. The second subgroup was treated with paracetamol then was injected with plant extract (0.5ml of 1/10 extract  $\text{LD}_{50}/\text{day}/5\text{days}$ ) after 48hrs of paracetamol injection blood samples and livers were collected after 24hr of last injection. The third subgroup was treated with silymarin (0.5ml of 25mg/ kg/ day/ 5days) then was injected with paracetamol in a dose of 500mg/ kg b.wt. while blood samples and livers were collected after 48hrs of paracetamol injection. The fourth subgroup was treated with paracetamol then was injected with silymarin (0.5ml contain dose of 25mg/ kg/ day/ 5days) after 48hrs of paracetamol injection, blood samples and livers were collected after 24hr of last injection.

### Acute toxicity assay

The acute toxicity test for *Origanum* extract was carried out to evaluate any possible toxicity. Swiss albino mice ( $n = 10$ ) of either ten mice were subjected to a 24 hour fast with water before initiating the test then was administered with different doses of the extract by increasing or decreasing the dose according to the response of animal (Bruce, 1985). The dosing patron was 500, 1000, 1500, 2000, 2500 and 3000mg/ kg by intraperitoneally injection while the control group received only the normal saline. All groups were observed for any gross effect or mortality during 48h.

### Biochemical assessment

At the end of the experimental period, animals were fasted for 12 h and blood samples were obtained from the experimental and control mice by puncturing retro-orbital plexus. Aspartate aminotransferase (AST) and alanine aminotransferase (ALT) activities in serum were measured with kits (Reitman and Frankel, 1957). After collection of blood samples mice's livers were, collected then immediately excised, rinsed in ice cold normal saline. Liver homogenate(5%) was prepared in bidistilled water using potter-Elvehjem homogenizer with Teflon pestle. Protein concentration was measured as described, by Sedlack and Lindsay (1968). GPx activity was assayed spectrophotometrically at 340nm (Paglia and Valentine, 1967) and the amount of the

enzyme converting 1 $\mu$ mol GSH per min per mg protein was taken as 1 activity unit. GR activity was measured spectrophotometrically at 340nm (Goldberg and Spooner, 1983) and the amount of the enzyme reducing 1 $\mu$ mol GSSG per min per mg protein was regarded 1 activity unit as elsewhere described. GST activity was measured spectrophotometrically at 340nm (Habig et al., 1974) and the amount of the enzyme that conjugate 1, chloro-2, 4-dinitrobenzene with reduced glutathione per min per mg protein was regarded 1 activity unit. SOD was measured at 560nm (Fridovich , 1974) as the reduction suppression rate of nitrotetrazolium blue and for 1 unit of activity, the amount of protein was taken which provided 50% inhibition of nitrotetrazolium blue reduction under standard conditions. GSH concentration was measured spectrophotometry at 405nm (Griffith, 1980). and the unit of concentration was mg/g tissue using Ellman's reagent (5,5'-dithiobis 2-nitrobenzoic acid; DTNB), which was reduced by thiol groups to form 1 mol 2-nitro 5-mercaptopbenzoic acid/mol thiol and with maximal absorption at 412 nm. Malondyaldehyde (MDA) determination in liver was assayed by spectrophotometric method at 534nm (Ohkawa et al., 1979). and the unit of concentration was  $\mu$ mol/ g tissue.

#### Statistical analysis

Data were analyzed by one-way ANOVA test for comparisons among means at  $p \leq 0.05$ .

#### Histopathological assessment:

Specimens of liver and kidney from all animals were dissected immediately after death. All the specimens were fixed in 10% neutral-buffered formal saline for 72 hours at least, washed in distilled water and then dehydrated in ascending grades of alcohol, cleared in xylene and embedded in paraffin wax. Serial sections of 6  $\mu$ m thick were cut and stained with Haematoxylin and eosin (Drury and Wallington, 1980) for histopathological investigation.

Histochemical investigation by using Periodic acid Schiff's reagent (Mac-Manus and Cason, 1950) was performed to evaluate the mucopolysaccharide content in these tissues.

Images were captured and processed using Adobe Photoshop version 8.0.

### 3. Results

#### 1) Effect of OSE on antioxidant parameters:

Administration of paracetamol significantly decreased glutathione concentration also considerably reduces GR, GST, GPx and SOD activities while it elevated protein concentration and lipid peroxides concentration in liver tissue as compared to control group.

Data presented in table (1) shows the elevation of glutathione production in mice treated with extract and sylimarin as compared to paracetamol induced mice or healthy group administered saline, the healthy group administered OSE or sylimarin has the same trend of

results. GR was significantly enhanced by administration of OSE and sylimarin but it was magnified by OSE administration more than sylimarin administration, sylimarin administration has approximately the same activity when administered as hepatoprotective or therapeutic agent but OSE is superior to sylimarin in two cases.

Paracetamol administration significantly decreased GST by 68% as compared to healthy group. Administration of OSE or sylimarin significantly enhanced GST and there was no significant difference between GST activities when OSE was administrated without liver injury or used as therapeutic drug after paracetamol administration, it means that GST was magnified to be in a healthy level. Also there was no significant difference in GST when sylimarin was administered as hepatoprotective or therapeutic agent. The best recorded activity was in case of OSE administration as therapeutic drug.

Data presented in table (1) shows that, paracetamol decreased GPx by 72% while OSE and sylimarin induced GPx in healthy animal treated with OSE or sylimarin also GPx was induced to be nearly ve<sup>-</sup> control group in paracetamol induced liver injury mice when treated with OSE. Sylimarin as protective agent gave results nearly the same to OSE as therapeutic agent, while it gave the least GPx activity when administered as therapeutic agent.

Injection of paracetamol highly decreased SOD by about 82% while OSE and sylimarin administration significantly enhanced SOD to be more than healthy group in healthy mice treated with OSE and sylimarin also SOD was elevated in liver injured mice when they were treated with OSE as hepatoprotective or therapeutic agent. Sylimarin also induced SOD and the hepatoprotective effect was more sufficient than therapeutic effect but OSE is superior to sylimarin in enhancing SOD activity either protective or therapeutic agent.

The obtained results indicates that injection of paracetamol significantly induced LPC by 90.5% while treating mice with extract or sylimarin didn't enhance liquid peroxide production so LPC is still nearly to control level in healthy treated mice also treating mice with extract or sylimarin protect liver from increasing of lipid peroxide as a response of liver injury with paracetamol in both methods of treatments, as hepatoprotective or therapeutic. *Origanum syriacum* extract significantly decrease LPC as compared to paracetamol group and there is no significant difference between ve- control group (injected with saline) and group treating with extract as hepatoprotective agent, these results are true with sylimarin. Treating mice with extract as therapeutic agent showed the best result in decreasing LPC as compared to paracetamol group.

The obvious mentioned results shows that the extract significantly increase all determined antioxidant enzyme activities and glutathione concentration so it Table (1): Antioxidant activity of *Origanum syriacum* extract in paracetamol induced - liver injury in mice

significantly reduces lipid peroxide concentration in both cases, hepatoprotective or therapeutic agent, and it is superior than sylimarin and the best result was

compared to control

a P<0.001, compared to paracetamol group b P<0.05,

c n.s., compared to control

recorded in case of extract as therapeutic agent.

Injection of paracetamol in an over dose significantly increased protein production in liver tissue while it was decreased when these animals were treated with extract or sylimarin as hepatoprotective agents and sylimarin as therapeutic agent although it was significantly increased when extract used as therapeutic agent. There was no significant difference between ve<sup>-</sup> control group and healthy groups treated with OSE and sylimarin also between OSE and sylimarin as hepatoprotective agents, this means that both of OSE and sylimarin have the same effect on protein production in liver tissue.

## 2) Effect of OSE on Liver function

Glutamic-oxaloacetic transaminase was significantly enhanced by paracetamol as mentioned in table (2)

while it was still at the control level when extract was administered as therapeutic agent also GOT was around the recorded values of healthy group when it was administered as hepatoprotective agent. Administration of sylimarin increased GOT when it was administered as hepatoprotective or as therapeutic drug, as compared to healthy group administered saline. The obtained results indicate that *Origanum* extract reduced the danger effect of paracetamol on liver by 72.9% as hepatoprotective and by 74.8% as therapeutic agent. *Origanum* extract showed the same effect on glutamic- pyruvate transaminase so there was no significant difference between healthy group treated with saline or healthy group treated with extract, treating liver injured

animals with extract prevent elevation of GPT by paracetamol administration. It is clear from the recorded activities that treating animals with

sylimarin was less sufficient than *Origanum* extract when used as hepatoprotective or therapeutic agent.

### Histopathological Results:

Using paracetamol had a marked damaging effect on many organs in the body. In liver tissue its effect appears in the form of marked dilatation of the main blood vessels with fibrosis around and multiple foci of cellular infiltration, proliferation of kuppfer cells in blood sinusoids and acidification of some hepatocyte cytoplasm (Fig. 1,b).

**Figure 1:** (a) is a section of liver tissue from a control rat showing the normal structure of it, where the hepatocytes are arranged in the form of plates radiating from the central vein. (b) is a section of liver tissue from a rat received paracetamol showing marked dilatation of blood vessels with fibrosis around (yellow arrow), focal cellular infiltration (black arrow), proliferation of kuppfer cells in blood sinusoids (black arrow head) and acidification of some hepatocyte cytoplasm (green arrow). Signs of apoptosis were observed in the form of DNA fragmentation (yellow arrow head) and karyolysis (white arrows). (c) is a section of liver tissue from a rat received origanum extract and then paracetamol showing mild dilatation of blood sinusoids (arrow head) and cellular infiltration around main blood vessels (arrow). (d) is a section of liver tissue from a rat received sylimarin and then paracetamol showing marked dilatation of blood sinusoids (arrow), vacuolar degeneration in many of the hepatocytes (v) and focal necrotic areas among the hepatocytes (arrow head). (e) is a section of liver tissue from a rat received paracetamol and then origanum extract showing a nearly normal liver tissue except for a little cellular infiltrate around main blood vessels (arrow). (f) is a section of liver tissue from a rat received paracetamol and then sylimarin showing a noticeable dilatation of blood vessels that are surrounded by fibrosis and cellular infiltration (arrow).

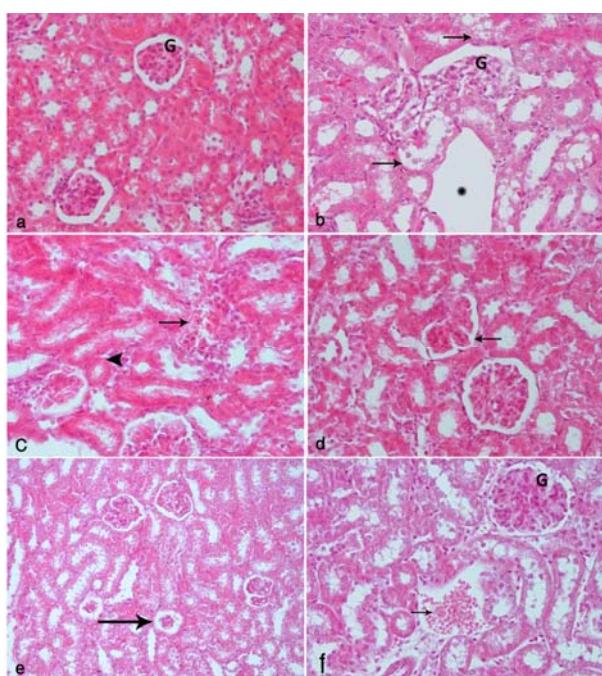

(Hx. & E. X 50, 100)

In our work, examination of renal tissue from mice exposed to paracetamol revealed the presence of deformity of glomeruli and vacuolar degeneration in

tubular lining epithelium in a good number of tubules (Fig. 2,b).

Using origanum extract as a protecting agent before subjecting mice to paracetamol gave moderate results as mild cellular infiltration specially around blood vessels in liver tissue (Fig. 1,C) and some deformed glomeruli in renal tissue (Fig. 2,C) were still noticed.

Using this extract as a treating agent after subjecting mice to paracetamol gave better results. Liver tissue showed quite normal liver tissue except for only very mild cellular infiltrate around blood vessels (Fig. 1,e) and renal tissue showed normal appearance except for a few glomeruli that appeared atrophied (Fig. 2,e).

**Figure 2:** (a) is a section of renal tissue of a control rat showing the normal structure of this tissue composed of glomeruli (G) and different types of tubules. (b) is a section of renal tissue of a rat received paracetamol showing deformation of glomeruli (G), vacuolar degeneration of epithelial lining of the tubules and large gaps denoting edema. (c) is a section of renal tissue of a rat received origanum extract and then paracetamol showing that most of the tubules appear normal (arrow head), while glomeruli show some deformity and/or hemorrhage (arrow). (d) is a section of renal tissue of a rat received sylimarin and then paracetamol showing lobulation of some glomeruli (arrow). (e) is a section of renal tissue of a rat received paracetamol and then origanum extract showing a nearly normal renal tissue except for atrophy of a few glomeruli. (f) is a section of renal tissue of a rat received paracetamol and then sylimarin showing

hemorrhage (arrow) in interstitial tissue. Some of the epithelial lining of tubules show vacuolar degeneration.

(Hx. & E X 50, 100)

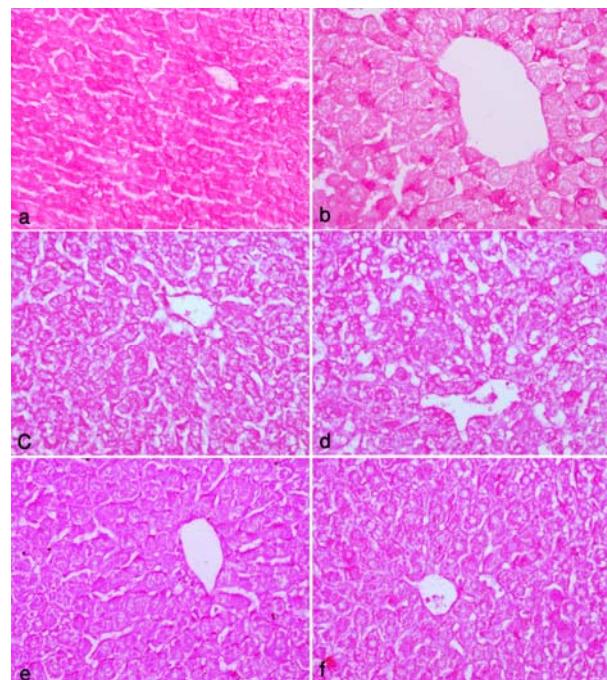

On the other hand, using sylimarin as a protective agent gave less effective results than *Origanum* as in liver tissue marked dilatation of blood sinusoids, vacuolar degeneration in many of the hepatocytes, focal necrotic areas among the cells (Fig. 1,d) and lobulation of some glomeruli in renal tissue (Fig. 2,d) were still present.

Using sylimarin as a therapeutic agent gave better results than those obtained from using it as a protective agent, although still less than those obtained from *Origanum* extract as dilatation of blood vessels with fibrosis and cellular infiltration in liver tissue (Fig. 1,f) hemorrhage and vacuolar degeneration of the epithelial lining of some tubules in renal tissue (Fig. 2,f) was observed.

Results obtained from *Origanum syriacum* extract as a protecting and a treating agent were much better than those obtained from sylimarin used as a protecting and a treating agent respectively.

#### Histochemical results:

The histochemical results of the present work confirmed those of the histopathological investigations as Periodic acid Schiff reagent showed that injection of mice with paracetamol caused marked depletion of mucopolysaccharide content of cells both in liver tissue (Fig. 3, b) and in renal tissue (Fig. 4, b).

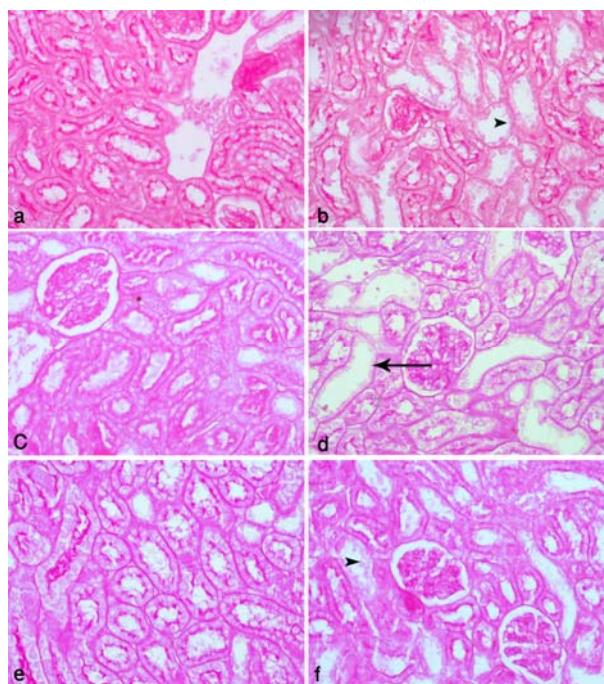

**Fig. 3:** (a) is a section of liver tissue from a control rat showing the normal component of mucopolysaccharides in hepatocytes. (b) is a section of

liver tissue from a rat received paracetamol showing marked depletion of mucopolysaccharides in most of the hepatocytes. (c) is a section of liver tissue from a rat received origanum extract and then paracetamol showing a mild decrease in mucopolysaccharide content in hepatocytes (d) is a section of liver tissue from a rat received sylimarin and then paracetamol showing a moderate decrease in mucopolysaccharide content in hepatocytes if compared with control group. (e) is a section of liver tissue from a rat received paracetamol and then origanum extract showing restoration of the normal mucopolysaccharide content in liver tissue. (f) is a section of liver tissue from a rat received paracetamol and then sylimarin showing a more or less same result as the previous group.

#### (Periodic acid Schiff X 100)

Using origanum extract before subjecting animals to paracetamol led to moderate amelioration in the mucopolysaccharide content in hepatocytes (Fig. 3, C) and renal cells (Fig. 4, C), while using it after injection of paracetamol led to restoration of the normal content of mucopolysaccharides in both liver tissue (Fig. 3, e) and renal tissue (Fig. 4,e).

**Fig. 4:** (a) is a section of renal tissue of a control rat showing the normal content of mucopolysaccharides in renal tissue, being localized at the basement membranes of renal tubules and Bowmen's capsules and also in the brush borders of proximal convoluted tubules. (b) is a section of renal tissue of a rat received paracetamol showing loss of positive reaction of the stain at the site of brush borders of many tubules (arrow head). (c) is a section of renal tissue of a rat received

origanum extract and then paracetamol showing a positive reaction of the stain at the normal places but with less density of the stain if compared with the control group. (d) is a section of renal tissue of a rat received sylimarin and then paracetamol showing a weak positive reaction of the stain and complete loss of it at the site of brush border of some tubules (arrow). (e) is a section of renal tissue of a rat received paracetamol and then origanum extract showing restoration of the normal content of mucopolysaccharide in renal tissue. (f) is a section of renal tissue of a rat received paracetamol and then sylimarin showing a loss of positive reaction of the stain at the site of brush borders of some tubules (arrow head).

#### (Periodic acid Schiff X 100)

Using sylimarin as a protective agent led to slight amelioration of mucopolysaccharide content in hepatocytes (Fig. 3, d) and in cells of renal tissue (Fig. 4, d). Using the same drug as a therapeutic agent gave better results, although they are less than those obtained from origanum extract in both liver tissue (Fig. 3, f) and in renal tissue (Fig. 4, f).

#### 4. Discussion

Drug-induced liver injury (DILI) is a major health problem that challenges not only health care professionals but also the pharmaceutical industry and drug regulatory agencies. According to the United States Acute Liver Failure Study Group (Rumack, 2004), DILI accounts for more than 50% of acute liver failure, including hepatotoxicity caused by overdose of acetaminophen (39%) and idiosyncratic liver injury triggered by other drugs (13%). Because of the significant patient morbidity and mortality associated with DILI, the U.S. Food and Drug Administration (FDA) has removed several drugs from the market (Elgayar et al., 2001). Paracetamol is widely used as an analgesic and antipyretic agent. However, accidental or intentional intake of high doses often causes acute hepatocellular necrosis with high morbidity and mortality (Park et al., 2005& Qiu et al., 2001). It was reported that many mechanisms are involved in paracetamol hepatotoxicity, Jaeschke et al. (2003) showing that the toxicity is mediated by CYP450 metabolism of paracetamol to N-acetyl-p-benzoquinone imine which covalently binds to critical proteins leading to inactivation of these proteins, especially after GSH depletion. CYP2E1 is usually assumed to be the most active CYP450 in catalyzing the metabolism of paracetamol to hepatotoxic NAPQI (Xia Chen et al., 2009).

The histopathological results of the present work go in coincidence with these reported findings as multiple foci of cellular infiltration, proliferation of Kupffer cells in blood sinusoids and acidification of some hepatocyte cytoplasm can be explained by the fact that the toxicity of paracetamol is mediated by generation of rather toxic

metabolite, N-acetyl- p-benzoquinone imine, whose detoxification may lead to a dramatic depletion of hepatic GSH (Yokozawa and Dong, 2001).

Deformity of glomeruli and vacuolar degeneration in tubular lining epithelium in a good number of tubules observed in sections of renal tissue from animals subjected to paracetamol are in coincidence with Ortiz *et al.* (2000) who stated that an acute paracetamol overdose can lead to potentially lethal liver and kidney failure in humans and experimental animals and in severe cases to death. Paracetamol is a phenacetin metabolite. Phenacetin was considered one of the most nephrotoxic analgesics. Tubular cell loss is a characteristic feature of both acute renal failure and chronic renal disease and is observed when cell death predominates over mitosis. Apoptosis is an active form of cell death that offers the opportunity for therapeutic intervention.

There is increasing evidence to suggest that the endoplasmic reticulum stress apoptotic pathway is important in the kidney, specifically in tubular epithelial cells. It has been found that the expression of GADD153, a marker of endoplasmic reticulum stress, is increased in tubular epithelial cells during paracetamol-induced apoptosis. (Corinal *et al.*, 2004).

The Importance of antioxidant constituents of plant materials in maintaining health and in protecting against many diseases and cancer is raising interest among scientists, food manufacturers and consumers, as the trend of the future is moving towards functional food with specific health effects (Kahkonen *et al.*, 1999). In our present study, we evaluate *Origanum syriacum*, aqueous methanolic extract, hepatoprotective and therapeutic activities as compared to sylimarin which recommended as hepatoprotective drug. The antioxidant activity of extract in liver tissue was used as indicator for amelioration of liver to be healthier as compared to ve<sup>r</sup> control group and paracetamol induced liver injury group. It increased GST, GR, SOD, GSH and decreased lipid peroxides.

Glutathione-S-transferases are multifunctional enzymes, which play a key role in cellular detoxification. The enzyme protect cells against toxicant by conjugating them to glutathione, thereby neutralizing their electrophilic sites, and rendering the products more water soluble, the glutathione conjugates are metabolized further to therapeutic acid and then excreted. The enzyme is comprised of both cytosolic and microsomal enzyme.

Cellular glutathione peroxidase is a member of peroxidases enzyme whose function is to detoxify peroxides in cell because peroxides can decompose to form highly reactive radicals, the GP<sub>X</sub> play a critical role in protecting cell from free radical damage. It catalyzes the reduction of H<sub>2</sub>O<sub>2</sub> to organic peroxides

using glutathione as a source of reducing equivalents (Paglia and Valentine, 1967).

Superoxide dismutase is metalloenzyme that catalyzes oxygen and hydrogen peroxide and thus form a crucial part of the cellular antioxidant defense mechanism that prevent body from disease linked to oxidative stress. Lipid peroxide concentration was determined as indicator for oxidative status of liver tissue.

Using *Origanum* extract as a protecting agent gave moderate results in both liver and renal tissue as mild cellular infiltration specially around blood vessels in liver tissue and some deformed glomeruli in renal tissue were still noticed, while using it as a therapeutic agent gave better results because liver tissue showed quite normal appearance except for only very mild cellular infiltrate around blood vessels and renal tissue appeared normal except for a few atrophied glomeruli.

*Origanum* effect on liver status may due to the high content of polyphenol in *Origanum* extract. It has a high content of total phenols and flavonoids also *Oregano* extracts (aqueous and methanol extracts) have very high polyphenol content while anthocyanins and catechins represent a smaller amount (Cervato *et al.*, 2000). Rosmarinic acid is a dominant component detected in Oregano aqueous tea also the Oregano aqueous extract contains eriocitrin, apigenin-7-O-glucoside, luteolin-7-O-glucoside, Caffeic acid, quercetin, luteolin and apigenin so the aqueous tea infusions of *Oregano* represented a good source of the compounds with significant antioxidant activity (Kulisic *et al.*, 2006)

In conclusion, the results indicate that the sufficient activity of *Origanum* extract in hepatic protection against administration of paracetamol in an over dose as liver injury drug. All results shows the role of *Origanum* extract in liver amelioration to be in a healthy status and it is more effective than sylimarin as hepatoprotective or therapeutic drug but it is superior as therapeutic than hepatoprotective also it is sufficient to decrease the oxidative stress on liver as mentioned in magnification of glutathione-antioxidant system and detoxification in liver with glutathione path way.

## Water quality status of Golden Key Lake in Clement Town, Dehradun, Uttarakhand

Avnish Chauhan\*, Mayank Pawar\* and Showkat Ahmad Lone

\* Department of Applied Sciences, College of Engineering, Teerthanker Mahaveer University, Moradabad-244001  
Department of Environmental Science, Uttarakhand College of Science and Technology, Dehradun-248001

**Abstract:** An attempt has been made to understand to provide information on the physico-chemical characteristics of Golden Key Lake which is being used for aquaculture, were studied between Nov 2008 to Feb 2009. All the parameters has been correlated with each other and each parameters has shown correlation matrix with different parameters at selected sites.

[Avnish Chauhan, Mayank Pawar and Showkat Ahmad Lone. Water quality status of Golden Key Lake in Clement Town, Dehradun, Uttarakhand. Journal of American Science 2010;6(11):459-464]. (ISSN: 1545-1003).

**Keywords:** TDS, TSS, pH, DO, COD, Ca, Mg, K, Golden Key Lake.

### Introduction:

Physico-chemical features of water and sediment play important role in structure and functioning of the lake ecosystem Okram, *et al.*, 2003). Water is one of the most abundant compounds found in nature covering approximately three-fourths of surface of the earth (Beebi *et al.*, 2004). Water is the elixir of life, a precious gift of nature of mankind and millions of other species living on the earth. It is fast becoming a scarce commodity in most part of the world (Usharani *et al.*, 2010). Water is an essential requirement of human and industrial development and also it is one of the most delicate parts of the environment (Das and Acharya, 2003). Attention on water contamination and its management has become a need of the hour because of for reaching impact on human health (Sinha and Srivastava, 1995). Continuous assessment of physical, chemical and biological parameters of water is an essential part of current water quality control programmes. These efforts lead to accumulation of considerable information which cannot usually produce direct judgmental determination of water quality (Sharifi, 1990). In the present study the physico-chemical status of Golden Key Lake, Clemet Town, Dehradun, Uttarakhand State of India was investigated.

### Material and Methods:

**Study Area:** Dehradun is capital of Uttarakhand, famous for its beauty, basmati rice, litchi and also a centre of various research institutes as well. It is bounded in the north by the higher range of lesser Himalaya and in the south by the younger Shivalik ranges. The river Yamuna and Ganga from the

valley's western and eastern boundaries in the NW and SE direction, respectively. Geographically the Doon valley lies between latitude 29° 55'N and 38° 30'N, longitude 77° 35'E and 78° 20'E covering an area of about 3088 sq. km, with a population of 12,82,143 (as per 2001 census). (Chauhan, 2008).

**Study Sites:** The study carried out between November 2008 to February 2009 to asses the physico-chemical characteristics of Golden Key Lake in Clement Town of Dehradun. The lake divided in to two compartment I<sup>st</sup> & II<sup>nd</sup>, the I<sup>st</sup> compartment has an area about 2000 m<sup>3</sup> while the II<sup>nd</sup> compartment has an area about 4500 m<sup>3</sup>. The lake is used for aquaculture purpose and various species like *catla*, *catla*, rohu, silver carp etc. are cultured here and various types of trees and plant grow on its bank. Four sites were selected for evaluation the physico-chemical properties of Golden Key Lake, site 1 lies in east direction of lake whereas site 2 is located in the centre of the lake while site 3 is located in the south-west direction of the lake and site 4 is located in north direction of lake.

### Result and discussion:

Physico-chemical parameters were studied during November 2008 to February 2010 for the samples collected from four selected sites of Golden Key Lake. Physico-chemical parameters for the selected sites are presented in Table-1-4, while correlation matrix values among these parameters are given in Table 5-8.

pH value observed between 6.5 to 7.10, 6.9 to 7.08, 7.01 to 7.43 and 7.54 to 8.0 at site 1, 2, 3 and 4, respectively. TDS value was reported between as 120.0 to 146.0, 308.0 to 400.00, 200.1 to 217.0 and 363.0 to 400.0 mg/L at site 1, 2, 3 and 4, respectively. DO was reported as between 20 to 2.9, 5.8 to 6.7, 5.9 to 6.9 and 5.9 to 6.1 mg/L at site 1, 2, 3 and 4, respectively, whereas the value of COD was reported as ranged between 200 to 290.0, 100.0 to 104.0, 112.0 to 115.0 and 109.0 to 110.8 mg/L at site 1, 2, 3 and 4, respectively. While in case of chloride was ranged between 54.6 to 65.1, 17.9 to 26.1, 9.9 to 19.1 and 5.9 to 12.7 mg/L at site 1, 2, 3 and 4,

respectively. Negi et al., have studied 13 physico-chemical parameters viz. water temperature, DO, Free CO<sub>2</sub>, alkalinity, TDS, total hardness, chloride, phosphates and nitrates of Hinval freshwater stream and Ganga River water during 2005-2007. Nagdali and Gupta also reported some important physico-chemical parameters and nutrients of Metropole of famous Nainital Lake of Uttarakhand, India. Okram et al., (2003) also studied the physico-chemical parameters of Waithou Lake in Manipur state of India on monthly basis. Spence (1967) reported that pH of the oligotrophic lakes ranges from 4.8 to 8.0 whereas in the eutrophic lake he range is 7.7 to 9.6.

Table: 1, showing monthly variations in physico-chemical characteristics of Golden Key Lake at site 1.

**Abstract:** The objective of the present study was to determine the effects of *Lactobacillus acidophilus* on the sensory attributes, ripening time, and composition of Gouda cheese and to investigate the survival of *L. acidophilus* during ripening. Five types of Gouda cheeses, control cheese (Tc), made with mesophilic lactic starter bacteria, Ta1, Ta2, Tb1 and Tb2 cheeses made using modified mesophilic lactic starter bacteria by freeze-shocked at -10°C/-20°C for 24, 96 hrs and probiotic Lactobacillus, as adjunct culture. Cheese samples were assessed for microbiological and compositional properties, proteolysis, and sensory evaluation at different ripening stages. The composition and the pH value were almost identical between control and experimental vats within a single trial cheese. Characterization of proteolysis of gel electrophoresis of cheese samples at various stages of ripening showed that the extent of casein degradation varied between samples in all cheeses,  $\alpha_{S1}$ -Casein was more extensively degraded than  $\beta$ -casein. However, levels of soluble nitrogen (SN/TN) increased with ripening period for all cheeses, only moderate enhancement of proteolysis as in amino acid -N in all trials. The formation of non protein nitrogen (NPN/TN) was slightly increased compared to control at the end of ripening. Organoleptic evaluation showed that probiotic cheese had higher sensory evaluation than control cheese, without probiotic strain. The population of Lactobacillus survived to numbers  $> 10^7$  cfu/g, which is necessary for positive effects on health. These results showed that the contribution of modified mesophilic lactic starter bacteria by freeze-shocked and probiotic strain as adjunct culture can be successfully used in production of Gouda cheese.

Keywords: Physically freeze-shock mesophilic starter, probiotic bacteria, proteolysis Gouda cheese.

## 1. Introduction

Cheese is an excellent dietary source of high-quality protein, vitamins and minerals such as absorbable dietary calcium. Gouda Dutch type semi hard cheese is a traditional, creamery, hard cheese. It is round with very smooth, yellow, waxed rind. The flavor is sweet and fruity. As time passes, the taste intensifies and becomes more complex. Mature Gouda (18 months plus) is coated in black wax which provides a stark contrast to the deep yellow interior. Gouda is considered to be one of the world's great cheeses. A great deal of research in Cheddar cheese technology is devoted towards the addition of adjunct cultures which may accelerate ripening times or to improve flavor (Wilkinson, 1993). The use of attenuated starters was first proposed by Petterson and Sjöström (1975) to accelerate the ripening of Svecia, a Swedish semi-hard cheese; these authors attenuated

cells by heat treatment. Besides heat treatment, other methods to achieve attenuation have been studied including freezing and thawing, freeze or spray drying, lysozyme treatment, use of solvents, and natural and induced genetic modification. Freezing cells at sub-optimal conditions reduces the viability of lactic acid bacteria. Stressed cells do not contribute significantly to acid production during cheese making, but may retain protease and peptidase activity (El-Tanboly 1991). Frozen cells may lyses to a greater extent than non-frozen cells, and thus release intercellular enzymes (Barteis *et al.*, 1987). Dairy foods, including in particular, fermented milks and yogurt are among the best accepted food carriers for probiotic cultures. The aim of this study was to develop new probiotic foods, particularly, the production of high quality Gouda cheese containing high levels of probiotic bacteria. The dairy products

with probiotic bacteria recognition as functional foods that provide health benefits beyond basic nutrition and the emerging clinical evidence to their potential in preventing some diseases have notably enlarged their consumption and stimulated innovation and new product development (Boylston *et al.*, 2004; Ong *et al.*, 2007). Although yogurt and fermented milks have received the most attention as carriers of probiotic bacteria, some cheese varieties such as Gouda, white and Cheddar cheeses (Gomes *et al.*, 1995; Kasmoglu *et al.*, 2004; Ong *et al.*, 2007). Cheeses have a number of advantages over fermented milks as a delivery system for viable probiotic microorganisms, because they generally have higher pH and buffering capacity, more solid consistency, and relatively higher fat content (Ong *et al.*, 2007; Joutsjoki, 2009). These features give protection to probiotic bacteria during storage and passage through the gastrointestinal tract. To exert positive health effects, the microorganisms need to be viable, active, and sufficiently abundant, in concentrations of at least  $10^6$  cfu/g throughout the shelf life (Vinderola *et al.*, 2000; Narvhus, 2009). The aims of this study was to influence of physically modified mesophilic lactic starter bacteria by freeze-shocked and probiotic strain of Lactobacillus, as adjunct on the rate of ripening Gouda cheese and flavor development.

## 2. Materials and Methods

### Mesophilic lactic starter bacteria and adjunct lactobacilli conditions

The mixed strains of mesophilic lactic starter bacteria 022 and adjunct lactobacilli used for experiments were obtained from the Production Laboratory of Dairy Biopreparation in Olsztyn, Poland. Bacteria were inoculated at 2% (v/v) into sterile 10%(w/v) reconstituted non-fat milk (RNFM). It was subcultured at least twice for 18 hrs at 23°C before treatment. Overnight adjunct lactobacilli (37°C for 16 h) were obtained from (MRS) broth. Cells were harvested by centrifugation at 8,000 x g for 20 min at 4°C. The resultant pellet was washed twice with saline solution (0.9% NaCl in distilled water) and resuspended in 10% sterile skim.

### Mesophilic lactic starter bacteria modification

Biomass cells of mixed mesophilic lactic starter bacteria 022 were physically modified by freeze-shocked at -10, -20°C for 24 and 96 hrs. thawed the following experimental moring at 40°C and added just prior to renneting.

### Gouda cheese manufacturing

Cheeses were manufactured according to the standard procedure Fox *et al.*, (2004) from three trials, T<sub>c</sub> (control) of milk with modified mesophilic lactic starter bacteria, T<sub>a1</sub> (-10°C/24 hr), T<sub>a2</sub> (-20°C/24 hr), T<sub>b1</sub> (-10°C/96 hr) and T<sub>b2</sub> (-20°C/96 hr) made using

modified mesophilic lactic starter bacteria and probiotic Lactobacillus, as adjunct culture.

### Microbiological analysis

Samples cheeses were tested for counts of mesophilic lactic starter bacteria, *L. acidophilus* and coliform bacteria using standard methods (Vanderzant & Splittoesser, 1992). Plate count agar was used for enumeration of mesophilic lactic starter bacteria. Plates were incubated aerobically at 30°C for 48 h. *L. acidophilus* was counted on acidified (pH 5.4) MRS agar and incubated anaerobically at 37°C for 3 days. For the count of coliform bacteria, violet red bile agar was used and incubated aerobically at 37°C for 48 h.

### Chemical analysis of Gouda cheese

pH was measured by pH-meter 646 with glass electrodes, Ingold, Knick, Germany. Titratable acidity (°SH) was done with Soxhlet Hankel method as described by (IDF,1993). Moisture content and cheese fat content was determined according to (IDF, 1986). Secondary proteolysis was measured by nitrogen fraction in cheese. Total nitrogen content (TN) was determined according to method of Kjeidahl, soluble nitrogen at pH 4.6 (SN), Non protein nitrogen (NPN), Peptide-N and Amino acid-N (AAN) was estimated according to as described by (IDF, 1993).

### Organoleptic assessment of Gouda cheese

The cheese were evaluated organoleptically by a team of experienced cheese graders. The cheese samples were characterized by appearance of body, texture and flavor during ripening period. Cheese samples were analyzed chemically, when fresh and after 3 and 6 weeks.

## 3. Results and Discussion

### Gross chemical composition of Gouda cheese

The composition of Semi hard cheese was almost identical for control and experimental vats within modified mesophilic lactic starter bacteria and probiotic Lactobacillus, as adjunct culture. The composition was similar between trials with a moisture content ranging 40-41 % , fat 28-30 %, salt in moisture 6.9-8.7 %, protein 24.6-29.4 % and PH 5.4-5.8 at 6 weeks of ripening. However, the production schedules were not altered because of the added modified mesophilic starter and probiotic Lactobacillus, as adjunct culture as illustrated in Table (1). Similar results were described by Degheidi *et al.*, (2007).

### Microbiological analysis

Initial numbers of *L. acidophilus* inoculated into the milk were  $10^5$ - $10^6$  cfu ml<sup>-1</sup>, but they grew rapidly during the one week of ripening and reached to  $10^7$ - $10^8$  cfu g<sup>-1</sup> in trials cheeses, respectively. Rapid growth of *L. acidophilus* might be due to the fermentation of lactose by modified mesophilic starter bacteria. It is well known that lactobacilli grow best

under acidic conditions (Mäkeläinen, *et al.*, 2009). The viable cell numbers of *L. acidophilus* began to decrease after two weeks of ripening, because of the decrease in moisture level, increase in salt content, and the low ripening temperature. Although *L. acidophilus* decreased until the end of the ripening period, it did not decrease below  $10^7$  and  $10^6$  cfu g<sup>-1</sup> in trials cheeses, respectively. As indicated earlier, it is necessary to maintain the viability of *L. acidophilus* at  $\geq 10^7$  cfu g<sup>-1</sup> of cheese, to call the cheese probiotic (Jatila *et al.*, 2009). There were no differences between the trials cheeses for the number of modified mesophilic starter bacteria count during the ripening period. Also, survival and growth of modified mesophilic starter bacteria was similar to that of the *L. acidophilus* at different stages of ripening for trials and Tc cheeses. Similar results were described by Degheidi *et al.*, (2007). Modified mesophilic starter bacteria showed a decline after the one week of ripening. This reduction might be due to the low growth ability of modified mesophilic starter bacteria under acidic conditions (Mundt, 1986). Coliform bacteria were not detected in any of the samples in the present study.

#### **Proteolysis of Semi hard cheese during ripening**

##### **(A) primary proteolysis**

Characterization of proteolysis of gel electrophoresis of cheese samples at various stages of ripening are shown in Fig.1. Polyacryamide gel electrophoresis (PAGE), as well as stacking gel electrophoresis (SGE), showed cheese made with modified mesophilic starter and probiotic *Lactobacillus*, as adjunct culture did not show any distinct proteolysis of  $\alpha_{S1}$ -casein but slight proteolysis was evident as a very faint band in trials Tb1 and Tb2 after just salting of ripening. There was no evidence of proteolysis of  $\beta$ -casein in 0-day old cheese for any trials. After 3-weeks of ripening, Ta1, Ta2, Tb1, Tb2 and Tc had a distinct proteolysis of  $\alpha_{S1-1}$  peptide.

A  $\beta$ -1 peptide appeared as very faint band in all trials.  $\gamma$ -casein were present in all cheeses after 6-weeks ripening. Major differences were observed in amount intact  $\alpha_{S1}$ - and  $\beta$ -casein. Ta1 and Ta2 showed extensive degradation of  $\alpha_{S1-1}$  peptide and increased intensities of  $\gamma_2$ - Casein and  $\beta$ -1 peptide bands. Trials and had smaller amount of  $\alpha_{S1}$ - and  $\beta$ -Casein present as shown in Fig. (1). These results are in agreement with those of Jensen and Ardö (2009). The forgoing results of Polyacryamide gel electrophoresis (PAGE) of cheese samples treated with modified mesophilic bacteria and probiotic culture at different stages of ripening indicate that the proteolysis of both  $\alpha_{S1}$ -casein and  $\beta$ -casein increased during ripening,  $\beta$ -casein was more resistant to hydrolysis than  $\alpha_{S1}$ -

casein which rapidly degraded during ripening, there are also increasing amount of some low-mobility peptides were detected in the  $\gamma$ -casein regions of all cheese samples.

##### **(B) Secondary proteolysis**

Addition of modified mesophilic starter bacteria and probiotic *Lactobacillus*, as adjunct culture, increase soluble-N levels over those in the control in several trials. The rate of proteolysis in Ta2 and Tb1 was higher in the first stage of ripening than when ripening had progressed. On contrary, the rate of proteolysis in Tc , Tb1 and Tb2 was lower in the first stage of ripening (Fig. 2). The data indicated that the Non protein-N values generally increased slightly for Tb1 and Tb2 compared to the control (Tc) at the end of ripening period (Fig. 2). On the both previous cheeses trials contained approximately 6.85 to 8.04% of the Total-N contents at the end of ripening time. Furthermore, it was observed also that the levels of Non protein-N were 32.21 to 38.67% of soluble-N. The accumulation of Peptide-N was increased slightly in modified mesophilic starter and probiotic *Lactobacillus*, as adjunct culture trials than control. Tb2 was greatest being 0.446 and 7.29% (relative to Total-N and soluble-N at the beginning of ripening of ripening time, increased to 2.495 and 14.075% after 6 weeks ripening, respectively.

It was found to increase rapidly in the course of ripening mainly due to the breakdown of protein and peptide. Enhancement of proteolysis was observed only in Tb1 and Tb2 approximately 4.664 and 26.315% increased to 6.601 and 33.920% at the end of ripening period (Fig. 2). Only slight enhancement of proteolysis in T1 and Ta2.

A comparison between the results and those by other investigators would reveal similar influences , Gagnaire *et al.*, (2009) who reported that a heat treated culture of *Lb. helveticus* could be used to increase proteolysis and enhancement of cheese flavour without introducing bitter taste in Swedish hard cheese . This might be due to the results of cell lyses and release of intracellular proteinase of modified starter into surrounding cheese matrix, high level and specificities (Gagnaire *et al.*, 2009).

In view of the foregoing available evidence, it could be concluded that a combination of rennet, regular and modified mesophilic starter bacteria and probiotic *Lactobacillus* was successful in accelerating maturation of Gouda cheese. They were mainly responsible for accelerating casein breakdown and contribute to hydrolysis of medium sized peptides to amino acids nitrogen . it is also clear that maturation time for semi hard cheese can be halved by using modified starter and can improve flavour intensity and reduce bitterness (El-Tanboly *et al.*, 2010).

Table (1) The changes in chemical composition during ripening of Gouda cheese made from modified mesophilic lactic bacteria and probiotic culture during ripening

*Trials	Ripening period (weeks)	Composition (%)				**FDM (%)	***S/M (%)
		fat	protein	Moisture	salt		
TC	0	27.5	22.83	42.70	2.10	47.99	4.92
