The Journal of American Science

The ***Journal of American Science*** is an international journal with a purpose to enhance our natural and scientific knowledge dissemination in the world. Any valuable paper that describes natural phenomena and existence or any reports that convey scientific research and pursuit is welcome. Papers submitted could be reviews, objective descriptions, research reports, opinions/debates, news, letters, and other types of writings that are nature and science related. All the manuscripts will be processed in a professional peer review. After the peer review, the journal will make the best efforts to publish all the valuable works as soon as possible.

Introductions to Authors

1. General Information

(1) Goals: As an international journal published both in print and on internet, *The Journal of American Science* is dedicated to the dissemination of fundamental knowledge in all areas of nature and science. The main purpose of *The Journal of American Science* is to enhance our knowledge spreading in the world. It publishes full-length papers (original contributions), reviews, rapid communications, and any debates and opinions in all the fields of nature and science.

(2) What to Do: *The Journal of American Science* provides a place for discussion of scientific news, research, theory, philosophy, profession and technology - that will drive scientific progress. Research reports and regular manuscripts that contain new and significant information of general interest are welcome.

(3) Who: All people are welcome to submit manuscripts in any fields of nature and science.

(4) Distributions: Web version of the journal is opened to the world. The printed journal will be distributed to the selected libraries and institutions. For the subscription of other readers please contact with: editor@americanscience.org or americansciencej@gmail.com or editor@sciencepub.net

(5) Advertisements: The price will be calculated as US$400/page, i.e. US$200/a half page, US$100/a quarter page, etc. Any size of the advertisement is welcome.

2. Manuscripts Submission

(1) Submission Methods: Electronic submission through email is encouraged and hard copies plus an IBM formatted computer diskette would also be accepted.

(2) Software: The Microsoft Word file will be preferred.

(3) Font: Normal, Times New Roman, 10 pt, single space.

(4) Indent: Type 4 spaces in the beginning of each new paragraph.

(5) Manuscript: Don't use "Footnote" or "Header and Footer".

(6) Cover Page: Put detail information of authors and a short title in the cover page.

(7) Title: Use Title Case in the title and subtitles, e.g. "**Debt and Agency Costs".**

(8) Figures and Tables: Use full word of figure and table, e.g. **"Figure 1.** Annul Income of Different Groups**", Table 1. Annual Increase of Investment".**

(9) References: Cite references by "last name, year", e.g. "(Smith, 2003)". References should include all the authors' last names and initials, title, journal, year, volume, issue, and pages etc.

Reference Examples:

Journal Article: Hacker J, Hentschel U, Dobrindt U. Prokaryotic chromosomes and disease. Science 2003;301(34):790-3.

Book: Berkowitz BA, Katzung BG. Basic and clinical evaluation of new drugs. In: Katzung BG, ed. Basic and clinical pharmacology. Appleton & Lance Publisher. Norwalk, Connecticut, USA. 1995:60-9.

(10) Submission Address: editor@sciencepub.net, Marsland Company, P.O. Box 21126, Lansing, Michigan 48909, The United States, 517-980-4106.

(11) Reviewers: Authors are encouraged to suggest 2-8 competent reviewers with their name and email.

2. Manuscript Preparation

Each manuscript is suggested to include the following components but authors can do their own ways:

(1) Title page: including the complete article title; each author's full name; institution(s) with which each author is affiliated, with city, state/province, zip code, and country; and the name, complete mailing address, telephone number, facsimile number (if available), and e-mail address for all correspondence.

(2) Abstract: including Background, Materials and Methods, Results, and Discussions.

(3) Key Words.

(4) Introduction.

(5) Materials and Methods.

(6) Results.

(7) Discussions.

(8) References.

(9) Acknowledgments.

	3. Faculty of Veterinary Medicine and Pharmacology, University of Maiduguri, P.M.B 1069, Maiduguri, Borno State, Nigeria. E-mail: joechemakan@yahoo.com **ABSTRACT:** Acute and sub-acute toxicities of aqueous extract of Vitex doniana was carried out in rats. The LD50 following intraperitoneal administration estimated at 95% confidence interval was 980 mg/kg. The oral administration of the extract for 21 days at 50,100 and 200mg/kg had beneficial effects on the haematological parameters. There were significant (P<0.05) increases in red blood cell count (RBC) haemoglobine (HB) concentration and packed cell volume (PCV) values in treated rats. The treated animals had leucocytosis, which may be due to increase lymphocyte count observed. The i.p LD50 (980 mg/kg) indicated that the extract is moderately toxic, though the prolong oral administration of the extract under the condition of this study shows that the extract may be toxic at higher doses. Nevertheless, the extract appear to be more beneficial at lower doses and significantly (p< 0.05) improves RBC, HB and PVC values and this effect has potential application as anti-anaemic agent. This seems to provide justification for its use as anti-anaemic agent in African traditional medicine. [Journal of American Science. 2010;6(12):8-12]. (ISSN: 1545-1003). **Keywords:** Vitex doniana, Red blood Cell Count, Haemoglobin Concentration, Packed Cell Volume, Anaemia, Aqueous Extract		
3	**Evaluation of Antioxidant Effect of Nigella sativa oil on Monosodium Glutamate-Induced Oxidative Stress in Rat Brain** Neveen, A. Noor* and Iman, M. Mourad Zoology department, Faculty of science, Cairo University, Egypt; *neveen.nour5@gmail.com Abstract: Oxidative stress is a characteristic feature in a number of neurodegenerative disorders. The present study evaluates the antioxidant effect of Nigella sativa oil (NSO) in comparison to that of vitamin C (vit.C) in the cortex and hippocampus of rats pretreated with monosodium glutamate (MSG) as an animal model of oxidative stress. The intraperitoneally injected MSG (4 mg/g body wt.) for 6 consecutive days induced significant decreases in cortical and hippocampal catalase activity and cortical glutathione-S-transferase (GST) activitity and glutathione reduced (GSH) level after 4 weeks. Oral administration of vit.C (200 mg/kg) to stressed rats restored catalase activity, increased GST activity and decreased malondialdehyde (MDA) level after 4 weeks in the cortex. Oral administration of NSO (1 ml/kg) for 4 weeks to MSG-treated rats increased cortical and hippocampal catalase activity and cortical GSH content but significantly inhibited GST activity and increased MDA level in the cortex. Combined administration of vit.C and NSO revealed nonsignificant changes in cortical and hippocampal parameters, as compared to control levels, except for a significant decrease in hippocampal GSH content. In conclusion, although there are some antioxidant effects of NSO, the pro-oxidant effect of NSO cannot be ruled out in the present MSG model of oxidative stress. [Journal of American Science. 2010;6(12):13-19]. (ISSN: 1545-1003). **Key words:** Oxidative stress, monosodium glutamate, vitamin C, Nigella sativa oil, cortex, hippocampus	Full Text	3
4	**Modulating Effect of Carvedilol on Doxorubicin-Induced Cardiomyopathy and Hepatic Damage** Safinaz S. Ibrahim*, Maged A. Barakat and HebaTullah S. Helmy Biochemistry Department, Faculty of Pharmacy, Cairo University, Cairo, Egypt. * dr_safinaz_747@hotmail.com **Abstract:** Background: Doxorubicin is an anthracyclin antibiotic that is considered as one of the most effective antitumor agents. The clinical use of doxorubicin soon proved to be hampered by such serious problems as hepatotoxicity and most notably cardiomyopathy. Objectives: The current study aims at evaluating the efficiency of carvedilol as an adjuvant therapy with doxorubicin to protect against doxorubicin - induced cardiomyopathy and hepatic damage. Materials and Methods: Animals were divided into normal group and doxorubicin -treated group injecting doxorubicin as a dose of 2.5 mg/kg/twice weekly/ 3 weeks. Doxorubicin - treated animals were divided into two groups, one kept without further	Full Text	4

	treatment (doxorubicin group) and second group, (doxorubicin + carvedilol), received carvedilol 1mg/kg/ 7 times over a period of 4 weeks including a dose before doxorubicin 1st dose. Creatine phosphokinase, lactate dehydrogenase, as cardiac damage markers, and alanine aminotransferase, as indicator of hepatic damage, were measured. Malondialdehyde and nitric oxide levels, as cardiac oxidative status indices, glutathione content, glutathione peroxidase, glutathione-S–transferase and superoxide dismutase activities, as measures for cardiac antioxidant capacity, were also investigated. Histopathological changes in cardiac and hepatic tissues of all groups were examined. Results and Conclusions: Our results revealed that doxorubicin caused oxidative stress which plays a major role in doxorubicin -induced cardiomyopathy and hepatic damage. Co-administration of carvedilol in concomitant with doxorubicin caused protection against doxorubicin–induced cardiomyopathy; however, it augmented doxorubicin -induced hepatic damage. Histopathological examination of cardiac and hepatic tissues supported the previous biochemical results. [Journal of American Science. 2010;6(12):20-32]. (ISSN: 1545-1003). **Keywords:** Doxorubicin, carvedilol, cardiomyopathy, hepatic damage		
5	**Effect of Water Stress and Ascorbic Acid on Some Morphological and Biochemical Composition of Ocimum basilicum plant.** 1Soha E. Khalil, 2 Nahed G. Abd El- Aziz and 1Bedour H. Abou Leil 1Departments of Water Relation and Field Irrigation, National Research Centre, Dokki, Cairo, Egypt 2Department of Ornamental and Woody Trees, National Research Centre, Dokki, Cairo, Egypt Soha_khalil2001@yahoo.com **Abstract:** Basil (Ocimum basilicum c.v. Thai Magic) is an annual herb plant belonging to the lamiaceae family that used as drug, mainly cultivated for leaves and flowering topes, the plant yield have an essential oil on steam distillation. The experiment was conducted to study the effect of different levels of water stress (30, 50 and 70% depletion of available soil moisture), different concentrations of ascorbic acid (0, 100, 150 and 200 ppm) and spraying time (at vegetative or vegetative plus flowering stages) on some morphological and biochemical characteristics of basil plant. A pot experiment was conducted in a split-split plot design with 24 treatments and three replicates in greenhouse. The results of staticall analysis showed that water stress, ascorbic acid concentrations and spraying time have significant effect on morphological and biochemical characteristics. Plant height, number of branches, number of leaves, leaf area, fresh and dry weights of the first cut showed significant increase under 50% soil moisture level while further increase in water stress level showed significant decrease in previously mentioned parameters. The same tendency was observed for relative water content % as well as photosynthetic pigments concentrations (chla, chlb, total chla+b and carotenoids). While in the second cut, the previously mentioned characters showed progressive decrease with increasing water stress level (except for photosynthetic pigments which revealed the same trend as in the first cut). Reveres trend observed for oil% and proline content. The data also indicated that the application of ascorbic acid in different concentrations showed significant increase in all growth parameters, fresh and dry weights, relative water content, oil % and photosynthetic pigments compared with control treatment and revealed decrease in proline accumulation. [Journal of American Science. 2010;6(12):33-44]. (ISSN: 1545-1003). **Keywords:** Water Stress; Ascorbic Acid; Biochemical Composition; Ocimum basilicum	Full Text	5
6	**Isolation and Screening of a Feather-Degrading Keratinolytic Actinomycetes from Actinomyces sp** T.Jayalakshmi 1, P. Krishnamoorthy 1,, G.Ramesh kumar 2, P.Sivamani 3 1 Dept of Bioinformatics, Bharath University, Chennai,Tamilnadu - 600073, India. 2 Dept of Bioinformatics, MIT Campus, Anna University, Chennai, Tamilnadu-600044, India. 3 Microlabs, Vellore, Tamilnadu-632521, India. jayamaniraaja07@gmail.com	Full Text	6

	ABSTRACT: The Actinomycetes comprise a ubiquitous order of bacteria which exhibits wide physiological and morphological diversity. These microorganisms are particularly abundant in alkaline soils rich in organic matter. Keratin is an insoluble structural protein of skin, and its derivatives (e.g. feather, hair, wool and horn) are known for their high stability. Actinomycetes producing keratinases are having high applications in feed, fertilizer, leather and also for pharmaceutical and biomedical applications. Actinomyces species newly isolated, thermo tolerant feather degrading bacterial strain was investigated for its ability to produce keratinase enzyme. Maximum keratinolytic activity was observed at 28°C and pH 7.5. Keratin-containing materials (feather, hair, wool, etc.) are abundant in nature but have limited uses in practice since they are insoluble and resistant to degradation by the common proteolytic enzymes. Keratinous wastes represent a source of valuable proteins and amino acids and could find application as a fodder additive for animals or source of nitrogen for plants. Actinomycetes have the ability to break down many different varieties of organic compounds. The keratinase production by the thermophilic actinomycete strain Actinomyces was induced by chick feather as the sole source of carbon and nitrogen in the cultivation medium and characterization studies were carried out for the identification of the specific strain. [Journal of American Science. 2010;6(12):45-48]. (ISSN: 1545-1003). **Keywords:** Keratin, Actinomycetes, Antibacterial activity, Actinomyces		
7	**Denaturation and Viscosity of Whey Proteins Solutions as Affected by Frozen Storage** Soliman, T.N.*1, A.F. Farrag1; A. Shendy2 and El-Sayed, M.M.1 1Dairy Dept. National Research Centre, 2Dairy Dept. Faculty of Agriculture, Al-Azhar University, Cairo, Egypt. Tariknour.nrc@gmail.com **Abstract:** Concentrated solutions of whey proteins (WPC) were prepared from sweet whey by ultrafiltration technique, and stored at – 18°C up to three months. Denaturation degree and viscosity of WPC solutions were assessed. Denaturation degree of whey protein solutions increased significantly ($P<0.05$) as affected by duration of frozen storage and protein content. The highest degree of denaturation was found at pH 5.0 and 7.0 after one month of storage. Denaturation percentages of heated and thawed WPC solutions increased significantly ($P<0.05$) as function of storage, protein content and pH. The flow properties of unheated WPC solutions exhibited a time-independent non-Newtonian behaviour as shear-thickening (dilatants) properties with an increase in the apparent viscosity with increasing the shear rate. Heated thawed WPC solutions behaved as thixotropic fluids with a decrease in the apparent viscosity with increasing shear rate. Apparent viscosities of unheated and heated WPC solutions greatly affected by frozen storage, protein content and pH. [Journal of American Science. 2010;6(12):49-62]. (ISSN: 1545-1003). **Key words:** WPC, Frozen storage, Denaturation, Viscosity	Full Text	7
8	**Evolution and Development Towards 4th Generation (4G) Mobile Communication Systems** M. Junaid Arshad, Amjad Farooq, Abad Shah Department of Computer Science and Engineering, U.E.T., Lahore-Pakistan junaidarshad@uet.edu.pk amjadfarooq@uet.edu.pk abadshah@uet.edu.pk Abstract: It is the need of hour to get ourselves acquainted with the communication technology, its tools and its trends. Mobile communication is an important technology in this regard and mobile phone has become the most common tool of communication over the recent years. As a number of innovative improvements in the field of mobile communication technologies have been made by developing various multiple-access schemes used for wireless communication (such as TDMA, FDMA, CDMA, WCDMA, EDGE etc) but a big challenge is to select the right technology for the applications and systematically identify the factors that influence the overall performance. In this research paper, we present the detail comparison of the different generations of the mobile communication technologies in a tabular form to have a better knowledge and understanding in the advancement of mobile communication systems. The survey presented here will be helpful for designing the new strategies for the development of 4th	Full Text	8

	generation mobile communication systems. This research work can steer all those learners who are trying to enhance their acquaintance in the field of mobile communication system, and also for such mentors and researchers who desire to have a foundation for further research and study in this field. [Journal of American Science. 2010;6(12):63-68]. (ISSN: 1545-1003). Keywords: Mobile Communication, Evolution, Generations, Comparison, Wireless Technologies		
9	**A Layered approach for Similarity Measurement between Ontologies** Amjad Farooq, M. Junaid Arshad and Abad Shah Computer Science and Engineering Department, University of Engineering and Technology, Lahore-Pakistan amjadfarooquet@gmail.com **Abstract:** With the vision of Semantic Web, the ontology operations such as aligning, merging and mapping have gained much importance. The measuring of similarity between concepts of source ontologies is preprocessing of all these operations. Several techniques have been proposed for measuring similarity between concepts based on their lexical, taxonomic and elementary characteristics but a very little attention has been given on their non-taxonomic relations. We have observed that lexically similarity between concepts is mandatory in order to their taxonomic similarity. Furthermore, the taxonomic similarity between two concepts is pre-requisite of their non-taxonomic similarity. This motivates that if the similarity measurement process is made in layered fashion then it will become more efficient. In this paper, a new technique is proposed that includes non-taxonomic relations of concepts along with their lexical and taxonomic characteristics while measuring their similarities. The proposed technique works in a layered fashion that enables the measuring process more efficient. [Journal of American Science. 2010;6(12):69-77]. (ISSN: 1545-1003). **Keywords:** Ontology Matching, Lexical Similarity, Taxonomic Similarity, non-taxonomic similarity	Full Text	9
10	**Physicochemical Parameters in Soil and Vegetable Samples from Gongulon Agricultural Site, Maiduguri, Borno State, Nigeria** 1J. C. Akan, 1F.I. Abdulrahman, 2O.A. Sodipo, 1A. G. Lange 1. Department of Chemistry, University of Maiduguri, P.M.B 1069, Maiduguri, Nigeria. 2. Department of Clinical Pharmacology and Therapeutics, College of Medical Sciences, University of Maiduguri, Maiduguri, Nigeria. E-mail: joechemakan@yahoo.com **ABSTRACT:** Anthropogenic activities are a leading cause of metal emission, often associated with high elevated soil and plant metal concentrations. The accumulation of heavy metals and anions in soil and vegetables in the vicinity of Gungulung agricultural site were investigated. Soil samples were collected at depths of 0-5 cm, 5-10 and 10-20 cm. Soil properties including pH, electrical conductivity (EC), organic matter, organic carbon, cation exchange capacity (CEC) and heavy metals content were determined using standard procedures. Vegetable samples (spinach, Amaranthus caudatus; carrot, Daucus carota; lettuce, Lactuca sativa; cabbage, Brassica oleracea; tomato, Lycopersicon sculenetum; waterleaf, Talinum Triangulare and onion Allium cepa were used for this research. The plant samples were prepared for heavy metals and anions determination using standard procedures. Results show that the soil metal content, conductivity and organic carbon decreased with depth, suggesting anthropogenic sources of contamination while pH, organic matter and CEC decreased with depth. The results obtained from this analysis revealed that Zn and Mn show the highest concentrations, Ni shows the lowest levels. Similarly, the results also revealed that Fe, Zn and Cu show the highest concentrations, while Pb shows the lowest levels in the whole vegetables parts studied. The leaves contained much higher concentrations of heavy metals and anions than roots and stems. The concentrations of the above parameters in the vegetable samples were	Full Text	10

	higher than the FAO, WHO/EU and FAO/WHO allowed limit. The high values might be attributed to the use of wastewater from river Ngada and application of sewage sludge by farmers for the irrigation of these vegetables. The results of this study suggest that the vegetables grown in the vicinity of Gugulung agricultural site are subjected to anthropogenic activities. Thus, the high values of these metals in the vegetable samples could put the consumers of these vegetables at health risk with time due to bioaccumulation. [Journal of American Science. 2010;6(12):78-87]. (ISSN: 1545-1003). **Key words:** Physicochemical, Parameters, Soil, Vegetables, Bioavailability, Uptake		
11	**Data Networks' Design and Optimization through MPLS VPNs using BGP** Mohammad Junaid Arshad 1, Tauqir Ahmad 2, Amjad Farooq 3 1, 2, 3 Department of Computer Science & Engineering, University of Engineering and Technology Lahore, Pakistan. junaidarshad@uet.edu.pk **Abstract:** The key strong points of the Internet have been its vast scalability and flexibility to provide accommodation to the variety of applications. In this context, MPLS (Multi Protocol Label Switching) is the newest technology being employed today's in the Internet core, which is continuously growing to meet the increasing demands of bandwidth and connectivity. In this research work, we provide a survey of MPLS, BGP (Border Gateway Protocol) and both layer-2 and layer-3 VPNs (Virtual Private Networks). We address the issues (such as speed, scalability and security) of traditional IP-based VPNs. Since layer-2 VPNs are efficient but not so intelligent and scalable, while layer-3 VPNs are intelligent and scalable but not so efficient. Thus, we propose a new design scheme for MPLS/BGP-VPNs in such a way that the features of layer-3 as scalability and intelligence are merged with the efficiency of layer-2 to deal with today's evolving demands of speed, scalability and security. The proposed design of optimized data networks through MPLS/BGP-VPNs is implemented in Dynagen simulator for the better understanding the system. This research work will be helpful for adding new security features in core networks in future and provides a guideline for network engineers towards the world of network security. [Journal of American Science. 2010;6(12):88-95]. (ISSN: 1545-1003). **Keywords:** BGP-Border Gateway Protocol, MPLS-Multi Protocol Label Switching, QoS-Quality of Service and VPN-Virtual Private Network	Full Text	11
12	**GRIAS: GUI-Based Real-Time Industrial Automation Software** Mohammad Junaid Arshad 1, Amjad Farooq 2 1, 2 Department of Computer Science & Engineering, University of Engineering and Technology Lahore, Pakistan. amjadfarooq@uet.edu.pk junaidarshad@uet.edu.pk **Abstract:** Industry has a great importance in the development of a country. These days a country cannot progress and prosper without industrial development. Industrial revolution has changed the fortune of many western countries. In the fast moving world of today, the industrial plants have become very complicated and many new technologies have been introduced in the market to overcome these complications by automating the industrial plants. This work proposes an industrial automation software called GRIAS (GUI-Based Real-Time Industrial Automation Software) that can be used for any industrial plant in which OPC (OLE (Object Linked Embedding) for Process Control) compliant hardware devices are used. This generic software has the ability to interact with an OPC server which is responsible to retrieve runtime data from the hardware device. The data provided by the server can be used by the software to monitor the running industrial plant. It can also be used in critical industrial units where it is very difficult to manually control the machinery. The industry has been looking for such software which can meet up their requirements, thus, this new industrial automation software will surely be able to realize their dreams into reality. The purpose of this automation software is not only to eliminate the perils and hazards involved in industries but also to speedup the process of manufacturing and production in such a	Full Text	12

	way that it is no more error prone. [Journal of American Science. 2010;6(12):96-101]. (ISSN: 1545-1003). **Keywords:** Graphical User Interface (GUI), Human Machine Interface (HMI), Design, Industrial Automation, OPC, Solution		
13	Arch Dam Failure Diagnosis Applying Micro-Planes Damage Based Framework Mojtaba Labibzadeh 1 1. Department of Civil Engineering, Faculty of Engineering, Shahid Chamran University, Ahvaz, Iran Labibzadeh_m@scu.ac.ir Abstract: A recently new developed set of constitutive equations which simulating the mechanical behavior of plane concrete have been implemented for monitoring the probability of cracking phenomenon within an arch concrete dam . The applied constitutive model was build on the basis of combination of micro-plane theory and damage framework. This model had been verified through comparing numerical results with experimental ones. The case study is a high elevated concrete arch concrete dam entitled Liroo dam. Obtained analysis results demonstrated that under proposed earthquake excitations, dam experiences some cracks near its middle crest. [Journal of American Science. 2010;6(12):102-107]. (ISSN: 1545-1003). **Keywords:** Arch dam, Micro-planes, Cracks, Constitutive relations, Concrete	Full Text	13
14	**Exploring the Potential and Constraints to Implementing the International Best Practice Principles of EIA Follow-up: The Case of Pakistan** Obaidullah Nadeem1 , Rizwan Hameed2 Department of City and Regional Planning, University of Engineering and Technology, Lahore, Pakistan. 1obaidnadeem@yahoo.com; 2d_rizwan@hotmail.com **Abstract:** Every Environmental Impact Assessment (EIA) carried out for development projects in Pakistan includes a long list of mitigation measures and an environmental management plan (EMP). The environmental approvals also contain numerous conditions including implementation of EMP during construction and operation phases of development projects. Without appropriate follow-up and compliance monitoring the entire exercise may go waste. That is why follow-up is considered essential to ensure positive outcome of EIA by protecting the environment and learning lessons for its improvement. In this regard, the International Association for Impact Assessment has suggested best practice guiding and operating principles. This paper attempts to explore the potential and constraints to implementing these principles in Pakistan. Various data sources including interviews with the officials of environmental protection agencies, project proponents, EIA consultants and representatives of some of the affected communities as well as review of EMPs have been used to provide empirical evidence for this purpose. This paper identifies some potential but overall it argues that a lot more is needed to be done to bridge the gap between the international best practice principles and the current state of EIA follow-up in Pakistan. Some imperative steps have also been suggested in this context to improve follow-up and hence strengthen the overall process for EIA. It is expected that other developing EIA regimes may also benefit from the suggestions. [Journal of American Science. 2010;6(12):108-121]. (ISSN: 1545-1003). **Keywords:** EIA follow-up; Best practice principles; Pakistan.	Full Text	14
15	**Effect of Trichoderma Species on Damping off Diseases Incidence, Some Plant Enzymes Activity and Nutritional Status of Bean Plants** Abd-El-Khair *1, H., R. Kh. M. Khalifa 2and Karima, H. E. Haggag3 1*Plant Pathology Department, 2Fertilization Technology Department, National Research Centre, and	Full Text	15

	3Pest Rearing Department, Central agricultural Pesticides Laboratory, Dokki, Giza, Egypt. **Abstract:** Fusarium solani and Rhizoctonia solani are the common causal pathogens causes the damping off disease of beans (Phaseolus vulgaris L.) in Egypt. The antagonistic effect of four Trichoderma species, i.e. Trichoderma album, Triechoderma hamatum, Trichoderma harzianum and Trichoderma viride, was tested against F. solani and R. solani in vitro, in greenhouse and in field. In vitro tests, all Trichoderma spp. significantly reduced the mycelial growth of two pathogenic fungi. In greenhouse experiment, T. album, T. hamatum, T. harizianum and T. viride, as soil treatments, significantly reduced the pre- and post-emergence damping off disease incidence under artificial infection with F. solani and R. solani. Soil treatments with four Trichoderma species significantly reduced the incidence of damping off disease where the percentages disease incidence were in the range of 7.0 -20.0% and 2.4 – 6.5%, compared to 25.7 and 13.5% in control plants, at pre- and post-emergence stages ,respectively. The best protection to damping off disease was obtained by T. hamatum, followed by T. viride, T. album and T. harzianum, respectively. The treatments gave the highest plant survival (%) and improved the growth and yield parameters. Results showed that the levels of chitinase, peroxidase and polyphenol oxidase activities highly increased in treated bean plant compared in untreated plants. The macro- and micro-elements content in treated bean plants was affected by Trichoderma species treatments compared to elements content in untreated plants. The relationship between plant nutrient content and some plant enzymes activity was studied. [Journal of American Science. 2010;6(12):122-134]. (ISSN: 1545-1003). **Key words:** Fusarium solani, Rhizoctonia solani, Phaseolus vulgaris, Trichoderma spp., biological control, nutritional atatus		
16	**Phase I Trial: Mesenchymal Stem Cells Transplantation in End Stage Liver Disease** El-Ansary M,1 Mogawer Sh,2 Abdel-Aziz I,3* and Abdel-Hamid S,1 Department of Clinical Pathology1, Department of Hepatology and Gastroenterology2 Cairo University, *3Department of Haematology (Theodor Bilharz Research Institute), Cairo, Egypt. *iman_khaled@yahoo.com **Abstract:** Background, End-stage liver disease and in particular human liver cirrhosis represents a worldwide health problem. Currently, liver transplant is the only effective treatment, but it is affected by many problems including relative lack of donors, operative damage, risk of rejection and high costs. Stem cell therapy is very attractive in this setting because it has the potential to help tissue regeneration while providing minimally invasive procedures and few complications. The aim of this study was to evaluate the effect of autologous transplantation of bone marrow derived mesenchymal stem cells in cirrhotic patients following chronic hepatitis C virus infection. Methods, Twelve patients with Child C liver cirrhosis, Model of End Stage Liver Disease (MELD) score > 12 were included. They divided into 2 groups according to method of MSCs injection, 1st group was injected intrasplenic and 2nd group was injected through the peripheral blood. First group patient's ages ranged from 32 to 69 years, mean value was 48.50 ±11.09, they were 4 males (67%) and 2 females (33%). Second group patient's ages ranged from 43 to 59 years, mean value was 50.83 ±6.88, they were 5 males (83%) and 1 female (17%). Fifty ml bone marrow was aspirated from the iliac bone for separation of MSCs. Surface expression of CD271 and CD34 were analyzed using flowcytometry. Finally approximately 10 million MSCs/ 5ml saline were infused intrasplenic or peripherally in one session. There was highly statistical significant difference between CD271 before and after culture, p value was <0.01. Results, Monthly Follow up of patients for 6 months revealed partial improvement of liver function tests with decline of elevated bilirubin and liver enzymes and elevation of prothrombin concentration and serum albumin levels. There was statistically significant difference between total bilirubin, direct bilirubin, MELD score and creatinine level before and after MSCs injection in both groups, p value was <0.05. Conclusion, MSCs are the most potent component of bone marrow cells in its ability to differentiate into hepatocytes thus, MSC transplantation can be used as a potential treatment for liver cirrhosis. The dose, frequency and route of administration of this treatment are still to be defined. [Journal of American Science. 2010;6(12):135-144]. (ISSN: 1545-1003). **Keywords:** End-stage liver disease; liver cirrhosis; liver transplant; autologous transplantation; bone marrow; mesenchymal; stem cell	Full Text	16

17	Role of Hepcidin in Anemia of Chronic Hepatitis C Patients Salwa Toima1, Abeya Saleh*1, Mona Madkour1, Olfat Hammam2 and Emad EL-Din Baioumi3 1Hematology Department, 2Pathology Department, 3Hepatology and Gastroenterology Department, Theodor Bilharz Research Institute, Cairo, Egypt. dr.abeyasaleh@hotmail.com **Abstract:** This study was done to clarify the role of hepcidin in the regulation of iron homeostasis and development of anemia in chronic hepatitis C (CHC) patients targeting the differentiation of the type of anemia. Patients and methods: This study was conducted on 70 CHC patients. Iron profile and soluble transferrin receptor (sTfR) were measured. Transferrin saturation and transferrin receptor ferritin (TfR-F) Index were calculated. Serum prohepcidine hormone and IL6 levels were measured (ELISA). Histopathological examination and immunohistochemical detection of hepcidin were done. According to the iron profile patients were reclassified into iron deficiency anemia (IDA) group, anemia of chronic disease group (ACD) and combined anemia group (COMBI). Results: 64.3% of patients were of the COMBI group, 10% had ACD and 25.7% had IDA. Hepcidin was increased in Child C group ($P<0.05$). Hepatic expression of hepcidin showed reduced expression in Child A, B and C groups. Hepcidin level was found to be increased in ACD and COMBI group in comparison to control and IDA group. Stepwise logistic regression demonstrated that sTfR was the most predictive parameter for IDA while hepcidin was the most predictive parameter for ACD and COMBI in CHC patients. Conclusion: hepcidin plays an important role in the pathogenesis of anemia in CHC patients. The role of hepcidin in discriminating different types of anemia in CLD is comparable to that of sTfR/logFn index. An appropriate combination of both tests provides evidence for iron depletion or reflects excessive production of hepcidin which will help to establish a correct diagnosis of IDA, ACD or combined anemia in patients with CHC. [Journal of American Science. 2010;6(12):145-154]. (ISSN: 1545-1003). **Key words:** Hepcidin, CHC, IDA, ACD, Anemia	Full Text	17
18	**Controversial Role of Two Different Local Haemostatic Agents on Bone Healing** Ali Sawan 1 Yousry Elhawary2 Mohamed Zaghlool Amer*3 and Mohamed Abdel Rahman4 1 Professor Of Oral & Maxillofacial Surgery-,2Associate professor Of Oral Biology, 3 Lecturer of Oral & Maxillofacial Surgery- Faculty of Dentistry-Mansoura University, 4 B.D.S 2002- Ministry of Health, Mansoura –Egypt. *norhanmohammed910@yahoo.com **Abstract:** Controversial role of different local haemostatic agents on bone healing represented a major challenge for oral & maxillofacial surgeons. So, this study was directed to evaluate the effect of water soluble alkylene copolymer hemostat (ostene) versus bone wax on bone healing. Material & Methods: Forty five adult male rabbits weight 1kg were divided into three equal groups. A surgical bone defect was created into the anterior mandibular area. In 1st group the surgical defects were not subjected to any of local haemostatic agents. In 2nd group water soluble alkylene copolymer was applied within surgical defect and bone wax was applied within the 3rd group. Postoperatively, 3 animals were sacrificed from each group at 1, 2, 3, 6 and 12 weeks for histological assessment through H&E and Trichrome stain Results: Water soluble alkylene copolymer hemostat treated defects showed faster healing rate in 1st, 2nd weeks than defects left untreated. Ostene was disappeared from surgical defect at 1st week without presence of inflammatory cells in the defect. In 3rd group, the defects showed large empty vacuoles, representing bone wax remnants with inflammatory cells infiltration that interfere bone healing. Conclusion: Water soluble alkylene copolymer is biodegradable material that does not interfere with bone healing in contrast with bone wax which causes foreign body reaction, leading to interference of bone healing. [Journal of American Science. 2010;6(12):155-163]. (ISSN: 1545-1003). **Key words:** Local Haemostatic Agents- Bone wax- Ostene	Full Text	18
19	**A Framework for Testing Software Product**	Full Text	19

	Amjad Farooq[1], M. Junaid Arshad[1] and Muhammad Abuzar Fahiem[2] [1, 2]Computer Science and Engineering Department, UET, Lahore [2]Department of Computer Science, Lahore College for Women University, Lahore, Pakistan amjadfarooq@uet.edu.pk **Abstract:** There is a growing need of frameworks for automatic testing of software product because manual testing of huge software product is very time-consuming and costly. Furthermore, the manually testing of complex software becomes more difficult and a challenging activity. However this can be easily achieved through automatic testing strategies. In this paper we propose a framework for testing software automatically. Now errors and bug finding become simpler and easier. It takes less time to test the whole application rather than testing application modules separately. The proposed framework provides programmatic access to most user interface elements. The main propose of our framework is to make testing phase easier and cost efficient. We validate our framework through a case study. By analyzing the results of testing the correctness and completeness of framework is proved. [Journal of American Science. 2010;6(12):164-173]. (ISSN: 1545-1003). **Keywords:** Software testing; test automation; test framework		
20	**Effect of Mineral, Organic Nitrogen Fertilization and Some Other Treatments on vegetative growth of Picual Olive Young Trees.** Laila, F. Hagag1 ; H. S. A. Hassan1; M. Abou Rawash2; H. El-Wakeel2 and A .Abdel-Galel 1 1-Pomology Department, National Research Center, Cairo, Egypt 2- Dept. of Hort. Fac. of Agric. Ain Shams Univ., Shobra El-Khiema, Cairo, Egypt **Abstract:** This study was carried out through two successive seasons (2007& 2008) on cultivated Picual olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on growth parameters at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, plant height, stem diameter, lateral shoot number, lateral shoot length, leave numbers per plant, Percentage of plant height increment, whole plant dry weight were determined and recorded. The obtained results revealed that as follow: plant height, shoot number, shoot length, leaves number and stem diameter were not affected by different treatments in both seasons. Meanwhile, whole plant dry weights were improved by humic acid treatment compared with control and all other treatments in Picual cv. [Journal of American Science. 2010;6(12):174-179]. (ISSN: 1545-1003). **Keywords:** Nitrogen Fertilization; vegetative growth; Picual Olive	Full Text	20
21	**Response of Picual Olive Young Trees to Mineral, Organic Nitrogen Fertilization and Some Other Treatments** M. Abou Rawash2; H. El-Wakeel2; Laila, F. Hagag1 ; H. S. A. Hassan1 and A. Abdel-Galel1 1-Pomology Department, National Research Center, Cairo, Egypt	Full Text	21

	2- Dept. of Hort. Fac. of Agric. Ain Shams Univ., Shobra El-Khiema, Cairo, Egypt **Abstract:** This study was carried out through two successive seasons (2007& 2008) on a cultivated Picual olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on leaf mineral contents at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, leaves dry weight per plant, and leaf mineral content were determined and recorded. The obtained results revealed that as follow: Effect of treatment on Leaves dry weight (g) per plant, fifth treatment with humic acid and sixth treatment with activated dry yeast gave the highest significant values in the first season, meanwhile in the second season fourth treatment with 50% cattle manure and fifth treatment with humic acid recorded higher significant values. Leaf nitrogen content revealed that first, fifth, sixth and seventh treatments showed higher significant values respectively than those of other treatments in the first season. In the second season, the first treatment had higher significant leaf nitrogen content compared with most of other treatments. [Journal of American Science. 2010;6(12):180-186]. (ISSN: 1545-1003). **Keywords:** Picual Olive; Organic Nitrogen; Treatments		
22	**Effect of Bud Load on Bud Behavior, Yield, Cluster Characteristics and some Biochemical Contents of the Cane of Crimson Seedless Grapevines** 1Fawzi M. I. F. 1Shahin M. F. M. and 2Kandil E. A. 1Pomology Department, National Research Center. 2Horticulture Research Institute agriculture Research Center, Giza, Egypt **Abstract:** This study was conducted through the seasons of 2007 and 2008 to determine the optimum bud loads/ vine for Crimson seedless "grapevines. Eight years old uniform vines were chosen and pruned to six different levels of bud load, namely 75, 91, 104, 117, 130 and 143 buds/ vine. Number of buds was fixed at 13 bud/cane. The results showed that the number of bursted buds was increased significantly by increasing bud load /vine in the two seasons of the study, while the percentage of bursted buds decreased. The bud fertility and fruitfulness were decreased by increasing bud load. Data also indicated that 104 or 117 buds/ vine were more suitable for Cirimson seedless grapevines to produce good yield and fruit quality. On the other hand, 78 or 143 buds/vine was unfavorable science it produced rather compact clusters. Increasing bud load increased number of cluster/vine and yield but reduced cluster weight. Vines pruned to 117 bud/vine gave the greatest cluster weight, length, rachis weight, berry weight, berry firmness, adherence, T.S.S and total sugars. Increasing bud load on the vine significantly increased total carbohydrates and protein contents of the canes during the dormant season. In this respect, vines pruned to 143 bud/vine showed higher percent of both total carbohydrate and protein contents than the other levels of bud load. [Journal of American Science. 2010;6(12):187-194]. (ISSN: 1545-1003). **Key words:** Grapevine, winter pruning Crimson seedless, bud load, fruit quality.	Full Text	22
23	**The Effect of some Slow Release Nitrogen Fertilizers on Growth, Nutrient Status and Fruiting of "Mit Ghamr" Peach Trees** 1 Kandil, E. A., 2M. I. F. Fawzi, and 2M. F. M. Shahin 1Hortcultural Research Institute, 2 National Research Center, Dokki, Giza, Egypt. **Abstract:** This study was conducted for comparing three slow release N fertilizers namely, urea – formaldehyde, phosphorus – coated urea and sulphur coated- urea and that fast release nitrogen namely (urea) at 500, 750 and 1000g/tree/year for vegetative growth, leaf mineral content, yield and fruit quality of	Full Text	23

	"Mit Ghamr" peach tree grown in a private orchard Aga city Dakahlia Governorate, Egypt, during 2008 and 2009 seasons, were studied. Urea was added at two times at the start of spring growth and after fruit set, while slow – release N fertilizers applied once at the start of spring growth. Results showed that supplying the tree of "Mit Ghamr" peach with the three slow release N fertilizers were superior to the application of the fast one in improving shoot length, leaf area, percentage of leaf N, as well as physical and chemical characteristics of the fruits. Application of sulphur – coated urea (SCU), phosphorus- coated urea (PCU) and urea- formaldehyde in a descending order was very favorable. Generally, "Mit Ghamr" peach trees once with sulphur coated urea at 500-750g/trees/year was the best results on vegetative growth, yield nutritional status of trees and fruit quality. In addition saving nitrogen fertilization cost and reducing nitrate pollution. [Journal of American Science. 2010;6(12):195-201]. (ISSN: 1545-1003). **Keywords**: N fertilizers; urea; formaldehyde; phosphorus; sulphur		
24	**Influence of Foliar Application of some Nutrient (Fertifol Misr) and Gibberellic Acid on Fruit Set, Yield, Fruit Quality and Leaf Composition of "Anna" Apple Trees Grown in Sandy Soil** 1Shahin M. F. M. 1Fawzi M. I. F. 2Eman. A. K and 2kandil E. A. 1Pomology Department, National Research Center, 2Horticulture Research Institute agriculture Research Center, Giza, Egypt. **Abstract:** The effect of Fertifol Misr (N, P, K, Mg zn, Fe, Mu, Cu, Mo & B) and gibberellic acid on fruit set, drop percentage, yield, fruit quality and leaf chemical composition on "Anna" Apple trees were studied during 2007 and 2008 seasons. Results showed that, fruit set%, drop%,, yield, leaf minerals & chlorophyll contents as well as physical and chemical characters of the fruit were positively effected by single or combined application of Fertifol Misr and gibberellic acid compared to unspraying .There was a slight promotion on such characters with increasing Fertifol Misr concentration from 1.5 – 2.5 g/l. The best results with regard to yield and fruit quality were obtained due to spraying "Anna" apple trees three times with a mixture containing Fertifol Misr at 2.5 g/l and gibberellic acid at 20ppm. [Journal of American Science. 2010;6(12):202-208]. (ISSN: 1545-1003). **Key words:** Anna apple, foliar application, nutrients, gibberellic acid.	Full Text	24
25	**Anti-Ulcer Effect of Cinnamon and Chamomile Aqueous Extracts in Male Rats** Amr, A. Rezq* and Maysa, M. Elmallh Nutrition and Food Science Department, Faculty of Home Economics, Helwan University, Cairo, Egypt. *dr.amr_rezq@yahoo.com **Abstract:** Peptic ulcer disease is a problem of the gastrointestinal tract. Nowadays, drugs are expensive and have many side effects during treatment of any disorders. Therefore, our study aimed to investigate and compare antiulcer effect of cinnamon and chamomile aqueous extracts at doses of (100, 200, 300, 400mg/kg of body weight) with antiulcer drug (Zantac ™ Ranitidine). Fifty male rats weighing 160±5g were distributed into ten groups. Group I serves as a positive group. Group II serves as control group (treated with drug). Groups III, IV, V and VI were administered orally the different doses of cinnamon aqueous extract (CIAE). Groups VII, VIII, IX and X were administered orally the different doses of chamomile aqueous extract (CHAE). Values of pH and volume of gastric juice, ulcer area and curative ratio were estimated as well as histopathological examination of gastric. Results revealed that treatment with Zantac and CIAE or CHAE was associated with significant increase in the pH values compared to the respective value of the positive group. CHAE was superior to that of CIAE. Oral administration of CIAE or CHAE was associated with significant reduction in the volume of gastric juice compared to positive and control groups. Curative ratios of gastric ulcer were better in rats given CIAE or CHAE over those given Zantac. Furthermore, CHAE was superior over CIAE in its curative ratios of gastric ulcer. Histological examination showed necrosis of gastric mucosa associated with congestion of submucosal blood vessels, submucosal edema and hemorrhage in the stomachs of positive rats. The stomachs of group receiving Zantac showed necrosis of gastric mucosa associated with hemorrhage. Whereas, higher dosages of CIAE	Full Text	25

	(300 and 400 mg/kg of body weight) and CHAE dosages i.e., 200, 300 or 400 mg/kg of body weight were efficient to arrest histopathological changes in the stomachs. Conclusion: our finding concluded that water extracts of cinnamon and chamomile had potential antiulcer effect, which was superior to the respective effect observed with Zantac. Chamomile extracts were more superior to cinnamon in its protection of the stomach. The antiulcer curative ratios were dose dependent with no adverse effects. [Journal of American Science. 2010;6(12):209-216]. (ISSN: 1545-1003). **Keywords:** Chamomile- Cinnamon-Peptic ulcer		
26	**Botanical Studies On Phaseolus Vulgaris L. Ii- Anatomy Of Vegetative And Reproductive Organs** 1 Rania M. A.Nassar, 2 Mohamed S. Boghdady and 3 Yasser M. Ahmed 1- Department of Agricultural Botany, Faculty of Agriculture, Cairo University, Giza, Egypt. 2- Department of Agricultural Botany and Plant Pathology, Faculty of Agriculture, Zagazig University, Egypt. 3- Department of Vegetable Crops, Faculty of Agriculture, Cairo University, Giza, Egypt. **Abstract:** The present study is concerned with the histological features of Kidney bean plant. The anatomical structure of different vegetative and reproductive organs was investigated fortnightly throughout the whole growing season. Studied organs included main root, main stem (represented by apical and median internodes), different types of foliage leaves developed on the main stem and on lateral shoot; including lamina and petiole, flower bud, fruit and seed. Histological features of various organs of Kidney bean plant were analyzed microscopically and photomicrographed. [Journal of American Science. 2010;6(12):217-229]. (ISSN: 1545-1003). **Keywords:** Phaseolus vulgaris L., Kidney bean, Fabaceae, Anatomy, Vegetative organs, Reproductive organs	Full Text	26
27	**Efficacy of Intercropping Mango, Mandarin or Egyptian Clover Plants with Date Palm on Soil Properties, Rhizospere Microflora and Quality and Quantity of Date Fruits** *1H. F. H. Abouziena, 2Elham Z. Abd El-Motty, 3Youssef, R. A. and 4Sahab, A. F. 1Botany Department, 2Pomology Research Department, 3Soils and Water Use D Department, 4Plant Pathology Department, National Research Center, Dokki, Cairo, Egypt. *abouzainah@yahoo.com **Abstract:** Intercropping is claimed to be one of the most significant cropping techniques in sustainable agriculture; to its utilization a number of environmental benefits, from promoting land biodiversity to diversifying agricultural outcome. This model integrates low, medium, and tall plants, as well as plants of short, medium, and long life cycles, including trees. Therefore, a study was carried out to evaluate the impact of intercropping mango (Mangifera indica L.), Balady mandarin (Citrus reticulate Blanco) and Egyptian clover (Trifolium alexandrinum L) crops with date palm on soil chemical properties and quality and quantity of date fruits, in comparison with date palm sole. Rhisosphere of palm (pure stand) had a high concentration of N compared to palms intercropped with mango or mandarin. Intercropped mandarin with palms caused a depletion of N from soil by 14.3%, relative to date palm pure stand. High levels of Zn and Mn in soil were recorded in rhisosphere of clover and palms intercropped with mandarin. The effect of intercropping on occurrence and enumeration of microorganisms in the rhizosphere of trees was also studied. The results indicated that the colony count of fungi and bacteria in date palm rhizosphere were fluctuated according to plantation method. Intercropping date palm with mandarin decreased the total fungal count from 21.17 cfu x 103g-1 in the non- intercropped roots to 16.00 cfu x 103g-1 (24.4% decrease) in date palm root intercropped with mandarin. While, intercropping date palm with mango and clover increased the total fungal count to 118.32 cfu x 103g-1 and 52.00 x103g-1 in date palm root intercropped with mango and clover, respectively. Growing mango or mandarin under date palm resulted in the highest fruit yield/palm. However, intercropping Egyptian clover with date palm caused a significant reduction in fruit diameter. Intercropping mango gave the highest net profit ($8213/ha/yr), followed by the	Full Text	27

	same area intercropped with mandarin ($3992/ha/yr). Evaluation of growing mango, mandarin or Egyptian clover with date palm indicated that growing mango with date palm could be used for combating desertification in sandy soil in arid lands regions and gave the highest net return per unit area. [Journal of American Science. 2010;6(12):230-238]. (ISSN: 1545-1003). **Key words**: intercropping, date palm, Egyptian clover, mango, mandarin, fruit		
28	**Study the Effect of some Metallic Additives on the Physical Properties of the Commercial Pure Aluminum Metal** E.M.Sakr*1, A.Nassar2, N.Tawfik2 and M.Soliman2 1 Physics Department- Faculty of Girls for Arts, Science & Education- Ain Shams University, 2 Physics Division- National Research Center (NRC), Cairo, Egypt. *Elham.sakr@yahoo.com **Abstract:** The aim of the present work is to develop the 6201 alloy, which is the most used for conductor cables by adding different amount of Ce into Al-Mg-Si alloy namely (0.0, 0.024, 0.043, 0.054, 0.133, 0.166 and 0.194 wt% Ce) concentration. Sample alloys were homogenized by annealing at 540º C for various duration in range (½ to 5 hours), followed by water quenching. Tensile tests, hardness, electrical conductivity tests, microstructure characterization in Scanning Electron Microscope (SEM) have all been investigated as-cast and annealing. The results indicate that the alloys with Ce content make a more refined structure of grains and have higher tensile properties especially in range (0.043 to 0.054 wt% Ce) content and also hardly increase resistivity rather than the alloy which is free of cerium. [Journal of American Science. 2010;6(12):239-252]. (ISSN: 1545-1003). **Keywords:** Tensile test, hardness, electrical conductivity, microstructure characterization	Full Text	28
29	**The Role of some Natural Soil Conditioner and AM Fungi on Growth, Root Density and Distribution, Yield and Quality of Black Monukka Grapevines Grown on Calcareous Soil.** *1Mervat, S. Rizk-Alla and 2Hager, I. Tolba 1*Hortcultural Research Institute, 2Microbiology Dep., Soils, Water & Environment Research Institute, Agricultural Research Center, Giza, Egypt. **Abstract**: The current research was carried out during two successive seasons (2007 and 2008) on ten years old Black Monukka grapevines to disclose the role of some natural soil conditioners namely, humic acid (HA), Nile fertile (NF) and AM fungi (AM) in a single application or in combined mixture growth, root density and distribution, yield and quality of Black Monukka grapevines grown under calcareous soil in a private vineyard in Nobaria at Cairo-Alexandria Desert Road; the results showed that all different soil conditioners were effective but the treatment of humic acid at 15 ml/ vine (HA1) + Nile fertile at 200 g/ vine (NF1) + AM fungi gave the best results in comparison with other treatments and control. This treatment enhanced the growth characters namely total leaf area/ vine, shoot diameter and coefficient of wood ripening, total chlorophyll, NPK% of the leaves and total carbohydrates of the canes. Also, the vines of this treatment produced the heighest fibrous root fresh weight, larger number and longest fibrous root. With respect to microbiological activity in the rhizosphere, it was noticed that the best AM infection %, no. of AM spores /g dry soil, total microbial count, phosphatase and dehydrogenase enzymes activity were obtained by the same treatment. From the economic point of view, this treatment was accompanied by the highest yield and best its components namely physical and chemical characteristics of bunches and berries. Under such promising treatment the adverse effects of calcareous soil on growth and production of vines could be overcome. [Journal of American Science. 2010;6(12):253-263]. (ISSN: 1545-1003). **Keywords:** grapevine; humic acid (HA); Nile fertile (NF); AM fungi (AM); microbiological activity	Full Text	29
30	**Microbial Bio-Fertilization Approaches to Improve Yield and Quality of Washington Navel Orange and Reducing the Survival of Nematode in the Soil**	Full Text	30

	Abdelaal Shamseldin1; Mohamed H. El-Sheikh2; H. S. A. Hassan*3 and Kabeil S.S.4 1Environmental Biotechnology Department, 2Horticulture Department at Arid lands Cultivation and Development Institute (ARADI); Mubarak City for Scientific Research and Technology applications, New Borg-Elarab, Alexandria, Egypt, *3 Pomolgy Department, National Research center, Cairo, Dokki-Egypt. 4Protien Research Department at Genetic Engineering and Biotechnology Research Institute (GEBRI) Hsasm2000@yahoo.com **Abstract:** To test the ability of microbial strains Pseudomonas flourescence strain 843 and Azospirillum brasilense strain W24 to improve Washington navel orange fruit quality and to control the persistence of nematode in the soil, strains were applied one time monthly during the period of experiment to trees at two levels 300 ml and 500 ml per tree with 10-8 cells ml-1. Bio-fertilizer inoculation with strain Pseudomonas fluorescence strain 843 growth promoting rhizobacteria was significantly improve fruit quality as well as increased fruit yield, fruit weight, fruit length, TSS and juice volumes, while inoculation with strain Azospirillum brasilence strain W24 increase but not significantly improve fruit quantity and quality of Washington navel orange. Commonly, three types of nematode were detected in the roots including Tylenchulus Spp, saprophytic nematode and Pratylenchulus while the dominant species was Tylenchulus semipenetrans. Generally there is a reduction in the number of nematode with the two examined strains while the addition of Pseudomonas f. strain 843 was successfully greater to inhibit the growth of nematode than Azospirillum b. strain W24 suggesting that this strain can be use as a bio-fertilizer for promoting citrus growth and bio-control for reducing the distribution and propagation of nematode associated with citrus. Enhancement and maintenance of soil fertility and conservation of the soil's health through bio-fertilizer applications will be a vital role and occupy significant concern for many of researcher in the future as a unique key for sustainable agriculture in developing countries. [Journal of American Science. 2010;6(12):264-271]. (ISSN: 1545-1003). **Key words:** Citrus, Bio-fertilizers, Azospirillum brasilence, Pseudomonas fluorescence, Tylenchulus semipenetrans and biological control		
31	**Experimental Natural Prints And The Re-Calculated General Equations Of The Electrical Parameters For Buried Bare Pipe -Soil- Earth System With And Without Applying Cathodic Protection System]** Dr. Ashraf Abdel Raouf Mohamed Fouad Ahmed Canadian International College CIC – Egypt Ashrafahmed9000@yahoo.com **Abstract:** The rate of discharge through the stray electrolytic capacitor between the pipe and the remote earth is to be considered as the corrosion current. The electrochemical properties of the soil, which are the soil resistivity of the soil volume, the relative permittivity of the soil layer around the pipe and the chemical properties which could be considered as the pH of the soil film layer around the pipe, are affected directly by the humidity change. When considering the room temperature and by neglecting the effect of CO2 content in the soil, these values of the electrochemical properties of any soil returns back to its initial conditions after soil dryness to its initial condition. This means that corrosion rate will also be changed during the humidity change around the pipe segment. So, when considering the fact that the pipeline will not be changed or replaced and the surrounding medium around it will not be changed or replaced by another kind of soil, then the behavior of the electrical parameters (stray electrolytic capacitance, stray potential, surface created charge) of the pipe-soil-earth system will act as a print of this combination of this pipe and this soil. This paper recalculates the general form of the equations of the electric parameters and obtains the print curves & constants at natural condition with and without applying cathodic protection system in terms of the electrochemical properties around the pipe. The average error reduced to be less than ± 5%. This will help to study both the corrosion problem and cathodic protection by an electric concept with an electric analogue circuit which is the aim of this study. [Journal of American Science. 2010;6(12):272-283]. (ISSN: 1545-1003).	Full Text	31

32	**A Systematic Approach for Mobile Agent Design Based on UML (Class and Sequence Diagrams)** M. S. Al_Kholy, A. R. Khalifa and M. G. Alsaied Systems and Computer Engineering Department, Faculty of Engineering, Al-Azhar University, Cairo, Egypt **Abstract:** Agent researchers are still trying to determine useful ways to represent agents and agent-based systems. So, this paper presents a proposal for a Systematic Approach for Agent Design by using a Unified Modelling Language (UML) diagram. Here we illustrate notions for the behavior of an agent using and extending UML class diagrams. Focus on representing the agent migration from take requests and between other hosts. In this case study, we explain one variant of notation that is the most suitable for given scenario, show that it is easier to design agent applications based on agent UML, by developing software for our case study generated by UML software package. [Journal of American Science. 2010;6(12):284-290]. (ISSN: 1545-1003). **Keywords:** Mobile Agent Design, Class Diagram ,Sequence Diagram, UML, A Systematic Approach	Full Text	32
33	**EFFECT OF VANADIUM TOXICITY IN CLARIAS LAZERA** Mona S. Zaki[1]; Nevin E.Sharaf[2] and Mostafa H. Osfor[3] [1]Head of Department of Hydrobiology, National Research Center, Cairo, Egypt. [2]Department of Environmental and Occupational Medicine, National, Research Center, Cairo, Egypt . [3]Department of Nutrition, National, Research Center, Cairo, Egypt dr_mona_zaki@yahoo.co.uk **Abstract:** The effect of dietary carbohydrates and vanadium toxicity on haematalogical profile, blood chemistry and hormonal level was studied in cat fish Clarias Lazera. Fish were divided into 3 groups (n=10) and exposed to different doses of vanadium sulfated and carbohydrate. Group1 was served as control, group 2 was fed with carbohydrate and vanadium sulfate (10 mg/ Kg diet ration), group 3 was fed with carbohydrate and vanadium sulfate (15 mg/Kg diet ration). There is a significant decrease in hemoglobin and P.C.V in group (3). There is a significant increase in serum cortisol, cholestrol, AST, ALT, urea, creatinine and alkaline phosphatase in group (3), also there is a significant decrease in serum phosphorous, sodium and potasium in treated fish. There is a significant high level of vanadium content in kidney muscles, heart and spleen in group (3) suggesting toxic effects of vanadium on cat fish Clarious Lazara. The total viable count of bacteria identified higher in fish fed on carbohydrate vandium. Predominate bacteria were identified as Aeromonas, E. coli, Staph aureus. Pseudomonas, Fluorscences and Lacto bacilus species. We emphasize the finding that increase in carbohydrate concentration causes harmful pathological effects which reduces humoral immune responses and enhances dietary vanadium toxicity. 37	**Lambda, the pyrethroid insecticide as a mutagenic agent in both somatic and germ cells.** Abdel Aziz K.B. and Abdel Rahem H.M. Cell Biology Department, National Research Center, Cairo, Egypt.	Full Text	37

	k.badrakhan.yahoo.com **Abstract:** Cytogenetic evaluations of pyrethroid insecticide cyhalothrin (lambda) were investigated in mice *in vivo* by recording chromosomal aberrations in bone marrow cells and in primary spermatocytes. Cyhalothrin (lambda) insecticide was orally administrated with 2, 2.5, 5 mg/kg b.wt. (1⁄10, 1⁄8, 1⁄4 LD50 doses respectively) for repeated treatment. Cyhalothrin (lambda) was found to produce a significant structural and numerical chromosomal damage after subacute treatment in both bone marrow cells and primary spermatocytes. This effect was dose and time-dependent. For studying sperm abnormalities, mice were orally treated with the highest dose, 1⁄4 LD50. Cyhalothrin (lambda) insecticide was found to induce a significant increase in the percentage of sperm abnormalities which was mainly in the head. The present study clearly indicates that Cyhalothrin (lambda) insecticide is genotoxic to the different kinds of cells analyzed. Accordingly, much more care should be taken during the use of these pesticides. [Journal of American Science. 2010;6(12):317-326]. (ISSN: 1545-1003). **Keywords:** Pyrethroid insecticides; Lambda-cyhalothrin; chromosomal aberrations; Sperm abnormalities; genotoxicity		
38	**Chlorophyll-a dynamics in relation to environmental parameters in a tropical lagoon** [1]P. C. Onuoha, [2]D.I. Nwankwo and [3]Vyverman, W. [1]Department of Fisheries and Marine Biology, Federal College of Fisheries and Marine Technology, Bar-beach Victoria Island, Lagos Nigeria. E-mail- hydro_vision@yahoo.com [2]Department of Marine Sciences University of Lagos, Akoka, Lagos, Nigeria [3]Protistology and Aquatic Ecology Research Laboratory, University of Ghent, Belgium **Abstract:** The chlorophyll-*a* dynamics and environmental factors of the Ologe lagoon, Lagos were investigated for 2 years (Feb., 2002 – Jan., 2004). The environmental indices reflected seasonal changes related to rainfall distributive pattern and tidal seawater incursion. Air temperature (27-34 ^{0}C), surface water temperature (25-32^{o}C), transparency (24-76cm), total dissolved solids (48-294mg/l), salinity (0-0.5‰), conductivity (83-631µS/cm), pH (5.8-8.1), total alkalinity (42-162mg/l), biochemical oxygen demand (0-28mg/l), chemical oxygen demand (6-39mg/l), total hardness (62-342mg/l), cations, and heavy metals recorded increasing values in the dry season than the wet months, while dissolved oxygen (7-12.7mg/l), total suspended solids (7-378mg/l), nitrate-nitrogen (0.02-1.02mg/l), phosphate-phosphorus (0.03-1.79mg/l) and silicate (2.05-9.54mg/l) had higher values in the wet season than the dry season. Estimation of phytoplankton biomass by chlorophyll-*a* concentration ranged from 0.1 to 64.5ug/l with mean value of 16.99ug/l. Values for chlorophyll-*a* were higher in the dry than wet season for the lagoon. Analysis, using Pearson correlation co-efficient recorded positive relationship between chlorophyll-a values and air temperature, surface water temperature, salinity, conductivity, total dissolved solids, pH, transparency, biochemical oxygen demand, chemical oxygen demand, alkalinity, total hardness and cations. Analysis using ANOVA showed significant differences in the sample means of physico-chemical parameters of effluent discharge station (OL4) and the other stations within the lagoon at 5% level of probability. Recorded chlorophyll-*a* values placed the Ologe lagoon between the mesotrophic and eutrophic status. It is suggested that increasing tidal influence associated with reduction in rain events may have encouraged elevated salinities and created conditions for the development of more algal cells, hence higher chlorophyll *a* records. [Journal of American Science 2010;6(12):327-337]. (ISSN: 1545-1003). **Keywords**: Chlorophyll-a, environmental factors, mesotrophic, eutrophic, Ologe	Full Text	38
39	**Effect of Mineral, Organic Nitrogen Fertilization and some other Treatments on Vegetative Growth of Kalamata Olive Young Trees.** Hassan, H. S. A[*1]; Laila, F. Hagag[1]; H. El-Wakeel[2]; M. Abou Rawash[2] and A. Abdel-Galel[1] [1]Pomology Department, National Research Center, [2] Dept. of Hort. Fac. of Agric. Ain Shams Univ.,	Full Text	39

	Shobra El-Khiema, Cairo, Egypt *Hsasm2000@yahoo.com **Abstract:** This study was carried out through two successive seasons (2007& 2008) on Klamata olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on growth parameters at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA_3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, plant height, stem diameter, lateral shoot number, lateral shoot length, leaves numbers per plant, percentage of plant height increment, whole plant dry weight were determined and recorded. The obtained results revealed that plant height, shoots number, shoot length, leaves number and stem diameter were not affected by different treatments. However the fifth treatment with humic acid and seventh treatment with GA_3 spray gave highest significant values of leaf numbers per plant compared with all other treatments in the first season, but in the second one, the differences among treatments lake significance. As for Whole plant dry weight, no significant differences among treatments could be noticed in both seasons. [Journal of American Science 2010;6(12):338-343]. (ISSN: 1545-1003). **Keywords:** Klamata olive; mineral fertilizer; organic fertilizer; growth parameter; plant		
40	**The Proposed Electric Circuit Diagram Of The Buried Bare Pipe Segment- Soil - Earth System With And Without Applying Cathodic Protection System** Dr. Ashraf Abdel Raouf Mohamed Fouad Ahmed Canadian International College CIC – Egypt. Ashrafahmed9000@yahoo.com **Abstract:** Based on proposed electrical concept of corrosion process, it is possible to simulate buried bare pipe segment with the surrounding soil medium by an electric circuit where the circuit electric quantities are function of the electrochemical properties of the soil as 4^{th} degree polynomial equations. The equivalent cylindrical electrolytic capacitor between the pipe and the remote earth and the potential across it, verifies the equation that charge $Q = C \times V$ at natural condition with & without applying cathodic protection system. The created positive charges consists with an equivalent negative charge (electrons losses) a charged stray electrolytic capacitor between the pipe and the earth through thin film soil layer around the pipe as cylindrical capacitor. The amounts of these charges are depending on the electrochemical properties of the soil which are surrounding the pipe segment, the length of the pipe segment and its diameter. The rate of discharge (equivalent to capacitor self discharge) is to be considered as the corrosion current. That's beside the facts deduced before that all electrical parameters prints & equations are function of the electrochemical properties of soil medium around the pipe at different cathodic protection levels. The error of these new equations of the electrical parameters reduced to be less than ± 5%. This will help to study both the corrosion problem and cathodic protection for a complete pipeline by an electric concept with an electric analogue circuit which is the aim of this study. This will help, in the future, in the choice of pipeline route, pipeline cathodic protection design and cathodic protection maintenance process for the pipe line along its route, however long it is. [Journal of American Science 2010;6(12):344-354]. (ISSN: 1545-1003). **Keywords:** Electrical study of pipe – soil – earth system	Full Text	40
41	**Molecular Markers for New Promising Drought Tolerant Lines of Rice under Drought Stress *via* RAPD-PCR and ISSR Markers** Youssef; M. A., Mansour A. and Solliman S. S Genetics Department, Faculty of Agriculture, Zagazig University, Zagazig, Egypt,	Full Text	41

	bakr2000us@yahoo.com **Abstract:** Random amplified polymorphic DNA polymerase chain reaction (RAPD-PCR) and inter simple sequence repeats (ISSRs) markers were performed to detect the genetic diversity among 6 new rice lines and 4 cultivars with different responses to drought tolerance and establish specific DNA markers associated with drought tolerance. Among 16 RAPD primers tested, only 5 produced bands polymorphic between lines with an average of 5.2 bands per primer (ranging from approximately 252 to 1232 bp) and 73.02 % were polymorphic. Among the tested ISSR primers, only five amplified polymorphic ISSR loci with an average number of 4.4 bands per primer (ranging from approximately 80 to 813 bp) and the mean percentage of ISSR polymorphism was 90.91. Based on band polymorphisms generated by RAPD-PCR and ISSR after using the primers, the highest similarity value (0.93) was found between P-5-3-b line and P-5-3-a line and the lowest value (0.44) was found between P-5-3-b line and Giza 172. The dendrogram separated all cultivars and new lines into two clusters and indicated that the cross of tolerant line (P-5-3-b) and susceptible cultivar (Giza 172) is suggested as the most suitable cross for drought tolerance analysis studies as they have the lowest similarity value (0.44) and also grouped in distinct cluster. Since two fragments of about (315 and 505 bp) were visualized using HP15 primer in the genomic DNA of the drought tolerant lines while were absent in the sensitive cultivars, they can be considered as positive drought tolerant markers. [Journal of American Science 2010;6(12):355-363]. (ISSN: 1545-1003). **Key words:** RAPD-PCR, ISSRs, rice, drought stress, dendogram		
42	**Genetic Evaluation and Molecular Markers for Heat Tolerance in Tomato (*Lycopersicon esculentum* Mill.)** M.A. Kamel*[2], S.S.Soliman[1], A.E. Mandour[1] and Mahassen S. S. Ahmed[1] [1]Genetics Department, Fac. Agric., Zagazig University, Egypt, [2] Samtrade trials station, Samtrade, Samir Fahmy Group, Egypt. *kamel_moh77@yahoo.com **Abstract:** Genetic evaluation was performed on twenty three genotypes of tomato (*Lycopersicon esculentum* Mill.) under high temperature at summer season to determine the variation between them for heat tolerance. Heat tolerance related criteria, i.e., pollen viability, fruit setting, osmotic pressure and fruit yield per plant. LSSS1, Homestead 24, Black Russian Plum, Super Marmand and Money Maker possess more tolerance of heat. In contrast, Super Stain B, Castle Rock, Cherokee Purple, Moskvich and Nicholevna Pink were more susceptible of heat. The pollen grain viability and fruit setting criteria consider as suitable morphological markers for heat tolerance than other heat tolerant related criteria as osmotic pressure. Heritability was high and moderately whereas, the genetic improvement of new strains could be done. From previous evaluation, Lsss1 as tolerant line and Super Strain B as sensitive cultivar of heat tolerance was crossed for study of molecular markers related to heat tolerance by using bulk segregant analysis (BSA). Crossing was carried out between these two genotypes to obtain the F_1 seeds which were left for selfing to obtain the F_2 seeds. The two selected genotypes, their F_1 and F_2 plants were evaluated for their response to heat stress by recording some heat stress related traits. Bulk of the two extremely F_2 plants (most tolerant and most sensitive F_2 groups), the two contrasting parents and their F_1, were used to develop some molecular genetic markers associated with heat tolerance in tomato by using ten RAPD and seven ISSR primers. two RAPD markers (with molecular sizes of 100 bp for primers A16 and 500 bp for primer Z13)and one ISSR marker(with molecular size of 650 bp) were considered as reliable markers for heat tolerance as well as susceptible genotypes possessed eight RAPD markers (with molecular sizes 500 and 1500 bp for primer C02, 1750 and750 bp for primer C03, 2400 bp for primer C05, 550 bp for primer C08, 400 bp for primer C14 and 850 bp for primer C15). [Journal of American Science 2010;6(12):364-374]. (ISSN: 1545-1003). **Keywords:** Tomato, Heat stress, Heat related traits, Molecular markers, RAPD-PCR, ISSR-PCR. 43	**The Risk of Primary Open Angle Glaucoma and Glutathione S-Transferase M1 and T1 Polymorphism among Egyptians** Hoiyda A Abdel Rasool[1], Shahira Riad Nowier[2], Moataz Gheith[3], Ahmed T.S. Saif [4] and Somaia Ismail[5]	Full Text	43

	Dept. of Clinical and Chemical Pathology, Fayoum University[1], Dept. of Genetics, Research Institute of Ophthalmology[2], Dept. Ophthalmology, Research Institute of Ophthalmology[3], Dept. Ophthalmology, Fayoum University[4] Dept. Medical genetics, National Research Center[5], Cairo, Egypt **Abstract:** Purpose: Glaucoma, the second leading cause of blindness, is characterized by changes in the optic disc and visual field defects. The elevated intraocular pressure was considered the prime factor responsible for the glaucomatous optic neuropathy involving death of retinal ganglion cells and their axons. Extensive investigations into the pathophysiology of glaucoma now reveal the role of multiple factors in the development of retinal ganglion cell death. Genetic factors and oxidative damage have been shown to have a role in the development of primary open angle glaucoma (POAG). Glutathione S-transferases (GSTs) are a family of enzymes that inactivate xenobiotics and endogenous end products formed as secondary metabolites during oxidative stress. In humans, GSTT1 and GSTM1 deletion genotypes are associated with a variety of pathologic processes including certain ophthalmologic diseases. The aim of this study was to determine the effects of genetic polymorphisms of glutathione S transferase GSTM1 and GSTT1 on the risk of POAG in an Egyptian population. Methods: We compared the prevalence of GSTT1 and GSTM1 deletion genotypes, which were determined by multiplex polymerase chain reaction, in 32 patients with primary open angle glaucoma to 16 age, sex, and ethnically matched controls. Results: The GSTM1 positive genotype had an increased risk of developing POAG ($p< 0.05$, OR 4.681, 95% CI 1.190 – 18.412). The risk of glaucoma also increased significantly in subjects with a combination of GSTM1 positive and GSTT1 null genotypes ($p< 0.05$, OR 4.700, 95% CI 0.959 – 23.033). Conclusion: The GSTM1 positive genotype or the combination of both GSTM1 positive and GSTT1 null genotypes may be associated with the increased risk of development of POAG in the Egyptian population. The overall results indicate a possible variable association between various GSTT1 and GSTM1 genotypes and primary open angle glaucoma. Decreased GST function might interfere with the metabolism of oxidative intermediates and exacerbate the direct or indirect damaging effects of oxidative stress on the optic nerve. It is possible that these GST polymorphisms may be risk factors for primary open angle glaucoma [Journal of American Science 2010;6(12):375-381]. (ISSN: 1545-1003). **Keywords:** Glaucoma; optic disc and visual field defects; primary open angle glaucoma (POAG); Glutathione S-transferases (GSTs)		
44	**Determination of milk urea nitrogen for the Egyptian cattle fed the summer and winter diets.** Ahlam El Shewy; Sobhy Kholif; Tarek Morsy Dairy Sci. Dept. National Research Center, Dokki, Giza, Egypt. ahlam58aa@yahoo.com **Abstract:** Milk urea nitrogen (MUN) equilibrates with and is proportion to blood urea nitrogen. So, it is an excellent indicator of urea nitrogen status in dairy cows. The objective of this study was to determine the MUN during the summer (with a temperature range of 35-40°C) and winter (with a temperature range of 18-22°C) seasons. Forty hetero- parity lactating cattle twenty of each cows and buffaloes, at different stages of lactation were used to collect milk samples. All animals received the diet consisting of concentrate, fodder, and rice straw as 2:1:1 on DM basis. The fodder was berseem(*Trifolium alexandrium*) and rayana corn(*Zea mays mexicana*) in the winter and summer, respectively. The dietary crude protein was 11.38 and 8.97 % and the dietary gross energy was 3.86 and 3.83 Mcal/kg DM for the winter and summer diets, respectively. The results indicated, milk protein content was 3.06 and 3.18 % and MUN was 24.57 and 28.00 mg/dl for cows, while milk protein was 3.96 and 2.67 % and MUN was 19.60 and 28.03 mg/dl for buffaloes during the winter and summer seasons, respectively .This study revealed that the heat- summer significantly ($P<.05$) increased MUN of lactating buffaloes and this phenomenon needs further studies. [Journal of American Science 2010;6(12):382-384]. (ISSN: 1545-1003). **Keywords**: dietary protein, cow, buffaloes, milk urea nitrogen	Full Text	44
45	**In Vitro Propagation of *Tylophora indica*-Influence of Explanting Season, Growth Regulator Synergy, Culture Passage and Planting Substrate** Sulekha Rani, J S Rana*	Full Text	45

	Department of Bio & Nano Technology, Guru Jambheshwar University Of Science & Technology Hisar, Haryana (India) -125001, jogenderrana@yahoo.co.uk **Abstract:** An efficient protocol for rapid clonal propagation of an endangered medicinal plant, *Tylophora indica* (Burm. *f.*) Merrill through *in vitro* culture is described. High frequency bud break (85%) and multiple shoot formation were induced from nodal segments explanted between September through November and cultured on MS medium supplemented with 2.0mg/l BAP. Although callus- free multiple shoot formation was a function of cytokinin activity alone, faster bud break coupled with enhanced frequency of shoot development (95%) and internode elongation were dependent on the synergistic effect of GA_3(0.2mg/l). By repeated sub culturing of nodal segments harvested from the newly formed axenic shoots, prolific shoot cultures, free of proximal callusing, showing a high frequency multiplication rate were established within three months. The percentage shoot multiplication as well as the number of shoots per node attained the highest values (100%, 7 shoots/node) during the first two culture passages; beyond this there was a gradual decline in shoot bud differentiation. Rooting of the excised shoots from secondary or subsequent cultures was best induced on ½ strength MS medium containing 0.5 mg/l IBA. Vermi-compost was the most suitable planting substrate for hardening and its use ensured high frequency survival (96%) of regenerated plantlets prior to outdoor transfer. Regenerated plants get established in pots containing garden soil followed by their transfer to natural soil under full sun. The *in vitro* regenerated plants were uniform and identical in growth characteristics and morphology to the donor plants. [Journal of American Science 2010;6(12):385-392]. (ISSN: 1545-1003). **Keywords:***Tylophora indica,* medicinal plant, micropropagation, culture media, explants, growth regulators		
46	**Kinetic and Electrolytic Conductivity of C.I. Acid Orange 15 and C.I. Acid Red 97 dyes in Different Media** A.M. Gamal Chemistry Department, Faculty of Science, Al-Azhar University (Girls), Nasr City, Cairo, Egypt **Abstract:** The electrolytic conductivities for Acid Orange 15 and C.I. Red 97 have been studied. The electrolytic conductivities have been analyzed by Deby HUckel-Onsager theory, The degree of ionization, α, Van't Hoffs factor, i, and thickness of ionic atmosphere, X^{-1}. were calculated. Each value diminishes with increasing dye concentration. The dye anion transport number, t, mobility's, μ were also computed at infinite dilution. The results provide evidence for the presence of interionic attraction and association. Furthermore the kinetics of two acid dyes has been studied using spectrophotometric and conductimetric methods. The former study was carried out at 28°C at different percentage of solvents. The results revealed that the reaction rate was govemed by a pseudo-first order. [Journal of American Science 2010;6(12):393-399]. (ISSN: 1545-1003). **Keywords :** C.I. Acid Orange 15, C.I. Acid Red 97, solvents, electrolytic conductivity, spectrophotometry, kinetics	Full Text	46
47	**Adsorption of Cadmium (II) and Mercury (II) onto Natural Adsorbent Rice Husk Ash (RHA) from Aqueous Solutions: Study in Single and Binary System** A.G. El-Said, N.A. Badawy, and S.E. Garamon Chemistry Department. Faculty of Science, Al-Azhar University (Girls), Nasr City, Cairo, Egypt **Abstract:** The present study deals with the competitive adsorption of cadmium (Cd(II)) and mercury (Hg(II)) ions onto rice husk ash (RHA) from single component and binary systems. Equilibrium adsorption is affected by the initial pH (pH_0) of the solution. The $pH_0 \approx 6.0$ is found to be the optimum for the individual removal of Cd(II) and Hg(II) ions by RHA. The pH of the system, however, increases during the initial sorption process for about 60 min and, thereafter, it remains constant. The equilibrium adsorption data were obtained at different initial concentrations (C_0 = 10–100 mg/l), 6 h contact time, 25 °C	Full Text	47

	temperature, RHA dosage of 10 g/l at pH_0 6. The single ion equilibrium adsorption data were fitted to the non-competitive Langmuir and Freundlich isotherm models. The Freundlich models represent the equilibrium data better than the Langmuir model in the studied initial metal concentration range (10–100 mg/l). The adsorption capacity of Cd(II) is higher than that for Hg(II) for the binary metal solutions and is in agreement with the single-component adsorption data. The equilibrium metal removal decreases with increasing concentrations of the other metal ion and the combined action of Hg(II) and Cd(II) ions on RHA is generally found to be antagonistic. Equilibrium isotherms for the binary adsorption of Cd(II) and Hg(II) ions onto RHA have been analyzed by using Langmuir and Freundlich models.. Desorption with various solvents showed that the nitric acid is the best solvent; the maximum elution being about 28.41 % for Cd(II) and about 31.53 for Hg(II). [Journal of American Science 2010;6(12):400-409]. (ISSN: 1545-1003). **Keywords:** Mercury (II); Cadmium(II); Binary adsorption; Rice husk ash (RHA); Simultaneous metal removal; Adsorption isotherms		
48	**Impact of Gibberellic Acid Enhancing Treatments on Shortening Time to Budding of Citrus Nursery Stocks** HODA, M.MOHAMED; ABD EL-RAHMAN, G.F. and ABD EL-RAHEEM, M.E. Horticultural institute, Agricultural Research Center, GIza, Egypt. **Abstract:** Screen house experiment was conducted to study the application of gibberellic acid (GA_3) at different concentrations on budding shortening time of Volkamer lemon (*C.Volkameriana* Ten & Pasq) and Sour orange (*C.aurantium L.)* rootstocks in two seasons (2008-2009). Shortening the period to reach suitable diameter for budding seedling would benefit nurserymen by reducing various production inputs and their costs. The results indicated that, the highest success rate of suitable seedlings for budding was in mid-July. This time led to shortening the period for budding about 8 months, whereas, resulting seedlings could be budded because their stem diameter reached of a pencil size (5.4 mm) or larger. Also, this study revealed that, Volkamer lemon rootstock was superior as compared to sour orange rootstock in terms of vegetative growth, root distribution, leaf mineral content and percent of suitable seedlings for budding, while leaves of sour orange contained higher chlorophyll and total carbohydrate. It could be recommended to use T_5 (Soaked seeds and seedling treated with GA_3 at 200 ppm) for giving the best vegetative growth and suitable seedlings for budding in mid July. [Journal of American Science 2010;6(12):410-422]. (ISSN: 1545-1003). **Keywords:** Screen house; gibberellic acid (GA_3); lemon; vegetative growth	Full Text	48
49	**Prognostic Impact of Elevated Serum Hyulronic Acid, Ferritin and Interleukin-6 in Patients with Acute Myeloid Leukemia** **Nabila Abd El Maksoud,[1] Halla M. Ragab[1], Maha M. Abd El Latif[2] and Sh. Abdalla[3]** [1]Department of Biochemistry, Genetic Engineering and Biotechnology Division, [2]Department of research and applications of supplementary medicine, National Research Centre, and [3]Department of Clinical Pathology, El-Sahel Teaching Hospital, Cairo, Egypt . hmragab@yahoo.com **Abstract: Background:** Acute myeloid leukemia (AML) is a clonal disease of hematopoiesis with poor clinical outcome despite recent improvements in chemotherapy and stem cell transplantation regimens. It is the most common acute leukemia in adults. Hyaluronic acid, ferritin and Interleukin-6 are involved in the pathogenesis of acute myeloid leukemia , but their prognostic significance in these diseases is unknown. In the current study, the authors assessed the serum levels of these parameters in different stages of the disease to predict their prognostic value, which might therefore represent interesting target for immunotherapy in patients with different hematological malignancies. **Methods:** Serum levels of. hyaluronic acid, ferritin and Interleukin-6 were measured using a commercially available sandwich Enzyme Linked Immune Sorbent Assay (ELISA) kit in patients with AML who were attending for	Full Text	49

	treatment at National Cancer Institute, Cairo University from September 2006 through January 2009. **Results:** Newly diagnosed and relapsed patients with AML had significantly higher serum levels of hyaluronic acid, ferritin and Interleukin-6 compared with both control group and leukemic patients in remission stage. Serum levels of hyaluronic acid, ferritin and interleukin–6 in patients with AML (at diagnosis and at relapse) correlated inversely with the hemoglobin concentration. While their serum levels correlated positively with both total leukocyte count and with the % of blast cells in bone marrow in patients with AML. **Conclusions**: It could be concluded that serum levels of hyaluronic acid, ferritin and Interleukin-6 can be used as prognostic markers at diagnosis of adult AML and it could be used as follow up parameters for early detection of relapse. Furthermore, they might represent interesting target for immunotherapy in patients with different hematological malignancies. [Journal of American Science 2010;6(12):423-432]. (ISSN: 1545-1003). **Keywords:** Acute myeloid leukemia (AML), Hyaluronic acid (HA), Ferritin (Fe), Interleukin–6 (IL-6).		
50	**The Effect of Green, Roasted and Decaffeinated Coffee on Serum Glucose, Insulin and Serum Lipid Profile in Diabetic Experimental Animals** **Eman A.Sadeek[*1] , Hala, A. Abd El;-Rahman[2] and Waffa, Sh. Ali[3]** [1]Department of Biochemistry & Nutrition -Women's College –Ain –Shams University. [2] Food Tech. Res. Ins. Agric. Res. Center. [3]College of Home Economics, Helwan University. Cairo, Egypt [*]dr_emansadeek@yahoo.com **Abstract:** Aim of the work: Assessing the Effect of green, roasted and decaffeinated coffee on serum glucose, insulin and serum lipid profile in diabetic rat models. Methods: Design of the Study: Thirty female wistar rats weighing 124.5 ±5.41g (mean ±S.D) were divided into 5 groups. The first group served as a control and consumed a standard diet according to (AIN – 93). The other 4 groups were injected intraperitoneally with 105 mg / kg body weight of alloxan . One group was kept without further treatment and served as a positive diabetic control. Groups 3, 4, 5 consumed 5% green, roasted and decaffeinated coffee in drinking water, respectively. The feeding trial continued for four weeks. At the end of the experiments, the animals were sacrificed, blood samples were collected, and the liver, kidney, spleen and heart were separated, washed, dried and weighed. Laboratory investigations Consisted of serum glucose, insulin, calcium, phosphorus and complete lipid profile was determined to test the magnitude of antioxidant potential green, roasted and decaffeinated coffee. Results: The present study show a significant difference ($p < 0.05$) in body weight gain and food intake between all treatment groups , with non significant difference in water intake , relative weight of organs including liver , kidney , spleen and heart . the study also shows significant elevation ($p < 0.05$) in serum glucose and insulin in diabetic control group as compared to normal control group. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ($p < 0.05$) .There is a significant decrease ($p < 0.05$) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green, roasted and decaffeinated coffee respectively indicating an association between coffee consumption and bone health. our results also shows that alloxan injection produced a significant increase($p < 0.05$) in serum total- cholesterol(TC); triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio however a significant decrease ($p < 0.05$) in serum HDL-C is observed ; In diabetic rats compared to normal control .green, roasted and decaffeinated coffee resulted in a significant decrease ($p < 0.05$) in triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ($p < 0.05$) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study. Conclusion: The observed improvement in glucose, insulin profile, triacylglycerol and HDL-C confirm the potent biological action of green, roasted and decaffeinated coffee and suggest that chlorogenic acid (a component in coffee) might have an antagonistic effect on glucose transport. Suggesting a novel function of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well. [Eman A.Sadeek, Hala, A. Abd El;-Rahman and Waffa, Sh. Ali. 51	**Combined at-admission estimation of plasma gelsolin and injury severity score could predict the outcome of multiple trauma patients** Adel F. Al-Kholy [1], Mosad M Odah [1], Jehan Sabry [2], Ehab El-Shahat [3], Ehab Said [3] [1] Department of Medical Biochemistry, Faculty of Medicine, Benha University [2] Department of Clinical Pathology, Faculty of Medicine, Benha University [3] Department of Anesthesia & ICU, Faculty of Medicine, Benha University *adeladel59@yahoo.com* **Abstract**: To estimate plasma gelsolin levels in multiple trauma patients and its predictability for their outcome in relation to clinical data. The study included 70 multiple trauma patients and 20 healthy adult controls for blood donation as control group for the plasma level of gelsolin. All patients underwent history taking, time elapsed since trauma inflection and amount of external bleeding if present. Clinical evaluation included both Acute Physiology and Chronic Health Evaluation II (APACHE II) and Injury Severity Scores (ISS). Patients were evaluated daily throughout their ICU or hospital stay for the development of secondary morbidities and/or mortality. Venous blood samples were obtained at 12 hours after ICU admission for ELISA estimation of plasma gelsolin level. During hospital stay, 20 patients (28.6%) developed secondary morbidities and 8 patients (11.4%) died. Mean plasma gelsolin levels were significantly lower in patients compared to control levels with significantly lower levels in non-survivors compared to controls and survivors. Development of secondary morbidities showed a positive significant correlation with at admission ISS score and a negative significant correlation with plasma gelsolin. Survival rate showed positive significant correlation with plasma gelsolin level and negative significant correlation with both time since trauma inflection and ISS score. ROC curve analysis, defined prolonged time since trauma inflection as the significant sensitive predictor for both morbidity and mortality, while plasma gelsolin level was significant specific predictor for development of secondary morbidity and combined with ISS score were significant specific predictors for mortality. Conclusion: At admission plasma gelsolin level is a specific independent marker for prediction of the development of secondary morbidities that may progress to endanger patients' life and time since trauma inflection was found to be significant sensitive parameter for the patients' survival irrespective of development of these morbidities. 	Abstract: To investigate the relationship between clinical parameters of pre-eclampsia (PE) and serum levels of Retinol binding protein4 (RBP4) and Placental growth factor (PlGF). Patients and Methods: The study included 90 pregnant women categorized as Group I: Control group (n= 20), included pregnant women who continued their pregnancy without development of PE manifestations, Group II: included patients had Mild PE (n=56) and group III included patients had Severe PE (n=14). After clinical evaluation and ultrasonographic examination, samples of maternal peripheral blood were obtained either at time of diagnosis of PE in groups II and III or at time of delivery in control group for ELISA estimation of serum RBP4 and PlGF. Results: PE patients had significantly lower serum PlGF, but significantly higher serum RBP4 levels when compared to the corresponding levels of the control group. Serum levels of PlGF showed negative correlation with systolic and diastolic blood pressures (SBP and DBP) and extent of proteinuria, but showed positive significant correlation with birth weight, while serum levels of RBP4 showed positive significant correlation with DBP, extent of proteinuria and patients' body weight measures. Conclusions: RBP4 and PlGF were associated with the development and severity of PE. [Adel F. Al-Kholy, Mamdouh Z. Abadier, Ebrahem M. 53	**Soil Plant Nutrients and Maize Performance as Influenced by Oilpalm Bunch Ash plus NPK Fertilizer** Ojeniyi, S. O.[1], Awanlemhen, B. E.[2] and Adejoro, S. A.[1*] [1.]Department of Crop, Soil and Pest Management, Federal University of Technology, PMB 704 Akure, Nigeria. [2.]Nigeria Institute for Oilpalm Research, Benin City, Nigeria. solomonadejoro@yahoo.com **ABSTRACT:** The work investigated the effects of combined application of oilpalm bunch ash (OPBA) with NPK fertilizer (NPK) on soil and plant nutrient content and maize performance at two sites in southern Nigeria. Six treatments: control, OPBA at 4 t/ha, NPK (15-15-15) at 300 kg/ha, 75% NPK + 25% OPBA, 50% NPK + 50% OPBA, 25% NPK + 75% OPBA were applied to maize at Nigeria Institute for Oilpalm Research (NIFOR) Benin and Ekiadolor in rainforest zone of Nigeria. Relative to control, other treatments increased soil organic matter (OM), N, P, K, Ca, Mg and pH, and plant nutrients content, growth and cob yield. The effects were generally significant except in case of OPBA alone. The NPK, 75% NPK + 25% OPBA and 50% NPK + 50% OPBA gave significantly high and similar values of the parameters. The treatments increased cob yield by 20 – 22%, OPBA most increased soil pH and K. [Ojeniyi, S. O, Awanlemhen, B. E, Adejoro, S. A. Abstract: The objective of the present study was to explore modification in toxico-pathological responses of rats toward aflatoxins (AF) in the presence of white ginseng. The dietary supplementation with white ginseng (WG) at levels of of 0.0, 1 and 2 % (W/W) of the composition of daily rations, on the performance and toxicity of female Albino rats received aflatoxins-contaminated diets (1.011 mg/kg ration, of dry matter basis), were successively examined for six weeks, as attempt to prevent or minimize the negative probabilities due to ingesting aflatoxin(s) contaminated food. Thirty native apparently healthy female Albino rats with average weight of 100± 3.4 gm., were put under observation for two weeks, then they were divided into five equal groups of six rats each according to their live body weight for performing feeding trials. An exposure study extended for two different stages was conducted using female Albino rats. The 1st stage (pre-treatment) was suggested to compare the performance of animal groupings under the normal conditions before receiving any treatment, either level of contamination(s) or dosage(s) of additive, such stage extended for 2 weeks. The 2nd stage (treatment), the animals received different levels of aflatoxin(s) and the food additive (white ginseng), such stage extended for 4 weeks. Rats treated with AF-contaminated diet alone showed depression, decrease in feed intake, body weight and loose feces. The activities of serum ALT, AST enzymes, which are reflecting liver function, were obviously affected during exposure to aflatoxins, but such levels came back to normal as the level of the WG in the ration increased. Serum urea and creatinine concentrations had also severed and such severe effects came back to moderate when receiving the proposed additive. Livers exhibited fatty change, necrosis and newly formed bile ducts. Lesions in kidney included tubular necrosis and pink homogeneous tubular casts. Rats fed white ginseng only had no significant differences compared to the negative control group (fed on a sole diet without any additives). A concurrent treatment of AF with white ginseng indicated a potentiation of the animal performance reflected by decreased severity of clinical signs and inccreased body weight gains. The studied food additive minimized and reduced significantly the deterioratsion of such performance which obviously observed in animal grouping received AF-contaminated diet. Female rats were responding to contaminated diets and to the food additive as well. Thus, our data strongly suggested that deleterious effects of AF could be overcome or, at least, significantly were diminished by WG. Moreover, this plant by itself did not show any toxic effects.

Abstract: This article seeks to understand the mentality of Akhond Khorasani, the leader of the Iranian constitutional revolution (1905-1911) regarding the political and social concepts such as freedom and justice. In the Iranian society, concepts such as freedom and justice were always affected by various kinds of understanding and comprehension. These concepts were never interpreted based on their original and true meanings which are essentially the principles of democracy. In other words, the Iranian society was faced some problems and difficulties in absorbing these concepts and it seems even nowadays these concepts do not possess their true meaning in the political social culture of Iran and everybody explain

	them based on their own personal assumptions and subjectivity. It is for this reason that Iran has not had much of a practical experience from the existence of these concepts and achieving such and experience needs more time. Understanding the opinions of Akhond Khorasani (the revolution's leader) vis-à-vis these concepts can be an indication of the formation of democracy's pillar in Iran and also an indication of how the clergy faced these concepts, understand them and what practical ways they used to realize them. The theoretical framework of this article is based on the modernity theory. In essence, modernity comprises the theoretical aspects of the entire social, political, economical and cultural issues and guide human societies through the passageway of tradition to the modern world. The methodology used in this study is the unobtrusive research methodology, since this is a qualitative and historical research. The content analysis method which is one of the methods used in qualitative and historical researchers has also been implemented in this research. 56	**Chemical Composition and Potential Application of *Spirulina platensis* Biomass** Aly, M. S[*1] and Amber. S., Gad[2] Agriculture microbiology Dept, [2]Chemistry of Natural and Microbial products Dept., NRC, Cairo, Egypt. [*]mohamed_saad_1@hotmail.com **Abstract**: Submerged batch cultures, Semi -pilot scale cultivations and Outdoor biomass production were performed to increase Spirulina platensis biomass which is naturally grown in El Khadra lake water body. Comparing Chlorella vulgaris and Spirulina platensis showed higher protein contents of Spirulina as it reached 64 % (w/w) so, it may be used in agriculture as a nitrogen biofertilizer and as an animal and fish growth promoter. Bio-chemical analysis of Spirulina biomass showed presence of 17 amino acids, 10% (w/w) carbohydrates, 8 %(w/w) fibers and 8 %(w/w) lipids. The biomass of Spirulina contained 0.04 ppm Mg, 0.3 ppm Ca, 0.16 ppm Mn, .0.8 ppm Fe, 0.16 ppm Zn, 11.3 ppm Na, 0.003 ppm Se and 5.6 ppm K. It also contained 1 ppm Cu, 0.04 ppm Hg, 0.03 ppm Ni, 0.9 ppm Cr, 0.1 ppm Cd, and 0.6 ppm Co. [Aly, M. S and Amber. S., Gad. **Chemical Composition and Potential Application of *Spirulina platensis* Biomass**. Journal of American Science 2010;6(12):480-488]. (ISSN: 1545-1003). 57	**Microbial load as Pollution Indicator in Water of El-Khadra Lake at Wadi El-Natroun, Egypt** Ali, M. S. [1]and Osman, G. A. [2] [1]Agriculture Microbiology Department, National Research Centre, Cairo, Egypt. [2]Bacteriology Lab., Water Pollution Research Department, National Research Center, Cairo, Egypt. [*]mohamed_saad_1@hotmail.com gamalosmanali2005@yahoo.com **Abstract:** Occurrence and survival of some classical bacterial indicators, (salmonellae group, total staphylococci and *Pseudomonas spp.)* in water samples at surface and one meter depth of El-Khadra lake have been studied as well as, cyanobacteria and fish lagoons were included for comparison. The results showed that, fecal streptococci and *Pseudomonas spp.* are not present in surface and deep lake water samples respectively, while other bacteria tested are presented. Similarly, salmonellae group and fecal coliform were absent in all water samples from the fish lagoon and the deep lake samples. In addition, the high and low log average counts of total viable bacteria incubated at 37 ºC for 24 hours were 7.5 and 3.4 /100m in cyanobacteria lagoon and surface lake water samples respectively. On the other hand, the high log average counts of total viable bacterial incubated at 22 ºC for 48 hours was 7.3 /100m in cyanobacteria	Full Text	57

	lagoon, while the low recorded 3.67 /100m in surface water samples. The statistical analysis (log average) showed that, some factors such as human activity, sun ray and sedimentation as well as biological activity play role on the bacterial distribution in all water samples tested. 58	**Effect of Different Rates of Cobalt on some Macro-Micronutrients and Heavy Metals Contents in Lettuce under Different Types of Recently Reclamation Soils** **Abdel Fattah. M. S and Khaled. S.M.** Plant Nutrition Dept. National Research centre-Cairo, Egypt. **Abstract:** The main objective of this research work is to assess the influence of cobalt element addition on the uptake of some macronutrients (N, P and K) and some heavy metals (Cd, Ni and pb) in two different reclaimed soils. The first soil was sandy from (Abu- Rwash) region, the second soil was calcareous from (El Noboria) region. Cobalt was added with different rates (10, 15 and 20) ppm after plantation stage. Nitrogen was added by rate 100 ppm N at form amonium nitrate NH_4NO_3. Moreover, Dihydrogen potassium phosphate H_2KPO_4 at rate 200 ppm as source of phosphours and potassium was added at the same time. Lettuce plant of class (lactuca sativa var capitata). The obtained results can be summarized as follows: In sandy soil a positive connection between rates of cobalt and (N,P,K) contents, negative contact was found between cobalt concentrations and heavy metals contents (Cd, Ni, pb). Dry weight gave a positive contact with cobalt treatments, all differences were significantly to each of chlorophyll concentration and all trace elements contents except Mn were a positive relationship with cobalt treatments. All differences between treatments were significantly. In calcareous soil negative contact was found between rates of cobalt and nitrogen, while potassium a positive contact was found with phosphorus, concerning the heavy metals (Cd, Ni, pb) contents, positive contact was found with rates of cobalt. All this connections were significantly. Dry weight gave a negative connection with cobalt treatments but not significantly. Chlorophyll concentration and trace elements contents were in a positive relationship with cobalt treatments. All differences between treatments were significantly. Dry weight gave a negative connection with cobalt treatments but notsignificantly. Chlorophyll concentration and trace elements contents were in a positive relationship with cobalt treatments. All differences between treatments were significantly. [Abdel Fattah. M. 60	**Bio-removal of nitrogen from wastewaters-A review** Gaber Z. Breisha[1], Josef Winter[2] [1.] Department of Agricultural Microbiology, Faculty of Agriculture, Minia University, Minia, Egypt [2.] Institut für Ingenieurbiologie und Biotechnologie des Abwasser, Universität Karlsruhe, Germany gaberbresha@yahoo.com, Josef.Winter@iba.uka.de **Abstract:** If the present large volumes of nitrogen-containing wastewater of domestic and industrial origin are discharged into the environment without proper treatment, they lead to extensive soil and water pollution. Proper elimination of pollutants from these effluents is essential in industrialized countries and is becoming increasingly important from an environmental and human health point of view in developing and emerging countries. Beside the conventional nitrogen removal process (lithoautotrophic nitrification and denitrification), novel and cost-effective biological nitrogen elimination processes have been developed, including simultaneous nitrification and denitrification, anaerobic ammonium oxidation (Anammox), and its combined system (completely autotrophic nitrogen removal over nitrite, Canon). This review summarizes the recent studies dealing with agricultural, domestic and industrial wastewaters regarding their nitrogen content. Traditional and novel biological nitrogen elimination technologies are reviewed. Furthermore, recent studies dealing with temperature, dissolved oxygen, nitrate concentration, salinity, pH or the free ammonia concentration as factors affecting the nitrogen removal efficiency have also been incorporated. [Gaber Z. Breisha, Josef Winter. Bio-removal of nitrogen from wastewaters-A review. Journal of American Science 2010;6(12):508-528]. (ISSN: 1545-1003). **Keywords:** wastewaters; nitrogen removal; salinity; free ammonia; temperature; dissolved oxygen	Full Text	60
61	**Comparison of Electrostatic and Spinning-discs Spray Nozzles on Wheat Weeds Control** Ali Esehaghbeygi[1], Ali Tadayyon[2], Shahin Besharati[2] [1]Department of Agricultural Engineering, [2]Department of Agronomy and Plant Breeding College of Agriculture, Shahrekord University, Shahrekord, Iran, 115 esehaghbeygi@cc.iut.ac.ir **Abstract:** Electrostatic spraying is the method that is noted for improving the spraying efficiency and droplet deposition. The efficacy of electrostatic charge and spinning-discs spraying were assessed for the	Full Text	61

	application of 2, 4-D to control weeds in irrigated wheat. Sprayer nozzle performance was evaluated in terms of wheat grain yield (*Ghods* variety), weed shoot biomass, and wheat residual (straw) at the research farm of Shahrekord University in 2007 and 2008. The results indicated that electrostatic spraying gave better weed control. Spray penetration through dense weeds enhanced with electrostatic charging. The spinning disc nozzle decreased water use and so was cheaper to operate, but it did not significantly improve herbicide efficacy, especially in dense canopies compared with the electrostatic charge. [Ali Esehaghbeygi, Ali Tadayyon, Shahin Besharati. **Comparison of Electrostatic and Spinning-discs Spray Nozzles on Wheat Weeds Control.** Journal of American Science 2010;6(12):529-533]. (ISSN: 1545-1003). http://www.americanscience.org **Keywords:** electrostatic, spinning disc, wheat, weed		
62	**The Effect of work support and family support on Work- Family Conflict (W-FC) Among Married Female Nurses in Shiraz-Iran** Hajar Namayandeh, Siti Nor Yaacob, Rumaya Juhari Faculty of Human Ecology, University Putra Malaysia. h_nemayandeh@yahoo.com **Abstract:** The present study highlights the significance of work support (supervisor and coworker support) on work- family conflict. Furthermore, this paper also examines the effects of family support (husband and family members/relatives support) on work-family conflict. This study consists of 198 married female nurses in Shiraz-Iran. The findings revealed that reducing support from husband, family members/relatives and supervisor might increase perceived conflict between work and family. Unlike previous studies, the finding also indicates that there is no significant relationship between the respondents' support from co-worker with work- family conflict, which may be explained by the specific cultural context in Iran. Implications are discussed and recommendations are made regarding future researches in this area. [Hajar Namayandeh, Siti Nor Yaacob, Rumaya Juhari. **The Effect of work support and family support on Work- Family Conflict (W-FC) Among Married Female Nurses in Shiraz-Iran**. Journal of American Science 2010;6(12):534-540]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Work- family conflict, Work support, Family support	Full Text	62
63	**Effect of using pectin on lead toxicity** Dalia, M. El-Nahal Special Food and Nutrition Dep., Food Technology Research Institute, Agric. Res. Center, Giza, Egypt daliaelnahal@hotmail.com **ABSTRACT:** Lead has many undesired effects on humans and animals, including neurological, behavioral, respiratory, visual, growth retardation, hematological immunological, renal, hepatic. **The aim of** the present study was to investigate the alterations in biochemical parameters in serum and blood due to lead retention in blood, organs and estimating the role of low and high esterified pectin in alleviating the negative effects of lead. **Material and Methods**: Sixty male *albino* rats which were divided into ten groups (6 rats for each). The first group (was fed on basal diet ;normal control). Groups 1,2 and 3 [which were fed on basal diet and administrated lead acetate (LA) daily once a time for 30 days by gavages at three different concentrations 61.94, 30.97 and 15.49 mg /Kg bw (1/4, 1/8, and 1/16 of lead acetate LD_{50};positive control]. Groups 4,5 and 6 [were fed on basal diet containing 10% low esterified pectin (LEP, DE 31%) and administered the same LA doses]. Groups 7,8 and 9 [were fed on basal diet containing 10% high esterified pectin (HEP, DE 73.5%) with the administration of the same LA doses]. **Results** obtained showed that LA significantly induced a decrease in body weight, serum total protein, albumin, globulin, total billirubin, direct billirubin, indirect billirubin, RBCs and WBCs counts, blood haemoglobin (Hb), heamatocrite values (PVC), serum triidothyronine (T3)and thyroxin (T4) levels. In the contrary, alanine aminotransferase (ALT), aspartate aminotransferase (AST), alkaline phosphatase (AlP), gamma	Full Text	63

	glutamyl transferase (γ-GT) activities, serum urea, uric acid and creatinine were significantly increased in positive control rat groups. Additionally, treatment of rats with LA led to a considerable increase in accumulation of the metal in the blood, liver, kidney, brain, heart and bones compared with the normal group. LEP and HLP significantly decreased the effect of LA on the tested parameters and level of lead in different organs. Histopathological examination clearly indicated that LEP or HEP eliminated from the harmful effect of LA on liver, kidney and brain tissues. **In conclusion**, LEP and HLP have beneficial effects which could be able to antagonize lead toxicity. Moreover, LEP was contributed to fast elimination of the lead acetate to blood, organs and bones, whereas HEP removed lesser amount of lead. It could be recommended that LEP has a good effect to bind material of lead and should be incorporated into human food to reduce the hazards toxicity of lead pollution of food and water. [Dalia, M. El-Nahal. **Effect of using pectin on lead toxicity.** Journal of American Science 2010;6(12):541-554]. (ISSN: 1545-1003). http://www.americanscience.org. **Key words**: Lead toxicity, esterified pectin, Histopathological examination		
64	**Chemopreventive effect of celecoxib and expression of cyclooxygenase-2, Casapase-3 and AGNOR on chemically- induced rat submandibular salivary gland neoplasm.** **Mohamed Zayed** Lecturer, Oral Biology, Oral Histopathology Department, Misr International University (MIU). dr_zayed2@yahoo.com **Abstract: BACKGROUND:** Cyclooxygenase-2 (COX)-2 inhibitor (Celecoxib) is a non-steroidal anti-inflammatory drug (NSAIDs) and over-expression of COX-2 protein and mRNA has been reported in various cancer tissues. Therefore, it has been suggested that COX-2 is related to carcinogenesis. **METHODS:** Twenty five albino rats were used .They were divided into 3 groups; group I (normal control) and group II and III which was delivered 4-NQ in the drinking water .Meanwhile group III was given 1500 ppm celecoxib. Submandibular salivary glands were obtained after 32 weeks. Immuno-histochemical staining for COX-2 was performed to determine the COX-2 level and Caspase-3 immuno-expression was done for detection of apoptosis and silver nitrate staining of nucleolar organizer regions (AgNORs) was done for estimating the proliferating cells. The data were analyzed using Student's independent t-test and one-way analysis of variance (ANOVA). **RESULTS:** The group II and III showed pathological evidence of cancer. COX-2 immuno-staining was stronger in group II than in Group III. Caspase-3 immuno-reaction was statistically highly significant in group III ($p<0.05$) .Meanwhile proliferation estimated by AgNOR nuclear count was statistically highly significant group II ($p<0.05$). **CONCLUSION:** The COX-2 expression was increased in group II (untreated group) than group III. Administration of celecoxib demonstrated the chemo-preventive potential against the carcinogenesis through induction of apoptosis and suppression of tumor growth and proliferation. [Mohamed Zayed. Chemopreventive effect of celecoxib and expression of cyclooxygenase-2, Casapase-3 and AGNOR on chemically- induced rat submandibular salivary gland neoplasm. 65	**The Outcomes of Concomitant Radiation Therapy plus Capecitabine for Refractory Locally Advanced Breast Cancer Patients Pre-Treated with Anthracycline Based Regimens** **Fatma Zakaria Hussen; Hanan Shawky Gamal El-Deen*; Amr Abd- El Aziz Ghanam; Samar Galal U** **and Omnia Abd –El-Fatah G.** Clinical Oncology Department, Faculty of Medicine, Tanta University Hospital, Tanta, Egypt	Full Text	65

hannshawky@yahoo.com*

Abstract: Purpose: Anthracycline based chemotherapy is the first line treatment for most of patients with locally advanced breast cancer (LABC). However, some patients fail to respond to these regimens and no established second line treatment. Effective treatments options for patients with LABC resistant to anthracyclins based regimens are limited. We have conducted a phase II trial of capecitabine concomitant with radiation therapy to assess the safety, tolerability and efficacy of this regimen as a second line for down staging those inoperable patients with LABC. Patients and methods: Between February 2008 and September 2009, 27 patients with infiltrating ductal carcinoma, locally advanced breast cancer , who were refractory to first line anthracycline based regimens were planed to receive radiation therapy (50Gy/25f) and concomitant capecitabine (850 mg/m^2) twice daily for 14 days every 3 weeks, at Clinical Oncology Department , Faculty Of Medicine, Tanta University Hospital. All patients were assessed for objective response rate (ORR), progression –free survival (PFS), overall survival (OS), safety and tolerability. Results: Eighty five percent of patients (23 out of 27) became operable. The remaining four patients didn't undergo surgery because of progressive disease. Objective response rates (ORR) including those with complete clinical response 0.0% and partial clinical response in 10 (37%) patients. A complete pathological response for primary tumor and axillary lymph nodes was seen in 1 patient (3.7%). Pathologically negative axillary lymph nodes were seen in 5 patients (18.5%). The median follow up period was 16 months (range 6-26 months), the median PFS for all patients was 10 months (range 2-22 months), the one –year PFS was 29%. The median OS was not reached, the mean OS was 20.8 months (95% CI 17.78 - 23.84) and the two-year OS rate was 69.5%. Positive significant correlations were observed for PFS in patients with age ≥ 45 years , postmenopausal , +ve estrogen receptors (ER), +ve progesterone receptors (PR), -ve human epidermal growth factor receptors (HER-2), non triple negative patients, patients with ER/PR positive tumors, non inflammatory breast cancer (IBC) patients and those with axillary lymph node ratio (ALNR) <50%. There were no grade 3 or 4 adverse events with study protocol. Conclusion: The results of this phase II trial prove that concomitant capecitabine and radiation therapy is safe and effective in down staging of inoperable locally advanced breast cancer patients resistant to primary anthracycline based regimens. We are ongoing trial to use capecitabine as a maintenance monotherapy in patients with advanced breast cancer.

Abstract: The mycotoxin ochratoxin A (OTA) is a widespread contaminant in human food and animal feed. It is a carcinogenic, genotoxic, teratogenic, immunotoxic, and hepatonephrotoxic agent. Therefore, the present study was designed to assess the possible protective effect of *Lactobacillus rhamnosus* GG (LGG) against OTA-induced toxicity in mice. Four groups of 30 mice each were used: control group, LGG-treated group (1 × 10^{10} CFU), OTA-treated group (1.8 mg/kg b.w.) and a group of mice given LGG two hours before OTA gavage. The levels of malondialdehyde (MDA), glutathione (GSH) and superoxide dismutase (SOD) activity were measured in of liver and kidney. Bone marrow micronucleus test and chromosomal aberrations in spermatocytes, as well as mitotic and meiotic activities were performed to assess the genotoxicity; besides sperm parameters were evaluated. Results showed that OTA significantly decreased the body weight. OTA significantly elevated the tissue levels of MDA, whereas the levels of

	GSH as well as SOD activity were significantly decreased in both liver and kidney. OTA increased statistically the frequencies of MNPCEs in bone marrow and structural and numerical aberrations in spermatocytes. In addition, mitotic and meiotic activities of somatic and germ cells were declined significantly. Also, OTA caused a high significant reduction in cauda epididymal sperm count, sperm motility and increased sperm abnormalities, as compared to control. In mice received LGG before OTA gavage, a significant amelioration in LPO in liver and kidney, by increasing the contents of GSH and SOD activity, have been occurred. Cytogenetic analyses revealed that LGG administration before OTA gavage significantly reduced frequencies of MNPCEs in bone marrow and chromosomal aberrations in spermatocytes, and recovered mitotic and meiotic activities as well. Moreover, gavage LGG before OTA intoxication caused significant recovery in all sperm parameters studied. In conclusion, LGG was found to be safe and successful agent counteracting the oxidative stress and protected against the genotoxicity induced by OTA, in addition to reduction in spermatotoxic alterations. 67	**Study of Risk Factors Involved in the Progression of Non Alcoholic Fatty Liver Disease in Egyptian Patients** **Elsayed A. Wasfy[1], Nadia M. Elwan[*1], Shreif L. Bayomi[2], Thanaa F. El- Sheikh[3], Sahar A. El-yamani[1] and Boshra E. Talha[1]** Tropical Medicine[1], Bathology[2]and Biochemistry[3] Departments, Tanta University, Tanta, Egypt *nadiaelwan@yahoo.com **Abstract:** Nonalcoholic fatty liver disease (NAFLD) includes hepatic steatosis, nonalcoholic steatohepatitis (NASH), fibrosis, and cirrhosis .NAFLD has also the potential to progress to hepatocellular carcinoma (HCC) or liver failure. NAFLD is linked to obesity, insulin resistance, hyperlipidaemia and genetic factors. *Our objective was* to study the risk factors that involved in the progression of non alcoholic fatty liver disease. Subjects and methods: Thirty-three patients and ten healthy controls were included in our study. Patients were classified into 3 groups. Group I included12 patients with simple liver steatosis. Group II included 11 patients with NASH. Group III included 10 patients with cirrhosis most probably a late sequel of NASH. Results: BMI, fasting blood glucose, insulin and HOMA-IR were significantly higher in patients with fatty liver, NASH and cirrhosis, also, NASH patients showed a significant high serum triglycerides and ALT. All previous parameters were significantly increased with the increased severity of histopathological score in patients with fatty liver and NASH. Serum AST levels and AST / ALT ratio were significantly increased in NASH and cirrhotic patients as compared to patients with steatosis alone and controls. Mitochondrial ATP levels in patients with fatty liver and NASH showed a statistically significant decrease. Also patients with NASH showed a statistically significant decrease when compared to patients with fatty liver. Finally, patients with fatty liver and NASH showed a significant decrease in mitochondrial ATP with increased BMI and histopathological score. Conclusion: Increased BMI, hyperglycemia, hypertriglyceridaemia, insulin resistance and depletion of mitochondrial ATP in hepatocytes can be considered risk factors involved in the development and progression of fatty liver to NASH and cirrhosis. Abstract: Optimization of Cd (II), Zn (II) and Cu (II) biosorption from contaminated water were performed as function of parameters (pH, contact time, initial metal ions concentration and yeast dose). The experimental results showed that the highest equilibrium adsorption capacity at the optimum pH were 8.5 for Cd (II) and 6 for Zn (II) and 6 for Cu (II). Optimum pH values were carried out to evaluate other parameters. Results demonstrate that removal efficiency increased with increased contact time for the three metal ions. Results indicated that removal efficiency increased with increased yeast dose up to 2 g/ 100ml, and removal efficiency decreased with increased yeast dose from 2.2 g/100ml to 4 g/100ml. The results also showed that increasing removal efficiency from 1 to 20 mg/L concentration for the three metal ions and the removal efficiency decreasing with increasing initial concentration from 25 to 50 mg/L. It is evident that the highest removal efficiency for Cd (II) ion compared to Zn (II) and Cu (II). This study revealed that use of baker's yeast is suitable for removal of these ions from contaminated water in order Cd > Zn > Cu at these conditions. The negative values of the standard free energy change (ΔG°) indicate spontaneous nature of the process. Competitive biosorption of (Zn and Cu) ions was investigated in terms of sorption quantity. The amount of Cu metal ion adsorbed onto unit weight of biosorbent (q_e) decreased with increasing the competing metal ion (Zn), in contrast, the amount of Zn ion adsorbed onto unit weight of yeast has been increased with increasing the competing metal ion (Cu). The binding capacity for Zn (II) is more than for Cu (II). Ion exchange is probably one of the main mechanism during adsorptive process.

Abstract: The techniques of artificial intelligence based in fuzzy logic and neural networks are frequently applied together. The reasons to combine these two paradigms come out of the difficulties and inherent limitations of each isolated paradigm. Hybrid of Artificial Neural Networks (ANN) and Fuzzy Inference Systems (FIS) have attracted the growing interest of researchers in various scientific and engineering areas due to the growing need of adaptive intelligent systems to solve the real world problems. ANN learns from scratch by adjusting the interconnections between layers. FIS is a popular computing framework based on the concept of fuzzy set theory, fuzzy if-then rules, and fuzzy reasoning. The structure of the model is based on three-layered neural fuzzy architecture with back propagation learning algorithm. The main objective of this paper is two folds. The first objective is to develop Fuzzy controller, scheme for the prediction of the changing for the NO2 or SO2, over urban zones based on the measurement of NO2 or SO2 over defined industrial sources. The second objective is to develop a neural net, NN; scheme for the

69

	prediction of O3 based on NO2 and SO2 measurements. [Tharwat E. Alhanafy, Fareed Zaghlool, and Abdou Saad El Din Moustafa. Neuro Fuzzy Modeling Scheme for the Prediction of Air Pollution. 70	**Ester Phosphate of Discarded Palm Oil from Potato Chip Factories as Fat-Liquoring Agent** **M. G. Megahed[1] and El-Shahat H. A. Nashy[2*]** [1]Department of Fats and Oils, National Research Centre, Dokki, Cairo, Egypt. [2]Department of Chemistry of Tanning Materials and Leather Technology, National Research Centre, Dokki, Cairo, Egypt. [*]nashy_eha@yahoo.com dr_mgmegahed@hotmail.com **Abstract:** In Egypt most potato chip factories used palm oil for frying. The quantity of palm oil resulting from frying processes as discarded represents more than half of the total other oils used in the Egyptian food factories. Discarded palm oil resulting from frying processes was preliminary treated by purification and bleaching as well as characterized via its physico-chemical properties and fatty acids composition. Therefore, this work was devoted to explore the application of the discarded palm oil in leather industry as fat-liquoring agent. Fat-liquors help to prevent the loosening of leather grain and ugly appearance of chrome tanned leather after drying. In addition, fat-liquoring process improves leather characters such as soft handle, full, flexibility, and pliability as well as enhancement its mechanical properties. The study involved preparation of discarded palm fat-liquor via phosphoration process. The importance of the prepared fat-liquor is due to their environmentally friendly nature, relatively safe utilization by human being, in addition to their economical feasibility. The fat-liquored leather led to an improvement in the mechanical properties of the leather e.g. tensile strength, elongation at break and tear strength. In addition a great enhancement in the texture of the treated leather by discarded palm fat-liquor as indicated from the scanning electron microscope (SEM). [M. G. Megahed and El-Shahat H. A. Nashy. 71	**Reuse of Industrial Materials in Buildings to Activate their Application in Egypt** **Nermin Mokhtar Mohamed** Civil and Architectural Department ,Engineering division, National research centre, Egypt Nermin_farag@yahoo.com **Abstract:** Increasingly stringent rules and regulations on construction and demolition waste, diminishing landfill space and depletion of natural resources are all reasons for the push for industrial byproduct materials recovery. In Egypt, Industrial byproduct materials are generated in large volumes every day that are potentially usable materials, and must be disposed of. The main goal of this paper is to change the way Egyptians' think about waste—to see the value of a used material as a product or commodity, not as a waste, and encourage the use and recycling of these rich, largely untapped resources. Positive economic rewards and environmental results are moving our partners toward more waste reduction and materials	Full Text	71

	management. This paper summarizes the proposed Egyptian industrial materials waste management guidelines to reuse in building, which cover: (1) Identify the parties involved and the distribution of responsibilities; (2) Complementarily of roles of parties(owner, engineer, designer, and contractor) involved in the process of re-use to remove the causes that hinder the management of such material in Egypt; and (3) Participation of the Parties to the proposed project to achieve sustainable development fields at the actual application of the project. El Namaky** Parasitology and Animal Diseases Department, National Research Center, Dokki, Giza, Egypt, kandil_om@yahoo.com* **Abstract:** In the current study, Mitochondrial Cytochrome *c* oxidase gene especially codons within subunit 1 (*cox1*) of *H. diminuta and H. nana* Egyptian isolates from two stages (adult worms and eggs) and hosts origin (human and rat) were amplified, sequenced and aligned. PCR products were approximately 700 bp, 702 bp and 715 bp of *H. nana* rat isolates, *H. diminuta* rat isolates, and *H. nana* human isolates, respectively. Moreover, despite their host susceptibility differences they all gathered in one cluster with three genbank published isolates of *H. nana*; AB033412.1, AB494472.1 and AY121842.1), forming one clade with 100% similarity, which was non significantly decreased on internal nodes. In addition, clearly far away from *H. diminuta* published sequence AB033412.1 who's assumed to be genetically closely related to Egyptian *H. diminuta* than all other *H. nana* isolates. Both Egyptian murine isolates of Hymenolipidid; *H. diminuta* and *H. nana*, were closer to each other than being to *H. nana* of human origin. The annotated sequences of Egyptian isolates were deposited in GenBank under the following accession numbers; *H. diminuta* (GU433102), *H. nana* rat isolate (GU433103), and *H. nana* human isolate (GU433104). Finally, the development of effective control strategies will only be possible if complete understanding of the epidemiology of infection is elucidated. [Omnia M. Kandil, Mona S. 74	**Novel Switching H_2/H_∞ Control: Combination of Dwell Time Switching Signal and Multiple Lyapunov Function** Fatemeh Jamshidi [1], Mohammad Taghi Hamidi Beheshti [1] [1] Communication and Control Lab, School of Computer and Electrical Engineering, Tarbiat Modares University, Tehran, Iran Fjamshidi59@yahoo.com, mbehesht@modares.ac.ir **Abstract:** In this paper, a switching strategy is employed to solve the H_2/H_∞ multi objective controller design. Two controllers are designed to meet the H_2 and H_∞ performance specifications. Linear matrix inequalities are used in the controller design process. New switching signal is defined which is the combination of dwell time switching signal and multiple Lyapunov function such that stability of closed loop system is guaranteed as well as desired performance. Simulation results show that proposed switching strategy improves the performance of the controller and reduces the conservation in comparison with the common H_2/H_∞ controller. [Fatemeh Jamshidi, Mohammad Taghi Hamidi Beheshti. Novel Switching H_2/H_∞ Control: Combination of Dwell Time Switching Signal and Multiple Lyapunov Function. 75	**Investigation of Groundwater quality for Domestic and Irrigation purposes around Gubrunde and Environs, northeastern Nigeria** [1]Arabi, Suleiman Abdullahi; [1]Funtua, Idris Isa; [1]Dewu, Bala .Muhammad; [2]Zabosrki, Peter; and [2]Alagbe, Solomon .A [1]Centre for Energy Research and Training, Ahmadu Bello University, Zaria [2]Department of Geology, Ahmadu Bello University, Zaria-Nigeria Email: arabisuleiman@gmail.com **Abstract:** Fourteen groundwater samples were collected from boreholes, springs and hand dug wells in and around Gubrunde in Borno State north-eastern Nigeria to investigate its quality for domestic and irrigation uses. The area investigated falls within longitude 11° 35' - 12° 05' and latitude 10° 10' - 10° 31'. The samples were analyzed using Atomic Absorption Spectrometer (AAS), multi-analyte photometer and Flame photometer while interpretation of the results was carried out with RockWare Aq•QA software, a spreadsheet for water analysis. Six of the samples investigated are of NaCl water type while fourteen were CaCl water types. Sodium Adsorption Ratio (SAR) values recorded ranges from 0.80 – 2.84, Exchangeable Sodium Ratio (ESR) 0.33 – 1.78, Magnesium hazard (MH) 5.19 – 47.9, Residual Sodium Carbonate (RSC)	Full Text	75

	0.00, Hardness 0.65 – 221.48 and Total Dissolved Solid (TDS) ranges from 130 – 407308mg/l. Twelve of the samples analyzed had medium Salinity Hazard (SH), and one each for high and low Salinity Hazard (SH). For water with high salinity hazard, adverse effect is expected on crops, medium salinity hazard has detrimental effects only on crop that are sensitive to salinity while waters with low salinity hazard is suitable for all crops. The variation in chemical composition of groundwater in the study area may be due to leaching of terrestrial salts, extensive use of chemical fertilizers and ion exchange between water and the host rock. The result of samples analyzed indicates that all the samples are undersaturated in calcite and aragonite, while most of the major anion and cations falls within World Health Organization and Nigeria Industrial Standard for Drinking water Values. Nine samples had NO_3 values ranging from 53 – 106mg/l exceeding the 50mg/l standards. NO_3 values exceeding 50mg/l has the tendency of causing asphyxia to infants less than three months old. A plot of SO_4, HCO_3 and Cl indicates that the groundwater samples are from intermediate water category (neither fresh nor old). Generally, the groundwater quality is fairly suitable for agricultural uses and suitable for domestic utilization. [Arabi, Suleiman Abdullahi; Funtua, Idris Isa; Dewu, Bala .Muhammad; Zabosrki, Peter; and Alagbe, Solomon .A. 76	**Effect of the Type of Aggregate on the Properties of Alumina Refractory Concrete** **S.A. Ghonaim[1], H.B.G. Ghazal[2], and M.F. Abadir[*3]** [1] Egyptian Organization for Standardization and Quality, [2]The High Institute of Engineering, Shorouk [3]Chemical Engineering Department, Faculty of Engineering, Cairo University, Cairo, Egypt. [*]magdi.abadir@yahoo.com **Abstract:** Low cement refractory concrete samples were prepared by mixing cement (containing 50% alumina) in percentages ranging from 10 to 20% with some aggregates and the necessary amount of water. Two types of refractory aggregate were used: Bauxite containing 81% alumina and grog containing 52% alumina. Four particle sizes of each aggregate were used. The cast samples were left in their moulds for 24 hours in a 100% relative humidity cabinet. The de–molded specimens were left in an open air until their moisture content reaches 3–6%, then kept in a drying oven at (110 ± 5) ºC until reaching constant weight. They were then tested for phase constitution, water absorption, bulk density, apparent porosity and cold crushing strength (after 28 days curing). It was found that bauxite based samples gave better results than those prepared with grog. It was also found using statistical analysis that the percent cement used affects all properties much more than does the particle size of aggregate. [S.A. Ghonaim, H.B.G. Ghazal, and M.F. Abadir. Effect of the Type of Aggregate on the Properties of Alumina Refractory Concrete. Journal of American Science 2010;6(12):673-684]. Hanna[1]and Nehal Salah[2]** [1]Child Health Department and [2]Clinical Pathology department, National Research Center, Cairo, Egypt [*]enas_raafat@hotmail.com **Abstract:** Background: Osteoporosis is a disease characterized by low bone mass and deterioration of bone structure that causes bone fragility and increases the risk of fracture. . Children and adolescents with	Full Text	77

	type 1 (insulin-dependent) diabetes mellitus (T1DM) show several impairment of bone metabolism and structure, resulting in a higher risk of decreased bone mass and its related complications later in life. Objective: to analyze whether bone mineral density (BMD) with bone status are influenced in children with T1DM and evaluate their relationships with clinical status, age and duration. Patients and Methods: Forty cases (age 7.5 $\pm$ 3.4 and duration of disease 3.7 $\pm$ 2.5 years) were studied. BMD expressed as Z-score was measured at neck of femur and Lumbar spines (L_2 – L_4) using dual energy x-ray absorptiometry (DEXA) for 15 cases. Urinary excretion of deoxypyridinoline (DPD) was measured by radio immunoassay and was corrected by creatinine (Cr). Serum levels of osteocalcin, osteoprotegrin, procollagen and rankle – markers of bone formation and resorption were measured. They were matched by age and sex for another 40 normal children as control. Results: there was a significant decrease in serum level of osteocalcin in 12 of our patients,all cases showed significant increase in serum rankle with significant difference $P < 0.05$ compared to control. Mean values of procollagen showed no significant difference compared to controls. As regard DPD mean values of cases showed a significant increase compared to control. BMD – expressed as Z-score-by DEXA revealed 10 cases with mild degree osteopenia, while the other 5 cases showed moderate degree. Conclusion: pediatric patients with T1DM appear to constitute a population at risk of developing osteopenia. Age-optimizing of metabolic control in growing diabetic children may prevent osteoporosis in later life. [Enas R. Abdel Hameed, Hisham W. Badr, Azza A.Abdallah, Wagdi M. 78	**Studies on Antimicrobial and Antioxidant Efficiency of Some Essential Oils in Minced Beef** **Amany, M. Salem[*], Reham, A. Amin and Gehan, S. A. Afifi** Food Control Department, Fac. Vet. Med., Benha University, Benha, Egypt dr_amany40@yahoo.com[*] **Abstract:** In this study, the antioxidant and antibacterial effect of garlic (G), thyme (T) and lemon grass (L) oils were investigated in refrigerated minced beef. It is noticed that, all essential oils used had considerable effectiveness in decreasing aerobic plate count (APC), *Enterobacteriaceae* count, Coliform count and *Staphylococci count*, as well as chemical indices as pH, total volatile nitrogen (TVN) and thiobarbituric acid (TBA). Sensory analysis indicated significant advantages in using lemon grass and thyme oils in refrigerated minced beef. In addition, a highly significant differences ($P<0.05$) between the different oils were noticed. Also, results indicated that the bacterial counts, pH, TVN and TBA values decrease as the concentration of the oil increases since the concentration (1.5%) gives the best effectiveness. The antioxidant and antibacterial activities of the added essential oils followed the order lemon grass oil > thyme oil > garlic oil. The treated minced beef samples extend the shelf life of the treated samples more than the control samples by 6 days. In conclusion, lemon grass, thyme and garlic oils can play an important role as antioxidant and antibacterial agents in refrigerated minced beef, but lemon grass oil is the best one. [Amany, M. Salem, Reham, A. Amin and Gehan, S. A. Afifi. Studies on Antimicrobial and Antioxidant Efficiency of Some Essential Oils in Minced Beef. Journal of American Science 2010;6(12):691-700]. 	[2]**Osman, N.M.N.** [1]Bact. Mycol. and Immuno. Dept. Vet. Med. Beni-Suef University, Beni-Suef, Egypt [2]Micro. and Immuno. Dept. National Research Centre, Cairo, Egypt Sohad_dorgham@yahoo.com **Abstract:** A total of 152 cows was examined in this study for Staphylococcus species, it was found that 44.3% of cows and were clinically mastitic whereas 14.5% were subclinically mastitic respectively. The identification of Staphylococcus species revealed that *S. aureus, S. epidermidis, S. intermedius* and *S. hyicus* for cows were (17.2%, 7.5%, 3.9% and 1.6%) respectively. *Staphylococcus aureus* isolates were confirmed after biochemical identification by API test. The study of virulence factors of total *S. aureus* isolates from mastitic cows revealed that lipase, fibrinolysin, DNase and protein A production were presented as percentage 67.3, 74.0, 85.6 and 84.6 respectively. The antibiotic sensitivity for *S. aureus* revealed that 96.2% of cow isolates were methicillin sensitive which considered the drug of choice for these isolates. The study also included the identification of *S. aureus* enterotoxins using set-RPLA and multiplex PCR. The incidence of enterotoxins C,A,B and D by set-RPLA were 36.5%, 14.4%, 10.6% and 2.9% respectively. Meanwhile the results of multiplex PCR were 7 isolates as enterotoxin C,4 isolates as enterotoxin E and one isolate for each A,B, and D respectively. The identification of MRSA of cow's isolates using PCR revealed that 3 isolates out of 5 isolates were positive. [El-Seedy,F.R, El-Shabrawy, M; Hakim, A. S; Dorgham,S.M.m Ata, S. 80	**Biosynthesis and Characterization of *Aspergillus Niger* AUMC 4301 Tannase.** **M. Z. El-Fouly[1]; Z. El-Awamry[2]; Azza A.M. Shahin[1]; Heba A. El-Bialy[1]; E. Naeem[2] and Ghadeer E. El-Saeed[1]*** [1] National Center for Radiation Research and Technology (NCRRT), Radiation Microbiology Department, Atomic Energy Authority, Cairo, Egypt. [2] Faculty of Science, Azhar University, Cairo, Egypt. **Abstract:** A study on biosynthesis and characterization of an extracellular tannase from *Aspergillus niger* AUMC 4301 was carried out. *A. niger* AUMC 4301 was selected out of one hundred and thirty fungal isolates have the ability to grow in the presence of tannic acid. Maximum enzyme synthesis under solid state fermentation was attained in the presence of 3% tannic acid and 0.2% ammonium nitrate after five days incubation at 30°C. Effect of different carbon and nitrogen sources on tannase formation was also investigated. Crude tannase had maximum activity at pH 4.8, 60°C and 20 min as a function of reaction time. The catalytic action of biosynthesized tannase was directly proportional to the amount of enzyme in the reaction mixture. Using tannic acid as substrate, the K_m value for tannase was 2.50 mM. Gallic acid was shown to be a competitive inhibitor to tannase and the inhibition constant (K_i) was 1.35 mM. Effect of EDTA and some metal salts on enzyme activity was also studied. [M. Z. 	Potassium Fertilization **El-Bassiony, A.M*.; Z.F. Fawzy; E.H. Abd El-Samad and A.A.Ghoname** Vegetables Crop Research Dept., National Research Centre, Dokki, Cairo, Egypt *mohsin2eg@yahoo.com Abstract: Two field experiments were conducted during the two successive summer seasons of 2009 and 2010 at the Experimental Farm of the National Research Centre in Nobaria region, Behira Governorate, to investigate the response of sweet pepper plants cv. California wonder to different rates of potassium fertilization (50, 100 and 200 kg/fed.) as potassium sulfate in addition to foliar application by potassium oxide (2 and 4 cm/L) and potassium humate (4 gm/L) as a stimulative dose. Potassium foliar applications were made 3 times in a 15 days interval with the same doses during the growing period (30, 45 and 60 days after transplanting). The highest potassium fertilization rate (200 kg/fed.) gave the tallest sweet pepper plants, the highest number of leaves and branches per plants and the highest fresh and dry weights of leaves as well as the highest total yield. Also, the obtained results reported that the fruit measurements expressed as fruit length, average fruit weight and vitamin C content, as well as leaves chemical composition (N, P, K and total chlorophyll) were increased with increasing potassium fertilization rate. On the other hand, spraying sweet pepper plants with potassium humate at rate of 4 gm/L markedly increased vegetative growth, yield, fruit quality and chemical composition. The favorable effects of the potassium on the growth, total yield and fruit parameters were obtained when sweet pepper plants fertilized with 200 kg/fed. potassium sulfate plus foliar application of potassium humate 4 gm/L followed statistically by 200 Kg/fed. potassium sulfate with foliar application of either 2 or 4 gm/L potassium oxide with no significant differenced between them but both of them were significantly higher than control. [El-Bassiony, A.M.; Z.F. Fawzy; E.H. Abd El-Samad and A.A.Ghoname. Growth, Yield and Fruit Quality of Sweet Pepper Plants (*Capsicum annuum* L.) as Affected by Potassium Fertilization. 82	**How Do University Students Spend Their Time On Facebook? An Exploratory Study** Alimohammad Aghazamani Faculty of Technology and Science, Karlstad University, Karlstad, Sweden' Aghazamani99@yahoo.com **Abstract:** Despite major productive uses of Internet technology in today's digital world, users prefer to spend much more time on social networking sites (SNSs) like Facebook. The objective of this study is to determine student motives for using Facebook. A close-ended questionnaire was administered to 595 University students who were recognized as users of the site at Karlstad University in Sweden. Male users spend more time on the site than female users during both weekdays (p-value=0.9238) and weekends (p-value=0.9953). The survey showed that undergraduate students login more times per day than graduate students (p-value=0.2138). In addition, friendship was named the most favorite activity among male users (p-value=0.8883) and also among undergraduate students comparing with graduate students (p-value=0.2045). If users were asked to pay a membership fee to use the site, the results showed that male users (p-value=0.9991) and undergraduate students (p-value=0.9884) were more likely to pay the charge than other groups (females and graduate students). It is apparent that using Facebook can be seen as an important part of daily life among University students and its phenomenon spread out inevitably. [Alimohammad Aghazamani**. 83	**Succession Planning In Iranian Governmental Agencies** Masoud Porkiani[1], Malikeh Beheshtifar[2], Mahmood Nekoie-Moghadam[3] [1.] Assistant Professor, Management Department, Islamic Azad University, Kerman Branch, Kerman, Iran [2.] Member of scientific board, Management Department, Islamic AZAD University, Rafsanjan Branch, Rafsanjan, Iran [3.] Associate Professor, Management Department, Kerman University of Medical Sciences, Kerman, Iran m.beheshtifar@yahoo.com **Abstract:** It is becoming increasingly challenging for organizations to obtain qualified and talented staff. Succession planning is often introduced as a way to attract and employ such staff. Succession planning is a process of recruitment and development of employees for vital roles within the organization. Implementation of succession planning is central to certain organizational requirements. This research surveyed organizational requirements in Iranian governmental agencies and their relation to the implementation of succession planning. This study used descriptive methods with correlation. The statistical population consisted of two groups, experts and managers of Iranian governmental agencies, and data was collected using three questionnaires. The findings of this study demonstrated a meaningful relationship between organizational requirements such as managers' commitment, organizational culture, organizational readiness, and managers' competencies with the implementation of succession planning. By considering these organizational requirements in their management practices, managers are more likely to be successful in recruiting, evaluating, training and developing talent as dimensions of the implementation of succession planning. Ph.D[2], Akobundu, C.[1]** Department of Biology, Alvan Ikoku Federal College of Education, Owerri, Imo State, Nigeria[2]. Department of Microbiology, Federal University of Technology, Owerri, Imo State, Nigeria[1] nwachukwucu2005@yahoo.co.uk **Abstract:** There has been an increase in the frequency of fungal infections over the past decade. Nosocomial transmission of fungal pathogens and the recognition of resistance to antifungal agents pose a significant problem. This study identified the fungi species prevalent in the labour ward of the general hospital Umuguma and Umezuruike Hospital, Owerri Imo State Nigeria. Fungi are eukaryotic cells and therefore more complex than bacteria. The data available shows that Mucor Species and Rhizopus Species are the predominate species found in both hospitals in decreasing order. Fungal infection are often severe, rapidly progressive and difficult to diagnose or treat, therefore a thorough appreciation and understanding of fungi infections, including diagnostic and therapeutic modalities are needed among clinicians and microbiologists to provide a better patient care. [Ijioma B. C. Ph.D, Nwachukwu C. U. Hanafy** Al_Azhar University,Faculty of Engineering, Systems and Computers Department s_ewiss@yahoo.com **Abstract:** In this paper, the Fusion of neural and fuzzy Systems will be investigated. Membership Function Generation and its mapping to Neural Network are introduced. An adaptive network fuzzy inference system (ANFIS) is introduced, and Multiple Inputs /Outputs Systems (Extended ANFIS Algorithm) is implemented. A Modification algorithm of ANFIS, Coupling of ANFIS called coactive neuro fuzzy system (CANFIS), is introduced and implemented using Matlab. The software of the modified algorithm of MIMO model identification is built. To test the validity of the modified algorithm ANFIS (CANFIS algorithm), an example is simulated from the numerical equation. The result of modified algorithm (CANFIS) showed a conformance with the simulated example and the root mean square (RMSE) is very small. [Tharwat O. S. Hanafy. 86	***In vitro* and *in vivo* Activity of some Antibiotics against Staphylococcal Biofilm and Planktonic Cells Isolated from Diabetic Foot Infections.** **A. Abd El-Aziz[1], T. El-Banna[1], A. Abo-Kamar[1], A. Ghazal[2], and R. AboZahra[*3]** [1]Microbiology Department, Faculty of Pharmacy, Tanta University, Tanta, Egypt [2]Microbiology Department, Medical Research Institute, Alexandria University, Alexandria, Egypt. [3]Microbiology Department, Faculty of Pharmacy, Pharos University, Alexandria, Egypt [*]rania_abozahra@yahoo.com **Abstract:** The diabetic foot syndrome is clearly one of the most important complications of diabetes and is the most common cause of hospitalization among diabetic patients. *Staphylococcus aureus* is found to be the commonest pathogen present in diabetic foot infections. The aim of the present study is to determine activities of three kinds of antibiotics against Staphylococcal biofilm and planktonic cultures in vitro, and to indicate the difference in wound healing between staphylococcal planktonic and biofilm stage of colonization in vivo by using diabetic rat models. Biofilm forming staphylococci were identified by using the modified microtiter plate method. And the effect of different concentrations of several antibiotics (including ciprofloxacin, gentamycin and amoxicillin-clavulanic acid) on eight isolates was determined. The result showed that out of 86 Staphylococcal isolates, eight strains were found to be strong biofilm forming. It was found that the preformed biofilm was very difficult to remove with most isolates even with multiples of the MIC and that the biofilm MBC reached 46 times the planktonic MBC in some isolates. This was also noticed in case of the diabetic foot infection of the rat model, as the treatment was more efficient when it started immediately after infection, before the formation of the biofilm, as the bacterial infection was eliminated within 3-4 days, while it could not be completely eliminated when treatment started after the biofilm formation. This was also observed from the rate of healing and confirmed by histological examination. [**A. Abd El-Aziz, T. El-Banna, A. Abo-Kamar, A. Ghazal, and R. 87	**Women Participation in Agro-allied Small and Medium Scale Enterprise and Its Impact on Poverty Alleviation in Oyo State Nigeria** Fajimi F.O and Omonona B.T Department of Agricultural Economics, University of Ibadan, Ibadan, Nigeria **ffovivid@yahoo.com** Abstract: This study examined the impact of women participation in agro-allied small and medium scale enterprises (SME) on poverty alleviation. Data were collected using the multistage sampling technique from 119 respondents in the study area made up of 59 participants and 60 non-participants. Data generated were analysed using descriptive statistics, FGT – weighted poverty measures and Probit regression analysis. Results from the study showed that the non-participants have the highest poverty level (51%), while the participants have poverty level of (17%) and the non-participants contribute greatly to whole group poverty. The estimated probit regression analysis showed that marital status, household size and women status in the family are poverty enhancing while educational status participation in Small and Medium Enterprises, income and monogamous family type are poverty reducing. Hence participation in agro-allied Small and Medium Enterprises is antidote to reducing poverty among women. [Fajimi F.O, Omonona B.T. 88	**Studies on Probiotic Effects of Lactic Acid Bacteria Against *Vibrio vulnificus* in freshwater Prawn *Macrobrachium rosenbergii*** **Mona M. Ismail[1] and Waleed S. E.Soliman[2]** 1-Fish Disease and managment Department Fac. Vet. Med. Suez Canal Univ.Ismailia,Egypt 2- Hydrobiology Department National Research Center Dokki, Egypt soliman.waleed@ymail.com **Abstract:** Cell free extracts of three strains of Lactic acid bacteria (LAB) viz. Lactobacillus. acidophilus, Streptococcus.cremoris and Lactobacillus bulgaricus inhibited growth of Vibrio vulnificus in nutrient broth. The antagonism of LAB to Vibrio vulnificus was further confirmed by streak plating wherein suppression of growth of Vibrio was obtained. Juveniles of Macrobrachium rosenbergii (average weight 0.985 ± 0.1 g) on administering orally a moist feed base containing 5 × 106 cells·g of the three LAB probionts for a period of four weeks showed better survival (77 to 93%) when challenged with V. vulnificus by intra-muscular injection of 0.1 ml containing 3 × 109 cells·ml. Animals maintained on a diet devoid of bacterial biomass exhibited 95% mortality. No external or internal pathological changes were observed in shrimp fed with the LAB incorporated diets. Results showed inhibition of V. vulnificus by LAB and stimulation of the non-specific immune response resulting in resistance to disease in the prawn fed on LAB incorporated diets. [Mona M. Ismail and Waleed S. E.Soliman. **Studies on Probiotic Effects of Lactic Acid Bacteria Against *Vibrio vulnificus* in freshwater Prawn *Macrobrachium rosenbergii*.**. 89	**Coag-flocculation studies of *Moringa olifera* coagulant (MOC) in brewery effluent; Nephelometric approach.** ***Menkiti Matthew .C. and Onukwuli Okechukwu .D.** Department of Chemical Engineering, Nnamdi Azikiwe University, Awka, Nigeria. *Corresponding author Department of Chemical Engineering, Nnamdi Azikiwe University, Awka, Nigeria. E-mail: cmenkiti@yahoo.com; Telephone: +234 8037441882 **ABSTRACT:** The coag-flocculation behavior of MOC in respect of pH variation in brewery effluent has been investigated at room temperature using various dosages of unblended MOC. Coag-flocculation parameters such as order of reaction α, rate constants (K and K_s), coagulation period $\tau_{1/2}$ e.t.c were determined. Turbidity measurement was carried out using the single angle (90°) nephelometric standard jar test while MOC processing was based on work reported by Ghebremichael. Microsoft excel package was employed in the evaluation of simulated parameter K_s. The maximum MOC performance are recorded at K of 6.6667 x $10^{-4}m^3$/kg.s, dosage of 0.4kg/m^3, pH of 4 and $\tau_{1/2}$ of 289.2614s while the minimum are recorded at K of 1.3333 x $10^{-4}m^3$/kg.s, dosage of 0.5kg/m^3, pH of 2 and $\tau_{1/2}$of 1446.6419s. The least value of E (%) recorded after 30 minutes is > 78%, thus confirming MOC as effective coag-flocculant. In general, the parameter obtained lie within the range of previous works, confirming that the theory of perikinetics holds for coag-flocculation of brewery effluent using MOC at the conditions of the experiment. [Menkiti Matthew. C. and Onukwuli Okechukwu. D. **Coag-flocculation studies of *Moringa olifera* coagulant (MOC) in brewery effluent; Nephelometric approach**. 90	**Association between inflammation and the risk of cardiovascular disorders in atherogenic male rats: Role of virgin and refined olive oil** **Azza M. EL Wakf[*1]; Hamdy A. Ebraheem[1]; Hanaa A. Serag[1]; Hanaa A. Hassan[1]; Hussein S. Gumaih[2]** [1]Faculty of Science, Mansoura University, Mansoura, Egypt, [2]Faculty of Education, Sana'a University, Sana'a, Yemen [*]dr_azzaelwakf@yahoo.com **Abstract:** The aim of the present study was to determine changes in inflammatory markers, lipid profile and vascular wall integrity, (monitored as nitric oxide levels) in the male rats with experimental atherosclerosis. Also, to evaluate the role of two olive oils (virgin and refined) in these changes. Experimental atherosclerosis was induced by feeding rats normolipidemic diet (NLD) supplemented with (4% cholesterol, 1% cholic acid and 0.5% thiouracil, w/w) for three months. Feeding atherogenic diet (AD) exhibited marked elevation in serum total cholesterol (TC), low density lipoprotein cholesterol (LDL-C), very low density lipoprotein cholesterol (VLDL) and triglycerides (TG), along with decreased high density lipoprotein cholesterol (HDL-C). Besides, an elevation in serum level of the two inflammatory markers, tumor necrosis factor-α (TNF-α) and fibrinogen was demonstrated with a lowered	Full Text	90

	nitric oxide (NO) levels in both aorta and cardiac tissues, indicating impaired vessel wall integrity and development of cardiovascular disorders in response to hyperlipidemia and enhanced inflammation. Subsequently, marked elevations in total leucocytes and other inflammatory mediators, including monocytes and lymphocytes have been recorded in the atherogenic diet fed rats. In addition, a significant reduction in erythrocytes count, hemoglobin (Hb) content and other hematologic indices was demonstrated, indicating further signs of inflammation. However, administration of olive oil (OO) [(in particular virgin olive oil (VOO)] to atherogenic rats exhibited improved inflammatory status, lipid profile and NO levels. Therefore, VOO might be a good candidate to replace other fats in the functional food for retarding atherosclerosis and risk of cardiovascular disorders. [Azza M. EL Wakf; Hamdy A. Ebraheem; Hanaa A. Serag; Hanaa A. Hassan; Hussein S. Gumaih. **Association between inflammation and the risk of cardiovascular disorders in atherogenic male rats: Role of virgin and refined olive oil**. [4]Faculty of Agriculture, Cairo University, Egypt. mgergis@yahoo.com	Full Text	92

	Abstract: The present investigation was designed to evaluate the role of yeast, *Saccharomyces cerevisiae* (SC) in the reduction of aflatoxicosis induced by aflatoxin B_1 (AFB_1) in Japanese quail. Sixty male quail were used and distributed into six groups. The first group received basal diet. The other five groups received the basal diet plus 0.5 mg AFB_1/kg diet. Four of them received increasing levels of SC (0.5, 1.0, 2.0 and 2.5 gm/kg diet, respectively). All groups received their prospective diets for 35 days. The birds were weighed weekly to determine body weight (BW) and body weight gain (BWG). The results showed that addition of the SC to AFB_1-containing diet significantly reduced the adverse affect of AFB_1 on quail BW and BWG. The concentrations of AFB_1 had been lowered in the breast muscle and liver samples of quail fed diet containing AFB_1 plus SC than those found in such quail organs of AFB_1 group. The expression levels of neural and gonad genes were significantly up-regulated in quail fed diet containing AFB_1 plus high levels of SC compared to those of AFB_1 group. It could be concluded that SC supplementation to quail diets suppressed the aflatoxicosis in quail tissues leading to improvement of growth performances and enhancement of expression levels of neural and gonadal genes. Thus, the use of HPLC and gene expression analysis might contribute in detecting aflatoxin contamination in the poultry industry in Egypt. [Mariam G. Eshak, Wagdy K.B. Khalil, Eman M. Abstract: In the present study formulated synbiotic tarhana (Turkish fermented cereal food) was produced as a functional food from the fermentation of wheat flour, some spices [salt, pepper, dill and sweet marjoram (Organum majorana)], some vegetables [tomato (Lycoprsicum esculentum), pepper (Capsicum annum) and onion (Allium cepa)], and synbiotic yoghurt which prepared with prebiotic (inulin and lactose each 3%) and different concentrations of the probiotic culture (0.5, 1.5, 3, 4.5% DVS-ABT2 containing Streptococcus thermophilus, Lactobacillus acidophilus and Bifidobacterium bifidum). After fermentation (3 days), tarhana dough was dried in the sun. The effect of the fermentation (0, 1, 2 and 3 days) and the probiotic culture concentration on the chemical composition and the probiotic population of the wet tarhana were evaluated. The effect of the probiotic culture concentration on the chemical composition, the probiotic population and the sensory attribute of dried tarhana were evaluated. Also the effect of dried tarhana (prepared from yoghurt which was fermented by 4.5% probiotic culture) on the plasma lipid profile of human subjects was studied. The results showed that the pH value decreased while the acidity increased, acetaldehyde and diacetyl values increased during the fermentation period and by increasing the probiotic culture concentration of the wet and the dried tarhana. Neither the fermentation nor the concentration of the probiotic culture of wet and dried tarhana affected the crude protein, ether extract, crude fibre, and ash values. The numbers of probiotic bacteria increased until the second day of fermentation. However, in the following day, with an increase of the acid content their number decreased. Generally the increasing of the probiotic culture concentration increased the numbers of probiotic bacteria of the wet and dried tarhana. Also the concentration of the probiotic culture didn't affect the sensory attributes of dried tarhana. Subjects supplemented with dried tarhana showed significant reduction in total plasma cholesterol, low density lipoproteins (LDL-C) and triglycerides, while high density lipoprotein (HDL-C) increased.

Response of Wheat to Different Rates and Ratios of Organic Residues on Yield and Chemical Composition under Two Types of Soil

Yassen, A.A*; Khaled, S.M and Sahar, M. Zaghloul and Habib, A.M.

Plant nutrition Dept., National Research Centre, Dokki, Giza, Egypt. *azimyassen@yahoo.com

Abstract: Two field experiments were conducted in two successive seasons (2007-2008 and 2008-2009) at Atta, Giza –Governorate and Nubaria region to study the effect of different rates and ratios of organic residues (Farmyard manure and filter mud) on yield and chemical composition of wheat under two types of soils (sandy and Calcareous soil). Results showed that, application of farmyard manure and filter mud residue gave a significant increase in grain and straw weight, total yield, crop index, harvest index, curd protein, N, P and K compared to the control treatment. Data also, indicated that significant increase grain, straw and total yield in sandy soil compared with calcareous soil under study in all treatments. On the other hand, the addition of organic materials (Farmyard manure and filter mud) were effective either individual or mixed with other. The pronounced increase in grain and straw weight, N, P and K content and uptake was noticed when farmyard manure was combined with filter mud at the rate of 2% compared with 1% of organic residues.

96	**Radioprotective activity of L- Carnitine and α -Lipoic acid against whole body γ- irradiation in rats** **Sally S. Alam[1*], Aziza M. Hassan[1], Nermine K. El Halawaney[1], Dalia E. El-Nashar[2], Mona G. Abd El-Azeem[2]** [1]Cell Biology Department, National Research Center, 12622 Dokki, Giza, Egypt. [2]Health Radiation Research, National Center for Radiation Research and Technology (NCRRT). Atomic Energy Authority, Cairo, Egypt. dr_Sallyalam@yahoo.com **Abstract:** The present study was designed to investigate the radioprotective efficacy of naturally occurring antioxidants, L - carnitine (LC) and α -Lipoic acid (LA) on radiation-induced bone marrow and liver damages in a rat model. The cellular changes were estimated by evaluation the expression of antioxidant enzymes, superoxide dismutase (SOD) and glutathione peroxidase (GPx), genes using RT-PCR and DNA damage in bone marrow and liver cells. The histopathological and ultrastructural changes were also determined. To evaluate the effects of the above antioxidants, adult rats were treated with LC (300 mg/kg b wt) and LA (150 mg/kg b wt) after exposure to whole-body γ-rays (6 Gy) for 10 days, or treated with LC & LA for 7 consecutive days and one hour after the last administration, animals irradiated a single dose of whole-body γ-rays (6 Gy) and received again LC & LA in same dose for 10 days. The obtained data revealed that γ –irradiation significantly decreases the expression of SOD and GPx genes and increases DNA fragmentation in liver cells as well as the incident of micronuclei in bone marrow cells. In addition, different histological and ultrastructural alterations in the liver of irradiated animals were recorded. These alterations were varied from hemorrhage, congestion in blood vessels, pyknosis and necrosis as well as complete degenerated area in the liver electron micrographs recorded swollen mitochondria, fragmented endoplasmic reticulum, distorted nuclei and cell membrane. Treatment with LC & LA post-exposure to radiation attenuated most of these changes. Whereas pre- and post- treatment with LC & LA to γ-irradiation normalized the expression of the antioxidant genes enzymes, decreased the DNA fragmentation and micronuclei formation with a normal restoration of histopathologial and ultrastrucure liver architecture. Thus, our results suggested that pre-treatment with LC & LA offers protection against γ-irradiation induced cellular damage. [Sally S. Alam, Aziza M. Hassan, Nermine K. El Halawaney, Dalia E. 97	**Fresh Water (The Nile And Its Branches) As One Of The Ways For The Development Of Fish Protein Sources In Egypt** **Saber Mostafa Mohamed, Mahmoud Khalifa Ahmed and l. A. E l Karyony** National Institute of Oceangraphic & fishries (NIoF) Alexandria. **saber_mostafa0@yahoo.com** **Abstract:** This study aimed to identify the freshwater fisheries in Egypt in terms of its evolution of fish production, the economic significance of the geographical distribution of the fish with identifying the seasonal productivity and measuring the impact of effort done on the fish production with emphasis on ways of development of those fisheries. The study had been adopted to achieve its goals on both economic analysis and descriptive statistical. The most important results were as follows: The fish production increased from river Nile fisheries from 57.8 thousand tons in 1995 to 79.7 thousand tons in 2008, after interest in the development of this source to provide fry tilapia and carp used in the development of water bodies.The study has been identified on the most important species and their relative importance, which represents about 72.3% of the average fish production during the study period, estimated at approximately	Full Text	97

	87500 tons. The tilapia, catfish, carp, and bayad are the most important varieties of high production are estimated the relative importance of 32.5%, 17.8%, 12.7%, and 9.8% respectively. While, the order comes after that in the arrangement, Nile perch, Shelan, (unicornfish) Albesaria, Nile lebeo, Eel, and barbal with an estimated relative importance of 3.9%, 3.6%, 3.3%, 2.1%, and 0.8%, respectively. The 96% of the annual variability production is due to changes in the productivity of varieties perch, catfish and tilapia. The middel Delta region (Desouk, Kafr El-Zayat, Menouf, Qanatier, and Benha) of the most important productive areas for fish in the River Nile, where a production of about 39.1%, followed by the region of the Nile Valley, which includes (Cairo, Giza, Fayoum, Beni Suef, Minya, and Assiut) represents 26.1%, while the production of Aswan region, represent 16.3%, which include (Sohag, Qena, Aswan).With regard to the employment and fishing boats, has decreased from 16400 boats in 1990 to about 11800 boats in 2008. While, the employment of fishing has decreased at high rates, which dropped from 51.5 thousand fishermen in 1990 to about 7.9 thousand fishermen in 2008, mostly working through the primitive ways, which have lacked in the safety manner. Furthermore, the number of boats licensed reflects the non reality where, the manual boat needed two or more person to complete the various operations on the boat, which indicates an increase in employment of fishing, non-licensed in those fisheries. The average production of the boat has increased with an average annual increase of productivity of 0.28 kg, while the average annual increase of productivity of a fisherman about 0.72 kg per year. However, the number and the productivity of boats are affected by 98% due to the annual changes of the production. Regarding, the examining of seasonal productivity and using seasonality index after excluding the effect of the general trend shows that, production is more than the overall average in the months of May, June, August and December. Whilst, the production is lower than of the overall average in the rest of the year months. Now there are a lot of efforts for the development of freshwater fisheries, through a variety of development programs (i.e. protect fisheries from pollution, fishery Seed supply, determine the appropriate fishing effort, and re-evaluate the characteristics and working methods of fishing). The targeted development plans to increase fish production through the overall development and coordination between the various parties to prevent the pollution of water resources and expansion in the construction and clearing waterways of plants, and re-stocking, especially carp fish, the Nile fish varieties, which became extinct with the quiet water stream, and made use of fish production. [Saber Mostafa Mohamed, Mahmoud Khalifa Ahmed and l. A. E l Karyony. Fresh Water (The Nile And Its Branches) As One Of The Ways For The Development Of Fish Protein Sources In Egypt. 98	**Role of lactic acid bacteria as a biopreservative agent of Talbina** **Amal S. Hathout*, Soher E. Aly** Toxicology & Food Contaminant Dept., Food Industries & Nutrition Division, National Research Centre, Dokki 12622, Cairo, Egypt. amal_hathout@hotmail.com **Abstract:** Talbina is a mixture of barley flour and milk. The aim of this study is to evaluate the role of probiotic bacteria (*L. gasseri*, *L. reuteri*) compared to yoghurt starter bacteria (*S. thermophilus* and *L. delbreukii* sub sp. *bulgaricus*) as a biopreservative agent of Talbina samples. Shelf life of refrigerated Talbina processed by lower count (ratio 1:3 LAB : Talbina) of *L. gasseri* or *L. reuteri* increased and reached over 21 days at 6±2°C, compared to yoghurt starter bacteria which ranged between 6 and 14 days depending on the type of milk used. Storage temperatures are considered the main factors for biopreservation action of lactic acid bacteria (LAB). Increasing storage temperature to 12±2°C increased total fungal count and greatly changed fungal profile. It could be concluded that the potential of LAB to inhibit the growth of common food spoiling fungi opens up new perspectives for the bio-preservation of food products. [Amal S. Hathout, Soher E. Aly. **Role of lactic acid bacteria as a biopreservative agent of Talbina**. Journal of American Science 2010;6(12):889-898]. 99	**Immunohistochemical Study of Heat Shock Protein 70 in Psoriasis Vulgaris** Amina Gamal el Din[1]*, Hanan M Saleh[2], Nermeen Abdel Fattah[2] and Abdel Maksoud A[3] [1].Pathology Department, Medical Research Division, National Research Centre,Dokki, Cairo-12622 (Egypt)* [2.]Dermatology & Venereology Department, Faculty of Medicine, Ain Shams University, Abbasia, Cairo-12622 (Egypt). [3]Dermatology and Venereology Department, Medical Research Division, National Research Centre, Dokki, Cairo-12622 (Egypt). hassaneinamina@yahoo.com **Abstract:** Psoriasis, a common skin disease in Egypt, has drawn much attention to study the potential role of immunity in its pathogenesis.. Exposure of skin to microbial antigens and other stressful stimuli can induce heat shock proteins (HSPs) expression. HSPs comprise a large number of antigens against which immune responses are directed, owing to their cytokine-like effects and immunomodulatory properties. The potential role of HSP70 in pathogenesis of psoriasis is under investigation. We aimed at evaluating the differential immunohistochemical expression of HSP 70 in psoriatic skin and correlating the results with disease severity ; to elucidate its potential role in pathogenesis of psoriasis. Skin biopsies were taken from 20 patients with different severity of untreated chronic plaque-type psoriasis and from 20 healthy volunteers. Antibodies to HSP70 were analyzed immunohistochemically. Immunoreactivity intensity distribution index (IRIDI) scores including the proportion of immunoreactive cells and their staining intensity were calculated in the basal, suprabasal, superficial as well as the whole epidermal layers of patients and controls. Differential and total IRIDI scores for HSP70 expression showed highly significant higher values in psoriatic patients compared to controls. Statistical differences were found between the different groups of patients; according to their disease severity and controls. Positive correlations also existed between IRIDI scores of patients and disease severity. Based on the findings of the present study, HSP70 is suggested to play a role in the pathogenesis of psoriasis and to correlate with disease severity. Further studies on immunotherapeutic intervention are recommended, aiming at inhibiting events in an ongoing immune response which may provide new therapeutic and perhaps preventive approaches for psoriasis. 101	**Assessment Removal of Heavy Metals Ions from Wastewater by Cement Kiln Dust (CKD)** **Taha, A. Waly[1]; A. M. Dakroury[2]; G. O. El-Sayed[3] and S. A. El-Salam[1]** [1]Egyptian Fuel Manufacturing Pilot Plant (FMPP), [2]Hot Lab. Center and Waste Management, Atomic Energy. Authority, Egypt. [3]Department of Chemistry, Faculty of Science, Benha University. Benha, Egypt [*] aishaw95@yahoo.com **Abstract:** The effective removal of HM ions from aqueous wastes is among the most important issues for many industrialized countries. The present work has been carried out to study the adsorption of Cd(II),	Full Text	101

	Al(III), Co(II) and Zn(II), by adsorption technique using CKD which, are both wastes and are pollutants. The sorption process was examined in terms of its equilibria and kinetics. Batch adsorption experiments were conducted to evaluate the removal of Cd(II), Al(III), Co(II) and Zn(II), onto CKD waste over a wide range of operating conditions of sorbat concentration, pH, contact time, sorbent dose. The batch experiments showed that the most effective pH range was found from 5.5 to 8. Time-dependent experiments for the removal efficiency of HM ions showed that Al(III) required a shortest contact time, for Zn(II) and Cd(II), binding to the CKD was rapid and occurred within 20 to 40 min and completed for Co(II) within 4 hrs. High sorption capacities were observed for the four HM ions. The binding capacity experiments revealed the following amounts of HM ions bound per gram of CKD: 165.994 mg/g, 75.389 mg/g, 64.296 mg/g and 108.875 mg/g for Zn(II), Al(III), Co(II) and Cd(II), respectively. The equilibrium data for HM ions fitted both Langmuir and Freundlich models and based on Langmuir constant. The adsorption isotherm studies clearly indicated that the adsorptive behavior of HM ions on CKD satisfies not only the Langmuir assumptions but also the Freundlich assumptions, i.e. multilayer formation on the surface of the adsorbent with an exponential distribution of site energy. 102	**Evaluation of Avian Influenza Vaccines used in Broiler Flocks in Egypt.** **Lebdah, M.A and *Shahin, A.M.** Avian and Rabbit Medicine Department; Faculty of Vet. Med.; Zagazig University *abeer.shahin@gmx.de **Abstract:** This study was carried out to investigate the efficacy of different types of commercial Avian Influenza Vaccines (H5N1 &H5N2) used in Egypt. Three – hundred and fifty day-old broiler chicks were divided into 7 groups. Six groups of chickens were vaccinated with H5N1 and H5N2 AI vaccines at 1, 7, and 14 days-old. The chickens of group 7 were kept as negative control. All groups were fed adlibtum and kept under observation. Serum Samples were collected at day-old to evaluate the maternal immunity and after 7 weeks post vaccination with both types of vaccines from all chickens. This study revealed that, the challenge virus was highly pathogenic for control group as causing 100 % mortalities 24 hours after challenge with 10^6 EID_{50}/ 0.2 ml intranasal. Challenge of other groups showed difference in pathogenicity of the virus and immune response of the chickens according to type of vaccine and age of birds at vaccination. It could be concluded that H5N2 AI vaccine was more protective than H5N1 AI vaccine as the protection percentage and GMHI titer of experimentally broiler chicks vaccinated at day-old and fourteen days-old with H5N2 higher than chicks vaccinated with H5N1. Moreover, the vaccination of the chicks at seven days-old showed higher GMHI titer and protection percentage than vaccination at one day-old. 103	**Her 2/neu Gene and VEGF in Bladder Cancer in Egypt: Relationship to Schistosomiasis** **Olfat A. Hammam [1], Iman Abdel Aziz [2],Ola Mahmoud [2], Manal Zahran [2], Amr Alkholy [3], Ahmed Abdel Hadi[1], Maha Akl [1], Mohamed Wishahi [3]. Bruno Voss[4] and Sabine Boehm[4]** Departments of Patholog [1], Hematology [2], Urolog[3], Theodor Bilharz Research Institute, El-Nil Street, Giza,	Full Text	103

	Egypt Research Institute for Occupational Diseases[4], Ruhr University Bochum, Germany. *totoali1@hotmail.com **Abstract:** The aim of the current study was to assess Her2/neu protein on paraffin tissue sections and serum VEGF in carcinoma of the urinary bladder in a cohort of Egyptian patients. Furthermore, they were correlated to the schistosomal-associated and non-schistosomal associated bladder cancer as well as tumor types and disease stages. Immunohistochemical (IHC) procedure for Her 2/neu, FISH for detection of Her2/neu gene and serum level of VEGF by EIISA were performed in 35 patients with chronic cystitis (10 patients with nonschistosomal chronic cystitis and 25 patients with chronic schistosomal cystitis), 135 were schistosomal-associated malignant patients (75 cases of squamous cell carcinoma and 60 cases of urothelial carcinoma) and 50 cases of non schistosomal-associated urothelial carcinoma. In addition to 20 normal blood donor volunteers act as control. IHC results for Her 2/neu was overexpressed in malignant group compared to control and chronic schistosomal cystitis groups ($p<0.01$). In malignant group it was 1^+ in 33 (30%), 2^+ in 45 (40.9%) and 3^+ in 32 (29.09%). Her 2/neu incidence was significantly higher in urothelial carcinoma group 80/110 (72.2%) compared to SCC 30/75 (40%) with ($p<0.01$) and in high grade tumors than low grade tumors with ($p< 0.01$). FISH results in SCC showed that the signal ratio were 0-1.0 in 2 (6.6%), 1.1-2.0 in 18 (60%), and ≥2.0 in 10 (33.35%), which were considered positive for Her 2/neu gene amplification. In urothelial carcinoma the signal ratio was 0-1.0 in 10 patients (12.5%), 1.1-2.0 in 25 (22.3%), and ≥2.0 in 45 (58.2%). Overexpression of Her2/neu gene was significantly higher in high grades; 31 (63.6%) than in low grades; 14(56%) tumor with ($p< 0.01$), also Her2 /neu gene was significantly ($p< 0.01$) higher in invasive tumors; 45 cases (78.9%) than in non invasive tumors 10 (43.3%) with high significance ($p< 0.01$). The serum VEGF levels showed higher levels for SCC, urothelial carcinoma patients, chronic cystitis patients compared to normal controls, they were 94.7% (71/75), 89% (98/110), and 22.9% (8/35), 5% (1/20) respectively. Our results suggest that Her 2/neu overexpression might provide additional prognostic information in patients with bladder carcinomas. Because 50% of our patients harbor Her 2/neu overexpressing those patients may potentially benefit from molecular targeted therapy targeting Her 2/neu for bladder carcinoma and they should be identified by gene amplification analysis using FISH in IHC 2+ patients. In addition association between increased serum VEGF levels with high grades and invasive bladder cancer patients indicates that serum VEGF may play a role in the invasion and metastasis of cancer and may serve as an indicator of tumor progression and future recurrence and may be a candidate as a new noninvasive diagnostic tool. 104	**Ultrasonic Comparative Assessment for Biodiesel Production from Rapeseed** **N.N. Ibiari*, S.A. Abo El-Enin, N.K. Attia and G. El-Diwani** Chem. Eng. and Pilot Plant Dept., National Research Centre, Egypt **Abstract:** The application of ultrasound during extraction and trans-esterification of oil from rapeseed was evaluated. Two methods of extraction were used, batch wise extraction and soxhlet extraction. In batch wise extraction procedure, ground rapeseeds were added to solvent and ultra-sonicated either by cleaning bath or ultrasonic generator. Conventional soxhlet extraction assisted in the soxhlet chamber by ultrasound has been developed. Ultrasonic technique reduced time required to extract oil. Using batch wise extraction procedure, percent recovery of oil increased almost 17.83% and 20.99% by using cleaning bath and ultrasonic generator respectively rather than control after 2hrs.While in using soxhlet extraction percent recovery reached 85% after 1.5 hr in case of ultrasonic and after 4 hrs without using ultrasonic. Physical and chemical properties of rapeseed oil were tested. Then the alkaline trans-esterification of rapeseed oil with methanol and potassium hydroxide for production of biodiesel was studied, using ultra-sonication and magnetic stirring. In trans-esterification the use of ultra-sonication and magnetic stirring led to similar high	Full Text	104

	yields of 90% of methyl esters after approximately 10 min. of reaction time. Comparison between biodiesel obtained and standard biodiesel and diesel fuel was done. [N.N. Ibiari, S.A. 105	**Application of Different Methods of Natural Aeration of Wastewater and their Influence on the Treatment Efficiency of the Biological Filtration** **Tarek Ismail Sabry [1], Walid Hamdy[*2] and Saleem S. AlSaleem[3]** [1] Sanitary Engineering, Ain Shams University, Egypt. [2] Sanitary Engineering, Helwan University, Egypt. [3]Al Qassim Research Station, King Abdulaziz City for Science and Technology, KSA. awawalid@yahoo.com **Abstract:** The main objective of the proposed study is to examine the performance and the feasibility of using three different natural aeration methods (AM). The first two methods are the spray aerator (AM1) and the cascade aerator (AM2). The third method, the curtain aerator (AM3), is a new aeration technique that has different dynamic movement of wastewater falls (physical scrubbing action of aeration) for the aerobic treatment of raw sewage. The study investigates the most effective and suitable natural aeration system among these three methods for use in rural areas of developing countries where high costs of construction, operation, and maintenance of high-rate energy-intensive conventional aeration system technologies are the main bottleneck. The influences of the investigated natural aeration systems on the biological filtrations system are also investigated. The experimental results indicate an increasing in the aeration during the whole experimental by 21 %, 29 %, and 27 % for the AM1, AM2, and AM3 aeration systems, respectively; in respect with dissolved oxygen saturation. The results also showed that the amount of DO added to wastewater was influenced by both the surface loading rate ($m^3/m^2.hr$) of the aeration method and the splash movement of wastewater through the surface of the different methods As well, it was observed that cascade aerator (AM2), and the curtain aerator (AM3) had better removal efficiency in BOD, COD, and TSS compared with the spray aerator (AM1). [Tarek Ismail Sabry, Walid Hamdy and Saleem S. AlSaleem. **Application of Different Methods of Natural Aeration of Wastewater and their Influence on the Treatment Efficiency of the Biological Filtration**. 	*aboufares90@yahoo **Abstract:** Pregnancy is the more prevalent stress in under feeding small ruminant with multiple bearing. Fifty Ossimi ewes of two years old and their body weight ranging between 35 and 50 kg were allotted into three groups; Group I: contains ten non pregnant non lactating ewes were used as control group. Group II: contains twenty single pregnant ewes* and Group III: contains twenty twin pregnant ewes used as experimental animals. Our study focused on the comparison between single and twin bearing ossimi ewes in the last four weeks of pregnancy and the day of parturition by measurement of reduced glutathione (GSH) level and the activities glutathione peroxidase (GSH-Px); glutathione reductase (GR-ase); glutathione-S-transferase (GST) and total superoxide dismutase (t-SOD) in erythrocytic haemolysate. In addition, glucose, non esterfied fatty acid (NEFA), Beta hydroxyl butyric acid (BHBA), cortisol, insulin and protein electrophoric patterns were measured in serum. Our results concluded that, In erythrocytic haemolysate the mean values of GSH-Px and GST in group II and III during the period of 2nd and last week before parturition and at the day of parturition were high significantly increased. While, GSH and t-SOD were high significantly decreased (P<0.01) and GR-ase activities were significantly decreased. While serum insulin level decreased while serum NEFA, BHBA and cortisol were increased in single and twin but in twin the values is more significant. The data showed that twin bearing ewes are more susceptible to pregnancy toxemia than single bearing that may be influence the productivity and performance of those animals. 	[3] Children with Special Needs Dept., Medical Reseach Division, National Research Centre, Dokki, Giza, Egypt drmohgashafik@yahoo.com., hayatsharadamk@gmail.com.,esmatashour3@yahoo.com., malakalhoda@yahoo.com., Meguidna@yahoo.com **Abstract :Background:** Phenylketonuria (PKU) is a metabolic disorder characterized by high phenylalanine (Phe) levels in blood. Tissue accumulation of L-phenylalanine (Phe) is the biochemical hallmark of human phenylketonuria (PKU), an inherited metabolic disorder clinically characterized by mental retardation and other neurological features. The mechanisms of brain damage observed in this disorder are poorly understood. S-100B protein is highly specific for nervous tissue where its role is not yet fully understood. **Objective:** The aim of our study was to determine the diagnostic value of measuring S-100b in the serum of PKU patients as a marker for brain lesion. Additional validity should be acquired by a comparison with plasma levels of phenylalanine. **Methods:** Nineteen PKU patients from 15 families were selected from the clinic for special needs at the National Research Centre. Their age ranged between 2 and 20 years in addition to 15 healthy controls with same age. Blood samples were drawn to investigate circulating serum levels of S-100b using ELISA technique for all the studied cases. **Results:** Statistical significant increase of serum S-100B concentrations was present in PKU patients compared to controls. Regarding sensitivity and specificity, PKU patients, serum neural protein S-100b showed high sensitivity and specificity values. In addition, there was non significant negative correlation between S100B and Phe **Conclusion:** we concluded that serum S-100B blood could be a useful peripheral marker of nervous system damage in patients with phenylketonuria. [Mohga S Abdallah, Hayat M Sharada, Esmat Ashour, Lamiaa Mageed, Nagwa Meguid. **Role of S-100B as a Serum Biochemical Marker for Brain Injury in Egyptian Patients with Phenylketonuria**. 109	**Changes in Biochemical and Isozymes Components of Watermelon seeds during accelerated Ageing Technique** Magdy M. Rashed[1]; Magdy shallan[1]; Mahmoud Fathy[2]; and Anisa I. Ismail[2] [1]Bio Chemistry Department, Faculty of Agriculture, Cairo University, Giza,Egypt [2]Department of Seed Technology, Horticulture Research Institute, A R C, Ministry of Agriculture, Giza, Egypt **Abstract: The aims** of this work was to study some changes in the total content of storage components of watermelon (*citrullus lanatus*) seeds during accelerated ageing technique and its relation to seeds viability. **Materials and Methods**: Before the experiment, seeds were stored for two years in store house at 25C° in the start experiment, ageing at 50°C with 17% moisture up to 24, 48, 72, and 96 hours respectively. Germination percentage was decreased, a reduction in the total content of storage components such as proteins, carbohydrates, in addition, increasing oils and decreases in the activities of various esterase enzymes under the same condition were observed. **Results:** It was clearly that 50°C with 17% moisture content could be used as a good ageing seed testing condition for watermelon seeds In the present study The treatments watermelon seeds could be identified by Biochemical analysis (Esterase isozyme and Protein) banding pattern. [Magdy M. Rashed; Magdy shallan; Mahmoud Fathy; and Anisa I. Abstract: Purpose: In this study the therapeutic low-power laser (LPL) and Betamethasone (as an anti-inflammatory) were compared in terms of their effects on edema and trismus associated with surgical removal of impacted mandibular third molars. **Material and methods:** 20 healthy patients divided into two equal groups were included in the study. Group (I) received LPL irradiation (energy output 6 J/cm^2 with constant power density of 100 mW, wavelength 980 nm) on the 1st and 3rd postoperative days. Group (II) received a single dose of 4 mg systemic intramuscular Betamethasone Sodium Phosphate (Diprofos) into the gluteal region immediately after suturing of the surgical wound. Both groups received the usual medical and physical postoperative recommendations. **Results:** LPL irradiation (group 1) showed reduction of postoperative edema on the 3rd postoperative day. In addition, no significance difference resulted on comparing this effect between both groups. Postoperative trismus was nearly the same in both groups. No adverse effects of the procedure or medication were observed. **Conclusion**: LPL therapy is effective than systemic Betamethasone in reducing postoperative edema after third molar surgery without statistical significant differences. However both treatment modalities have the same effect on postoperative trismus.

istifanuschindo@yahoo.com

Abstracts: The oil quality parameters of the seed and condiment oil of Adansonia digitata were evaluated. The Iodine value, Peroxide value, Saponification value and percentage Free Fatty Acid (FFA) were 98.07g/100g, 1.4mEq/Kg, 122.60mg/g and 0.21% respectively for seed oil and 71.06g/100g, 10.20mEq/Kg, 142.80mg/g and 6.37% respectively for the condiment oil. The variation in the parameters from seed oil to condiment oil observed include increased in peroxide value, FFA and Saponification value and decreased in Iodine value. The changes have been interpreted to be due to some structural changes in the Triglyceride leading to the formation of new chemical properties and products. The Infra Red (IR) spectra have also given an identification of Rancidity of the condiment oil due to bands observed at 3400-2700 and 1705 cm-1 indicating the possible formation or absence of acid and aldehyde respectively; which are products of oxidative Rancidity.

113	**An Introduction of OSCE versus Traditional Method in Nursing Education: Faculty Capacity Building &** **Students' Perspectives** [1*]Shadia A. Eldarir, [2]Hanan A. El Sebaae, [2]Hanaa A. El Feky, [3]Hewida A. Hussien, [1]Nagwa Abd El Fadil and [4]Inas H. El Shaeer [1]Maternal-Newborn Health Nursing Dept., [2] Medical Surgical Nursing Dept., [3] Pediatric Nursing Dept., [4] Community Health Nursing Dept., Faculty of Nursing Cairo University, Cairo, Egypt	Full Text	113

	*shadiaeldarir@yahoo.com **Abstract:** Background Assessment of clinical competence is of great importance when evaluating the expected learning outcomes of nursing education. Increasing number of students enrolled at Egyptian nursing faculties might increase the chances of malpractice that compromise patients' conditions. Therefore it is challenging to have such an objective assessment tool to comprehensively assess students' clinical competencies especially with increased students' number. Aims of the current project are building capacity of nursing faculties and staff members for OSCE; establishing simulated learning experiences (OSCE) in nursing practice; comparing the feasibility, utility, and effectiveness of using OSCE versus traditional clinical assessment; examining faculty and students perspectives for OSCE; and evaluating the effectiveness of OSCE versus traditional clinical assessment. Method: To achieve aims of this study needs' assessment of faculty members were carried out during conduction of raising awareness seminar about OSCE which attended by 72 faculty and staff members from both Cairo and Ain Shams Universities. A total of 7 workshops were held to build up their capacities on the scheme of OSCE and clinical scenario writings .One-hundred and forty faculty and staff members were attended and pre-post tests a were administered. Out of the 140, 31 were trained as data collectors. . Implementation of the OSCE was carried out on 400 second and third year students at the areas of critical care units. Comparison of students' achievements at traditional and OSCE methods were carried out. Faculty's and students' perspectives were investigated. Results: Needs' assessment revealed that 57% of faculty members knew nothing about OSCE and 98.6% of them had no experience in using OSCE; also a high statistical significant differences between OSCE and traditional assessment groups in the first and second trial ($t = 2.423$, $p= 0.016$), and ($t= 6.23$, $p= 0.000$) respectively. The students' achievements were better with OSCE. Faculty staff members indicated that, OSCE saves time (76.3%), prepares highly qualified competent students (62.5%) and improve students' performance (62.5%). Conclusion OSCE examination offers an attractive option for assessment of students' competency. It provided particular strengths in terms of faculty staff objectivity and reliability of the assessment process for all students, especially when compared with other methods of assessing practice. 114	**Effect of Type of Aggregate on the Properties of Refractory Concrete** **S.A. Ghonaim*, H.B.G. Ghazal**, and M.F. Abadir*** [+]** * Egyptian Organization for Standardization and Quality ** The High Institute of Engineering, Shorouk *** Chemical Engineering Department, Faculty of Engineering, Cairo University [+] Corresponding author: Magdi F. Abadir The Chemical Engineering Department, Faculty of Engineering, Cairo University, Giza, Cairo, Egypt Area Code: 12613; Tel: 202 35678617; Fax: 202 35678625; E–mail: magdi.abadir@yahoo.com **ABSTRACT:** Low cement refractory concrete samples were prepared by mixing cement (containing 50% alumina) in percentages ranging from 10 to 20% with aggregate and the necessary amount of water. Two types of refractory aggregate were used: Bauxite containing 81% alumina and grog containing 52% alumina. Four particle sizes of each aggregate were used each time. The cast samples were left in their moulds for 24 hours in a 100% relative humidity cabin. The de–molded specimens were left in open air until their moisture content reaches 3–6%, then put in a drying oven at (110 ± 5) ºC until reaching constant	Full Text	114

	weight. They were then tested for phase constitution, water absorption, bulk density, apparent porosity and cold crushing strength (after 28 days curing). It was found that bauxite based samples gave better results than those prepared with grog. It was also found using statistical analysis that the percent cement used affects all properties much more than does the particle size of aggregate. [S.A. Ghonaim, H.B.G. Ghazal, and M.F. This case-control study is an effort to clarify the effect of chronic asthmatic chest troubles, as chronic illnesses, on the cognition and psychological aspects of such chronically ill children. This study was executed in the Chest Clinic of the Abou El-Reesh Children's Hospital, Cairo University. The Study was carried out on 23 children suffering from chronic asthmatic chest troubles (13 boys and 10 girls) with an age range of 6-15 years (mean age ± SD = 9.6±2.67). Twenty three age and sex matched children not suffering from any disease and living under the same socioeconomic conditions were taken as controls. WISC-R and PSCL were used to assess the cognitive and psychosocial adjustment among children while the mid-year scores for Mathematics and Arabic language were used to evaluate the academic performance. Our results indicated that chronic asthmatic disease has a negative effect on cognitive abilities, psychosocial behavior and academic achievement of such children. [*]a_mamdouh8@hotmail.com

Abstract: Objectives: This study aimed to evaluate the diagnostic yield of estimation of serum cartilage oligomeric matrix protein (COMP) as a screening tool for osteoarthritis (OA) among patients with knee joint pain. Patients & Methods: The study included 140 female patients with knee pain and 20 volunteers to donate blood as a control group for laboratory findings. All patients underwent full history taking, clinical examination for evaluation of pain severity using a visual analogue scale (VAS) and extent of patient mobility using mobility score (MS) and had knee anteroposterior radiographs that were scored using the Kellgren-Lawrence scoring (K-L score) system. Patients were classified according to K-L scores into: group A: pain plus no radiographic findings (K-L score=1), group B: pain plus doubtful or minimal radiographic findings (K-L score=1) and group C: pain plus radiographically determined OA (K-L score≥2). Venous blood samples were obtained from all patients and controls for erythrocyte sedimentation rate (ESR) determination and ELISA estimation of serum COMP and high-sensitivity C-reactive protein (hsCRP) levels. Results: Group C patients had significantly higher pain scores and lower MS compared to groups A and B. Mean patients' serum COMP levels was significantly higher compared to control levels and in group C compared both to controls and to groups B and A levels with significantly higher levels in group B compared to controls and group A. However, serum COMP levels were non-significantly higher levels in group A compared to control levels. There was a positive significant correlation between serum COMP levels and body mass index (BMI), pain VAS score and radiological grade and a negative significant correlation with MS. ROC curve analysis revealed that elevated serum COMP is a sensitive predictor and high BMI is a specific predictor for the presence of OA. Serum COMP at 1097.5 ng/ml was the best cutoff point with high sensitivity (87.7%), positive predictive value (PPV, 92.6%) and accuracy (84.3%) for differentiation between patient with and without OA radiological manifestations and serum COMP at 1290 ng/ml showed 100% specificity and PPV and accuracy rate of 65.7% for diagnosis of the presence of radiological findings of OA. Conclusion: Estimation of serum COMP level could be considered as screening modality for patients with knee pain and using cutoff point of 1097.5 ng/ml helps to define patients free of OA and cutoff of 1290 ng/ml could define patients with OA.

Abstract: Pregnancy is the more prevalent stress in under feeding small ruminant with multiple bearing. Fifty Ossimi ewes of two years old and their body weight ranging between 35 and 50 kg were allotted into three groups; Group I: contains ten non pregnant non lactating ewes were used as control group. Group II: contains twenty single pregnant ewes* and Group III: contains twenty twin pregnant ewes used as experimental animals. Our study focused on the comparison between single and twin bearing ossimi ewes in the last four weeks of pregnancy and the day of parturition by measurement of reduced glutathione (GSH) level and the activities glutathione peroxidase (GSH-Px); glutathione reductase (GR-ase); glutathione-S-transferase (GST) and total superoxide dismutase (t-SOD) in erythrocytic haemolysate. In addition, glucose, non esterfied fatty acid (NEFA), Beta hydroxyl butyric acid (BHBA), cortisol, insulin and protein electrophoric patterns were measured in serum. Our results concluded that, In erythrocytic

	haemolysate the mean values of GSH-Px and GST in group II and III during the period of 2nd and last week before parturition and at the day of parturition were high significantly increased. While, GSH and t-SOD were high significantly decreased (P<0.01) and GR-ase activities were significantly decreased. While serum insulin level decreased while serum NEFA, BHBA and cortisol were increased in single and twin but in twin the values is more significant. The data showed that twin bearing ewes are more susceptible to pregnancy toxemia than single bearing that may be influence the productivity and performance of those animals. 121	**A Typical Bacteria in Ventilator Associated Pneumonia; an Egyptian University Hospital Experien** **Nadia Abdel-Salam Mokhless[1,3] , Malaka Farouk El-Mofty[1,3] , Nesrine Fathy Hanafi[* 1,3], Akram Muhammad Fayed[2,3] and Sara Lotfy Asser[1,3].** [1]Medical Microbiology and Immunology, [2]Critical Care Medicine, [3]Faculty of Medicine University of Alexandria, Egypt. drnesra1@hotmail.com* **Abstract:** Background Ventilator-associated pneumonia (VAP) is the most common hospital acquired infection seen in ICU in patients on mechanical ventilation. A diversity of microbes can cause VAP, causative agent differ according to patient populations and types of ICUs. Atypical bacteria not cultured by routinely used methods , have been implicated as causes of VAP, still no sufficient studies to assess size of their role as causative agent in VAP. In this study we aim at estimation of the potential role of atypical bacteria as Mycoplasma pneumoniae, Chlamydia pneumoniae and Legionella pneumophila in ventilator-associated pneumonia in the intensive care units of Alexandria Main University Hospital. Materials and methods: 60 endotracheal aspirates were collected from VAP ICU patients. Samples were subjected to routine culture as well as PCR amplification using specific primers for detection of the following atypical bacteria : Mycoplasma pneumoniae, Chlamydia pneumoniae and Legionella pneumophila. Results: Out of the 60 endotracheal aspirate, routine culture revealed growth of: enterobacteriaecae in 14 (23.3%) aspirate, pseudomonas in 13(21.7%), candida in14(23.3%) , and MRSA in 10 (16.7%) . In 19 (31.7%) endotracheal aspirates, no growth was encountered on routine culture. PCR reaction was positive for Atypical bacteria in 9 (15%) out of 60 samples, five were positive for mycoplasma, three for Legionella, and only one was positive for Chlamydia. Atypical bacteria positive results were encountered in 4 (21%) out of 19 aspirates with no growth culture results. Conclusion: Our results point that atypical bacteria are not an uncommon cause for VAP. This finding has to be taken into consideration while tailoring the empiric antimicrobial coverage of patients diagnosed with VAP. (CAPL), Agriculture Research Center (ARC), Cairo, Egypt.	Full Text	122

	Abstract: Twenty three new 2-cyanomethyl benzoxazole derivatives were synthesized by different methods. Their structures were elucidated by many ways as elemental analysis, spectroscopic analysis and chemical methods. The herbicidal activity of the newly synthesized compounds was evaluated against wheat as pattern for monocotyledonous plants, three plant parameters were studied, seed gerimination, root and shoot growth under laboratory conditions. Compounds that showed an observable inhibition on one or more of the growth parameters under study were considered as promising compounds and needs more studies from the toxicological, soil, environmental and formulation points of view to stand on the most potent derivative that can be formulated in a suitable formulation form to be used in the field of pest control. Compounds (**16a**),(**16b**),(**16f**),(**13b**),(**10a**),(**7a**) and (**3b**) inhibited all growth parameters under study by different degrees. While compounds (**13b**) and (**13a**) were more effective on root and gerimination respectively. Most synthesized compounds inhibited markedly shoot growth. 123	**Designing a Reliable Supply Chain Network Model under Disruption Risks** Nader Azad, Hamid Davoudpour Department of Industrial Engineering, Amirkabir University of Technology, P.O. Box 15875-4413, Tehran, Iran. n.azad@aut.ac.ir **Abstract:** In this paper, we consider random disruption risks in designing a reliable distribution network model. We consider the disputations in the location and the capacity of the distribution centers. In our model, the probability of disruption in distribution centers is dependent to the amount of investment for opening and operating them. We show that this problem can be formulated as a non-linear integer programming model, and then for obtaining optimal solution, we linearize the mentioned model. In the following to solve the model in large-sized instances, a tabu search algorithm is developed. The results indicate that the tabu search method is efficient for a wide variety of problem sizes. [Nader Azad, Hamid Davoudpour. **Designing a Reliable Supply Chain Network Model under Disruption Risks**. Journal of American Science 2010;6(12):1091-1097]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Supply chain network, Distribution network, Facility location, Random disruption risks, Tabu search	Full Text	123
124	**Serum Fetuin-A in Chronic Renal Disease Patients: Contribution to Endothelial Dysfunction and Hemostatic alteration** Nadia A. Hussein[1], Ola M. Mahmoud[1], Manal Y. Zahran[1], Manar A. Rafaat[2] [1]Hematology and [2]Nephrology Departments, Theodor Bilharz Research Institute, Giza, Egypt nadhussein@hotmail.com **Abstract: Background/Aim:** Fetuin-A is a circulating calcium-regulatory glycoprotein that inhibits vascular calcification. In the present study, serum fetuin-A was studied as a novel risk factor for the development of endothelial dysfunction (ED) and hemostatic alteration in patients with chronic renal disease (CRD). **Patients and Methods:** 15 CRD patients on conservative treatment, 15 end stage renal	Full Text	124

	disease (ESRD) patients on regular hemodialysis (HD) treatment and 15 healthy volunteers were enrolled in the study. Fetuin-A, thrombomodulin (TM), von Willebrand factor (vWF), tissue plasminogen activator (t-PA), plasminogen activator inhibitor (PAI-1), D-dimer, high sensitivity CRP (hs CRP) and IL-6 were measured by ELISA. **Results:** There was a significant reduction in Fetuin-A levels in CRD and HD patients compared to controls. A significant decrease was also detected in HD group when compared to CRD group. The inflammatory markers, hs CRP and IL-6, were significantly increased in CRD and HD patients in comparison to controls. The increase was also significant on comparing HD group to CRD group. A strong inverse correlation was found between serum fetuin-A and each of hs CRP and IL-6. In addition, regression analysis revealed that hs CRP is an independent determinant of serum fetuin-A level. The traditional markers of ED, TM and vWF, were significantly increased in CRD and HD patients compared to controls. The increase was also significant when HD patients were compared to CRD patients. The significant inverse correlation between fetuin-A and each of TM and vWF supports the hypothesis that low serum fetuin-A with subsequent vascular calcification could be one of the contributing factors for the development of ED in CKD and HD patients. The fibrinolytic parameters tPA, PAI-1 and D-dimer levels were significantly higher in CRD and HD compared to controls. HD patients had significantly higher values of the previously mentioned parameters in comparison to CRD patients. t-PA, PAI-1 and D-dimer were significantly correlated to fetuin-A in CRD and HD patients. **Conclusion:** The results of this study demonstrate that in CKD and HD patients inflammatory processes are increased and linked to low fetuin-A and vascular calcification which represents a novel risk factor for the development of ED. The interplay of these phenomena could be responsible for the development and progression of accelerated thrombogenesis that is peculiar to renal patients. [Nadia A. Hussein, Ola M. Mahmoud, Manal Y. Zahran, Manar A. Rafaat. **Serum Fetuin-A in Chronic Renal Disease Patients: Contribution to Endothelial Dysfunction and Hemostatic alteration**. Journal of American Science 2010;6(12):1098-1105]. 125	**Electrogastrographic Findings in Cerebral Palsy Patients** **Nassar M.F.[1] Aly R.H.[1], Mahmoud N.H.[2], El-Batrawy, S.R.[3] and Abdel-Kereem N.[1]** [1]Pediatrics Department and [2]Clinical Pathology Department, Faculty of Medicine, Ain Shams University, [3]Department of Anthropology, National Institute of Research, Cairo, Egypt. [*]maie_nassar@yahoo.co.uk **Abstract:** Objectives: This work was designed to detect any changes in the gastric electrical activity and gastrin levels in infants with cerebral palsy (CP) and correlate them to the clinical findings. Patients and methods: The study was conducted on 30 CP patients in comparison to 12 age and sex matched clinically healthy infants. All enrolled infants and children were initially subjected to complete history taking with special emphasis on gastrointestinal symptoms, clinical examination and routine laboratory procedures as well as total serum gastrin hormone by ELISA. Electrogastrographic (EEG) recording for gastric electrical activity was performed for all subjects upon enrollment. Results: The initial power ratio was non-significantly higher in CP patients compared to the controls while the dominant frequency (DF) was non-significantly lower. Regarding the initial visual analysis of the EGG, 13 patients (43.3%) were normogastric compared to bradygastria in 16 (53.3%) of them. Initial serum gastrin was higher in CP patients compared to the controls. The regression analysis revealed that gastrin was the most determinant factor for dominant frequency values followed by the power ratio in the CP patients. Conclusion: In conclusion, CP patients have disturbed gastric motility which explains the different proximal gastrointestinal clinical manifestations experienced by our patients and this should be considered during their nutritional rehabilitation programs. [Nassar M.F. Aly R.H., Mahmoud N.H., El-Batrawy, S.R.and Abdel-Kereem N. **Electrogastrographic findings in cerebral palsy patients.** Journal of American Science, 2010; 6(12): 1106-1113]. 126	**Significance of Angiopoietin-2 as a Serum Marker for Hepatocellular Carcinoma** Shereen Shoukry Hunter*[1], Maha Sayed Hassab-Allaah[1], Mahmoud Ahmad El-Ansary[2], Faten M El Shanawani [3] and Mona M Hassan[3] [1]Tropical Medicine Department, Faculty of Medicine, Cairo University, Cairo, Egypt [2]Hepatology and Gastroenterology Department, Theodor Bilharz Research Institute, Cairo, Egypt [3]Clinical Chemistry Department, Theodor Bilharz Research Institute, Cairo, Egypt *shereenhunter@hotmail.com **Abstract:** Background and study aims: Hepatocellular carcinoma (HCC) is one of the most common malignancies worldwide and one of the major causes of death. The aim of this study was to investigate the potential role of Angiopoietin-2 as a non-invasive marker for HCC. Patients and Methods: This study was conducted on 30 patients with documented HCC and 30 cirrhotic patients with no evidence of HCC; as well as 30 healthy subjects who served as control group. The levels of alfa fetoprotein (AFP) and angiopoietin-2 (Ang-2) were measured for all cases together with full clinical assessment, liver biochemical profile, viral markers, ultrasound, abdominal triphasic computerized tomography (CT) scan and guided liver biopsy for HCC cases with atypical triphasic CT pattern. Results: There was a statistically highly significant elevation ($p< 0.001$) in the mean serum AFP in HCC group (155.5 ± 271.5 ng/ml) when compared with the control group (6.3 ± 2.4 ng/ml) and also a highly significant elevation ($p<0.01$) when compared to the cirrhosis group (29.3 ± 31.2 ng/ml). There was a statistically highly significant elevation ($p< 0.001$) in the mean serum Ang-2 in HCC group (10855 ± 5321.92 pg/ml) when compared with both the control (480.67 ± 202.3 pg/ml) and cirrhosis (5578.33 ± 2928.21 pg/ml) groups. The diagnostic sensitivity of AFP at a cutoff of 200 ng/ml was 24% and the specificity was 100%. The cutoff level of Ang-2 for diagnosis of HCC in this study was 8100 pg/ml, with a sensitivity and specificity of 70% and 80% respectively. Serum Ang-2 was significantly elevated in HCC patients with portal vein thrombosis than those without. There was a significant positive correlation between the number of hepatic focal lesions and the serum level of Ang-2. The combined use of the two markers (AFP and Ang-2) led to an increase in the sensitivity of AFP from 53.3% to 83.3%. Conclusion: Serum Ang-2 is elevated in patients with cirrhosis and further elevated in patients with HCC, so its use as an independent tumor marker in the diagnosis of HCC is to be considered. Simultaneous measurement of serum AFP and Ang-2 may enhance the sensitivity of HCC detection. 127	**Double -Control, Randomized Study of Antibiotic Prophylaxis during Standard Dose Chemotherapy in Cancer Patients** Fatma Zakaria*[1] and Mohamad Zakaria[2] Departments of Clinical Oncology[1] and Microbiology[2], Faculty of Medicine, Tanta University, Tanta, Egypt **Abstract:** Background: Dilemma of antibacterial prophylaxis after chemotherapy still opened. Patients and methods:Double, control trial in patients who were receiving cyclic chemotherapy for solid tumors or lymphoma and who were at risk of temporary, sever neutropenia (fewer than 500 neutrophils/ml). Patients were randomly divided into two group, the first groups assigned to receive oral 500 mg of quinolone once daily for seven days during the expected neutropenic period, while the second group received no	Full Text	127

	prophlaxis (control group). The primary end point was the incidence of clinically documented febrile episodes (FE) (temperature of more than 38°C) due to infection. Assessment of the risk of FE in controll group on first versus non first cycles with or without first cycle FE in the light of different pretreatment factors. Secondary end point included the incidence of all infections, severe infections, hospitalization and cost. Results: A total of 403 patients randomly divided into 201 patients received antibacterial prophylaxis quinolone (levofloxacin®) and 202 patients as control group. The tumors included breast cancer 238 (59.1 percent), lung cancer 82 (20.3%), testicular cancer 34 (8.4%) and lymphoma 49 (12.2%). During the first cycle of chemotherapy, 3.5% of patients in the quinolone group had at least one febrile episode, as compared with 8.4% in the control group (P=0.009).The per- cycle FE rate for the first cycle was 8.4% compared with 4.4% in non first cycles in control group. During the entire chemotherapy course, 9.5% of patients in the quinolone prophylactic group had at least one febrile episode; as compared with 16.3% in the control group (P ≤0.005).There was significant reduction in the rate of G3&G4 neutropenia in quinolone group (52%). The respective rates of infections were 33.8% and 42.1% (p=0.098) for quinolone versus control group. Hospitalization was required for treatment of infection in 3% of patients in the quinolone group and 7% of patients in the control group (P≤0.05). Respective rates of reduction of cost and length of stay (LOS) were 51.8% and 51.6% for infections in quinolone prophylactic group. Respective rates of sever infections were 1.0% and 2.0% (p≤0.06), for quinolone and control group, with one infection related death in each group. An organism was isolated in 194/250 cycles (77.6% of infections). Conclusions: Quinolone prophylaxis (levofloxacin is preferred) should be offered to those receiving standard dose chemotherapy for solid tumors and lymphomas to reduce incidence of fever, infection, hospitalization and cost with rational selection of patients for antibacterial prophylaxis with first cycle chemotherapy. [Fatma Zakaria[*1] and Mohamad Zakaria. **Double -Control, Randomized Study of Antibiotic Prophylaxis during Standard Dose Chemotherapy in Cancer Patients**. Journal of American Science 2010;6(12):1124-1135]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Antibiotic Prophylaxis; standard Dose; Chemotherapy; Cancer; Patient		
128	**Protective Effect of Broccoli and Red Cabbage Against Hepaocellular Carcinoma Induced by N-Nitrosodiethyamine in Rats** Aml F. M. Morsy*[a], Hodaa S. Ibrahim[a] and M. A. Shalaby[b] [a] Nutrition and Food Science Department, Faculty of Home Economics, Helwan University, Egypt. [b] Pharmacology Department Faculty of Veterinary Medicine, Cairo University, Egypt. * dr_aml_fawzy@yahoo.com **Abstract:** The hepatoprotective effect of broccoli and red cabbage extracts against hepatocellur carcinoma induced by N- Nitrosodiethyamine (NDEA) in male rats were studied. Four groups of rats were used; group (1) was used as a negative control (normal), while rats of the other groups were given NDEA as a single interperoitenial dose with subcutaneous injection of carbon tetrachloride (CCl4) once weekly for six weeks to induce hepatocellular carcinoma. Group (2) was left as a positive control, while groups (3) and (4) were pretreated with broccoli and red cabbage 10%extract, for 12 weeks, respectively. At the end of the experiment, blood samples were taken for biochemical analysis and liver tissues were histopathologically examined. The obtained results revealed that rats with hepatocellur carcinoma (HCC) had significant increase in serum levels of AST, ALT, ALP, total protein, albumin, total and direct bilirubin and malondialdehyide (MDA), as well as significant decrease in reduced glutathione (GSH), glutathione peroxidase (GPX), superoxide dismutase (SOD) and catalase (CAT) enzymes, compared to the normal control group. Liver sections of rats with HCC showed fatty infiltration of hepatocytes, cytomegaly with karyomegaly as well as vesicular active nuclei and presence of more than one nucleolus in some hepatocytes. Oral administration of broccoli and red cabbage extracts caused significant reduction in serum levels of AST, ALT, ALP, total protein, albumin, total and direct bilirubin as well as MDA and produced significant increase in GSH, GPX, SOD and CAT, compared to the positive group. Liver of these rats revealed only slight hydropic degeneration of hepatocytes, while other sections showed apparent normal hepatocytes. This study concluded that broccoli and red cabbage have a protective effect against	Full Text	128

	hepatocellular carcinoma in rats, therefore this study recommends increased dietary intake of broccoli and red cabbage may be beneficial for patients with liver cancer as a preventative measures. 129	**Eating Behavior and Problems in Egyptian Adolescents; Relation to Dietary Intake** Zeinab M. Monir*; Abla G Khalifa; Fawzya Hassaballa; Sawsan Tawfeek; Mohamed Abdelmonem, Moönes Abu Shady and Manal Mansour Child Health Department, National Research Centre, Dokki, Giza, Egypt. *zeinab_monir@yahoo.com **Abstract:** Objective of this study is to examine the presence of disordered eating (ED) behavior among Egyptian adolescent boys and girls and detect the influence of obesity, body image, depression, somatic symptoms, binging and weight teasing by peers and family members as well as assessing dietary intake of macronutrients and micronutrients and its correlation to obesity and eating disorder. *Subjects and Methods*: The sample consisted of 1124 adolescents (642 girls & 482 boys) aged from 14-17 years, divided according to their BMI into four groups. The questionnaires used were EAT, ACDI, body image, and teasing, 24hr- dietary recall. and sociodemographic data were collected. *Results*: we found that 25.5% & 38.6% of boys and girls reported ED that was significantly correlated to body image, bad eating habits, depression and somatic symptoms. ED is more prevalent among overweight-obese adolescents of high social class. Adolescents have deficient intake of vitamin A, calcium, thiamine and niacin; girls are more deficient in iron and boys are deficient in vitamin C. On assessing weight teasing by peers and family member by weight status and ED after adjustment for socioeconomic standard; there was statistically significant association with obesity in girls & boys. *Conclusion*: Social back ground, obesity, negative body image and depression and teasing are the main risk factors for developing ED. Early detection and intervention for ED by biological and psychological approaches, treatment of overweight and obesity using family based treatment; early detection of depression and encouraging sports practice are recommended. Mansoura, Egypt, *biboelsayed@yahoo.com **Abstract:** Objectives: To assess and raise the awareness of deaf students and their school care-givers about first aid intervention in medical emergencies. Participants: All deaf students in both the preparatory and secondary levels of education in a school for the deaf, who were under 18 years old (n = 44), in addition to school dormitories care-givers (n = 2) were participated in this study. Research Hypothesis: An implementation of first aid intervention program would have a positive outcome on raising awareness of deaf students and their school care-givers in medical emergencies. Methods: Participants' knowledge and skills were assessed using pre and post test questionnaire sheet contained thirty seven quiz multiple choices statement questions in Arabic language. Moreover, post-test intervention didactic and practical learning sessions consisted of six video films on DVD-ROM are presented to the participants accompanied by sign language translation in order to achieve the research objectives. Results: An intervention program showed	Full Text	130

	a clear positive outcome on raising awareness of deaf students and their school care-givers about first aid intervention in medical emergencies. The highest percentage of deaf students (61.4%) obtained the lowest sum score lies between zero to less than 25% in the pre-intervention phase, while about half of them (45.5%) obtained sum score lies between 50 to less than 75%, and more than tenth (11.3%) obtained the highest sum score that lies between 75 to 100% in the post-intervention phase, which revealed statistical significant differences in the participants' knowledge of skills at p=0.001 and 0.000. Similarly, pre knowledge sum scores of the two school care-givers about first aid skills rose from 43.2% and 63.2% respectively reached to the mastery level of 100% in response to the study intervention programmed. Conclusion: Although not enough for all items to be statistically significant, first aid intervention program raised the awareness of deaf students and their school care-givers. [Rabab El-Sayed Hassan and Samar Elhoseiny Abd-Elraouf. Raising Awareness of Deaf Students and their School Care-Givers about First Aid Intervention in Medical Emergencies. 131	**Sudeck's Atrophy, Hyperhydrosis and other Hypersympathetic Syndromes, what is the Recent Proper Surgical Management?** Abulazaym A.A.[1*] and Horria H.[2] [1]Neurosurgery Department, Faculty of medicine, Cairo University, Cairo, Egypt. [2]General surgery Department, Faculty of medicine, Mansoura University, Mansoura, Egypt. abaaaza51@yahoo.com* **Abstract:** Twenty eight patients with upper limb Sudeck's atrophy (minor causalgia), hyperhydrosis (palmar and axillary) and causalgia were submitted to endoscopic transthoracic sympathectomy as a definitive treatment. There were 9 patients with Sudeck's atrophy, 16 patients with upper limb hyperhydrosis and 3 patients with major causalgia. The procedure was successful in curing 26 patients (92.86%) and gave mild improvement in two patients (7.14%) whom belonged to the Sudeck's atrophy (minor causalgic) group because of the advanced dystrophic changes in their limbs. The commonest side effects were compensatory sweating. The procedure is effective, very simple, and required only two nights stay, and is recommended as a method of choice for the surgical treatment of hypersympathetic syndromes of the upper limbs as Sudeck's atrophy, hyperhydrosis and major causalgia. [Abulazaym A.A. and Horria H. **Sudeck's Atrophy, Hyperhydrosis and other Hypersympathetic Syndromes, what is the Recent Proper Surgical Management**. 132	**Reconstructive Cervical Laminoplasty with the Preserved Fixed Spinous Processes Row as an Intervening Bone Graft; a Successful Novel Surgical Approach.** Abulazaym A.A.[*1] and Meziad M.[2] [1]Neurosurgery Department, Faculty of Medicine, Cairo University, Cairo, Egypt [2]Orthopedic Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt abaaaza51@yahoo.com* **Abstract: Study design:** A prospective study to evaluate the outcome of a novel operation for cervical	Full Text	132

	myelopathy secondary to cervical canal stenosis; the Reconstructive Cervical Laminoplasty with the preserved fixed spinous processes row as an intervening bone graft. **Objective:** To explore a more effective, less invasive and more physiological operative technique for cervical myelopathy of cervical spinal canal stenosis. **Background:** The popular two cervical laminoplasties for the nowadays becoming common in elderly people cervical myelopathy of cervical spinal canal stenosis, i.e. open door laminoplasty and double doors laminoplasty are plagued with many drawbacks such as around 50% diminution in the range of cervical movements, 25% occurrence of kyphotic deformity, laminar fusions, from 10% to 50% chronic axial neck pain and nuchal musculature atrophy. A more physiological modification of this very beneficial operation is badly needed. We presented our novel reconstructive cervical laminoplasty with the preserved fixed spinous processes row as an intervening bone graft to avoid such drawbacks. **Methods:** This prospective preliminary study included 14 patients who underwent the novel reconstructive cervical laminoplasty with the preserved fixed spinous processes row as an intervening bone graft operation for their cervical myelopathy. **Results:** The novel operation is proved to be easier, more physiological and succeeded to avoid to a great extent the aforementioned drawbacks of the two popular cervical laminoplasties; only about 30% diminution of cervical movements occurred, no kyphotic deformities, post-operative axial neck pain was moderate and occurred in only 21% of the patients and the post operative nuchal musculature atrophy was avoided. **Conclusion:** Cervical myelopathy secondary to cervical spinal canal stenosis can be managed adequately with our novel cervical reconstructive myelopathy with the preserved fixed spinous processes row as an intervening bone graft. This technique obtained satisfactory outcomes and avoided the drawbacks of the popular laminoplasty operations. It can be a standard procedure for the surgical treatment of this nowadays becoming common disease. Researcher, Department of Surgery and Oral Medicine, National Research Centre, Cairo, Egypt 4. Assistant Researcher, Department of Surgery and Oral Medicine, National Research Centre, Cairo, Egypt **Corresponding author:** Dr. Basma Mostafa Zaki, BDS, MDS, PhD Researcher, Department of Surgery and Oral Medicine, National Research Centre, 33 El Bohouth Street Dokki- Cairo- Egypt-12311, Phone: +202 0124901019; E-mail: boshta@hotmail.com **Abstract:** This study was conducted to compare between two self-tapping, self-drilling tapered one-piece implant designs used for immediate post-extraction placement with the immediate loading protocol. **Materials and Methods**: Ten patients (6 males and 4 females), with a mean age of 28.5 years (range 18-39 years) were included in this study. All selected patients had two or more maxillary unrestorable hopeless anterior or premolar teeth indicated for extraction. Each patient received two implants of different designs (The OsteoCare™ Midi and Maxi-Z implants) which were placed in fresh extraction sockets and immediately loaded. Clinical criteria were survival rate, papillary bleeding index, probing depth, gingival index, Periotest M values, crestal bone level and bone density. An overall survival rate of 100% was attained. **The results** showed no significant difference in both the bleeding index and gingival index scores and also in the probing depth values, bone density measurements and crestal bone level for both implant designs after 3 and 6 months. The mean and the standard deviation of the Periotest M values (PTMV) for the Midi and the Maxi-Z implants immediately post operative were (-1.83±0.8) and (-2.57±0.9) and after 6 months were (-3.06±0.7) and (-3.11±0.7) showing a significant difference immediately postoperative and no significant difference after 6 months. Surface area analysis revealed that there is a direct relation between the initial stability and the surface area. **Conclusion**;It can be concluded that the immediate implant placement and loading using both designs is a successful treatment modality and the prognosis depends on proper case selection and treatment planning. 135	**Grape seed extract alleviate reproductive toxicity caused by aluminium chloride in male rats** Hala, A.H. Khattab [a], Inas, Z.A. Abdallah[a] and Gehan, M. Kamel [b] [a] Nutrition and Food Science Department, Faculty of Home Economics, Helwan University [b] Pharmacology Department, Faculty of Veterinary Medicine, Cairo University haya_khattab@hotmail.com **Abstract:** Natural dietary antioxidants are studied for their ability to protect cells from miscellaneous damage. Grape seed extract (*Vitis vinifera* L., Vitacease) is a potent antioxidant. The present study aimed to investigate the protective effect of grape seed extract (GSE) against the possible testicular dysfunction caused by aluminium chloride (AlCl3) in male rats. Twenty sexually mature male albino rats were divided into four equal groups, the first served as negative control, the second received AlCl3 (20 mg/kg bw, 1/ 20 LD 50), the third administered GSE (75 mg/kg bw), and the fourth received AlCl3 and treated with GSE. Doses were given once daily via gavage for 70 consecutive days. The results revealed that, AlCl3 induced significant decrease in final body weight, sex organs relative weight, sperm concentration, motility and viability, serum testosterone concentration and superoxide dismutase (SOD) activity, with significant increase in sperm abnormalities and thiobarbituric acid reactive substance (TBARS) concentrations. Moreover, AlCl3 induced apparent alteration in the histological structure of the testis. Treatment with GSE ameliorated the harmful effects of AlCl3, this was also proved histopathologically by the noticeable improvement in the testis tissues . It may be concluded that GSE may be promising as a natural therapeutic agent in AlCl3-induced reproductive toxicity and oxidative stress in the male rat testes. [Hala, A.H. Khattab, Inas, Z.A. 136	**Assessment of Body Composition, Fat Distribution and Serum lipid Profile in Obese School Children** Nayera E. Hassan[1], Sahar A. El-Masry[*1], Rokia A. El Banna[1], Mona Salam[2], Azza M Sarry El-Din[1], Tarek S Ibrahim[2] and Mona Anwar[3] [1]Biological Anthropology Dept., [2] Child Health Dept., [3]Medical Biochemistry Dept., National Research Centre, Dokki, Giza, Egypt [*]masrysa@yahoo.com **Abstract:** Objective*:* To determine the relationship between body compositions, fat distribution and blood lipid profile in obese school children aged 7 to 18 years. Methodology*:* In this cross-sectional study, 150 pupils between the ages of 7 to 18 years were included. Anthropometric measures of adiposity (BMI, waist circumference, waist-to-hip ratio, peripheral adiposity: as the sum of triceps and biceps skinfold thickness, central adiposity: as the sum of sub scapular, suprailiac and abdominal skinfold thickness), body composition and serum total lipids profile were assessed. Results*:* There are significant sex differences in ages 7 -18 years regarding BMI, abdominal skinfold thickness and TC/ HDL-C, and in peripheral adiposity at young age (7-11 years) and central one at adolescents (12-18 years). Body composition and fat distribution showed significant sex differences in adolescent period only; and in fat distribution in young age period. For young age, triglycerides and HDL-C are correlated to most of the body composition and anthropometric parameters in boys and not in girls. For adolescents, there is no correlation between any one of the lipid profile and the body composition and anthropometric parameters in either gender. Conclusion*:* This study has shown that in comparison to girls, the correlation of body composition, fat distribution and lipid profiles were higher in boys aged 7 – 11 years only, with a tendency to develop the higher risk level of cardio vascular disease. Particular attention should be focused on the time prevention of	Full Text	136

137	**Evaluate of Head Loss, Sediment Value and Iron Removal in Rapid Sand Filter** Hossein Banejad [1], Reza Pirtaj Hamedany [1], Navab Daneshi [1] [1.] Department of Water Engineering, Faculty of Agriculture, Bu-Ali Sina University, Hamedan, Iran Hossein_banejad@yahoo.com **Abstract:** Quality and appropriate quantity of water is necessary for human kind to survive. Along with the technology development and increasing consumption of water resources, we are experiencing low qualities in the mentioned resources. Iron is the fixed element found in the crust of the earth. This metal found variously in water resources and industrial activities. Therefore, it needs to treat the water resources from these excessive amounts. Different methods have used for this reason but the most used method during recent years has been the absorption by economic absorbers such as sand. Rapid sand filters usually used in water treatment plants for water clarification. In this research, a single layer gravity rapid sand filter has used to reduce different concentrations of iron. sediment value and head loss arising from it specially oxidized iron sediments in filter media is simulated by using combination of Carman-Kozeny, Rose and Gregory models in different discharges of rapid sand filter. Results have shown that with increasing in discharge and decreasing in input iron concentration, arriving time to given head loss, is increasing. In addition, results demonstrated that with increasing in iron concentration in influent, removal efficiency is decreasing somewhat. Results of this research can applied in (1) appropriate design of rapid sand filter to iron removal, (2) prediction of rapid sand filter ability to iron removal and (3) estimation of arising head loss during filter work thus evaluating of time interval backwash. 138	**Comparative Study Of Isocratic And Gradient Elution Chromatography In Stability Indicating Assay Of An Antihypertensive Drug Combination.** M. Abdel Kawy*, A.E. El-Gendy**, E.S. Shokry** * Faculty of pharmacy, Cairo university ** Faculty of Pharmacy, Misr International University **ABSTRACT:** Inspite that chromatographers are cautioned to avoid gradient elution when isocratic elution will do. In this work, the analytical properties of gradient and isocratic elution applied to separation of a complex sample of (fosinopril, hydrochlorothiazide and their degradation products) which can be done under isocratic condition are compared. Procedures were developed for determining fosinopril and hydrochlorothiazide in presence of each other and their degradation products by HPLC in the gradient	Full Text	138

	elution mode using methanol- 20 mM KH_2PO_4 (PH 2.4) containing 0.1% triethyl amine. In the isocratic mode, the same mobile phase composition was applied in a constant ratio of 60: 40 (Buffer: methanol). Separation was achieved on a cyanopropyl column (4 x 250 mm, 5 µm) known for its high selectivity for polar and hydrophilic compounds and the least retentive of hydrophobic compounds which do not normally elute on standard C18 or C8 columns. The present work shows that gradient elution gave a shorter overall analysis time with similar resolution of the critical pair without sacrificing repeatability in parameters, so many of the reasons given to avoid gradient elution deserve serious reconsideration especially for those samples that can be separated isocratically. [M. Abdel Kawy, A.E. El-Gendy, E.S. 139	**Effect of *Rhazya stricta* extract on rat adiponectin gene and insulin resistance.** Nabih A. Baeshen[1], Sahira A. Lari[2], Huda A. R. Al Doghaither[1] and Hassan A. I. Ramadan[1, 3] [1]Department of Biological Sciences, Faculty of Sciences, King Abdul-Aziz University, Jeddah [2]Department of Biochemistry, Faculty of Sciences, King Abdul-Aziz University, Jeddah [3]Department of Cell Biology, National Research Centre, Dokki, Egypt **Abstract:** *Rhazya stricta* plants have always played a major role in the treatment of human and animal diseases. The aim of this study was to study the effect of different doses of *Rhazya stricta* extract administered orally to rats, treatment period, effect on adiponectin protein, insulin resistance and finally its effect on exon 3 of adiponectin gene. Oral administration of aqueous leaves extracts of *Rhazya stricta* evoked fluctuations in adiponectin levels during eighteen weeks period of treatment. Serum adiponectin levels showed a significant increase after 2 and 4 weeks of treatments. Also a highly significant increase in adiponectin level, compared with the control group, was detected in rats treated with 0.125 gm/ml and 0.150 gm/ml after eighteen weeks of treatment. Insulin resistance is an important risk factor for type II diabetes mellitus and cardiovascular disease. Therefore, we performed HOMA-IR to check the degree of insulin resistance in rats. The results showed an inverse highly significant correlation between adiponectin levels and insulin resistance degrees after two weeks of treatment with *Rhazya stricta*. Studies published to date indicate that polymorphisms at the adiponectin gene (exon 3) are indeed predictors of circulating adiponectin levels. However, our results showed a significance increase in adiponectin levels, we did not detect any rare mutation in this locus using CSGE technique. The effects of *Rhazya stricta* extract on the increase of adiponectin levels concentrations could be promising issue (after avoiding its possible mutagenic effects) in treating diabetes, carbohydrate metabolism, hypertension, as well as inflammatory conditions. [Nabih A. Baeshen, Sahira A. Lari, Huda A. R. Al Doghaither and Hassan A. I. Ramadan. **Effect of *Rhazy stricta* extract on rat adiponectin gene and insulin resistance**. 140	**Biomonitoring Of Aquatic Ecosystem With Concept And Procedures Particular Reference To Aquatic Macro invertebrates** Shailendra Sharma, Praveen Sharma *Department of Zoology, Shari Umiya Girls College, Mandleshwar,(M.P.) India	Full Text	140

	Department of Chemistry, Narmada Samagra, Bhopal,(M.P.) India shailendra.b.sharma@gmail.com **ABSTRACT: The "biological monitoring" has been widely used to assess the environmental impact of pollutant discharges. The methodology must be evaluated in terms of false positives and false negatives. A false positive is an indication that an excursion beyond previously established quality control conditions (i.e., unacceptable conditions) has occurred when, in fact, one has not. A false negative is an indication that conditions are acceptable when, in fact, they are not. Statistics must play a more important role in biological monitoring because they are capable of explicit statements of confidence in the biological monitoring results. With appropriate statistical evaluation of the data, professional judgment on whether to initiate immediate action or wait for more confirming data will be more objective and reliable. In order to optimize the usefulness of biological monitoring, the selection of biological monitoring methodology shall not be based on the investigator's favorite organism or group of organisms. Neither can be a convenient methodology adopted by regulatory agencies. The selections must be based on the compatibility of data generated with the decision making process, including the statistical establishment of confidence in the result obtained. A pot experiment was conducted in green house at the Department of Soil Science and SWC, Pir Mehr Ali Shah Arid Agriculture University, Rawalpindi during Rabi season, 2007. Phosphorus was applied at the rate of 40 and 80 kg P ha^{-1} in the form of SSP, TSP, NP and DAP. A basal doze of 100 kg N and 60 kg K ha^{-1} was applied as urea and murate of potash (MOP) respectively. All the growth parameters of wheat were significantly improved by addition of P application. It was concluded from the study that phosphorus application at the rate of 80kg P ha^{-1} as single super phosphate (SSP) showed better results as compared to triple super phosphate (TSP), nitrophos (NP) and diammonium phosphate (DAP) on phosphorus deficient soil of Balkasr area of Tehsil Chakwal. [Muhammad Bilal Khan, Muhammad Iqbal Lone, Rehmat Ullah, Shuaib Kaleem and Muhammad Ahmed. **Effect of different phosphatic fertilizers on growth attributes of wheat (Triticum aestivum L.)**. 142	**A new categorization of construction materials based on sources of waste across supply chain**	Full Text	142

Mohamad Reza Parsanejad[1], Mansor Momeni[2], Ahmad Jafarnejad[3], Ali Mohaghar[4]
[1,2,3,4] Department of Industrial Management, Faculty of Management, University of Tehran parsanejad@ut.ac.ir

Abstract: Construction industry is an important part of any economy. But it does not have an appropriate performance especially in the productivity of materials. Statistics show production of billions of tons of construction waste per year in the world, and these issues threaten all beneficiaries of this industry. Thus, convenient strategies should be founded for improving waste production. This will not be achieved unless we recognize waste sources across construction supply chain. Also each material has its own source of waste, therefore exact identification of any material and after that its source will help to develop waste minimization strategies. In this research 30 questionnaires were distributed between experts. At first we prioritized waste sources, and by following the question about impact of sources on selected material, using binominal test, it observed that a category of sources had impact on some of material and another sources on another materials. Analysis of these two types of materials showed us that this result was not accidental and those materials when use in building, their dimensions is important (like brick, block, tile and etc.), those sources have impact on their waste that emphasize design parameters of building. Those material when use in building, their weight are important (like cement, gypsum, sand and etc.), those sources have impact on their waste that emphasize purchasing level of ordering and purchasing. Therefore materials categorized by their sources of waste across supply chain.

Abstract: The study was conducted to investigate the antitumor activity of miso, storage at different period or prepared with different starters, on human cell lines {HEPG2 (liver carcinoma), MCF7 (breast carcinoma), and HCT116 (colon carcinoma)}. The highest inhibitory effect on liver and breast carcinoma was seen when miso used after fermentation/aging zero time without storage period. Miso with different storage period (zero, 6 months and 5 years) has the same effect on colon carcinoma. Preparation of miso with different mixture of starters was also investigated on the same human tumor cell lines in culture. Miso prepared with *A. oryzae* and *Bacillus subtilis* starters inhibited the proliferation of human tumor cell lines culture with a wide variation in LC_{50} values (2.97, 3.37 and 3.37 µg/ml for MCF7, MCT116 and HEPG2, respectively). Miso prepared with *Aspergillus oryzae* and *Pleurotus ostreaus* starters inhibited human tumor cell line cultures with different LC_{50} values (10.9, 17.5 and 24.3 µg/ml for MCF7, MCT116 and HEPG2, respectively). The miso prepared with *A. oryzae* and *Rhizopus oryzae* effect only on MCF7 and HEPG2 with high LC_{50} values (25.5 and 35.8 µg/ml, respectively). We can conclude that the mixture of *A. oryzae* and *Bacillus subtilis* has the best effect among the other mixture of starters. The results indicated that all of fermented soybeans products with different mixture of starters contained higher isoflavones compounds than unfermented cooked soybeans. Moreover, soybean fermented with *B. subtilis* showed highest amount of isoflavones. Therefore, miso can be used as anticancer.

144	Oxidative Stress in Brains of Rats Intoxicated With Aluminum and the Neuromodulating Effect of Different Forms of Sage EL-Kholy, W.M.; EL-Habibi, E.M. and Mousa, A.T. Zoology Dept., Faculty of Science, Mansoura University, Mansoura, Egypt dr_mona_zaki@yahoo.co.uk **Abstract:** The present study was designed to investigate the role of oxidative stress and the status of antioxidant system in the management of aluminum chloride (AlCl3) induced brain toxicity in rats and further to elucidate the potential role of three forms of *Salvia officinalis* (sage) in alleviating such negative effects. The results revealed that the levels of thiobarbituric acid reactive substances (TBARS) and protein carbonyl (PC) were significantly increased, however, the activities of superoxide dismutase (SOD) and catalase (CAT) as well as the reduced glutathione (GSH) content were significantly decreased in the cerebral cortex (Co) and hippocampus (Hip) of rats intoxicated with $AlCl_3$. Inhibition, the lipid profile, total lipids (TL), total cholesterol (TC) and triglycerides (TG) were significantly increased in serum and the mentioned brain regions, while phospholipids (PL), total protein (TP) and serum HDL-C were significantly decreased in $AlCl_3$ group. Additionally, serum and brain regions acetylcholinesterase (AChE) as well as alkaline phosphatase (ALP) and acid phosphatase (ACP) activities were significantly increased. On the other hand, the results exhibited that, sage when given in any form along with $AlCl_3$ was able to regulate the mentioned parameters and the values returned close to the normal ones. It can be concluded that Al-induced neuronal oxidative stress and inhibition of the antioxidant system, accompanied with disturbed lipid profile, total protein and enzyme activities could be the cause of $AlCl_3$ neurotoxicity. In addition there different sage forms, by their antioxidant constituents, could be able to antagonize Al neurotoxicity perhaps by reducing the oxidative stress and improving the antioxidant status and particularly by inhibiting the acetylcholinesterase activity, thus may improve memory and other brain cognitive activities. [EL-Kholy, W.M.; EL-Habibi, E.M. and Mousa, A.T. Oxidative Stress in Brains of Rats Intoxicated With Aluminum and the Neuromodulating Effect of Different Forms of Sage. 146	**Biochemical studies on some cotton by products Part I- Chemical constituents and cellulose extraction of Egyptian cotton stalks** *****Fouad A. Ahmed; *Nadia M. Abdel-Moein ; **Amal S. Mohamed and **Shaimaa E. Ahmed *Agric. Biochemistry Dep., Fac. Agric., Cairo University ** Cotton Research Institute, Agricultural Research Center, Giza, Egypt shrose22@yahoo.com **ABSTRACT:** The main objectives of the current investigation are to compare some chemical constituents, mainly cell wall components (cellulose and lignin), of stalks of five Egyptian cotton cultivars, as a step to convert a low valued bio-wastes of cotton plant stalks into highly value product as pure cellulose, which will, also, contributed in solving major environmental and health problem in Egypt. Lignocellulosic raw material cultivars; Giza 80, Giza 85, Giza 89, Giza 86, and Giza 90 were used in this study. They were obtained from Cotton Research Institute experimental fields. As first stage, chemical analysis comparison among aforementioned cultivars was conducted. The results showed that, there were significant differences among the five studied cultivars in moisture, Lipids, wax, crude fibers and β cellulose contents. As coincides, ash, protein, holocellulose, hemicellulose, α cellulose and lignin percentages exhibits no significant differences among cultivars. The highest percentages of moisture estimated in Giza 89 (7.74%), also in ash and lignin (3.39% and 25.75%, respectively), but it was the lowest cultivar in wax percentage (2.43%). Giza 86 showed the highest percentage in lipids and crude fibers (1.96% and 46.92, respectively), also in protein and holocellulose percentages (5.12 and 77.26 %, respectively), but it was the lowest cultivar in β cellulose (1.11%) as well as ash (2.95 %). The highest percentage in wax and β cellulose estimate (3.67% and 2.72%, respectively) was in Giza 90, but it was the lowest cultivar in Lipids (0.96%) and hemicellulose (40.04%). The highest percentages in α cellulose (49.21%) was in Giza 80 which reflected the lowest percentage in the crude fibers (38.75%). The second stage was the preparation of cellulose by removing the waxes, lignin, and hemicellulose, since cotton stalk consists of 75±2% holocellulose percentage and 44±5% α cellulose %. The third stage was conducting physical test by analyzing the sample that was prepared by X-ray, then comparison with standard cellulose sample chart to confirm its structure as cellulose. [Fouad A. 	Abstract: Marine fishes are suffering from continuous depletion due to bacterial pathogens infections triggered by devastating environmental changes at their native aquatic environment. Qarun Lake and Suez Gulf are among the most vulnerable areas. 600 fish samples of Six different fish species; *Epinephelus tuvina*, *Sisganus rivulatus*, and *Dedlechilus labiosus* native to Suez-gulf at Suez governorate; *Mugil capito* , *Solea vulgaris* and *Tilapia zilli* native to Qarun Lake at El-Fayoum governorate were examined throughout the different year seasons. Gram positive and negative fish pathogenic bacteria were isolated from a total of 245 fish sample. Among those samples, the following bacteria were retrieved in the following percentages respectively, 17.55% (Vibrio*. anguillarum),* 16.73% (*Vibrio. alginolyticus*), 15.51% (*Pasteurella. piscicida*), 15.91% (*Pseudomonas. fluorescens),* 13.46% *(Streptococus. fecalis*), 11.02% (*Aeromans . hydrophila*), 6.12% (*Aeromans. sobria)* and 3.67% were infected with *Staph. aureus*. The *Siganus rivulatus* was the highest infected fish species with a prevalence of 8.33%, while *Mugil capito* was the lowest infected species (5.67 %). The highest total prevalence of bacterial infection was recorded in summer season (40.81%) while the lowest was recorded in winter (15.91%). The aforementioned bacterial isolates were successfully re-isolated from experimentally infected fish. The retrieved isolates were confirmed by semi-automated (API 20 E) and conventional biochemical tests. [M. Moustafa, Laila. A. Mohamed, M.A. Mahmoud, W.S, Soliman, A.E. Eissa and M.Y. 148	**Clinical Prespective Of Repeat Breeding Syndrome In Buffaloes** Ahmed W.M., El-khadrawy H.H., Emtenan M. Hanafi , Amal H. Ali , Shalaby S.A. Department of Animal Reproduction and Artificial Insemination, National Research Centre Dokki,Cairo, Egypt. (wahidmma@hotmail.com) **ABSTRACT:** Local meat production in Egypt is in continuous decrease and can not meet the local market requirement. So this study was designed to throw light on true repeat breeding syndrome (RBS) as one of the reproductive disorders that hinders the buffalo meat and milk production. A field survey was carried out on 1358 female buffaloes which were subjected to clinical and gynecological examination , and blood samples were collected for carrying out some relevant analyses. Treatment trials were practiced using different ways to control the condition and the economic impact of this syndrome has been studied. Results revealed that the incidence of clinical repeat breeding (RB) in the examined buffalo cows was 4.34 %. Typical repeat breeders represented 7.25 % of total reproductive disorders in female buffaloes. Serum progesterone level was 1.44 ± 0.39 and 3.66±0.84 in RB and normal buffaloes (NB), respectively. Oxidant/antioxidant markers in RB buffalo-cows showed increased malondialdehyde (MDA) and nitric oxide (NO) and decreased catalase (CAT), superoxide dismutase (SOD), ascorbic acid (ASCA), reduced glutathione (R-GSH) and total antioxidant capacity (TAC). Serum zinc, copper,iron and selenium values were lower in repeat breeder cows compared to normal animals. Repeat breeder buffalo-cows responded to the treatments with mineral mixture, GnRH and Lugol‘s solution with recovery rates; 63.64, 61.54 and 60.00%, respectively. The study concluded that special care should be paid for food additives to control this syndrome. [Ahmed W.M., El-khadrawy H.H., Emtenan M. Hanafi , Amal H. 149	**Efficiency of Natural Minerals in Presence of Different Nitrogen Forms and Potassium Dissolving Bacteria on Peanut and Sesame Yields** Gehan H. Youssef, Wafaa M. A. Seddik and Mona A. Osman	Full Text	149

Soil, Water and Environ. Research Institute, agricultural Research Center (ARC), Giza, Egypt

ABSTRACT: A field experiment was carried out for two summer seasons at Ismailia Agric. Res. Station to study the effect of some natural minerals combined with potassium dissolving bacteria inoculation in the presence of different nitrogen forms on chemical properties of soil, nutritional status and yield of peanut-sesame. Each experiment was designed in a split-split design with three replications. Three forms of nitrogen fertilizer were included along with two natural minerals, in a presence of potassium dissolving bacteria inoculation, as well as one mineral fertilizer as source potassium fertilizer. Furthermore, data show high significant increases in available N due to the application of ammonium nitrate in combination with feldspar, and calcium nitrate in combination with potassium sulfate in a presence of inoculation for peanut and sesame, respectively. However, application of calcium nitrate combined with potassium sulfate, and ammonium nitrate in combination with feldspar, in a presence of inoculation, led to significant increases in K available in soil for peanut and sesame, respectively. Oppositely, the pH values, different to those of EC, decreased either for inoculation or non-inoculation as compared to control. In spite of that, the values of EC and pH of soil were higher with application of either bentonite or bentonite + feldspar in a presence of all nitrogen fertilizer forms. Generally, the highest EC values in soil, after the two studied seasons were encountered with calcium nitrate fertilizer as well as bentonite mineral. Moreover, applying feldspar mineral and ammonium nitrate treatments had recorded the highest values of yield components as well as nutrient (N and K) uptake by either peanut or sesame crops, particularly in the presence of inoculation as compared to those given by other treatments.

Abstract: *Hymenolepis nana* and *H. diminuta* are the most common cestodes in humans, domestic and wild rodents. Since isolates of *H. nana* species are morphologically identical, the way they can be reliably distinguished is comparing the parasite in each host using molecular techniques. In the current study, Mitochondrial Cytochrome *c* oxidase gene especially codons within subunit 1 (*cox1*) of *H. diminuta and H. nana* Egyptian isolates from different developmental stages (adult worms and eggs) and hosts origin (human and rat) were amplified, sequenced and aligned. PCR products were approximately 700 bp, 702 bp and 715 bp of *H. nana* rat isolates, *H. diminuta* rat isolates, and *H. nana* human isolates, respectively. Moreover, despite their host susceptibility differences they all gathered in one cluster with three genbank published isolates of *H. nana*; AB033412.1, AB494472.1 and AY121842.1), forming one clade with 100% similarity, which was non significantly decreased on internal nodes. In addition, clearly far away from *H. diminuta* published sequence AB033412.1 who's assumed to be genetically closely related to Egyptian *H. diminuta* than all other *H. nana* isolates. Both Egyptian murine isolates of Hymenolipidid; *H.*

150

	diminuta and *H. nana*, were closer to each other than being to *H. nana* of human origin. The annotated sequences of Egyptian isolates were deposited in GenBank under the following accession numbers; *H. diminuta* (GU433102), *H. nana* rat isolate (GU433103), and *H. nana* human isolate (GU433104). Finally, the development of effective control strategies will only be possible if complete understanding of the epidemiology of infestation is elucidated. [Omnia M. Kandil, Mona S. Abstract: **Background:** The prevalence of childhood obesity is rapidly increasing, and many obese children suffer from emotional and behavior problems .**The aim** of this study was to explore the relationship between nutritional obesity and psychosocial behavior among school –children in their natural setting. ; and to examine whether social backgrounds play a role in this relationship. Target population was third; fourth and fifth grade primary school children (n=861; mean age10±0.72) attending 3 public elementary schools at Dokki District; in Giza Governorate. **Measurements:** Weight status was assessed through measurements of Body Mass Index percentiles (BAP) for age& sex using World Health Organization Growth Standards. Familial backgrounds**&** academic school achievements of the children were recorded from school files. Data on anxiety and depressive symptoms of children was assessed using standardized methods. **Results:** 23.5% of boys and18.7% of girls showed signs of depression; whereas anxiety was prevalent among 54%of boys and 52% of girls. Calculation of odds ratio (OR) showed that depression and anxiety is higher in low school achievers in girls ($p<0.05$) and boys ($p<0.01$). In a multiple regression model; depression was predicted by anxiety, age and academic achievements ($R^2=0.53$; $P\leq0.001$). Anxiety was predicted by BAP and birth order ($R^2=0.38$; $P\leq0.003$)**. Conclusion:** Obesity affects psychosocial adjustment of children raising the importance of early detection and prevention of obesity in the form of nutritional and health awareness programs and training of school health personnel.

Abstract: *Back ground and aim:* Metabolic syndrome is a group of interrelated risk factors, accurate clinical diagnosis and treatment is mandatory for detection of population at risk for coronary heart disease and diabetes. Physical exercise protects against the development of cardiovascular disease, partly by lowering plasmatic total cholesterol, LDL and increased HDL .In addition it is now established that increased C - reactive protein (CRP) and plasminogen activator inhibitor-1(PAI-1) play a role in the maintenance of an inflammatory state and in the development of cardiovascular disease.This study aimed to compare plasma levels of LDL, HDL, CRP, and PAI-1 in patients with metabolic syndrome before and 6 months after moderate intensity exercise. **Methods:** Forty five obese non smoker, males with metabolic syndrome living sedentary life were included in the study .Blood samples were collected at the beginning of the study and 6 months later. However only 42 patients completed in our study The plasma lipid profile (Triglycerides, HDL, LDL, totalcholesterol), fasting blood glucose, C - reactive protein and PAI-1 levels were determined. Body weight and BMI were also measured before and after the exercise. **Results:** Total cholesterol ,LDL,HDL,triglycerides,CRP,PAI-1 levels were lower after moderate intensity exercise in relation to levels before moderate intensity exercise($p<0.05$).In addition we observed a positive correlation between PAI-1 and LDL after exercise($r=0.301$,$p=0.053$),PAI and triglycerides after exercise($r=0.286$,$p=0.066$), negative correlation between HDL and PAI-1($r=-0.315$,$p=0.042$). These results indicates that moderate intensity exercise induces favorable changes in metabolic syndrome in lowering lipid profile and PAI-1 levels and may reduce risk of cardiovascular diseases.

154	**Reuse of Industrial Materials in Buildings To activate their application in Egypt** Nermin Mokhtar Mohamed Researcher in Civil and Architectural Department, Engineering division, National research centre, Egypt **ABSTRACT:** Increasingly stringent rules and regulations on construction and demolition waste, diminishing landfill space and depletion of natural resources are all reasons for the push for industrial byproduct materials recovery. In Egypt, Industrial byproduct materials are generated in large volumes every day that are potentially usable materials, and must be disposed of. The main goal of this paper is to change the way Egyptians' think about waste—to see the value of a used material as a product or commodity, not as a waste, and encourage the use and recycling of these rich, largely untapped resources. Positive economic rewards and environmental results are moving our partners toward more waste reduction and materials management. This paper summarizes the proposed Egyptian industrial materials waste management guidelines to reuse in building ,which cover: (1) Identify the parties involved and the distribution of responsibilities; (2) Complementarily of roles of parties(owner, engineer, designer, and contractor) involved in the process of re-use to remove the causes that hinder the management of such material in Egypt ; and (3) Participation of the Parties to the proposed project to achieve sustainable development fields at the actual application of the project. 155	**Molecular Biological And Biochemical Studies On Avian Influenza Virus Receptors In Different Avian Species** Hussein I. El-Belbasi; Mohamed F. Dowidar and Safaa I. Khater Department of Biochemistry, Faculty of Veterinary Medicine, Zagazig University,Egypt H_elbelbasi2003@yahoo.com **Abstract:** Avian influenza viruses are considered to be the key contributors to the emergence of human influenza pandemics. A major determinant of infection is the presence of virus receptors on susceptible cells to which the viral haemagglutinin is able to bind. Avian viruses preferentially bind to sialic acid α 2,3-galactose (SA α 2,3-Gal) linked receptors, whereas human strains bind to sialic acid α 2,6-galactose (SA α 2,6-Gal) linked receptors. Although ducks are the major reservoir for influenza viruses, they are typically resistant to the effects of viral infection, in contrast to the frequently severe disease observed in chickens In order to understand whether differences in receptors might contribute to this observation, we studied the expression of influenza receptors in upper and lower respiratory organs of ducks and chickens (expression of ST3Gal-III sialyltransferase and ST6Gal-I sialyltransferase genes) using semi quantitative RT-PCR. There was a marked difference in the expression of primary receptor type in the trachea of chickens and ducks. In chicken trachea, SA α 2,6-Gal was the dominant receptor type whereas in ducks SA α 2,3-Gal receptors were most abundant. This suggests that chickens could be more important as an intermediate host for the generation of influenza viruses with increased ability to bind to SA α 2,6-Gal receptors and thus greater potential for infection of humans. Chicken tracheal and intestinal epithelial cells also expressed a broader range of SA α 2,3-Gal receptors in contrast to ducks, which suggests that they may be able to support infection with a broader range of avian influenza viruses. 156	**Synbiotic Tarhana as a functional food** *Shreef G N Gabrial, ** Ahmed H Zaghloul, ***Abd El-Rahman M Khalaf-Allah, ***Nagwa M El-Shimi, *Rasha S Mohamed and *Gamal N Gabrial * Food Science and Nutrition Department, National Research Centre, Dokki, Cairo, Egypt. **Dairy Science Department, National Research Centre, Dokki, Cairo, Egypt. ***Food Science Department, Faculty of Agriculture, Cairo University, Giza, Egypt. E-mail: snoub_2000@yahoo.com **Abstract**: In the present study formulated synbiotic tarhana (Turkish fermented cereal food) was produced as a functional food from the fermentation of wheat flour, some spices [salt, pepper, dill and sweet marjoram (Organum majorana)], some vegetables [tomato (Lycoprsicum esculentum), pepper (Capsicum annum) and onion (Allium cepa)], and synbiotic yoghurt which prepared with prebiotic (Inulin and lactose each 3%) and different concentrations of the probiotic culture (0.5, 1.5, 3, 4.5% DVS-ABT2 containing Streptococcus thermophilus, Lactobacillus acidophilus and Bifidobacterium bifidum). After fermentation (3 days), tarhana dough was dried in the sun. The effect of the fermentation (0, 1, 2 and 3 days) and the probiotic culture concentration on the chemical composition and the probiotic population of the wet tarhana were evaluated. The effect of the probiotic culture concentration on the chemical composition, the probiotic population and the sensory attribute of dried tarhana were evaluated. Also the effect of dried tarhana (prepared from yoghurt which was fermented by 4.5% probiotic culture) on the plasma lipid profile of human subjects was studied. The results showed that the pH value decreased while the acidity increased, acetaldehyde and diacetyl values increased during the fermentation period and by increasing the probiotic culture concentration of the wet and the dried tarhana. Neither the fermentation nor the concentration of the probiotic culture of wet and dried tarhana affected the crude protein, ether extract, crude fibre, and ash values. The numbers of probiotic bacteria increased until the second day of fermentation. However, in the following day, with an increase of the acid content their number decreased. Generally the increasing of the probiotic culture concentration increased the numbers of probiotic bacteria of the wet and dried tarhana. Also the concentration of the probiotic culture didn't affect the sensory attributes of dried tarhana. Subjects supplemented with dried tarhana showed significant reduction in total serum cholesterol, low density lipoproteins (LDL-C) and triglycerides, while high density lipoprotein (HDL-C) increased. 157	**Relationships between Personal, Indoor, and Outdoor PM_{10} in the Residential Environment in Damietta, Egypt** Omnya A. El-Batrawy Environmental Sciences Dept., Fac. of Sci., Damietta Branch, Mansoura Univ., Egypt. Om_elbattrawy@mans.edu.eg **Abstract:** The relationship between indoor and outdoor air pollution levels is important as people spend about 90% of their time indoors. This may underline the importance of particulate as an environmental	Full Text	157

	health risk and the consequence need for monitoring them particularly in indoor microenvironment. The current study measured the concentrations of PM_{10} in the personal (P), indoor (I), and outdoor (O) air of buildings located in three residential areas at Damietta Governorate, Egypt, during the summer and the winter of 2009. Twenty- four homes were included in this study. The outdoor PM_{10} concentrations ranged from 975.9 – 512 μgm^3 in summer and from 1184 to 555.6 μgm^3 in winter. The indoor PM_{10} concentrations ranged from 997.1n to 65302 μgm^3 in summer and from 1198.8 to 705.6 μgm^3 in winter. The personal PM_{10} concentrations ranged from 1008.4to 334.52 μgm^3 in summer and from 1164.48 to 642.6 μgm^3 in winter. It was apparent that there is a general pattern of increasing levels from winter to summer, and similarly from indoor to outdoor air PM_{10} measured in this study. The indoor/outdoor (I/O) ratios varied between in summer (1–1.5) and winter (1–1.3). The I/O ratios obtained were linked to the indoor activities using occupant's diary entries. Results from the regression analysis showed a relatively strong correlation between the indoor and personal concentrations, between personal and outdoor PM_{10} concentrations and between indoor and outdoor concentrations at both summer and winter. The only exception was the correlation between the concentrations in summer season. Whereas statistically significant correlations were observed between outdoor and personal concentrations in winter, the correlations observed in summer were relatively low. The strongest correlations were found between indoor and personal concentrations, indicating that personal PM_{10} exposures were significantly affected by indoor PM_{10} than by ambient PM10. This shows that the contribution of outdoor pollutants to indoor pollution is higher in winter than summer. The estimated F_{inf} of the studied homes in summer and winter were 0.65 and 0.89, respectively. [Omnya A. El-Batrawy. **Relationships between Personal, Indoor, and Outdoor PM_{10} in the Residential Environment in Damietta, Egypt.** Journal of American Science 2010;6(12):1413-1422]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Personal; Indoor; Outdoor PM_{10}; Residential Environment; Egypt		
158	**Atypical Bacteria in Ventilator Associated Pneumonia; an Egyptian University Hospital Experience** Egypt **Background** Ventilator-associated pneumonia (VAP) is the most common hospital acquired infection seen in ICU in patients on mechanical ventilation. A diversity of microbes can cause VAP, causative agent differ according to patient populations and types of ICUs. Atypical bacteria not cultured by routinely used methods , have been implicated as causes of VAP, still no sufficient studies to assess size of their role as causative agent in VAP. In this study we aim at estimation of the potential role of atypical bacteria as Mycoplasma pneumoniae, Chlamydia pneumoniae and Legionella pneumophila in ventilator-associated pneumonia in the intensive care units of Alexandria Main University Hospital. **Materials and methods:** 60 endotracheal aspirates were collected from VAP ICU patients. Samples were subjected to routine culture as well as PCR amplification using specific primers for detection of the following atypical bacteria : Mycoplasma pneumoniae, Chlamydia pneumoniae and Legionella pneumophila. **Results:** Out of the 60 endotracheal aspirate, routine culture revealed growth of: enterobacteriaecae in 14 (23.3%) aspirate, pseudomonas in 13(21.7%), candida in14(23.3%) , and MRSA in 10 (16.7%) . In 19 (31.7%) endotracheal aspirates, no growth was encountered on routine culture. PCR reaction was positive for Atypical bacteria in 9 (15%) out of 60 samples, five were positive for mycoplasma, three for Legionella, and only one was positive for Chlamydia. Atypical bacteria positive results were encountered in 4 (21%) out of 19 aspirates with no growth culture results. **Conclusion:** Our results point that atypical bacteria are not an uncommon cause for VAP. This finding has to be taken into consideration while tailoring the empiric antimicrobial coverage of patients diagnosed with VAP. 159	**The neuroprotection role of heat shock protein 70 (HSP70) against microwave radiation induced DNA damage in male Wistar rat brain**	Full Text	159

Magda Mohamed El-Ezabi

Department of Zoology – Faculty of Science – Benha University- Egypt

E-mail address:dr.rosa@hotmail.com

Abstract : This investigation aims to study the effect of radiofrequency (RF) radiation on DNA damage in brain cells of male Wistar rats using the comet assay and to investigate the role of HSP70 as a protective molecular chaperone that increases stress tolerance of brain cells. Male Wistar rats (118±20g) were divided into three groups. The 1st (exposed) group was subdivided into three subgroups and exposed for 15 min to activated cell phone emitting a frequency radiation of 900 MHz, at non-thermal specific absorption rate (SAR) of 2.9×10^{-3} W/Kg. The 2nd (exposed) group was also subdivided into three subgroups but was exposed for 30 min to the cell phone. The third group was the sham-exposed (control). Animals in each group were sacrificed after 1, 3 and 7 days recovery period. The comet assay parameters showed significantly increased DNA damage in brain cells after 1 and 7 days in the first group and after 7 days in the second group. The HSP70 showed significantly increased levels after 7 days in both exposure groups. Meanwhile, HSP70 showed significantly decreased levels after 1 day in the second group. The results of the present study demonstrate a damaging effect of RF radiation on DNA of the brain cells. This damaging effect initially inhibits the synthesis of HSP70; But after a 7 day recovery period, the levels of HSP70 increase significantly possibly due to powerful capacity of the cells for recovery.

Abstract: The use of portfolio for learning and assessment within nursing education has recently increased. The main purposes of developing a portfolio is to link understanding about clinical experiences and theoretical knowledge, promotion of student-centered learning and reflective learning. It is important that students developing a portfolio understand the process. Unless portfolio is perceived by students to be relevant and useful, they will not be committed to using portfolios to their full potential. This paper aimed to identify perception of student nurses towards the use of portfolio and to compare the perception of first and second year student nurses towards the use of portfolio. The sample of the study composed of 376 first and second year students studying medical surgical nursing, in a faculty of nursing. Students were asked to respond voluntary to portfolio perception questionnaire, which was developed by researchers. The results of the present showed that students stated that portfolio encourage their independent learning, understanding and utilization of basic concepts. The results showed also some discrepancies between first and second year students in their perceptions toward portfolio. Students expressed how the portfolio process could be improved and they recommended the continued use of portfolio in subsequent study years.

161	**Utilization Of Alfalfa And Atriplex For Feeding Sheep Under Saline Conditions Of South Sinai, Egypt** Afaf M. Fayed, Abeer, M. El- Essawy, E.Y. Eid, H. G. Helal, Ahlam, R. Abdou & H. M. El Shaer* 1) Department of Animal & Poultry Nutrition, Desert Research Center, Mataria, Cairo, Egypt **ABSTRACT:** Atriplex nummularia (At) can be an effective fodder component in mixed diets for livestock. Alfalfa (alf) protein is poorly utilized by ruminants due to its rapid degradation in rumen. The objective of this study was to assess the influence of replacing alfalfa by Atriplex as roughage fed to animals. Twenty four adult Barki lambs weighed an average 49± 77 kg and age 3 years were used in six digestibility trials (4 animals each). Experimental diets were made of alfalfa and Atriplex nummularia in different ratios to each other as follow:R1: 75 % alf + 25% At, R2: 50 % alf + 50 % At, R3: 25 % alf + 75 % At, R4: 100 % At, T5: 100 % alf furthermore R6: berseem hay (BH) + CFM. All animals were fed on barley at 25 % of energy requirements. Results obtained indicated that: all experimental diets had comparable values of DM. Mixing of plants affecting chemical composition of feed ingredients where highest CP was recorded in R5 and least one was in R4. CF values were decreased as follow in R6, R5, R1, R2, R3 and R4, respectively. R6 and R4 had comparable values of condensed tannins while highest saponin levels were recorded in R4. Animals fed on R5 showed highest DM intake and TDN g/kg BW followed by those fed on R1 and R2. Nitrogen intake showed higher values in R5 followed by R1, R2, R3, R6 then R4. Nitrogen retention also was maximum in R5 and minimum in R6. Animals fed on At alone showed highest water intake with significant ($P< 0.05$) differences when compared with other treatments. There is a sampling time effect (zero and 6 hrs post feeding) on serum metabolites, liver enzymes and some minerals. Indeed the prefeeding rumen parameters (NH3 – N) and TVFA,s were increased significantly ($P\leq 0.05$) to reach the peak value at 8 hr post feeding. Some minerals Na, K, Ca and P were analyzed. Finally R2 is nutritious despite the generally low the nutritive value and energy content. [Afaf M. Fayed, Abeer, M. El- Essawy, E.Y. Eid, H. G. Helal, Ahlam, R. Abdou & H. M. 162	Oxidative stress in brains of rats intoxicated with aluminum and the neuromodulating effect of different forms of sage EL-Kholy, W.M.; EL-Habibi, E.M. and Mousa, A.T. Zoology Dept., Faculty of Science, Mansoura University, Mansoura, Egypt **ABSTRACT:** The present study was designed to investigate the role of oxidative stress and the status of antioxidant system in the management of aluminum chloride (AlCl3) induced brain toxicity in rats and further to elucidate the potential role of three forms of *Salvia officinalis* (sage) in alleviating such negative effects. The results revealed that the levels of thiobarbituric acid reactive substances (TBARS) and protein carbonyl (PC) were significantly increased, while the activities of superoxide dismutase (SOD) and catalase (CAT) as well as the reduced glutathione (GSH) content were significantly decreased in the cerebral cortex (Co) and hippocampus (Hip) of rats intoxicated with $AlCl_3$. Regarding the lipid profile, total lipids (TL), total cholesterol (TC) and triglycerides (TG) were significantly increased in serum and the mentioned brain regions, while phospholipids (PL), total protein (TP) and serum HDL-C were significantly decreased in $AlCl_3$ group. Additionally, serum and brain regions acetylcholinesterase (AChE) as well as alkaline phosphatase (ALP) and acid phosphatase (ACP) activities were significantly increased. On the other hand, the results exhibited that, sage when given in any form along with $AlCl_3$ was able to regulate the mentioned parameters and the values returned close to the normal ones. It can be concluded that Al-	Full Text	162

	induced neuronal oxidative stress and inhibition of the antioxidant system, and the consequent disturbed lipid profile, total protein and enzyme activities could be the mechanisms of $AlCl_3$ neurotoxicity. Moreover, the results suggested that the different sage forms, by their antioxidant constituents, could be able to antagonize Al neurotoxicity perhaps by reducing the oxidative stress and improving the antioxidant status and particularly by inhibiting the acetylcholinesterase activity, thus may improve memory and other brain cognitive activities. [EL-Kholy, W.M.; EL-Habibi, E.M. and Mousa, A.T. Oxidative stress in brains of rats intoxicated with aluminum and the neuromodulating effect of different forms of sage. 163	**Study on immune response of quail for avian influenza vaccines** M.A.saad, A.I.Abd-Elhady, A.EL-nagar Central laboratory for evaluation of veterinary biologics Quail influenza **Abstract:** This study was a trial to evaluate: The immune responses of quails vaccinated with common AI commercial vaccines in Egypt The results revealed that: There were high to moderate levels of maternal immunity against AIV (H5N1and H5N2) on the 1st, 5th day of age and low levels on the 7th day of age. There was no significant difference concerning the immune response of H5N1 and H5N2 AI vaccines ($P < 0.05$) in vaccinated quails. Vaccination at 8-days of age with 0.5ml of vaccine, gave satisfactory titers, on the 3rd week post vaccination. By the 4th week post vaccination quails exhibited highest titers and continued to the 5th week post vaccination(age of slaughter or marketing of quail) against AIV. And Some Ciliates Infecting *Chrysichthus Auratus* (Bagridae) From The Damietta Branch Of River Nile, Egypt** Enayat Salem Ahmed Reda Department of Zoology, Faculty of Science, Mansoura University, Mansoura, Egypt **Abstract:** The present study was carried out as a general survey for the possible ectoparasites that can infect the Nile fish *Chrysichthus auratus*. A total of 52 fish specimens were collected from Damietta branch of River Nile. Examination of the investigated fish revealed that, fish were infected with four ectoparasitic species belonging to three genera. These species were: *Neonosemoides* sp., *Scyphidia* sp. 1, *Scyphidia* sp. 2 and *Ichthyophthirius multifillis*. The first three species were recorded for the first time in Egypt. The recovered parasites have pathological effects on the host fish with subsequent economic losses were discussed. [Enayat Salem Ahmed Reda. **First Record Of Microsporidium *Neonosemoides* Sp. 165	**A Novel Self-adaptive Behavior Quantum Evolutionary Algorithm**	Full Text	165

	Hassan K. Khalafi School of Mathematics and Computer Science, Damghan University, Damghan, Semnan, P.O. Box 36715-364 Iran h_kadkhodaei@du.ac.ir **Abstract:** In accordance with tradition quantum evolutionary algorithms can obtain excellent results in the optimization of Multi-peak functions. In any case, they are easy to be trapped to hurriedness. In this article, A Novel Self-adaptive Behavior Quantum Evolutionary Algorithm is recommending on the basis of the concepts and tenet of quantum evolutionary algorithms in order to enhance the efficiency. Firstly, Self-adaptive Behavior triploid chromosome is constructed to keep the population variety; Secondly, double mutation is used to make sure the variety of the swarm, then individual chromosome cross will be imported into this new algorithm in order to achieve the information communication between the chromosomes and enlarge the search scope in the available space. Experiments on test functions of varied intricacies are implemented and compared with other EAs. The result indicates that the new algorithm in this article can search and get the global most efficient solution in a shorter time. [Hassan K. Khalafi. **A Novel Self-adaptive Behavior Quantum Evolutionary Algorithm**. Journal of American Science 2010;6(12):1483-1486]. 166	**The Factors For Free Flow Speed On Urban Arterials – Empirical Evidences From Nigeria** Ibrahim Tunde Yusuf Department of Civil Engineering, University of Ilorin, P.M.B. 1515, Ilorin, Kwara State of Nigeria (zip code: 234). Email**:** ityusuf@yahoo.com; tunde_aroes@hotmail.com **ABSTRACT:** Many generic factors of the weather, environment, vehicles (machines), fixed facilities (roadway) characteristics, humane (driver) and traffic streams either singly or in combination influence the free flow speed. The quantitative measures of these factors are desirable for reliable system design, analysis and evaluation for effectiveness, especially as reflect the typical humane-machine-environment system prevailing in Nigeria. This paper therefore presents the outcome of the quantitative evaluation of the influence of some factors on the free flow speed on an arterial in a medium sized urban settlement in Nigeria with a view to determining the probable analytical values for towns of similar hierarchy in Nigeria. Instantaneous speeds of forty test vehicles were observed in-vehicle at lull periods on the 7.1km Offa Garage-Emir's Market urban Road, Ilorin with simultaneous collection of data on age of driver, age of vehicle, passenger occupancy, roadside packed vehicles and businesses. The geometric properties of the arterial ware earlier established and segmented to four uniform sections. The data were computed using the category and statistical analysis approach. The results of the study indicated that the three factors of the environment (weather), humane and roadway geometry have negative influences on the free flow speed on an urban arterial. Estimates of the reduction of the various factors were detailed in the paper which was recommended for adoption for design and analysis of traffic stream in Nigeria and other medium sized towns in Nigeria. [Ibrahim Tunde Yusuf. **Factors for Free Flow Speed on Urban Arterials – Empirical Evidences from Nigeria**. Journal of American Science 2010;6(12):1487-1497]. 167	**Biochemical and Molecular genetic Evaluation of some conifers genetic resources** Soliman.M.H.,⋆ Gad,Mervat,M.A.⋆⋆ Hussein, H.Mona, ⋆ Mohamed,A.S.⋆⋆ ⋆ Department of Genetics, Faculty of Agriculture, Cairo University, Giza, Egypt. ⋆⋆ Horticulture Research Institute, Agricultural Research Center , Giza. **Abstract:** Genetic polymorphism was investigated in six conifers representing four Pinus species, i.e (*P.halepensis, P.canariensis, P.pinea, and P.roxburghii)which belong to family Pinaceae and two members of family Taxodiaceae, i.e. (Sequoia sempervirens and Taxodium distichum).* In this respect, genetic biochemical (proteins and isozymes), as well as molecular (RAPDs and ISSRs) analysis were investigated. Proteins and peroxidase banding patterns resulted in extensive polymorphism among conifers under investigation, however, Adh isozyme banding patterns were not satisfactory in this concern. RAPD analysis exhibited a total of 66 bands, out of them 25 bands were polymorphic (37.88%). Five ISSR primers generated reproducible and informative amplified products. those were used to distinguish between the six conifers, since 38 bands were polymorphic out of total 81 bands with 47.95% of polymorphism which can be considered as useful markers for identifying conifers. Based on combined data obtained by proteins, peroxidase, RAPD and ISSR analysis, it was possible to discriminate between the six conifer trees under investigation. The present study indicates that the application of biochemical and molecular fingerprinting of the six conifers provided a solid ground that will allow an easier and faster genetic identification of other woody trees species. [Soliman.M.H., Gad,Mervat,M.A. Hussein, H.Mona, Mohamed, A.S. **Biochemical and Molecular genetic Evaluation of some conifers genetic resources.** Journal of American Science 2010;6(12):1498-1509]. 169	**Modification of Silk for Improvement of Weighting and Properties**	Full Text	169

	S.M.Gawish*, A.M.Ramadan, S.M.Abo El-Ola Textile Research Division, National Research Centre, Tahrir Street, Dokki, Cairo, Egypt *Samihagawish@yahoo.com **Abstract:** Silk was modified by 2-hydroxy ethyl methacrylate (HEMA) and glycidyl methacrylate (GMA) and GMA/ derivatives to increase the weight, improve silk properties, antibacterial and fungicidal activities. Thus silk was grafted using a chemical method to different percentage add-on HEMA and GMA. Modified silk / GMA were further reacted with Diethylene triamine (DETA) at 85ºC for one hour to yield bactericidal and fungicidal silk fabrics. The weight of silk was increased and the properties were improved including moisture regain, crease recovery angles, abrasion resistance, whiteness and decrease of yellowness index. Characterization of modified fabric was done by FTIR, thermal gravimetric analysis (TGA) and SEM. [S. M. Gawish, A. M. Ramadan, S. M. Abo El-Ola. 171	**Diagnosis of Egyptian Bovine Meat Borne Zoonosis** **Nawal, A. Hassanain; Mohey, A. Hassanain; Raafat, M. Shaapan; Hassan, A. Fadaly and Ashraf, M. Barakat** Department of Zoonotic Diseases, National Research Center,	Full Text	171

	nnawalah@yahoo.com **Abstract:** Food borne zoonoses have a major health impact in both industrialized and developing countries. Meat might be infected with some bacterial and parasitic agents; that could be threatening on human health. One hundred and eight meat samples (20 buffaloes and 88 cows) were collected from different Cairo abattoirs and examined parasitologically and bacteriologically. Results showed that 16.67% and 34.26% of the examined meat samples were infected with bacteria and parasites, respectively. The bacterial isolates were non typhoid *Salmonella* (50%), *E. coli* (38.89%) and *Mycobacterium bovis* (1.11%). Three out of the *E. coli* isolates (16.67%) were identified as *E. coli* O157:H7. The liberated parasites were *Cysticercus bovis* (51.35%) and *Toxoplasma gondii* (48.65%). ELISA results showed that seroprevalence of toxoplasmosis was 47, 22.7 and 38.42% in human, cows and buffaloes, respectively. The immunoreactive profiles of *C. bovis* (167.82, 137.32, 88.839, 66.859, 59.851, 54.660 and 48.480 KDa) and *T. gondii* local tachyzoite (158, 111, 102, 86, 55 and 33 KDa) antigens probed with rabbit hyper immune serum showed one immunoreactive band at 55 KDa. While those of *E. coli* (182.01, 144.90, 72.558, 60.324, 28.312 and 18.392 KDa) and non typhoid *Salmonella* (91.967, 60.955 and 20.031 KDa) antigens displayed one common immunoreactive band at 60 KDa. It can be concluded that although immunoblotting help in identification of strains and detection of common cross reactive epitopes between different pathogens, there still exist many challenges and opportunities to improve the current technology of food pathogen detection. [Nawal, A. Hassanain; Mohey, A. Hassanain; Raafat, M. Shaapan; Hassan, A. Fadaly and Ashraf, M. Barakat. **Diagnosis of Egyptian Bovine Meat Borne Zoonosis**. Journal of American Science 2010;6(12):1526-1533]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords**: Meat borne, human health, parasites, bacteria, ELISA, SDS-PAGE, immunoblotting		
172	**Effect of Titanium oxide toxicity on Biochemical, Haematological and clinicopathological Changes in *Clarias lazera* Present in the River Nile** **Mona, S. Zaki[*1], Refat A. Yossef [2] and Nadia M. Taha[3]** Department of uHydribuilogy[1], National Research Centre, Cairo, Egypt Soil and Water Uses Department[2] National Research Centre, Cairo, Egypt Department of Physiology[3], Faculty of Verti. Medicine Cairo University [*]dr_mona_zaki@yahoo.co.uk. **Abstract:** The effect of dietary carbohydrates and titanium oxide on haematalogical profile, blood chemistry and hormonal level was studied in cat fish *Clarias lazera*. Fish were divided into 3 groups (n=10) ant exposedto different doses of titanium oxide and carbohydrate. Groupi was served as control. Group 2 was fed with carbohydrate and titanium oxide (10 mg Kg^{-1} diet ration), group 3 was fed with carbohydrate and titanium oxide (1 5 rng Kg^{-1} diet ration). There is a significant decrease in hemoglobin and P .C.V in group (3). There is a significant increase in serum corlisol, cholesterol, AST, ALT, urea, creatinine and alkaline phosphorous in r group (3), also there is a significant decrease in serum phosphorous, sodium and potassium in treated fish. There is a significant high level of titanium content in kidney muscles, heart and spleen in group (3) suggesting toxic effects of titanium on cat fish *Clarias lazera*. The total viable count of bacteria identified higher in fish fed on carbohydrate titanium. Predominate bacteria were identified as Aeromona, E. coli, Streptococcous, Pseudomonas, Fluorscences and Lacto bacilus species. We emphasize the finding that increase carbohydrate concentration causes harmful pathological effects which reduces humoral immure responses and enhances dietary titanium toxicity. [**Mona, S. Zaki, Refat A. Yossef and Nadia M. Taha. Effect of Titanium oxide toxicity on Biochemical, Haematological and clinicopathological Changes in *Clarias lazera* Present in the River Nile**. 173	The Influence of Technological Changes on Labour Availability: A Case of Cocoa Farming Households in Ogun State, Nigeria. [1]Oluyole, Kayode A and [2] Egbetokun, Olugbenga A [1]Economics and Statistics Division, Cocoa Research Institute of Nigeria, PMB 5244, Ibadan, Nigeria [2]Institute of Agricultural Research and Training, PMB 5029, Apata, Ibadan **greatjoge@yahoo.com** **Abstract:** This study examined the effects of technological changes on labour availability. Primary data was collected using structured questionnaires administered to a purposive sample of eighty cocoa farmers in Ogun state of Nigeria. The data collected was analyzed using descriptive statistics, Analysis of Variance (ANOVA) and Multi-variate regression analysis. Descriptive analysis revealed that some technologies such as improved spacing and fertilizer application require the employment of more labour while some technologies like mechanization and herbicide application displace labour. The result of the ANOVA shows that there is significant difference in the magnitude of labour used in different technological groups. Multi-variate regression analysis revealed that availability of labour is influenced by the extent of cultivation as well as the expenditure on improved technologies ($P<0.01$). The study recommended that small scale processing industries should be established in the rural areas to take the advantage of the available excess rural labour resulting from the displacement by some technologies thereby eliminating the problem of unemployment that is likely to be generated as a result of the adoption of the technologies. [Oluyole, Kayode A and Egbetokun, Olugbenga A. **Toxic Effects of *Grewia mollis* Stem Bark in Experimental Rats**. Journal of American Science 2010;6(12):1540-1543]. 174	**Toxic Effects of *Grewia mollis* Stem Bark in Experimental Rats** Wilson Obidah[†], Julius L. Godwin[†], Joseph Z. Fate[#] , Mike A. Madusolumuo[†] [†]Department of Biochemistry, Federal University of Technology Yola, P.M.B.2076 Yola, Nigeria. [#]Department of Science Laboratory Technology, Federal Polytechnic Mubi, P.M.B. 35 Mubi, Nigeria. domwam@yahoo.com **Abstract:** *Grewia mollis* stem bark used locally in Nigeria as food additive was mixed with the normal diet at 0, 1, 5 and 10% and fed male albino Wister rats over a four week period. No deaths or remarkable changes in general appearance or behaviour were observed in treated animals. Significant increases ($p< 0.05$) in serum transaminases activities, accompanied by decreased food intake were observed in rats fed the stem bark at 10% dietary level. Treatments had no effect on serum alkaline phosphatase activity, urea, creatinine, triglycerides, cholesterol, glucose concentrations and body and organ weights determined. These findings suggest that dietary exposure of rats to *Grewia mollis* stem bark at high concentrations may cause some adverse effects, especially liver injury. [**Toxic Effects of *Grewia mollis* Stem Bark in Experimental Rats. Toxic Effects of *Grewia mollis* Stem Bark in Experimental Rats**. Journal of American Science 2010;6(12):1544-1548]. Soil samples collected in three zones of Mulindi Valley were analyzed in the laboratory through PH Meter and the results showed that pH of all soil samples is less than 5 (pH<5), which implies that the soil in that valley is acidic. During this study, soil erosion caused by deforestation has been noticed and the sediments carried down and deposited in valley were became a peat after process of acidification. On the another hand, the analysis of water samples from the tank in polyethylene of three streams of Mulindi using spectroscopic techniques revealed a high concentration of elements like: Na, Ca NO^{3-}, H^{+}, H_2NO_3, Cu and S. and elements with low concentration : Fe, NO_3, K, and $al^{3.}$ This pollution may be due to agrochemicals used. Finally we proposed the methods	Full Text	179

	which can be applied in the country in order to ensure a sustainable tea agriculture and better environmental conservation. 180	**Antimicrobial Activity Of *Waltheria Indica*** *Zailani, A. Hauwa , #Jada, S, Mahmud and +Wurochekke, U Abdullahi. Department of Biochemistry, Federal University of Technology, P.M.B Yola, Adamawa State, Nigeria. +wchekke@yahoo.co.uk; #amjnennelushi@yahoo.com; *howwrkoulou@yahoo.com **Abstract:** *Waltheria indica* is used in Nigeria traditional medicine for the treatment of diarrhoea, infertility, skin diseases, gonorrhea and for relieving pains. Phytochemical analysis revealed the presence of steroids, tannins, saponins, and cardiac glycosides in all parts of the plant; flavonoids were detected only in the leaves and stem, while terpenoids and alkaloids were detected in the leaves only. No part of the plant showed the presence of anthraquinones. Antimicrobial activity of different parts of the plant on *E.coli, Pseudomonas aeroginosa and Salmonella typhi* showed the leaves having highest activity against *E.coli and pseudomonas aeroginosa* with the stem having the lowest activity against the three organisms. Column chromatography of crude extracts of the leaves gave fractions I, II and III that were eluted with ethylacetate/methanol benzene/methanol and acetic acid/methanol respectively. Of these extracts, fraction III showed highest activity against *E.coli and Salmonella typhi.* These findings support the traditional use of the plant as an anti diarrhoeal agent. [Zailani, A. 182	**Purification and properties of alanine aminopeptidase from water buffalo kidney** Mahmoud A. Ibrahim[1], Abdel-Hady M.Ghazy[1], Mohamed N. Mosaad[2] and Doaa A. Darwish[1] [1.] Molecular Biology Department, National Research Centre, Dokki, Cairo, Egypt [2.] Zoology Department, Faculty of Science, Banha University ibrahimm70@hotmail.com **Abstract:** Aminopeptidases participate in the development of flavour in food products. The present study aims at production of aminopeptidase(s) from the safe mammalian locally available rich sources. Three forms of alanine aminopeptidase AAP1, AAP2 and AAP3 isoenzymes were purified to homogeneity from the kidney cortex of water buffalo. The purification procedures involved anion exchange chromatography on DEAE-cellulose column and gel filtration through Sephacryl S-300 column. All of the purified isoenzymes turned out to be homogeneous as judged by native polyacrylamide gel electrophoresis. The molecular weights of the native isoenzymes AAP1, AAP2 and AAP3 were determined by gel filtration to be 120, 400 and 310 kDa. AAP1 was a homodimer of 60 kDa subunits. AAP2 was a homohexamer of 67 kDa subunits. AAP3 was a homohexamer of 53 kDa. AAP1, AAP2 and AAP3 displayed their maximum activity at pH 8, 7.8 and 7.8 and their isoelectric point (pI) values at pH 6.4, 6.2 and 6.6 respectively. The type of inhibition of AAP1 by dithiothreitol and AAP2 and AAP3 by 1,10 phenanthroline was found to be competitive. One binding site was deduced on each isoenzyme for its corresponding inhibitor. 184	**A Multi-Objective Approach for Multi Capacity warehouse Location within Distribution Supply Chain Problem** Mehrdad Rezazadeh [1], Sajjad Farahani [2] [1.]School of Industrial Engineering, Islamic Azad University - South Tehran Branch, Tehran, Iran. [1.] Industrial Engineering department at Amirkabir University of Technology, Tehran, Iran. Sajad.farahani@gmail.com **Abstract:** In this paper, we propose a mixed integer programming formulation for a location distribution problem. We have a two layer supply chain, central warehouses/stocks, regional warehouses and customers. Stocks should satisfy the multi-commodity customers demand. Our objectives are to minimize transportation cost of goods, from stocks to regional warehouses and from regional warehouses to customers, and installing cost of warehouses and to maximize average service level of customers. Our model determines a set of Pareto optimal solution for considering these two conflicting objectives. We have a three type alternatives for both stocks and regional warehouses with varying installing costs and capacities. Regarding the long term decision making for a location problem, we consider time value of money to have more assumptions of real worlds. As a result, a case study is indicated to show efficiency of model to solve the industrial problems; a sensitivity analysis is also implemented upon the rate of return and the life of cycle of the supply chain system. [Mehrdad Rezazadeh, Sajjad Farahani. **A Multi-Objective Approach for Multi Capacity warehouse Location within Distribution Supply Chain Problem**. Journal of American Science 2010;6(12):1624-1628]. 185	**Patient Satisfaction And Its Related Factors Within Emergency Care Departments: A Study Of Iranian Military Hospitals** Ahmad Ameriyon[1],Mohammadkarim Bahadori[1*], Mohammad Meskarpour Amiri[2], Hosein Amini Anabad[2] [1.] Health Management Research Centre, Baqyattallah University of Medical Sciences, Tehran, Iran [2.] Department of Health Economics, School of Medicine, Shahed University, Tehran, Iran bahadorihealth@gmail.com	Full Text	185

	Abstract: Background: Today, researchers pay special attention to patient satisfaction with emergency care services, the first line of hospital healthcare services. However, the nature of emergency medicine (EM) has changed significantly in recent years, and related factors in patient satisfaction have changed over time. The aim of this study was assessment of patient satisfaction and its related factors with emergency care services in six Iranian military hospitals. **Materials and Methods:** In this cross-sectional study, the satisfaction levels of 360 patients of emergency care services in six military hospitals of Iran in 2007 were assessed. After discharge from the emergency ward, a checklist of basic information and a 12-item questionnaire about satisfaction levels was completed for each patient. A 5-level Likert scale was used for the responses. Scores from 20-100 were allocated to each response (completely dissatisfied to completely satisfied), respectively. **Results:** 3,559/4,220 responses (82.4 percent) were completely satisfied or satisfied. In respect to priority, "Observation of ethical issues," "giving information “and” behavior of reception personnel" had the highest scores. "Variety of medical specialists," "emergency ward facilities," and "speed in calling doctor" scored the lowest. The total satisfaction score reported by patients older than 35 year (p=0.022), insurance coverage (p=0.002) and with history of previous referring to that emergency ward (p=0.017) was significantly higher than others. Gender, marital status, and educational level had no statistical correlation with the total satisfaction score (p>0.05). **Conclusion:** The findings of this study revealed favorable satisfaction levels for patients receiving emergency care services at military hospitals. However, using a variety of expert physicians and more facilities and also improving the process of calling doctors into the emergency ward are aspects that need more attention from healthcare managers in emergency centers. 186	**Growth Pattern in Anemic Children and Adolescents, aged 12-14 years** **Sanaa Kamal *; Moushira Erfan *; Shams Mohamad Kholoussi**; and karima Abd Elfatta Bahgat***** *Biological anthropology Department, Medical Research Division, National Research Centre (NRC) **Immuno-genetics Department, Human Genetics and Genome Research Division, NRC ***Pediatric Department faculty of Medicine (Girls), Al-Azhar University. moushiraz@yahoo.com **Abstract:** Iron deficiency anemia among children and adolescents is a large health problem worldwide. Adolescence is characterized by a large growth spurt and the acquisition of adult phenotypes and biologic rhythms. During this period, iron requirements increase dramatically in both boys and girls. Anemia due to iron deficiency often coexists with zinc deficiency. Deficits in macronutrients or micronutrients can impair growth. Menstruation increases the risk for iron deficiency anemia among girls throughout their adolescence. The aim of the present work is to assess growth pattern in anemic boys and girls and to study relations between anthropometric parameters and hemoglobin, iron and zinc levels. The sample consisted of 60 anemic children and adolescents aged from 12- 14 years (30 boys and 30 girls) and 30 normal healthy children (15 boys and 15girls). Weight, height, mid upper arm circumference (MUAC), waist and hip circumferences were measured and body mass index (BMI) was calculated. Sex- and age-independent SD scores (SDS) were calculated for all anthropometric measurements with the use of the Egyptian reference data. Hemoglobin concentration, serum ferritin, iron and zinc were measured for patients and control. Anemic girls showed significant association between height SDS, weight SDS, BMI SDS and hemoglobin concentration level and also between MUAC SDS and zinc level. Anemic boys showed less marked growth delay. The study showed that growth delay was pronounced among anemic girls during adolescent growth spurt. Thus, age and sex are the factors most predicative of growth delay among Egyptian adolescents. The study emphasized that iron and zinc are essential micronutrients for normal growth and anemia has a negative impact on growth. The study suggests regular nutrition assessment of adolescents	Full Text	186

	and recommends behavior modification to get dietary change among adolescents. The inhibited growth rate, induced by the iron-deficient diet could be reversed by giving a diet supplemented with iron. 187	**Effect of Spraying with some Nutrient Elements on Tolerance Beachilyfolia Pear Rootstock to Salinity** **Faten, H. M. Ismaeil[*1] and Wahdan, M. T. [2]** [1]Agric. Botany. Dept. Fac. of Agric. Benha Univ. Benha, Egypt [2] Hort. Dept. Fac. of Agric. Suez Chanel Univ. Egypt fatenesmaeil@yahoo.com[*] **Abstract:** The present investigation was carried out during 2008 and 2009 seasons in the experimental farm belonging to El-Kanater Horticultural Research Station, Kalyubeia Governorate Egypt to study effect of some nutrient elements on tolerance beachilyfolia pear rootstock to salinity. The following measurements were recorded: vegetative growth, nutritional status and some physiological properties of Beachilyfolia pear rootstock, irrigated with saline solution at 6000 ppm with 6 SAR and high chloride level (Cl : So4). Zinc at 50 ppm, Potassium at 250 ppm and Phosphorus at 250 ppm were used in this study to give more explanation about the protect against salt injury. The results revealed that, foliar spray treatments caused a significant increase of some growth measurements (stem height, root length, number of branches & leaves, leaf area, stem diameter and fresh & dry weights of plant organs), leaf photosynthetic pigments content (chlorophyll A, B and carotenoids), leaf mineral content (N, P, K, Na, Fe Mn and Zn), physiological properties (leaf succulence grade, leaf water potential and leaf relative turgidity) of beachilyfolia pear rootstock transplants during 2008 and 2009 consecutive seasons. On the contrary, leaf sodium and proline contents and leaf osmotic pressure took the other way around during the study. [Faten, H. M. Ismaeil and Wahdan, M. 188	**Black Tea Forestalls Sodium Fluoride-Induced Neurobehavioral Toxicity in Laboratory Rats** **Mervat M. Kamel[1*], Heba S. El-lethey[1], Iman B. Shaheed[2], and Gehan M. Kamel[3]** [1]Department of Animal Hygiene and Management, [2]Department of Pathology, [3]Department of Pharmacology, Faculty of veterinary Medicine, Cairo University, Cairo, Egypt, mevy58@yahoo.com[*] **Abstract:** The present study aimed to investigate the main effects as well as the interaction effect of supplemental Na-F and black tea on emotional reactivity and learning and memory capacities in rats using a variety of behavioural tasks. Eighty weanling 32-days old Wistar male rats randomly distributed into four groups of 20 animals each, were supplemented with Na-F at 100 ppm and 2% black tea in a factorial pattern to constitute 4 experimental treatments. Brain tissue specimens, representing all treatments, were taken for biochemical and histopathological investigations. In the open field test, Na-F-treated rats displayed higher levels of anxiety that were significantly reduced when black tea was concomitantly administered. Marked impairment in habituation was a significant remark for Na-F group. A superior learning and memory ability was recorded for black tea-supplemented rats during classic maze test, where black tea significantly recovered the intervention observed in Na-F-exposed rats. Moreover, black tea significantly enhanced spatial cognition learning ability and successfully alleviated Na-F-induced spatial	Full Text	188

	memory impairment. Rats administered Na-F displayed distinct neurodegenerative changes of nerve cells especially in hippocampus, accompanied by inhibition of brain acetylcholinesterase (AChE) activity with increased oxidative stress. Administration of black tea along with Na-F was able to afford protection against these Na-F-induced alterations. Our findings suggest a profound ameliorative effect of black tea on Na-F-induced adverse alterations in the brain of rats as indicated by hindrance of learning and memory performance, and argue for concurrent administration of black tea to Na-F-exposed individuals in order to help alleviate fluoride intoxication. [Mervat M. Kamel, Heba S. El-lethey, Iman B. Shaheed, and Gehan M. Kamel. **Black Tea Forestalls Sodium Fluoride-Induced Neurobehavioral Toxicity in Laboratory Rats**. 189	**Epidemiological Studies of Urinary Tract Infection (UTI) among Post-menopausal Women in Uyo Metropolis, South-South, Nigeria.** **[1]Akinjogunla, O. J., [2]Odeyemi, A. T. and [3]Olasehinde, G. I.** [1]Department of Microbiology, Faculty of Science, University of Uyo, P.M.B. 1017, Uyo, Akwa Ibom State, Nigeria. [2]Department of Microbiology, Faculty of Science, University of Ado-Ekiti, P.M.B.5363, Ado-Ekiti, Ekiti State, Nigeria. [3]Department of Biological Sciences, College of Science and Technology, Covenant University, Ota, Ogun State, Nigeria. papajyde2000@yahoo.com **ABSTRACT:** Cross-sectional studies of UTI among post menopausal women were carried out between January and June, 2009 using standard microbiological techniques. The result obtained showed that 42 (39.6%) out of 106 postmenopausal women had urinary tract infections with highest prevalence among women aged 56-60 and lowest among those aged ≥ 61 . Microscopic examinations of forty-two (42) mid-stream urine samples revealed the presence of 13(30.9%) epithelial cells, 5 (11.9%) phosphate crystals, 16 (38.1%) pus cell , 9 (21.4%) yeast cells, 7(16.7%) red blood cells and eggs of *Schistoma haematobium* 2(4.8%). Bacteria isolated were: *Escherichia coli* 20 (25.3%), followed by *Staphylococcus aureus* 16 (20.3%), *Pseudomonas aureginosa* 10 (12.7%), Coagulase negative *Staphylococcus* spp 9 (11.4%), *Streptococcus pyogenes* 6 (7.6%), *Serratia marcescens* 6 (7.6%), *Enterobacter* spp 5 (6.3%). *Klebsiella* spp. 4 (5.1%) and *Enterococcus faecalis* 3(3.8%). *E. coli* showed low percentage resistance to ciprofloxacin, ceftazidime and ceftriaxone. *Enterobacter* spp. were susceptible to ciprofloxacin and cotrimoxazole in 80%, respectively. Between 60-80% of *Pseudomonas aeruginosa* and *Enterobacter* spp were susceptible to all the tested antibiotics, while 4(66.7%) *Streptococcus pyogenes,* 6 (66.7%) CON-*Staphylococcus* spp and 4(66.7%) *Serratia marcescens* were sensitive to ceftazidime. All the *Enterococcus faecalis* and *Klebsiella* spp isolated were sensitive to ciprofloxacin. The phenotypic determination identified a low ESβL rate of 28.8 % (13 of 45 isolates). ESBLs were detected among the following species: 5 *Escherichia coli* (25.0%), 3 *Pseudomonas* spp (30.0%), 1 *Klebsiella* spp (25.0%), *Serratia marcescens*2 (33.3%) and *Enterobacter* spp. 2 (40.0%). The result also showed that 18.9 % of the bacteria were resistant to at least 3 antibiotics with (MAR) index ranging from 0.2 to 0.8. The results obtained in this study are statistically significant (*p≤0.05*). However, continuous surveillance to monitor the prevalence of UTI and antimicrobial resistance among post menopausal women is overwhelmingly necessary. [Akinjogunla, O. J., Odeyemi, A. T. and Olasehinde, G. 190	**Morphology And Wall Structure Of Some Turonian Rudists (Bivalvia, Hippuritoida) Of Gabal**	Full Text	190

	Yelleg, Northern Sinai, Egypt **Hosni Hamama** Geology Department, Faculty of Science, Mansura University, Mansura 35516, Egypt. **hamamahem@hotmail.com** **Abstract:** The Turonian succession exposed at the northern extremity of Gabal Yelleg at Northern Sinai yields many rudists. Most of these rudists exhibit polymorphism. Identification, systematic, wall structure and the biostratigraphy of the rudists are made. Rudists encountered are found to belong to: Family RADIOLITIDAE Gray which includes species related to subfamily RADIOLITINAE Gray: 1948: *Radiolites* cf *polyconilites* Orbigny, *Radiolites peroni* (Choffat), *Radiolites sauvagesi* (d Holmis-Firmas), *Gorjanovicia costata* Polsak and *Praeradiolites biskraensis* (Coquand); subfamily BIRADIOLITINAE Douville : *Milovanovicia heraki* Polsak 1968; Subfamily SAUVAGESIINAE Douville: *Suvagesia sharpie*(Bale), *Durania* gaensis (Dacque), *Suvagesia nicaisei* (Coquand), *Durania barakatnsis* nov. sp, *Durania cornupastoris* (Des Moulins) and *Durania arnaudi* (Choffat) and subfamily LAPEIROUSIINAE K u¨hn: *Lapeirousella aumalensis* (Douville). From the family HIPPURITIDAE Gray, 1948 only species *Hippurites (Hppuritella)* cf. *castroi* Vidal was identified. One species among the rudists of Gabal Yelleg is suggested as new species: *Durania barakatnsis* nov. sp. Fourteen thin sections representing the described Turonian rudists were prepared to study the wall structure of rudists, and the evaluation such structure in classification of the studied rudists is discussed. [Hosni Hamama. **Morphology And Wall Structure Of Some Turonian Rudists (Bivalvia, Hippuritoida) Of Gabal Yelleg, Northern Sinai, Egypt**. Journal of American Science 2010;6(12):1682-1701]. 192	**Phenotypic and Gene-technological Methods for the Identification of Clinically Isolated *Streptococcus pneumoniae* from Egyptian Children** **Fouz Mohamed El-Antably[*1], Salah Abdalla[2], Alaa El-Dien MS Hosney[3] and Gehan Saddik El-Hadidy[4]** [1]Ministry of Heath, Egypt, [2]Department of Microbiology & Immunology, Faculty of Pharmacy, Suez Canal University, Egypt, [3]Department of Microbiology & Immunology, Faculty of Pharmacy, Cairo University, Egypt, [4] Department of Microbiology & Immunology, Faculty of Medicine, Suez Canal	Full Text	192

	University, Egypt fouzelantably@yahoo.com* **Abstract:** *Streptococcus pneumoniae* is an important human pathogen that causes both serious invasive infections, such as septicemia, meningitis and pneumonia, as well as mild upper respiratory infections. The purpose of the study was to identify the *Streptococcus pneumoniae* using the conventional phenotypic methods and the PCR assay; especially, to evaluate their usefulness in the identification of suspected pneumococcal isolates lacking one or more of their typical phenotypic characteristics. A total of 123 nasopharyngeal specimens obtained from children under five years of age, with acute upper respiratory tract infection were subcultured and identified by conventional and gene-technological methods. Forty-one isolates were identified as *Streptococcus pneumoniae*. Approximately (7.31%) were found to be atypical optochin-resistant, while, (4.87%) were bile insoluble. A 209-bp fragment indicative the pneumolysin (ply) gene was obtained from all typical and atypical isolates. The bile solubility test is more specific than the optochin test for identification of *Streptococcus pneumoniae*. Genetic test (PCR) for ply could be used to evaluate any isolates giving questionable results by any of the other phenotypic methods. [Fouz Mohamed El-Antably, Salah Abdalla, Alaa El-Dien MS Hosney and Gehan Saddik El-Hadidy. **Phenotypic and Gene-technological Methods for the Identification of Clinically Isolated *Streptococcus pneumoniae* from Egyptian Children**. 193	**Relationship between Nursing Procedures and Oxygen Saturation Level of Preterm Infants with Respiratory Distress Syndrome** **Randa El-Sayed Mohammed El-Sayed*; Gamalat El-Sayed Mansy; Bahaa Salah El-Din Hamad and Nehad Sabry Basiouny** Pediatric Nursing, Faculty of Nursing, Alexandria University, Alexandria, Egypt *randa_7373@yahoo.com **Abstract:** The present study was conducted to determine the relationship between nursing procedures (Suctioning, change of position, Heel stick) and blood oxygen saturation level, using pulse oximter monitoring. Fifty preterm infants with respiratory distress syndrome were monitored during performing the nursing procedures at the Neonatal Intensive Care Unit, in Maternity University Hospital at EI-Shatby in Alexandria. An assessment sheet was developed for monitoring the oxygen level before, during, and after each of the three nursing procedures. The main results were the preterm neonates with respiratory distress syndrome reacted to nursing care procedures with decrease in oxygen saturation (SPO_2) during different positioning and repositioning, suctioning and heelstick. After the procedures, all preterm neonates returned to pre-procedure average of oxygen saturation except after repositioning from side- lying to supine, from supine to prone position, and after suctioning. The supine position contributed to a slight decrease in oxygenation. Both prone position and suctioning contributed to an increase in oxygenation after the procedures. The main recommendation is that continuous monitoring of oxygen saturation before, during and after performing the nursing procedures is mandatory. [Randa El-Sayed Mohammed El-Sayed*; Gamalat El-Sayed Mansy; Bahaa Salah El-Din Hamad and Nehad Sabry Basiouny. **Relationship between Nursing Procedures and Oxygen Saturation Level of Preterm Infants with Respiratory Distress Syndrome**. Abstract: Seedlings of the leguminous shrub; *Colutea istria* Mill. were used as explants for the micropropagation of this vulnerable species. Cotyledonary nodes, stem node sections and shoot tips from the *in vitro* germinated seedlings were examined for micropropagation. The *in vitro* establishment of explants was attempted by using various concentrations of 6-benzylaminopurine (BA), Thidiazuron (TDZ) and N6-(2-isopentenyl) adenine (2iP) (0.5, 1, 2 mg/L each) in combination with NAA at 0.1 and 0.2 mg/L incorporated into Murashige and Skoog (MS) and Gamborg's (B5) media, in addition to the MS and B5 media without plant growth regulators (PGRs). The best results were obtained on MS medium supplemented with NAA and BA, in addition to PGRs free MS medium. And the best average number and length of shoots were obtained by using cotyledonary nodes as explants. For multiplication, the explants were cultured on MS medium containing BA at concentrations of 0.25, 0.5 and 1 mg/L either individually or in combination with 2iP at a concentration of 0.5 mg/L. The combination of BA and 2iP is recommended for multiplying the established shoots produced from colyledonary nodes and stem node sections due to the significantly higher average number of shoots/explant comparing to the media containing BA singly. However, BA is better for the multiplication of shoot tip explants. When axillary shoots were subcultured on the same medium, the shoots failed to multiply and began to senesce. The senescence progressed to the entire shoot, and growth ceased. Reducing of the duration of the subculture to 3 weeks is necessary to prevent this problem. Explants rooted on MS medium containing 0.5 mg/L of both Indole-3-butyric acid (IBA) and NAA and plantlets with well developed shoots and roots transferred to soil and grew normally without loss of green colour and wilting.

Abstract: Amaryl (Glimepiride) is the third generation antidiabetic sulphonylurea known to possess the antioxidant effect in streptozotocin (STZ) induced diabetes. In this study, the antimutagenic activity of amaryl (0.03mg/kg.po daily for 30 days) was evaluated against the cytotoxic effect of alloxan (150mg/kg) on somatic cells using bone marrow (for chromosome abnormality and micronucleus tests) and liver samples (for DNA fragmentation test). As well as, germinal cells (using sperm abnormality test) cells in albino rats. The present results showed that the glucose levels significantly increased in alloxan diabetic rats compared to those found in the control. The alloxans diabetes of rats (males or females) had higher frequencies of structural and numerical chromosome aberrations compared to normal control. The diabetic condition in both male and female rats also increased the populations of each of micro nucleated erythrocytes and DNA fragmentation. Moreover, the diabetic condition of male rats significantly increased the sperm shape abnormalities besides significant reducing of caudal sperm count. On the other hand, the administrations of amaryl (glimepiride) to the alloxan diabetic rats had reduced the blood glucose level, abnormalities of genetic materials (chromosomal aberrations, the population of micro-nucleated erythrocytes, DNA fragmentation) and sperm shape abnormalities besides enhancing the sperm count. In

The strains were prepared and inoculated into 5ml broth and incubated at 37^{o}C for 24 h. The freshly mixed sealers were placed into the prepared wells of agar plates (inoculated with the test microorganisms). The antimicrobial effect of each sealer was determined by measuring the diameter of zones of inhibition in millimeters at one and three days period. Five plates were prepared for every sealer in each method. **Results** showed that Sealapex gave the highest mean of inhibition zone diameter. This was followed by CRCS and Apexit showed the lowest mean of inhibition zone after one day. While at the three days period, the Sealapex gave the largest inhibition zone diameter and there was no statistically significant difference between CRCS and Apexit groups. The three methods used confirm these results. [Omar N., Negem M., Kataia M., and Zaazou M. 	Abstract: Inflammatory gingival enlargement is the most common inflammatory gingival disease and is associated with multiple factors including inflammation due to bacterial plaque colonization, as aside-effect of systemic medications, prolonged orthodontic treatment, and other etiological factors. This study investigated the effect of different etiological causes of gingival enlargement; including the treatment with cyclosporine A, the plaque, and the orthodontic treatment; on the angiogenic inflammatory mediators such as vascular endothelial growth factor (VEGF), cycloxygenase-2 (COX-2), 5-lipoxygenase (5-LO), and tumor necrosis factor-α (TNF- α), using histopathological and immune-histochemical analysis. The results of the immune-histochemical analysis of different angiogenic inflammatory mediators in the gingival enlargement samples indicated that in cyclosporine A-induced enlargement neither of VEGF, COX-2, 5-LO, nor TNF-α were affected, while there is a remarkable general over-expression of VEGF, COX-2, and 5-LO in the parakeratinized epithelial surface, the epithelial layer, connective tissue and in the fiber bundles regions of plaque-induced enlargement gingival. Additionally, orthodontic treatment samples indicated that there is a very high expression of VEGF in the epithelial layer of gingival but not in the connective tissue nor in the fiber bundles regions with no change in COX-2, 5-LO, nor TNF-α expression. In conclusion, this report indicated that the expression of different angiogenic and inflammatory mediators in gingival enlargement is influenced by the etiological factor that initially induced this enlargement.

Corresponding author :mohamedzaazou@yahoo.com **Abstract: Purpose:** This study was designed to assess the effect of 3 different bleaching regimens on color and microhardness of enamel. **Materials and Methods**: Ninety bovine upper central incisors were divided into three main groups according to the bleaching regimen used; chemically activated (Viva Style Paint on Plus), photo activated (Zoom 2), and laser activate (Opalescence X-Boost) bleaching agents. Each group was stained with (tea, carbonated beverage or a combination of both tea and carbonated beverage for 1 day or 6 days. Color was assessed using computerized image analysis in terms of grey scale, while Vickers microhardness tester was used to assess change in enamel microhardness. **Results:** Computerized image analysis revealed statistically significant decrease in the mean grey scale value of all teeth immersed in the three staining solutions used. The results also revealed that color change become intense as the immersion time increased. After bleaching with the three bleaching regimens the results revealed increase in the mean grey scale value of all the three bleaching regimens used with statistically significant increase in the mean grey scale value of both photo and laser activated bleaching agents than did chemical activated bleaching agent. Microhardness results revealed that there was statistically significant decrease in enamel microhardness after immersion in the three solutions, where the carbonated beverage group showed the lowest mean microhardness value than did the tea and the combination solutions. After bleaching with the three bleaching regimens enamel revealed a significant decrease in its microhardness. For all groups, no correlation was found between color change of enamel surface and its microhardness. **Conclusion**: Tea and Carbonated beverages have the ability to discolor teeth and alter their microhardness. Different bleaching regimens are lightening the color of discolored teeth but adversely affect enamel microhardnes. Abstract: Studies of maxillary overdentures supported by conventional implants often show a high implant failure rate. It was believed that maxillary implants should be splinted to retain a removable maxillary overdenture in order to maintain osseointegration. **Materials and Methods:** The present study evaluated the clinical performance of new generation of OsteoCare's Midi self-tapping self-drilling one-piece (ball type) implants for the support of maxillary overdentures. Seventy five implants were placed in the anterior maxillary region of 14 patients. A transmucosal flapless procedure was used to place four to six implants for each patient and followed by immediate delivery of an overdenture. The patients were evaluated at 6-month intervals for a follow-up period of 18 months. The clinical criteria to be checked were survival rate, Periotest values, radiographic crestal bone level and patient satisfaction. The **results** showed that 73 implants had successfully osseointegrated as indicated by the clinical and radiographic examinations. Implant survival rate of 97.3% was attested. The accumulated mean marginal bone loss was 0.88mm at the end of the follow-up period. Patients showed a very high degree of satisfaction of the treatment outcome due to the highly improved retention with partial palatal coverage using horse shoe designed maxillary over-dentures. This procedure has many advantages which include implant placement with minimally invasive transmucosal flapless surgery, decreased postoperative pain and a decreased cost of treatment. Single-stage one-piece implant placement, immediate loading, and transmucosal flapless surgery can result in high success rates when proper techniques are utilized with appropriate patient selection. In **conclusion**, the use of the Osteocare's Midi one-piece (ball type) implants is a valid unique simple treatment modality to support maxillary over-dentures.

Abstract: Ground water is highly important source of drinking water in Egypt. Some provinces suffer from high content of iron and manganese in ground water which threat human health. Different processes, such as electrochemical (EC), photo (UV), and combined photo-electrochemical (CPE) methods were used to attain both metals content to the level in accordance to reports of World Health Organization (WHO). A cell containing aluminium electrode as anode, graphite electrode as cathode and UV lamp were used and filled with waste water enriched with iron and manganese as an electrolytic solution. A limited quantity of sodium chloride salt was added to enhance the electric conductivity through the solution. A comparison between different methods was undertaken to evaluate the applied conditions and the efficiency of Fe and Mn removal at different times and initial concentrations. The results revealed that CPE method was the best choice for the simultaneous removal of both iron and manganese in a short time < 10 min. [Journal of American Science. 2010;6(12):1-7]. (ISSN: 1545-1003).

Keywords: Ground water; Egypt; electrochemical (EC); photo (UV); combined photo-electrochemical (CPE); World Health Organization (WHO).

1. Introduction:

Some regions in Egypt suffer from the contamination of ground water with high concentration of iron and manganese, which threat human health and leading to chronic diseases. Groundwater pollution can occur in various ways, in addition to natural or geochemical contamination, by leaks in pipelines, from landfill leachates, etc. It can be divided into three main contamination categories, by organic compounds, by microorganisms, and inorganic pollutants. The contamination of groundwater with metals of inorganic pollution comprises a danger environmental problem due to the fact that metals are not biodegradable and can cause severe adverse effects on human health [1].

The presence of iron and manganese compounds in groundwater, and eventually in drinking water, is a serious environmental problem. When iron and manganese compounds are present in both surface and groundwater, even at low concentrations, they can be linked to various water quality problems and their removal is essential.

The Safe Drinking Water Act (SDWA) secondary standards for iron in drinking water is 0.3 parts per million (ppm) and for manganese it is 0.05 ppm. Iron and manganese are both known to stain the water supply. They can make water appearance red or yellow, create brown or black stains, and give off an easily detectable metallic taste. Several years ago, it was believed that incumbent soil layers, acting as natural filters and protected ground waters, but actually it was found that soil ores of iron and manganese can be easily dissolved into ground water particularly at highly acidic medium [2].

Iron in water supplies causes aesthetic and operational problems, such as bad taste and colour, staining and deposition in the water distribution system leading to high turbidity. Manganese is a very common compound that can be found everywhere on earth and it is one of the most abundant metals in soils, where it occurs as oxides and hydroxides, and cycles through its various oxidation states. Manganese is one out of three toxic essential trace elements, which means that it is not only necessary for humans to survive, but it is also toxic when too high concentrations are present in a human body [3].

Manganese is one of the most abundant metals in soils, where it occurs as oxides and hydroxides, and it cycles through its various oxidation states. Manganese occurs principally as pyrolusite (MnO_2), and to a lesser extent as rhodochrosite ($MnCO_3$).

Manganese, in the form of potassium permanganate, may be used in drinking water treatment to oxidize and remove iron, manganese, and other contaminants [4-6].

Manganese in ground water is difficult to remove by using normal methods, where it required a high potential to overcome its high activation energy required for manganese oxide formation, where MnO_2 is formed by highly oxidizing and high pH conditions [7, 8]

In recent years, various treatment technologies have been employed to enhance water quality by

removing inorganic and organic contaminants. Both photo and electro-chemical oxidation technologies recently have become more popular for water treatment. Doan and Saidi [9] used combined electrochemical and photochemical oxidation for the removal of inorganic contaminants like Zn and Ni, and organic contaminants like alkylbenzene sulfonate. They found that the results of combined system are at comparable levels to those obtained in the sole electrochemical system. Peralta-Hernández et al [10] designed an annular tube reactor of combined photo- electrochemical system for the generation of H_2O_2 and Fenton reagent in situ, the rate of oxidation was increases substantially when the semiconductor anode was illuminated as compared to the same processes carried out in the dark. These processes are considered as attractive options in solving the issues concerning iron and manganese removal from water particularly, if other compounds such as ammonia, total dissolved solids or natural organic matter (NOM) are found [11]. To solve this problem, Fe^{+2} or Fe^{+3} can be introduced into the system, constructing an electro-Fenton's reagent as one of a special class of oxidation techniques defined as advanced oxidation processes (AOPs) [12]. These processes are characterized by the capability of exploiting the high reactivity of free hydroxyl radicals. Free hydroxyl radical ($OH^{\bullet}$) is a non selective and very powerful oxidant agent able to oxidize organic and inorganic pollutants in water and is generated from chemical, electro and photochemical (by using light irradiation) processes. Electro-Fenton process can be enhanced in presence of UV radiation [13]. Stephen and Charlotte were used electrolytic cell containing aluminum and iron electrodes of high surface area relative to the volume of electrolyte for the generation of fine flocs of Al(OH)3 acting as colloids and adsorption centers for contaminants dispersed in waste water [14].

In the present study an approach was studied and evaluated for the removal of heavy metals like, iron and manganese to avoid their harm to human health. Combined photo electrochemical oxidation technique was investigated for the removal of iron and manganese from water, since a little information is available on this approach. The removal of iron and manganese from synthetic solution using bench-scale CPE oxidation system was evaluated using different concentrations levels of both iron and manganese at different conditions.

2 - Materials and Experimental:

2.1. Materials

Ferrous sulfate heptahydrate ($FeSO_4.7H_2O$) were used as a source of iron in form of Fe (II) was supplied by S.D. Fine Chem. Ltd. Manganese sulfate mono-hydrate ($MnSO_4.H_2O$) was used as sources of manganese in form of Mn (II) was supplied by S.D. Fine Chem. Ltd. Pure sodium chloride (NaCl) was used as electrolyte, purchased from Merck. Distilled water was used throughout. Analar Sulfuric acid 98 % purchased from ADWIC.

2.2. Experimental Set-up

A laborator combined photo electrochemical unit was used for the batch experiments. The schematic diagram of the experimental set-up used is shown in Fig.1. It consists of a cylindrical quartz photo reactor (1.2 L), with a coaxial and immersed medium pressure UV mercury lamp used as the UV emitter and light source (Heraeus TQ150, input energy of 150 W) emitting a polychromatic radiation in the range from 100 to 280 nm wavelength. The UV lamp was equipped with a cooling water jacket to maintain the temperature of the reaction of wastewater treatment at room temperature.

The reaction vessel was filled with authentic solution containing both iron and manganese. The electrochemical characterization of the solution was carried out by using DC power supply GW 3030 an two electrodes, graphite cathode and aluminium anode. The measurements were performed at room temperature and the mixing was accomplished by using continuous magnetic stirrer.

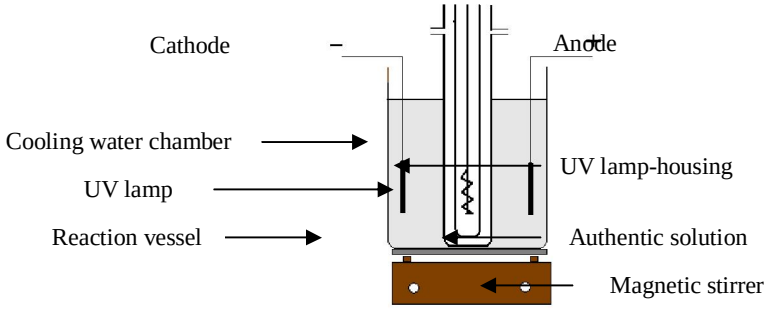

Figure (1): The schematic diagram of the experimental set-up

2.3. Procedures and Analysis

Workers have developed an approach for the removal of heavy metals like, iron and manganese. Three techniques were examined for the removal of iron and manganese namely, Electrochemical (EC), photochemical (UV), and combined photo-electrochemical (CPE) methods, where the study comprised a comparison between all techniques to track the most efficient one by determination of removal efficiency.

Authentic solutions of different iron and manganese concentrations are prepared as model of ground water by dissolving definite concentrations of both a mixture $FeSO_4.7H_2O/MnSO_4.H_2O$ in distilled water. Definite amounts of NaCl were added to improve the conductivity and ionic mobility through the electrolyte. The solution was acidified by drops added of prepared dilute sulfuric acid 15 % to pH 3. The efficiency of the process was evaluated by measuring the metal removal from samples at the end of each experiment. Samples are filtered before the measurement of metals by using atomic adsorption (Percken Elmar 1100B, Germany) [15]

3. Results and Discussion:

3.1. Comparative removal behaviour of different methods

Before iron and manganese can be filtered, they need to be oxidized to a state in which they can form insoluble complexes. Oxidation involves the transfer of electrons from the iron and manganese to the oxidizing agent. Oxidation methods using additives like chlorine, ozone, air; or those using an oxidizing filter media fall to oxidize iron and manganese.

UV oxidation, electrochemical oxidation (EC) and combined photo-electrochemical (CPE) methods were used for removal of both dissolved iron and manganese from authentic solution. Fig.2 represents a comparison between the removal efficiency of dissolved iron and dissolved manganese by using combined CPE method from a mixture solution of concentration 5 ppm $FeSO_4.7H_2O$ and 5 ppm $MnSO_4.H_2O$. A highly removal efficiency was achieved after a short time, where the concentration of Fe was decreased from 5 ppm to less than 0.1 ppm after 5 min (R=98%), while the removal of Mn was decreased from 5 ppm to 1.7 ppm after 5 min. (R= 66 %), and it was highly decreased to 0.2 ppm after 20 min (R= 96%). It is obviously shown that the removal efficiency of Mn was less than Fe after the same time, where the removal of Mn required an oxidation potential higher than iron, so the removal efficiency of Mn can be improved by using high potential and adequate time.

This indicates that the electrochemical potential supported by UV irradiation (CPE) enhanced the oxidation of both soluble Fe^{2+} and Mn^{2+} to insoluble Fe^{3+} and Mn^{4+} ions in a short time, which can be adsorbed on the surface of formed $Al(OH)_3$ floc.

The lowest concentration obtained of Mn after CPE treatment was 0.2 ppm (R = 96 %), but it still higher than the recommended standard values according to the reports of WHO. So, the second treatment may be required for the removal of residue of Mn to attain the standard concentration 0.05 ppm (R = 99.6 %),

Another method was carried out by using electrochemical oxidation, where the solution was totally exposed to electric field between anode and cathode. Some reactions were taken place at the surface of electrodes and in the bulk of electrolytic solution, where Al^{3+} ions were generated by anodic oxidation, reduction of hydrogen ions at the surface of cathode and water molecules were electrolyzed to OH^- and H^+.

$$Al \rightarrow Al^{3+} + 3e^- \quad (1)$$

$$H_2O \rightarrow OH^- + H^+ \quad (2)$$

$$Al^{3+} + OH^- \rightarrow Al(OH)_3 \quad (3)$$

The concentration of dissolved iron was decreased sharply from 5 to 0.1 ppm within 10 min of oxidation time as shown in Fig.3 (R= 98 %). The concentration of Mn was decreased slowly from 5 to 2.2 ppm after 5 min (R = 56%) and by elongation of time, the removal efficiency was improved to (R= 76%), where the concentration of manganese was decreased from 5 to 1.2 ppm after 20 min.

In the electrochemical method, the formed Al $(OH)_3$ floc gave a high important role as a suspended colloids having an electrostatic adsorption capability of agglomeration of dissolved Fe^{2+} and Mn^{2+} ions.

On the other hand, one can observe the comparative removal of iron and manganese of different methods. As shown in Fig.4, a quite slow removal of 5 ppm of Fe by using UV light after 20 min was occurred to attain the lowest concentration 0.5 ppm after 20 min (R=90%), while the lowest concentration residue of Mn was 3.5 ppm (R= 30 %) was obtained after 20 min. This indicates the low energy produced and consequently low effect of UV irradiation, where the generation of a very small concentration of the main oxidant $OH^{\bullet}$ radical from the decomposition of water.

Also, it was obviously observed that the removal efficiency values of (EC) method was approximately similar to (CPE) method; i.e. the oxidation activation energy of (EC) method >> the

oxidation activation energy of (UV) irradiation method. This indicates the low effect of UV irradiation for metal oxidation process by CPE method.

On the other hand, the removal efficiency of iron by all methods was generally higher than the removal efficiency of manganese; this behavior can be attributed to the higher oxidation potential required for oxidation of Mn, where the insoluble form MnO_2 is formed by high potential (1.05 V) and high pH value 9. While a high removal efficiency of iron was achieved due its lower oxidation potential (0.77 V) required for the formation of Fe $(OH)_3$.

UV irradiation participates marginally in the oxidation of Fe and Mn, while the participation of electrochemical oxidation was proved in Fig.2. The role of photo oxidation can be outlined in the following points: (i) It accelerates the oxidation of Fe and Mn to the insoluble high oxidation state, (ii) In the presence of photo oxidation $^{\bullet}OH$ free radical can be formed by the photolysis of H_2O and (iii) it can be excellently used for the disinfection of municipal water.

In the electrochemical oxidation, hydroxyl radicals may be produced over the surface at high-oxygen over voltage anode from water oxidation and electro generation of hydrogen peroxide (H_2O_2) formed from the two-electron reduction of O_2 at a graphite cathode [16]. The oxidizing H_2O_2 can be enhanced in the presence of catalytic Fe^{2+}, due to the formation of hydroxyl radicals from the classical Fenton's reaction between both species.

$$H_2O \rightarrow OH^{\bullet} + H^+ + e^- \quad (4)$$

$$O_{2\,(g)} + 2H^+ + 2e^- \rightarrow H_2O_2 \quad (5)$$

It can be seen from Fig.2, the quicker iron removal found by combined photo electrochemical oxidation where 96.8 % iron removal was obained within 10 minutes reaction time due to the generation of more hydroxyl radicals with the enhancement of electrochemical oxidation in the presence of UV light (CPE).

Moreover, in both EC oxidation and CPE oxidation processes, by using aluminum as anode in the electrolytic cell, aluminum ions (Al^{3+}) are formed which reacts with hydroxyl ions (OH^-) and forms aluminum hydroxide as flocs which adsorb Fe^{2+} and Mn^{2+} ions and co-precipitate together.

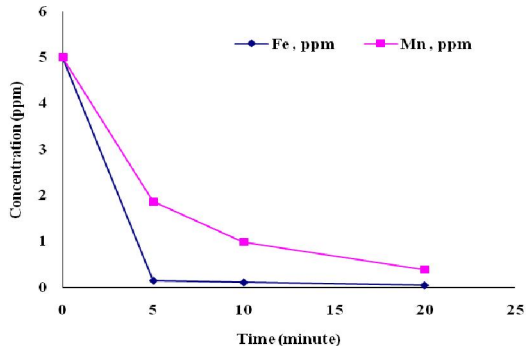

Fig. 2: Removal efficiency of Fe and Mn by (CPE) oxidation method from a mixture authentic solution of (Fe&Mn) [Initial concentration 5 ppm, 150W, 0.25 A]

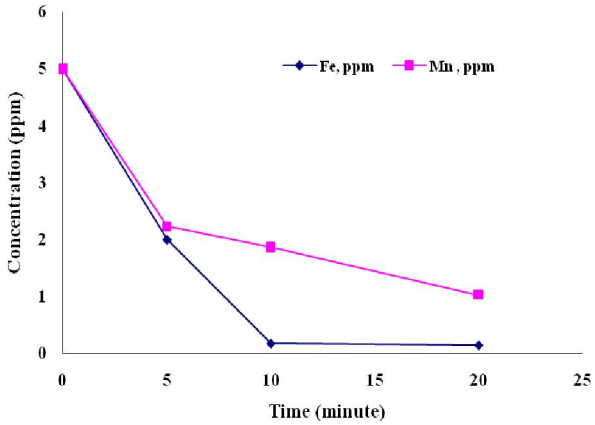

Fig.-3 : Removal efficiency of Fe and Mn by (E) oxidation method from a mixture authentic solution of (Fe&Mn) [Initial concentration 5 ppm, 0.25 A]

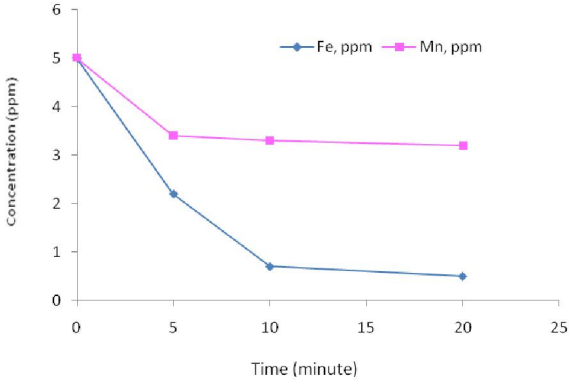

Fig.-4 : Removal efficiency of Fe and Mn by (UV) oxidation process from a mixture authentic solution of (Fe&Mn) [Initial concentration 5 ppm, 150W].

3.2. Effect of initial concentration on the removal of Fe and Mn by CPE

The presence of high concentration of dissolved metals into ground water gives an advantage for the treatment by electrochemical or combined CPE method, where the dissolved salts increase the electric conductivity and the ionic mobility of ions through the solution toward or backward both electrodes.

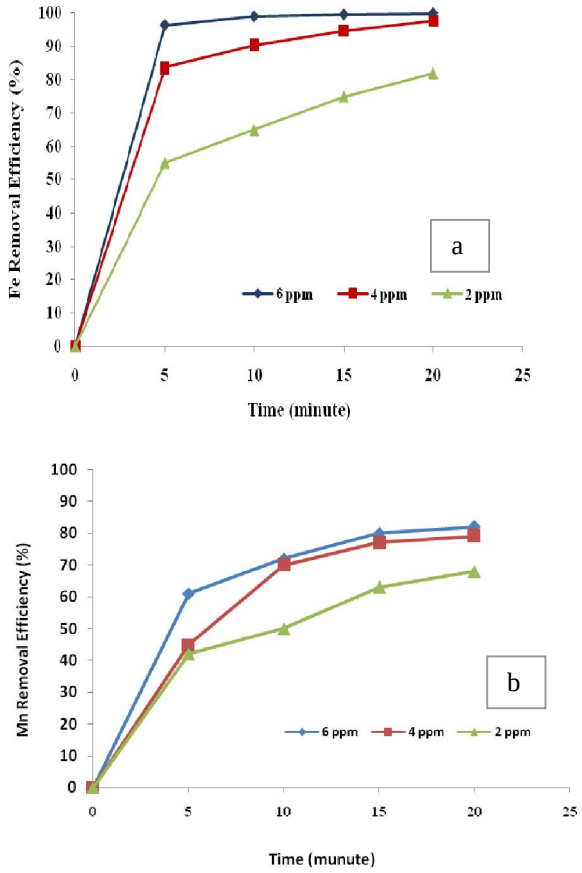

Fig. 5: Removal Efficiency of (a) Fe and (b) Mn from mixture solutions of different concentrations 2, 4, and 6 ppm by (CPE) method.

As shown in Fig. 5, the removal efficiency was highly affected by the initial concentrations of mixture solution Fe/Mn. Fig.3a showed the rapid and high removal efficiency of iron (R= 96 %) from high concentration 6 ppm of mixture Fe/Mn solution after 5 min, while after the same time, the treatment of less concentrations 2 and 4 ppm by CPE method showed a lower removal efficiencies 54 and 82 % respectively. Generally, the removal efficiency was enhanced with time in low concentration. Removal efficiency of manganese in a mixture solution Fe/Mn as shown in Fig. 5b revealed lower removal efficiencies than Fe, this is attributed to the high activation energy required for oxidation of Mn more than Fe, so removal of Mn needs a long time and high potential more than Fe, where R of Mn of concentration 6 ppm was 63 % and 89 % after 5 min and 20 min, respectively. While at low concentration 2 ppm 54% was achieved after 20 min.

It can be observed that the removal efficiency of high concentrations 6 ppm of dissolved Fe and Mn revealed better values more than less concentrations 2 ppm, where the high concentrations strengthen the electrochemical reactions and overcome the resistance of ionic mobility through the solution.

3.2. Effect of current on the removal of Fe and Mn by CPE

The applied electric current played a big role in the removal efficiency enhancement, where at high electric current there is a better condition for the electrolysis of water molecules to produce OH^- and anodic oxidation of aluminium to produce Al^{3+} . Finally, a high content of $Al(OH)_3$ flocs were formed which are a strong adsorbed electrostatic particles.

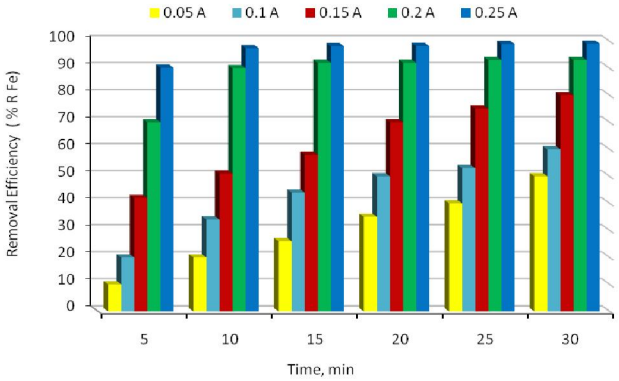

Fig.6 : Effect of current density on the removal efficiency of iron by CPE method at different time

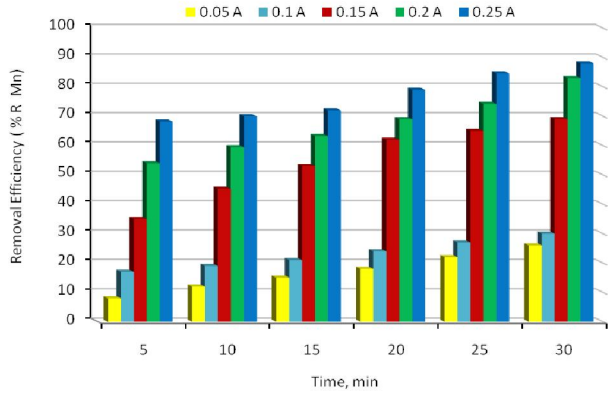

Fig.7 : Effect of current density on the removal efficiency of manganese by CPE method at different time

As shown in Fig.6, according to the applied electric current, the removal efficiency was varied , where at low applied electric current, a low values of % R was obtained, but by elongation of time, the removal efficiency was improved. At low time 5 min, the removal efficiency was less than 10% at low current 0.05 A, and it did not exceed 68 % by increasing current to 0.25 A. Removal efficiency was increased with time from 5 to 30 min, where at low electric current 0.05A the removal efficiency was 10 % after 5 min and 49 % after 30 min, while at high electric current 0.25 A, the removal efficiency was 89 % and 97% after 5 min and and 30 min, respectively. The study of removal of dissolved Mn by CPE method showed that the removal efficiency was less than Fe at the same concentration, pH, temperature in spite of incresing of electric current or time.

As shown in Fig.7, the removal efficiency of Mn at low current 0.05 A was less than 6 % and 24 % after 5 min and 30 min , respectively. While at higher current 0.25 A, the removal efficiency was 68 % and 87 % after 5 min and 30 min , respectively.

Thus, it was ascertained that the removal efficiency of iron was higher than manganese at the same conditions, this phenomenon is attributed to the high oxidation potential of Mn (1.05 V) more than iron (0.44 V). Moreover, because the oxidation of iron at low potential takes place before Mn, the major $Al(OH)_3$ flocs were consumed in the adsorption of Fe^{2+} ions before the adsorption of Mn^{2+}.

3.2. Effect of NaCl dose added on the removal of Fe and Mn by CPE

In both CPE and EC methods, the addition of salt to the solution such as sodium chloride has an important role to reduce the resistivity and improve the ionic mobility through the solution and hence electrochemical reactions are going forward.

Sodium chloride was added according to the limits of standard WHO values, where the concentration added was not exceed 45 ppm. Without addition of salts, the final pH was not varied where pH was 3 in the beginning of treatment.

An additional advantage of using NaCl is the bacteriacidal effect by the chlorination, where Iron and manganese bacteria are destroyed. Moreover, Hypochlorite and chlorate anions can be formed by oxidation of chloride ions, forming strong oxidizing agents in the solution as the following:

$$2Cl^- \longrightarrow Cl_2 + 2e^-$$
$$Cl_2 + H_2O \longrightarrow HOCl + Cl^- + H^+$$
$$HOCl \longrightarrow OCl^- + H$$
$$2HClO + OCl^- \longrightarrow ClO_3^- + 2\,HCl$$

Fig. 8 shows the effect of NaCl added where, as the dose of NaCl increased from 15 to 45 ppm, pH was varied from 5.5 to 7.2 and also current intensity was increased from 120 to 260 mA.

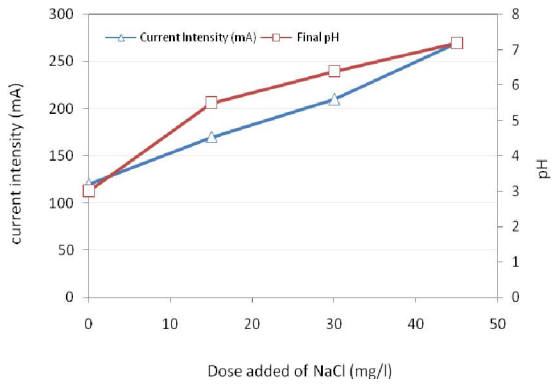

Fig.8: Effect of addition of NaCl on both current intensity and final pH

Furthermore, without addition of NaCl, the removal efficiency was very low (R=60%), while it was increased from 77 to 92 as the dose of NaCl added from 15 to 45 ppm. The removal efficiency was increased as the dose added of NaCl increased, this indicate the importance of salt addition to the solution when the conductivity is not adequate for the ionic transfer between the bulk solution and the surface of electrodes.

The presence of manganese into the solution of iron may behave as a catalyst for the oxidation of Fe^{2+} to Fe^{3+} and Mn^{2+} is oxidized to Mn^{4+} and co-precipitated together.

So, it can be considered that the presence of two or several types of dissolved metals is more applicable in the electrochemical or CPE methods, where the dissolved salts enhance the conductivity and hence, reduce the potential required. They behave as a catalyst and mediators for oxidation according to their redox potential.

4. Conclusion:

A combined photo electrochemical method was used for oxidation of soluble forms Fe^{2+} and Mn^{2+} to the insoluble forms Fe^{3+} Mn^{4+}. The combined method (CPE) revealed more efficiency than a sole EC and UV methods. The presence of both dissolved iron and manganese has the advantage of less resistivity of the solution of waste water. Low concentration of NaCl (15-45 ppm) was added to increase the conductivity and electric current beside its bactericide effect after electrolysis to chlorine. The effect of Fe^{2+} and Mn^{2+}

concentrations revealed that the higher concentration of dissolved iron and manganese ions, the higher removal efficiency obtained.

The study showed the rapid oxidation of Fe^{2+} more than Mn^{2+} due to the lower oxidation potential of iron than manganese and the catalytic oxidation behaviour of manganese may accelerate the oxidation of iron.

ABSTRACT: Acute and sub-acute toxicities of aqueous extract of Vitex doniana was carried out in rats. The LD50 following intraperitoneal administration estimated at 95% confidence interval was 980 mg/kg. The oral administration of the extract for 21 days at 50,100 and 200mg/kg had beneficial effects on the haematological parameters. There were significant ($P<0.05$) increases in red blood cell count (RBC) haemoglobine (HB) concentration and packed cell volume (PCV) values in treated rats. The treated animals had leucocytosis, which may be due to increase lymphocyte count observed. The i.p LD50 (980 mg/kg) indicated that the extract is moderately toxic, though the prolong oral administration of the extract under the condition of this study shows that the extract may be toxic at higher doses. Nevertheless, the extract appear to be more beneficial at lower doses and significantly ($p< 0.05$) improves RBC, HB and PVC values and this effect has potential application as anti-anaemic agent. This seems to provide justification for its use as anti-anaemic agent in African traditional medicine. [Journal of American Science. 2010;6(12):8-12]. (ISSN: 1545-1003).

1. INTRODUCTION

There is little doubt the positive roles that herbal medicines have and continue to have on the lives of Nigerians and of all people throughout the world. Herbs are known to have sustained mankind not only as sources of food but also as medicines and poisons utilized in various ways for varied purposes (Abdu-aguye, 1997). The use of medicinal plants in West Africa is probably as old as the duration of human settlement in the region.

Vitex doniana is one of the agents used for folklore medicinal purposes. Although parts of the plant are used by traditional healers for the treatment of various ailments (Akiniyi and Sultanbawa 1987) information on the toxicity of the extract in man animal are lacking. The present study investigated the acute and chronic toxicity of the aqueous extract of vitex doniana in rats. This is important since science requires the validation of drugs by medicinal practitioners and drug regulatory authorities demand that all potential drugs should pass through a rigorous series of study and scrutiny (Abdulrahman, 2004).

2. MATERIALS AND METHODS

2.1 Plant collection and preparation

The root-bark of *Vitex doniana* was collected from the outskirts of Maiduguri, Borno State and identified by Prof. S.S. Sanusi a plant taxonomist in the Biological Sciences Department of University of Maiduguri, Nigeria. The air-dried root-bark was subsequently ground into powder. Five hundred grammes (500g) of the powdered root- bark was exhaustively soxhlet extracted with distilled water (Mittal *et al.,* 1981 and WHO, 1992). The extract was concentrated *in vacuo* and stored at $4^{O}C$ until required. A fresh solution was prepared from the residue on each day of extract administration.

2.1.1 Animals

Rats of both sexes weighing between 94. 8-l 20 g was used for the experiments. They were obtained from a colony of rats maintained at the animal house of the Institute for Trypanosorniasis Research, Vom, Nigeria. The animals were housed in clean plastic cages and had access to feed (ECWA Feeds Nigeria LTD, Jos, Nigeria) and water ad libitum. They were allowed to acclimatize for two weeks in the Veterinary Physiology and Pharmacology Laboratory before the commencement of the studies. The animals were handled according to the international guiding principles for Biochemical Research (CIOMS, 1985) as certified by the Animal ethics committee of the Faculty of Veterinary Medicine, University of Maiduguri, Maiduguri, Nigeria.

2.2 EXPERIMENTAL PROCEDURE

2.2.1 Acute Toxicity of Aqueous Extract of *Vitex doniana* in Rats

Six groups of five rats each were used. The animals in groups A to E were dosed intraperitoneally (i.p.) with varying doses (400, 600, 1000, 1200 and 1600 mg/kg) of aqueous extract of *vitex doniana* while the rats in group F (control) received distilled water only by same route. The rats were allowed access to food and water *ad libitum* and observed over a period of 24 hours for clinical signs and death. The LD_{50} with 95% confidence interval was determined using the arithmetic methods of Aliu, and Nwude (1987).

2.2.2 Effect of Extract on Haematology

The rats (100) were separated into four equal groups. Animals in groups I-III were treated with 50, 100 and 200 mg/kg of the root-bark extract orally respectively for three (3) weeks, while group IV served as control and was given distilled water only by the same route. Clinical signs and haematological parameters were used to assess the effects of the various doses of the extract on the rats following prolonged administration. The animal were bled weekly and the blood used for the determination of the total red blood cell counts (RBC), packed cell volume (PCV), haemoglobin concentration (Hb), white blood cell counts (WBC) and differential leucocyte counts (DLC) using standard procedure (Kelly, 1977 and Pflanzer, 1990).

3 RESULTS AND DISCUSSIONS

3.1 Acute Toxicity Study

The dose of water root-bark extract of *Vitex doniana* that produced mortality was 3000 mg/kg, while the dose that causes 100% death was 1600 mg/kg (Table 1). The symptoms of toxicity observed with extract administration were dose dependent. Ten to fifteen minutes after administration of extract all the rats in the various groups were very weak. Those that received 600 mg/kg dose and above were deeply sedated and slept. Signs observed before death included loss of appetite, lethargy, paralysis of hind limb, which progressed to fore limbs, difficulties in respiration and coma. Mortality was recorded five hours after 1600 mg/kg extract of *Vitex doniana* treatment. The $LD_{5}o$ with 95% confidence limit of the extract was estimated to be 980 mg/kg.

Table 1. The dose of water root-bark extract of *Vitex doniana*

Group (n=5)	Extract dose (mg/kg)	Number of death	% Mortality
A	400.00	0	0.00
B	600.00	0	0.00
C	1000.00	3	60.00
D	1200.00	4	80.00
E	1600.00	5	100.00
F	Control (distilled water)	0	0.00

3.2 Effect on haematology

The rats treated with 100 and 200mg/kg of the water extract of Vitex dtmiana were depressed and less active compared to the rats in the other groups. The percentage weight gain decreased significantly with increase in extract dose (Table 2). Twenty one days following administration of the extract at 50, 100 and 200 mg/kg respectively to rats, there was a percentage weight gain of 56.0, 40.0 and 5.6 percent, Fourteen days following termination of treatment resulted in percentage weight gain of 52.3, 53.4 and 28.9 percent respectively in the group treated with 50, 100 and 200 mg/kg of Vitex doniana extract. The control group showed a percentage weight gain of 112.8 percent by the end of the experimentation period. The mean RBC counts of rats treated with the aqueous extract of the root back of vitex doniana orally for 21 days (3 weeks) are shown in Table 3. The RBC counts of rat treated with the extract increased significantly ($p<0.05$) and at 21 days of treatment the percentage increase were 93.3, 38.1 and 36.7 percent respectively in groups treated with 50, 100 and 200 mg/kg of the extract. RBC counts decreased with the termination of treatment but were still above the pre - treatment values.

The mean Hb concentration (Table 4) increased from the pretreatmcnt values of 1 1.4 ± 0.11, 12.2 ±0.17, 13.2±013g/dl respectively in groups treated with 50, 100, 200mg/kg of the root bark extract to 14.6 ± 0.13, 15.0 + 0.37 and 14.4 ±0.38g/dl at 21days of treatment. Following the termination of extract treatment there was gradual decrease in Hb

concentration.

The mean PVC value of rats treated with various doses of the root back extract of vitex doniana showed that at 21 days of treatment the PCV value were significantly (P<0.05) increased (36.4±0.13, 37.4±0.27 and 37.4±0.34, however at 14 days post-treatment the values decreased to 30.0 ±0.21, 28.0 ± 0. 44 and 29.0 ± 0.55 per cent in the groups treated with 50, 100 and 200 mg/kg of extract doses (Table 5).

Control = Given distilled water only

The total leucocyte (WBC) counts (Table 6) in rats treated with 100 and 200mg/kg doses of the water extract of Vitex doniana root-back were significantly increased ($P<0.05$) from day 14 of treatment. However, 14 days following withdrawal of the extract the high leucocyte values were reduced and were below the values for the control. The mean WBC counts of the control were statistically the same throughout the experimentation period. The differential leucocyte counts (DLC) of rats treated with various doses of the aqueous extract of root-bark of Vitex doniana showed some fluctuations. Following treatment with the extract, neutrophile significantly decreased ($P<0.05$), while the percentage lymphocytes increased significantly ($P<0.05$) when compared to the control. When treatment was withdrawn the percentage lymphocyte/neutrophil ratio improved. The percentage basophil, monocyte and eosinophil were also decreased following extract treatment but improved with the termination of treatment.

The LD50 of the aqueous extract of vitex doniana following intraperitoneal administration was 980 mg/kg using the arithmetic method of Aliyu and Nwude (1987).The calculated LD50 showed that the exlract is not very toxic. Clark and Clark (1977) were of the opinion that any substance whose LD50 in rats that falls between 50-500 mg/kg should be regarded as very toxic, while substances with LD50 above 500 mg/kg but below 1000 mg/kg are classified as being moderately toxic. The signs observed before death following the administration of Vitex doniana extract in this study included loss of appetite, paralysis of hind limbs. This progressed to fore limbs, dyspnea and corna. The toxicity observed may have resulted from the various organic chemicals like saponins, tannins, glycosides and phenolic compounds present in the extract (Abdulrahman, 2004).

The administration of the extract to rats for 21 days at 100 and 200 mg/kg doses produced depression, with the animals being less active. The percentage weight gain also decreased with increasing extract dose. The overall weight gain in the control rats was much higher than those of the extract treated animal. The decreased weight gain in extract treated rats may be due to decreased feed consumption since the animals were depressed and inactive. It also may be due to the indirect effect of saponin present in the extract. Saponins are known to cause bloating, thereby reducing the appetite of the treated animals (Trease and Evans, 1992).

The aqueous root-back extract of vitex doniana administered at various doses for 21 days to albino rats appears to have some beneficial effects on haematological parameters. The results of the haematological study revealed significant increase in RBC, Hb and PCV values of the treated rats (Table 3, 4 and 5) when compared with the control. The increase in haematological parameters also appears to decrease with increased concentration of the extract. This may be an indication that the extract could be more beneficial at low dosages than at higher concentration. The improvement of RBC, Hb and PCV values of treated animals is an indication of the anti-anaemic effect of the extract. Substance with anti-anaemic effect is known to stimulate increase production of RBC and improve the values of Hb and PCV (Brown, 1976). The higher percentage increase in RBC of rats treated with 50 mg/kg of the aqueous extract of vitex doniana compared to those of rats treated with 100 and 200 mg/kg of the extract could be an indication of the concentration of saponin absorbed following treatment.

It is suggested that the saponin component of the extract at 50 mg/kg would be very low to exact any appreciable effect after administration on RBC. However, at 100 and 200 mg/kg doses higher saponin contents occur and could be responsible for the lower percentage RBC values when compared to the group with 50 mg/kg dose. Saponins are known to cause lysis of the RBC and/or inhibition of blood cell synthesis (Effraim, et al., 1999 and Irvine, 1961). Furthermore orally administered saponins are known to indirectly affect the haematological parameters by

reducing the appetite of the animals (Trease and Evans, 1989). Interaction of saponins with micronutrients makes the nutrients unavailable and could also affect haemopoesis (Xing et al., 1995).

The improvement of RBC, Hb and PCV values of treated rats in this study may be an indication that the extract could be useful for treatment of anaemia, hence the justification for its use by natives.

The administration of the extract at various doses stimulated increased production of WBC significant ($P<0.05$) from day 14 of treatment. This could be a result of possible stimulation of immune system (Kashinath, 1990). Furthermore, reports have shown that persistent antigen load in the body results in lymphocytosis (Schalm, et al., 1975). Lymphocytosis may be primarily responsible for the increases in WBC count in the present study.

4. Conclusion

In conclusion, the aqueous extract although used by traditionalists for treatment of ailments in man was observed in rats under the conditions of this study to be toxic. Therefore, caution must be exercised in its usage especially in high doses. In low dosage the extract improved the haematological parameters and could be used to treat anaemia.

Evaluation of Antioxidant Effect of *Nigella sativa* oil on Monosodium Glutamate-Induced Oxidative Stress in Rat Brain

Neveen, A. Noor* and Iman, M. Mourad
Zoology department, Faculty of science, Cairo University, Egypt
*neveen.nour5@gmail.com

Abstract: Oxidative stress is a characteristic feature in a number of neurodegenerative disorders. The present study evaluates the antioxidant effect of *Nigella sativa* oil (NSO) in comparison to that of vitamin C (vit.C) in the cortex and hippocampus of rats pretreated with monosodium glutamate (MSG) as an animal model of oxidative stress. The intraperitoneally injected MSG (4 mg/g body wt.) for 6 consecutive days induced significant decreases in cortical and hippocampal catalase activity and cortical glutathione-S-transferase (GST) activitity and glutathione reduced (GSH) level after 4 weeks. Oral administration of vit.C (200 mg/kg) to stressed rats restored catalase activity, increased GST activity and decreased malondialdehyde (MDA) level after 4 weeks in the cortex. Oral administration of NSO (1 ml/kg) for 4 weeks to MSG-treated rats increased cortical and hippocampal catalase activity and cortical GSH content but significantly inhibited GST activity and increased MDA level in the cortex. Combined administration of vit.C and NSO revealed nonsignificant changes in cortical and hippocampal parameters, as compared to control levels, except for a significant decrease in hippocampal GSH content. In conclusion, although there are some antioxidant effects of NSO, the pro-oxidant effect of NSO cannot be ruled out in the present MSG model of oxidative stress. [Journal of American Science. 2010;6(12):13-19]. (ISSN: 1545-1003).

Key words: Oxidative stress, monosodium glutamate, vitamin C, *Nigella sativa* oil, cortex, hippocampus.

1. Introduction

Oxidative stress is a characteristic feature in a number of neurodegenerative disorders such as stroke, Parkinson's disease and Alzheimer's disease.[1,2] The brain is particularly vulnerable to oxidative stress injury because of its high rate of oxidative metabolic activity, high content of polyunsaturated fatty acids, relatively low antioxidant capacity, the abundance of redox-active transition metal ions,[3] and non-replicating nature of its neuronal cells.[4]

Certain brain regions are highly enriched in non-heme iron, which is catalytically involved in the production of oxygen free radicals,[5] thus increasing the risk of neurodegenerative disease. It has been shown that the regions like cortex and hippocampus are more susceptible to oxidative damage when compared to cerebellum. [6,7]

Reactive oxygen species (ROS) are generated continuously in nervous system during normal metabolism and neural activity. When the balance between ROS (for example: superoxide, hydrogen peroxide, hydroxyl radicals and singlet oxygen) and antioxidant system is lost, oxidative stress results.[8,9]

In order to scavenge ROS, different defense systems exist in the brain, such as enzymatic (superoxide dismutase, glutathione peroxidase and catalase), non enzymatic (glutathione and uric acid) and dietary (vitamins A, E and C, β – carotene, quinones and flavons) antioxidants. If ROS are not effectively eliminated, they can cause peroxidation of cell membrane phospholipids, proteins (receptors and enzymes) and DNA.[9]

Monosodium glutamate (MSG), the sodium salt of glutamate, is commonly used as a flavor enhancer,[10-12] to increase palatability and food selection in a meal.[13] Many people throughout the world ingest large doses of MSG and in many countries there are no limitation on the amount of MSG that can be added to food.[14]

Glutamate is the main excitatory neurotransmitter in rat brain.[15] It has been shown that MSG administration during neonatal period increase lipid peroxidation in the midbrain of adult rats.[16] Bawari *et al*[16] suggested that oxidative stress caused by excitotoxin- generated free radicals sustained and progressed during development until adulthood. In addition, Park *et al*.[17] reported that MSG could impair memory retention and induce damage in the hypothalamic neurons in mice. Moreover, alteration due to MSG in mitochondria lipid peroxidation and antioxidant status in different brain regions is well documented.[18]

Vitamin C (ascorbic acid) is an essential micronutrient required for normal metabolic functioning of the body. It is a well known antioxidant in animal tissues.[19] It decreases the adverse effects of ROS implicated in chronic diseases including neurodegenerative diseases.[20] Neurons maintain relatively high intracellular concentrations of ascorbic acid.[21] The reduced form of the vitamin C (ascorbate) is an especially effective antioxidant owing to its high

electron – donating power and ready conversion back to the active reduced form,[7] in addition to the stability and low reactivity of the ascorbyl radical formed when ascorbate scavenges a reactive oxygen or nitrogen species.[22]

Nigella sativa, commonly known as black seeds, belongs to the botanical family of *Ranunculaceae*. In recent years, the plant has been investigated to justify its broad traditional therapeutic value.[9] Many favorable biological properties of *Nigella sativa* have been reported such as anti-inflammatory,[23] antioxidative,[24,25] antitumour,[26] antiulcerogenic,[27] and hepatoprotective,[28] properties. The biological activity of *Nigella sativa* seeds is attributed to its essential oil components.[23]

The aim of the present study is to evaluate the antioxidant properties of *Nigella sativa* oil (NSO) in comparison to that of the established antioxidant, vit. C and whether the combination of both treatments could increase the effect of each other or not. The activities of catalase and glutathione-S-transferase (GST), as well as, the levels of glutathione reduced (GSH) and malondialdehyde (MDA) were measured in the cortex and hippocampus of rats pre-treated with monosodium glutamate (MSG) as an animal model of oxidative stress and after treatment with vit. C and/or NSO.

2. Materials and Methods:

Animals

Male albino rats (*Rattus norvegicus*) weighing 120-180 g were used as experimental animals. The animals were obtained from animal house of the National Research Center. They were maintained on stock diet and kept under fixed appropriate conditions of housing and handling. All experiments were carried out in accordance with research protocols established by the animal care committee of the National Research Center, Egypt.

Chemicals

L- glutamic acid sodium salt monohydrate (MSG), was purchased from WINLAB, U.K. and vitamin C **(**L-ascorbic acid) was from SAS chemicals co. India. Phosphate buffer and reagent kits were purchased from Bio-diagnostic Company, Egypt. *Nigella sativa* oil was obtained by pressing of seeds on cold to keep the active constituents unaltered.

Experimental design

The animals were divided into 5 groups. Animals of group (1) served as control and were daily administered distilled water throughout the experimental protocol. Animals of groups 2, 3, 4 and 5 were injected intraperitoneally (i.p.) with 4 mg/g body wt. MSG for six consecutive days.[29] At the 7th day, animals of the 2nd, 3rd, 4th and 5th groups were daily administered orally with distilled water, vit.C (200 mg/kg)[30], NSO (1 ml/kg)[31] and both vit C (200 mg/kg) and NSO (1 ml/kg) respectively, for 4 weeks.

Handling of tissue samples

Both treated and control animals were sacrificed after being fasted overnight. The brain of each animal was quickly removed and rapidly transferred to an ice-cold Petri dish and dissected to obtain the cortex and hippocampus.[32,33] Each brain area was weighed and frozen until analyzed.

The hippocampus and cortex were homogenized in 4 and 6 ml of ice cold phosphate buffer (50 mM pH 7.4, 0.1% tritonX and 0.5 mM EDTA), respectively. The homogenate was centrifuged at 1753 g for 15 minutes at 4ºC using a high speed cooling centrifuge (Type 3K-30, Sigma, Germany). The clear supernatant was separated and used for analysis. Catalase activity,[34,35] GST activity,[36] GSH level,[37] and Thiobarbituric acid reactive substances (expressed as malondialdehyde, MDA content),[38] were determined by using reagent kits.

Statistics

The data were expressed as mean ± SEM. Statistical analysis was performed using one-way analysis of variance (ANOVA) followed by Bonferroni post hoc test for multiple comparisons. Analysis was made using the SPSS statistical software. The *p*-values less than 0.05 were considered statistically significant. Percentage difference representing the percent of variation with respect to the control was calculated.

% difference = (treated mean–control mean/control mean)×100.

3. Results

The data represented in Table (1) showed a significant decrease in cortical and hippocampal catalase activity in MSG-injected group as compared to control group. These decreases in the enzyme activity persisted after treatment of MSG-injected rats with vit.C, being nonsignificant and significant in the cortex and hippocampus, respectively as compared to control animals. However, the oral administration of NSO to MSG-treated rats induced a significant increase in the enzyme activity in both cortex and hippocampus in comparison to the control, MSG and vit.C-treated groups. The combined administration of vitamin C and NSO to MSG-treated rats returned the enzyme activity to nearly control values in the cortex and hippocampus.

Regarding GST activity (Table 2), the present data showed that the cortical GST activity decreased significantly after MSG injection. The oral administration of vit. C alone and vit. C+ NSO to MSG-treated animals induced significant and

nonsignificant increases in GST activity, respectively in comparison to control group. Meanwhile, the oral administration of NSO to MSG-treated rats did not alter the significant decrease in the enzyme activity due to MSG injection alone. On the other hand, GST activity in the hippocampus did not show any significant changes during the experimental period.

As shown in Table (3), the cortical GSH level decreased significantly after MSG treatment. However, this decrease in GSH level persisted significantly after vitamin C administration in comparison to the control. The oral administration of NSO alone and vit. C+NSO induced significant and non significant increases in GSH levels, respectively relative to the control group. In contrast to the cortex, the data did not record any significant changes in the hippocampal GSH content after MSG injection. The combined administration of both vit. C and NSO showed a significant decrease in the GSH content as compared to the control value.

Data in Table (4) revealed a nonsignificant change in the cortical lipid peroxidation after MSG injection as determined by MDA formation. However, vit. C administration to MSG-injected rats induced a significant decrease in MDA level. Meanwhile, NSO administration provoked a significant increase in MDA level as compared to control, MSG and vit.C-treated groups. The combined administration of vit.C and NSO to MSG-treated rats did not induce any significant change in MDA level in relation to control and MSG-treated groups. MDA content in the hippocampus presented a significant decrease due to MSG injection. Administration of vit.C did not change the decrease in MDA level obtained as a result of MSG injection alone. Nonsignificant changes were observed in MDA level as a result of NSO and vit.C+NSO treatments to MSG-treated rats as compared to control group.

Table (1): Effect of daily oral administration of vit. C and/or NSO on catalase activity (U/g tissue) in the cortex and hippocampus of rats treated with MSG.

4. Discussion:

The present data showed that the i.p. injection of MSG for 6 consecutive days to adult rats induced significant decreases in cortical and hippocampal catalase activity as well as cortical GST activity and GSH content after 4 weeks, as compared to control rats. Singh *et al*.[29] reported that repeated monosodium glutamate doses showed prolonged and delayed effects on the mitochondrial free radical scavenger system and the consequential membrane damage as inferred from altered levels of Mn-superoxide dismutase (Mn-SOD), catalase, glutathione peroxidase (GPx), glutathione reduced (GSH), lipid peroxidation and uric acid content in mitochondria in different brain regions of male rats.

Thus, it could be suggested that the i.p. injection of MSG administration may provide a successful model of oxidative stress and hence may be used to investigate the antioxidant properties of several natural products.

Decreased catalase activity has been shown to be associated with oxidative stress in brain regions.[39,40] It functions to catalyze the decomposition of H_2O_2 to water and oxygen.[41]

Singh *et al*.[29] investigated the effect of i.p. MSG administration for 6 consecutive days on mitochondrial lipid peroxidation and antioxidant status in adult rat cerebral hemisphere after 30 and 45 days. In the present study, the effect of MSG is investigated in the cerebral cortex and hippocampus of adult male rats and the decrease in catalase activity and glutathione reduced content in the cerebral cortex is in accordance with the results of Singh *et al*.[29] in the cerebral hemisphere. Thus, the cerebral cortex could be the target area for MSG effects in the cerebral hemisphere. Furthermore, the present results agree with the more recent study of Farombi and Onyema,[12] who indicated a decrease in brain GSH content and catalase activity after i.p. injection of adult rats with MSG for 10 days.

Kono and Fridovich,[42] suggested that increased production of free radicals may lead to depletion or inactivation of catalase enzyme. Further reports have shown that mitochondria generate superoxide and related ROS during glutamate receptor over activation.[43,44] During oxidative stress, the superoxides destroy the iron-sulfur centers and thereby irreversibly deactivate the iron containing enzymes.[45,46]

Thus, the decrease in cortical and hippocampal catalase activity in MSG-injected group may be due to depletion or irreversible deactivation of the catalase enzyme by superoxide generation.

GSH (a tripeptide comprised of glutamate, cysteine and glycine) plays a critical role in protecting cells from oxidative stress and xenobiotics. GSH can function as an antixodant in many ways. It can react non-enzymatically with superoxide,[47] nitric oxide,[48] hydroxyl radical,[49] and peroxynitrite.[50] Thus, it functions directly as a free radical scavenger. Therefore, the decrease in cortical GSH content observed in the present study may be due to its consumption in scavenging the generated ROS.

Glutathione-S-transferases (GSTs) are a family of enzymes that catalyze the addition of the tripeptide glutathione to endogenous and xenobiotic substrates which have electrophilic functional groups.[51] Subsequently, the observed decline in the cortical GST activity, in the present study, may be ascribed to the reduction in the level of its substrate, GSH.

Lipid peroxidation is an autocatalytic mechanism leading to oxidative destruction of cellular membranes.[52] MDA is the major

aldehyde metabolite of lipid peroxidation.[53] The present nonsignificant change in cortical MDA level in MSG-treated group may confirm the delayed effect of MSG exposure and this result is in line with the results of Singh *et al*.[29] as they found significant increase in the level of mitochondrial lipid peroxidation in the cerebral hemisphere at the 45th day of MSG administration and not at the 30th day.

In the present study, it was found that the oral administration of vit. C to MSG-injected rats restored cortical catalase activity to nearly control level, whereas it reversed the significant decrease in cortical GST activity due to MSG injection to a significant increase (+66.67%). Meanwhile, GSH content in the cortex was not affected by vit. C treatment to stressed rats. However, cortical MDA level was decreased significantly after vit. C administration as compared to control group.

Vitamin C is a well known antioxidant and has been shown to protect various tissues against the damage caused by ROS.[19] In addition, many studies have indicated that vitamin C may be of benefit in chronic diseases such as cardiovascular disease, cancer and cataract, probably through antioxidant mechanisms.[54] Moreover, Huang *et al*.[55] reported that vitamin C (500 mg ascorbate/day) supplementation in non-smokers reduced lipid peroxidation.

Therefore, the present increase in GST activity and restoration of catalase activity to nearly control level in addition to the decrease in MDA content in the cortex could indicate that the antioxidant properties of vit. C may be mediated on one hand by an increase in antioxidant enzymatic activity and by a decrease in lipid peroxidation on the other hand.

Within the brain, ascorbate levels are not homogenous; in humans, the highest levels are found in the hippocampus, amygdala, and hypothalamus.[56] Therefore, the mild oxidative state observed, in the present study, in the hippocampus due to MSG administration may be due to the inherent high content of vit. C in this brain area.

Treatment of oxidatively stressed rats, in the present study, with NSO increased catalase activity in the cortex and hippocampus as well as the GSH content in the cortex. Meanwhile, a significant inhibition of cortical GST activity accompanied by an increase in MDA was obtained.

Thymoquinone (TQ) is the main constituent of NSO. It was intensively studied and ascribed to possess antioxidant properties.[57] On the other hand, Khader *et al*.[58] reported that TQ like other quinone compounds, can be considered to be a redox-cycler which is metabolized *in vitro* to hydroquinones or semiquinone radicals by cellular oxidoreductases leading to the production of ROS. This may explain the present increase in cortical MDA content after treatment of MSG-injected rats with NSO.

It has been reported that the exposure to ROS and nitrogen species may raise the GSH content by increasing the GSH synthesis rate.[59,60] Thus, the increase in cortical GSH content may be an attempt to counteract the increase in MDA level as a defense mechanism by brain cells against free radicals generation.

Cortical and hippocampal catalase activity showed significant increases due to NSO treatment of stressed rats. In agreement with the present result, Kanter *et al*.[61] found that NSO prevented inhibition of catalase activity following experimental spinal cord injury in rats. Moreover, Al-Majed *et al*.[62] found that thymoquinone is beneficial in restoring declined hippocampal SOD and catalase due to ischemia insult.

Although, there are some antioxidant effects of NSO which are represented in the increase of GSH content and catalase activity, the pro-oxidant effect of NSO cannot be ruled out in the present MSG model of oxidative stress.

Vitamin C is considered the most important water-soluble antioxidant in extracellular fluids,[63] and must have neutralized the ROS generated in the aqueous phase before lipid peroxidation was initiated.[12]

Therefore, it could be concluded that the combined administration of vitamin C and NSO to stressed rats, in the present study, may represent a synergestic antioxidant effect between the water soluble vit. C and lipid soluble components of NSO. Moreover, vit. C may counteract the pro-oxidant effects of NSO. However, further studies are recommended for the evaluation of the antioxidant properties of NSO in different models of oxidative stress.

Modulating Effect of Carvedilol on Doxorubicin-Induced Cardiomyopathy and Hepatic Damage

Safinaz S. Ibrahim*, Maged A. Barakat and HebaTullah S. Helmy

Biochemistry Department, Faculty of Pharmacy, Cairo University, Cairo, Egypt
* dr_safinaz_747@hotmail.com

Abstract: Background: Doxorubicin is an anthracyclin antibiotic that is considered as one of the most effective antitumor agents. The clinical use of doxorubicin soon proved to be hampered by such serious problems as hepatotoxicity and most notably cardiomyopathy. Objectives: The current study aims at evaluating the efficiency of carvedilol as an adjuvant therapy with doxorubicin to protect against doxorubicin - induced cardiomyopathy and hepatic damage. Materials and Methods: Animals were divided into normal group and doxorubicin -treated group injecting doxorubicin as a dose of 2.5 mg/kg/twice weekly/ 3 weeks. Doxorubicin - treated animals were divided into two groups, one kept without further treatment (doxorubicin group) and second group, (doxorubicin + carvedilol), received carvedilol 1mg/kg/ 7 times over a period of 4 weeks including a dose before doxorubicin 1st dose. Creatine phosphokinase, lactate dehydrogenase, as cardiac damage markers, and alanine aminotransferase, as indicator of hepatic damage, were measured. Malondialdehyde and nitric oxide levels, as cardiac oxidative status indices, glutathione content, glutathione peroxidase, glutathione-S–transferase and superoxide dismutase activities, as measures for cardiac antioxidant capacity, were also investigated. Histopathological changes in cardiac and hepatic tissues of all groups were examined. Results and Conclusions: Our results revealed that doxorubicin caused oxidative stress which plays a major role in doxorubicin -induced cardiomyopathy and hepatic damage. Co-administration of carvedilol in concomitant with doxorubicin caused protection against doxorubicin–induced cardiomyopathy; however, it augmented doxorubicin -induced hepatic damage. Histopathological examination of cardiac and hepatic tissues supported the previous biochemical results. [Journal of American Science. 2010;6(12):20-32]. (ISSN: 1545-1003).

Keywords: Doxorubicin, carvedilol, cardiomyopathy, hepatic damage.

1. Introduction

Almost all clinically used antitumor drugs exhibit toxic side effects affecting heart function. Because of cardiotoxicity during anticancer chemotherapy, effective doses of cytostatics have to be limited, which may worsen antitumor efficacy. Doxorubicin (Dox) is an anthracyclin antibiotic that is considered as one of the most effective antitumor agents. Dox is an essential component of treatment of breast cancer (1), soft tissue sarcomas (2) and many other cancers (3). The immense value of Dox in treating a variety of malignant conditions is unquestioned. However, the clinical use of Dox soon proved to be hampered by such serious problems as the development of resistance in tumor cells (4) and toxicity in healthy tissues, in the form of central nervous system toxicity (5), nephrotoxicity (6) and most notably in the form of cardiomyopathy and congestive heart failure (7). These adverse effects of the drug can preclude its use in some patients and limit the duration of its use in many others (8).

Carvedilol is non cardioselective β-blocker which lacks intrinsic sympathomimetic activity. In addition, it has blocking effects at vascular α1-receptors, antioxidant, and calcium antagonist properties (9). The antioxidant activity of carvedilol was examined in a variety of *in vitro* and *in vivo* assay systems, including physicochemical, biochemical and cellular models. The data indicate that carvedilol prevents electron adduct formation in both aqueous or lipid environments containing either superoxide- or hydroxyl-radical generating systems (10). Furthermore, carvedilol and several of its metabolites are as effective in inhibiting lipid peroxidation in brain and heart membranes (11). The cardioprotective effect of carvedilol has been shown in a variety of *in vitro* and *in vivo* models. The efficacy of carvedilol has been observed with anthracyclin cardiomyopathy and ischemia/ reperfusion (12). One most likely mechanism of cardioprotection by carvedilol is the antioxidant effect (13-15).

The current study aims at evaluating the efficiency of carvedilol as a protective agent against cardiomyopathy and hepatic damage induced by Dox.

2. Materials and Methods:

A- Animals:

We used a total of 32 male albino rats of the Wister strain, weighing 170-200 g, that were obtained from the central animal facility at the Faculty of Pharmacy, Cairo University, Cairo, Egypt. All rats were housed in a room with a controlled environment,

at a constant temperature of 23 ± 1^0 C, humidity of 60% ± 10%, and a 12 hr light/dark cycle. The animals were housed in groups and kept at constant nutritional conditions throughout the experimental period. The experimental protocols were approved by the Ethical Committee of Faculty of Pharmacy, Cairo University.

B- Drugs and chemicals:

Doxorubicin HCL was obtained from Pharmacia & Upjohn, Milan, Italy. Carvedilol was obtained from Cadila Pharmaceuticals Limited, India. Other chemicals in the experiments were of analytical pure grade and supplied by British Drug House (BDH, UK) and Sigma Chemical Company (USA).

C- Experimental design:

Animals were divided into a normal control group (10 rats), receiving the appropriate volume of saline i.p, and Dox-treated group (22 rats). Dox was dissolved in saline and injected i.p. as total cumulative dose of 15 mg/kg, divided into 6 equal doses, each of 2.5 mg/kg. They were injected twice weekly/ 3 weeks (16). The Dox-treated animals were divided into two groups, one was kept without further treatment termed Dox-group(12 rats), and a second group (10 rats), termed Dox + carvedilol group, received carvedilol as an i.p dose of 1mg/kg / 7 times over a period of 4 weeks including a dose before the 1st Dox dose (17).

D- Serum and Tissue sampling:

Twenty four hours following the last Dox injection, rates were sacrificed by decapitation. A blood sample of each animal was collected into a dry centrifuge tube. Serum was separated by centrifugation at 3000 r.p.m/15 minutes and used to determine creatine phosphokinase (CPK), lactate dehydrogenase (LDH) and alanine aminotransferase (ALT). Serum CPK activity was determined using a kit provided by STANBIO, USA (18). Serum LDH activity was determined using a kit provided also by STANBIO, USA (19). Serum ALT activity was determined, using kit provided by Quimica Clinica Aplicada, Spain (20).

For determination of the biochemical parameters and histopathological changes, hearts and livers were removed by dissection, washed by ice-cold saline and blotted between filter papers.

Histopathological study:

Samples were taken from hearts and livers of rats in different groups and fixed in 10% formol saline for 24 hours. Washing was done in tap water, then serial dilutions of alcohol (methyl, ethyl and absolute ethyl) were used for dehydration. Specimens were cleared in xylene, embedded in paraffin at 56^O C in hot air oven for 24 hours. Paraffin bees wax tissue blocks were prepared for sectioning at 4 microns thickness by sledge microtome. The obtained tissue sections were collected on glass slides, deparaffinized and stained by hematoxylin and eosin stains (21) for histopathological examinations using light microscope.

Biochemical parameters:

The remainder of heart tissue of each rat was weighed and homogenized in ice-cold saline for 1 minute, using an ice-cold Potter Elvejhem glass homogenizer, forming 10% w/v homogenate.

Estimation of cardiac glutathione (GSH) content

A portion of homogenate was mixed with ice-cold 7.5% sulfosalicylic acid in a ratio 1:1 and centrifuged at 3000 r.p.m/15 minutes. The resulted supernatant was used for the determination of GSH (22), depending on the reaction between GSH and 5, 5'- dithio-bis, 2-nitrobenzoic acid to yield a stable yellow colour which can be measured colourimetrically.

Estimation of cardiac malondialdehyde (MDA) level:

Another portion of homogenate was mixed with ice-cold 2.3% KCL (1:1), centrifuged at 3000 r.p.m/15 minutes. The level of MDA was determined in the supernatant depending on measuring the coloured complex formed between thiobarbituric acid reagent and MDA in acidic medium (23).

Preparation of cytosolic fraction for the estimation of glutathione peroxidase (GPx), glutathione-S–transferase (GST) and superoxide dismutase (SOD) activities:

Part of the homogenate was mixed with equal volume of ice-cold Tris- EDTA buffer (pH=7.6), centrifuged at 39.000 r.p.m/4ºC/ 20 minutes. The resulted supernatant was used for the determination of GST; GPx and SOD activities. Determination of GST activity (24, 25) depends on the ability of GST to catalyze the formation of GSH- adduct with 1-chloro-2,4- dinitrobenzene(CDNB). This adduct was measured by noting the net increase in absorbance at 340 nm. Determination of GPx activity (26) is based on following the rate of oxidation of GSH by H_2O_2 in the presence of GPx. Oxidized GSH was determined by following up the decrease in absorbance of the reaction medium at 340 nm, as NADPH was converted to NADP. SOD activity was determined (27) depending on the fact that the spontaneous autoxidation of pyrogallol, at alkaline pH less than 9.5, produces superoxide anion, which in turn enhances further oxidation of pyrogallol with a resultant increase in the absorbance at 420 nm. The

presence of SOD in the reaction medium inhibits pyrogallol autoxidation by scavenging the formed superoxide anion. Protein content of the supernatant was determined (28) using bovine serum albumin as standard.

Estimation of nitric oxide (NO) (NO2- / NO3-):

An aliquot of the homogenate was centrifuged at 17.000 r.p.m/ 4ºC/ 20 minutes. The resulted supernatant was used for the determination of NO. Determination of NO radical itself is difficult because of its radical nature and very short half-life. Therefore, determination of the stable oxidation products of NO radical, nitrite ($N0_2^-$) and nitrate ($N0_3^-$) concentrations is used as a measure for the production of NO radical. NO content was determined (29, 30) depending on the colourimetric detection of nitrite with Griess reagent after the enzymatic reduction of nitrate to nitrite using nitrate reductase enzyme. The Griess reaction involves the reaction of nitrite with sulfanilamide in an acidic solution to yield a diazonium salt, followed by coupling with N-(1-naphthyl) ethylenediamine to yield a colored azo dye that can be measured colourimetrically at 540 nm.

Statistical analysis

Results were analyzed statistically by one-way analysis of variance (ANOVA test) with subsequent multiple comparisons using Tukey test. Differences were considered statistically significant at p less than 0.05. Results are presented as the mean ± standard error of the mean (SEM), with the number of observations (n) given in parentheses. All data obtained were submitted to a computerized statistical treatment using SPSS statistical package, version 17. Tables were represented by Microsoft Excel computer program.

3. Results:

Effect of doxorubicin (Dox), separately or in combination with carvedilol, on serum lactate dehydrogenase (LDH) and creatine phosphokinase (CPK) activities in rats:

Results of table (1) revealed that Dox caused significant increase in serum levels of LDH and CPK amounting to 182.4% and 183.6%, respectively, as compared to the normal values. Carvedilol co-administration caused normalization of LDH as well as significant decrease in CPK serum levels reaching 119.4% of the control value.

Effect of doxorubicin (Dox), separately or in combination with carvedilol, on cardiac malondialdehyde (MDA) and nitric oxide (NO) levels in rats:

Table (2) illustrated that, Dox caused significant increase in MDA and NO levels amounting to 183.36% and 177.7%, respectively, of the control values. Carvedilol co-administration caused normalization of both MDA and NO levels.

Effect of doxorubicin (Dox), separately or in combination with carvedilol, on cardiac glutathione (GSH) content, glutathione peroxidase (GPx), glutathione-S-tranferase (GST) and superoxide dismutase (SOD) activities in rats:

As shown in table (3), Dox administration caused a significant decrease in cardiac GSH level reaching to 64% of the normal value. Co-administration of carvedilol significantly raised GSH content to about 92% compared to the control value. Results of the same table showed significant increase in cardiac activities of GPx, GST and SOD in the Dox-treated rats amounting to 410%, 184% and 225%, respectively, compared to the normal values. Co-administration of carvedilol produced normalization of GST and significant decrease in GPx and SOD activities, accounting to157%, 151% respectively, compared to the control values.

Effect of doxorubicin (Dox), separately or in combination with carvedilol, on serum alanine aminotransferase (ALT) activity in rats:

Results of table (4) revealed that Dox administration caused significant elevation in the serum ALT level to reach 118% of the normal value. Co-administration of carvedilol caused significant elevation in the same enzyme level compared to both Dox-treated and normal group values, reaching 128.8% of the normal control level.

Histopathological examination of the cardiac tissues:

Histopathological examination of the control cardiac section showed normal structure of the myocardium (Figure 1). Sections obtained from rats administrated Dox showed hyalinization the myocardial bundles associated with either inflammatory cells infiltration only or inflammatory cells and oedema in focal manner in between the bundles (Figures 2, 3). With respect to cardiac sections obtained from rats administrated combined therapy of Dox+ carvedilol, no histopathological alterations, compared to normal section, were observed (Figure 4).

Histopathological examination of hepatic tissues:

Examination of liver sections of the different groups illustrated that liver tissue of the normal group showed hepatic lobules with normal architecture (Figure 5). In case of liver sections of rats

administrated Dox, congestion was observed in the central vein in addition to kupffer cells proliferation in diffuse manner between the fatty degenerated hepatocytes (Figures 6, 7). In rats administrated Dox + carvedilol, livers were most affected, congestion was observed in both the central and portal veins associated with diffuse kupffer cells proliferation in between the hepatocytes. Moreover, the portal area showed inflammatory cells infiltration (Figures 8, 9).

Table (1): Effect of doxorubicin, separately or in combination with carvedilol, on serum lactate dehydrogenase (LDH) and creatine phosphokinase (CPK) activities in rats:

Group	LDH(U/L)	CPK(U/L)
Control	581.17±13 (9)	616.5±20.8 (9)
Doxorubicin	1060.2±29.4 [a, c] (10)	1131.9±32 [a, c] (10)
Doxorubicin + Carvedilol	598.5±23.6 [b] (9)	736.3±41.2 [a, b] (9)

Values are given as means ± SEM (No. of observations are given in parentheses)
a: Significant difference from control group at P<0.05
b: Significant difference from doxorubicin group at P<0.05
c: Significant difference from doxorubicin+ carvedilol group at P<0.05

Table (2): Effect of doxorubicin, separately or in combination with carvedilol, on cardiac malondialdehyde (MDA) and nitric oxide (NO) levels in rats:

Group	MDA nmole /gm tissue	NO nmole / gm tissue
Control	57.6±1.9 (9)	175±11 (9)
Doxorubicin	105.8±4.6 [a, c] (10)	311±18 [a, c] (10)
Doxorubicin + Carvedilol	59.1±3.5 [b] (9)	184±8 [b] (9)

Values are given as means ± SEM (No. of observations are given in parentheses)
a: Significant difference from control group at P<0.05
b: Significant difference from doxorubicin group at P<0.05
c: Significant difference from doxorubicin + carvedilol group at P<0.05

Table (3): Effect of doxorubicin, separately or in combination with carvedilol, on cardiac glutathione (GSH) content, glutathione peroxidase (GPx), glutathione-S-tranferase (GST) and superoxide dismutase (SOD) activities in rats:

Group	GSH µg/gm tissue	GPx nmoles /min /mg protein	GST nmoles /min/mg protein	SOD U/mg protein
Control	64.3±1.5 (9)	33.6±1.9 (9)	29.6±1.0 (9)	21.3±1.4 (8)

4. Discussion:

Doxorubicin (Dox) is a potent anticancer drug that is used in treating both hematological and solid tumors. However, severe cardiomyopathy and heart failure have been observed in Dox-treated cancer patients, which limit the clinical dosage of Dox in cancer treatments (31). Oxidative stress is generally held as the mediating mechanism in the multiple biological processes leading to Dox cardiomyopathy, e.g. redox mediated superoxide radical production (32), tissue-specific mitochondrial DNA damage (33) and disturbances of calcium (34) or iron (35). Results of the present study revealed that 15 mg/kg total cumulative dose of Dox induced cardiomyopathy and hepatotoxicity manifested biochemically as significant increase in serum levels of LDH; CPK and ALT. In addition, Dox caused elevation in cardiac NO, MDA levels, SOD, GPx, GST activities, and reduction in GSH content. Histopathological examination of heart and liver sections of Dox-treated animals supported these biochemical results.

Results of table (1) revealed that Dox caused significant increase in the serum levels of LDH and CPK, considered as important markers of cardiac injury. Many previous studies have demonstrated similar elevations in cardiac enzymes activities in rats following Dox administration (36, 37). Leakage of cardiac enzymes directly correlates to ultrastructure damage of heart tissues examined by electron microscope. Dox-induced cardiomyopathy is mainly attributed to increase oxidant production in heart. Dox may undergo a one-electron reduction through a metabolic activation by NADPH-cytochrome P-450 reductase. This reduction leads to the formation of the free radical semiquinone, which in turn can produce a variety of active ROS/RNS, including H2O2, •OH and ONOO (38). These species can attack the cardiomyocyte membrane, damage several macromolecular cellular components, cause protein and lipid peroxidation and consequently lead to cardiomyocyte apoptosis or death (39). This effect would compromise the cellular integrity and potentially account for the leakage of heart enzymes, LDH and CPK, through the membranes and increase their serum activity.

Regarding the effect of Dox administration on cardiac oxidative status, Dox caused significant increase in MDA level (table 2), which is in agreement with previous study (40) who used similar drug regimen. This elevation might be attributed to Dox mediated oxidative stress. The first targets of Dox-mediated free radical damage are various cellular membranes, which are rich in lipids prone to peroxidation. This radical damage results in production of many relatively stable and highly toxic aldehydes, such as MDA. These aldehydes can easily diffuse within the cell, or even cross the plasma membrane, and attack macromolecular targets far from where they were generated and thus act as "second cytotoxic messengers" (41). Table (2) revealed also a marked increase in cardiac NO level in those rats received Dox. This finding is in harmony with previous study (42), which used a model of Dox-induced cardiomyopathy similar to that used in our study. The increase in NO level can be explained on the basis of the ability of Dox to mediate the induction of nitric oxide synthase (NOS) expression and, hence, NO release in heart (43). Previous studies suggested that stimulation of endothelial cells with calcium-mobilizing agents activates and dissociates the membrane-bound eNOS (44). Because Dox-induced toxicity is mediated by intracellular H_2O_2 as well as calcium influx, Dox treatment causes an increase in eNOS transcription and protein activity in aortic endothelial cells and thus NO synthesis.

Dox administration, as shown in table (3), caused a significant decrease in cardiac GSH content, which is quiet compatible with previous studies (40, 45). The overproduction of ROS, caused by Dox administration, can account for this decrease in GSH

content, as these species are detoxified by endogenous antioxidants mainly GSH causing their cellular stores to be depleted (46). The observed decrease of cardiac GSH content may also be attributed to the enhanced activities of GSH metabolizing enzymes, as shown in the present study. One is GPx which reduces H_2O_2 and various peroxides using GSH as reducing agent, the other is GST which consumes GSH in the conjugation of Dox toxic metabolites (47).

Table (3) showed, also, significant increase in cardiac activity of SOD in the Dox-treated rats, which is consistent with some studies (40, 48). The increase in SOD activity can be explained on the basis that the redox cycling of Dox between quinone and semiquinone forms generates large amounts of O_2 (38), which in turn stimulate SOD as an adaptive response to counteract oxidative stress (49). Also, it was previously showed that ROS can upregulate and induce the synthesis of SOD protein (50). The observed increase in SOD activity might lead to overproduction of hydroperoxides. In consequence, cardiac GPx activity might be stimulated in response to the accumulated peroxides which can subsequently lead to the formation of highly toxic •OH radical through Fenton reaction catalyzed by iron (51). This assumption was supported by our results which showed a significant enhancement in cardiac GPx activity in the Dox-treated group. Another assumed explanation for such increased GPx activity is that multiple doses of Dox alter the activities of antioxidant enzymes in the heart so as to protect against Dox cardiotoxicity (42, 49). Additionally, GPx have been reported to be over expressed in Dox-treated cells, especially those tumor resistant ones (52). This can be considered as intracellular detoxification process for free radical end products (53). In our study, we assumed that this detoxification mechanism can occur also in cardiac myocytes, exposed to Dox administration, to prevent the accumulation of peroxides and the propagation of peroxidation. Table (3), additionally, revealed significant increase in cardiac GST activity in rats treated with Dox, which is in agreement with previously reported results (54). The increase in cardiac GST activity might be related to the fact that GSTs are family of dimeric proteins that posses a multitude of functions including the enzymatic conjugation of GSH to electrophilic xenobiotics (55). It has been reported that cellular exposure to xenobiotics and antioxidants leads to coordinated induction of a battery of genes encoding detoxifying enzymes including GST (56). Indeed, it has been known that Dox is metabolized, via alkedoreductases, yielding C13 hydroxyl derivative, doxorubicinol. This metabolite is actually more polar and toxic than Dox itself. Doxorubicinol accumulates in the heart and contributes significantly to chronic cumulative cardiotoxicity induced by Dox (57). In brief, GST has showed elevation after Dox injection to detoxify Dox and its metabolites and to attenuate the elevated oxidative stress (58). Moreover, Dox-treated cancer cell lines often show elevated GST expression and activity, which is in consistence with our result. Such increased activity of GST enzyme almost certainly leads to increased resistance to Dox treatment, and hence, creation of one of the most problems of Dox therapy (59).

Our results showed also an elevation in serum ALT upon Dox administration (table 4). This result agrees with previous study (60). Leakage of hepatic ALT into the serum is due to Dox-induced oxidative damage to hepatocytes (61). Dox-induced hepatotoxicity may be less severe than its cardiotoxicity. This can be related to the fact that liver mitochondria, unlike cardiac mitochondria, lack the NADH-related pathway of reducing equivalents from the cytosol to the respiratory chain, as a result, liver mitochondria do not generate significant amounts of Dox semiquinones (62).

The previously mentioned biochemical results produced by Dox administration are supported by the obtained cardiac histopathological results which showed that in the cardiac sections of the Dox-treated rats, serious morphological changes were observed in the myocardium. Also, the examination of liver sections of the same group illustrated that congestion was observed in the central vein in addition to kupffer cells proliferation in diffuse manner between the fatty degenerated hepatocytes.

From the previously mentioned discussion, it has been well established that oxidative stress plays a major role in Dox-induced cardiomyopathy and hepatotoxicity. Thus, the importance of antioxidant co-administration as an adjuvant therapy with Dox in preventing these damages has been emphasized.

Carvedilol is an 1-blocking agent and a potent antioxidant, with a 10-fold greater activity than vitamin E. Some carvedilol metabolites found in human plasma also exhibit antioxidative activity approximately 50- to 100-fold greater than carvedilol. These unique properties of carvedilol may be important in preventing progressive deterioration of left ventricular dysfunction and chronic heart failure (63). Results of the present study revealed that co-administration of carvedilol with Dox could attenuate the cardiotoxicity manifested biochemically by normalization of LDH as well as significant decrease in CPK serum levels. Also, such combined therapy caused normalization of cardiac MDA and NO levels, as well as, significantly raised GSH content. Moreover, co-administration of carvedilol produced normalization of GST, as well as, significant

decreased in cardiac activities of GPx and SOD. Histopathological examination of heart sections supported the alleviating effect of carvedilol on Dox-induced cardiotoxicity. On the contrary, carvedilol caused significant elevation in the serum ALT level compared to both normal and Dox-treated groups. Histology of liver sections showed that liver in this group was most damaged compared to other groups.

Our results showed that, carvedilol effectively prevented cardiomyocyte damage caused by Dox, evidenced biochemically by its ability to reduce the leakage of cardiac enzymes LDH and CPK into the serum. This finding is in harmony with previous results (64). This observed result is attributed to the antioxidant capacity of carvedilol and its ability to protect cellular membranes against oxidative damage preserving their integrity. The protective effect of carvedilol is strongly supported by the present ultra structural results, as carvedilol completely relieved cardiac histopathological damage induced by Dox. This observation is in harmony with results reported previously who related the cardioprotective effect of carvedilol to its positive impact on cardiac mitochondrial function, since, carvedilol prevented the inhibitory effect of Dox on mitochondrial respiration in heart, and also prevented the decrease in mitochondrial Ca^{2+} loading capacity and the inhibition of the respiratory complexes of heart mitochondria caused by Dox. Thus, co-administration of carvedilol decreased the extent of cellular vacuolization and cell death in cardiac myocytes (65, 66).

Our results revealed also that MDA was greatly reduced by the administration of carvedilol concomitantly with Dox, reaching to the normal level. This result is quiet consistent with many previous studies (67, 68). Earlier report (69) showed that carvedilol reduced plasma lipid peroxidation in patients with heart failure. Another possible mechanism is the direct antioxidative property of carvedilol which is attributed to the carbazole moiety of the drug (70). Carvedilol inhibited Fe^{2+}-initiated lipid peroxidation via scavenging free radicals (71) or by sequestering ferric ion (72). Carvedilol can also scavenge lipid radicals directly, thus breaking the chain reaction in membranes (73). On the other hand, as shown in our study, carvedilol caused significant reduction in cardiac NO level, reaching to normal value. This finding is in harmony with previous report (74) demonstrated the effect of carvedilol as a NO quenching agent. Carvedilol protected nitrosylation of intracellular molecule by exogenous NO and reduced intracellular concentration of NO produced by NO donors. Moreover, carvedilol is able to inhibit ROS generation by leukocytes (75) and decrease phagocyte degranulation and the amount of free myeloperoxidase (76), which at the sites of inflammation may function as a catalytic sink for NO (77).

As shown in our results, carvedilol produced remarkable inhibition of the observed GSH depletion in rats treated with Dox, which is in harmony with previous results (78, 67) that used carvedilol dose similar to that used in the current study. This result can be explained depending on the fact that carvedilol is potent antioxidant, since it reduced the production of free radicals in heart and thus the consumption of endogenous antioxidants especially GSH (46). Moreover, a reduced energy breakdown offered by carvedilol is expected to maintain cellular viability, thus avoiding membrane damage, alteration of ionic homeostasis and the occurrence of oxidative stress. Therefore, the positive effects on glutathione and –SH group metabolism which were found after treatment with carvedilol are most likely the consequence of a generalized cardiac protection due to the β-blocking-mediated energy saving (64).

Our study revealed also that carvedilol caused significant decrease in SOD and GPx activities in heart when administered concomitantly with Dox. This effect is, to some extent, similar to previous observation (67). Carvedilol protects a variety of cultured cells from oxygen radical- induced damage when subjected to either artificial oxygen-radical generating systems, such as Fe2+/vitamin C, or endogenous oxygen radical generating systems, such as xanthine-xanthine oxidase which involves the release of superoxide ions. This effect of carvedilol may result from its ability both to scavenge superoxide ions and to inhibit the production of superoxide radicals, the latter being inferred from the observation that carvedilol inhibits superoxide release from phorbol ester-activated neutrophils (79). The reduction in superoxide radical production may in turn relief the adaptive increase in SOD activity preceding Dox administration, as shown in our results. This decrease in cardiac SOD activity might be considered as a direct mechanism for the concomitant decrease in cardiac GPx activity observed in the present study, since no more H2O2 to be declared by GPx.

Regarding the effect of carvedilol on Dox-induced elevation in cardiac GST, the present study showed that carvedilol caused significant decrease in such enzymatic activity, reaching to the normal level. This finding might be related to previous observations that carvedilol could reverse cellular drug resistance by inhibiting MRP1 drug efflux system (80, 81). GST catalyzes the conjugation of Dox and its metabolites to GSH (47). Glutathione conjugates of Dox show high affinities toward the MRP1 pump, a drug efflux protein mediates efflux of GSH conjugates (82). The inhibitory effect of carvedilol on MRP1 can, in turn, reduce the efflux of GSH conjugates of Dox and thus

down regulates the production of the conjugating enzyme, GST.

Our results revealed that in the group administered a combined therapy of Dox+carvedilol, significant elevation in serum ALT level, with respect to both control and Dox- administrated group levels, was shown. Histopathological examination of liver sections of this group supported the biochemical result in that liver tissues of rats belonging to this group were shown to be most damaged compared to other groups, given that, congestion was observed in both the central and portal veins associated with diffuse kupffer cells proliferation in between the hepatocytes and the portal area showed inflammatory cells infiltration.

5. Conclusion:

Oxidative stress plays a major role in Dox-induced cardiomyopathy and hepatic damage. Carvedilol could effectively attenuate the cardiomyocyte damage caused by Dox as evidenced by the biochemical measurements and histopathological examination of cardiac tissue. Unfourtiontly, carvedilol augmented Dox-induced hepatic damage as evidenced by the present biochemical result and the histopathological examination of the hepatic tissue.

Competing Interests:

The authors declare that they have no competing interests.

Authors' Contributions :

SSI: participated in designing the point of research and the plan of work; followed up all the practical experiments; reviewed the statistical analysis; participated in analysis and interpretation of data; drafted the manuscript; the corresponding author for article publication; read and approved the version to be published.

MMB: participated in designing the point of research and the plan of work, read and approved the version to be published.

HSH: carried out the experimental works and performed the statistical analysis.

Acknowledgements:

We are thankful to Dr. Mohamed A Ali, Assistant professor of Histology, Faculty of Medicine, Cairo University, for his professional help in carrying out the histopathological examination.

Abstract: Basil (*Ocimum basilicum c.v. Thai Magic*) is an annual herb plant belonging to the lamiaceae family that used as drug, mainly cultivated for leaves and flowering topes, the plant yield have an essential oil on steam distillation. The experiment was conducted to study the effect of different levels of water stress (30, 50 and 70% depletion of available soil moisture), different concentrations of ascorbic acid (0, 100, 150 and 200 ppm) and spraying time (at vegetative or vegetative plus flowering stages) on some morphological and biochemical characteristics of basil plant. A pot experiment was conducted in a split-split plot design with 24 treatments and three replicates in greenhouse. The results of staticall analysis showed that water stress, ascorbic acid concentrations and spraying time have significant effect on morphological and biochemical characteristics. Plant height, number of branches, number of leaves, leaf area, fresh and dry weights of the first cut showed significant increase under 50% soil moisture level while further increase in water stress level showed significant decrease in previously mentioned parameters. The same tendency was observed for relative water content % as well as photosynthetic pigments concentrations (chla, chlb, total chla+b and carotenoids). While in the second cut, the previously mentioned characters showed progressive decrease with increasing water stress level (except for photosynthetic pigments which revealed the same trend as in the first cut). Reveres trend observed for oil% and proline content. The data also indicated that the application of ascorbic acid in different concentrations showed significant increase in all growth parameters, fresh and dry weights, relative water content, oil % and photosynthetic pigments compared with control treatment and revealed decrease in proline accumulation. [Journal of American Science. 2010;6(12):33-44]. (ISSN: 1545-1003).

Keywords: Water Stress; Ascorbic Acid; Biochemical Composition; *Ocimum basilicum*

1. Introduction

Water stress is the most influential factors affecting crop yield particularly in irrigated agriculture in arid and semi arid regions, it is necessary to get maximum yield in agriculture by using available water in order to get maximum profit form per unit area because existing agricultural land and irrigation water are rapidly diminishing due to rapid industrialization and urban development. Optimizing irrigation management due to water scarcity together with appropriate crops for cultivation is highly in demand; the cost of irrigation pumping and inadequate irrigation scheme capacity as well as limited water sources is among the reasons that force many countries to reduce irrigation applications. Potential of water stress tolerance and the economical value of medicinal and aromatic plants, make them suitable alternative crops in dry lands (Ghanbari et al., 2007).

Ocimum basilicum plant is one of the most important aromatic plants which used to flavor foods and in traditional medicines (Yusuf et al., 1994). In aromatic plants, growth and essential oil production are influenced by various environmental factors, such as water stress (Burbott and Loomis, 1969). Efforts are being made to overcome this problem primarily by studding the tolerance of different plants to water stress or by using hormones, chemical and physical treatments as well as biological methods (El Saidi, 1997). Water stress is one of the important limiting factors of plant growth that has limited the production of 25% of world lands (Levitt, 1980). Solinas and Deiana (1996) reported that secondary products of plants can be altered by environmental factors and water stress is the major factor affecting the synthesis of natural products. Water stress resulted in significant reduction of fresh and dry matter, nutrient content and essential oil yield (Mirsa and Strivastov, 2000). Fresh and dry weights of Ocimum bacilicum L. were decreased as plant water deficit increased (Simon et al., 1992). The linalool and methyl chavicol contents of sweet basil as percentage of total essential oil increased as water stress increased (Simon et al., 1992) the essential oil yield of basil was increased by subjecting plants to water stress just before harvesting (Baeck et al., 2001). Essential oil, total carbohydrates and proline contents were pronouncedly increased with increasing stress levels of Salivia officinalis L. (sage) plants (Hendawy and khalid, 2005) Moreover, Ashraf and Foolad (2007) reported that osomoprotectants such as proline and glycine betaine

were increased under drought stress. Also, Tawfik (2008) indicated that osmoprotectants such as total soluble sugars, proline and glycine betaine increased in plants subjected to water stress.

Ascorbic acid is one of the water soluble reductants which is very important antioxidant which protect plants by suppressing oxidative injury, by affecting many enzymes activities and also is required for regeneration of x-tocopheral (Smirnoff, 1995). Ascorbate occurs in the cell wall where it is a first line of defense against ozone; Ascorbate also has been implicated in regulation of cell division and photosynthesis. Ascorbate has benefits for human nutrition and possibly for tolerance of plants to photo oxidative stresses (Foyer et al., 1993; Smirnoff, 1995 and Abou-Leila 1994).

Therefore, we aim in this investigation to study the effect of water stress, ascorbic acid concentrations and spraying time on vegetative growth, essential oil % and chemical content of Ocimum basilicum which is economically important plant in Egypt.

2. Material and Methods

The experiment was conducted during the two successive seasons of 2008 and 2009 in the greenhouse of National Research Centre (NRC), Giza, Egypt. Seeds of Ocimum basilicum c.v. Thai Magic were sown in the second week of April in plastic pots (30 cm diameter), each pot was filled with 10 kg of air dried soil, physical and chemical properties of the soil used are presented in Table (1) using the standard method described by Klute (1986).

Seeds of Ocimum basilicum c.v. Thai Magic were provided by the Department of Medicinal and Aromatic plants, Ministry of Agriculture, Giza, Egypt. Ocimum seeds were irrigated regularly with tap water for three weeks until seedling emergency, then seedlings were thinned to two plants per pot, all pots received recommended does of NPK fertilizers.

The experiment including 24 treatments which were the combination between three levels of soil moisture (30, 50, and 70 % depletion of available soil water) and four concentrations of ascorbic acid spray (0, 100, 150 and 200 ppm.) which sprayed two times (at the vegetative stage or at vegetative plus flowering stages). The treatments arranged in a split- split plot design with three replicates, water stress was assigned at random in the main plots, while sub-plots were devoted to ascorbic acid concentrations and spraying time were allotted in the sub-sub plots. All pots were weighed daily and the needed amount of water was added. All plants received the soil moisture levels after three weeks from planting. The different concentrations of ascorbic acid were added for the first group at the vegetative stage only; the addition was twice, the first after 35 days from planting and the other two weeks later. While for the second group the addition of ascorbic acid was at vegetative plus flowering stages (four times) where the third addition was applied at the begging of flowering stage and the fourth two weeks later. The spraying process was foliar and always performed early in the morning; the plants were sprayed until run off.

The plants were harvested two times (first and second cuttings) by cutting plants 5 cm above the soil with three replications in each season, the first cut on the first week of July and the second cut on the first week of October. The growth parameters which recorded for each cut were plant height (cm), number of leaves/plant, number of branches/plant, leaf area (cm2) and fresh and dry weights (gm) of herb yield. The amount of chlorophyll (a, b, a+b and carotenoids) was determined according to Metzener et al., (1965).

The fresh plants were collected from each treatment during the first and second cuttings and weighed to extract the essential oil, the fresh plant material from each replicate of all treatments was subjected to steam distillation for 3h using petroleum ether, which was removed carefully and the essential oil was obtained according to (Guenther, 1961). Proline was determined in dry leaves in the first and second cuts using the method of Troll (1995). The relative water content was also measured according to Weatherly (1962). The averages of data from two seasons were tested by analysis of variance according to (Snedecor and Cochran 1980) and the means separations were compared by using Least Significant Difference (LSD) at 5% level.

Table (1): Mechanical and chemical analyses of the tested soil.

Mechanical characteristics	first season	second season
Clay %	17.00	16.00
Sand %	23.75	25.25
Chemical Properties		
PH (1:2.5)	7.25	7.9

Zn	1.18	1.34
Cu	1.00	1.31
Cl	0.58	0.66
Texture Sandy Soil		

3. Results

Effect on growth criteria:

Data presented in Tables 2&3 revealed the effect of water stress, ascorbic acid concentrations, spraying time and their interactions on growth criteria of ocimum plants in both cuts. For the effect of water stress, the data of the first cut showed that all growth characters increased significantly so as to reach their maximum values under 50% soil moisture level followed by decrease under 30% depletion of the available soil moisture level. While for the second cut, the data showed progressive increase in growth criteria with increasing soil moisture level so as to reach their maximum values under 30% depletion of the available soil moisture level. Moreover, all growth criteria were significantly reduced under the highest stressed level (70% depletion of the available soil moisture level) in both cuts.

Data in the same tables revealed also that plants treated with 150 ppm ascorbic acid showed the highest significant increase in growth criteria of the first cut compared with control treatment, followed by 100 ppm where the difference between the two concentrations was insignificant in most cases. While in the second cut, the highest significant increase in growth criteria appeared in plants sprayed with 200 ppm ascorbic acid compared with control treatment, followed by 150 ppm where the difference between the two treatments was insignificant for plant height, number of branches and dry weight.

Spraying plants with ascorbic acid at the vegetative stage only showed the highest significant means of growth criteria in the first cut. While in the second cut, spraying plants with ascorbic acid at vegetative plus flowering stages revealed the highest significant means of growth criteria compared with the other treatment.

In addition, the data of interaction between water stress and ascorbic acid concentrations indicated that the highest significant increase in growth criteria of the first cut observed under 50% soil moisture level interacted with 150 ppm ascorbic acid, followed by 100 ppm under same moisture level where the difference between the two treatments was insignificant, except for number of branches/plant which revealed insignificant increase. While in the second cut, the highest significant means observed under 30% depletion of the available soil moisture level interacted with 200 ppm ascorbic acid.

The data of interaction between water stress and spraying time showed that plants grown under 50% soil moisture level and sprayed with ascorbic acid at the vegetative stage only revealed the highest significant means in the first cut. While, plants grown under 30% depletion of the available soil moisture level and sprayed with ascorbic acid at vegetative plus flowering stages showed the highest significant means in the second cut.

Also, the data of interaction between ascorbic acid concentrations and spraying time revealed in the first cut that the highest significant means in number of branches/plant, fresh and dry weights reached when plants sprayed with 100 ppm ascorbic acid twice at the vegetative stage only, while for plant height, number of leaves/plant and leaf area the highest significant increases observed when plants sprayed with 150 ppm ascorbic acid twice at the vegetative stage only. For the second cut, spraying plants twice with 200 ppm ascorbic acid at vegetative plus twice at flowering stage showed the highest significant means of growth criteria compared with the other treatments.

The interaction between the three studied factors showed that the highest significant means in growth criteria of the first cut observed when plants grown under 50% soil moisture level and sprayed twice with 150 ppm ascorbic acid at the vegetative stage only. While for the second cut, the highest significant means observed in plants grown under 30% depletion of the available soil moisture level and sprayed twice with 200 ppm ascorbic acid at vegetative plus twice at flowering stage.

Table (2): Effect of water stress, ascorbic acid concentrations, spraying time and their interactions on growth criteria of Ocimum basilicum plant in the first cut (combined analysis of two seasons)

2- Effect on some physiological process: Photosynthetic pigments content:-

Data presented in Tables 4 & 5 showed the effect of water stress, ascorbic acid concentrations, spraying time and their interactions on photosynthetic pigments content of basil leaves. The obtained data revealed that the concentration of photosynthetic pigments i.e. chla, chlb and total chl (a+b) as well as carotenoids was higher in plants grown under 50% soil moisture level and with significant difference in both cuts.

The data in same tables also indicated that plants sprayed with ascorbic acid showed significant increases in photosynthetic pigments content compared with control plants. Where the highest records in photosynthetic pigments content of the first cut observed under 150 ppm ascorbic acid and 200 ppm in the second cut compared with control plants.

It could be also noticed that spraying plants with ascorbic acid at the vegetative stage only during plant life revealed the highest significant increases in chla, chlb, chl (a+b) as well as carotenoids of the first cut. Furthermore, spraying plants with ascorbic acid at vegetative plus flowering stages during plant life showed the highest significant increases in photosynthetic pigments of the second cut.

Concerning the effect of interaction between water stress and ascorbic acid concentrations, the data demonstrated that plants grown under 50% soil moisture level and sprayed with 150 ppm ascorbic acid showed the highest significant increases in photosynthetic pigments of the first cut and 50% soil moisture level interacted with 200 ppm ascorbic acid for the second cut.

Also, the data of interaction between water stress and spraying time showed that the highest significant increases in photosynthetic pigments recorded in plants grown under 50% soil moisture level in both cuts, spayed with ascorbic acid at the vegetative stage only for the first cut and sprayed with ascorbic acid at vegetative plus flowering stages for the second cut.

Irrespective to water stress, the data revealed that the highest significant increases in photosynthetic pigments obtained in plants sprayed with 150 ppm ascorbic acid twice at the vegetative stage only for the first cut. While for the second cut, the highest significant increases in photosynthetic pigments obtained in plants prayed with 200 ppm twice at vegetative plus twice at flowering stage.

The data of tri-interaction indicated that the best treatment for the first cut observed when plants grown under 50% soil moisture level and sprayed twice with 150 ppm ascorbic acid at the vegetative stage only and with significant difference compared with the other treatments. While, the highest significant records in photosynthetic pigments of the second cut obtained when plants grown under 50% soil moisture level and sprayed with 200 ppm ascorbic acid twice at vegetative plus twice at flowering stage.

Relative Water Content (RWC %):

Data in Tables 4 & 5 also revealed the effect of water stress, ascorbic acid concentrations, spraying time and their interactions on RWC % of basil leaves. The obtained data revealed that the highest records for the RWC % observed under 50% depletion of the available soil moisture in the first cut and 30% depletion of the available soil moisture for the second cut.

The obtained data also indicated that all ascorbic acid concentrations showed significant increase in RWC % compared with untreated plants of both cuts. Where the highest significant increase in RWC % obtained in plants sprayed with 150 ppm ascorbic acid in the first cut and 200 ppm for the second cut.

For the effect of spraying time, the data revealed that spraying plants with ascorbic acid at the vegetative stage showed the highest significant means in RWC % of the first cut compared with the other treatment, while for the second cut, spraying plants with

ascorbic acid at vegetative plus flowering stages revealed the highest means in RWC%.

Regarding the effect of interaction between water stress and ascorbic acid concentrations, the data illustrated that the highest significant means of RWC% obtained under 50% soil moisture level combined with 150 ppm ascorbic acid in the first cut, and 30% depletion of the available soil moisture combined with 200 ppm ascorbic acid for the second cut. It was also clear from data that spraying plants with different concentrations of ascorbic acid caused increase in RWC % under different soil moisture levels and with significant difference.

The data of interaction between water stress and spraying time revealed that plants grown under 50% soil moisture level and sprayed with ascorbic acid at the vegetative stage only showed the highest significant means of RWC % in the first cut and under 30% depletion of the available soil moisture combined with two sprays of ascorbic acid at the vegetative plus two at flowering stage in the second cut.

Irrespective to water stress, the data illustrated that spraying plant twice with 150 ppm ascorbic acid at the vegetative stage proved to be effective in increasing RWC % significantly in the first cut. While for the second cut, spraying plants with 200 ppm twice at vegetative and twice at flowering stage revealed the highest significant means of RWC % in the second cut.

The combined effect between the three studied factors showed that the highest significant values of RWC% attained when plants grown under 50% soil moisture level and sprayed twice with 150 ppm ascorbic acid at the vegetative stage of the first cut. While for the second cut, the highest significant means observed in plants grown under 30% depletion of the available soil moisture level and sprayed twice with 200 ppm ascorbic acid at the vegetative and flowering stages.

Proline content:-

Examination of data in Tables 4 & 5 showed that increasing water stress level caused progressive and significant increase in proline content of basil leaves. Moreover, the highest significant increase in proline accumulation in both cuts obtained under 70% depletion of the available soil moisture level, while the lowest accumulation in both cuts observed under 30% depletion of the available soil moisture level combined with 150 ppm.

Treated basil plants with different concentrations of ascorbic acid revealed significant decrease in proline accumulation compared with untreated plants. For the first cut, the lowest means obtained under 150 ppm ascorbic acid and the highest means observed under the control treatment. While for the second cut, the difference between the different concentrations of ascorbic acid was insignificant while the highest means observed under control plants also.

Spraying plants with ascorbic acid at the vegetative stage only revealed the lower means in proline accumulation in both cuts, compared with the other treatment.

Concerning the bi-interaction between water stress and ascorbic acid concentrations, the obtained data revealed that the different concentrations of ascorbic acid caused significant decrease in proline accumulation under different water stress levels compared with control plants. Furthermore, the highest significant increase in proline accumulation obtained in control treatment of 70% depletion of the available soil moisture level, while the lowest accumulation obtained under 30% depletion of the available soil moisture level, these results were true for both cuts.

The data of interaction between water stress and spraying time also proved that plants sprayed with ascorbic acid at the vegetative stage only revealed the lowest means in proline accumulation under different soil moisture levels compared with the other treatments, this result was true for both cuts.

It could be also observed from the data of interaction between ascorbic acid concentration and spraying time that the highest accumulation of proline obtained in untreated plants (control plants) in both cuts, while the lowest accumulation obtained when plants treated with different concentrations of ascorbic acid at the vegetative stage only.

The effect of tri-interaction illustrated that the lowest significant means in proline accumulation obtained when plants grown under 30% depletion of the available soil moisture level and sprayed twice with 150 ppm ascorbic acid at the vegetative stage only in both cuts, while the highest means obtained in control plants of 70% depletion of the available soil moisture level.

Oil percent:

The results in Tables 4 & 5 showed also the effect of water stress, ascorbic acid concentrations, spraying time and their interactions on oil % of basil leaves. The data of both cuts indicated that water stress induced significant and progressive increase in oil %, where the highest significant increase in oil % of both cuts obtained in plants grown under 70 % depletion of the available soil moisture level.

Ascorbic acid treatments caused significant increase in oil % compared with untreated plants in both cuts, where 150 ppm ascorbic acid proved to be the most effective concentrations that affected oil % significantly in both cuts.

A significant increase was also recorded when plants treated with ascorbic acid twice at vegetative and flowering stages in both cuts.

In addition, the interaction between water stress and ascorbic acid concentrations indicated that oil % increased significantly with increasing stress levels, also spraying plants with ascorbic acid induced significant increase in oil % under different soil moisture levels, where the highest significant increase in oil % appeared in plants grown under 70% depletion of the available soil moisture and sprayed with 150 ppm ascorbic acid in both cuts.

For the interaction between water stress and spraying time the data in both cuts illustrated that the highest significant means of oil % obtained in plants grown under 70% depletion of the available soil moisture level and sprayed with ascorbic acid twice at vegetative and twice at flowering stage.

Moreover, the data of interaction between ascorbic acid concentrations and spraying time showed that the highest significant means of oil % in both cuts appeared when plants sprayed twice (at vegetative and flowering stages) with 150 ppm.

The effect of tri-interaction indicated that 70% depletion of the available soil moisture level interacted with 150 ppm ascorbic acid when sprayed twice at both vegetative and flowering stages proved to be the most effective treatment in oil % compared with the other treatments and with significant difference, this result was true for both cuts.

Table (4): Effect of water stress, ascorbic acid concentrations, spraying time and their interactions on some physiological process of *Ocimum basilicum* plant in the first cut (combined analysis of two seasons).

4. Discussions

From the results, it was clear that the highest water stress level (70% depletion of the available soil moisture level) caused an observed adverse action on growth characters, fresh and dry weights, relative water content % as well as photosynthetic pigments of basil plants in both cuts. Previous results were supported by Fatima *et al.*, (1999); Mirsa and Strivastava (2000); Khalid (2006) and Tawfik (2008). This result could be due to that one of the first signs of water shortage was the decrease of turgor which resulted in decrease in growth and development of cell especially in stem and leaves (Alishah *et al.*, 2006). When the leave level decreased the plant lose less water through transpiration so the restriction of leaves level could be the first mechanism against drought (Levitt, 1980). Farooqi *et al.*, (1998) and Fatima *et al.*, (1999) supported previous results. Moreover, when the leaf level decrease the light attraction decrease and the total capacity of photosynthesis decrease so plant growth became less and plant performance decrease (Hsiao, 1973), which leads also to the decrease in dry matter production (Cox and Joliff, 1987), this result agrees with Fatima *et al.* (1999); khalid (2006) and Alishah *et al.*,(2006). Drought stress made chloroplast break down and the amount of chlorophyll decrease, therefore formation of chlorophyll a, b and carotenoids decrease. Our finding was in harmony with Cox and Jolliff (1987); Begum and Apaul (1993); Sepehri and Modarres (2003) and Alishah *et al.*, (2006). Furthermore, proline content showed significant increase with increasing water stress level and these results agree with Blum and Ebercon (1976) who indicated that proline is regarded as a source of energy, carbon, and nitrogen for recovering tissue, so it increased under water shortage, Aspinal and Paleg (1981) stated that under water deficit condition the concentration of amino acid proline increase. Since

chlorophyll and proline are both synthesis from the same substance therefore the increase in synthesis of proline leads to the decrease in synthesis of chlorophyll under drought conditions. Bajji *et al*, (2001); Begum and Paul (1993); Irigoyen *et al.,* (1992); khalid (2006) and Tawfik (2008) reached the same conclusions. Moreover, the essential oil percentage was increased significantly with increasing water stress level; these results were in line with those of Sabih *et al*., (1999); Baher *et al*., (2002) and Khalid (2006). Our results also indicated difference between results of two cuts, since the results of the first cut revealed that 50% soil moisture level showed the highest records in growth parameters, fresh and dry weights, RWC % and photosynthetic pigments which may results from increasing total capacity of photosynthesis as result of increasing photosynthetic pigments under this soil moisture level. While in the second cut, the data revealed progressive decrease in previously mentioned characters with increasing stress levels (except for photosynthetic pigments) which may due to that plants in the second cut exposed to higher temperature degrees than plants in the first cut because of summer season which revealed increase in the amounts of water that loss through transpiration and evapotranspiration and increasing needs for more water.

Water stress causes various physiological and biological changes in plants, one of which is the accumulation of reactive oxygen species in the cell, the reactive oxygen radicals are toxic and may result in a series of injuries to plant metabolism, it damages photosynthetic components, inactivates protein and enzymes, destroys cell membrane structure and permeability by causing lipid peroxidation, also excess accumulation of reactive oxygen species results in a series of oxidative injuries to plant prolines, polysacchorides and nucleic acids (Price and Henry, 1987, 1989, 1991, Winston, 1990), as a result normal cell metabolism can be seriously disturbed. The results of the present study indicated that ascorbic acid reduced the harmful effects of reactive oxygen species and improved plant resistance to water stress. In brief, ascorbic acid treatment reduced the damaging action of drought and decreased enzyme activity due to scavenging of reactive oxygen species; thereupon it may be effective for improvement of stressed plants in arid and semi-arid regions (Dolatabadian *et al*, 2009).

ABSTRACT: The Actinomycetes comprise a ubiquitous order of bacteria which exhibits wide physiological and morphological diversity. These microorganisms are particularly abundant in alkaline soils rich in organic matter. Keratin is an insoluble structural protein of skin, and its derivatives (e.g. feather, hair, wool and horn) are known for their high stability. Actinomycetes producing keratinases are having high applications in feed, fertilizer, leather and also for pharmaceutical and biomedical applications. *Actinomyces* species newly isolated, thermo tolerant feather degrading bacterial strain was investigated for its ability to produce keratinase enzyme. Maximum keratinolytic activity was observed at 28°C and pH 7.5. Keratin-containing materials (feather, hair, wool, etc.) are abundant in nature but have limited uses in practice since they are insoluble and resistant to degradation by the common proteolytic enzymes. Keratinous wastes represent a source of valuable proteins and amino acids and could find application as a fodder additive for animals or source of nitrogen for plants. Actinomycetes have the ability to break down many different varieties of organic compounds. The keratinase production by the thermophilic actinomycete strain *Actinomyces* was induced by chick feather as the sole source of carbon and nitrogen in the cultivation medium and characterization studies were carried out for the identification of the specific strain. [Journal of American Science. 2010;6(12):45-48]. (ISSN: 1545-1003).

Keywords: Keratin, Actinomycetes, Antibacterial activity, *Actinomyces*.

1. INTRODUCTION

Actinomycetes sometimes cause bio-deterioration of materials and are often responsible for spoilage of hay, straw, cereal grains, seed, wood paper, wool, hydrocarbon, rubber and plastics. In nature, biodegradation by acinomycetes plays an extremely useful role in waste removal and is an integral part of the recycling of materials. Most actinomycetes live in aerobic soils, where they biodegrade organic substrate. Number of actinomycetes living in soils often exceed in one million per gram. The keratin chain is tightly packed in the helix and then substrate turns into a supercoiled polypeptide chain resulting in mechanical stability and resistance to common proteolytic enzymes such as pepsin, trypsin and papain (Parry and North, 1998). Keratin is having more protein and aminoacid source Chicken feather mainly contains keratin, which is an insoluble protein with high stability and is indigestible by common proteases (Parry and North., 1998; Kreplak *et al.*, 2004). Keratinase enzyme are reported to produce by some species of bacteria especially Microbacterium sp (Thys *et al*., 2004) and by actinomycetes such as Bacillus and Streptomyces (Williams *et al.*, 1990)and by some keratinolytic Fungi (Yamamura *et al*., 2002). In this study, keratinolytic actinomycetes present in the soil environment were analyzed and isolation techniques were carried out.

2. MATERIALS AND METHODS

2.1 Collection of soil

The soil samples were collected from various poultry and chick farm.

2.2Cleaning of glassware

The glassware of borosil grade was used in all the experiments. The glassware was cleaned by soaking in chromic acid solution (100g potassium dichromate dissolved in one liter water with 500ml concentrate sulphuric acid) for two hours and washed in water.

2.3Chemicals used

All the chemicals were used of high purity and whenever necessary sigma grade chemicals were used.

2.4 Sterilization techniques

All the glass wares were sterilized in a hot air oven at 180^{o}C for two hours. All the prepared media and water blanks were sterilized in an autoclave at 1atm for 95 minutes. All the antibiotics were filter sterilized using sintered glass filter the isolation, purification, inoculation and other microbiological

works were carried out in a laminar Air flow chamber (Air Flow, India).

2.5. Isolation and screening of keratinolytic actinomycetes

A basal medium, containing 0.5g $M_gSO_4.7H_2O$, 1.0g K_2HPO_4, 3.0g $CaCO_3$, 20g agar per liter and 1ml trace element solution was used to test the ability of salt – loving actinomycetes to grow on sterile feathers. The feathers were supplied in small pieces on the surface of the solidified medium and were the sole source of carbon and nitrogen.

The basal medium was fortified with 100gm/LNacl to adjust salinity to 10%, and the initial pH of the medium was adjusted to 7.5-7.6. The plates were seeded with spore suspensions of the actinomycetes strains, and were incubated at 28^{o}C. Plates were examined for growth and colonization on feather pieces. Strains that showed visible growth on the feathers were considered to be potentially keratinophillic.

Keratinolytic potential of selected salt-loving strains

The keratinolytic potential of the two newly described salt-loving actinomycetes species, *Nocardiopsis halotolerans* and *Saccharomonospora halophila* (Al-Zarban *et al*.2002), were tested by a modification of the diffusion method of minimal agar medium containing 0.15% chicken feather flour (ball-milled) was poured in Petri plates. After solidification 4mm wells were cut in the agar, filled with culture fluid (initially grown in starch nitrate broth plus 10% Nacl) and incubated at 28^{o}C. The positive utilization of the feather flour as the sole source of carbon and nitrogen was assessed by the formation of a clear zone around the wells.

3.Physiological characteristics of Actinomycetes

3.1 Effect of pH

Modified Bennett broth was prepared and sterilized. The pH of broth was adjusted to 5, 7, and 8.5 using 0.1 N HCL and NaoH. The actinomycete cultures were inoculated in the broth. The tubes were incubated at room temperature for 7 days & 14 days after incubation the growth was recorded (Ivanko and Varbanets *et al*., 2004).

3.2 Effect of temperature

Modified Bennett broth was prepared and sterilized. The Actinomycetes cultures were inoculated in the broth. The tubes were incubated at 37° C & 45° C for 7 and 14 days, then at 4^0C & 10^0C for 2 and 4 weeks respectively. After incubation the growth was recorded. The pH and temperature optima were determined to be 8.6 and 70^{o}C (Ignatova *et al*., 1999).

3.3 Effect of Inhibitory compounds

Modified Bennett broth was prepared and sterilized. Inhibitory compound such as crystal violet (0.0001 gm/100ml), phenol (0.1 gm/100ml), sodium azide (0.01, 0.02 gm/100ml) sodium chloride (4, 7, 10, 13 gms/100ml) were added. Actinomycetes cultures were inoculated into the broth then the tubes were incubated at room temperature for 7 and 14 days. After incubation the growth was recorded.

3.4 Utilization of carbon source

Modified Bennett broth was prepared with carbon source like Dextrose, sucrose, Lactose, Maltose, Mannitol, L-arabinose, D-arabinose, D-Galactose, L-Rhamnose & starch. The tubes were sterilized at 121^0C for 15 lbs, 10 minutes Actinomycetes cultures were inoculated into the broth. Then tubes were incubated at room temperature for 7, 14 and 21 days after which the tubes were examined for the growth (Al-Musallam *et al*., 2003).

3.5 Utilization of Nitrogen source

Modified Bennett broth was prepared with Nitrogen source such as L-cysteine, L-histidine, L-phenylalanine, L-serine, L-Threonine, L-Glycine and L-valine Actinomycetes cultures were inoculated into the broth. Then the tubes were incubated at room temperature for 15 days. After incubation the growth was recorded (Chao *et al*., 2007).

3.6 RESISTANCE TOWARD SODIUM CHLORIDE:

The basal medium was prepared in 5 batches which are supplemented with NaCl (g/lit) 2, 7, 10, 30, 50, 70, and120 separately, the medium was autoclaved and poured into the plates.

An agar plate surface was divided into 4 sections. Each section was streaked with an actinomycete culture and incubated for 5 days at 30°C. Inhibition of growth from strong to moderate level was tested based on the observation of nature of growth compared to control.

Antibacterial property of the purified product was determined by overlay method. In this method spores were streaked on Petri plates containing 15ml of arginine glycerol salt agar medium and incubated for 5days at 30°C. 10ml (0.75% agar) of test bacteria were mixed with 0.1ml of cell/spores suspension (10^2 ml^{-1}) and overlaid on 5 days old growth of isolated actinomycetes. The plates were further incubated at 30°C for 24 hrs.

4. RESULTS

Streptomyces and *Actinomyces* partially degraded native chicken feather at 50°C (Bockle *et al*., 1995).

Figure: 4.1. Plate shows the Cultural characteristics of *Streptomyces spp* in Starch Caesin agar

5. DISCUSSION:

The soil samples were collected from various poultry and chick farm wastes was collected from Namakkal district and in and around Arcot, Tamil Nadu, India and the 64 isolates of actinomycetes were obtained from them is shown in Table 5.1.

Table 5.1. Total Actinomycetes population in different soil

S. No	Nameof The Soil	Number Of Actinomycetes Obtained
1	Poultry soil	28
2	Sheep soil	18
3	Cow soil	12
4	Buffalo soil	06
TOTAL		**64**

Total actinomycetes colonies were differentiated by cultural characteristics. The Actinomycetes isolates population was shown in Table 5.2, which were mainly Actinomyces and Streptomyces species.

Table 5.2. Selection of Keratinolytic Actinomycetes isolates

S. NO	NAMEOF THE SOIL	NUMBER OF DIFFERENT ISOLATES OBTAINED
1	Poultry soil	16
2	Sheep soil	12
3	Cow soil	8
4	Buffalo soil	3
TOTAL		39

SUMMARY AND CONCLUDING REMARKS

The present study mainly involved in the isolation of Actinomyces based on its morphology and identification based on the cultural characteristics. The Actinomyces species isolation was mainly based on the physiological characters and its potentiality were identified. Further work should be focused in species identification and on the keratinolytic potential of some dermatophytic fungi such as Trichophyton and Microsporum (Asahi et al., 1985, Qin *et al*., 1992, Filipello Marchisio 2000, Moallaei *et al*., 2006).

Denaturation and Viscosity of Whey Proteins Solutions as Affected by Frozen Storage

Soliman, T.N.[*1], A.F. Farrag[1]; A. Shendy[2] and El-Sayed, M.M.[1]

[1]Dairy Dept. National Research Centre, [2]Dairy Dept. Faculty of Agriculture, Al-Azhar University, Cairo, Egypt.
Tariknour.nrc@gmail.com

Abstract: Concentrated solutions of whey proteins (WPC) were prepared from sweet whey by ultrafiltration technique, and stored at – 18°C up to three months. Denaturation degree and viscosity of WPC solutions were assessed. Denaturation degree of whey protein solutions increased significantly (P<0.05) as affected by duration of frozen storage and protein content. The highest degree of denaturation was found at pH 5.0 and 7.0 after one month of storage. Denaturation percentages of heated and thawed WPC solutions increased significantly (P<0.05) as function of storage, protein content and pH. The flow properties of unheated WPC solutions exhibited a time-independent non-Newtonian behaviour as shear-thickening (dilatants) properties with an increase in the apparent viscosity with increasing the shear rate. Heated thawed WPC solutions behaved as thixotropic fluids with a decrease in the apparent viscosity with increasing shear rate. Apparent viscosities of unheated and heated WPC solutions greatly affected by frozen storage, protein content and pH. [Journal of American Science. 2010;6(12):49-62]. (ISSN: 1545-1003).

Key words: WPC, Frozen storage, Denaturation, Viscosity

1. Introduction

Whey proteins are used as functional ingredients in many food products not only for their nutritional properties, but also for their functional and technological properties. The functional properties of whey proteins may be refered to as: (a) hydration properties that have an important effect on wettability, swelling, adhesion, dispersibility, solubility, viscosity, water absorption and water holding; (b) interfacial properties including emulsification and foaming characteristics; (c) aggregation and gelation properties which are related to protein–protein interactions (Kresic, et al. 2006). These functionalities can be affected by either heat treatment (Mulvihill & Donovan, 1987) or pressure treatment (Patel, et al. 2005).

Preservation of the valuable cheese whey proteins in the form of a whey protein concentrate (WPC) powder has been increasing in recent years. Studies on the functional properties of dried WPC (Harper, 1984; Mangino, 1992; de Wit, 1989; Morr & Foegeding, 1990) indicate variability depending upon the source of whey, extent of protein denaturation during processing, presence of non-protein components and failure to standardize pre-treatment and processing conditions for manufacture.

Storage at freezing temperature is a well established technique for long-term preservation of many foods and other commodities. Surprisingly, very little attention has been paid to the possibility of using frozen storage for long preservation of protein solutions. Freezing of foods may result in undesirable changes, including textural damage, protein denaturation, destruction of cellular membranes mainly due to the freeze-concentration phenomenon. Bhargava & Jelen (1995) investigated the effects of freezing on viscosity of concentrated WPC solutions. They found that a small but statistically highly significant difference in viscosity, showing an effect of the slow freezing rate.

Denaturation of WPI results from a complex mechanism dominated by the denaturation of β-lactoglobulin which has been explained by Simmons *et al.,* (2007) and Schokker *et al.* (2000), by a two-step process. The first step is endothermic; which consists of protein unfolding and changes in the equilibrium between protein dimers and native and non-native monomers, associated with reversible or irreversible intramolecular rearrangements (e.g. disruption of hydrogen bonds). The second step corresponds to aggregation, resulting mainly from an intermolecular –SH to S–S exchange and, to a lesser extent, from non-covalent interactions. Aggregation starts with the formation of non-native dimers and oligomers which rapidly grow as a function of chemical environment and temperature, mainly by incorporation of monomers and smaller aggregates (Le Bon et al., 1999).

The apparent viscosity of WPC determines the potential application of these ingredients with excellent technological functionality and high nutritional value in liquid food preparation as textural ingredients (Patocka et al., 2006).

The main objective of the present work was therefore to investigate the influence of frozen storage followed by heat treatment on the WPC denaturation degree and viscosity of WPC solutions.

2. Materials and Methods:

Materials

Sweet whey from Mozzarella cheese manufacture (pH 5.9 – 6.0) was obtained from Arab Dairy products Co. Kaha, Kalubia. Residual fat and curd were removed from the whey by a cream separator. Clarified whey was directly concentrated by ultrafiltation using a 50,000 molecular weight cut off zirconium oxid membrane installed in a Carbosep pilot plant (modules S 151 UF system, Nova-Sep France). Ultrafiltration was carried out in a batch mode at 45-50°C, inlet and outlet pressure of 5.5 and 3.5 bar, respectively. Ultrafiltration was continued to a concentration factor 20. The retentate (whey protein concentrates) was diluted with an equal volume of water and diafiltered three times to remove most of lactose and minerals from whey retentate.

The WPC solutions were packaged in polyethylene sacs and stored frozen at ─18°C. A sample sac was removed from freezer after 1, 2, and 3 months of storage and thawed in a refrigerator at 4°C for analysis.

After thawing WPC was diluted with distilled water to obtain three WPC solutions which containing of different protein ratios. These solutions were adjusted to pH 3.0, 5.0, 7.0 and 8.6 using 1N HCl or NaOH, heated to 80°C for 10 min, and cooled rapidly. Undenatured whey proteins and viscosity for WPC preparing solutions were determined before and after heating.

Methods:

1. Chemical analysis:

Whey protein concentrate solutions were analysed for total solids by dry oven at 105°C for 6 hrs as described in AOAC (1990). Fat by Gerber bytrometer and protein nitrogen fractions by micro Kjeldahl method and pH according to Ling (1963). Lactose content by the phenol-sulphuric method of Barrnet and Tawab (1957).

2. Determination of denaturation of WPC

The degree of denaturation of WPC was determined according to Andersen *et al.* (1983). Aliquot of the WPC solution was adjusted to pH 4.6 using 1N acetic acid and 1N sodium acetate solutions respectively. The precipitate was removed by filtration and the total nitrogen was determined in the filtrate. Trichloroacetic acid (TCA) solution was added to the supernatant to give 12% TCA in the mixture. The precipitate was removed by filtration, and NPN was determined in the filtrate. The percentage of undenatured whey proteins (UDW%) was calculated as:

$$\% \text{ UDW} = \frac{\text{Percentage of 4.6 soluble N – NPN}}{\text{Total WPC N before heat treatment - NPN}} \times 100$$

3. Viscosity of WPC

The viscosity of WPC was measured according to Farrag *et al.* (2006). The apparent viscosity of the thawed and heated WPC solutions were measured using a Bohlin coaxial cylinder viscometer (Bohlin Instrument Inc., Sweden) attached to a work station loaded with software V88 viscometery programme. The system C30 was filled with the WPC solution at the measurement temperature of 20°C. The viscosity was carried out in the up mode at shear rate ranging from 37 to 910 1/s.

The heated WPC solutions samples at 80°C for 10 min were kept at refrigerator at 5-6°C for 24 hrs to examine renaturation of whey proteins again.

Statistical analysis

The data were analysed according to Statistical Analysis System (SAS, 1998). Duncan multiple range test was carried out for separation among means. All experiments were replicated 3 times.

3. Results and Discussion

The chemical composition of whey and WPC solutions are shown in table (1). WPC solutions contained total solids (TS) of 9.50, 4.75 and 3.20% for WPC 1, WPC 2 and WPC 3 respectively. Its contained total proteins (TP) of 5.09, 2.5 and 1.7% in the same order. Although the WPC solutions had been subjected to diafiltration, the solutions still contained residual lactose and fat.

Table 1: Chemical composition of whey protein concentrates (WPC) solutions of different protein content.

Concentration Test	Whey	WPC 1	WPC 2	WPC 3
TS %	7.25	9.50	4.75	3.20
TN %	0.220	0.798	0.385	0.259
TP %	1.40	5.09	2.50	1.70
Fat %	0.1	1.8	0.9	0.6
Lactose %	5.5	2.40	1.23	0.83
pH	5.99	5.85	5.75	5.75

Whey protein denaturation as affected by frozen storage

Degree of denaturation of the whey protein concentrates solutions as affected by freezing storage are given in Table 2.

After one month of frozen storage no visible changes was observed in the WPC solutions at all pHs on freezing and thawing. The percentage of denaturation increased significantly ($p<0.05$) compared

with fresh or zero time samples. The highest degree of denaturation was found at pH 5.0 and 7.0 being 48.71 and 48.94% compared with that found at pH 3.0 and 8.6 namely 45.10 and 46.46% at WPC solution containing 5.09% protein. The percent of denaturation decreased with decrease in the protein concentration. It was decreased from 45.10 for WPC1 to 41.94% for WPC3 at pH 3.0 and from 48.71 for WPC1 to 39.96 % for WPC3 at pH 5.0. The same trend was found at different pHs. These results were agreement with that reported by Farrag *et al.* 1997.

After two and three months of frozen storage, thawed WPC exhibited protein destabilization with flocculated protein aggregates. At pH 5.0 solutions, a uniform small protein aggregates could be seen in the WPC solution. These observations agreement with that finding by (Bhargava & Jelen, 1995). They found that the protein aggregates seen after thawing appeared to consist of larger clumps along with small floating fragments, indicating possible minor effects of the freezing storage at pH 5.0.

After two months of frozen storage the denaturation degree of WPC solutions increased significantly ($p<0.05$) compared with fresh or one month samples. After three months freezing storage the highest denaturation was found at pH 8.6 of 56.12, 52.16 and 51.61% for WPC1, WPC2 and WPC3 respectively. Previous studies reported good protein stability in WPC solution stored below -20°C (Antifantakis *et al.*, 1980; Bastian, 1994, Young, 1985). Koschak *et al*. (1981) reported that frozen bovine milk and milk concentrates stored at -20°C or lower remain stable for long periods of time, but stability decreases greatly as the temperature is raised above -20°C.

Heat denaturation of thawed WPC solutions:

Table 3 shows the denaturation percentages of heated WPC solutions as function of freezing storage, protein content and pH. At pH 3 heating denaturation degree increased significantly ($P<0.05$) from 71.43% at zero time to 85.19% after 3 months of freezing storage of WPC 1 solution. At pH5.0 degree of denaturation increased significantly ($P<0.05$) of 70.00, 74.44, 82.50 and 85.37% after zero time, 1 month, 2 months and 3 months for WPC2 solution respectively. At pH 7.0 the same trend were found. On the other hand at pH 8.6 no significant differences were found in the denaturation percent of WPCs solutions (different protein content) after 3 months of freezing storage. Higher pH values caused formation of soluble whey proteins aggregates. Vasbinder and de Kruif (2003). Heat treatment at higher pH caused a clear formation of whey protein aggregates, indicating a pH dependent aggregation mechanism. Anema and Klostermeyer (1997) demonstrated using ultracentrifugation that at higher pH more whey proteins remained soluble than at lower pH.

Table (2): Effect of frozen storage on the denaturation % of WPC solutions at different pHs.

By varying the pH prior to heat treatment the mechanism of denaturation is influenced. The degree of denaturation is rather constant (Law & Leaver, 2000), but heat treatment at higher pH results in the formation of more whey protein aggregates while heat treatment at lower pH results in more association of the whey proteins with the casein micelle (Anema & Klostermeyer, 1997; Corredig & Dalgleish, 1996).

However, heating does have a definite effect on the whey protein fractions, which consists mainly of β-lactoglobulin (β-lg) and α-lactalbumin (α-la). Upon heating, a reactive thiol group is exposed in β-lg due to conformational changes of the molecule. This reactive thiol group can form disulfide links with other proteins having a reactive thiol group or through thiol group-disulfide bridge exchange reactions. The reaction makes the denaturation process irreversible, in contrast to the reversible denaturation of porcine β -lg which lacks free thiol groups (Burova, et al., 2002; Ugolini *et al.*, 2001).

Renaturation

Table 4 showed that the ability of denatured heated whey proteins to relation its nature after keeping in refrigeration temperature for 24 hrs. The results showed that slight decrease in the ratio of denatured proteins.

The process of denaturation and subsequent aggregation of bovine β -lg resembles a polymerisation process, in which the unfolding represents the initiation step (de Kruif et al., 1995; Roefs & de Kruif, 1994). α-La cannot initiate the polymerization process due to the absence of a free thiol group; however as it has four disulfide bridges it is irreversibly denatured in the presence of β-lg due to thiol group-disulfide bridge exchange reactions (Mulvihill & Donovan, 1987).

According to de Wit (1989), the solubility of whey protein is impaired by heating above 70°C when the pH is 4.0-6.5 due to irreversible unfolding, while at pH 6.8 or 7.0, the increase in aggregation and visible turbidity does not result in the formation of sedimentable particles (Britten *et al.*, 1993). For pH 5.0 samples, the precipitate was in the form of loose aggregates of denatured protein particles; indicating the lack of any major impairment of the structural network formed after heating by the preceding freezing step.

Viscosity

Apparent viscosity of WPC samples at different pHs showed different patterns. For all the fresh WPC solutions at different pHs, the apparent viscosities were increased with increasing shear rate.

Also, the apparent viscosities of WPC solutions were increased with increase in the whey protein content. As shown in Fig. 1, at pH values above 5.0 all apparent viscosities were low with little variation, but below this pH at pH 3.0 values increases in apparent viscosity occurred, accompanied by the development of 'greasy' textures (Rattray & Jelen 1995). At shear rate of 185 1/s the apparent viscosities of WPC 1 sample of 4.8, 2.9, 3.6 and 3.2 mPas at pH 3.0, 5.0, 7.0 and 8.6 respectively (Fig 1). On the other hand at decreasing total solids content as sample WPC 3 no differences were records at different pHs uses. At pH 5.0 and 7.0 the highest apparent viscosity was recorded and its increased to 56 and 34.4 mPas for heated WPC 1at shear rate of 185 1/s (Fig. 2). However, at pH 5.0 all WPC solutions were found to be thixotropic fluids as there was a decrease in the apparent viscosity with increasing shear rate. These results were agreement with finding of Howard, (1991).

After one month of frozen storage the apparent viscosity of WPC solution increased at all pHs compared to fresh WPC solutions (Fig. 3). For WPC1, at pH 5.0 the viscosity of 13.3 mPas decreased to 11, 8.4 and 6.6 mPas at pH 3.0, 7.0 and 8.6 respectively at shear rate of 37 1/s. Also apparent viscosities were decreased with decrease of protein content of WPC solutions. Viscosities of heated thawed WPC solutions were illustrated in Fig. 4. The results showed significant differences in the viscosities of different pHs heated WPC solutions stored frozen as compared to the unfrozen control samples. Apparent viscosities were increased significantly of 308, 264 and 269 mPas for WPC 1 at pH 5.0, 7.0 and 8.6 respectively at shear rate of 37 1/s. On the contrary, at pH 3.0 the WPC solutions were observed significantly decreased in apparent viscosity as compared to other pHs. The increase in the viscosity of WPC coincide with the degree of denaturation, Kresic *et al.* (2008) and Meza, *et al.*, (2009) which was confirmed in the present study. The impact of protein denaturation on the development of high apparent viscosities is noticeable. Conceivably, heat treatments of WPC solutions led to some protein denaturation, rendering the proteins more pronounced to pH. (Rattray & Jelen 1995). Fig. 5 and 7 showed the apparent viscosity of WPC solutions after two and three months of frozen storage. Apparent viscosity was increased with increase shear rate. No significant differences in viscosity values were recorded between WPC solutions after two or three months from freezing storage.

Apparent viscosities of heated WPC solutions after two and three months of freezing storage were illustrated in Fig. 6 and 8.

After two months of freezing storage significantly differences were obsereved in apparent viscosity of heated WPC solutions as affected by protein content and pHs (Fig. 6). Viscosities values of WPC1 (highest protein content) record of 8.2, 39.6, 62.4 and 107 mPas at pHs of 3.0, 5.0, 7.0 and 8.6 at shear rate of 185 1/s. These values decreased to 6.5, 8.0, 9.3 and 6.5 for WPC3 sample (lowest protein content) in the same order. The presence of large number of high molecular weight aggregates increase the resistance to flow which, in turn, increases the apparent viscosity (Rattray and Jelen, 1995).

On the other hand, further freezing storage to three months led to increase in the viscosity values of 13.8, 18.7 and 18.5 mPas for heated WPC2 and of 7.0, 10.1 and 8.3 mPas for heated WPC3 at pHs of 5.0, 7.0 and 8.6 respectively (Fig. 8). On contrary, apparent viscosity of heated WPC1 was decreased to 49.0, 64.0 and 56.0 mPas compared to that finding in two months of freezing storage.

From the summarized over all viscosities results showed that the apparent viscosities of unheated WPC solutions exhibited a time-independent non-Newtonian character what should be considered as shear-thickening (dilatants) properties. In this type the increase in shear rate results in an increase in apparent viscosity (Kresic et aL. 2008). On the other hand, heated thawed WPC solutions were found to be thixotropic fluids as there was a decrease in the apparent viscosity with increasing shear rate. Generally viscosities results showed that the apparent viscosities of unheated and heated WPC solutions greatly affected by protein content and pH degree. The investigation carried out on the WPC of different protein concentration (Lelas and Herceg, 2002), revealed that the intensity of mentioned increase of water binding properties is proportional to protein concentration.

4. Conclusion:

From the obtained results it can be concluded that frozen storage increased the denaturation degree and viscosity of WPC. However, the protein content and pH play a role in the observed changes in the denaturation and viscosity of stored WPC.

Evolution and Development Towards 4th Generation (4G) Mobile Communication Systems

M. Junaid Arshad, Amjad Farooq, Abad Shah
Department of Computer Science and Engineering, U.E.T., Lahore-Pakistan
junaidarshad@uet.edu.pk amjadfarooq@uet.edu.pk abadshah@uet.edu.pk

Abstract: It is the need of hour to get ourselves acquainted with the communication technology, its tools and its trends. Mobile communication is an important technology in this regard and mobile phone has become the most common tool of communication over the recent years. As several innovative improvements regarding mobile communication technologies have been made by developing various multiple-access schemes used for wireless communication (such as TDMA, FDMA, CDMA, WCDMA, EDGE etc) but a big challenge is to select the right technology for the applications and systematically identify the factors that influence the overall performance. In this research paper, we present the detail comparison of the different generations of the mobile communication technologies in a tabular form to have a better knowledge and understanding in the advancement of mobile communication systems. The survey presented here will be helpful for designing the new strategies for the development of 4th generation mobile communication systems. This research work can steer all those learners who are trying to enhance their acquaintance in the field of mobile communication system, and also for such mentors and researchers who desire to have a foundation for further research and study in this field. [Journal of American Science. 2010;6(12):63-68]. (ISSN: 1545-1003).

Keywords: Mobile Communication, Evolution, Generations, Comparison, Wireless Technologies

1. Introduction

The Internet is the network of large-scale group of connected computers around the world that sends out data using packet switching technique based on the TCP/IP stack. (Wright and Steven, 1995) With a continuous improvement in the field of communication technologies (ITU-R, 2000) and infrastructures by means of enhancing the functionalities of the wired/wireless protocols, the Internet has achieved the massive success and popularity. Over the time with the growing and accelerating progresses in communication patterns (wired and wireless) and wildly demands for spare capacity and connectivity, the Internet in almost every aspect frequently experiences modifications and changes in order to bring up-to-date. Along with the requirements supporting the Internet has been an implausible progress in the field of wire-less and mobile technologies. Since during the last few years, a countless fast improvements have been observed in the area of mobile and wireless technologies, and these two drastically rising user-driven service demands have significantly and intensely revolutionized the spirit and nature of worldwide telecommunications (Freeman and Roger, 2004) in these millenniums and have developed the modern telecom territory.

In this research work, we present the detail survey of the different generations of the mobile communication systems and our purpose is not to choose a victor because many of the technologies are still in progress. Somewhat, we anticipate to get in detail knowledge of the situations wherein different technologies would work better, and the sources of performance degradation.

The remainder of this paper is structured as follows. In Section 2, we give an overview of the different wireless technologies. In Section 3, we present the comparative analysis of 4th generation mobile communications system to the earlier generations (i.e., 1G, 2G and 3G) and progressively analyze their characteristics, and elaborate the various visions for the future utilization of 3G and 4G technologies. Finally in Section 4, we present the conclusions of this work.

2. Review of Literature

2.1 Introduction to 1G, 2G, 3G and 4G

The list of wire-less air interface protocols which follows signifies the most familiar standards in exercise around the world nowadays. They're structured almost by means of generations (i.e., 1st G, 2nd G, 3rd G and 4th G) of development and include various derivations or alternate terms used to describe them.

1st Generation (1G): 1G of technology was analog (voice-only) i.e., 1G wireless phones exercised analog technology. These devices were weighty and exposure was unreliable, however they effectively

presented the inherent easiness of mobile communications.

2nd Generation (2G): The 2G of technology is digital – in the United States, mostly devices & services are digital. Digital cellular services are vastly deployed world-wide. They presented a significant development in the quality of voice (since analog information is much subject to distortions as that of digital information) and enhanced capacity as well, as voice calls in a more efficient way can be multiplexed. It provides the different services like some degree of web-access facility, digital voice calling and short message service (SMS). The GSM, TDMA and CDMA are the few cell phone standards of 2G.

3rd Generation (3G): The 3G (Smith et al., 2000) of wireless technology is committed to provide reasonably speedy wireless communication to support more useful services such as data, video and multimedia as well as voice. The wire-less mobile communication technology in it's present form is often known as 2.5 G (Gozalvez et al., 2001) (called EDGE technology) but simply existing right networks of 3G in the United States are EVDO & UMTS (with HSPDA) offered by (Sprint/Verizon) and Cingular carriers, respectively. The 3G offers next to future advances into the business/private wire-less technology, particularly in a field of mobile communications and some expected capabilities and features of 3G systems are:

- Enhanced features for multimedia communications (i.e., digital data & voice, video & remote controls system)
- Supporting to utilize onto all advanced modes (i.e., electronic-mail, fax, paging, cellular-telephones, web-surfing, video-conferencing etc)
- Extensive bandwidth & high-speed capability (upwards of 2 Mbps)
- Providing flexibility for Routing(repeaters, satellites, LANs etc)

4th Generation (4G): The 4G (Woerner, 2001) of wireless technology is still underway and stands to be the upcoming wireless devices standard. The key difference between 4G and 3G technologies is the improved data transfer rates and security, like it is for 3G over 2.5G or 2G. The 4G is looked forward to offer more enhanced versions of the same advancements promised by 3G (e.g., improved-multimedia, video-streaming, global-access and worldwide-portability through all kinds of devices).

Normally, a generation is defined by the result of technology grows over a time-frame of ten-to-fifteen year, hence, 4G would turn to whatever is deployed in the 2010 period onward, supposing 3G exploitation covers the 2000-2010 period.

Somewhat, 4G would provide customers with on demand first-class video and audio by utilizing OFDM (Robertson, 1999) (Orthogonal Frequency Division Multiplexing) technique and would able to better allocate network resources to multiple clients by making use of multiple channels simultaneously. Unlike the 3G networks which are a mixture of packet-switching and circuit-switching networks, 4G (Hui et al., 2003) will be based on packet switching only and might actually connects the whole world and be operable from any place above or on the surface of the globe.

2.2 Code Division Multiple Access (CDMA)

CDMA (Gharavi et al., 2001) is a type of multiplexing which doesn't share the channels by frequency or time (like FDMA or TDMA), however it en-codes information by some unique codes related to each channel and exploits dynamic interferences effects of a particular code to do multiplexing. In addition, it refers to a digital cellular telephony system which utilizes these multiple access schemes. CDMA has since been applied in a number of communication systems (i.e., Omni-TRACS satellite system (Freeman et al., 2004) and Global Positioning System (GPS) (Hatch et al., 2002)). Figure 1 presents a general architecture of a CDMA system.

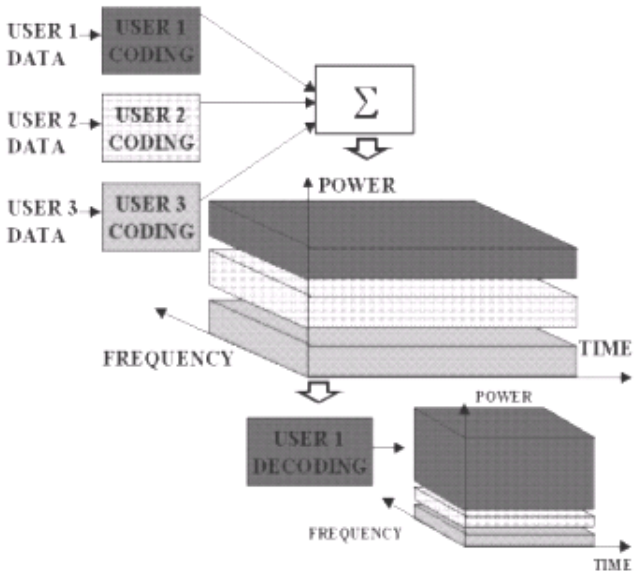

Figure 1. Working of CDMA system

2.3 Wideband Code Division Multiple Access (WCDMA)

WCDMA (Bidaud, 2001) is a type of wideband digital radio-access technology. In 1998, the European Telecommunications Standard Institute (ETSI) used it to support 3G multimedia applications for wideband digital radio-access. WCDMA offers an innovative service capability, improved network speed and low-cost for services (data and voice) compared to 2G technologies. It is the foremost worldwide 3G-standard preferred by eight of the world's ten largest service-providers. Operators can softly progress from GSM on the way to WCDMA, hence saving investments via reutilizing the GSM setups and services (Gozalvez et al., 2001).

2.4 Global System for Mobile Communications (GSM)

For mobile communications the most well-liked standard in the world is GSM (Bach, 2000). More than 2-billion people across the world (over 250 countries/territories) use the services offered by the GSM. It distinguishes much from its ancestors given that collectively speech and signaling channels are digital, indicating that it is assumed as the 2G mobile communication system. GSM now becomes an open standard that is presently proposed by the 3GPP. According to the consumer judgment, the GSM system's main advantage has been high-quality digital-voice channels and reduced price alternative to make calls (like SMS) and from a network operator prospective, it has been the potential to employ equipments as of various providers as the open standards accepts simple inter-compatibility. In addition, these standards permitted networks providers to allow roaming facilities that means the customers can utilize their phones whole across the world. Figure 2 illustrates the general architecture of a GSM system.

2.5 General Packet Radio Service (GPRS)

The GSM mobile phones users get benefit from a new mobile data service called GPRS (Bratton et al., 2001). The GPRS is an imperative step in the evolution of 2G mobile systems towards 3G systems. It offers a reasonable data transfer speed, via utilizing unoccupied TDMA channels in the GSM networks. It provides friendly billing system, high capacity channel and reduced call setup time. The GPRS system is optimized for the packet switched data networks and is transition totally from the cellular network of circuit switched to packet switched. Figure 3 describes the general architecture of a GPRS system. GPRS improves GSM data services providing:

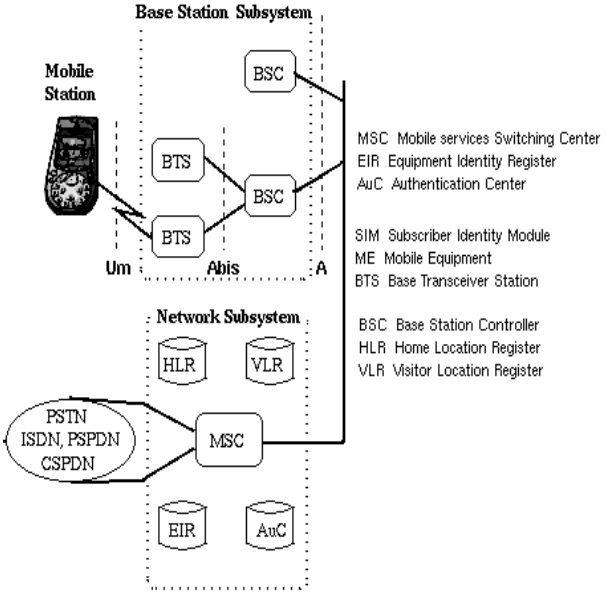

Figure 2. GSM system's architecture

- offer variety of services at reasonably low-cost to support flexible co-existence using GSM voice
- provide bursty traffic support
- possible support for connectivity to the Internet
- providing fast-access time
- utilize network and radio resources efficiently

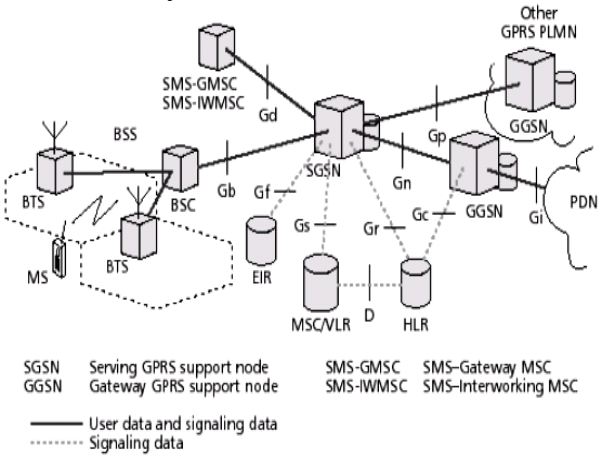

Figure 3. GPRS system's architecture

3. Comparison of Technologies

3.1 Tabular Comparison of 1G, 2G and 3G Technologies

Table 1 shows the comparison of the three technologies (i.e., 1G, 2G and 3G) in terms of data services currently offered by the different carriers.

3.2 Tabular Comparison of 3G and 4G Technologies

The 3G is the next step leaving beyond the 2G standards (for instance CDMA and GSM). The important aspects of 3G consist of the skills to merge the cellular mobile networks with the internet, adding multimedia applications to a wireless computer/mobile phone by improving the range and QoS of voice and data services. In near future, the 4G is the upcoming technology of wire-less networks which will switch from 3G to 4G networks. To understand both the technologies more clearly their detail comparison are as follows (Table 2):

Table 1: Comparison of 1G, 2G and 3G technologies

Generation	Technology	Features
1st Generation (1G)	AMPS (Advanced Mobile Phone Service)	Support voice service: Analog, data services: No
	CDMA (Code Division Multiple Access)	Analog Cellular (Discontinued) Speed: 9.2-kbits/sec
2nd Generation (2G)	Time Division Multiple Access (TDMA) Personal Digital Cellular (PDC)	PDC & TDMA (only support one-way data transmission) Offers advance calling options as caller ID Not constantly on data connections
	Code Division Multiple Access (CDMA)	CDMA carriers: Sprint, Verizon Technology: 1xRTT Digital voice service Speed: 128-Kbits/sec
	Global System for Mobile Communications (GSM)	GSM carriers: Cingular, Nextel, T-Mobile Technology: GPRS, EDGE, UMTS Speed: 40-160-kbits/sec
3rd Generation (3G)	Wideband Code Division Multiple Access (WCDMA)	Carriers: Cingular Technology: UMTS Excellent voice qualities About 2-Mbits/s Constantly on data connection
	CDMA-2000	CDMA carriers: Sprint, Verizon Technology: EV-DO Speed: 500-700-kbits/sec Based on the Interim Standards (95) CDMA standards
	Time-Division Synchronous Code Division Multiple Access (TD-SCDMA)	Supports broad-band data services (such as multimedia & video), Improved roaming features

Table 2: Comparison of 3G and 4G technologies

Key Parameters	3rd Generation (3G)	4th Generation (4G)
(1) Speed	**3G has the ability to utilize circuit/packet data at higher bit rates** 144 kb/s or higher in high capacity vehicular-traffic. 384 kb/s for pedestrian traffic. 2 Mb/s or greater for indoor-traffic.	**4G can support data rates up to 20 to 100 Mbps in mobile mode** A developed wireless corporation NTT-DoCoMo is evaluating 4 G tech over 100 Mb/s (when moving) & 1 Gbit/s (when it is still)
(2) Bandwidth	**3G uses 5to20 MHz Bandwidth** A radio signal bandwidth is defined as being the difference b/w the upper/lower frequencies of the signal. The bandwidth amount required for 3G service would be as more as 15to20 MHz.	**4G has the absolute bandwidth-range of 100MHz or above** The bandwidth could be as much as (100MHz) and data could be sent at much highly rates. The data sending cost could be relatively much low and worldwide mobility could be probably 100MHz or above.
(3) Switching Design Basis	**3G is relay on packet switching or circuit switching** A few 3G aspects also utilize packet switching. Circuit switching leads PSTN-public switched telephone network. Networks	**4G utilizes packet-switching** Packet-switching dominating the data-networks such as the internet. Through circuit switching, whole packets send directly towards the receiver in an arranged manner, over a single track in sequence. Remaining

	resources establish calls through the most capable route.	packets from other calls race upon such circuits too, making the mostly use of each path or flow, pretty different the circuit switching calls which engage a single path to the omission of all others.
(4) Access Technologies	**3G utilizes CDMA-2000 & WCDMA as access technologies** WCDMA offers speeds b/w 384kb/s & 2Mb/s. If this protocol is deployed over a WAN, the maximum-speed is 384kb/s. If it is employed in a LAN, the upper-speed is 2Mb/s. It is approved also by the ITU. The others important 3G standards are CDMA2000 that is product of the initial 2G CDMA IS-95 standard. The different transmission technology utilized in CDMA2000 that are 1xRTT, CDMA-2000-1xEV_DV & 1xEV_DO.	**4G is based on OFDM/OFDMA** 4G uses OFDM/OFDMA to better distribute networks resources among the available users. 4G enable equipments permit to utilize available bandwidth and to make utilizing multiple channels parallely. In OFDM, pulse making task & modulation can be done via an easy IDFT that can be deployed much better as that of IFFT. Thus, in the receiver we requie only a FFT for reversing this process.
(5) Frequency Band	**Country dependent/continent (1800to2400 MHz)** In Europe, the satellite services utilize the 1980to2010 MHz for uplink-bands & 2170to2200 MHz for downlink. In United States, 45MHz of capacity in the 1710to1755 MHz band & 45MHz of space in the 2110to2170 band for 3G applications are available.	**High frequency bands capability (2to8 GHz)** Mobile communication 4G systems will have to exploit the frequency band as competently as feasible, with the minimum possible transmission power.
(6) Network Architecture	Cell-Based Wide-Area (WAN)	Wire-less LANs Hybrid Integrations (WiFi/Bluetooth) & Wide Area
(7) Forward Error Correction	Convolutional rate: (1/2), (1/3)	Concatenated Coding Schemes
(8) Component Design	Optimized antenna design, multi-bands adapter	Smart Enabled Antenna, softwares multi-bands & wide-band radio
(9) Major Requirement Driving Architecture	Pre-dominantly voice driven: data was constantly add-on	Converged data & VoIP (Voice Over IP)
(10) Internet Protocol	Numerous air link protocols, plus IP 5.0	Up to (IP 6.0)
(11) Backup Compatibility	3G CDMA-2000 is backward compatible to the 2G IS-95 standards. It supports less compatibility.	4G enhances the 3G capacity/capability by an order of magnitude.
(12) Market Overview	**(a) Lacks of Demand** The 3G services market diffusion has been slow as estimated initially because of fewer demands for developed services lately exploitation by the service providers & challenges relevant to QoS and convergence. **(b) Other Challenges** Other challenges are operational costs that are considerably greater than in a 2G/2.5G operation and doubt surrounding nearby demand for non-voice qualities	**(a) High-Speed Multimedia Service Demand** **(b) Fixed-Mobile Convergence** **(c) Issues of Spectrum** **(d) Issues of Standards and Certification** **(e) Technological Challenges** **(f) Alternative Services/Applications for 4G**
(13) Mobile Top Speeds	200 kilometer per hour	200 kilometer per hour
(14) Cost Comparison	It's working costs that are considerably larger than in a 2G-2.5G system and doubt nearby estimate requirement for non-voice qualities.	At this phase, no certified 4G networks devices have been commercialised that's why costs are not determined. Though, it is sensible to guess that unverified latest technologies will initially be a focus for less demand hence, costs will be comparatively large & will only reduce slowly as demand raises. Because of the beginning price of CPEs, 4G vendors are assuming to provide leasing contracts.

4. Conclusions

In this research work, we have surveyed four wireless technologies namely 1G, 2G, 3G and 4G. We conclude that the 4G mobile technologies will stimulate subscriber interest in broadband wireless applications because of its ability and flexibility towards the world of wireless mobile communications. A concentrated effort seems to categorize how wire-less mobile technologies can accompaniment a more user focused world of wire-less. Finally the report elaborates the different Mobile Communication Technologies that have been developed in the past and their evolution and development towards 4th generation communication systems. Their detail comparison with each other has been discussed to have a better knowledge and understanding about the technological advancement made towards the evolution and development of 4th generation communication systems. In this research work, we have tried to gather as much information as possible and assemble it in such a manner that the reader can gain maximum knowledge of the topic.

A Layered approach for Similarity Measurement between Ontologies

Amjad Farooq, M. Junaid Arshad and Abad Shah

Computer Science and Engineering Department
University of Engineering and Technology, Lahore-Pakistan
amjadfarooquet@gmail.com

Abstract: With the vision of Semantic Web, the ontology operations such as aligning, merging and mapping have gained much importance. The measuring of similarity between concepts of source ontologies is preprocessing of all these operations. Several techniques have been proposed for measuring similarity between concepts based on their lexical, taxonomic and elementary characteristics but a very little attention has been given on their non-taxonomic relations. We have observed that lexically similarity between concepts is mandatory in order to their taxonomic similarity. Furthermore, the taxonomic similarity between two concepts is pre-requisite of their non-taxonomic similarity. This motivates that if the similarity measurement process is made in layered fashion then it will become more efficient. In this paper, a new technique is proposed that includes non-taxonomic relations of concepts along with their lexical and taxonomic characteristics while measuring their similarities. The proposed technique works in a layered fashion that enables the measuring process more efficient. [Journal of American Science. 2010;6(12):69-77]. (ISSN: 1545-1003).

Keywords: Ontology Matching, Lexical Similarity, Taxonomic Similarity, non-taxonomic similarity

1. Introduction

Nowadays the web has become the main source of information but the semantic heterogeneity is its main bottleneck in the retrieval of relevant information. The semantic web proposed its solutions but still the problem is not fully solved. Semantic web is mainly based on ontologies whereas ontologies themselves suffer from heterogeneity when simultaneously used in some integrating processes such as merging, aligning and mapping. Those ontologies may contain some lexically similar concepts belonging to different context and likewise some contextually similar concepts may have different roles or granularities in their respective ontologies (Farooq and Shah, 2010). When such ontologies are required to reuse simultaneously in some operations for sharing and acquiring of information, the heterogeneity usually arises and then it is required to find the similarity between their concepts to handle the situation.

With respect to ontology, a concept is defined as a class of objects or individuals with some common elementary, taxonomic and non-taxonomic characteristics. A concept has a certain name with some synonyms. Usually, it is known by its taxonomic characteristics (parents, children and siblings), and the non-taxonomic characteristics it keeps in a certain domain in addition to its name or synonyms.

Motivations

- Usually a concept is known by the role it keeps in its respective domain rather than by its parent, sub and/or sibling concepts, therefore the similarity of concepts based on their roles should be properly measured.
- Some pairs of similar concepts are discarded during the measuring of their taxonomic similarity because they have un-similar immediate parent, sub or sibling concepts. This motivates that there is a need of change in the measuring process of taxonomic similarity.
- Some pairs of similar concepts are discarded during the measuring of their lexical similarity because the terms used to name them are not similar. This motivates that there is a need of change in the measuring process of lexical similarity.
- There may some concept those are lexically similar but taxonomically they are not similar but vive versa is not true. Similarly taxonomically similar concepts may be un-similar with respect to their roles but again the vice versa is not true. This motivates that the measuring process should be in some layered fashioned to make it efficient.

- There should be an integrated language-independent technique for measuring lexical, taxonomic and role-based similarities between concepts of ontologies whereas the measuring process should be at conceptual levels of ontologies to make it language independent.

In this paper we propose an integrated language-independent technique, for measuring similarity between concepts of two ontologies by taking into consideration the above motivations to achieve the following objectives: (a) None of similar pair of concepts should remain undetected or eliminated. (b) The role-based similar concepts between ontologies should be determined. (c) The measure process should be more efficient, complete and realistic.

The paper is structured as follows. The related work is briefly overviewed in Section 2. The proposed technique is given in Section 3 and it is validated through a case study in Section 4. Finally the paper is concluded with future directions in Section 5.

2. Background and Related Work

In lexical similarity, the terms used to represent concepts, are compared. Different techniques such as (i) edit-distance (ii) prefix (iii) suffix and (iv) n-gram as surveyed in (Lee et al., 2001) are used to measure the degree of similarities between terms. A method (Muller et al., 2006) known as edit distance is mostly used for measuring the similarity between two terms. In this method, the similarity is measured based on the number of insertions, deletions and substitutions to transform one term into other. The degree of similarity between two concepts based on their terms can be measured using a metric as proposed in (Madhavan et al., 2001), based on (Muller et al., 2006) and that metric is:

$DoS_{Lex}=$

$$Max(0, \frac{Min(Length(a), Length(b)) - NoOfIDS(a,b)}{Min(Length(a), Length(b))}) \in [0,1] \quad (1)$$

In above Equation, the *NoOfIDS* is a function that returns integer-value equal to the number of insertion, deletion or substitutions to transform term *a* into *b* or vice versa. In some scenarios, the Equation 1 *does not give accurate results* e.g. the degree of similarity between terms *Deptt* and *Department* of respective ontologies *A and B* is 0.25 i.e. these are partially similar according to this equation, although both terms represent the same concept.

The two concepts are rendered similar taxonomically (Miller, 1995; Noy and Musen, 2001; Giunchiglia et al., 2007; Aleksovski et al., 2006) if i) their direct super-concepts are similar; ii) their sibling-concepts are similar; iii) their direct sub-concepts are similar; iv) their descendant-concepts are similar; v) their leaf-concepts are similar and vi) concepts in the paths from the root to those concepts are similar. Irrespective of the structural aligning technique used, we have observed that *certain pairs of similar concepts are categorized dissimilar* because of bias of above mentioned criteria towards those concepts whose siblings-concepts, sub-concepts or direct super-concepts are not similar. Secondly, the roles of concepts represented via non-taxonomic relations are not properly incorporated in the similarity measuring process.

The non-taxonomic relations of a concept represent its roles and in most of domains, a concept is known by the role it keeps. However, in some domains the concepts have no intellectual properties e.g. in ontology of a furniture domain, the concepts like chair, table and desk have only taxonomic (i.e. parent, child, sibling) and elementary (i.e. color, type, etc.) characteristics. For such situation the granularities of concepts should be used for measuring semantic relations.

In (Erhard and Philip, 2001; Lambrix and Tan, 2006; Shvaiko and Euzenat, 2005; Hariri et al.,, 2006), the similarities between concepts are measured based on their taxonomic properties (parents, siblings and children concepts) and the degree of similarity between two ontologies may decrease because of over-looking of some pairs of similar concepts in these approaches. The measuring of similarities of concepts based on different criteria is discussed in (Lambrix and Tan, 2006) where a software package WordNet (Miller, 1995) has been used to measure the semantic similarity between a pair of concepts through their synonyms (Giunchiglia et al., 2007). If the similarity score is above a given threshold then the concepts are considered to be similar. In order to identify semantic equivalence between concepts of different ontologies, only SubClassOf, Generalize, partOf and InstanceOf relationships with predefined semantics have been considered. Several ontology alignment tools are reviewed and a new tool for ontology alignment is described in (Isabel et al., 2007). Mostly these tools have XML-schema orientation. That is, the ontologies are represented into XML trees. XML nodes are taken as concepts. Their similarities are computed on the bases of similarities of their respective parents and sub-nodes.

In (Maedche and Staab, 2002), a set of similarity measures for ontologies at lexical and conceptual levels of their concepts have been proposed. Similarity measures at lexical level compare the terms used for

concepts in ontology but at conceptual level the similarity is computed from hierarchical relations existing between those terms. Schema-based matching techniques and systems have been surveyed in (Erhard and Philip, 2001), in which techniques are grouped into terminological, structural and semantic categories. The terminological techniques are further divided into string-based and language-based categories. Structural category includes all taxonomy-based and graph-based techniques whereas the semantic category includes all model-based techniques such as propositional satisfiability and description logics reasoning techniques. In (Aleksovski et al., 2006), the background knowledge of domain has been used via ontology to determine similarity between concepts of two ontologies, especially for those concepts which are not lexically and structurally similar. A similar work was presented in (Aleksovski et al., 2006), and it has been evaluated by matching a medical ontology to another, while using comprehensive medical domain ontology as background knowledge. The key consideration of this technique is if source ontologies are missing some non-taxonomic or logical relations between concepts, then for those logical relations, the third ontology i.e. the comprehensive domain ontology can be consulted while measuring similarity for those concepts. This technique is well suited for those ontologies having very poor taxonomic and non-taxonomic relations between concepts.

3. Proposed Technique

As stated earlier:

(i) Usually a concept is also known by the non-taxonomic relations it keeps in its respective domain in addition to its other characteristics; therefore the non-taxonomic relation based similarity of concepts should be measured.

(ii) To make result more complete and accurate, the taxonomic similarity of two concepts should be based on the similarity of their respective parents only whereas the similarity of sub and sibling concepts should be relaxed to determine all pairs of similar concepts.

(iii) The lexical similarity should be measured via domain-vocabulary of respective system instead of using existing techniques such as edit-distance, prefix, suffix and n-gram to make result more complete and accurate.

(iv) To make measuring process more efficient, the similarity should be measured in a layered fashion because there is no need to measure the contextual similarity for primarily un-similar concepts. Furthermore, there is no need to measure role-based similarity for those concepts which are contextually un-similar.

(v) There should be an integrated technique for measuring primarily, contextual and role-based similarities between concepts of ontologies whereas the measuring process should be at conceptual levels of ontologies to make it language independent.

The proposed technique fulfills these requirements as said above. It works in three phases as shown in Figure 1. First of all we describe the main terms used in the proposed technique:

Primary similarity may be called as conceptual similarity or 1st level of similarity and it is updated form of lexical similarity. Since in ontologies, the concepts are represented via terms, therefore while measuring primarily similarity we identify the corresponding terms between source ontologies, representing the exactly-same or similar concepts in addition to representing entirely different concepts.

Taxonomic similarity: Two concepts are contextually similar if and only if they possess primarily similarity and there are one or more common concepts in their respective parent-concepts. It may also be called 2nd level of similarity and it is updated form of taxonomic similarity.

Non-taxonomic similarity: This is a 3rd level of similarity between concepts. Two concepts possess 3rd level of similarity if and only they have second level similarity and they have similar roles i.e. their interaction with concepts other than parent, children and sibling concepts, in their respective domains.

The input ontologies are taken in triple-forms where each triple consists of three parts i.e. subject, predicate and object. There are some preprocessing activities of acquiring concepts, their super-concepts and their roles. The details of preprocessing are omitted here just for sake of simplicity. The concepts of source ontologies *A* and *B* are taken into sets CS_A and CS_B as mathematically represented in Equations 1 and 2 respectively.

$$CS_A = \{a_i \mid \forall\ a_i \in A\} \qquad (1)$$

$$CS_B = \{b_j \mid \forall\ b_j \in B\} \qquad (2)$$

Since contextual similarity of two concepts is based on the similarity of their respective parent concepts, therefore in order to it we need the parent-concepts of each concept. The parents of each concept of *A* and *B* ontologies are separately acquired in two sets i.e. C^PS_A and C^PS_B, formally defined as:

$C^PS_A = \{(a_i, p_i) \mid \forall\ a_i, p_i \in A \wedge p_i\ isParentOf(a_i)\}$ (3)

$C^PS_B = \{(b_j, p_j) \mid \forall\ b_j, p_i \in B \wedge p_j\ isParentOf(b_j)\}$ (4)

Similarly, to measure the role-based similarity we need to acquire the roles of concepts. The roles of each concept of *A* and *B* ontologies are separately acquired in two vectors i.e. C^RS_A and C^RS_B, formally defined as:

$C^RS_A = \{(a_i, r_i) \mid \forall\ a_i, r_i \in A \wedge r_i\ isRoleOf(a_i)\}$ (5)

$C^RS_B = \{(b_j, r_j) \mid \forall\ b_j, r_j \in B \wedge r_j\ isRoleOf(b_j)\}$ (6)

Phase-1: Measurement of Primary Similarity

The primarily similarity as defined earlier, is not the same as terminological similarity as reported in literature because we focus is on concepts rather than terms used to represent them.

We measure the first-level similarity between concepts via a domain-specific vocabulary that contains the terms-names, abbreviated-names, synonyms and hyponyms of those concepts. While populating synonyms and hyponyms of a concept the WordNet can be used as helping aid.

The measuring process of first-level of similarity is given in algorithmic form in Figure 1. Let DV be the domain-specific vocabulary of source ontologies A and B whose similarity is to be determined. Each element of *DV* has four components: (i) *name* (term that is exactly the same spelled as concept); (ii) *aName* - the abbreviated-names, (iii) *sName* - the synonyms and (iv) *hName* - the hyponyms of a concept. The output of this phase is a vector containing pairs of similar concepts with semantic relations exist concepts of each pair separately.

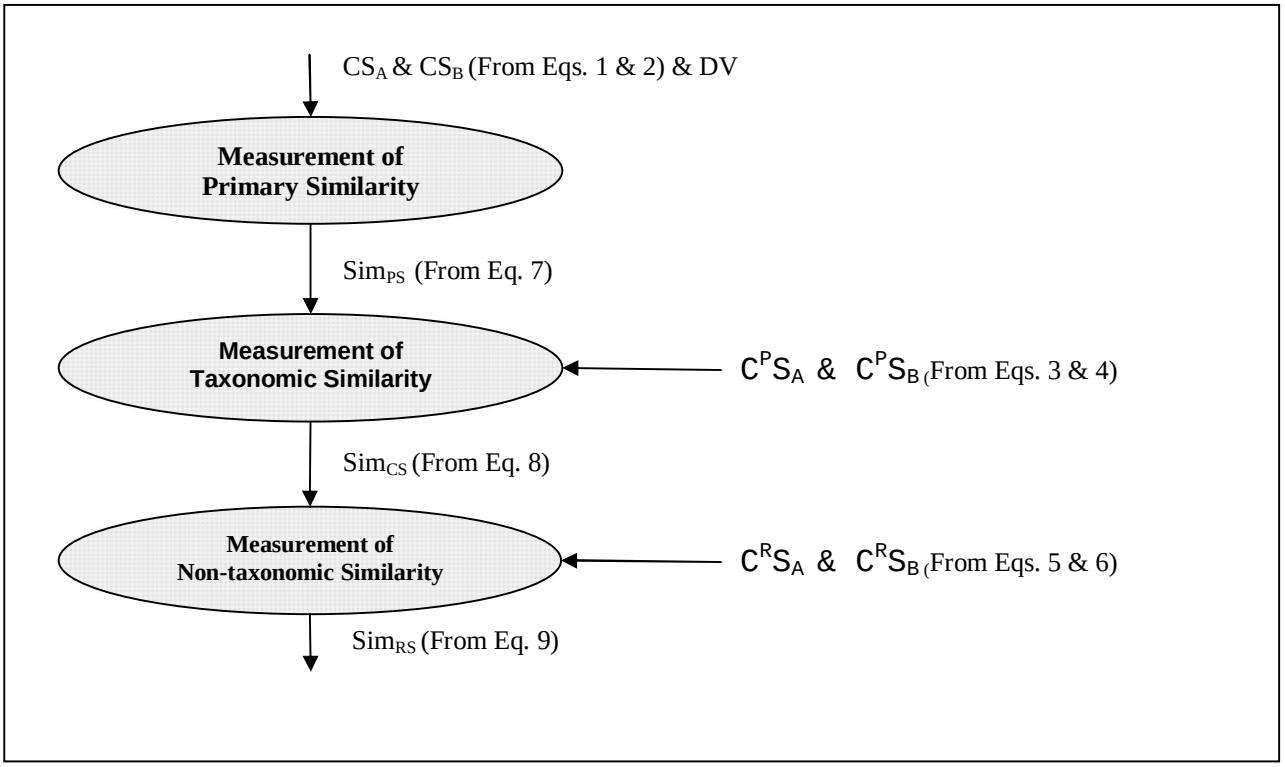

Figure 1: Outline of proposed technique

The terms used for concepts in both source ontologies A and B, as obtained in sets CS_A, CS_B (from Eqs. 1 & 2) is input and a set as formally defined in Equation. 7, containing pairs of primarily similar concepts is obtained as output of this phase. A slice of pseudo code of this phase is given in Figure 3.

$Sim_{PS} = \{(a_i, b_j, SR) \mid \forall a_i \in CS_A \wedge b_j \in CS_B\}$ (7)

The terms a_i and b_j holds a semantic relation *SR* and this may be equal (=), more generic ($\supseteq$) or more specific ($\subseteq$), i.e. ai = bi or ai $\supseteq$ bj or ai $\subseteq$ bj.

$$DoS_{PS} = LexSim(A:ai, B) \ return \ P$$

The *P*, in above expression, is a vector containing pairs of terms a_i and b_j with semantic relation *SR* i.e., $P = (a_i, b_j, SR)$

There may be no b_j exactly similar to a_i, and there may be multiple b_j*s* that are more specific that a_i and/or multiple b_js that are more generic than b_js. In that cases, we have opted two strategies i.e. up-ward and down-ward strategies. In up-word strategy, we choose a pair (a_i, b_j) with *SR* such that b_j is least granular in all b_js. Similarly in down-ward strategy we choose a pair with b_j having the maximum granularity. If there is no b_j similar to a_i then a_i is declared entirely different term. In that case p = (a_i, null, null) will be returned and this pair is not included in the resultant vector and it is simply discarded. For mapping, aligning and merging of ontologies, the correspondence between their similar concepts are required. It is required to find exactly equivalent, and the semantic relations between similar concepts

Phase-2: Measurement of Taxonomic Similarity

This phase takes C^pS_A, C^pS_B (from Eqs. 3 & 4) and Sim_{Lex} (from Eq. 7) as input and returns a set Sim_{CS}, formally defined in Eq. 8, containing pairs of taxonomically similar concepts as output.

$$Sim_{CS} = \{(a_i, b_j, SR) \mid \forall a_i, b_j \in Sim_{PS} \wedge \exists \ isSameParent(C^pS_A(a_i), C^pS_B(b_j)))\} \quad (8)$$

Taxonomic similarity is based on taxonomic positions of a_i and b_j. To measure this similarity, we need to measure the similarity between their respective parents. A slice of pseudo code of measuring process of taxonomic similarity is given in Figure 4.

```
Algorithm: Measurement of primary similarity

Input:  two vectors CSA, CSB (from Eqs. 1 & 2), DV (Domain Vocabulary)
Output: SimPS (From Eq. 7); a vector containing pairs of primarily similar concepts
Begin
For each a in CSA
  For each d in DV
   IF d.name.equal(a)OR d.aName.found(a)OR d.sName.found(a)
   THEN {tempA.add(d.rowId, a, 1); break;}
   Else IF a.hName.found(a)
   THEN {tempA.add(d.rowId, a, 2); break;}
  Next
Next
For each b in CSB
For each a in tempA
IF (a.level=1) AND ( DV[a.rowId].name.equal(a) OR
    DV[a.rowId].aName.found(b) OR DV[a.rowId].sName.found(b)
THEN { SimPS.add(a, b, '='); break;}
ELSEIF (a.level=1) AND  DV[a.rowId].hName.found(b)
THEN      { SimPS.add(a, b, '⊇'); break;}
ELSEIF (a.level=2) AND (DV[a.rowId].name.equal(a) OR
       DV[a.rowId].aName.found(b)  OR  DV[a.rowId].sName.found(b)
THEN { SimPS.add(a, b, '⊆'); break;}
ELSE      // a and b are dissimilar
Next
Next
End
```

Figure 2: A slice of pseudo code for measuring primary similarity

```
Algorithm: Measurement of taxonomic similarity
Input:(i) Two vectors   CpSA, CpSB (From Eqs. 3 & 4);
      (ii) SimPS vector (From Eq. 7)
Output: SimCS (From Eq. 8); a vector containing pairs of taxonomically
similar concepts
Begin
      For each p in LexSim
            parentCa = CpSA.getParents(p.Ca)
            parentCb = CpSB.getParents(p.Cb)
            same = isSameParent(parentCa, parentCb)
            If same Then SimCS.add(p)
      Next
         -  - -
         -  - -
         -  - -
      End.
```

Figure 4: A slice of pseudo code for measuring taxonomic similarity

```
Algorithm: Measurement of non-taxonomic similarity
Input:(i) CRSA, CRSB (From Eqs. 5 & 6);
      (ii) SimTax (From Eq. 8)
Output: SimNonTax (From Eq. 9); a vector containing pairs of non-
taxonomically similar concepts.
Begin
For each p in SimTax
      NTRCa= CRSA.getNTRs(p.Ca)
      NTRCb= CRSB.getNTRs(p.Cb)
      same = isSame(NTRCa, NTRCb)
      If same Then  SimNonTax.add(p)
Next
         -  - -
         -  - -
         -  - -
End.
```

Figure 5: A slice of pseudo code for measurement of non-taxonomic similarity

Phase-3: Measurement of Non-taxonomic Similarity

It is based on roles of concepts. In a domain, usually a concept is known by the roles it keeps, in addition to its parents, children, siblings and attributes. The non-taxonomic relations represent roles of concepts and their parts as well. If some pairs of concepts have no intellectual characteristics then they may have no roles. In that case those pairs of concepts possess third level of similarity implicitly. Figure 5, depicts a slice of pseudo code of measuring process of non-taxonomic similarity.

The C^RS_A, C^RS_B (from Eqs. 5 & 6) and Sim_{CS} (from Eq. 8) is the input and a set Sim_{RS}, formally defined

in Eq. 9, containing pairs of similar concepts based on their roles, is output of this phase.

$$Sim_{RS} = \{(a_i, b_j, SR) \mid \forall a_i, b_j \in Sim_{CS} \wedge \exists isSameRole(C^{R}S_{A}(a_i), {}^{R}S_{B}(b_j))\} \quad (9)$$

4. Case study

Using various ontologies we validated our proposed technique for its both cases i.e. some ontologies may have only taxonomic relations whereas some other ontologies may have both taxonomic and non-taxonomic relations at the same time. Two ontologies about university domain developed by different groups were used. Concepts along with non-taxonomic relations of O_1 and O_2 are listed in Tables 2 and 3 respectively. A set of sample concepts selected from both ontologies is shown in Figure 6. For sake of simplicity, we have just show the similarity status in terms or true of false rather than semantic relation in Table 3.

5. Conclusion and Future Work

The proposed technique measures similarity in a layered fashion. The conceptual schemas of two ontologies are taken as input (technique is language-independent). Concepts with their super-concepts and non-taxonomically relating concepts along with synonyms of concepts are acquired in phase-1. Concepts are short-listed in phase-2, based on their primarily similarity so-called lexical similarity. Only those concepts, short-listed in phase-2, are tried to find their taxonomic similarity i.e. Concepts are short-listed based on their taxonomic similarity in phase-3. Only those concepts, short-listed in phase-3, are tried to find their non-taxonomic similarity in phase-4. We validated the technique by a case study. The current test case study includes small ontologies. Although the similarities between concepts of large realistic ontologies are difficult to obtain however, they are necessary for better evaluation of proposed technique. A framework is needed to realize its full potential and completeness.

ABSTRACT: Anthropogenic activities are a leading cause of metal emission, often associated with high elevated soil and plant metal concentrations. The accumulation of heavy metals and anions in soil and vegetables in the vicinity of Gungulung agricultural site were investigated. Soil samples were collected at depths of 0-5 cm, 5-10 and 10-20 cm. Soil properties including pH, electrical conductivity (EC), organic matter, organic carbon, cation exchange capacity (CEC) and heavy metals content were determined using standard procedures. Vegetable samples (spinach, Amaranthus caudatus; carrot, Daucus carota; lettuce, Lactuca sativa; cabbage, Brassica oleracea; tomato, Lycopersicon sculenetum; waterleaf, Talinum Triangulare and onion Allium cepa were used for this research. The plant samples were prepared for heavy metals and anions determination using standard procedures. Results show that the soil metal content, conductivity and organic carbon decreased with depth, suggesting anthropogenic sources of contamination while pH, organic matter and CEC decreased with depth. The results obtained from this analysis revealed that Zn and Mn show the highest concentrations, Ni shows the lowest levels. Similarly, the results also revealed that Fe, Zn and Cu show the highest concentrations, while Pb shows the lowest levels in the whole vegetables parts studied. The leaves contained much higher concentrations of heavy metals and anions than roots and stems. The concentrations of the above parameters in the vegetable samples were higher than the FAO, WHO/EU and FAO/WHO allowed limit. The high values might be attributed to the use of wastewater from river Ngada and application of sewage sludge by farmers for the irrigation of these vegetables. The results of this study suggest that the vegetables grown in the vicinity of Gugulung agricultural site are subjected to anthropogenic activities. Thus, the high values of these metals in the vegetable samples could put the consumers of these vegetables at health risk with time due to bioaccumulation. 1. INTRODUCTION

Several studies have indicated that vegetables, particularly leafy crops, grown in heavy metal contaminated soils have higher concentrations of heavy metals than those grown in uncontaminated soil (Guttormsen el al. 1995; Dowdy and Larson 1995). A major pathway of soil containing through atmospheric deposition of heavy metals from point sources such as: metaliferous metal smelting and industrial activities. Other non point sources of contamination affecting agricultural soils include inputs such as, fertilisers, pesticides, sewage sludge and organic (Singh 2001). Additionally, foliar uptake of atmospheric heavy metals emissions has been identified as an important pathway of heavy metal contamination in vegetable crops (Salim et al. 1992). Vegetable growing areas are often situated in, or near sources of deposits, and thus have an elevated risk of potential contamination. There have been a number of studies which have investigated atmospheric deposition in soil and/or vegetables growing in the vicinity of industrial areas (Gzyl 1995). These studies indicate high concentrations of heavy metals in vegetables grown in the vicinity of industries and polluted areas and identify leafy vegetables at greatest risk of accumulating elevated concentration. Each plant species has its nutritive requirements differing from others. Thus different plants supported by identical solutions will contain varying concentrations of minor and macro elements. Application of industrial effluent decreases the budding and growth rate of vegetables (Ihekeronye and Ngoddy 1985). Leafy vegetables occupy a very important place in the human diet, but unfortunately constitute a group of foods which contributes maximally to nitrate and other anions as well as heavy metals consumption. The excessive application of nitrogen and other inorganic fertilizers and organic manures to these vegetables can accumulate high levels of nitrate and other anions as well as heavy metals. Consequently their consumption by humans and animals can pose serious health hazards. Although some heavy metals such as Cu, Zn, Mn and Fe are essential in plant nutrition, many of them do not play any significant

role in the plant physiology. The uptake of these heavy metals by plants especially leafy vegetables is an avenue of their entry into the human food chain with harmful effects on health (Ihekeronye and Ngoddy 1985).

Although the nutrient content of wastes makes them attractive as fertilizers, when untreated wastes are used in crop production, consumers risk to contact diseases like cholera and hepatitis, or to undergo heavy metal contamination (Drechsel et al., 1999). In fact, large amounts of the waste comprise organic material, but there are considerable proportions of plastic, paper, metal rubbish and batteries which are known to be real sources of heavy metals (Lisk, 1988; Zhang et al., 2002; Pasquini and Alexander, 2004). Heavy metals and non-biodegradable materials can accumulate in soils to toxic concentrations that affect plant and animal life. Contamination of soils by heavy metals can be caused by many factors such as metal-enriched parent materials, mining or industrial activities, non point sources of metals, especially automotive emission, and use of metal-enriched materials, including chemical fertilizers, farm manures, sewage sludge, and wastewater irrigation (Freedman and Hutchinson, 1981). However, soil contamination by heavy metals and toxic elements due to parent materials or point sources often occurs on a limited area and is easy to identify (He et al., 2005). In agricultural production systems, soil contamination of heavy metals is mainly related to input and accumulation of these elements through repeated use of metal enriched chemicals such as fungicides, farm manures, chemical fertilizers and biosolids (Webber, 1981). Biosolids and/or municipal composts made of biosolids and yard wastes often contain higher concentrations of Cu, Zn, Cd, Cr and Ni than those found in soils (He et al., 2001). Several works have been done in developed countries and showed excessive concentrations of heavy metals in agricultural soils and plants (Alloway, 1995).

The effect of pH on heavy metal availability to plants has been reported by many researchers and it is accepted that as pH decreases, the solubility of cationic forms of metals in the soil solution increases and, therefore, they become more readily available to plants (Gray et al., 1998; Salam and Helmke, 1998; Oliver et al., 1998, Singh et al., 1995; Evans et al., 1995; Filius et al., 1998; Mann and Ritchie, 1995; Chlopecka et al., 1996; Vigerust and Selmer-Olsen, 1985). Evans (1989) explained that pH has a major effect on metal dynamics because it controls adsorption and precipitation, which are the main mechanisms of metal retention to soils. Metal solubility in the solution depends on the solubility product of the solid phase (precipitate) containing the metal.

He and Singh (1993) found that application of sludge increased the cation exchange capacity (CEC) value of the soil (that is the ability of the soil to retain metals). The movement of heavy metals down the soil profile is often evident in high applications of heavy metals, usually in sewage sludge, in soils with low organic matter and clay contents, acidic conditions, and when high rainfall or irrigation water rates have been applied. The movement occurs through soil macropores or cracks which is also referred to as preferential flow (Dowdy and Volk, 1983).

Since organic matter plays an important role in metal binding, some researchers have tested whether organic carbon (OC) compounds influence metal leaching. Fotovat et al. (1996) reported that metals such as Cd, Ni and Zn may be influenced in their solubility characteristics from the presence of OC. LaBauve et al. (1988) applied synthetic waste water to soils and measured the soluble metals. It was found that the synthetic material increased the solubility of metals, especially Cd and Ni, and this was particularly attributed to the soluble organic matter of the waste.

Gongulon is an agricultural site located in Maiduguri Metropolis, Borno State, Nigeria along the coast of River Ngada. Vegetables are grown in this area of Gongulon for commercial purposes. The river receives copious amounts of wastes from residence houses and abattoirs sited along its course. Urban waste management and garbage disposal practices in the city are very poor. Process water from the Municipal waste and Abattoir located near the river contains large amounts of heavy metals. The contaminated water from river Ngada is used extensively for the irrigation of these vegetables particularly at the agriculture site in Gongulon. Hence, this poses significant effect on the soil and vegetable crops thereby exposing consumers of these vegetable crops to bioaccumulation of trace metals and anions with time. This study is aimed at determining the levels of some physicochemical parameters in vegetable and soil samples.

2. MATERIALS AND METHODS

2.1 Sample Areas

Soil and vegetable samples were collected from the agricultural sites of Gongulon located within Maiduguri Metropolis, Borno State, Nigeria. In these areas of study, sewage sludge and waste water from river Ngada are used by farmers to improve soil fertility for the growth of vegetables.

2.2 Sample Collections and Preparations

In the field, soil samples were collected from twelve plots. In each plot, soil samples were collected

at three depths (0-5 cm, 5-10 cm and 10-15 cm), by using spiral auger of 2.5cm diameter. Soil samples from the Agricultural site were randomly sampled and bulked together to form a composite sample. In all cases, soil samples were put in clean plastic bags and transported to the laboratory. Soil samples were then air-dried, crushed and passed through 2mm mesh sieve. The samples were then put in clean plastic bags and sealed. Soil samples were analysed for the following parameters: pH, electrical conductivity, organic matter, organic carbon, cation exchange capacity and heavy metals.

Vegetables (spinach, *Amaranthus caudatus;* carrot, *Daucus carota;* lettuce *Lactuca sativa*; cabbage, *Brassica oleracea*; tomato, *Lycopersicon sculenetum; waterleaf, Talinum Triangulare* and onion *(Allium cepa)* from the Gongulon agricultural site were freshly harvested from twelve farms and packaged into labelled paper bags, and transported to the laboratory awaiting analysis. The vegetable samples were collected and divided into root, stem and leaf. Soil and vegetable samples were collected four times a month from the period of January to July, 2008.

2.3 Soil sample analysis

The pH was measured using a 1:2 soil: water ratio (Mclean, 1982); electrical conductivity was determined using the aqueous extraction (1/5) method (Mathieu and Pieltain, 2003). Organic matter and organic carbon (OC) were determined using Anne method (modified Walkey-Black method) (Mathieu and Pieltain, 2003). Cation exchange capacity (CEC) was determined using standard method taken from Rowell (1994). The cation used in this method to saturate the soil solution is Na. Five gramme (5g) of soil were weighed into a 50 ml plastic centrifuge tube and 30 ml of 1 M NaOAc pH 8.2 were added. The sample was shaken at an end-to-end shaker at $21^{O}C$ for 5 minutes and was then centrifuged for 10 minutes at 4000 rpm. The supernatant was discarded and 30 mL of 1 M NaOAc pH 8.2 was added the sample was resuspended and the procedure was repeated for 2 more times. After the supernatant was discarded for the third time 30 ml of 95 % ethanol solution were added, the sample was resuspended and another 3 cycles were conducted. At the end of the third cycle, 30 ml of NH_4OAc pH 7 were added, the sample was resuspended and a new phase of 3 cycles was commenced. This time the supernatants were filtered through a filter paper, Whatman No 42, and collected into a 100 mL volumetric flask. At the end of this, the flask was made to the volume with NH_4OAc pH 7 solution. The samples were kept at $4\ ^{O}C$ until Na was measured on the FAAS according to standard procedure. CEC value was then determined by the formular

$$\text{CEC, cmol}_c\ \text{kg}^{-1}\ \text{soil} = \frac{10 * \text{Na concentration in mg L}^{-1}}{\text{Mass of sample (g)}}$$

2.4 Determination of Heavy Metals in Soil Sample

Two grammes of the soil samples were weighed into acid-washed glass beaker. Soil samples were digested by the addition of $20cm^3$ of aqua regia (mixture of HCl and HNO_3, ratio 3:1) and $10cm^3$ of 30% H_2O_2. The H_2O_2 was added in small portions to avoid any possible overflow leading to loss of material from the beaker. The beakers was covered with a watch glass, and heated over a hot plate at $90^{O}C$ for two hours. The beaker wall and watch glass were washed with distilled water and the samples were filtered out to separate the insoluble solid from the supernatant liquid. The volumes were adjusted to $100cm^3$ with distilled water. Blank solutions were handled as detailed for the samples. All samples and blanks were stored in plastic containers. The results were expressed in mg/kg dry weight. All statistical analyses were carried out with the program SPSS 12.3 for windows.

2.5 Sample Preparation and Digestion of Vegetables for Heavy Metals Determination

The vegetables samples were weighed to determine the fresh weight and dried in an oven at $80^{O}C$ for 72 hours to determine their dry weight. The dry samples were crushed in a mortar and the resulting powder digested by weighing 0.5g of oven-dried ground and sieved (<1mm) into an acid-washed porclain crucible and placed in a muffle furnance for four hours at $500^{O}C$. The crucibles were removed from the furnance and cooled. 10ml of 6M HCl were added covered and heated on a steam bath for 15minute. Another 1ml of HNO_3 was added and evaporated to dryness by continuous heating for one hour to dehydrate silica and completely digest organic compounds. Finally, 5ml of 6 M HCl and 10ml of water were added and the mixture was heated on a steam bath to complete dissolution. The mixture was cooled and filtered through a Whatman no. 541 filter paper into a 50ml volumetric flask and made up to the mark with distilled water.

2.6 Elemental Analysis of Samples

Determination of Cu, Zn, Co, Mn, Mg, Fe, Cr, Cd As, Ni and Pb in soil and vegetable samples were made directly on each of the final solution using Perkin-Elmer AAnalyst 300 Atomic Absorption Spectroscopy (AAS).

2.7 Determination Of Nitrate, Nitrite, Sulphate And Phosphate In The Vegetable Samples

2.7.1 ***Determination of nitrate and nitrite***

The concentration of nitrate and nitrite analyzed in each of the vegetable samples were carried out using smart spectro Spectrophotometer (LaMotte 2000). Vegetable samples solutions were prepared by chopping each sample into smaller sizes. A known amount (1g) of the chopped sample was transferred into 100ml flask and soaked with 50ml of distilled water. The flask was capped and shaken for 30 minutes, then filtered into another 100ml volumetric flask and the volume made to the mark with distilled water (Radojevic and Bashkin 1999). Nitrate was determined spetrophotometrically using standard cadmium reduction method 3649 – SC (Lamotte, 2000), while Nitrite was determined using standard diazotization method 3650 – SC (Lamotte, 2000).

2.7.2 *Determination of Phosphate*

Each of the vegetables samples was chopped into small pieces. The chopped samples were then air-dried. The air-dried samples were ground and sieved with a siever of mesh 1mm. A known amount (1g) of each of the ground and sieved samples was weighed into acid-washed porcelain crucibles. The crucibles were labelled and 5ml of 20% (w/v) magnesium acetate were added and evaporated to dryness. The crucibles were then transferred into the furnace and the temperature was raised to 500^0C. The samples were ashed at this temperature for four (4) hours, removed and cooled in desiccators.

Ten (10) ml of 6 M HCl were then added to each of the crucible and covered, then heated on a steam bath for fifteen minutes. The contents of each crucible were completely transferred into different evaporating basins and 1ml of concentrated HNO_3 was added. The heating was made to continue for 1 hour to dehydrate silica. 1ml of 6M HCl was then added, swirled and then followed by the addition of 10ml distilled water and again heated on the steam bath to complete dissolution. The contents of the evaporating basins were cooled and then filtered through a Whatman no.1 filter paper into 50ml volumetric flasks and the volumes made up to the marks with distilled water (Radojevic and Bashkin 1999). Phosphate was determined using Hach Direct Reading 2000 Spectrophotometer.

2.7.3 *Determination of Sulphate*

For sulphate determination, 5ml of magnesium nitrate solutions were added to each of the ground and sieved samples in the crucibles. These were then heated to 180^0C on a hot plate. The heating process was allowed to continue until the colour of the samples changed from brown to yellow (Kenneth, 1990). The samples were then transferred to the furnace at a temperature of 500^0C for four hours. Magnesium nitrate was added to prevent loss of sulphur. The contents of each crucible were carefully transferred to different evaporating basins. 10ml of concentrated HCl were added to each of them and covered with watch glasses. They were boiled on a steam bath for 3 minutes. On cooling, 10ml of distilled water were added to each of the basins and the contents of each were filtered into 50ml volumetric flasks and the volumes made up to the marks with distilled water (Radojevic and Bashkin 1999). Sulphate was determined using Smart spectro Spectrophotometer (2000).

3. RESULTS

3.1 Soil Properties

The soil properties had a wide range of values for measured soil properties (Figures 1). The soil pH values range from acidic (5.98) to moderately alkaline (7.26) and varied with depth. Conductivity values ranged from 2.03 µS cm^{-1} to 2.54 µS cm^{-1}. Organic carbon ranged from 1.03% to 2.11% and decreased with depth. Cation exchange capacity values were 20.45 to 23.54 C.mol/kg, while organic matter ranged from 8.56 to 10.55 %.

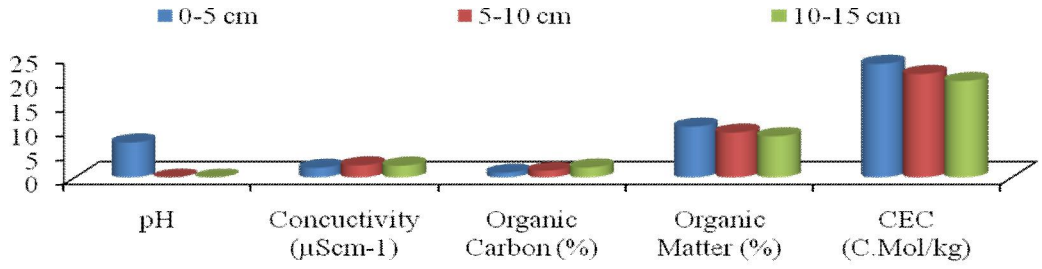

Figure 1: Mean concentration of chemical and physical properties of soil sample from Gongulon agricultural site

3.2 Distribution of Heavy Metals in Soil Profiles

At the Gongulon farming area, heavy metals concentrations increased significantly ($p < 0.05$) with depth

(Figure 2) suggesting anthropogenic sources of contamination. The concentrations of Cr in the soil sample from different depths were 2.21 to 5.32 mg/kg; Co ranged from 0.12 mg/kg (0-5cm) to 3.43 mg/kg (10-15cm). Fe concentrations in the soil ranged from 2.54 mg/kg to 4.21 mg/kg with depth; 0.98 to 1.22 mg/kg Ni; 6.75 to 14.54 mg/kg Pb; 23.75 to 33.92 mg/kg Zn; 8.94 to 15.97 mg/kg Cd; 6.88 to 7.65 mg/kg Cu; 1.03 to 1.76 mg/kg As and 13.76 to 19.96 mg/g Mn.

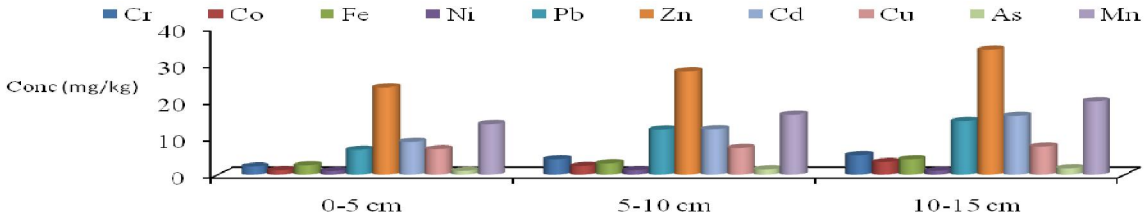

Figure 2: Mean concentration of heavy metals in soil samples from Gongulon agricultural site with depth

3.3 Heavy Metals in Vegetables

The concentrations of heavy metals in all the vegetable samples are presented in Figure 3a and b. The concentration of Cr ranged from 0.12 to 1.02 mg/kg; 0.11 to 0.72 mg/kg Mn; 0.33 to 3.21 mg/kg Fe; 0.11 to 1.21 mg/kg Cu; 0.11 to 0.53 mg/kg As; 0.11 to 2.04 mg/kg Ni; 0.11 to 0.39 mg/kg Pb; 0.11 to 1.44 mg/kg Zn and 0.11 to 0.66 mg/kg Cd.

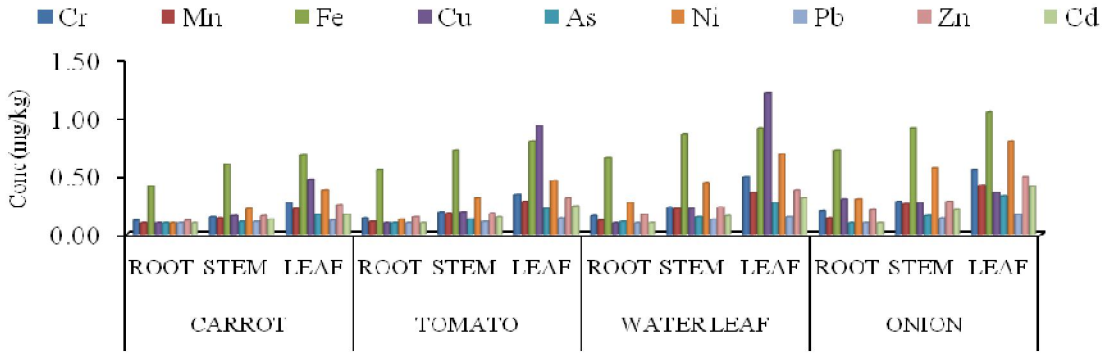

Figure 3b: Mean concentration of heavy metals in differnet of vegetable samples from Gongulon agricultural site

3.4 Anions in Vegetable Samples

The mean concentrations of anions for all the organs of different vegetable samples are as presented in Figure, 4, 5, 6 and 7. The concentrations of sulphate (Figure 4) ranged from 267.67 to 388.76 mg/kg carrot; 678.33 to 989 mg/kg spinach; 456.44 to 807.09 mg/kg lettuce; 378.66 to 487.66 mg/kg water leaf; 312.23 to 411.12 mg/kg cabbage; 217.81 to 294.55 mg/kg tomato and 422.45 to 566.70 mg/kg onion. For phosphate concentrations Figure 5, carrot ranged between 43.45 and 65.34 mg/kg; 134.77 and 187.99 mg/kg spinach; 118.45 and 154.33 mg/kg lettuce; 78.94 and 92.45 mg/kg water leaf; 56.23 and 74.00 mg/kg cabbage; 33.27 and 58.44 mg/kg tomato and 98.05 and 123.68 mg/kg onion. The levels of nitrate ranged from 210.03 to 359.67 mg/kg carrot; 421.22 to 674.22 mg/kg spinach; 322.56 to 587.33 mg/kg lettuce; 234.56 to 388.90 mg/kg cabbage; 289.00 to 412.33 mg/kg water leaf; 177.89 to 288.43 mg/kg tomato and 310.33 to 466.78 mg/kg onion Figure 6. Nitrite concentration ranged between 196.33 and 311.02 mg/kg carrot; 311.21 and 543.54 mg/kg spinach; 277.33 and 453.44 mg/kg lettuce; 211.02 and 398.77 mg/kg cabbage; 263.19 and 387.34 mg/kg water leaf; 167.88 and 281.07 mg/kg tomato and 233.23 and 428.11 mg/kg onion Figure 7. From figure 4, the maximum concentration of sulphate was found in spinach (678.33 to 989.01 mg/kg) and the minimum in tomato (217.81 to 294.55 mg/kg). Phosphate had the maximum concentration in spinach (134.77 to 187.99 mg/kg) and minimum in tomato (33.27 to 58.44 mg/kg) Figure 5. Nitrate content was higher in spinach (421.22 to 674.22 mg/kg) while tomato shows the least values (177.89 to 288.43 mg/kg) Figure 6. Nitrite showed the maximum concentrations in spinach (311.21 to 543.54 mg/kg) and the minimum concentrations in tomato (167.88 to 281.07 µg/g) Figure 7.

4. DISCUSSION

The sequence of heavy metals in the cultivated soil samples from the Gongulon agricultural site was in the order of Zn > Mn > Cd> Pb > Cu > Cr > Fe > Co > As >Ni Figure 1. The concentrations of heavy metals showed spatial and temporal variations, which may be ascribed to the variation in heavy metal sources and the quantity of heavy metals in irrigation water and sewage sludge. This trend suggests that continuous application of sewage sludge and municipal wastewater influenced the soil physicochemical properties (Willett *et al.,* 1984). The levels of organic carbon in the soil sample increased significantly with depth, while organic matter decreased. OC also increased with the increase in the water rate Davis *et al.,* 1988). This may be of significant environmental consequences, because it was shown that higher rates of applied water (irrigation) during the study periods increased the amounts of OC Figure 2, and this also influence the solubility and availability of heavy metals.

Evidence that heavy metals may move in the soil profile was provided by Lund *et al.,*(1976), in their field experiment the researchers used sludge with a high content of heavy metals and found that Zn had moved down to 50 cm, Cd to 17 cm while Ni to 75 cm. Davis *et al.,* (1988) measured the metal distribution in the soil profile in a field experiment where sludge had been applied at a rate of 40 t ha-1 and rainfall rate was around 560 mm per annum over a period of 4 years. They found a significant movement of Cd, Ni, Pb and Zn to a depth of 10 cm. Also Schirado *et al.,* (1986) reported that heavy metals had a uniform distribution in the soil profile to a depth of 1 m, due to their movement. Results such as these tend to have been obtained from the present study, where movement of heavy metals down the soil profile (leaching) to a depth of 15 cm due to application of sewage sludge and waste water from river Ngada were observed Figure 1. The concentrations of heavy metals in the soil samples obtained during the present study were higher than the FAO standard.

Soil pH was significantly greater and degreased with depth. pH is one of the factors which influence the bioavailability and the transport of heavy metals in the soil and according to Smith and Giller (1992) heavy metal mobility decreases with increasing soil pH due to precipitation of hydroxides, carbonates or formation of insoluble organic complexes. In the present study, it was observed that heavy metals increase significantly with decrease in pH ($p< 0.05$) Figures 1 and 2. The soil electrical conductivity (EC) also varied significantly with depth ($p< 0.05$). By comparism, Boulding (1994) classified EC of soils as: non saline <2; moderately saline 2-8; very saline 8-16; extremely saline >16. From the result of the study, the EC is classified as moderately saline. The amount of heavy metals mobilized in soil environment is a function of pH, properties of metals, redox conditions, soil chemistry, organic matter content, clay content, cation exchange capacity and other soil properties (Arun and Mukherjee, 1998; Kimberly and William, 1999; Sauve *et al.,* 2000). Heavy metals are generally more mobile at pH < 7 than at pH > 7. The pH of the soils from the Gongulon agricultural sites ranged from 5.98 to 7.26. This is therefore hazardous for agricultural purposes since crops are known to take up and accumulate heavy metals from contaminated soils in their edible portions (Wei *et al.,* 2005).

Leaves contained higher concentrations of heavy metals than roots and stems. Similar study carried out by (Santamaria *et al.,* 1999) shows that the heavy metal content of various parts of plant differs. They reported that in vegetable organs the concentrations of heavy metals are in the order of leaf> stem> root> tuber> bulb> fruit> seed. Amusan *et al.,* 1999, studied plant uptake of heavy metals on a similar site at University of Ife dump site and reported that Pb uptake by water leaf (*Talinum triangulare*), okra (*Albennucus esculentus*) increased in leaves and roots of water leaf and in the fruit of okra relative to those grown in the non-dump sites. Similar work by Ademoroti (1996) reported that vegetables accumulate considerable amount of heavy metals especially Pb, Cr, Cu and Zn in roots and leaves. The concentrations of heavy metals in all the vegetable samples analysed were higher than the FAO/WHO guideline values of 0.1-0.2 mg/kg Cr, 0.3 mg/kg Fe; 0.1 mg/kg Pb; 0.1 mg/kg Cu; 0.1 mg/kg Zn; 0.1 mg/kg Ni; 0.02 mg/kg Cd and 0.3 mg/kg Mn. Results from present and earlier reports (Liu *et al.,* 2005; Muchuweti *et al.,* 2006 and Sharma *et al.,* 2007) demonstrated that plants grown on wastewater-irrigated soils are contaminated with heavy metals and pose health concern. Absorption and accumulation of heavy metals in plant tissues depend upon many factors. These include temperature, moisture, organic matter, pH and nutrient availability, while the presence of organic matter has been reported to increase the uptake of zinc, chromium, lead, iron and copper in the wheat plant. (Rupa *et al.,* 2003). In the present study many soil factors such as pH, organic matter and organic carbon have interacted to impact on uptake. The acidic range of soil is known to increase the mobilization of heavy metals, thus increasing their uptake. The field data support this argument in that the soil pH was acidic.

The values of sulphate, phosphate, nitrate and nitrite in the vegetable samples show that the leaves are rich in this anion content than other organs studied. Similar study was carried out by Santamaria *et al.,* (1999) stated that nitrate and nitrite contents of

various parts of a plant differ in the order of leaf> stem> root> tuber> bulb> fruit> seed. Zhou *et al.,* (2000) reported that vegetables that are consumed with their roots, stems and leaves have a high nitrate and nitrite accumulation, whereas melons and those vegetables with only fruits as consumable parts have a low nitrate accumulation This observation was also noted by Hunt and Turner (1994) where leaf and stem accumulate the most nitrate, sulphate and nitrite followed by stem and roots. The concentrations of these anions were higher in the leafy vegetables (spinach and lettuce) than in tomato. Results of analysis of variance (ANOVA) showed that variation between vegetables and organs were statistically significant ($p<0.05$).

5. Conclusion

The levels of soil and plants contamination in the agricultural site of Gongulon appear to be as a result of anthropogenic activities within the area. The levels of heavy metals, pH and organic carbon increased significantly ($p < 0.05$) to a depth of 15 cm, while conductivity, organic matter and CEC, decreased to a depth of 15 cm. The results indicate that all the vegetable samples analyzed in this study had high levels of heavy metals. Heavy metal levels were higher than those recommended by Food and Agricultural Organization (FAO) and the WHO/EU joint limits. The high levels of these heavy metals might place the consumers of these and other vegetable crops grown within the vicinity of the area at health risk with time.

Data Networks' Design and Optimization through MPLS VPNs using BGP

Mohammad Junaid Arshad [1], Tauqir Ahmad [2], Amjad Farooq [3]

[1, 2, 3] Department of Computer Science & Engineering, University of Engineering and Technology Lahore, Pakistan
junaidarshad@uet.edu.pk

Abstract: The key strong points of the Internet have been its vast scalability and flexibility to provide accommodation to the variety of applications. In this context, MPLS (Multi Protocol Label Switching) is the newest technology being employed today's in the Internet core, which is continuously growing to meet the increasing demands of bandwidth and connectivity. In this research work, we provide a survey of MPLS, BGP (Border Gateway Protocol) and both layer-2 and layer-3 VPNs (Virtual Private Networks). We address the issues (such as speed, scalability and security) of traditional IP-based VPNs. Since layer-2 VPNs are efficient but not so intelligent and scalable, while layer-3 VPNs are intelligent and scalable but not so efficient. Thus, we propose a new design scheme for MPLS/BGP-VPNs in such a way that the features of layer-3 as scalability and intelligence are merged with the efficiency of layer-2 to deal with today's evolving demands of speed, scalability and security. The proposed design of optimized data networks through MPLS/BGP-VPNs is implemented in Dynagen simulator for the better understanding the system. This research work will be helpful for adding new security features in core networks in future and provides a guideline for network engineers towards the world of network security. [Journal of American Science. 2010;6(12):88-95]. (ISSN: 1545-1003).

Keywords: BGP-Border Gateway Protocol, MPLS-Multi Protocol Label Switching, QoS-Quality of Service and VPN-Virtual Private Network

1. Introduction

The purpose of this work is to analyze and identify the features and advanced requirements of core networks (i.e., MPLS/BGP-VPNs (Previdi, 2000)). MPLS/BGP-VPNs aim to provide secure, reliable and consistent communication. Some of the aspect of the world most popular core networks design is miserably handled and due to which they are being compromised time after time.

MPLS aim to provide enhanced Traffic Engineering (TE) (Awduche, 1999) mechanisms for IP-based networks to facilitate the ISPs for capably monitoring, assessing and fulfilling a variety of service provisions all through their networks backbone. Like L3-VPN PE-based (Rosen et al., 1999) technology, MPLS/BGP-VPN employs BGP for VPN routes advertisement and utilizes MPLS to send VPN packets over the provider backbone networks. MPLS/BGP-VPN has flexible networking modes, good extensibility and convenient support for MPLS QoS (Lee et al., 2003) and MPLS TE (Swallow, 1999), that's why it is extensively employed.

When building a VPN (Ferguson et al., 1998) based on p-to-p overlays, connection-oriented (like ATM or frame relay, tunneling-on-IP techniques) scalability is a main problem, while VPNs based on MPLS are used to address scalability issues (as they are purely designed on the basis of connection-less, peer-based architecture). Since, a customer-site in a peer-based architecture requires the peer simply within a single provider-edge router in place of the entire customer-edge/provider-edge routers which are associated with the VPN that results in the reduction of large number of VCs. In addition, MPLS-based VPNs naturally use connectionless approach. The Internet is to be obliged its worth to its fundamental approach which is based on connection-less, packet-switching network topology (i.e., TCP/IP). Thus, it does not require any prior act to make association possible in a flexible and useful way among the hosts. In an IP-based connection-less setup the traditional VPNs require initial connection establishment process over p-to-p, connection-oriented overlay networks. When it utilizes under a connection-less environment it still can not get benefit from the connection simplification and service expandability offered by connection-less network. In contrast, if a connection-less VPN is built, to guarantee the network privacy the use of tunnels and encryptions are not required, hence it eliminates the considerable complications.

In this work, the basic goal is also to highlight drawbacks in traditional IP-based VPNs (Callon, 2002) and show how MPLS/BGP VPNs (Alawieh et al., 2008) are used to handle these issues. The conventional IP VPNs in core networks have the following issues:

- **Quality of Service (QoS) Problem**

IP-based applications do not have any straight mechanism to state QoS, as many users and clients are uneasy with independently desirable QoS, because it requires extra charging on behalf of additional QoS category adopted. The regulations for policy managing to create QoS are achievable which are related to customers, servers and associations; however, the dilemma is the volume of the organization tasks. A better policy in simple is to give the matter of QoS headed for the whole VPN (e.g., the working of an ATM/frame-relay network etc). But it is hard to do this through IP-based services, for the reason that the OSPF protocols utilized for constructing routing table cannot share QoS statistics, in other words information concerning resource utilization of the specified trunks or nodes.

- **Scalability Problem**

A very large number of associations can be easily supported by a huge VPN network, and lots of millions can be easily supported by the Internet. So it requires a huge number of VCs which generally makes the process so weak. When every service-link-toward-partner relation is evaluated onto a VC, then the networks having C links of service will generate C(C-1)/2 VCs.

- **Security Problem**

Conventional IP-based Virtual Private Networks (VPNs) have been broadly employed all over the world for remote connectivity; however they are usually vulnerable by multifarious client software and complexities in handling the health position of remote clients. A lot of worms and viruses broadcast through these abandoned VPN endpoints causing destruction of the internal security of the networks. Thus with the Internet, one of the most important issue is the VPN's security, particularly for those which depend upon the publicly designed Internet used for transportation. The IP-based network (unlike ATM/frame relay or private-line services) doesn't allocate the constant logical/physical pipes to the special sites, applications or protocols. To address the Internet security, IPSec (Davis, 2001) is the latest IETF (Internet Engineering Taskforce) solution that was initially proposed for the IPv6 (Deering et al., 1998) protocol; however, it has been used in the current's IPv4 networks. Since, it describes a framework for giving a powerful security in support of network transport over the IP-based environments.

1.1 Contribution and Scope of the Proposed System

To meet high-level demands of security and efficiency in the backbone networks, MPLS aim to offer advanced IP network TE mechanisms these will facilitate the ISPs for easily evaluating, examining and meeting a variety of their service necessities a-cross the backbone. By the use of intelligent routers and speedy switches MPLS provides a technique for mapping IP segments with connection-based transport (such as frame relay or ATM) more efficiently. This supports the QoS definition inside the header of MPLS (Rosen et al., 2001; Rosen et al., 1999) as well. Using routing statistics of layer 3, MPLS distributes resources and builds forwarding tables for routing, while it utilizes layer 2 for switching or forwarding the information through the right link or route. Each IP packet includes a label of MPLS which is subsequently linked with a specific entry inside the forward routing table that identifies the upcoming hop. The network-flows with similar requirements for level of service and routing decisions, commonly keep the same pathway/route across the network resulting in a consistency of service-level for network-flows which having higher priority. MPLS is required to deploy the Label Switching Routers (Das et al., 2003) in the networks that will affect the momentum whereupon MPLS based solution is deployed. At the moment, MPLS is at target in favor of deployment in the backbones first.

We have implemented the MPLS/BGP VPNs in such a way that the features of layer 3 as scalability and intelligence are merged with the efficiency of layer 2 to cope up with almost all modern demands of speed, scalability and security. The proposed MPLS/BGP VPN design is implemented in Dynagen simulator (Dynagen, 2007) for easily understanding the system. Dynagen simulator is easily available and supports variety of network designs. In the proposed system five routers are used in which two routers belong to customer network and the rest belong to MPLS core network. BGP is used for route

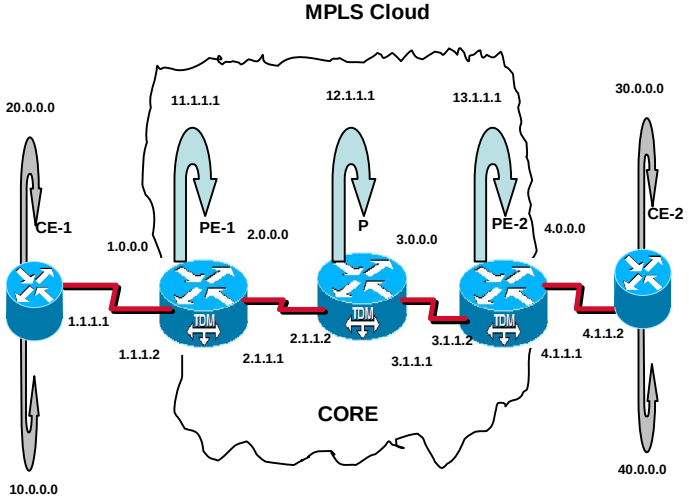

Figure 1. Network Topology

advertisement. After creating MPLS core testing is performed on customer routers which meet stated requirements.

2. MPLS/BGP VPNS Implementation

2.1 Network Topology

The proposed system MPLS/BGP VPN in a network core is implemented using Dynagen simulator in which the network topology consists of five routers that are as follows (also shown in Figure 1):

- CE-1 Customer Edge router at the one end of the network.
- CE-2 Customer Edge router at the other edge of the network.

- PE-1 Provider Edge router by the side of one end of the MPLS cloud. Interface of this router with IP address 2.1.1.1 is a part of MPLS/BGP VPN while the interface with IP address 1.1.1.2 does not belong to VPN.
- PE-2 Provider Edge router by the side of other end of the MPLS cloud. Interface of this router with IP address 3.1.1.2 is a part of MPLS/BGP VPN while the interface with IP address 4.1.1.1 does not belong to VPN.
- P is a Core router.

2.2 Network Configuration

Following configurations are made on each router in the proposed network design as given in Table 1:

2.3 Simulation Results

2.3.1 Operation 1

The following operation (Figure 2) is to perform that the designed MPLS/BGP VPN has been established and showing the VPNs basic feature of security against the unauthorized access. An attempt

to access interface 1.1.1.2 of router PE-1 from CE-1 gets 100 percent success while for the 2.1.1.1 is totally denied. Similarly, all attempts to access router P and 3.1.1.2 interface of PE-2 from CE-1 are refused. But all attempts to access 4.1.1.2 interface of router PE-2 and router CE-2 are again perfectly successful. So, it shows that MPLS BGP VPN exists consisting of three routers.

2.3.1.1 Results

The interfaces of the routers lying within the VPN are inaccessible by any external host but traffic destined through these is communicated properly which is an ultimately key security feature of VPN. As above configuration is of MPLS/BGP VPN so it becomes obvious that MPLS/BGP VPN is a dedicatedly secure channel for traffic transmission.

2.3.2. Operation 2

The following operation shows how labels are assigned to the routes in MPLS based networks (i.e., edge and core routers) and what is the role of these routers in traffic forwarding treat the routes.

2.3.2.1 Router PE-1

Tagging and Label Distribution

The following output (Figure 3) shows the labels being received and forwarded by the provider's edge router PE-1.

MPLS Forwarding & BGP Routing Table

The output displayed in Figure 4 shows the basic operation of provider edge router PE-1. It pops up the tags from all of routes received form P while it tags up the routes properly coming from CE-1 and directly connected to it. It shows the detail of valid and best routs along with their next hops. The presence of VPN named as VPN1 expresses the establishment of Tunnel.

2.3.2.2 Router P

MPLS Forwarding Table

The output displayed in Figure 5 shows the basic operation of provider core, it pops up the tags from all of routes received form PE-1 and PE-2.

Tagging and Label Distribution

Figure 6 and Figure 7 show the labels being received and forwarded by the provider core router P.

2.3.2.3 Router PE-2

Tagging and Label Distribution

Figure 8 shows the labels being received and forwarded by the provider edge router PE-2.

MPLS Forwarding & BGP Routing

The output displayed in Figure 9 shows the basic operation of provider edge router PE-2, it pops up the tags from all of routes received form P while it tags up the routes properly coming from CE-2 and directly connected to it. It shows the detail of valid and best routes along with their next hops. The presence of VPN named as VPN1 expresses the establishment of tunnel.

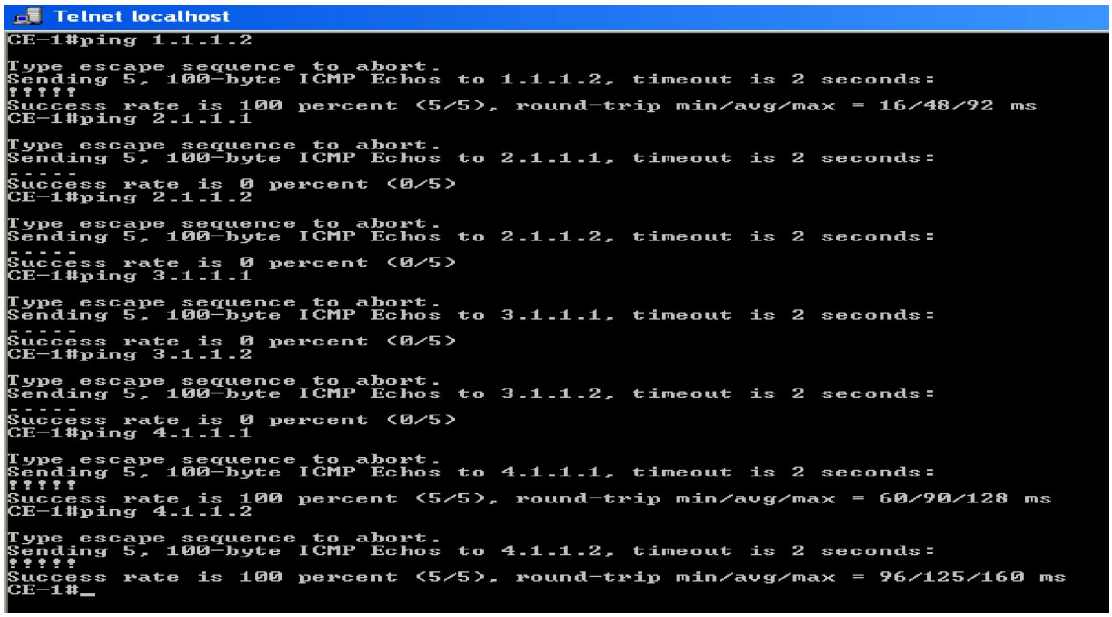

Figure 2(a). MPLS BGP VPN Test

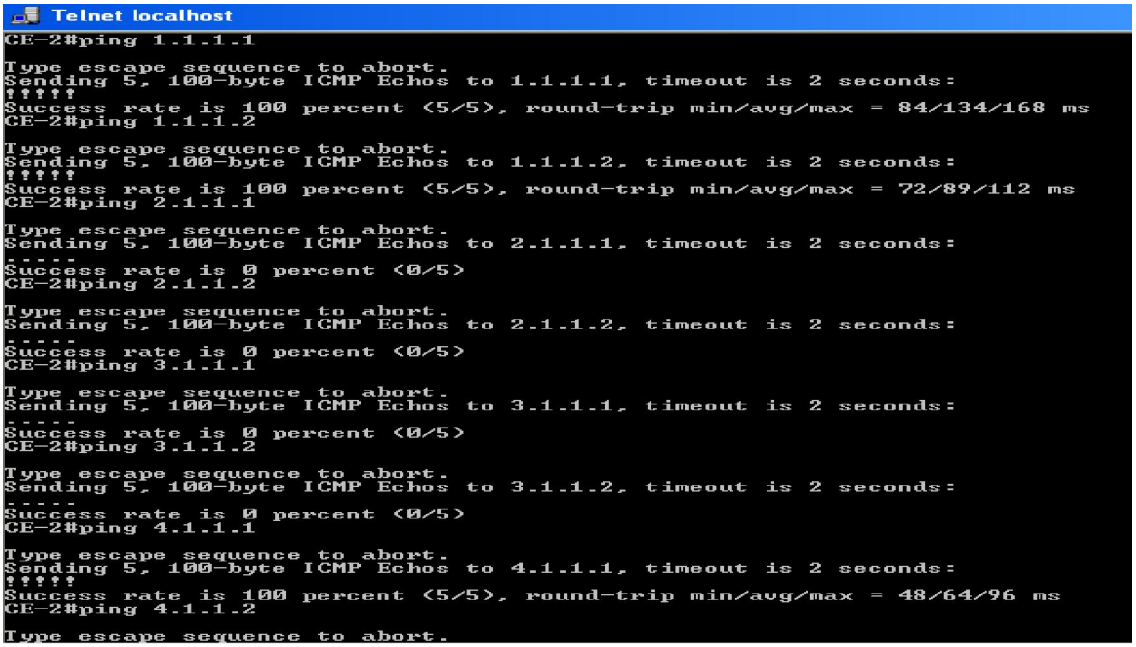

Figure 2(b). MPLS BGP VPN Test

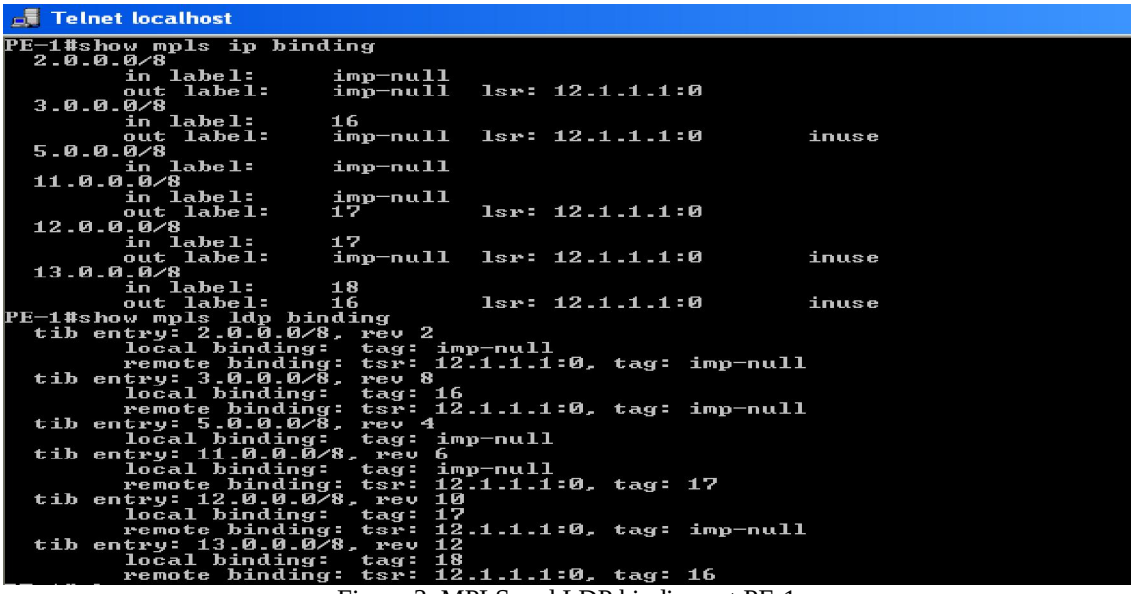

Figure 3. MPLS and LDP bindings at PE-1

2.3.3 Results

- The provider edge router PE-1 assigns labels to its directly connected networks and the traffic coming from CE-1 as starting edge router of MPLS cloud and sends it to core route P. The router which receives the outside traffic at the edge of MPLS VPN and forwards it to the core after labeling is called Ingress Router (IR). Similarly, it pops up the tags of traffic coming from core as ending edge router of MPLS cloud and sends it to C-1.
- The edge router which receives tagged traffic from the core and forwards this traffic after un-tagging is called Egress Router (ER). So PE-1 is ingress for the traffic coming form CE-1 and being forwarded to the core and is egress for the traffic coming from core and being forwarded outside the MPLS cloud.
- The PE-2 (provider edge router) is ingress for the traffic coming from CE-2 while it is egress for the traffic coming from core.
- The core router just switches the tags which causes a huge enhancement in traffic forwarding.

3. Conclusions and Future Work

In this research work firstly, we have comprehensively presented an overview of MPLS, BGP and, both layer 2 and layer 3 VPNs. In particular, IP VPNs issues such as speed, scalability and security are discussed in detail. Secondly, we have proposed a new design scheme for MPLS/BGP-VPNs by merging the features of layer-3 (such as scalability and intelligence) with the features of layer-2 (such as efficiency and simplicity), to deal with the today's evolving demands of network speed, quality of service, scalability and security.

We have discussed in detail the challenges when these two architectures will be merged to provide another infrastructure and we have also provided the solution to some of these challenges to make this new concept worthy and an asset to the current research world. We have presented a network simulation architecture that helps us to assess the security constraints for MPLS/BGP-VPNs.

Further this research can be enhanced to traffic engineering (TE), end-to-end performance, security and path management. Traffic engineering (TE) includes schemes and methods that are applied to force routed traffic to pass through the network on a path, except one which is selected on the basis of standard routing. This system will be helpful for adding new security features in core networks in future and provides a guideline for network engineers towards the world of network security.

In our future work, we will discuss the various issues regarding the implementation of MPLS/BGP-VPNs in multihomed (Junaid and Saleem, 2010; Junaid & Saleem, 2008) environments.

GRIAS: GUI-Based Real-Time Industrial Automation Software

Mohammad Junaid Arshad [1], Amjad Farooq [2]

[1, 2] Department of Computer Science & Engineering, University of Engineering and Technology Lahore, Pakistan
amjadfarooq@uet.edu.pk junaidarshad@uet.edu.pk

Abstract: Industry has a great importance in the development of a country. These days a country cannot progress and prosper without industrial development. Industrial revolution has changed the fortune of many western countries. In the fast moving world of today, the industrial plants have become very complicated and many new technologies have been introduced in the market to overcome these complications by automating the industrial plants. This work proposes an industrial automation software called GRIAS (GUI-Based Real-Time Industrial Automation Software) that can be used for any industrial plant in which OPC (OLE (Object Linked Embedding) for Process Control) compliant hardware devices are used. This generic software has the ability to interact with an OPC server which is responsible to retrieve runtime data from the hardware device. The data provided by the server can be used by the software to monitor the running industrial plant. It can also be used in critical industrial units where it is very difficult to manually control the machinery. The industry has been looking for such software which can meet up their requirements, thus, this new industrial automation software will surely be able to realize their dreams into reality. The purpose of this automation software is not only to eliminate the perils and hazards involved in industries but also to speedup the process of manufacturing and production in such a way that it is no more error prone. [Journal of American Science. 2010;6(12):96-101]. (ISSN: 1545-1003).

Keywords: Graphical User Interface (GUI), Design, Industrial Automation, Human Machine Interface (HMI), OPC, Solution

1. Introduction and Problem Statement

The sole super power of the world is basically an industrial power. Industry has the importance of a backbone in the economy of a country. In the fast moving world of today, the industrial plants have become very complicated and also very dangerous to the environment and the human life. A single industrial unit which is not functioning properly can prove to be a source of great peril to all human population in the nearby area.

The industrial trends have changed at a very fast pace and these days due to the presence of internet trends are changing on a day to day basis. The industrial trends are in a transition from traditional based business to business transactions, to web based and e-commerce. The most important parameters in the industrial manufacturing are the consumer interaction, product characteristics, rapidity, costs, strategic assets and productions.

The automation software has totally changed the industry trends. These days no industry can think of increase in productivity and competing in the market without the automation software. The automation software provides the competitive edge to the company using it, because it increases both efficiency and the productivity. Traditionally, without the presence of automation softwares, the speed of placing an order was too much. It took weeks to place an order and even months to receive the confirmation.

There are a large number of industrial automation technologies which are widely used in the market to automate an industrial plant/unit. These technologies cannot work in isolation and usually a blend of technologies is used to prepare an automation solution. Some of these are physical interface, data acquisition, databases, GUI/visualization etc. The various vendors have developed various tools which based on any one of these technologies. These tools provide an integrated development environment (IDE) which helps to develop a software solution in a very efficient way. The various software technologies are the SCADA (Supervisory Control and Data Acquisition) (Daneels et al., 1999), Human Machine Interface (HMI) (Hagenmeyer, 2005), OPC (OLE for Process Control) (DeltaV, 2007) and so on.

1.1. Overview of OPC

OPC is an industry standard for hardware devices used in critical industrial units. All OPC devices follow certain specifications which are laid down in the OPC standards papers (Draft-3, 1998; OPC; Zheng et al., 2002). These specifications force all the devices to use the same technology so that any software written for one OPC compliant device should be able to work with another. OPC is based on

OLE technologies. It characterizes standard objects, schemes and functions for real-time information servers (such as historian, PLCs (Baresi et al., 2000), DCS and other software applications). The end users by utilizing the OPC specifications may select the client application which best fulfills their demands. Prior to OPC an end user used particular client software that offered an interface for a specific control device only, but by means of OPC, any client application which is OPC compliant can interface to a control device with an OPC compliant server, thus, the end user finds the best way out for a specific assignment.

In this context, this work also proposes new automation software (i.e., GRIAS) to automate any OPC (OLE for Process Control) compliant device. The GRIAS automation software actually interacts with an OPC server which is responsible to retrieve runtime data from the hardware device. This data provided by the server is used by the software to monitor the running industrial plant. This data may be the temperature in a certain boiler or the pressure at a certain valve etc. The software is also able to generate commands to the hardware device through the OPC server in order to keep the industrial unit under control. These commands may result in lowering the pressure or temperature to a certain degree or the opening of a valve etc.

The GRIAS has two types of users; a higher level user (or the administrator) is able to configure the software for a particular industrial unit. The administrator can also perform certain administrative tasks like creating or deleting the operators and setting their privileges and logins. The second type of user is the operator who is assigned the task of monitoring the runtime data coming from the industrial unit. An operator may also issue the commands if required.

It also includes a manual to provide a systematic and right approach for making and maintaining automation software. The various design steps are explained with the help of market standard UML diagrams. The various use-case, sequence and collaboration diagrams are also included to give a clear view of the functionalities and the sequence in which various actions are taken by the software.

The most important feature of this work is that it throws light on the different development phases of software engineering which are necessary for developing quality software.

Thus, this research work proposes such GUI-Based Real-Time Industrial Automation Software that will be able to control an industrial plant which uses an OPC complaint hardware device. It will be used to monitor the industrial units and issue the required commands on time. This will make the overall process of industrial manufacturing and production very efficient and will certainly reduce the cost of business. Its implications will also include the safety of human lives as everything will be controlled by the software and no human interaction with the industrial plants will be needed.

1.2. Assumptions and Dependencies

In the initial software it will be assumed that the PLC (Programmable Logic Controller) (Baresi et al., 2000) device is available and the OPC server is also available. Since a PLC device is very expensive and a group of students without any funding cannot purchase it, thus it will be assumed that a PLC device is present and working. A simulator will be used instead of a PLC device; the simulator will help to generate the data for the software just like a PLC device produces. The data produced by the simulator will be used by the application and it will appear as if data is really coming from the hardware device that is the PLC.

2. Software Analysis and Design

In this section, data flow diagrams (DFD) are used to represent the flow of data in the system. The zero level DFD in Figure 1 shows the top level view of the proposed system. The first level DFD in Figure 2 then shows the various processes hidden in a zero level diagram and demonstrates the interaction of various external entities with these processes. The next level DFD in Figure 3 represents the processing of data at different levels and interaction of various processes with the data stores.

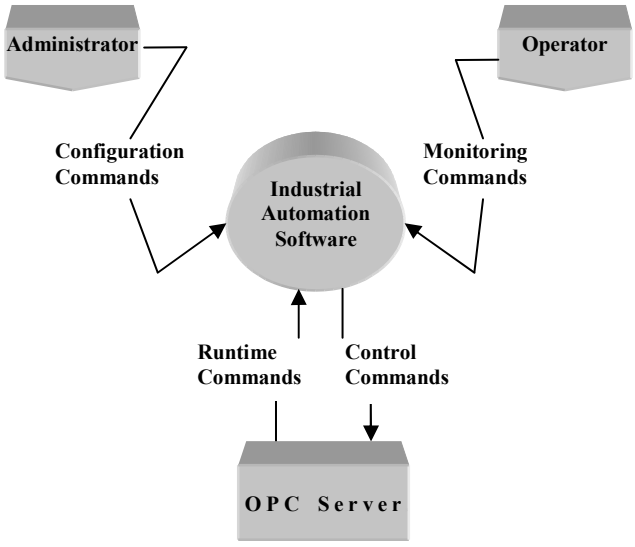

Figure 1. A top level view of the proposed system

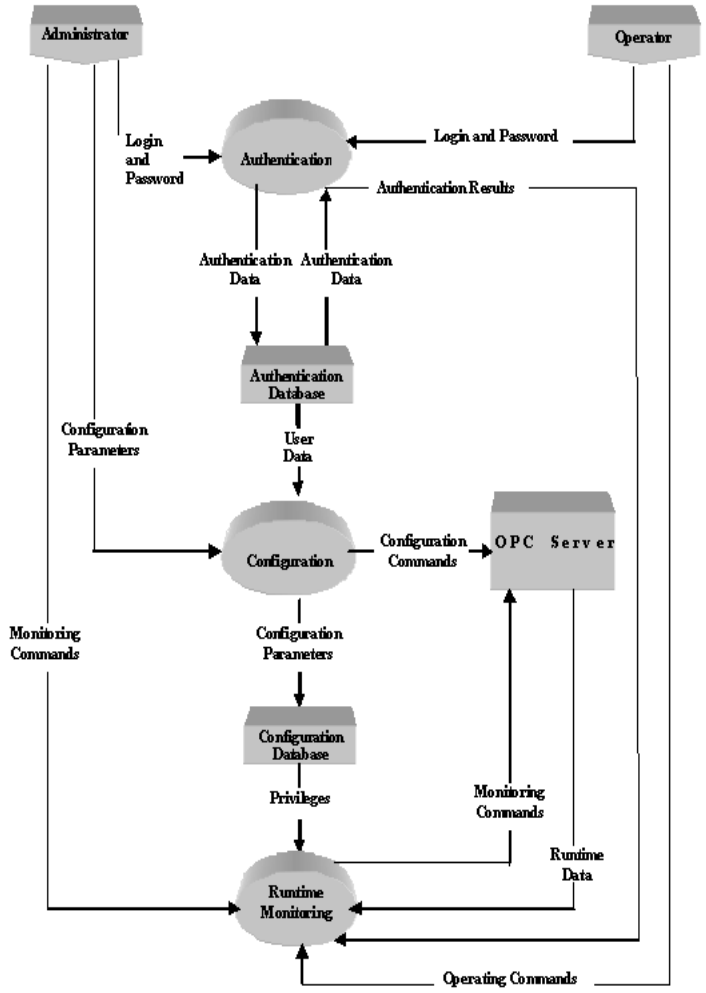

Figure 2. First level DFD of the system

3. Proposed Software's Features

3.1. Object-Oriented Architecture

This software involves some basic steps to build a process. Initially choose the object's type that the developer wants to make from software's big library having display, driver, control & data handling objects. Next, you organize the objects through software's advanced features and lastly you attach these objects. A developer is able to make remote/complex connection, or direct connection which perform calculation or check logical conditions. After creating the objects selected from software's extensive library, all the driver objects are now arranged to write and read from the field hardware attached to your system. You are even able to create a basic process also within an aggregate object to reuse with other processes that save your time.

3.2. Event-Driven Performance

Events drive the industrial automation software, meaning that whenever a change happens, it is instantly reported. As compared to loop-based softwares it responds to events more rapidly.

3.3. Online Configuration Features

A developer can build, modify and stop a process while its application is in progress. With the help of online configuration feature you can perform the maintenance without having any gap in your application data, event, alarm and records.

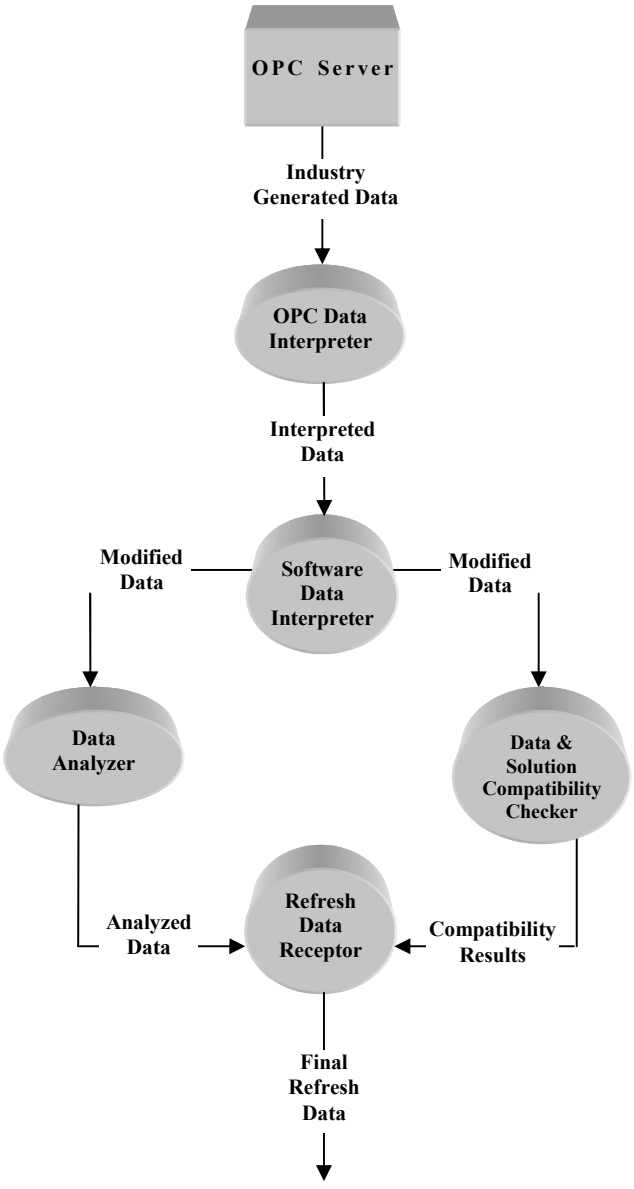

Figure 3. Second level DFD of the system

3.4. Redundancy Capabilities

GRIAS provides enhanced objects which can simply be used to produce urgent backing system to work at the time when the system breakdowns. A developer can apply objects as well to build and sprint several processes as of a single process model–all made the simple Industrial Automation Software way.

3.5. Web Capabilities

It also supports the web-connectivity and by the means of this feature; a developer is able to examine and supervise automation software's process by any workstation connecting to the Internet. You can rapidly construct a basic webpage by means of an easy export module and then via Internet Explorer the client process can be accessed. Also you can generate the HTML reports pages simply for observing.

3.6. Graphics and Visualization

GRIAS offers a simple visual interface for controlling and monitoring industrial applications. It allows the developers to apply graphics to visually illustrate their processes at control panels. This software contains a wide graphics library which includes not only animated figures but static pictures as well that can improve your process via graphically presenting your system and the variations that take place, as shown in Figure 4. Also your own graphics (for example auto-cad documents or photographs) for added customizing can be imported. This automation software also supports .wmf and .bmp files. The graphics and visualization add to the look and feel of the entire application that makes it more attractive.

3.7. Multi-Client/Multi-Server Networking

A developer can attach several computers, which are connected through Industrial Automation Software's server and client processes, as shown in Figure 6. The TCP/IP (Stevens, 1996) networking protocol integrated into Industrial Automation Software to interconnect networks in a simple-way like to drag a data-point on a control-panel view or typing into a URL.

3.8. Security

Automation software allows you to set different levels of security, with varying levels of write/read access derived from these levels of security.

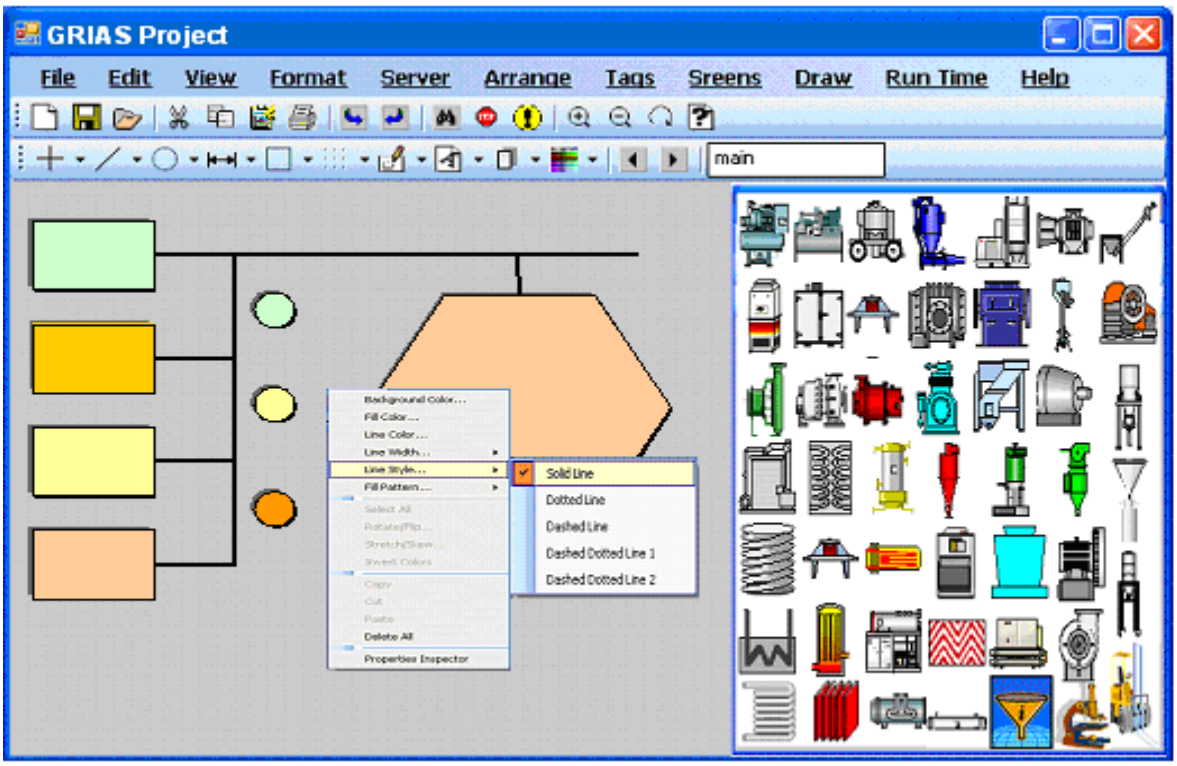

Figure 4. Screen shots of the GRIAS software

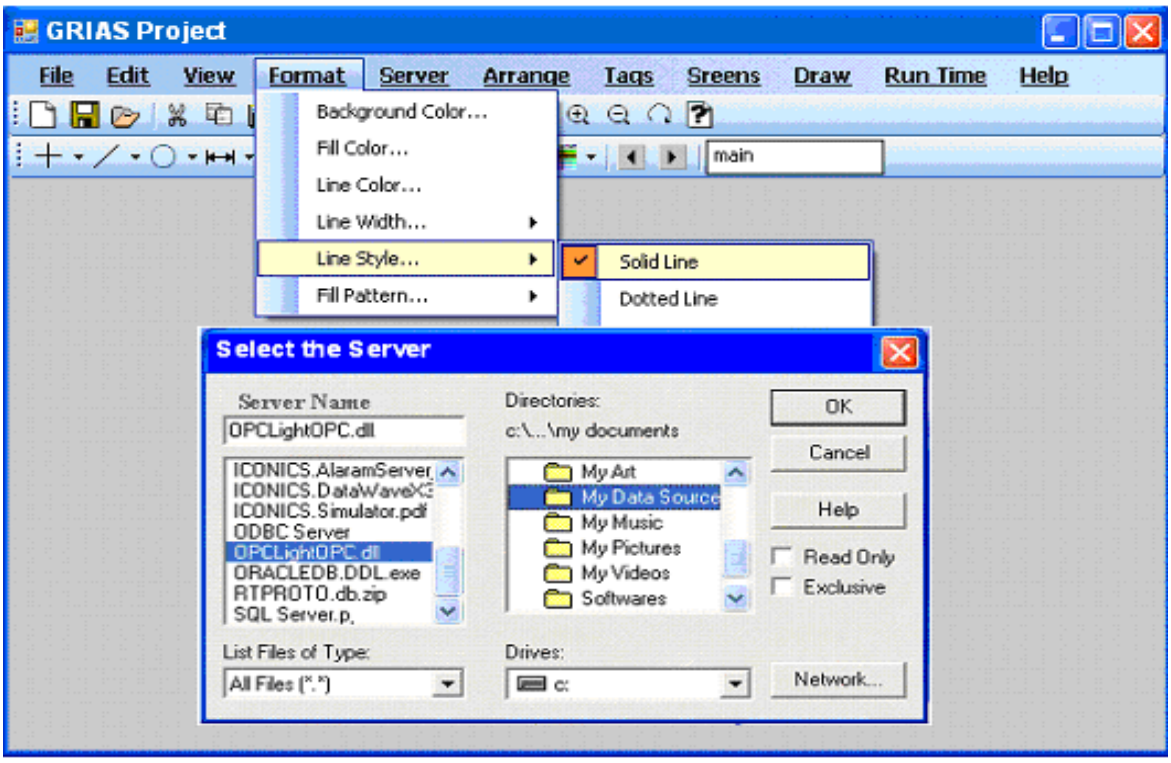

Figure 5. Screen shots for selecting a server

You are able to apply the security options restricting panel to retrieve and view, particular object handling or whether closing or minimizing the Automation Software. You can apply the limit over users and groups accessibility, including permission to a particular folder and individual object. Even you have the authority to impose accessing limit by means of IP-addresses.

In addition, Automation Software includes the following other capabilities:

Distributed Data-Logs- the GRIAS logs event, alarm and data to the software's personal data-base.

Trends & Charts- it facilitates the user to represent the graphics-data from several different sources at once in parallel.

Report Generation- it provides the facility to generate custom reports using your favorite spreadsheet package.

Telemetry- it supports the various protocols to utilize the single serial-port.

Hardware Connectivity- it provides notable integration for National Instruments (NI) hardware, for example, Field-Point & Data Acquisition (DAQ) (Hayles, 2006) equipments.

Technical Support- the software not only performs the automation but also helps in management purposes (e.g., it helps in maintaining session information).

Operating Systems Used- it supports different operating systems according to the requirements of an industry.

4. Conclusions

In this research work, we have proposed the GUI-Based Real-Time Industrial Automation Software to control and maintain an industrial plant which uses an OPC complaint hardware device. We have described the proposed system in terms of its interface to the process hardware and structural design, and presented its functionalities/facilities it provides for application development.

In some developing countries like Pakistan, there are still hundreds of small or medium size industries that are neither automated nor computerized, because they cannot afford to buy such costly automation software currently available in the market. Thus, through the proposed GRIAS software, the small or medium size industry of Pakistan that is running its system manually will be encouraged to use and maintain its system at the least possible cost. That tolerates significant progress in the competitive

development of a country via the use of real-time (and even web-enabled) automation software.

This research work will also be helpful for the researchers or whether you are an IT supervisor in an industrial unit or a novice who is interested in automating his industrial plants to give a boost to his productions.

Arch Dam Failure Diagnosis Applying Micro-Planes Damage Based Framework

Mojtaba Labibzadeh 1

1. Department of Civil Engineering, Faculty of Engineering, Shahid Chamran University, Ahvaz, Iran
Labibzadeh_m@scu.ac.ir

Abstract: A recently new developed set of constitutive equations which simulating the mechanical behavior of plane concrete have been implemented for monitoring the probability of cracking phenomenon within an arch concrete dam . The applied constitutive model was build on the basis of combination of micro-plane theory and damage framework. This model had been verified through comparing numerical results with experimental ones. The case study is a high elevated concrete arch concrete dam entitled Liroo dam. Obtained analysis results demonstrated that under proposed earthquake excitations, dam experiences some cracks near its middle crest. [Journal of American Science. 2010;6(12):102-107]. (ISSN: 1545-1003).

Keywords: Arch dam, Micro-planes, Cracks, Constitutive relations, Concrete

1. Introduction

In the field of structural analysis of concrete arch dams subjected to hydrostatic, thermal and earthquake loads many efforts have been performed until today (Noorzaie, et. al., 2002, Sadrnejad and Labibzadeh, 2006, Labibzadeh et. al., 2010, Labibzadeh and Khajehdezfuli, 2010, Labibzadeh, 2010). However, these analyses mostly done based on the hypothesis of macroscopic stress and strain fields. Mentioned assumption leads to some extent of limitation in obtaining desired level of accuracy of analysis results mainly due to the application of stress and strain invariants in derivation of material constitutive relations. Holding this issue in mind, in this study an attempt has been made to overcome such shortcoming through using a meso scale behavioral model named micro-planes in simulation. Micro planes model has been proposed for the first time by (Taylor, 1938) according to the plasticity model and after that (Bažant, et. al., 1984, 1985, 1988, 1997, 2000) has expanded the micro planes theory with strain softening and showed its ability in explanation of cracking and strain softening damages in brittle materials such as concrete. In this model the main concern is to present behavior of materials of different type in a scale between macro and micro scales called meso scale. In this paper, a recently developed micro-planes damage based model (Labibzadeh and Sadrnejad, 2006, Sadrnejad and Labibzadeh, 2006) has been implemented to failure analysis of an arch concrete dam named Liroo dam. Such a work had been done just one time in the past (Labibzadeh and Sadrnejad, 2007) and satisfactory results had been obtained which demonstrated the applicability of the proposed model. Liroo dam is a high elevated (height of the dam=200m) concrete arch dam which has been designed by Dez-Ab consulting engineers company and it is going to be constructed in north of the Khouzestan Province of Iran in near future.

2. Materials and Methods

Figure 1 outlines the procedure which should be followed to obtain the constitutive modulus matrix used in the fundamental stress-strain relation in material modeling. This flowchart has been pursued through any iteration in a nonlinear iterative solution method used in a developed finite elements code to evaluate the concrete behavior at any integration sampling point. The sequences which must be proceeded to the proposed three dimensional finite elements code have been shown schematically in figure 2. In each load step, the procedure described in figure 1 will be followed through any iteration until craving approximation may be achieved. According to devoted algorithms outlined in figures 1 and 2, a computer program has been developed based on the well-known F.E.M approximation method. This code then would have been implemented for analyzing the Liroo arch dam. The plan of the arches, the crown cantilever and profile of the line centers of the dam were shown in figures 3 and 4. As it can be seen from those two pictures the dam is a two-centered double curvature arch dam. The height of the dam equals to 220m from its base. The thickness of the crest and base of the dam are 10m and 35m respectively. The modulus of elasticity for the mass concrete was inserted as 25000 MPa into program and Poison's ratio was considered as 0.17.

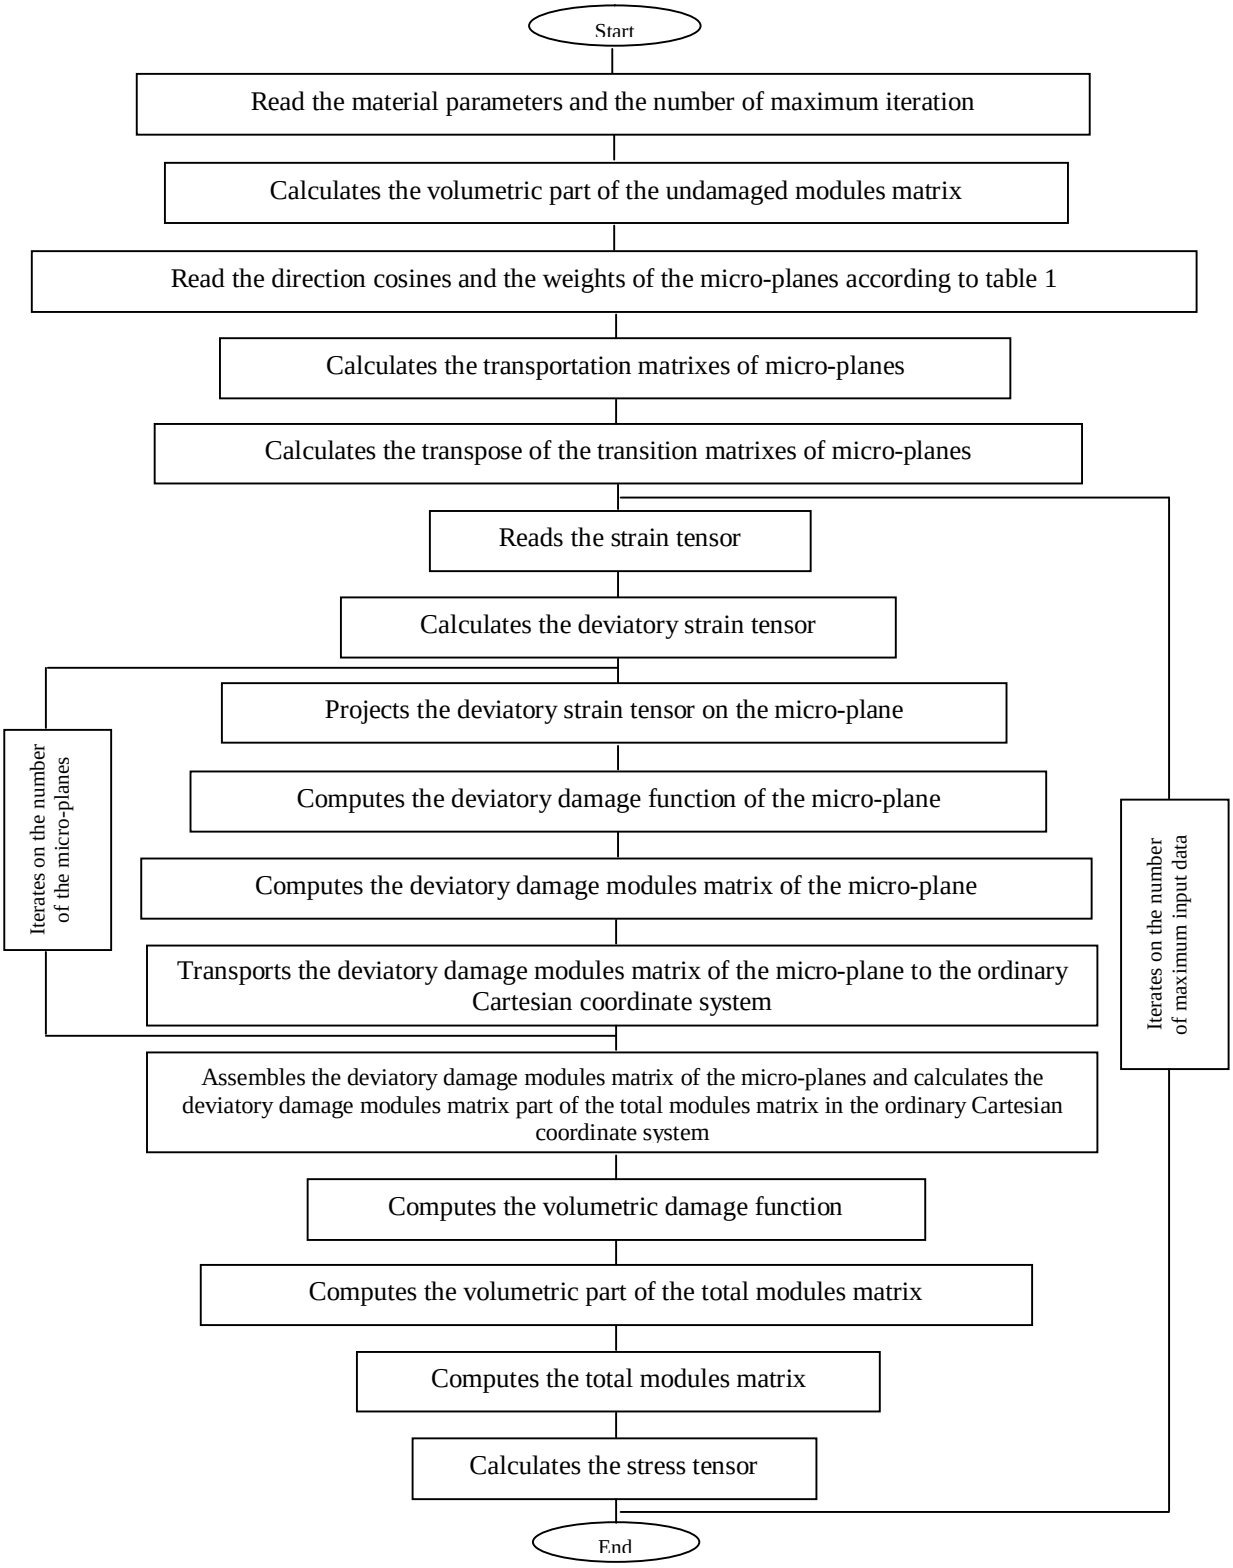

Figure 1. Operation sequence of the proposed micro-plane damage model developed in the VISUAL FORTRAN computer language

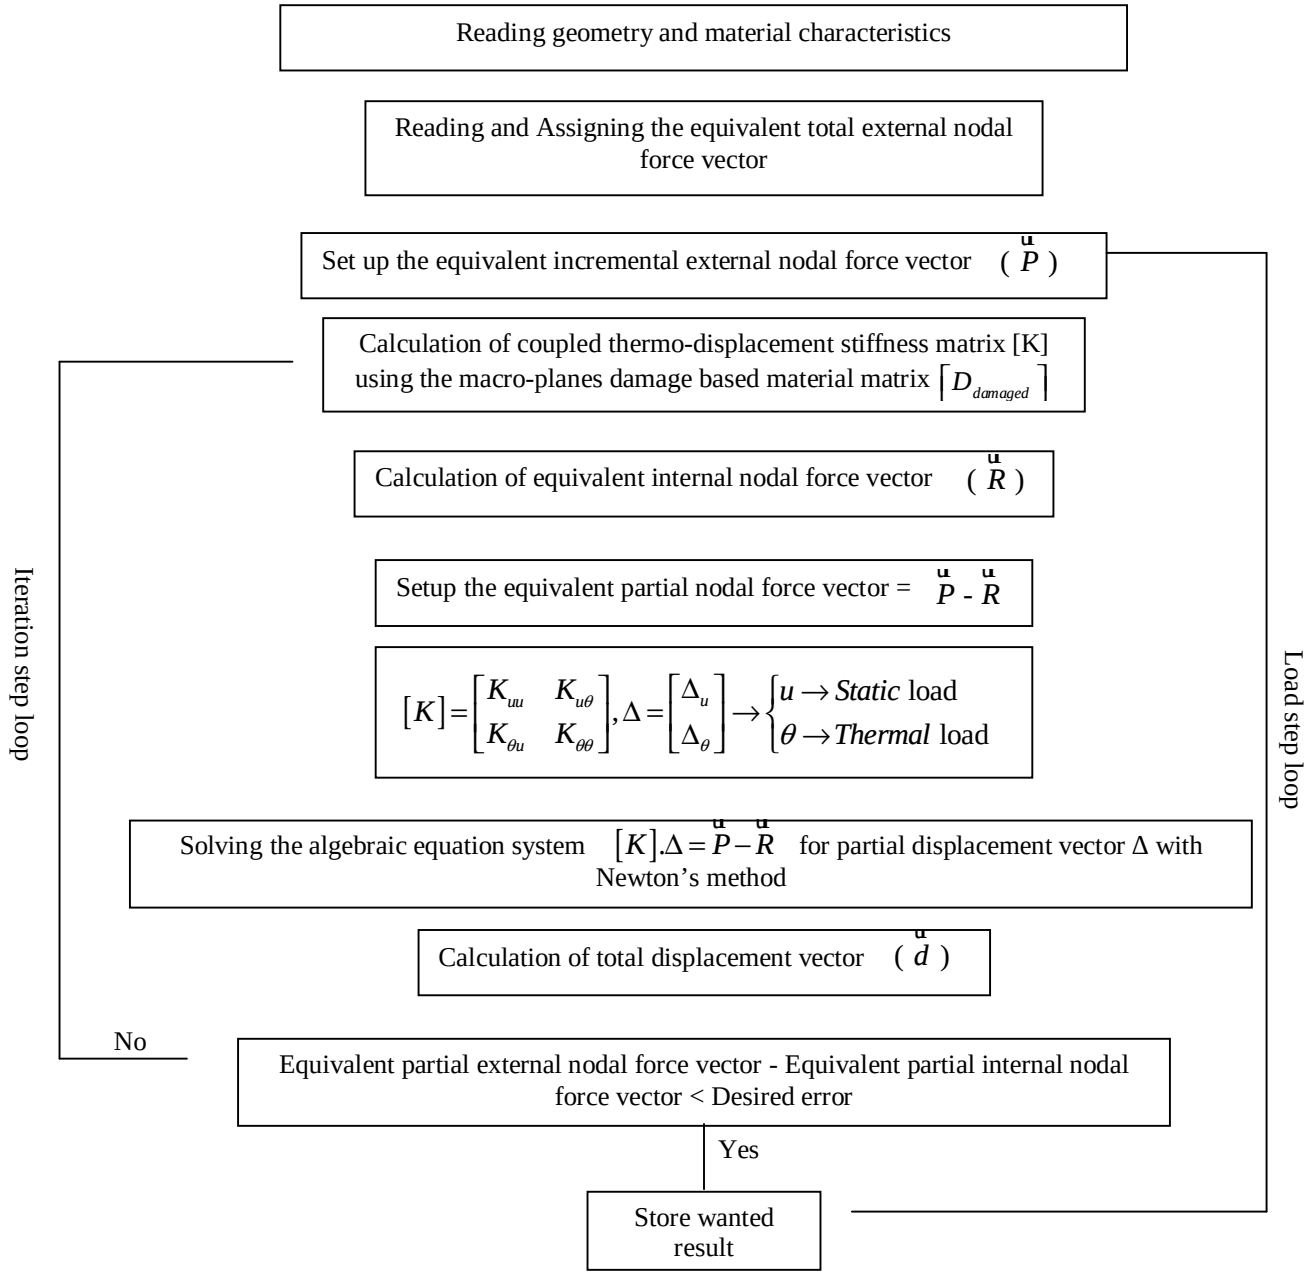

Figure 2. Operation sequence of the proposed F.E. solution method

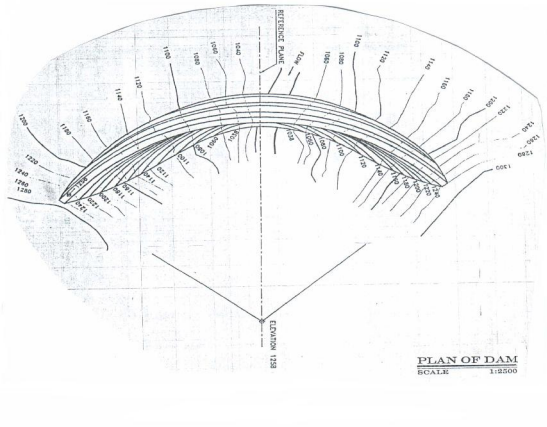

Figure 3: Liroo dam: Arches plan

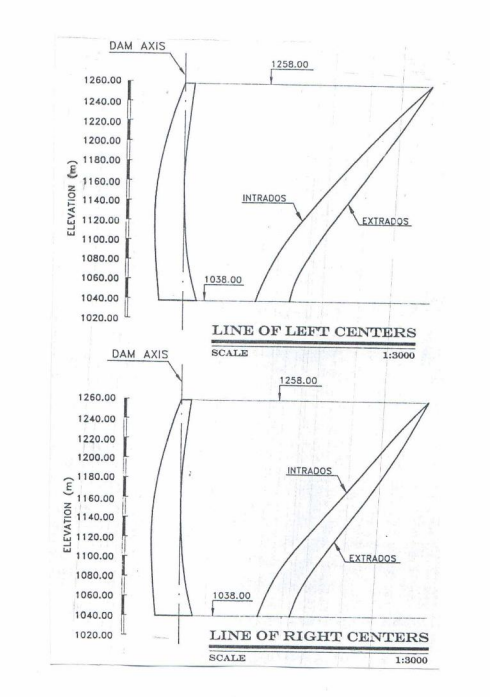

Figure 4: Liroo dam: Lines of the centers

3. Results and Discussions

Before applying the developed computer program for dam analysis, its ability for concrete failure simulation has been verified through analyzing some benchmark problems. One of them was an anti-symmetric four point shear test. The thickness of the beam was 38 mm. figure 5 shows the beam and its mesh. A total number of 428 brick 8-noded elements were used in the model.

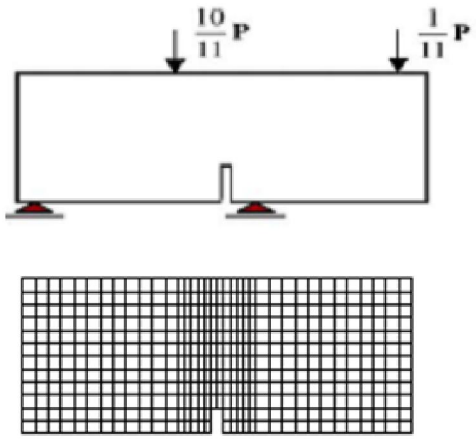

Figure 5. Single-edge-notched beam subjected to anti-symmetric four-point shear loading.

Material parameters are $E = 27000\,MPa$ and $\upsilon = 0.2$. As the load (P) increases, a crack starts growing from the left corner of the notch and continues its growth upwards to the left side of the loading platen. Figure 8 shows the crack path in the actual test. As it can be seen there is a good conformity between model result and experimental ones.

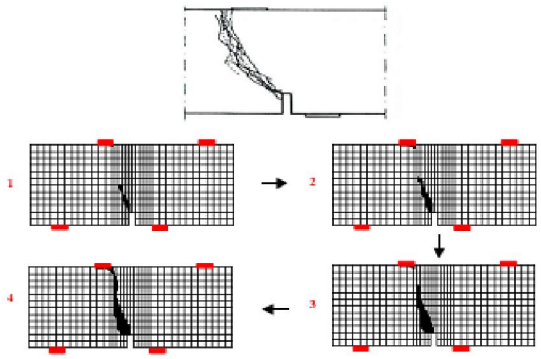

Figure 6. Comparison between simulated crack path and actual crack path

After getting the confidence on accuracy and correctness of model calculations, the Liroo dam was modeled by it. The finite elements model of the dam and its abutments has been viewed in figure 7. Total number of 652 brick elements and 1146 nodes are consumed in dam modeling. The modulus of elasticity of dam concrete was considered 30000 MPa and that of foundation was assigned 20000 Mpa. The Poison's ratio for both of the dam and its foundation was considered as 0.2.

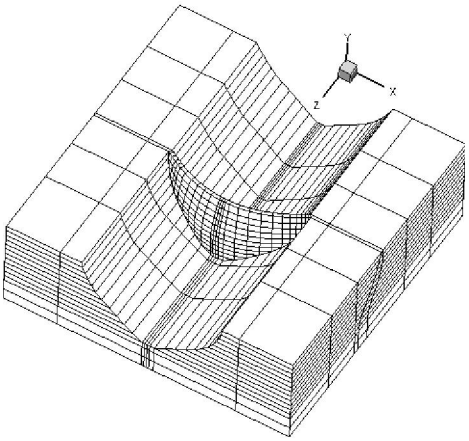

Figure 7. Liroo arch dam F.E. model

After completing the F.E. model of the dam, the gravity and hydrostatic loads were being applied to the model. Then, failure analysis was performed according to the manner discussed earlier and the following results were obtained.

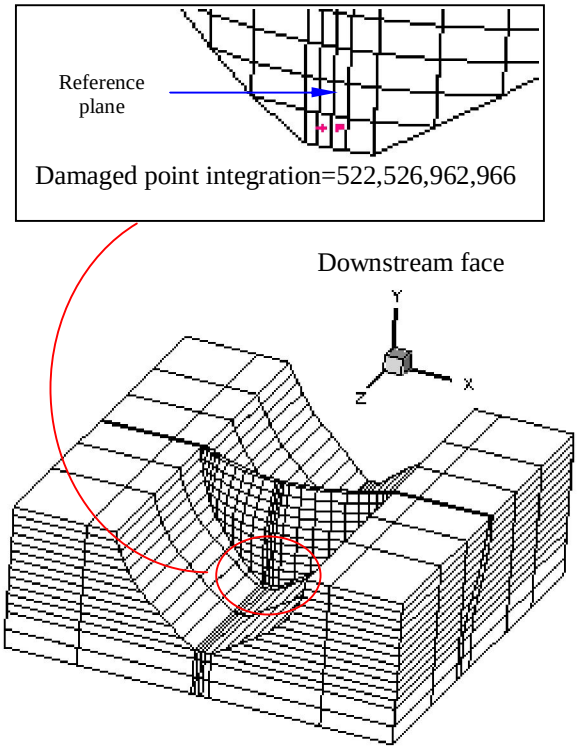

Figure 8. Damaged or failure points of the dam

As it is cleared from figure 8, at four integration points on the upstream face of the dam adjacent to the foundation (approximately 4m above the contact line), fracture phenomenon can be happened. Figure 9 shows the position and direction of the fractures. These cracks align in a plane that it is normal to the faces of dam and propagate through the thickness direction. The angle between crack lines and faces of the dam is about 45 degrees.

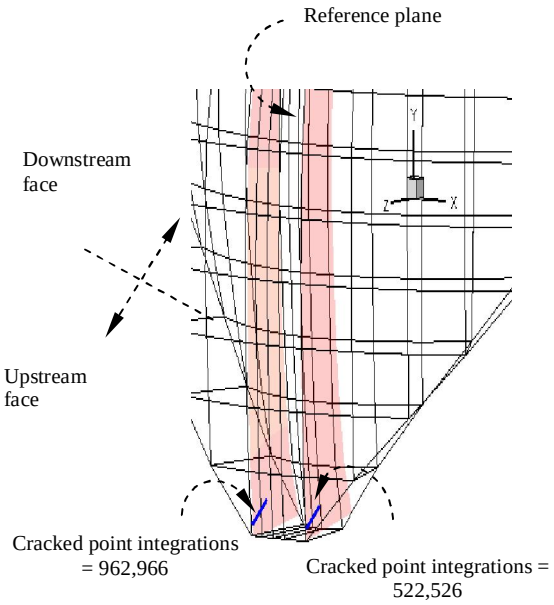

Figure 9. Position and direction of the cracks

It is also necessary to say that in all four cracked points the fractured micro-planes are as micro-planes number 9 and 10. These micro-planes have been illustrated in Figure 10.

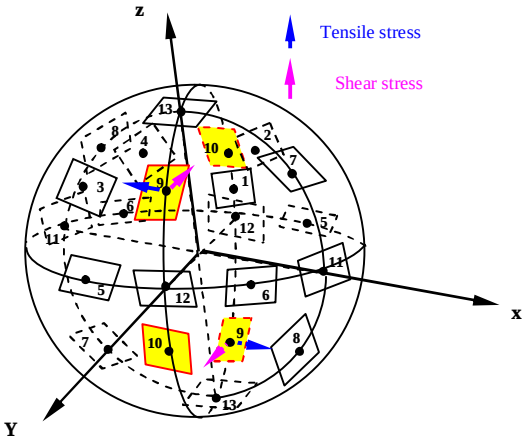

Figure 10. Damaged micro-planes

At these micro-planes there exists a combination of the tensile and shear stresses. So, it can be derived that the main reason of cracking of the dam in specified region would be the cotemporary

actions of tension and shear forces. This can be interpreted as follows: under the action of the hydrostatic loads resulted from the reservoir of dam, there would be a strong value of tension at the upstream face of the dam in vicinity of the foundation and concomitant to that strong shears through the thickness of the dam . However, from the action of the gravity loads, there would be a large quantity of compression right there at the same time. So, under the combined effects of these two main mentioned loads, there would be planes i.e. micro-planes on which the worse situation can be occurred from the stress point of view. This situation is the action of tensile and shear stresses and the planes would be plane designated as 9 and 10. Resultant stress becomes greater than the maximum allowable tensile strength of plane concrete and consequently the failure would be happened.

4. Conclusion

After reviewing the results it was cleared that under the action of hydrostatic and gravity loads, Liroo dam can be exposed to fracture on upstream face of the dam adjacent to the foundation in combined tensile-shear mode and the design should be reviewed exactly again.

Exploring the Potential and Constraints to Implementing the International Best Practice Principles of EIA Follow-up: The Case of Pakistan

Obaidullah Nadeem[1] , Rizwan Hameed[2]

Department of City and Regional Planning, University of Engineering and Technology, Lahore, Pakistan.
[1]obaidnadeem@yahoo.com; [2]d_rizwan@hotmail.com

Abstract: Every Environmental Impact Assessment (EIA) carried out for development projects in Pakistan includes a long list of mitigation measures and an environmental management plan (EMP). The environmental approvals also contain numerous conditions including implementation of EMP during construction and operation phases of development projects. Without appropriate follow-up and compliance monitoring the entire exercise may go waste. That is why follow-up is considered essential to ensure positive outcome of EIA by protecting the environment and learning lessons for its improvement. In this regard, the International Association for Impact Assessment has suggested best practice guiding and operating principles. This paper attempts to explore the potential and constraints to implementing these principles in Pakistan. Various data sources including interviews with the officials of environmental protection agencies, project proponents, EIA consultants and representatives of some of the affected communities as well as review of EMPs have been used to provide empirical evidence for this purpose. This paper identifies some potential but overall it argues that a lot more is needed to be done to bridge the gap between the international best practice principles and the current state of EIA follow-up in Pakistan. Some imperative steps have also been suggested in this context to improve follow-up and hence strengthen the overall process for EIA. It is expected that other developing EIA regimes may also benefit from the suggestions. [Journal of American Science. 2010;6(12):108-121]. (ISSN: 1545-1003).

Keywords: EIA follow-up; Best practice principles; Pakistan.

1. Introduction

Follow-up is internationally considered essential to determine the outcome of EIA through evaluating environmental performance of projects (Marshall et al., 2005; Morrison-Saunders et al., 2007). It is also termed as monitoring and auditing. Several authors have highlighted the significance of monitoring and auditing as important tools to evaluate the effectiveness of EIA during post-decision stages (see for example, Arts and Noteboom, 1999; Glasson et al., 1999; Arts et al., 2001; Morrison-Saunders et al., 2001; Wood, 2003). Theoretically, EIA follow-up is said to constitute a set of four activities: monitoring, evaluation, management and communication. These involve monitoring baseline conditions and environmental impacts during operation of project, evaluating impact significance and conformance with standards, preparing and implementing environmental management plan (EMP) including mitigation measures and communicating follow-up outcome to the key stakeholders (see Arts et al., 2001, p.176 for further detail). Matching the impacts predicted in the EIA report of a project with those actually arising during operation of that project is also stated as one of the benefits of follow-up to improve EIA practice. Thus, follow-up can be called a panacea for the EIA system as a whole.

Recent literature also suggests international best practice principles of EIA follow-up, as listed in Box-1(Morrison-Saunders et al., 2007; Marshall et al., 2005). These principles are organized on the basis of their core values as guiding principles indicating **'why'** follow-up is needed and identifying role of various stakeholders as **'who'** are responsible to undertake follow-up. The operating principles suggest the kind of follow-up activities as **'what'** to undertake; and the way **'how'** the follow-up should be conducted (Marshall et al., 2005, p.178). So far, the research on EIA follow-up is 'largely piecemeal' and focussed on its 'need and benefits', role and stakes, approaches and techniques, follow-up of socio-economic impacts as well as follow-up design etc (Glasson et al, 1994; Morrison-Saunders et al., 2001; Macharia, 2005; Burdge, 2003; Morrison-Saunders and Arts, 2005; Jha-Thakur at al., 2009). This paper draws attention towards the need to look into the potential and constraints to implementing EIA follow-up best practice principles in the context of overall EIA system and practice in a country. To this end it presents the case of Pakistan where EIA has become one time activity and follow-up practice is scrawny, similar to what the literature suggests in case of both the developed and developing EIA regimes (Wood, 2003; Bond et al, 2003; Glasson et al., 2005; Noble and Storey; 2005; Ahammed and Nixon, 2006; Jha-Thakur et al., 2009).

Box 1. EIA Follow-up International best practice principles

Guiding Principles
Why?
1. Follow-up is essential to determine EIA (or SEA) outcomes.
2. Transparency and openness in EIA follow-up is important.
3. EIA should include a commitment to follow-up.
What?
4. Follow-up should be appropriate for the EIA culture and societal context.
5. EIA follow-up should consider cumulative effects and sustainability.
6. EIA follow-up should be timely, adaptive and action oriented.

Operating Principles
Who?
7. The proponent of change must accept accountability for implementing EIA follow-up.
8. Regulators should ensure that EIA is followed up.
9. The community should be involved in EIA follow-up.
10. All parties should seek to co-operate openly and without prejudice in EIA follow-up.
11. EIA follow-up should promote continuous learning from experience to improve future practice.
How?
12. EIA follow-up should have a clear division of roles, tasks and responsibilities.
13. EIA follow-up should be objective-led and goal oriented.
14. EIA follow-up should be fit-for-purpose.
15. EIA follow-up should include the setting of clear performance criteria.
16. EIA follow-up should be sustained over the entire life of the activity.
17. Adequate resources should be provided for EIA follow- up.

Source: Morrison-Saunders et al. (2007, pp.1-4)

The next section indicates data sources used for gathering empirical evidence and qualitative analysis. The nature of legislative provision and guidelines for EIA follow-up in Pakistan is then described. The penultimate section presents analysis of the current state of EIA follow-up practice in the country with respect to the international best practice principles. Lastly, conclusions have been drawn identifying potential and constraints as well as necessary steps to improve the follow-up practice.

2. Data Sources

The Pakistan Environmental Protection Act (PEPA) 1997 and Initial Environmental Examination (IEE)/EIA Regulations 2000 of the Pakistan Environmental Protection Agency have been reviewed to explore the provisions for EIA follow-up in the country (GoP, 1997; GoP, 2000). The input data for qualitative analysis have been drawn from interviews with EIA officials of Federal and Provincial Environmental Protection Agencies (EPAs) in the country, EIA consultants, academics and proponents.

To gather empirical evidences of EIA follow-up, baseline environmental and socio-economic conditions, predicted impacts, proposed mitigation measures as well as environmental management plans (EMPs) of 18 projects were analysed. These projects relate to various development sectors viz. industrial, transport infrastructure, oil exploration and hydroelectric power generation dams. Only those projects were selected which had been granted EIA/EMP approval by the regulators/federal and provincial environmental protection agencies of Pakistan (the EMP of an industrial estate is presented in Appendix III as an example).

Concerned management employees of 4 (out of the 18) development projects located in the biggest province Punjab including two from industrial sector and two from transport infrastructure sector were also interviewed. The industrial projects include an industrial estate spread over an area of 1600 acres designed for nearly 700 medium and large industries, directly affecting about 10000 people. The other is spread over an area of 400 acres meant for a cement plant with a production capacity of 6000 tons per day, directly affecting about 21000 people. The transport infrastructure projects consist of a 120 meter wide and 100 km long motorway covering 3000 acres of predominantly agricultural land, directly affecting nearly 250 families including demolition of about 650 structures. Another project comprises 7.5 meters widening of 14 km long road after cutting about 2000 trees (see Nadeem and Fischer 2010 for further detail).

The purpose of undertaking detailed investigation of these four projects was to determine how far the mitigation measures suggested in EMPs and conditions of EIA approval for these projects were being implemented. In this regard, roles of key stakeholders i.e. regulators, proponent and affected communities have also been critically examined. From the aforementioned analysis, potential and

constraints to effective EIA follow-up in Pakistan are identified and improvement measures suggested.

3. Nature of legislative provisions and guidelines for EIA follow-up in Pakistan

The Pakistan Environmental Protection Agency (Review of IEE and EIA) Regulations (GoP, 2000) provide the basis for EIA follow-up in the country. The follow-up programme is not chalked out separately but in the form of EMP as well as EIA approval conditions. These two have been used in this paper as alternative to EIA follow-up.

Four out of twenty four sections of the said Regulations deal with various aspects of follow-up. Section 13 (2) clause (b) requires that prior to starting the operation; proponent of every project should obtain from the competent authority (Federal or Provincial EPA) a written confirmation of compliance with the conditions of EIA approval. The request should substantiate that the conditions related to project design; its construction and necessary mitigation measures have been implemented. Section 14(1) states that an EMP should also be included in every EIA report also indicating impact monitoring and auditing arrangements.

The competent authority is empowered under Section 18 to send its authorized staff for verifying the site characteristics and the extent to which conditions of EIA approval have been followed. For this purpose, the staff may also examine built up structures at project site and its plant machinery. Over and above, it is mandatory to submit every year a monitoring report regarding the project's environmental performance and impact management and adoption of mitigation measures. Under Section 20, the competent authority is empowered to cancel EIA/environmental approval, if it is found that the approval conditions have not been followed.

The major steps involved for EIA follow-up as suggested by the Pakistan Environmental Protection Agency are presented in Appendix I. Other than the legal requirements of obtaining written confirmation of compliance with the EIA approval conditions and submitting monitoring report, the proponent is required to develop a proper environmental management system and make follow-up as a continuous process. The implementation phase does not only include monitoring of predicted and un-expected impacts but also design review of EMP and environmental assessment audit involving post project analysis. These steps for EIA follow-up can prove to be helpful for project proponents, if properly followed up.

4. Analysis of EIA Follow-up Practice in Pakistan

This section presents the analysis and discussion on the of EIA follow-up practice in Pakistan with respect to the international best practice principles.

4.1 Use of follow-up to determine EIA outcome

Theoretically, follow-up is considered essential for positive outcome of EIA or to minimize adverse impacts of development projects and to improve quality of assessment (Morrison-Saunders et al., 2001; Wood, 2003; Glasson et al., 2005; Marshall et al, 2005; Noble and Storey, 2005; Morrison-Saunders et al., 2007). Interviews with officials of competent authorities, project proponents and EIA consultants in Pakistan also suggested fairly similar stance. Within the local context, it was strongly linked with the adequacy of technical and financial resources. Such limitations are hampering the consistency of follow-up on part of both the regulators and proponents**.** Thus after granting EIA approval, the regulators keep busy with processing other EIAs until someone files a complaint against the negative impacts of the project compelling them (the regulators) to take some action. On the other hand, the 'convenience' and 'suitability' are the factors considered by the project proponents to implement whatever deemed necessary out of the EMP which they got prepared very well through consultants by paying a 'handsome' remuneration. Given the above situation, the consequences of EIA decision making largely remain unknown.

4.2 Degree of transparency and openness

One of the pre-requisites for transparency and openness of any EIA system is easy access to information (Boyle, 1998; Beierle and Cayford, 2002; Rajvanshi, 2003). During the EIA follow-up, these are important at both pre and post-decision stages. In Pakistan, EIA report including data on baseline environmental conditions remain confidential, initially with the EIA consultants and then with concerned EPA. Stakeholders are not provided with access to such information except during public review of EIA report for 30 days. Even this regulatory requirement is not fulfilled properly. There are many examples of projects the EIA reports of which are either placed at locations far away from the affected public or made available for a period less than what was legally required (Nadeem, 2010). After the approval of EIA report and beginning of operation of projects, particularly for industrial development, even stakeholders' representatives are not allowed to access the EMP or know about the monitoring outcome.

4.3 Degree of commitment by the key stakeholders

Out of the triangle of stakeholders in EIA follow-up, comprising of project proponent, regulator and the community or affected/interested public (see Figure 1), the foremost key player i.e. the proponent has serious lack of commitment. According to EPA officials, the very reason is that proponents often regard EIA as a legal and technical barrier to development. But being a requirement, the proponents get the follow-up programme/EMP prepared and commit to implement the same along with conditions of EIA approval. However, they are not yet convinced that implementing EMP/mitigation measures can save cost, as the experience elsewhere suggests (Glasson et al., 1999; Morrison-Saunders et al., 2001; Aschemann, 2004). Rather, majority of proponents felt that implementing EMP would incur heavy cost and in turn it will increase the cost of production.

Contrary to this, the proponents of selected projects of industrial development claimed in their interviews that they were implementing conditions of approval/mitigation measures as and when the need aroused. But the project site visits and interviews with the nearby living communities unveiled totally different scenario (Nadeem, 2010). For instance, due to emission of raw cement, it was difficult to breathe even 2 kilometres away from a cement factory project which was installed after getting EIA clearance from the Punjab EPA. Similarly, in case of a paper and board mill, the community living close to the factory, though unaware of its EIA approval, protested directly to the proponent against the sawdust emitting out of its chimneys. In response, the proponent installed water sprinklers. Other than this type of apparent environmental pollution, the members of the community were unaware of other problems like decrease in ground water table as a result of continuous extraction and its contamination due to untreated effluent discharge from the paper mill.

Still there are some encouraging examples of public sector proponents who implemented many commitments made in the EMP of a project. For example, installation of effluent treatment plant worth Rs. 40 million (US$ 0.48 million) (1 US$ = 84 Rupees) and construction of landfill site have been made by the proponent organization of an industrial estate project. Not only that, provision of sewerage system and maintenance of roads in and around the villages near the estate at an estimated cost of Rs.20 million is also in progress. However, such examples are very rare. In most of the other development projects constructed after getting EIA approval, the communities are neither involved in EIA follow-up nor these actively pursue the concerned EPAs against environmental and socio-economic impacts, as found by Hussain and Ahmad (2009) in the case of paper mill and lather tannery projects.

4.4 Nature of accountability for implementing follow-up

It is suggested that "the proponent of change must accept accountability for implementing EIA follow-up" (Marshal et al., 2005, p.179). Under the Pak-EPA's IEE/EIA Regulations (GoP, 2000), the project proponent is held responsible for implementing EMP to mitigate adverse impacts as mentioned earlier (see Section 3). However, except in one or two cases, the project proponents with approved EIA are not held responsible as per spirit of the said regulations. So far very few cases against such proponents have been sent to Environmental Tribunals. Generally speaking, it is assumed that the proponents shall implement mitigation measures and submit yearly monitoring report, the authenticity of which is never checked as confirmed by the officials of concerned EIA during the interview. On the other hand, interviews with the affected communities revealed that most of the mitigation measures were not being implemented.

4.5 Role of regulators to ensuring follow-up

It is the responsibility of the regulator to ensure implementation of EIA approval conditions/ mitigation measures as committed by the project proponent. In most of the cases, EPAs field staff (regulators) do not routinely check the compliance with EIA approval conditions presumably due to lack of capacity and staff. It is left on the discretion of the proponent to implement whatever he considers appropriate. However, the EPAs do take quick action if some members of aggrieved community lodge a complaint against the proponent/project causing environmental pollution. In other words, whatever follow-up is pursued sometimes by EPA is generally as a response to complaints against severe impacts of development projects commissioned after EIA clearance (Nadeem and Hameed, 2008). For instance, while responding to several complaints by the representatives of the directly affected communities of a cement factory concerned EPA's field staff carried out environmental monitoring. The report revealed that

> "the unit along with other two units of cement factories located in close proximity were violating environmental laws by mismanaging natural resources, contaminating water ponds, disposing of untreated wastewater towards farm land, blocking conventional routes and disturbing socio-economic conditions of local

people. Large volumes of suspended particulate matter and toxic gases being emitted by the factory without any treatment or air filtration were also observed. The report further stated that about 4,060 acres of privately owned land and green hills used by locals as grazing fields for their livestock have been allotted to this factory for limestone quarry" (Nadeem, 2010, p.194).

The above report was prepared by the concerned District Officer Environment as a response to the complaints by the affected communities. But the communities' representatives revealed that after this report, EPA just issued a warning to the said factory administration simply asking for implementing mitigation measures. Although some mitigation measures have been adopted, but this situation arises off and on as the factory administration does not consistently ensure implementation of mitigation measure/EMP to avoid expenditures.

4.6 Extent of community involvement

Community involvement is considered vital for the continuity and acceptability of the follow-up in Pakistan (GoP, 1997a). But, the affected and interested public is informed about the EMP during public hearing and their comments are just responded to by the proponents. This means that the EMPs once prepared are not revised. Interviews with affected communities of two of the four development projects revealed that they were kept in dark about the conditions of EIA approval (Nadeem and Fischer, 2010). In fact, the EIA follow-up process provides the affected communities with an opportunity to know about the EMPs and conditions of EIA approval since these more often suggest to forming environmental monitoring committees which must include representatives of affected communities (Hussain and Ahmad, 2009; Nadeem, 2010). But no example was found in which the communities or even Environmental Non-Government Organizations (ENGOs) had played any role in EIA follow-up. Thus EIA follow-up in Pakistan can be called a uni-faceted mechanism revolving around the whims and mood of project proponents.

4.7 Nature of co-operation among the parties involved

The international principles envisage that "[a]ll parties should seek to co-operate openly and without prejudice in EIA follow-up" (Morrison-Saunders et al., 2007, p.3). This suggestion seems more idealistic than pragmatic. Practically, the proponent, the regulator and the community are three different corners of a triangle more often having competing interests; especially those of the proponent and of the affected community (see Figure 1). The proponent always tries to minimize the time and resources involved in mitigating adverse environmental and socio-economic impacts. On the other hand, the affected community may not even accept the project at proponent's desired location as such situation aroused in the cases of a cement factory and an industrial estate (See for example Nadeem and Fischer, 2010).

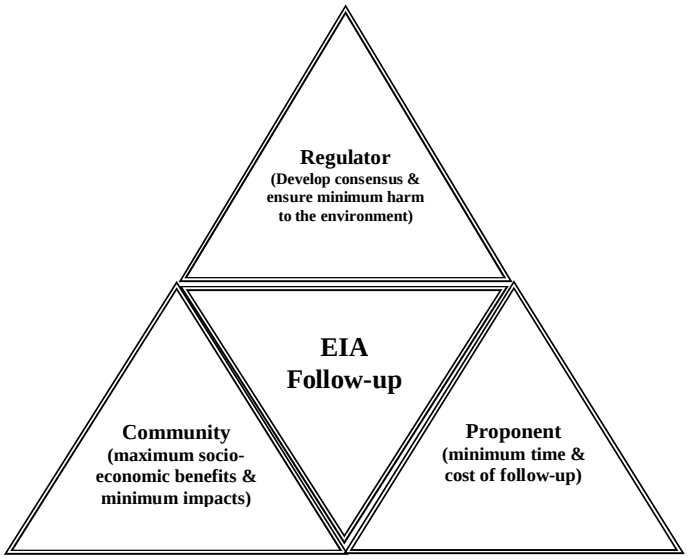

Figure 1. Competing interests of key stakeholders in EIA follow-up
Adapted from Morrison-Saunders et al. (2001,p.293)

The role of regulator in an EIA regime without consistent practice of accountability may not be impartial. However, it may act as a facilitator and builder of consensus over the procedures and methods of implementing follow-up programme which may be acceptable to the other two parties of a particular project and cause minimum harm to the environment. But the nature of cooperation among the parties involved in EIA follow-up in Pakistan is far from this notion.

4.8 Compatibility with EIA and social context

EIA follow-up in Pakistan is independent of the project planning process. It is essentially a proponent driven exercise without involvement of the other two stakeholders viz the competent authority/ regulator and the affected community. Once the project is planned, commissioned and EIA approved, follow-up is done independently to the extent whatever is considered essential by the proponent. The EMP is considered an important part of EIA

report. It is reviewed by the EPAs in Pakistan before granting EIA approval. In most of the cases EMPs have also been criticised by the affected and interested stakeholders during public hearings. There are instances where an EPA got the entire EIA report including the EMP revised (Nadeem, 2010). Despite these efforts, implementation of EMP or follow-up outcome is rarely reported to the competent authority, though it is required to be submitted annually. Out of the 18 cases of approved EIA by various EPAs in the country scrutinized by the first author, only 3 were found having annual monitoring reports. Those reports were submitted by the proponents of such projects whose cases were in the courts and affected communities had lodged complaints against adverse impacts of such projects. No one from the concerned EPA ever bothered to verify the authenticity of such monitoring reports.

Community organization is strong in rural areas of the country as compared to that in urban areas. There is a culture of frequent interaction among the community members through congregations in mosques and punchayats. It is not difficult to involve people or representatives of the affected communities in the EIA follow-up and monitoring activities. But the community organizations as well as the socio-economic and cultural circumstances do not have explicit links with follow-up. Except follow-up in a few cases like that of an industrial estate, it is a technical exercise limited to controlling air and noise pollution through installing electrostatic precipitators and mufflers at chimneys of industrial plants. On the other hand, majority of the people with low literacy rate are not aware about the indirect consequences of environmental impacts on human health and overall quality of life. ENGOs can help raising awareness among the masses about environmental and socio-economic impacts of development projects and form pressure groups to ensure positive outcome of EIA (World Bank, 2001; Lehrack, 2006; Morrison-Saunders, 1998). Unfortunately the country lacks such NGOs to do this job.

4.9 Consideration of cumulative impacts and sustainability

Consideration of cumulative impacts and overall sustainability of the environment is more relevant to strategic level of planning (including policy, plan and programme) and follow-up. Perhaps due to this reason, cumulative impacts and sustainability considerations are weak in EIA in Pakistan. Major emphasis of follow-up where pursued in reality remains on monitoring and implementation of mitigation measures to control air and noise pollution, or at the most, contamination of ground water due to liquid emissions during project operation. However, there are cases of industrial development projects in the EIA of which cumulative impacts were indicated in the form of qualitative statements without suggesting mitigation measures. Analysis of public hearing proceedings of 2 industrial and 2 road sector projects suggests that stakeholders have been emphasising the need to consider cumulative impacts but the proponents declared it beyond the scope of EIA and the competent authority accepted this stance of proponents (Nadeem and Fischer, 2010).

4.10 Timing and adaptability

Pak-EPA's guidelines suggest that follow-up should begin early in the project development process (GoP, 1997a). The practice indicates that EMP is ignored during construction of projects and the public has to suffer from severe environmental impacts during this phase. One of the very reasons is that EIA process is generally initiated after procurement of project site and beginning construction works (Nadeem and Hameed, 2008). Whilst the monitoring data for baseline environmental conditions is, of course, recorded during preparation of EIA, it is done occasionally during operation of projects. Proponents are not generally concerned with the variations in the air and noise emissions or other impacts rather they adopt mitigation measures should there be serious reaction or complaint from the communities adversely affected by the project. Adaptability of follow-up also pertains to the flexibility of its design. New situations or unforeseen impacts may arise during the construction as well as operation of projects. It is very rare that a mechanism or alternative measures are suggested in the EMPs of development projects in Pakistan to handle such situations except to deal with fire hazard.

4.11 Extent of learning from experience to improve follow-up

Learning from experience has increasingly been suggested to improve EIA follow-up practice. This can be done by matching the impacts arising during construction and operation of the project with those predicted in its EIA report (Glasson et al., 1999; Morrison-Saunders et al., 2003). In developed EIA regimes this is practiced to some extent but in developing countries this very important aspect of follow-up is neglected. Resultantly, stereotype EMPs are produced in almost all EIA reports of projects, particularly belonging to same development sector. The situation is no different in this regard were EIA approval conditions for most of the projects are mostly similar in nature in Pakistan (Nadeem and Fischer, 2010). The monitoring reports submitted to

EPAs are made part of EIA case file without analysing the nature of impacts arising during operation of project or matching them with those impacts predicted in its EIA. However, proponents do modify their EMPs during operation of projects as and when the need arises without informing the concerned regulating agency.

4.12 Division of follow-up tasks and responsibilities by proponents

The follow-up tasks are identified and responsibilities to execute the tasks are worked out by EIA consultants and made part of every EMP of development project which gets environmental clearance in Pakistan. Even the cost of implementing various mitigation measures is estimated by the consultants. Moreover, the project proponents are rarely involved in this very important matter which can directly influence the success of follow-up implementation. It appears that the division of tasks, responsibilities and calculation of cost of implementing follow-up provisions are suggestive in nature to fulfil the requirement of getting EIA approval. Once is approved, the proponents implement whatever is financially viable from their point of view and hence most of the suggestive exercise remains futile. This happens because the expert staff and required financial resource are often lacking or the proponents are reluctant to invest million of rupees on EIA follow-up. This is evident from thorough investigation of two projects including one of leather tannery and one of paper and board mill located in the Punjab (Hussain and Ahmad, 2009). There was a significant gap between the tasks and responsibilities assigned in their respective EMPs as compared to the presence of trained staff and mitigation measures which were actually being implemented.

4.13 Clarity of goal and objectives of follow-up

The overall goal of EIA follow-up in Pakistan is to ensure the implementation of mitigation measures for protecting the natural resources and the people. The Pak-EPA's guidelines for preparation and review of environmental reports (GoP, 1997a) clearly suggest five objectives of follow-up as presented in Box 2. It can be argued that the competent authorities have done a good paper work. But some of the objectives as suggested in the international principles for EIA follow-up are not explicitly indicated in the said guidelines. For instance, maintaining flexibility and promoting adaptive management; improving community awareness and acceptance of projects (Morrison-Saunders et al., 2007). The current state of EIA follow-up in the country, as portrayed in rest of the sections of this paper, also suggests a significant gap between these objectives and the actual practice.

Box 2. Objectives of EIA Follow-up in Pakistan

- monitoring the impacts actually arising during construction and operation of projects
- maintaining anticipated impacts within the levels predicted
- mitigating unanticipated impacts before becoming unmanageable
- ensuring that environmental management contributes to protecting the environment and achieving sustainability
- improving knowledge of project impacts prediction, management and EIA review process

Source: GoP (1997a, p.35)

4.14 Fit for purpose nature of follow-up

EIA follow-up in Pakistan is, to some extent, 'fit for purpose' in terms of project type, specific design, location, affected communities as well as availability of financial resources. For instance, the EMP of an industrial estate located close to villages suggested installation of combined effluent treatment plant while that of a leather tannery located away from residential areas relied only upon primary treatment of effluents being a single industry with limited financial resource. Similarly, electrostatic precipitator was suggested and installed to control the emissions of a cement factory but water sprinklers and fans for a paper and board mill (Hussain and Ahmad, 2009). The on-going scoping, as suggested in the follow-up principles, is done and reported to project management to limit the follow-up to the 'art of the possible'. On the other hand, about 60% of the EIA approval conditions suggested by the regulator for one type of projects are general and similar in nature except a few conditions specific to the project.

4.15 Clarity of performance criteria

Review of EMPs included in EIA reports of 18 development projects and interviews with the technical staff of proponents of 2 industrial and 2 road projects suggests that a general performance criterion of follow-up is to maintain the pollution levels within acceptable limits prescribed in the National Environmental Quality Standards (NEQS) of Pakistan. The NEQS further define parameters for noise level, liquid effluents and gaseous emissions (GoP, 1993, GoP, 2000a; GoP, 2009). Parameters for ambient air quality are not included in the said NEQS but have recently been drafted and public

consultation is currently going on. In this regard, the USEPA standards are referred to.

Methodologies to meet the said standards are usually defined as generic mitigation measures. For instance, a cement factory EMP suggests that noise would be brought within NEQS level by maintenance and repair of noise producing equipment and installation of low NOx preclaciner vessel to minimize emission of NOx from kiln. The EMP of an industrial estate suggests to creating air pollution barrier by planting trees and using high rise chimneys for minimizing the adverse impacts of air emissions from industries. However, the same EMP also suggests installation of combined effluent treatment plant to avoid contamination of ground water.

4.16 Sustainability of follow-up over lifespan of projects

The follow-up programme including EMP is normally formulated during the preparation of EIA report in Pakistan. It includes impact mitigation and management measures for construction and operation phases of development projects. The EMPs neither discuss de-commissioning phase nor suggest environmental management measures to be taken in case the project is closed or shifted somewhere else in future. The EIA approving authorities or the regulators do not emphasize the need to include such measures.

However, strategies/specific measures are identified to manage short-term as well as long-term environmental changes. For instance, EMP of an industrial estate suggested that the combined effluent treatment plant will be surrounded by 15 meter wide buffer zone to protect the environment from short and long term impacts and that the wastewater will be disposed off after treatment to recharge the aquifer. The EMP of a landfill site project suggested that groundwater monitoring well have been installed up and down stream of the site and will be monitored regularly. Similarly, the EMPs of road remodeling and motorway construction projects suggested planting 4 new trees in place of every tree to be cut and plantation of trees in 15 meter wide strips on both sides of motorway to control environmental and noise pollution. The outcome of even these types of measures depends on how rigorously these are implemented by the proponents and pursued by the EPAs.

4.17 Adequacy of technical and financial resources

Inadequacy of technical staff and financial resources for follow-up is one of the major impediments being faced both by the project proponents and the environmental protection agencies (EPAs) in Pakistan. The EMPs included in the EIA reports appear to allocate adequate resources. But in reality most of the mitigation measures are not implemented. Interviews with the proponents suggest that EIA follow-up was not their priority as it required extra staff and finances. During operation of the projects, the stakeholder's representatives are given all okay report and that efforts are going on to protect the environment. Some encouraging examples also exist. For instance, proponent of an industrial estate project employed qualified environmentalist and spent millions of rupees on EIA follow-up. The very reason appears to be the realization about social and economic benefits of protecting the environment.

However, interviews with concerned officials of the EPAs/regulators in Pakistan revealed that technical field staff to monitor the EIA follow-up activities and equipment to verify the pollution levels was far less as compared to that actually required for this purpose. Tantamount to that, EPA did not have sufficient financial resources even to get the EIA reports reviewed by experts. But recently the federal and provincial governments have allocated funds in their annual development plans for various capacity building projects. These include, training of officials of EPAs and line departments both at federal and provincial levels; establishment of environmental laboratories in six cities of the Punjab and more than one hundred new posts of field and office staff. But these are 2 to 3 years programmes. An overall summary of the potential and constraints with respect to the international best practice principles of EIA follow-up is presented in Appendix II.

5. Conclusions

EIA without follow-up can be termed as a futile exercise. The international principles provide a thorough understanding of necessary ingredients and qualities of the best EIA follow-up practice. These can also be used for evaluating the practice of EIA follow-up in other developing and developed countries as well as to determine the international applicability of these principles. Examining the EIA system of Pakistan with respect to these principles formed a basis to determine the potential and constraints to successful follow-up.

Legal provisions for EIA follow-up in Pakistan categorically put the responsibility of implementing mitigation measures including EMP and conditions of approval on the project proponents. The regulators are bound to undertake compliance monitoring. In these respects, the guidelines clearly spell out follow-up mechanism and roles of key stakeholders including the affected and interested communities. It is encouraging that every EIA report submitted to EPAs in the country includes EMP at the outset. The EMP is presented along with potential

impacts and mitigation measures of development projects during public hearing to the interested and affected communities or to their representatives whosoever attend the hearing. The conditions of EIA approval also include implementation of EMP and the proponent is required to submit an undertaking in this regard. The EMP provides a framework for EIA follow-up with clear division of tasks and responsibilities and even the cost of implementing each management measure.

But overall, EIA follow-up is lagging far behind the best practice principles. The dilemma is that EMPs solely prepared by EIA consultants generally lack consideration of public input and the proponent's willingness to implement. The EPAs/regulators in Pakistan are lacking in technical and financial resources. Their role in ensuring EIA follow-up is reactive and spontaneous rather than proactive and consistent. There is no effective accountability of regulators and proponents. Even the commitments for mitigating specific impacts are not fulfilled what to talk of cumulative impacts and sustainability which are considered beyond the scope of EIA by the proponents. Several other developing countries are also facing almost similar constraints.

To make EIA a useful exercise for protecting the environment as well as socio-economic rights of people, it is utmost important to launch a campaign for convincing project proponents that how EIA follow-up through implementing EMP could ultimately save their cost of operation and maintenance in the long run. Besides, financial incentives like tax exemption on importing environmental management equipment and award on better environmental performance can also help motivate proponents. In fact, the Ministry of Environment has already started this practice of recognizing the efforts of environmentally friendly projects through an award scheme.

In addition, capacity building of EPAs/regulators is urgently needed by provision of adequate technical staff and financial resources for this purpose. The need for this has been highlighted in nearly every study amid at strengthening EPAs in the country and gradual efforts have been started. If the government intends to save its natural resources and the people, it has to give top priority to EIA follow-up and make handsome investment particularly in capacity building to reap long term benefits. Lastly, it is expected that similar measures may also prove to be effective in other developing EIA regimes for successfully implementing the intentional best practice principles of EIA follow-up.

Appendix I. EIA follow-up guidelines in Pakistan
Based on GoP (1997a, p.36)

Appendix II. Summary of potential and constraints in Pakistan with respect to principles of EIA follow-up

EIA Follow-up Principles	Potential and Constraints in Pakistan
1. Use of follow-up to determine EIA outcome	• Notionally considered essential by the proponents and regulators for positive outcome of EIA • Practically constrained due to lack of technical and financial resources
2. Degree of transparency and openness	• Low degree of transparency and openness • After one month availability of EIA report during public review and hearing, EMP cannot be seen or known by stakeholders • Monitoring report is a confidential document • Stakeholders are not provided with any information on follow-up issues or monitoring outcome
3. Degree of commitment by the key stakeholders	• Low degree of commitment among the key players • After getting EIA approval, proponents do not implement most of the mitigation measures in order to save short term cost • Due to protest by the affected communities some proponents were forced to implement mitigation measures
4. Nature of accountability for implementing follow-up	• No formal accountability of project proponents except in response of complaints, if any • No formal accountability of EPA officials
5. Role of regulators to ensuring follow-up	• Field staff of the regulators does not routinely check compliance of EIA approval conditions • Monitoring is done, if serious environmental impacts are reported. Only warning is issued in such cases
6. Extent of community involvement	• Community consultations take place after preparation of EMP • No involvement of community in follow-up • No information to community about follow-up outcome
7. Nature of co-operation among the parties involved	• No cooperation among proponents and affected community due to opposing interests • Regulators attempt to build consensus but cooperation with proponent is not transparent
8. Compatibility with EIA and social context	• EIA is independent of project planning process • Political interference acts as a constraint to EIA follow-up • Community organization is strong in rural areas but weak in urban areas • Environmental awareness among general public is increasing but still poor in people with low literacy rate • Environmental NGOs are very few
9. Consideration of cumulative impacts and sustainability	• No consideration of cumulative impacts of developments at strategic/plan level • Where cumulative impacts are indicated those are just based on qualitative statements • Overall consideration of sustainability of affected environment is weak

EIA Follow-up Principles	Potential and Constraints in Pakistan
10. Timing and adaptability	• Initiated very late in the EIA process • No proper follow-up during construction and closure of projects • Monitoring data is recorded occasionally • Follow-up design is not flexible and lacks alternative measures for unforeseen impacts
11. Extent of learning from experience to improve follow-up	• Monitoring reports are not analysed by regulators to learn from follow-up outcome • No formal practice to match the impacts predicted in EIA report with those actually arising during operation of that project
12. Division of follow-up tasks and responsibilities by proponents	• Clearly indicated in most of the EMPs included in EIA reports • Proponents not involved in division of tasks and estimating cost of mitigation measures but EIA consultants do • Practically, expert staff is lacking
13. Clarity of goal and objectives of follow-up	• Goal and objectives are clearly defined but lacking in adaptive management • Follow-up of goals and objectives is weak
14. Fit for purpose nature of follow-up	• Generally stereotype EMPs are presented in EIA reports • Review of follow-up design on the basis of feedback is weak
15. Clarity of performance criteria	• Detailed performance criteria are not set • General criteria are set to meet the NEQS and USEPA standards
16. Sustainability of follow-up over lifespan of projects	• Follow-up programme/EMPs are formulated during EIA preparation • Cover construction and operation phases • Decommissioning phase not covered • Include generalized strategies for managing short and long-term environmental changes
17. Adequacy of technical and financial resources	• Employment of inadequate technical resources by most of the project proponents • A few encouraging examples also exist • Regulators are lacking technical staff and equipment • Regulators are provided with inadequate financial resources

Appendix II. Continued from previous page

Appendix III. Environmental management plan for monitoring of impacts during construction and operation of an industrial estate project in Pakistan

Concern/Impact Component	Considerations/ parameters	Applied Standards	Location	Monitoring Frequency	Duration	Responsibility
Groundwater	pH, turbidity, colour, TDS, hardness, sulphate, fluoride, iron, faecal coliforms etc.	NEQS	Construction site, effluent treatment plant and landfill site.	Quarterly	-	Environment Manager/ Resident Engineer
Wastewater	Effluent flow, pH, BOD, COD, TSS, Chromium, Copper and Zinc etc.	NEQS	Offices, Effluent treatment plant and landfill site.	Monthly	-	Manger Treatment Plant
Air Emissions	CO, NOx, SOx, PM10	USEPA air quality standards	3 points near the main entrance, treatment plant site and landfill site in downwind direction.	Quarterly	8 hours	Environment Manager/ Resident Engineer
Noise Levels	Noise levels on dB(A) scale	NEQS	7.5 meter from the vehicles at 6 points near construction site, generator room, treatment plant site.	Quarterly	15 minutes at each point	Environment Manager/ Resident Engineer
Solid Waste	Source, type, generation, used oil, discarded mechanical parts etc.	-	Construction site, administrative buildings, industrial sites.	Daily	-	Chief Sanitary Supervisor/ Incharge Landfill Site

Source: EIA Report/EMP of an industrial estate project in Pakistan.

Note: This also represents most of the EMPs of development projects in the country. However, some EMPs also include environmental management measures for flora, fauna, soil conditions, health and safety of workers and resettlement action plan (if needed) indicating targets and mitigation measures.

Effect of *Trichoderma* Species on Damping off Diseases Incidence, Some Plant Enzymes Activity and Nutritional Status of Bean Plants

Abd-El-Khair [*1], H., R. Kh. M. Khalifa [2] and Karima, H. E. Haggag[3]

[1*]Plant Pathology Department, [2]Fertilization Technology Department, National Research Centre, and [3]Pest Rearing Department, Central agricultural Pesticides Laboratory, Dokki, Giza, Egypt.

Abstract: *Fusarium solani* and *Rhizoctonia solani* are the common causal pathogens causes the damping off disease of beans (*Phaseolus vulgaris* L.) in Egypt. The antagonistic effect of four *Trichoderma* species, i.e. *Trichoderma album, Triechoderma hamatum, Trichoderma harzianum* and *Trichoderma viride*, was tested against *F. solani* and *R. solani in vitro*, in greenhouse and in field. *In vitro* tests, all *Trichoderma* spp. significantly reduced the mycelial growth of two pathogenic fungi. In greenhouse experiment, *T. album, T. hamatum, T. harizianum* and *T. viride*, as soil treatments, significantly reduced the pre- and post-emergence damping off disease incidence under artificial infection with *F. solani* and *R. solan*i. Soil treatments with four *Trichoderma* species significantly reduced the incidence of damping off disease where the percentages disease incidence were in the range of 7.0 -20.0% and 2.4 – 6.5%, compared to 25.7 and 13.5% in control plants, at pre- and post-emergence stages ,respectively. The best protection to damping off disease was obtained by *T. hamatum*, followed by *T. viride, T. album* and *T. harzianum*, respectively. The treatments gave the highest plant survival (%) and improved the growth and yield parameters. Results showed that the levels of chitinase, peroxidase and polyphenol oxidase activities highly increased in treated bean plant compared in untreated plants. The macro- and micro-elements content in treated bean plants was affected by *Trichoderma* species treatments compared to elements content in untreated plants. The relationship between plant nutrient content and some plant enzymes activity was studied. [Journal of American Science. 2010;6(12):122-134]. (ISSN: 1545-1003).

Key words: *Fusarium solani*, *Rhizoctonia solani*, *Phaseolus vulgaris*, *Trichoderma* spp., biological control, nutritional atatus.

1. Introduction

Beans (*Phaseolus vulgaris* L.) are considered one of the most important economic legumes in Egypt. Bean is very important as a human food, animal feed and its beneficial effects in improving the soil fertility (Anonymous, 2005 and Broughton *et al*., 2003). *Fusarium* root rot on beans is caused by the fungus *Fusarium solani* f. sp. *phaseoli*. The fungus can attack older seedlings, and is most severe on plants growing under stressful conditions. The pathogen usually survives as thick-walled chlamydospores in soil. *Rhizoctonia* root rot, caused by *Rhizoctonia solani,* is common throughout the world. It is one of the most economically important root diseases of beans. It has a broad host range that includes most annual and many perennial plants. Generally, *Rhizoctonia* survives between crops as sclerotia or as fungal mycelia in the soil. Young plants are more susceptible to infection than older plants. Application of the fungicides is not economical in the long time because they pollute the environment, leave harmful residues and can lead to the development of resistant strains of the pathogen with repeated use (Vinale *et al.,* 2008). Replacement of fungicides with bio-control agents is an alternative mean to; manage the plant pathogens, produce safety food and reduce the environment pollution (Barakat and Al-Masri, 2005). One of the most important bio-control agents is *Trichoderma* spp. that the most frequently isolated soil fungi and present in plant root ecosystems (Harman *et al*., 2004).*Trichoderma* spp. also are commercially marketed as biopesticides, bio-fertilizers and soil amendments. The use of *Trichoderma* fungi in agriculture can provide numerous advantages ; 1) colonization of the root and rhizosphere of plant, 2) control of plant pathogens by different mechanisms such as parasitism, antibiosis production and induce systemic résistance , 3) improvement of the plant health by promote plant growth , and 4) stimulation of root growth (Harman *et al.*,2004).

The antagonistic activity of the genus *Trichoderma* to *F. solani* and *R. solani* has been widely demonstrated (Lewis *et al*., 1998). *Trichoderma harzianum* protected the bean seedlings against pre-emergence damping off infection, reduced the disease severity and increased the plant growth in the presence of *R. solani* pathogen (Paula *et al*., 2001). El-Kafrawy (2002) reported that the *T. harzianum, Trichoderma hamatum, Trichoderma pseudoknonningii* and *Trichoderma polysporum* inhibited the radial mycelial growth of *R. solani in*

vitro test from 59.6 to 78.4 %. Soil treatment with *T. hamatum*, *T. harzianum* and *T. viride* gave the maximum protection against pre- and post-emergence damping off and reduced the disease incidence from 50 to 6.6, 10 and 10%, respectively, compared to fungicide Rizolex (tolclofos-methyl) at 10%. The bio-control agent treatments improved the plant heights, fresh and dry weight and increased dry seeds yield comparing with the control (El-Kafrawy, 2002). The seed treatment with the bio-control agents was less than soil treatment. Gonzalez *et al*. (2005) showed that the field application with *T. viride* and/or *T. harzianum* as soil application gave the same effectiveness (99%) against *R. solani* pathogen, comparing with the seed immersion. Soil amendments with *T. harzianum* significantly increased the heights and weight of plants and significantly reduced the *R. solani* infection (Malik *et al.*, 2005). Application of *T. harzianum* as seed treatment significantly reduced the incidence of damping-off diseases some leguminous crops, i.e. faba bean, lentil, and chickpea, when planted in a soil naturally infested with *Fusarium* spp. and *R. solani* (Abou-Zeid *et al*., 2003).*T. harzianum*, *Trichoderma koningii* and *T. viride*, as seed dressing, improved the seedling emergence and health of runner bean (*Phseous coccineus* cv. Eureka) [Pieta *et al*., 2003]. Seeds of common bean were dressed, prior to sowing; with conidia of *T. harzianum* protected the germinating seedlings and plants against infection by soil borne pathogenic fungi, i.e. *Fusarium* spp. and *R. solani* (Pieta and Pastucha, 2004).

Soil provides the medium for root development and with the exception of carbon, hydrogen, oxygen and some nitrogen, plants depend on soil for all other nutrients and water. The soil microbes that include bacteria, fungi, actinomycetes, protzoa and algae play a significant role in the nutrient cycling (Nannipieri *et al.*, 2003). Interactions between plant root systems and bio-control agents such as rhizobacteria are able to generate a wide array of secondary metabolites which can have a positive influence on plant growth, enhancing the availability of minerals and nutrients, improving nitrogen fixation ability and improving plant health through the bio-control of phytopathogens (Sturz and Christie, 2003). Applying biological control agents to infected plants increase mineral levels [(nitrogen (N), phosphorous (P), potassium (K) and magnesium (Mg)], and both chlorophyll biosynthesis and photosynthetic activity, which in turn led to the accumulation of metabolites i. e., carbohydrates and proteins (Mahmoud *et al*.,2004). *Bacillus subtilis* and *T. viride* only or combined were significantly increased the values of NPK concentration on tomato plants compared to control treatments (Henry *et al*., 2009 and Morsy *et al*., 2009).

The objective of this search was to evaluate the antagonistic potential effect of *Trichoderma* species (spp.), i.e. *T. album, T. hamatum, T. harzianum* and *T. viride* as bio-control agents against *F. solani* and/or *R. solani* the causal organisms of damping off disease and nutritional atatus in bean plants. The antagonistic activity of *Trichoderma* spp. was tested *in vitro*, in pot and in field. Role of bio-agents in enhance of some enzymes (chitinase, peroxidase and polyphrnol oxidase) related to disease control in plant was detected. The relationship between nutritional status of bean plants and *Trichoderma* spp. application was tested.

2. Materials and Methods

1- Plant material:

Bean seeds (*Phaseolus vulgaris* L.) cv. Pulista was obtained from Vegetable Crops Research Depart., Agricultural Research Centre, Giza, Egypt, to produce the host plants in this search. Health test of bean seeds was made. Seeds were placed on sterile cotton and filter paper moistened with sterile distilled water in Petri dishes and incubated at 25 ºC. Ten replicates of 20 seeds were used for each dish .No infected bean seeds were recorded through the test (Coskuntuna and Özer, 2008).

2- Pathogens:

Fusarium solani and *Rhizoctonia solani* were isolated from naturally infected bean plants, showing damping off and root rot symptoms, cultivated in Qalyubiya Governorate, Egypt. The isolated fungi were identified on the basis of cultural and microscopic morphological characters according to the key given by Barnett & Hunter (1972) and Booth (1985). Pathogencity of isolated fungi toward bean plants (cv. Pulista) was estimated (Sallam *et al*., 2008). Artificial inoculum of pathogenic fungi was prepared by growing each fungus on sorghum - sand medium as described by Abd El- Khair and El-Mougy (2003). The most aggressive isolate of each pathogenic fungus was used *in vitro* and in pot experiments.

3- Isolation of *Trichoderma* spp.:

Four fungi of *Trichoderma* species, i.e. *T. album, T. hamatum, T. harzianum* and *T. viride* were isolated from healthy bean plants rhizosphere collected from Qalyubiya Governorate , using dilution plate technique . All *Trichoderma* spp. fungi were purified by hyphal tip technique and identified on the basis of cultural and microscopic morphological characters (Barnett & Hunter, 1972 and Bissctt, 1991) in Plant Pathology Department,

National Research Centre. The fungi of *Trichoderma* spp. were used *in vitro*, in pots and in field experiments.

4- Preparation of *Trichoderma* spp. inoculums:

The propgules (colony forming unit, cfu) suspension of each *T. album*, *T. hamatum*, *T. harzianum* and *T. viride* fungus was prepared in sterile distilled water from 7-days-old-culture on potato dextrose agar [PDA] (Rojo *et al*., 2007). The fungal inoculum was harvested by flooding the culture with SDW and then rubbing the culture surface with a sterile glass rod. The fungal propgules concentration in each suspension was determined by counting using a haemocytometer slide (Adjusted at 10^8 cfu / ml). A mixture of milted soybean and talc powder (1:1, w: w) was used as a carrier mixture for antagonistic fungal propgules. A carrier mixture was added at rate of 50% to fungal suspension and mixed to even distribution of fungal propgules (Abd El-Khair and El -Mougy, 2003).

5- Evaluation of antagonistic activity of *Trichoderma* species:

5.1- In dual culture technique (*in vitro*):

The antagonistic effect of *T. album*, *T. hamatum*, *T. harzianum* and *T. viride* against *F. solani* and *R. solani* pathogens *in vitro* was evaluate using the dual culture technique (Coskuntuna and Özer, 2008). Each *Trichoderma* spp., *F. solani* and *R. solani* were cultured, separately, on PDA medium for 7 days at 25ºC. Disc (5mm- diameter) from each bio-control fungus was inoculated on surface of PDA medium in side of Petri dish. A disc (5 mm - diameter) of *F. solani* and *R. solani*, separately, was inoculated at equal distance of the opposite side of Petri dish. Petri dishes were inoculated with each pathogenic fungus only as control. Four Petri dishes for each bio-control - pathogenic fungus treatment, as well as the control, were used as replicates. The inoculated Petri dishes were incubated at 25 ºC at 7 days. Antagonistic effect of *Trichoderma* spp., as decrease of the mycelial growth of pathogenic fungi, was determined using the following formula.

$$\text{Antagonistic effect} = A-B/A \times 100$$

Where, A: The diameter of mycelial growth of pathogenic fungus in control and

B: The diameter of mycelial growth of pathogenic fungus with *Trichoderma* fungus.

5.2- In pot experiment:

Antifungal activity of *T. album*, *T. hamatum*, *T. harzianum* and *T. viride* against *F. solani* and *R. solani* pathogens was evaluated in pots under artificially infestation conditions. The experiment were designed under greenhouse conditions in Pest Rearing Department, Central Agricultural Pesticides Laboratory, using pots (40 cm – diameter) containing 4 kg of sterilized loamy clay soil. First, soil was infested with each pathogenic fungus grown on sorghum-sand medium at rate of 5 g/ kg soil in different pots and then the pots were irrigated for 7 days before bio-control agent inoculation. Next, soil was inoculated with each *Trichoderma* fungus at 5 g/ kg soil, and then pots were watered for 7 days before sowing. Ten of bean seeds (cv. Pulista) were sown in each pot. Five pots as replicates were used for each treatment as well as the control. The experiment included the following treatments; 1) non-infested soil (control), 2) soil treated with *F. solani* only, 3) *F. solani* + each *Trichoderma* fungus, separately, 4) soil treated with *R. solani* only and 5) *R. solani* + each *Trichoderma* fungus , separately. Pots were kept under greenhouse conditions till the end of the experiment. Disease incidence of pre- and post-emergence of damping off disease incidence and survival (%) of bean plants were recorded after 15, 30 and 45 days, respectively.

5.3- In field experiment:

The efficacy of soil treatment with *T. album*, *T. hamatum*, *T. harzianum* and *T. viride*, in separated block, against the incidence of damping off disease, were evaluated in a commercial bean field with a previous history of the disease in Qalyubiya Governorate. The field trial (20 plots) was designed in complete randomized block with four replicates. Each plot was 3x3 m in area and had four rows of 3m in length and 75 cm in width. First, each bio-control agent inoculum was applied at rate of 50g/1 m^2 of soil was incorporated with the 20 cm of the soil surface. Next, the soil was irrigated before 7 days before sowing. Bean seeds (cv. Pulista) were planted at rate of 3 seeds / hole at 20cm space. The field treatments were as follows; 1) soil naturally infected (control), 2) soil treated with *T. album*, 3) soil treated with *T. hamatum*, 4) soil treated with *T. harzianum* and 5) soil treated with *T. viride*.

Effect of the tested *Trichoderma* spp on:

5.3.1- Disease assessment:

Effect of the tested *Trichoderma* spp. in reducing the damping off disease incidence at pre- and post-emergence stages as well as the percentages of the survival of healthy plants were recorded after 15 , 45 and 60 days.

5.3.2- Plant growth and yield parameters.

Random samples of ten bean plants were collected at 60 days of sowing for each bio-control agent treatment as well as the control plants. The plant growth parameters as number of branches per plant, plant height, and number of leaves per plant and fresh weight of plant were determined. The yield parameters also recorded as number of pods per plant and the average pod weight were recorded.

5.3.3- Some plant enzymes activity:

Effect of *Tricoderma* spp. application on the activity of chitinase, peroxidase and polyphenol oxidase enzymes related to plant defense against pathogens infection were determined in leaves of bean plants.

Extraction of enzymes:

Plant tissue (g) was homogenized with 0.2 Tris Hcl buffer (pH 7.8) containing 14mM B-Mercaptoethanol at the rate of 1/3 w/v. The homogenate was centrifuged at 3000 rpm for 15 minutes. The supernatant was used to determine enzyme activities (Tuzun *et al*., 1989).

5.3.3.1-Chitinase assay:

Colloidal chitin was prepared from chitin powder (Sigma Co.) according to the method described by Ried and Ogryd –Ziak (1981).Twenty five grams of chitin powder suspended in 250 ml of 85 % phosphoric acid (H_3PO_4) and stored at 4 ^{O}C for 24 h., then blended in 2 liter of distilled water using blender. The suspension was centrifuged. This washing procedure was repeated twice. The colloidal chitin suspension was adjusted at PH 7 with (1N) NaOH and re-centrifuged. The pelleted colloidal chitin was stored at 4 c until used. Determination of enzyme activity was carried out according to the method of Monreal and Reese (1969).One ml of colloidal chitin in 0.05 M citrate phosphate buffer (pH 6.6) in test tubes. One ml of enzyme extract was added and mixed by shaking. Tubes were incubated in a water bath at 37 ^{O}C for 60 min., then cooled and centrifuged before assaying. Reducing sugars were determined in 1 ml of the supernatant by dinitro-salysilic acid (DNS). Optical density was determined at 540 nm.

5.3.3.2 - Peroxidase assay:

Proxidase activity was measured by incubation 0.1 of enzyme extract with 4 ml of guaiacol for 15 minutes at 25 ^{O}C and absorbance at 470 nm was determined. The guaiacol solution consisted of 3 ml of 0.05 M potassium phosphate. PH 7, 0.5 ml of 2 % guaiacol and 0.5 ml of 0.3 % H_2O_2 (Abeles *et al*., 1971). Peroxidase activity was expressed as the increase in absorbance at 470 nm/gram fresh weight/15 minutes.

5.3.3.3 - Polyphenol oxidase assay:

Activity of polyphenol oxidase was determined using the colorimetric method described by Matta and Dimond (1963). The reaction mixture contained 1.0 ml of crude enzyme extract, 1.0 ml 0.2 M sodium phosphate at pH 7.0 and 1.0 ml of 10 M catchall brought to final volume of 6.0 ml with distilled water (Morsy, 2005). The activity of polyphenol oxidase was expressed as the optical density at 475 nm.

5.3.4 - Macro- and micro-nutrient elements content:

Representative soil sample (0-30 cm) was taken before cultivation to determine some physico-chemical characteristic (Table, 1) according to standard methods described by Jackson (1973) and Lindsay & Norvel (1978). At early F1 (pods <10 cm long) growth stage, young mature blade from terminal and green pods were taken for determine their macro- and micro-elements content. The dry aching technique as described by Chapman and Pratt (1978) was used to extract macro- and micronutrients from dried leaves and pods.Total nitrogen (N) in leaves was determined by Buechi-320 apparatus, while potassium (K) and calcium (Ca) were measured using flame photometer, Genway instrument and phosphorus (P) was measured by using Spectrophotometer, Perkin Elemer instrument. The leaves content of iron (Fe), manganese (Mn), zinc (Zn) and magnesium (Mg) were measured by using Atomic Absorption Spectrophotometer, Perkin, Elemer, and Model 1100B.

5.4- Statistical analysis:

Data obtained were subjected to Computer Statistical Package (CO-STATE) originated by Anonymous (1989).

3. Results:

1 - *In vitro* tests:

The inhibitory effect of *T. album, T. hamatum, T. harizianum* and *T. viride* against the mycelial growth of *F. solani* and *R. solani in vitro* test are shown in Table (2). The antagonistic effects of *Trichoderma* spp. against *F. solani* were in the range of 38.9 – 57.5 %. *T. hamatum* gave the highest effect about 57.5 %, followed by *T. album* (49.1%), *T. harzianum* (44.4%) and *T. viride* (38.9 %), respectively. Results showed that the growth inhibition of *R. solani* by *Trichoderma* spp were in the range of 41.7 – 70.3 %. *T. hamatum* also highly inhibited the mycelial growth of *R. solani*, where the

growth inhibition was 70.3 %, followed by *T. harzianum* (61.1%), *T. album* (53.7%) and *T. viride* (41.7%), respectively. Results showed that the best growth inhibition against two pathogenic fungi was obtained by *T. hamatum*, while the lowest one was obtained by *T. viride* (Table, 2).

Table (1) : Some physico-chemical properties of soil sample from the experimental site.

Properties	**Items**
Sand %	29.2
Silt %	25.0
Clay %	25.2
Texture	Clay loam
pH (1:2.5 soil : water)	8.36

Control	9.0 a	-	9.0 a	-

(1) Means in each column followed by the same letter are not significantly different according to LSD test (P = 0.05).

2 - In greenhouse experiment:

Soil treatments with *T. album, T. hamatum, T. harizianum* and *T. viride* significantly reduced the pre- and post-emergence damping off disease incidence under artificial infection with *F. solani* and *R. solan*i in greenhouse conditions (Table, 3). The damping off disease incidence caused by *F. solani* under application of *Trichoderma* spp. were in the range of 9.5 – 19.0 % and 2.5 - 7.5% ,compared to 48.5 and 55.8 % at pre- and post-emergence stages ,respectively**.** At pre-emergence**,** *T. hamatum* gave the highest reduction to disease incidence about 81%, followed by *T. viride* (71 %), *T. album* (69%) and *T. harzianum* (61%). At post-emergence stage, *T. album* gave the best growth reduction to disease incidence about 96%, followed by *T. harzianum* (90%), *T. viride* (90%) and *T. hamatum* (87 %), respectively. The percentages of survival bean plants were in the range of 92.5 – 97.5 % compared to 44.2 % healthy bean plants in the control treatment. *T. album* gave 97.5 % healthy plants, followed by *T. harzianum* (94.5%), *T. viride* (94.3%) and *T. hamatum* (92.5%) where the percentages of the increase of healthy plants were 121 , 114, 113 and 109% ,respectively (Table,3).

The damping off disease incidence caused by *R. solani* under application of *Trichoderma* spp. were in the range of 4.0 – 16.0 % and 2.1 – 5.9% , compared to 35.0 and 52.5 % in the control plants , at pre- and post-emergence stages (Table,3). *T. hamatum* gave the highest reduction (80%) of disease incidence, followed by *T. viride* (63%), *T. album* (62%), and *T. harzianum* (54%) at pre-emergence stage. While at post-emergence, *T. album* gave the highest reduction (96%) against damping off disease, followed by *T. harzianum* (90%), *T. hamatum* (90%) and *T. viride* (89%), respectively (Table,3). The percentages of healthy bean plants were in the range of 94.1 – 97.9 %. *T. album* produced the highest percentage of healthy bean plants (97.9%), followed by *T. harzianum* (94.8%), *T. viride* (98%) and *T. hamatum* (95%), compared to 47.5 % in the control plants, where the percentages of the increase were 106, 100, 98 and 95, respectively.

3 - In field experiment:

Effect of *Trichoderma* spp. on:

3.1- Damping off disease incidence:

Soil treatments with four *Trichoderma* species, i..e., *T. album*, *T. hamatum*, *T. haezianum* and *T. viride*, significantly reduced the incidence of damping off disease in the field comparing with the control plants (Table, 4). Results showed that the percentages of damping off disease incidence were in the range of 7.0 -20.0% and 2.4 – 6.5%, compared to 25.7 and 13.5%, at pre- and post-emergence stages, respectivily. The best protection against the disease obtained by *T. hamatum*, where the disease incidence reduction was 73 %, followed by *T. viride* (53%), *T.*

album (38%) and *T. harzianum* (22%) at pre-emergence, respectively (Table, 3). At post-emergence, *T. album* gave the highly reduction (82%) to damping off incidence, followed by *T. viride* (65%), *T. harzianum* (63%) and *T. hamtum* (52%), respectively. Application of *Trichoderma* spp. also reduced the root rot disease of bean plants where the disease incidence were in the range of 0.0 – 2.2 % compared to 10.7 % in control bean plants.

Table (3): Effect of *Trichoderma* species treatments on the percentage of damping-off disease of bean plants under greenhouse condition (artificially infection) .

Trichoderma species	Disease assessment					
	Damping-off				Survival %	
	pre-emergence		Post-emergence			
	Incidence %	Reduction %	Incidence %	Reduction %	Healthy plants %	Increase %
Fusarium solani						
Trichoderma album	15.0 c[(1)]	69	2.5 e	96	97.5 a	121
Trichoderma hamatum	9.0 e	81	7.5 b	87	92.5 d	109

Control	35.0 a	-	52.5 a	-	47.5 a	-

(1) Means in each column (for each pathogenic fungus) followed by the same letter are not significantly different according to LSD test (P = 0.05).

Trichoderma spp. also significantly increased the percentages of healthy plants compared to control plants (Table, 4). Results showed that the survival bean plants were in the range of 91.3 – 97.6%, while in control bean plants was 75.5%. Application of *T. album* produced the highest percentage of healthy plants (97.6%), followed by *T. viride* (95.3%), *T. harzianum* (92.5%) and *T. hamatum* (91.3%), respectively.

Table (4): Effect of *Trichoderma* species treatments on the percentage of damping-off disease of bean plants under field applications (natural infection) .

Trichoderma species	Disease assessment						
	Damping-off %				Root-rot %	Survival %	
	Pre-emergence		Post-emergence

Control	25.7 a	-	13.5 a	-	10.7 a	75.8 e	-

(1) Means in each column followed by the same letter are not significantly different according to LSD test (P = 0.05).

3.2- Growth and yield parameters:

Results revealed that the average of bean plant height with *Trichoderma* application were in the range of 46.0-49.8 cm compared to 37.3 cm in the control plants (Table,5).*T. hamatum* gave the highest increase of plant height (34%) , followed by *T. harzianum* (26%) , *T. viride* (26%) and *T. album* (23%). No significant differences were recorded among *Trichoderma* treatments, while significant once were recorded between *Trichoderma* treatments and the control plants. The branches number average per plant as result for application of *Trichoderma* spp. were in the range of 5.0 – 6.3 branch/plant, compared to 3.7 branch /plant in control treatment. *T. harzianum* significantly increased the branches number average (70%), followed by *T. viride* (49%), *T. hamatum* (41%) and *T. album* (35). The leaves number average in treated bean plants were in the range of 11.5 – 15.2 leaves/plant; while in untreated plants were 9.5. *T. harzianum* significantly increased number of leaves (60%) , followed by *T. hamatum* (56%) , *T. viride* (50%) and *T. album* (21%).Results also showed that the fresh weight average without pods were in the range of 43.1 – 77.4% g , compared to 42.5g in the control plants (Table,5). *T. hamatum* significantly increased the fresh weight of bean plant (82%), followed by *T. harzianum* (36%), *T. viride* (21%) and *T. album* (2%).

Table (5): Effect of *Trichoderma* species treatments on some growth and yield parameters of bean plants under field applications (natural infection).

(1) Means in each row followed by the same letter are not significantly different according to LSD test (P = 0.05).

Application of *Trichoderma* spp. significantly increased the pods number average per plant where the number were in the range of 15.2 – 20.0 pods/plant ,compared to 10.8 pods/plant in the control plants (Table,5). No significant differences were recorded among *Trichoderma* treatments. *T. hamatum* significantly increased the pods number average (85%), followed by *T. harzianum* (62%), *T. album* (45%) and *T. viride* (41%).Results indicated that *T. hamatum* and *T. album* significantly increased the pod weight average about 48 and 15 % , respectively, comparing with other *Trichoderma* treatments as well as the control plants(Table,5).

3.3 - Some plant enzymes activity:

All *Trichoderma* spp. treatments stimulated the activity of chitinase, Perxidase and polyphenol oxidase enzymes, comparing with the control treatment (Table, 6). The optical density of chitinase enzyme activity in treated bean plants were in the range of 0.271 – 0.620, compared to 0.117 in control plants. The increases of chitinase enzyme activity were in the range of 132-430 %. *T. viride* gave the highest enzymatic activity of chitinase (430%), followed by *T. album* (174%), *T. harzianum* (150%) and *T. hamatum* (132%). The optical density of peroxidase enzyme activity was in the range of 0.437- 0.775 in bean plants under *Trichoderma* application, compared to 0.346 in untreated bean plants. The peroxidase enzymatic activity was in the

range of 26-124 % with *Trichoderma* treatments application. *T. harizanum* significantly increased the activity of peroxidase activity about 124 %, followed by *T. hamatum* (100%), *T. viride* (34%) and *T. album* (26%).Results showed that the optical density of polyphenol oxidase were in the range of 0.231 – 0.518 in treated bean plants , compared to 0.146 in control plants (Table,6). *Trichoderma* application enhanced the activity of polyphenol oxidase enzyme in bean plants from 58 to 255 %. *T. harizanum* significantly increased the enzyme activity (255%), followed by *T. viride* (108%), *T. hamatum* (103%) and *T. album* (58%), respectively (Table, 6).

Table (6): Enzymatic activity of chitinase, peroxidase and polyphenol oxidae, in bean plants treated with *Trichoderma* species in field applications.

Trichoderma species	Enzymatic activities					
	Chitinase		Peroxidase		Polyphenol oxidase	
	Activity	Increase %	Activity	Increase %	Activity	Increase %
Trichoderma album	0.321 b[(1)]	174	0.437 c	26	0.231 d	58
Trichoderma hamatum	0.271 e	132	0.693 b	100	0.296 c	103

Trichoderma viride	0.620 a	430	0.465 c	34	0.303 b	108
Control	0.117 d	-	0.346 d	-	0.146 e	-

(1) Means in each column followed by the same letter are not significantly different according to LSD test (P = 0.05).

3.4 - Macro- and micro-nutrient elements content:

3.4.1 – In bean leaves:

Results showed that the *Trichoderma* spp. treatments affected on the level of nutrients leave content from macro- and micro-elements (Table, 7). The *Trichoderma* spp. treatments significantly decreased the level of nitrogen and phosphorus content in bean leaves in treated plants .The level of nitrogen content was in the range of 2.19 – 2.60 %, compared to level of 2.73 % in untreated leaves. *T. harzianum* highly decreased the level of nitrogen content, where the level was 2.19 %, followed by *T. album* (2.21%), *T. hamatum* ((2.36 %) and *T. viride* (2.60 %). No significant differences were found between *T. album* and *T. harizanium* treatments. The level of phosphorus in leaves of treated plants was in the range of 15 – 17 %, compared to 0.21% in untreated control. The level of phosphorus was 15, 16, 16 and 17% in leave plants treated with *T. hamatum*, *T. album*, *T. viride* and *T. hariznum*, respectively. No significant differences were noticed among *T. hamatum*, *T. album* and *T. viride* (Table, 6).Results also revealed that the treatments increased the levels of potassium, magnesium, calcium and sodium in treated bean leaves than untreated one (Table,7). The level of potassium was in the range of 1.73 – 2.88% in treated leaves, compared to 1.39 % in untreated plants. *T. harzianum* significantly increased the level of potassium (2.88%) in treated leaves, followed by *T. viride* (20.16%), *T. album* (1.87%) and *T. hamatum* (1.73%). Treatment with *T. album*, *T. hamatum* and *T. viride* increased the level of magnesium in bean leave plants to 0.91, 0.88 and 0.84 %, except *T. harzianum* treatment decreased the level to 0.68 %, compared to level of 0.80% in untreated control. Results also showed that the level of calcium was in the range of 2.80 – 3.25 % in treated plants, compared to level of 2.75 % in controls. *T. viride* significantly increased the level of calcium in leaves (3.25%), followed by *T. album* (3.15%), *T. hamatum* (3.10%) and *T. harzianum* (2.80%). Treatment with both *T. hamatum* and *T. harzianum* significantly increased the level of sodium to 0.088 and 0.039 % in treated leaves, respectively, compared to the control (0.023%).

Effect of *Trichoderma* spp. treatments on the content of bean leaves in treated plants from micro-elements i.e. iron, manganese, zinc and cupper as shown in Table (7). The treatments significantly increased the levels of both iron and manganese in leave of treated plants. On the other hand, the same decreased the levels of zinc and cupper (Table, 7). The level of iron was in the range of 1250 – 2150 ppm .*T. hamatum* significantly increased the level of iron element (2150 ppm), followed by *T. album* (1550 ppm), *T. viride* (1425 ppm) , while *T. harzianum* significantly decreased the level of iron to 1250 ppm , compared to level of 1350 ppm in control . The level of manganese was in the range of 75 – 84 ppm, compared to level of 71 ppm in control plants. *T. viride* treatment only significantly increased the level of cupper in treated leaves. It is clear that *Trichoderma* spp. significantly increased the levels of potassium, calcium, iron and manganese in leaves in

treated bean plants. *T. hamatum* gave the highest values of magnesium, iron and manganese in bean leaves.

Table (7) : Effect of *Trichoderma* species on the nutrient elements content in bean leaves in field application (Average of two season).

Nutrient elements	Nutrient content of leaves with *Trichoderma* species				
	Trichoderma album	*Trichoderma hamatum*	*Trichoderma harzianum*	*Trichoderma viride*	Control

Cupper	9 cd	9 cd	8 d	13 a	10 b

(1) Means in each row followed by the same letter are not significantly different according to LSD test (P = 0.05).

3.4.2 – In fresh bean pods:

Results showed that *Trichoderma* spp. treatments significantly decreased the levels of both nitrogen and phosphorous in bean pods of treated plants, compared to control treatments (Table, 8).The level of nitrogen was in the range of 1.79 – 3.09 % , while the level of phosphorous was in the range of 0.42 – 0.50% , compared to 3.37 and 0.56 % in untreated pods. *T. harzianum* significantly increased the level of potassium to level of 4.42 %, while other *Trichoderma* spp. significantly decreased it as compared to level of 3.65 % in treated pods. The level of magnesium was in the range of 0.32 – 0.38 % in treated pods, compared to level of 0.43 % in untreated pods. *T. harzianum* only significantly increased the level of calcium and sodium to 0.35 and 0.022 % in treated pods, compared to levels of 0.25 and 0.014 %, respectively.

Effect of *Trichoderma* spp. on the levels of micro-elements in bean leaves as shown in Table (8). The treatments of *Trichoderma* significantly increased the content of pods from zinc*;* the level of element was in the range of 49 – 58 ppm, compared to level of 44 ppm in control. *T. harzianum* only significantly increased the levels of iron (550) and cupper (10 ppm) in pods of treated bean plants, compared to level of 475 and 6 ppm in untreated pods (Table, 8).

Table (8): Effect of *Trichoderma* species on nutrient elements content in bean green pods in field application (Average of two season).

Nutrient elements	Nutrient content of bean pods with *Trichoderma* species				
	Trichoderma album	*Trichoderma hamatum*	*Trichoderma harzianum*	*Trichoderma viride*	Control
Macro-elements (%)					
Nitrogen	2.03 d [(1)]	2.13 c	3.09 b	1.79 e	3.37 a
Phosphorus	0.45 d	0.42 e	0.48 c	050 b	0.56 a
Potassium	3.60 c	2.26 e	4.42 a	3.55 d	3.65 b
Magnesium	0.38 b	0.32 c	0.38 b	0.37 b	0.43 a
Calcium	0.25 c	0.28 b	0.35 a	0.26 c	0.25 c
Sodium	0.017 b	0.015 c	0.022 a	0.016 b	0.014 c
Micro-elements (ppm)

Cupper	6 c	6 c	10 a	7 b	6 c

(1) Means in each row followed by the same letter are not significantly different according to LSD test (P = 0.05).

3.4.3 – Correlation coefficient:

The correlation coefficient between macro- and micro-element nutrients concentration and some plant enzymes i.e. chitinase, peroxidase and polyphenol oxidase which related to plant disease resistance in bean leaves as average of two seasons are shown in Table (9). Results indicated that the significantly correlation was found between chitinase activity and the leaves content from phosphorous, potassium, calcium, manganese and cupper). The positive correlations were found between potassium, calcium, manganese and cupper, while the highly significant negatively one was found with phosphorous (Table, 9). Results showed that negatively correlation was noticed between the activity of peroxidase enzyme and macro-elements of nitrogen, phosphorus, magnesium, zinc and copper while positive correlation was detected with potassium and sodium. The activity of polyphenol enzyme in bean plants was negatively correlated with nitrogen, phosphorus and magnesium, while the significantly positive correlation was found with potassium. It is clear that the activity of peroxidase was highly correlated with nutrients elements, followed by chitinase and polyphenol oxidase. The highly significant positive correlation was recorded between the potassium and the activity of studied plant enzymes which may reflect emphatic role of potassium in plant resistance. The activity of polyphenol oxidase was correlated with micro-elements.

Table (9) : Correlation coefficient between nutrient elements content in bean leaves and enzymatic activity in leaves (Average of two seasons).

Nutrients content In bean leaves	Enzymatic activity in leaves

4. Discussion:

Our results revealed that the *T. album*, *T. hamatum*, *T. harzianum* and *T. viride*, which obtained from the rhizosphere of healthy bean plants, have bean reported as the best antagonists for damping off disease caused by *F. solani* and *R. solani* under laboratory, pot and field conditions. All *Trichoderma* spp. treatments reduced the mycelial growth of two pathogenic fungi. It is very important, especially the chemical methods are not economical in the long run, because the pollution the atmosphere, damage the environment, leave harmful residues, and can lead to the development of resistant strains among the target organisms with repeated use. Results indicated that all *Trichoderma* spp. significantly reduced the disease incidence at pre- and post-emergence stages in pot and field experiments. These results agree with those recorded by Abou-Zeid *et al*. (2003) and Pieta and Pastucha (2004). They reported that *T. harzianum*, *T. koningii* and *T. viride* protected the germinating bean seedlings against *Fusarium* spp. and *R. solani* infection. Our results, based on soil treatments with the tested *Trichoderma* spp. demonstrated a significant reduction to incidence of damping off disease in bean under pot and field infection (El-Kafrawy, 2002, Gonzalez *et al*., 2005 and Malik *et al*., 2005).

Our results showed that the use of *Trichoderma* spp. as bio-control agents induced the accumulation of some enzymes such as chitinase,

peroxidase and polyphenol oxidase which play an important role in plant defense mechanisms against pathogens infection. Results cleared that the enzymatic activity in treated bean plants increased than in untreated one. Nawar and Kuti (2003) reported that there are positive relationships between peroxidase and resistance development in plants. Caruso *et al*. (2001) also experimentally supported the idea that peroxidase play a defense role against invading pathogens. Hassan *et al*. (2007) recorded the lowest percentages of chocolate spot disease severity and the highest levels of peroxidase activities. Treatments with *Trichoderma* spp. gave the highly protection o bean seedlings against damping off disease at post-emergences stage comparison with per-emergence one. It is may be related to the ability of *Trichoderma* spp. to stimulate the enzymes in bean plants associated with increased the protection against disease. Our results revealed that *Trchoderma* spp. treatments increased some macro- and micro-elements content in leave and pods of bean and decreased the content of nitrogen, phosphorus and magnesium. These results agree with those reported by Snoeijers *et al* (2000). They reported that the successful colonization of plants by pathogens requires efficient utilization of nutrient resources available in host tissue. Our results revealed that the *Trichoderma* treatments highly increased the activity in bean leaves than pods. The treatments significantly increased the macro-elements of potassium, magnesium, and calcium and micro-element of iron which play an important role in defense plant tissues against plant pathogen infection. Results indicated that the activity of plant enzymes (chitinase, peroxidase and polyphenol oxidase) was correlated with level of macro- and micro-elements in bean plants.

Trichoderma is listed both in Europe and USA as an active principal ingredient permitted for use in organic farming for plant disease control. *Trichoderma* spp utilize various mechanisms including nutrient competition, antibiosis, antagonism, inhibition of pathogen or plant enzymes; processes of biodegradation, carbon and nitrogen cycling; complex interactions with plants in the root zone of the rhizosphere, which involve various processes such as colonization, plant growth stimulation, bio-control of diverse plant pathogens, decomposition of organic matter, symbiosis, and nutrient exchange (Howell,, 2003 and Harman, 2006). Recent studies indicate that these fungi can induce systemic resistance in plants, thus increasing the plant defense response to diverse pathogen attack (Harman *et al.*, 2004).

5. Conclusion

The previous results concluded that the soil treatments with *Trichoderma* spp significantly reduced the incidence of damping off disease .Results showed iit was positive correlation between the activity of chitinase , peroxidase and polyphenol oxidase and the level of nutrient elements especially potassium. Results recommended that the determine the nutritional status of plant under field treated with bio-control agents helps to select the suitable fertilization programs as well as diagnose nutritional deficiencies

Abstract: Background**,** End-stage liver disease and in particular human liver cirrhosis represents a worldwide health problem. Currently, liver transplant is the only effective treatment, but it is affected by many problems including relative lack of donors, operative damage, risk of rejection and high costs. Stem cell therapy is very attractive in this setting because it has the potential to help tissue regeneration while providing minimally invasive procedures and few complications. The aim of this study was to evaluate the effect of autologous transplantation of bone marrow derived mesenchymal stem cells in cirrhotic patients following chronic hepatitis C virus infection. Methods, Twelve patients with Child C liver cirrhosis, Model of End Stage Liver Disease (MELD) score > 12 were included. They divided into 2 groups according to method of MSCs injection, 1st group was injected intrasplenic and 2nd group was injected through the peripheral blood. First group patient's ages ranged from 32 to 69 years, mean value was 48.50 ±11.09, they were 4 males (67%) and 2 females (33%). Second group patient's ages ranged from 43 to 59 years, mean value was 50.83 ±6.88, they were 5 males (83%) and 1 female (17%). Fifty ml bone marrow was aspirated from the iliac bone for separation of MSCs. Surface expression of CD271 and CD34 were analyzed using flowcytometry. Finally approximately 10 million MSCs/ 5ml saline were infused intrasplenic or peripherally in one session. There was highly statistical significant difference between CD271 before and after culture, p value was <0.01. Results, Monthly Follow up of patients for 6 months revealed partial improvement of liver function tests with decline of elevated bilirubin and liver enzymes and elevation of prothrombin concentration and serum albumin levels. There was statistically significant difference between total bilirubin, direct bilirubin, MELD score and creatinine level before and after MSCs injection in both groups, p value was <0.05. Conclusion, MSCs are the most potent component of bone marrow cells in its ability to differentiate into hepatocytes thus, MSC transplantation can be used as a potential treatment for liver cirrhosis. The dose, frequency and route of administration of this treatment are still to be defined. [Journal of American Science. 2010;6(12):135-144]. (ISSN: 1545-1003).

Keywords: End-stage liver disease; liver cirrhosis; liver transplant; autologous transplantation; bone marrow; mesenchymal; stem cell

1. Introduction

Cirrhosis represents a late stage of progressive hepatic fibrosis characterized by distortion of hepatic architecture and formation of regenerative nodules. This results in many clinical manifestations including ascitis, variceal hemorrhage and encephalopathy (1).

Cirrhosis is the terminal outcome of viral hepatitis (particularly hepatitis C) *in our country* and alcoholic liver diseases. Other less frequent causes include some parasitic infections such as shistosomiasis, some metabolic disorders, toxic chemicals and unknown conditions. Egypt has the highest world wide prevalence of Hepatitis C reaching 20% in some areas. This is apparently due to past parenteral antischistosomal therapy. HCV infection was found to be a major cause of liver cirrhosis in Egypt (2).

Although liver cirrhosis carries a poor prognosis, the only very dated treatment for advanced liver cirrhosis is liver transplantation (3). Liver transplantation has become a procedure with a relatively good 5-year survival. Yet, organ donation has not kept up with the demand because of many problems, including relative lack of donors, operative complication, risk of rejection and high cost (4). Furthermore, it is expected that over the next few years there will be a 5- fold increase in the need for liver transplantation. For all these reasons, there is an urgent need to develop alternative strategies for the treatment of advanced liver disease (4).

Owing to the ability of stem cells to repopulate and differentiate at the engrafted site, stem cell-based therapy has received attention as a possible alternative to organ transplantation (5).

Bone marrow is a reservoir of various stem cells including hematopoietic (HSCs) and non-hematopoietic stem cells variously referred to as mesencymal stem cells or marrow stromal cells (MSCs) (6).While MSCs have been shown to be capable of mesodermal and neuro-ectodermal differentiation, they have the potential of endodermal differentiation; their differentiation into functional hepatocyte-like cells has also been demonstrated in vivo (7) and in vitro by continuous exposure to cytokine cocktail (8).

Both HSCs and MSCs have the ability to trans-differentiate to hepatocytes, but MSCs are the most potent component of bone marrow cells in hepatic differentiation. Thus, bone marrow stem cell transplantation, particularly MSC transplantation can be a potential treatment for liver cirrhosis (9).

Aim of work:

The aim of this study was to evaluate the effect of transplantation of autologous bone marrow derived mesenchymal stem cells into cirrhotic patients in improving liver function tests and patient's quality of life as a possible alternative to organ transplantation.

2. Subjects and Methods

Subjects & Methods:

Subjects:

The present study included 12 patients with chronic hepatic failure due to hepatitis C virus infection. According to modified Child Pugh scoring all our patients were Child's C liver cirrhosis, (MELD) score was > 12. They divided into 2 groups according to method of MSCs injection, the 1st group was injected intrasplenic and the 2nd group was injected through the peripheral blood. These patients were selected among cases referred from the medical department in Kasr EL- Aini hospitals; a written informed consent was taken from all patients.

Selection of the patients will be based on
Inclusion Criteria:

- Age 20-70 years
- Chronic hepatic failure due to hepatitis C or hepatitis B virus infection
- Child C liver cirrhosis
- Model of End –Stage Liver Disease (MELD) score > 12

Exclusion criteria:

History of moderate to severe hepatic encephalopathy or variceal bleeding during the last 2 months before enrolment ,presence of hepatic, portal or splenic vein thrombosis on Doppler ultrasonography, history of autoimmune diseases ,presence of active untreated infectious diseases, severe respiratory or cardiac diseases, presence of any types of malignancy, use of hepatotoxic drugs within the last 6 month before enrolment, severe bleeding and life threaten bleeding disorder.

The diagnosis was based on detailed history taking**,** complete clinical examination with special emphasis on abdominal examination**,** laboratory investigations including complete blood picture, Liver function tests, prothrombin time and concentration, alpha fetoprotein, kidney function tests, HCV Ab and HBs Ag using 4th generation ELISA technique, HCV (RNA) by RT-PCR and HBV (DNA) by PCR, radiological investigations including abdominal ultrasonography, doppler and duplex study of portal system.

Methods:

1. *Sampling*:

Fifty ml bone marrow was aspirated from the iliac bone after local anesthesia and placed in sterile tubes contains preservative free heparin.

2. *Mononuclear cells (MNCs) isolation:*

The bone marrow aspirate was diluted with phosphate buffer saline containing 2mM EDTA (PBS/EDTA buffer). MNCs were separated by density gradient centrifugation.

3. *Mesenchymal stem cells (MSCs) separation:*

The MNCs were plated in Dulbecco`s modified Eagle's medium (DMEM) and were cultured at 37˚C in 5% CO_2. After one day, non adherent cells were removed and adherent cells were cultured in presence of mesenchymal media for 3 weeks. After reaching 80% confluence the mesenchymal stem cells (MSCs) were harvested by incubation with trypsin / EDTA and counted on hemocytometer then flowcytometric analysis of surface expression of MSCs using anti CD271 and antiCD34 monoclonal antibodies was done. Finally, in a single session ten million MSCs in 5ml saline were injected percutaneously through the splenic vein under computerized tommograpy guidence.

4. Follow up:

Follow up of patients for 1-6 months by clinical assessment and laboratory work was done.

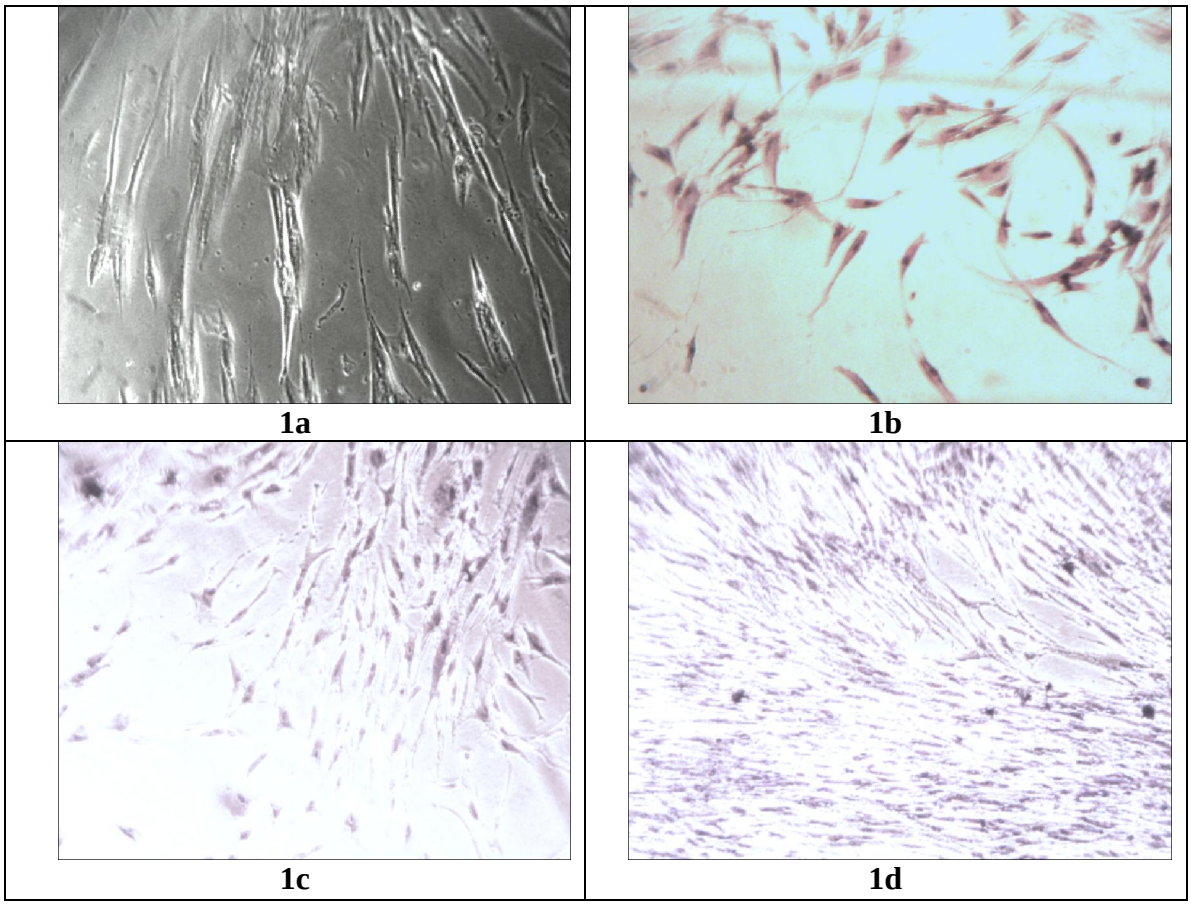

Figure (1): Photography of MSCs culture; 1a unstained MSCs 20% confluence, 1b stained MSCs 20% confluence, 1c stained MSCs 50% confluence and 1d stained MSCs 90% confluence.

Figure (2): CT photography taken after MSCs injection into the spleen

Statistical analysis:

Quantitative values are expressed as mean ± S.D, and were compared using Student's *t*-test. Qualitative data were compared using Qui Square test. A *p* value <0.05 was considered a significant. A *p* value <0.01 was considered as highly significant. Pearson's correlation coefficients for the different variables were calculated. The SPSS statistical package was used

3- Results:

First group (injected intrasplenic) patient's ages ranged from 32 to 69 years, mean value was 48.50 ±11.09, they were 4 males (67%) and 2 females (33%). Second group (injected through PB) patient's ages ranged from 43 to 59 years, mean value was 50.83 ±6.88, they were 5 males (83%) and 1 female (17%).

- On clinical examination before MSCs injection:

All patients of 1st and 2nd group had clinical evidence of decompensated liver cirrhosis. Three

patients (50%) of 1st group and 2 patients (33%) of 2nd group had a past history of at least one attack of encephalopathy, 5 patients (83%) of 1st group and 4 patients (67%) of 2nd group presented with jaundice, 2 patients (33%) of both groups had a history of hematemesis and/or melena, 5 patients (83%) of 1st group and 4 patients (67%) of 2nd group had lower limb edema during their initial assessment and 3 patients (50%) of both groups had mild to moderate ascitis. Splenomegaly was found in all patients.

- On clinical examination after MSCs injection:

In both groups of patients, only 1 patient (17%) show improvement of encephalopathic manifestation and ascitis, 3 patients (50%) show marvelous decline of jaundice, 2 patients (33%) show improvement of lower limb edema, however non of patients show improvement of bleeding manifestation (Table 1).

Statistical comparison between the 2 groups as regards clinical data before and after MSCs injection: On comparing the 2 groups regarding clinical data before and after MSCs injection there was no statistical significant difference, p value >0.05.

In both groups there was statistically significant difference between total bilirubin, direct bilirubin, MELD score, creatinine level before and after MSCs injection, p value was <0.05, also there was a highly statistically significant difference between CD271 before and after culture, p value was <0.01. However, comparison revealed statistically non significant difference as regards other laboratory data before and after injection, p value was >0.05, table-2 & table-3.

Correlation of CD271 expression after MSCs culture with clinical & fold change of laboratory data of patients before and after injection:

There was no statistical significant correlation between CD271 expression after culture with age, sex, clinical data and fold change of laboratory data before and after culture in both groups.

Statistical comparison between the 2 groups as regards laboratory data before and after MSCs injection:

On comparing the 2 groups regarding laboratory data before and after MSCs injection there was no statistical significant difference, p value >0.05.

4. Discussion:

End-stage liver disease, and in particular human liver cirrhosis, represents a worldwide health problem. Cirrhosis is the terminal outcome of viral hepatitis (particularly hepatitis C) and alcoholic liver diseases. Egypt has the highest prevalence of Hepatitis C Virus (HCV) in the world, up to 20% in some areas. HCV infection is a major cause of liver cirrhosis in Egypt (2). Currently, liver transplant is the only effective treatment, but it is affected by many problems, including relative lack of donors, operative damage, risk of rejection, and high costs. Stem cell therapy is very attractive in this setting because it has the potential to help tissue regeneration while providing minimally invasive procedures and few complications (4).

The bone marrow (BM) contains at least two populations of stem cells, haematopoietic stem cells (HSCs) and mesenchymal stem cells (MSCs), which provide stromal support for HSCs. It also contains many other haematopoietic cell types involved in immune surveillance, inflammatory responses and pathogen removal. It has long been proposed that bone marrow, a known source of stem cells, might be able to contribute to the repair of other organs (10).

Both HSCs and MSCs have the ability to trans-differentiate to hepatocytes, but MSCs are the most potent component of bone marrow cells in hepatic differentiation (9). MSCs are present in low numbers in BM and have a capacity to differentiate into a wide range of mesenchymal tissue types, including cartilage, bone, muscle, stroma, fat, tendon, and other connective tissues. Their differentiation

into functional hepatocyte-like cells has also been demonstrated in vivo (7) and in vitro by continuous exposure to cytokine cocktail (8).This term more recently has been applied to plastic adherent fibroblastic cells that are isolated from the bone marrow and other tissues that show mesenchymal multipotency. Unlike HSC, once isolated, these mesenchymal stromal cells can be grown in culture for many population doublings and now have been shown also to have a much broader potential, including neural differentiation. In some studies, the surface phenotype of an MSC has been investigated. They are negative for markers that include CD34, CD45, and CD14 and positive for CD166, CD105, CD29, and CD44 (11).

Upon liver injury, the typical repair process involves two distinct phases: a regenerative phase, in which injured liver cells are replaced with regenerated hepatocytes; and a phase known as fibroplasias or fibrosis, in which connective tissue replaces normal parenchymal tissue. Although initially beneficial, the repair process becomes pathogenic when it is not controlled appropriately. Extensive accumulation of ECM components can ultimately lead to cirrhosis and liver failure (12). Moreover, fibronectin, a component of ECM, has been proved to promote the MSC-induced cytoprotection following transplant for liver disease (13). The ideal strategy to treat liver injury is to generate new hepatocytes replacing damaged cells without causing excessive ECM deposition.

The first demonstration of the existence of putative liver stem cells in the bone marrow was reported by Petersen et al. (14). They showed that bone marrow cells transplanted into lethally irradiated mice engrafted in the recipient's liver and differentiated into liver stem cells (oval cells) or mature hepatocytes. These in vivo results were confirmed in animal models and in patients who received bone marrow transplantation for hematological disorders (15).

Hepatic stellate cells (HSCs) are the main ECM-producing cells in the injured liver. When a liver injury occurs (e.g., viral hepatitis), HSCs proliferate and undergo a dramatic phenotypical alteration, which is characterized by the acquisition of a proliferative, contractile, migratory, fibrogenic and inflammatory phenotype. Activated HSCs secrete large amount of ECM proteins, including collagen (I, III, and IV), fibronectin, undulin, elastin, laminin, hyaluronan, and proteoglycans (16). The accumulating interstitial ECM constituents that collectively form the hepatic scar replace the low-density type IV collagen with the normal subendothelial space of Disse. These interstitial fibril-forming collagens (especially types I and III collagens) become distributed primarily in the connective septa surrounding the regenerative hepatic nodules. A cirrhotic liver may contain up to six times more collagen and proteoglycan than a healthy organ (17). In addition to the resident HSCs, periportal fibroblasts, bone marrow-derived fibrogenic cells, epithelial-mesenchymal transition, and possibly circulating fibrocytes can contribute to the fibrogenesis in the liver. MSC have a significant impact on hepatic fibrogenesis through their ability of inhibiting activated HSC and re-regulating the fibrogenic process. The interventions of mesenchymal stem cells (MSC) include: (1) inhibit HSC proliferation; (2) stimulate HSC apoptosis; (3) inhibit ECM accumulation; (4) stimulate endogenous hepatocyte regeneration; and (5) hepatocyte-like differentiation (18).

MSC paracrine-mediated hepatic regeneration from endogenous liver stem cells may also contribute to the hepatocyte replication and recovery of hepatic function (19).

The aim of this study was to evaluate the effect of transplantation of autologous bone marrow derived mesenchymal stem cells into cirrhotic patients in improving liver function tests and patient's quality of life as a possible alternative to organ transplantation. The present study included 12 patients with chronic hepatic failure due to hepatitis C virus infection. The degree of hepatic affection was determined according to modified Child Pugh scoring. All our patients were Child's C liver cirrhosis, MELD score was > 12. They divided into 2 groups according to method of MSCs injection, the 1st group was injected intrasplenic and the 2nd group was injected through the peripheral blood. These patients were selected among cases referred from department of Internal medicine in Kasr EL Eini hospitals in Cairo University; a written informed consent was taken from patients. Bone marrow was aspirated from the iliac bone for separation of MSCs then 10 million MSCs in 5 ml saline were infused intrasplenic or peripherally in one session.

After 1-6 months follow up of patient's we observed that 1 patient (17%) show improvement of encephalopathic manifestation and ascitis, 3 patients (50%) show marvelous decline of jaundice, 2 patients (33%) show improvement of lower limb edema, however non of patients show improvement of bleeding manifestation. Partial improvement of liver function tests with decline of elevated bilirubin and liver enzymes and elevation of prothrombin concentration and serum albumin levels was noticed in both groups. There was statistical significant difference between total bilirubin, direct bilirubin, MELD score, creatinine level before and after injection in both groups, p value <0.05. Also there

was highly statistical significant difference between CD271 before and after culture, p value <0.01. However, comparison revealed no statistical significant difference as regards other laboratory data before and after injection of our patients following laboratory culturing of MSC, p value >0.05. On comparing the 2 groups regarding laboratory data before and after MSCs injection there was no statistical significant difference, p value >0.05 that might be explained by small number of patients, so large scale population study is required. There are only a handful of clinical trials in the field of regenerative cell therapy specifically in the field of hepatology, all of which are small-scale, uncontrolled safety and feasibility studies.

Our results were more or less in consistent with Terai et al. (20) who implemented a clinical trial on nine patients with decompensated liver cirrhosis. These patients were infused with $5.2 \pm 0.63 \times 109$ autologous bone marrow cells into the peripheral vein. At 24 weeks after transplantation, significant improvements were observed. These improvements included total protein, serum albumin, Child-Pugh scores, and α-Fetoprotein and proliferating cell nuclear antigen expression in liver biopsy tissues.

Also Gordon et al. (21) evaluated the effects of CD34+ hematopoietic stem cell intrahepatic injection and whole bone marrow peripheral infusion in five patients with liver cirrhosis. Their results showed a decrease in serum bilirubin and an improvement in serum albumin in three and four of the five patients, respectively, with the disappearance of ascites observed in one patient. They concluded that bone marrow stem cells are able to improve the residual liver function in cirrhotic patients.

More recently, Mohamadnejad et al. (22) performed two small scaled clinical studies, in their first trial, four patients with decompensated liver cirrhosis were infused 31.73×106 (mean) MSCs through a peripheral vein. At the end of follow-up (after 12 months), MELD scores of two patients improved by four points and by three points. The mean physical and mental component scales were more than doubled by the end of follow-up. Computed tomography (CT) showed the increase of liver volumes of three patients by the sixth month. However, the results of their second trial were not satisfactory. Four patients received 5.25×106 (mean) autologous bone marrow-hematopoietic stem cells infused through hepatic artery. Only marginal improvements were observed in some patients. The results of their MSC transplantation were more promising than the study of hematopoietic stem cell transplantation. They also indicated that hepatic artery delivery of stem cells was not a safe procedure. Because of the lack of reliable means of identifying transplanted stem cells in the human body, they recommended caution during the evaluation of the clinical outcomes.

Kuo et al. (23), Xu and Liu (24) and Dai et al. (25) described some parameters governing the success of using MSCs and characteristics of various delivery approaches in their recent papers. We can conclude from our results and others that MSCs are the most potent component of bone marrow cells in hepatic differentiation thus, bone marrow stem cell transplantation, particularly MSC transplantation can be a potential treatment for liver cirrhosis. Also from our results there was no difference in clinical and laboratory improvement regarding the route of administration. However, the dose, frequency and route of administration of this treatment are still to be defined.

Abstract: This study was done to clarify the role of hepcidin in the regulation of iron homeostasis and development of anemia in chronic hepatitis C (CHC) patients targeting the differentiation of the type of anemia. Patients and methods: This study was conducted on 70 CHC patients. Iron profile and soluble transferrin receptor (sTfR) were measured. Transferrin saturation and transferrin receptor ferritin (TfR-F) Index were calculated. Serum prohepcidine hormone and IL6 levels were measured (ELISA). Histopathological examination and immunohistochemical detection of hepcidin were done. According to the iron profile patients were reclassified into iron deficiency anemia (IDA) group, anemia of chronic disease group (ACD) and combined anemia group (COMBI). Results: 64.3% of patients were of the COMBI group, 10% had ACD and 25.7% had IDA. Hepcidin was increased in Child C group ($P<0.05$). Hepatic expression of hepcidin showed reduced expression in Child A, B and C groups. Hepcidin level was found to be increased in ACD and COMBI group in comparison to control and IDA group. Stepwise logistic regression demonstrated that sTfR was the most predictive parameter for IDA while hepcidin was the most predictive parameter for ACD and COMBI in CHC patients. Conclusion: hepcidin plays an important role in the pathogenesis of anemia in CHC patients. The role of hepcidin in discriminating different types of anemia in CLD is comparable to that of sTfR/logFn index. An appropriate combination of both tests provides evidence for iron depletion or reflects excessive production of hepcidin which will help to establish a correct diagnosis of IDA, ACD or combined anemia in patients with CHC. [Journal of American Science. 2010;6(12):145-154]. (ISSN: 1545-1003).

Key words: Hepcidin, CHC, IDA, ACD, Anemia

1. Introduction

The prevalence of hepatitis C virus (HCV) infection varies throughout the world, with the highest number of infections reported in Egypt [1]. Anemia of diverse etiology occurs in about 75% of chronic liver disease (CLD) patients and this frequent association provides a rationale for examining the contribution of the liver in the development of anemia in those patients [2].

Anemia of chronic illness is frequent among patients with inflammatory disease without apparent blood loss e.g. rheumatoid arthritis, renal failure or chronic hepatitis [3].

Increased iron requirements, limited external supply, and increased blood loss may lead to iron deficiency (ID) and iron-deficiency anemia (IDA). In chronic inflammation, there is hypoferremia and iron-restricted erythropoiesis, despite normal iron stores (functional ID). Anemia of chronic disease (ACD) can evolve into combined ACD and true ID (COMBI anemia) [4].

The liver performs three main functions in iron homeostasis. It is the major site of iron storage, it regulates iron traffic into and around the body through its production of the peptide hepcidin, and it is the site of synthesis of major proteins of iron metabolism such as transferrin and ceruloplasmin [5].

At the core of iron homeostasis is hepcidin, a small acute phase anti-microbial peptide that now appears to synchronously orchestrate the response of iron transporter, ferroportin and regulatory genes [6]. Liver hepcidin is regulated by a number of factors such as iron overload, inflammation, hypoxia and anemia [7].

The effects of inflammation on hepcidin levels are best understood and are mediated at least in part by interleukin 6 (IL6) [8]. Thus, in chronic inflammation, the excess of hepcidin decreases iron absorption and prevents iron recycling [9].

Laboratory tests provide evidence of iron depletion in the body, or reflect iron-deficient red cell production. The appropriate combination of these laboratory tests help to establish a correct diagnosis of ID status and anemia [3].

Measurement of serum ferritin is currently the accepted laboratory test for diagnosing iron deficiency, and a ferritin value of 12 µg/l is a highly specific indicator of iron deficiency. Other commonly used laboratory tests such as serum iron, total iron-binding capacity, mean corpuscular volume, and transferrin saturation provide little additional diagnostic value over ferritin [10]. However, serum ferritin levels are increased in several pathological conditions associated with chronic inflammatory conditions.

The transferrin receptor (TfR) mediates cellular uptake of iron by binding the iron carrier-protein

transferrin (Tf). The soluble form of TfR in serum is used as a surrogate marker of bone marrow erythropoiesis and red cell production [11]. Because serum ferritin reflects the storage iron compartment and sTfR reflects the functional iron compartment, these two values can be combined into a ratio, which is reciprocally regulated. The special value of the sTfR/log ferritin index (TfR-F Index) in the differential diagnosis of IDA has already been documented [12].

The aim of this study was to clarify the role of hepcidin (serum and tissue) in the regulation of iron homeostasis and development of anemia in patients with CHC targeting the differentiation of the type of anemia (ID, ACD or combined) in those patients. We also aimed at investigating the iron profile and tissue iron score and its relevance to the diagnosis of anemia in CLD patients with different clinical stages in an attempt to choose the best diagnostic markers for type of anemia.

2. Patients and Methods

This study was conducted on 70 CLD patients admitted to Hepatology Department Theodor Bilharz Research Institute in addition to 20 healthy controls who had normal biochemical tests, CBC, liver function tests and were negative for hepatic viral infection both by ELISA and by polymerase chain reaction (PCR) in addition to normal ultrasonograph configuration of the liver Patients were enrolled in this study if they had CLD as evidenced by 2-3 folds increased liver function tests for more than 6 months and the etiology of CLD was chronic hepatitis C (CHC) virus as diagnosed by HCV antibody detection in serum (ELISA) and PCR viral detection both quantitative and qualitative tests. Patients were excluded if they had hepatitis B or schistosomiasis co-infection or history of hematemesis or melena in the last 21 days. None of the patients received blood or blood components transfusion therapy in the past 21 days. Patients were classified according to modified Child Pugh classification (1973) [13] into child A (25 patients), Child B (17 patients) and Child C (28 patients).

After taking their written consent according to Helsinki guidelines of ethical research, Samples from all patients and controls were withdrawn in suitable vacutainers and subjected to liver function tests (AST, ALT, Albumin, Bilirubin and Prothrombin time), complete blood count (CBC) including Hb concentration, MCV, MCH, MCHC and RDW using hematology analyzer Celtac-MEK 8118 (Nihon Kohden, Japan), HCV antibody by ELISA and PCR detection of HCV both qualitative and quantitative. Liver biopsies of which pathological examination, tissue iron quantification and immunohistochemical detection of prohepcidine expression using monoclonal antibody was done. The same procedures were done on liver biopsies taken from patients during cholecystectomy operation after taking their written consents. Those acted as control for immunohistochemistry. Biopsies from controls were negative for hepatitis markers both B and C and didn't show any evidence of inflammation.

Iron profile (serum iron, TIBC, serum ferritin and transferrin) was measured by ELISA technique using commercially available kits (Bayer Diagnostics, U.K.) Transferrin saturation was calculated as serum iron (µg/dl) x 70.9/ serum transferrin (mg/dl). sTfR receptor (sTfR) level was measured by ELISA using Quantikin human sTfR kit (R&D systems Inc, USA). Calculation of the ratio TfR/log ferritin (TfR-F Index) was used as a determinant of body iron stores. If the Index was equal or more than 2, the patients were considered iron deficient. Patients were considered iron replete if Index was less than or equal to1 [14].

Serum prohepcidine hormone levels were measured by using DRG hepcidin prohormone ELISA kit (DRG, Germany). IL6 was evaluated by ELISA using Quantikine IL-6 (Quantikine IVD, minipolos, USA) test kits. Blood samples were collected from all patients at the same time during routine sampling to avoid diurnal variation of hepcidin.

According to the results of the iron profile and markers of inflammation, patients were regrouped into 3 groups; group 1: patients with iron deficiency anemia (IDA, n=18). Criteria of inclusion in this group were: low Hb (male<13 g/dl and female <12 g/dl), TSAT (<20%) and ferritin concentrations (<30 ng/ml). Group 2: patients with anemia of chronic disease (ACD, n=7). Criteria of inclusion in this group were: evidence of chronic inflammation (high CRP level>1mg/dl), Hb concentration <13 g/dl for male and<12 g/dl for female and low TSAT <20% but normal or increased serum ferritin concentration (>100 ng/ml) or low serum ferritin concentration (30-100 ng/dl) and sTfR/ log ferritin ratio< 1. Group 3 was compromised of patients who had combined ID and ACD (COMBI, n=45). Criteria of inclusion were: chronic inflammation (high CRP level >1mg/dl), hemoglobin concentration < 13 g/dL for male and < 12 g/dL for female, low TSAT < 20%, serum ferritin concentration > 30 and < 100 ng/mL, and a sTfR/log ferritin ratio > 2 [4].

Histopathological examination and tissue Iron evaluation:

Histological sections were processed and stained with hematoxylin and eosin (H&E) and Masson trichrome was used to examine the histopathological changes. Perls Prussian blue staining for iron was performed. Liver specimens were scored for grade of inflammatory activity according to the classification of Desmet et al. [15] The histological quantification of

iron was done according to Deugnier et al. [16] by scoring iron separately within hepatocytes (hepatic iron score (HIS) 0 to 36), sinusoidal cells (sinusoidal iron score (SIS) 0 to 12), and portal tracts or fibrotic tissue (portal iron score (PIS) 0 to 12). The total iron score (TIS) 0 to 60, was the sum of these scores.

Immunohistochemical procedure:

The standard avidin-biotin immunoperoxidase technique was used [17]. Hepcidin was detected using a primary antibody against hepcidin (Santa Cruz Biotechnology, Santa Cruz, CA., USA). The number of positively stained cells with positive intracytoplasmic brown stain was recorded within ten successive fields (X400), the final value represented 10 readings per case. Zero percentage was given to unstained sections. Hepcidin expression sites were examined in hepatocytes, intra-lobularly and in peri-portal areas.

Statistical methods:

All data are reported as mean +/- SD. The data were analyzed by computer using the statistical package SPSS for windows version 11 (software). Comparing means was performed by one-way ANOVA Post HOC LSD test. Correlations between different parameters were determined by bivariate Pearson correlation test. The linear relationship between variables was assessed by linear regression analysis. To determine the best predictors of ID, ACD and COMBI anemia multivariate analysis was done using stepwise logistic regression and odd ratios were estimate for each of the independent variables in the model. For all tests P values <0.05 were considered statistically significant.

3. Results:

The results of the biochemical tests of the control and patient groups are shown in table 1

The hematological results of the control and patients groups are shown in table 2.

Results of the iron profile (serum iron, TIBC, transferrin saturation and serum ferritin), sTfR, sTfR/Fn index, prohepcidin hormone, IL6, tissue expression of hepcidin, tissue iron scores and liver histology in the control, Child A, Child B and Child C groups are shown in Table 3.

Histopathological grading of inflammation and hepcidin detection:

In Child A, all cases were with mild inflammatory activity. All Child B cases showed moderate inflammatory activity and all 28 cases in Child C expressed severe activity.

Tissue expression of hepcidin was mainly in hepatocytes, expressed as cytoplasmic brownish stain (figures 1, 2 and 3). Figure 4 shows iron stain in a Child C patient.

Correlation studies:

In Child A group, there was a negative correlation between hepcidin and sTfR (r=-0.52) and a positive correlation between hepcidin and Fn (r= 0.059). Negative correlations were found between Fn index and hepcidin (r=-0.58) and between sTfR and Fn (r=-0.57) in Child A. In Child B group, there were two positive correlations between hepcidin and each of IL6 (r=0.54) and ferritin (r=0.49) while IL6 revealed a negative correlation with sTfR (r=-0.66) and a positive correlation with ferritin (r=0.93) in the same group. Correlation studies also showed an inverse correlation between sTfR and ferritin (r=-0.71) and between ferritin index and IL6 (r=-0.76) in Child B group. In Child C group there was a positive correlation between ferritin index and IL6 (r=0.39). The results of IDA group, ACD group and COMBI group are shown in table 4.

In Child A group, 10/25 (40%) of patients were categorized under IDA group, 5/25 (20%) under ACD group while 10/25 (40 %) were of the COMBI group. In Child B group 8/17 (47%) were found to have IDA, 2/17 (11.7%) were found to be in the ACD group while 7/17 (41.1%) were found to be of the COMBI group. As regard Child C group, all 28 patients (100%) were found to have combined IDA and ACD. In all diseased groups 18/70 (25.7%) had IDA, 7/70 (10%) had ACD and 45/70 (64.3%) had combined anemia.

Correlation studies revealed a negative correlation between hepcidin and sFe (r=-0.83) in ACD group. In COMBI group, positive correlations were expressed between IL6 and ferritin (r=0.37), Fn index and hepcidin (r=0.36) while negative correlations were noted between hepcidin and TfR (r=-0.46), IL6 and serum Fe (r=-0.32), Fn index and serum Fe (r=-0.42).

Univariate regression analysis comparing variables other than those used for classification of IDA, ACD and COMBI anemia revealed that sTfR (P<0.001) and ferritin (P<0.001) were the most predictive parameters for IDA, while hepcidin was the most predictive parameter for both ACD (P<0.05) and COMBI group (P<0.001). Stepwise multivariate logistic regression analysis demonstrated that sTfR was the most predictive parameter for IDA anemia while hepcidin was the most predictive parameters for ACD and COMBI in CLD patients. Odd ratios (OR) estimated for sTfR and hepcidin were considered significant. The 95% confidence interval (CI) for OR was 1.6 [lower bound (L) 1.2 and upper bound (U) 1.84] and 0.003 (Lower 0.0001and Upper 0.68) respectively with P<0.0014 and 0.043 respectively. This was confirmed by stepwise discriminate analysis (p<0.0001 for both parameters).

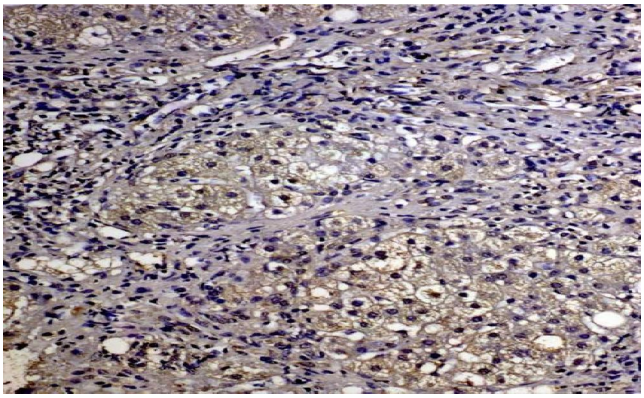

Figure 2: A case of HCV, Child C showing cirrhotic nodule expressing Hepcidin in about 40% of hepatocytes as brownish cytoplasmic color (IHC, DABx200) (20mcm).

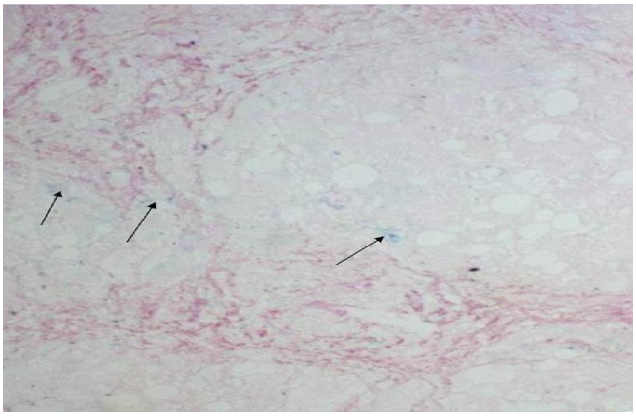

Figure 4: A case of HCV, Child C, showing some hepatocytes revealed positive expression of iron as bluish intracytoplasmic granules (Perl's iron stain, x100) (10mcm).

4. Discussion:

Hepatitis C virus (HCV) infection is a major cause of liver diseases [18] in which anemia is a prevalent feature. Hepcidin is the central regulator of systemic iron homeostasis. Hepcidin deficiency is the cause of iron overload in hepatitis C while hepcidin excess is associated with anemia of inflammation and iron-refractory iron deficiency anemia [19].

According to the Hb and RBCs indices, patients had microcytic hypochromic anemia with anisocytosis in all diseased groups. Since active bleeding was excluded in these patients, anemia could be attributed to iron deficiency either functional (FID) or true (TID). True iron deficiency in CLD could be due to increased requirements or diminished supplies. This may result from hidden blood loss or low-grade gastrointestinal bleeding which also may be compounded by decreased oral iron absorption because of dietary restrictions. Blood loss could be caused by defects of blood coagulation as a consequence of endothelial dysfunction, thrombocytopenia or deficiencies of coagulation factors. Anemia could also be due to secondary hemolysis caused by splenomegaly, which is usually caused by portal hypertension in patients with CLD. In some patients, bone marrow failure and aplastic anemia develop after an episode of hepatitis. Finally, anemia could be due to ribavirin-induced hemolysis as a complication of treatment of CHC with a combination of interferon and ribavirin [2].

The iron profile denotes that patients suffered from decreased iron in all groups. A significant reduction in ferritin was noted only in Child C. Low ferritin levels due to iron deficiency could be counteracted by increased ferritin synthesis which is induced by inflammatory cytokines [20]. The inflammatory state detected in those patients induces ferritin synthesis, probably through hepcidin secretion, masking the reduced ferritin levels due to iron deficiency [21]. Elevated serum ferritin and hepatic iron concentrations are frequently observed in CHC which may be related to hepcidin [22].

The level of tissue iron showed a statistical significant increase in all diseased groups. Increased serum hepcidin levels explain the inappropriate low hepatic hepcidin expression in an iron-over loaded cirrhotic liver. While the cirrhotic liver tissue is unable to secrete hepcidin, extra hepatic sources of hepcidin increases. Irrespective of the source of hepcidin, the downstream consequences are likely to be internalization and degradation of the cellular iron export protein ferroportin in the background of an elevation in the cellular iron import proteins such as transferrin receptor 1. This culminates in cellular iron accumulation; a phenotype which have previously been reported in HCV patients. This raises the possibility that hepcidin may have a dual effect contributing to the systemic anemia whilst acting locally at liver cells leading to iron accumulation. [23].

The soluble form of TfR (sTfR) is proportional to the total amount of surface TfR [24] and the erythroblasts rather than reticulocytes are the main source of serum sTfR [25]. The interpretation of the iron state according to sTfR has been controversial by many authors. Some believe that increased sTfR concentrations indicate ID even during ACD, and sTfR levels, was found to be considerably elevated in iron deficiency anemia but remain normal in the anemia of inflammation [24]. Others claim that elevated sTfR levels are also the characteristic feature of functional iron deficiency (FID) [25]. Increased sTfR may also indicate increased erythropoietic activity without ID, whereas lower sTfR concentrations may reflect decreased numbers of erythroid progenitors [24].

sTfR was found to be significantly increased in all patients compared to the controls ($P<0.05$). According to these results, all Child groups suffered from iron deficiency either solely or on top of ACD. It might also indicate the increased erythroid synthesis compensating for hemolysis or hidden gastrointestinal bleeding.

Statistical studies showed that in Child A and C most of the patients (80% and 100% respectively) suffered from iron deficiency either solely or combined with ACD which explains the high ferritin index values. In Child B group although still the percentage of patients suffering from iron deficiency was higher than those with ACD (88.3 versus 11.7), yet the marked high ferritin level of patients with ACD explains the decreased index value in this group. On regrouping patients into IDA, ACD and COMBI we found that after excluding patients with active bleeding the main type of anemia present in CHC patients is a combined form of ACD and IDA (COMBI anemia). All patients in Child C had COMBI anemia denoting that the more the progress of the disease the more patients are liable to acquire both types of anemia probably as a result of increased amount of chronic blood loss together with increased degree of inflammation caused by increased viral influence.

Statistical significant increase was detected in serum hepcidin in Child C group compared to control and Child A groups ($P<0.05$). On the contrary, hepatic expression of hepcidin showed reduced expression in diseased groups compared to the control group.

High level of hepcidin was detected in the presence of chronic hepatitis C (CHC) in many studies [26, 27]. The discrepancy between serum levels and hepatic expression levels could be due to the fact that hepcidin

expression was also localized in other tissues other than liver as kidney tubular system [28] and macrophages [29]. There is evidence that hepcidin is also expressed in the heart, kidney, adipose tissue, pancreas and haematopoietic cells [30].

Although there was an inflammatory state detected in all patients as proved by inflammatory index and CRP, significant increase in IL6 was detected only in Child C and in COMBI group. The lack of correlation between IL6 and hepcidin except in Child B group denotes that there are other factors contributing to increased hepcidin levels. The inflammatory stimulus to hepcidin secretion could be mediated through other stimulatory cytokines as IL1.

Four putative upstream regulatory pathways are generally thought to control liver hepcidin production: iron store, erythropoietic activity, inflammation, and a mandatory signaling pathway. All are found to interact with liver cells to initiate the production of sufficient hepcidin for correct maintenance of iron homeostasis [31].

Hepcidin transcription is stimulated by iron overload as well as by inflammation. Iron can accumulate in the liver in a variety of conditions, including anemia of chronic disease, hepatitis C and liver-specific iron accumulation of uncertain pathogenesis in cirrhosis [32].

A reduced hepcidin synthesis indeed might be one of the mechanisms leading to iron overload in advanced liver disease of any origin [33]. In a further step, progressive iron retention in the liver induces hepcidin formation to counterbalance hepatic iron accumulation by reducing duodenal iron absorption [34].

The liver plays a central role in maintaining body iron homeostasis not only as a storage tissue and a site of hepcidin production, but also by a relatively specific expression of several other iron-related genes including the hereditary hemochromatosis protein called HFE, transferrin receptor 2, hemojuvelin, bone morphogenetic protein 6, matriptase-2 and Transferrin [29]. Apart from these genes with a relatively specific expression, the liver expresses other genes and molecules involved in cellular iron transport, which are also present in other tissues. They include transferrin receptor 1, divalent metal transporter 1 and ferroportin [35]. The deregulated expression of these proteins in the diseased liver could result in aberrant hepcidin production [36].

Hepatic hepcidin repression might be the result of high circulating erythropoietin level due to ongoing hemolysis and oxidative stress due to accumulation of iron [23]. Hypoxia, anemia, increased erythropoiesis and reduced iron stores all negatively regulate hepcidin expression. The fact that elevated erythropoiesis increases iron absorption regardless of body iron loading could be explained by the presence of a direct connection between EPO and the suppression of hepcidin expression in hepatocytes, which express EPO receptors [29]. Anemia could mediate hepcidin suppression through multiple mechanisms including increased EPO, increased iron demand or liver hypoxia. The nature of the erythropoietic regulator of hepcidin is still uncharacterized, but may include one or more proteins released during active erythropoiesis. Possible candidate proteins include GDF15, secreted by erythroblasts, or soluble hemojuvelin, secreted by skeletal muscle [37]. Hepcidin is suppressed by hypoxia but the mechanisms are still uncertain and conflicting. Hypoxia-inducible factor (HIF)-1 and reactive oxygen species (ROS) have been both implicated [35].

The ongoing hemolysis, hidden blood loss, depressed bone marrow and decreased dietary intake or poor absorption from the intestine might lead to deteriorated iron supply in CHC patients. Iron deficiency state might cause anemia and suppress hepcidin synthesis in those patients [35]. In uncomplicated iron deficiency anaemia, both the anaemia per se and the absent iron stores provide a message to stop production of hepcidin [10].

Despite the fact that hemolysis down regulates hepcidin, Vokurka et al observed an increase in hepcidin expression despite severe hemolytic anemia after suppression of erythropoiesis [35]. This could be the case in patients with CHC in whom erythropoisis could be suppressed due to the presence of immune antibodies. Interferon based therapy can also suppress bone marrow production of erythrocytes [1] thus contributing to increased hepcidin production.

In addition, Merle et al showed that, in contrast to the liver, in which hypoxia results in down-regulation of hepcidin expression, cardiac hepcidin expression is significantly up regulated in response to hypoxia [38]. Extra hepatic sources of hepcidin could be up regulated due to hypoxia resulting in the observed increased levels.

This illustrates potentially differential effects of stimulation of hepcidin perhaps via inflammation and hepatic iron accumulation opposed by repression mediated by increased erythropoisis, anemia, hypoxia, reduced iron stores and oxidative stress. The effect of heamolysis and hypoxia on hepcidin repression could be reversed in our patients due to inhibition of erythropoisis due to interferon therapy and shifting the source of hepcidin to the extra hepatic sites where synthesis of hepcidin is induced by hypoxia. Increased hepatic iron is a double edged weapon which increases hepcidin synthesis as a compensatory mechanism to suppress iron absorption but in the same time it causes

decreased hepatic hepcidin synthesis due to accumulation of ROS.

The level of hepcidin in the three types of anemia is complementary to the pathophysiology of each type. In IDA the decreased iron levels lead to depressed hepcidin secretion while in ACD and COMBI anemia groups increased hepcidin secretion could be a cause or a result of increased hepatic iron accumulation.

It should not be forgotten that chronic disease anemia is a complex phenomenon and hepcidin is not the single molecule playing part in this condition. Numerous cytokines, particularly tumor necrosis factor alpha, which does not induce hepcidin m-RNA, can play an important role as well and the coexistance of iron deficiency may further complicate the process [39].

Univariate analysis study revealed that TfR is the most predicting parameter for the presence of IDA while hepcidin is the most predictive parameter for ACD. COMBI anemia was best predicted by hepcidin. The fact that hepcidin level was increased in ACD and COMBI groups without any statistical difference between these two groups while ferritin index was statistically increased in COMBI compared to ACD group could be used to discriminate between the two types of anemia. This denotes that a combination of the two tests is critical for the accurate determination of the type of anemia.

A positive correlation was found between hepcidin and ferritin levels in Child A and B groups. Hepcidin shifts the iron from the functional compartment to the stored one, part of which is ferritin. In addition ferritin could be the stimulus for hepcidin synthesis. Hepcidin could be the missing link between IL6 and ferritin explaining the positive correlation between the later two detected in Child B and COMBI groups. The negative correlation between hepcidin and ferritin index in Child A group is explained by the increased ferritin levels resulting from increased hepcidin level. The negative correlation between ferritin and sTfR in Child A and B and that between hepcidin and TfR in Child A and COMBI is due to the decreased erythroid synthesis manifested by decreased receptor levels in the presence of high ferritin level due to hepcidin production in ACD patients. The negative correlation between IL6 and TfR in Child B group is linked by increased hepcidin levels as a result of increased IL6 levels. The negative correlation between IL6 and ferritin index in Child B group and between IL6 and serum Fe in COMBI group is due to the stimulatory effect of IL6 on hepcidin production. Hepcidin in return lowers the serum iron level by shifting it to the storage compartment. The negative correlation between hepcidin and serum iron in ACD (r=-0.83) emphasizes the role of hepcidin in controlling the serum iron level in anemia of chronic disease.

5. Conclusion:

It could be concluded that hepcidin plays an important role in the pathogenesis of anemia in CHC patients. Accumulation of iron in hepatocytes together with inflammation induced by IL6 or other factors may cause increased hepcidin secretion whether from normal hepatic tissue or extra hepatic origins. The effect of anemia, hypoxia, ROS and erythropoisis counterbalances increased hepcidin levels. In CHC, combined ACD and ID is the main type of anemia after excluding active bleeding. Hepcidin is a good tool in discrimination of the type of anemia and is comparable to that of sTfR/logFn index. An appropriate combination of both tests provides evidence of iron depletion or reflects excessive production of hepcidin which will help to establish a correct diagnosis and appropriate therapy.

*norhanmohammed910@yahoo.com

Abstract: Controversial role of different local haemostatic agents on bone healing represented a major challenge for oral & maxillofacial surgeons. So, this study was directed to evaluate the effect of water soluble alkylene copolymer hemostat (ostene) versus bone wax on bone healing. Material & Methods: Forty five adult male rabbits weight 1kg were divided into three equal groups. A surgical bone defect was created into the anterior mandibular area. In 1st group the surgical defects were not subjected to any of local haemostatic agents. In 2nd group water soluble alkylene copolymer was applied within surgical defect and bone wax was applied within the 3rd group. Postoperatively, 3 animals were sacrificed from each group at 1, 2, 3, 6 and 12 weeks for histological assessment through H&E and Trichrome stain Results: Water soluble alkylene copolymer hemostat treated defects showed faster healing rate in 1st, 2nd weeks than defects left untreated. Ostene was disappeared from surgical defect at 1st week without presence of inflammatory cells in the defect. In 3rd group, the defects showed large empty vacuoles, representing bone wax remnants with inflammatory cells infiltration that interfere bone healing. Conclusion: Water soluble alkylene copolymer is biodegradable material that does not interfere with bone healing in contrast with bone wax which causes foreign body reaction, leading to interference of bone healing. [Journal of American Science. 2010;6(12):155-163]. (ISSN: 1545-1003).

Key words: Local Haemostatic Agents- Bone wax- Ostene

1. Introduction

Development of topical haemostatic agents has greatly improved surgeon's ability to achieve and maintain homeostasis, reduce patient blood loss, and decrease injury to the surrounding tissue that may occur with conventional haemostatic techniques. An ideal haemostatic agent has yet to be developed; however, with increased understanding and continued research on the coagulation mechanism, a number of new, commercially available products have been introduced to meet the criteria for the ideal agent .[1]

Over the years, bone wax products with various ingredients were developed in several countries. Bone wax has no haemostatic quality, but its effect is to tamponade marrow spaces[2]. Several reports have shown that bone wax residues are not resorbed and produce a foreign body giant cell reaction and inhibit bone reformation[3,4]. Furthermore, *Von Arx et al., in 2006* [5] detected that due to its adverse effects on tissue healing, it should no longer be used for homeostasis control in surgery.

Other haemostatic agents such as gelatin foam, oxidized cellulose and microfibrillar collagen are absorbable, less prone to tissue reaction, do not interfere with bone healing and have platelet stimulating effects. Unlike bone wax, however, because of their physical properties, they are not ideal to seal the bleeding cancellous surfaces[6].

Many efforts were made to obtain material with physical properties of bone wax to seal bleeding cancellous surface and also not interfere with bone healing[7]. A soft bone haemostatic wax (ostene) comprised of water-soluble alkylene oxide copolymers approved as local haemostatic material with this properties. This material comprises a sterile mixture of water-soluble alkylene oxide copolymers, derived from ethylene oxide and propylene oxide. These compounds are not metabolized, but eliminated from the body unchanged [8].

Form this point of view, this study was carried out to evaluate the effect of water-soluble alkylene oxide copolymers (ostene) versus conventional bone wax on bone healing process.

2. Materials and Methods:

Normal adult forty five rabbits Weight 1 kg each were used in this study. They were divided into three equal groups each group contained fifteen animals. *In 1st group,* a cortical bony defect was done in the anterior mandibular area of rabbit. The edges of the defects in this group of animals were not coated with any of local haemostatic agents.

In 2nd group, a cortical bony defect was done in the anterior mandibular area of rabbit.

The edges of the defects in this group of animals were coated with a commercially available water soluble alkylene oxide copolymers (fig. 1) (Ostene, absorbable haemostatic material, cermed, inc company. U. S. A). Conventional bone wax (bone wax, non absorbable sealant, synergy sutures, a member of matrix health care) was applied within the created surgical defect in anterior mandibular area of rabbits in the *3rd group.*

For each group, it was equally subdivided into five subgroups for histological assessment after 1, 2, 3, 6, and 12 weeks respectively.

Fig. 1: Showing the sterile package contain ostene.

Anesthesia and surgical procedures:-

All the rabbits included in this study were anaesthetized by using diazepam (0.5mg/kg) (valpam, amoun Co, Cairo, Egypt) and ketamine hydrochloride (20mg/kg) injection (ketamine hydrochloride; ketalar, amoun Co, Cairo, Egypt). Mepecaine hydrochloride with 1: 20000 levonordefrin (Mepecaine hydrochloride with 1: 20000 levonordefrin; Alexandria Co, Egypt) as local anesthetic agent was injected in the proposed area of surgery to improve the homeostasis and to provide post operative analgesia. The sub mental area of the mandible was disinfected using sterile pellet soaked with povidone iodine (Betadin) (Betadin; Nile Co, Cairo, Egypt).

Extra oral submental incision was made, and then mucoperiosteal elevator was used for flap elevation. No.3 rose head surgical bur was used to induce bony cavity of the same size (involving the cortex and spongiosa) under efficient coolant using normal saline. To ensure standardization of the bony defect, the same size of the bur was used making its head contained in the bone defect, at the same speed of the micro motor device for all animals.

In the 1st group, the edges of the cortical bony defect were not coated by any material. In the 2nd group, Ostene was manipulated between the finger till reach the body temperature to be soft and easy for application then was applied to the edges of the cortical bony defect. In the 3rd group, bone wax was applied to the edges of the cortical bony defect and the excess was removed.

The two edges of the incision were approximated and sutured by using 3/0 black silk.The incision line was painted with garamycin **(**Memphic Co, Cairo, Egypt) cream as local antibiotic.

Histological Evaluation:

Three rabbits within each subgroup were scarified at the different time intervals 1, 2, 3, 6, and 12 weeks respectively and the mandible was dissected out using a heavy scissor then fixed in 10% buffered formalin, decalcified and processed for paraffin sectioning. Sections were stained with hematoxylin for routine examination and trichrome stain for collagen.

3. Results

Histological observation using Hematoxylin and Eosin stain & Masson's Trichrome stains:-

In control group; the bony defect specimens contained granulation tissue, at the end of the first week (fig. 2). During second and third weeks, there were abundant less organized bony trabecullae with maturation of granulation tissue into connective tissue (fig. 3, 4), in addition; collagen bundles was seen running through the defect (fig. 5, 6). From three weeks to twelve weeks there were gradual increase in numbers, thickness coalescence (fig. 7, 8) and maturation of bony trabeculae (fig. 9).

In group II (ostene group) at the end of first week, the specimens of the bony defects revealed that more organized granulation tissue were formed with collagen bundles diffused through them, in comparison with the control group. Also there were new bony trabeculae formed (fig. 10, 11).

From two to six weeks, bony trabeculae were increased in number, thickness and organization when compared with control group. There was maturation of granulation tissue to connective tissue when compared with control group (fig. 12, 13, 14, 15, 16).

At the end of twelve weeks, the bone defects were completely filled with bony tissue which could not be distinguished from the surrounding normal bone (fig. 17, 18).

In group III (Bone wax), the histological specimens after one week revealed that the defect remained unchanged and there were some fibers at the base of defects, and the other part remained empty (fig.19). After two weeks, there were no bony trabeculae formation, but there were some inflammatory cells. By the time and after three

weeks, there were vacuoles between the fibers formed and more inflammatory cells (fig. 20). After six weeks, more bone destruction and inflammtory cells appeared (fig. 21, 22). After 12 weeks, the histological specimens showed micro abscess formation, increased inflammatory cells and more bone destruction (fig. 23).

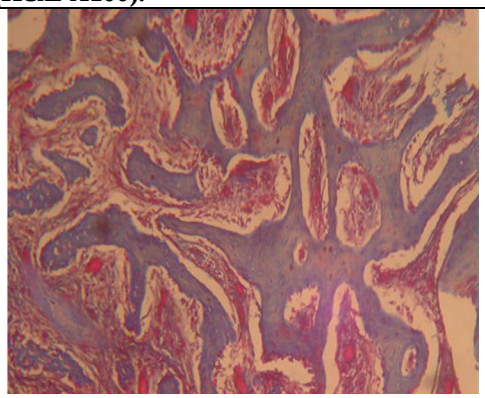

Fig. 9: Photomicrograph of bony defect in group I (control) after six weeks showing increased numbers of bony trabeculae with some degree of maturity (trichrom x 100).

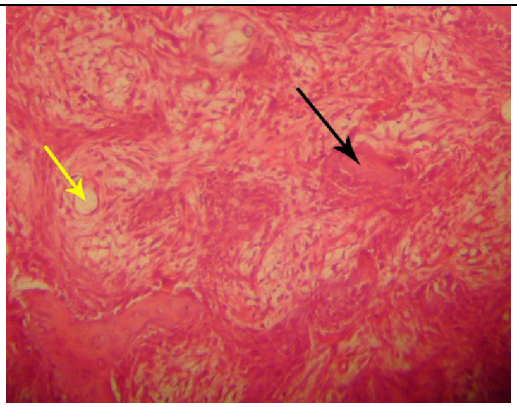

Fig. 10: Photomicrograph of bony defect in group II (Ostene) after one week showing, granulation tissue formation with newly formed blood vessels and newly formed bony trabeculae (H&E X100).

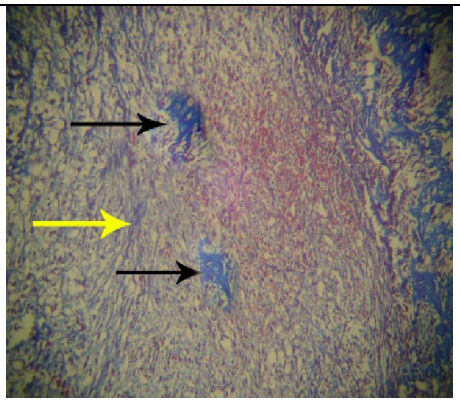

Fig. 11: Photomicrograph of bony defect in group II (Ostene) after one week showing, formation of collagen fibers with beginning of new bony trabeculae formation (trichrome x 100).

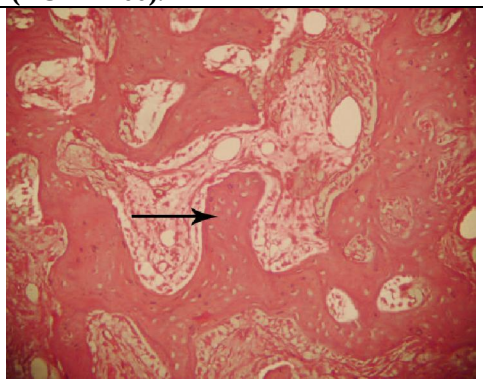

Fig. 12: Photomicrograph of bony defect in group II (Ostene) after three weeks showing increased numbers and maturity of bony trabeculae (H&E X100).

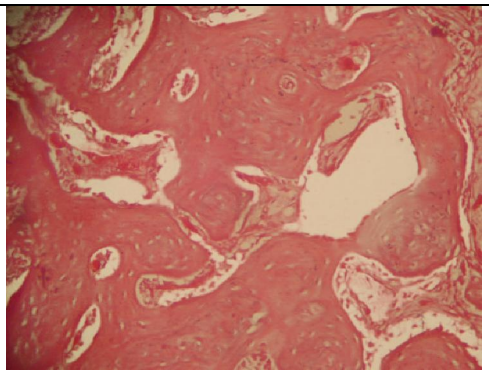

Fig. 13: Photomicrograph of bony defect in group II (ostene) after six weeks showing, more organization and maturity of bony trabeculae (H&E X100).

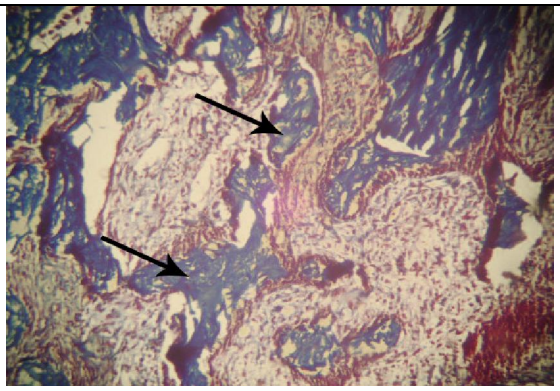

Fig. 14: Photomicrograph of bony defect in group II (Ostene) after two weeks showing, more collagen and bony trabeculae formation (trichrom x 100).

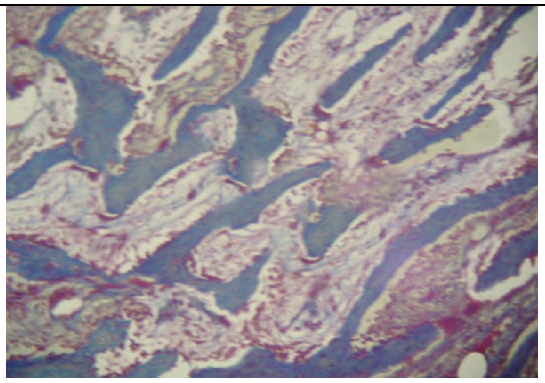

Fig. 15: Photomicrograph of bony defect in group II (Ostene) at three weeks showing increased numbers and maturity of bony trabeculae (trichrome x 100).

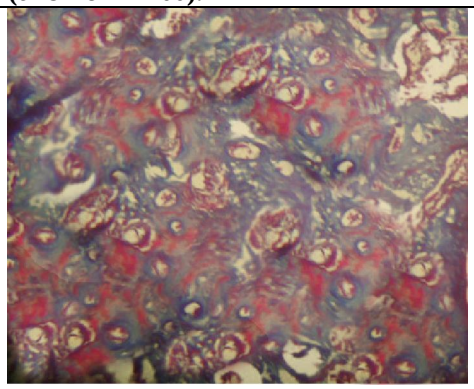

Fig. 16: Photomicrograph of bony defect in group II (ostene) after six weeks showing increased numbers of bony trabeculae with high degree of maturity (trichrome x 100).

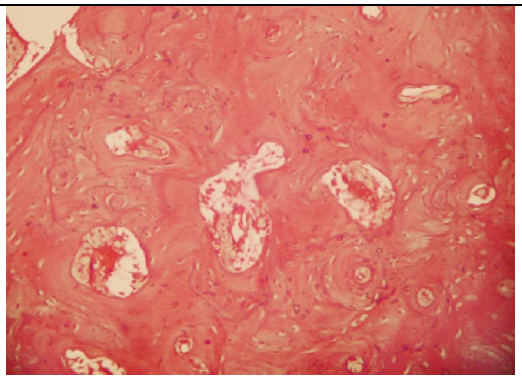

Fig. 17: Photomicrograph of bony defect in group II (ostene) after twelve weeks showing well maturated bony trabeculae (H&E X100)

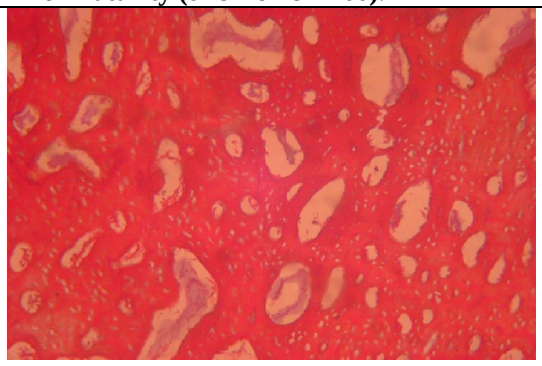

Fig. 18: Photomicrograph of bony defect in group II (Ostene) after 12 weeks showing, well organized bony trabeculae (trichrome x 100).

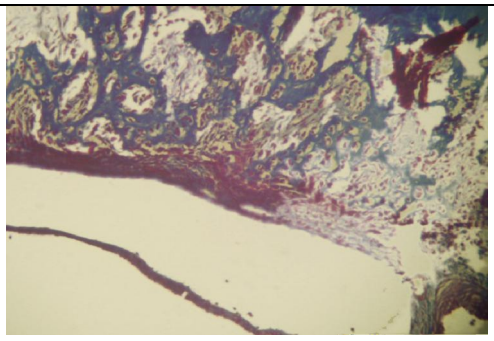

Fig.19: Photomicrograph of bony defect in group III (Bone wax) after one week showing, minimal fibers formed at the border of the cavity (trichrome x 100).

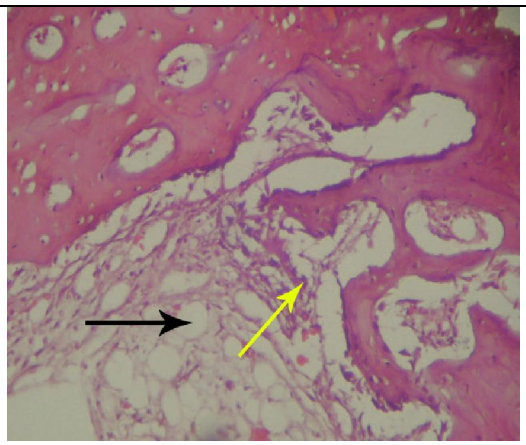

Fig. 20: Photomicrograph of bony defect in group III (Bone wax) after three weeks showing, no bone trabeculae formation, increased numbers of inflammatory cells and there were vacuoles between the fibers formed (H&E X100).

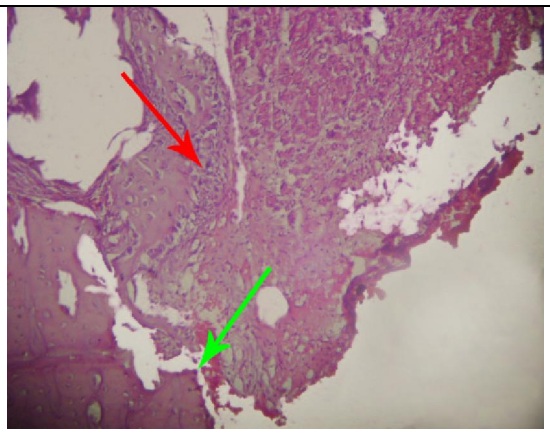

Fig. 21: Photomicrograph of bony defect in group III (Bone wax) after six weeks showing, more inflammatory cells and more destruction of bone (H&E X100).

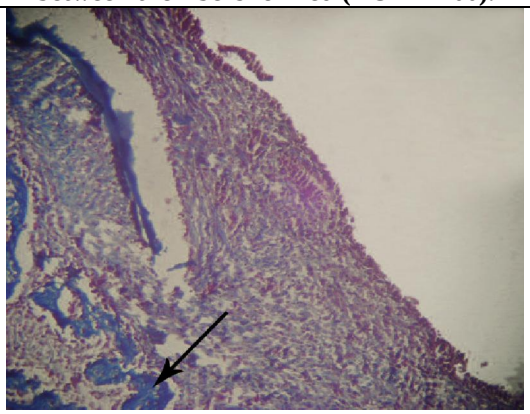

Fig. 22: Photomicrograph of bony defect in group III (Bone wax) after six weeks showing, no bony trabeculae formation with destruction of bone surrounding the defects (trichrom x 100).

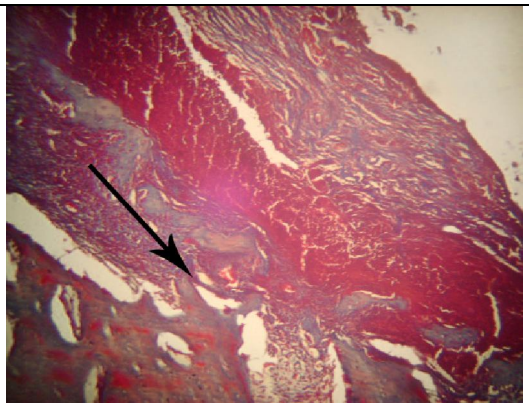

Fig. 23: Photomicrograph of bony defect in group III (Bone wax) after 12 weeks showing, micro abscesses were formed with destruction of bone surrounding the defects (trichrome x 100).

4. Discussion

In the last decade, the biotechnology has resulted in an explosive growth of topical haemostatic agents which are available to the modern surgeon[9]. One of the earliest topical haemostatic agents was cotton, in the form of gauze sponges. They are not absorbed by the body, and upon removal, the clot may be dislodged, leading to further bleeding[10].

Passive topical haemostatic agents can absorb up to several times their own weight in fluid. The expansion of a passive topical haemostatic agent can result in complications such as pressing nerves in surrounding tissue against bone or hard tissue; an extreme case of this has resulted in spinal cord compression leading to paraplegia[11-13]. Therefore, it is recommended that minimum amount of haemostatic agent necessary to achieve homeostasis be used and as much of the agent as possible be removed after homeostasis is achieved when a passive topical haemostatic agent is used on or near bony or neural spaces. Also, passive topical haemostatic agents do not adhere strongly to wet tissue and have little impact on actively bleeding wounds[14].

The physical presence of passive topical haemostatic agents can lead to confusion on subsequent diagnostic imaging because it may be difficult to distinguish between residual local topical homeostatic product and a tumor or abscess. Any residual product that may remain at the site also can

possibly potentiate a foreign-body reaction, chronic inflammation, or infection, which could promote granuloma formation and prevent optimal healing. Granulomas have been reported at a number of different sites after the use of passive topical haemostatic agents[14].

Absorbable topical haemostatic agents have been developed and provide useful adjunctive therapy when conventional methods of homeostasis are ineffective or impractical. *Wang et al., in 2001*[15] first described the use of a 'Pluronic copolymer blend' as a biocompatible and absorbable haemostatic alternative agent to bone wax.

Clinically, no signs of infection or inflammation were detected at the surgical site during the time of operation in all groups. This indicated that surgical technique was carried out under aseptic condition and there was no affection of bone vitality. In 2nd group, the water soluble alkylene copolymer material has no inflammatory effect on bone or surrounding tissue throughout all time intervals of follow up. These results were in accordance with the histological result of *Wellisz et al., in 2008*[16] that made a study on rabbit's tibias and the created defects were treated with the polymer, and observed that all of the cortical defects in the animals healed without evidence of infection. This might be due to tolerability and tissue compatibility of the water soluble alkylene copolymer material (ostene).

In 3rd group, there were no signs of infection or inflammation at the surgical site at the time of operation, after first week, but after the second week there were signs of infection and inflammation which include swelling at the surgical site appeared as cortical expansion, and this swelling increase with time to reach maximum level after 12 weeks. This result indicated that there was chronic infection which increases with time due to foreign body reaction. These results were in agreement with *Von Arx et al., in 2006* [5] who conducted a study in the calvarium of six rabbits. Standardized bony defects were trephined, and different haemostatic agents were applied and compared with control defects. Bone wax was one of these materials. He observed that bone wax residues were not resorbed and produce a foreign body giant cell reaction.

Furthermore, *Eser et al., in 2007* [2] reported that bone wax may cause a foreign body reaction and fibrosis and may increase the incidence of infection**.** Historically, several studies have described that, bone wax was noted to potentially cause chronic inflammation[17,18]**.** *Geary and Frantz, in 1950*[19] stated that, "in the series of control animals in which ordinary bone wax was used, no significant change in the implant was noted in the first 24 hours. At the 7th day, all showed an intense inflammatory reaction, three having cysts containing sterile fluid and numerous particles of wax and a fourth presenting a single, large encapsulated mass of wax".

In 3rd group the histological sections after one week showed large empty space at the bottom of the defects, representing bone wax remnants (dissolved during the embedding procedure). These results are in agreement with *Von Arx et al., in 2006* [5]who revealed large empty vacuoles; represent bone wax, which was applied in bony cavity created in rabbit calvarium model. Furthermore, *Sudmann et al.,in 2006* [20] demonstrated microscopically that bone wax remnants seen in 17of 18 sterna cadavers who prior to death had undergone surgery with median sternotomy and bone wax was used as haemostatic.

Histological sections of the control group and group II showed absence of inflammatory cells, no evidence of foreign body reaction was observed. These results were in accordance with *Lee et al., in 2009* [21] who reported that water soluble alkylene local haemostatic material did not cause local or systemic inflammation. This indicates the inert property of soluble alkylene copolymer material and its biocompatibility.

Histological examination of 2nd group after one week showed complete disappearance of the material at the application site, this indicate the biodegradable nature of material. These results are in agreement with *Wang et al., in 2001* [15] that used the same material, and had proved its effectiveness in allowing homeostasis at the bleeding sites of bone and can be absorbed within 24 to 48 hours.

During a comparison of bone healing between 1st versus 2nd group, bony trabeculae were formed in 2nd group and no bony trabeculae were evident in 1st group after first week. After second and third weeks, bony trabeculae in 2nd group were more in numbers, size, and maturation than 1st group. This revealed that healing started faster in 2nd group, at first, second, and third weeks. However, there was no remarkable difference in number, distribution, maturation, and coalescence of the bony trabeculae in both groups after six and twelve weeks. This indicated that bone healing levels occurred during later periods were nearly the same.

These results may be attributed to the nature of water soluble alkylene copolymer material which dissolved rapidly and eliminated from the body within days after surgery.

The previous results were in agreement with the observation of *Wellisz et al., in 2008* [16] that made his study on the tibia of rabbits and revealed that the use of the water-soluble polymer did not affect bone healing compared with controls. All of the cortical defects in the animals without radiographic evidence of infection had histological evidence of bone healing. *Lee et al., in*

2009 [21] showed that Ostene was effective in achieving bone homeostasis and absorbable in the body of rabbits. It did not inhibit new bone formation at the cut surface of the bone and did not cause local or systemic inflammation.

Furthermore, *Magyar et al., in 2008* [22] made a circular non critical-sized defect in the calvariae of rats. Alkylene oxide copolymer material was applied. He revealed that healing after 3 weeks was faster in defects with alkylene oxide copolymer material than defects without any material, and healing rate in the two groups were the same after six and twelve weeks from surgery**.**

During a comparison of bone healing between 3rd group versus 1st group, there were retardation and inhibition of bone healing. This demonstrated by absence of collagen fibers formation or bony trabeculae. This indicated that, bone wax inhibit osteogenesis. This result in agreement with number of studies, which reported that bone wax act as a mechanical barrier to bone regeneration [23,24]**.**

In 3rd group the histological findings showed inflammatory reaction, abscess formation, and destruction of bone at the border of cavity. Such findings might be attributed to the bone wax which remained in the defect, not absorbed, and acting as nidus for infection. The body reacted with these remnants as foreign body, it might lead to stimulation of chronic inflammatory cells and foreign-body reaction occurred. It might reduce bacterial clearance in cancellous bone and increase the liability of infection by decreasing the amount of bacteria needed to produce Staphylococcus aureus osteomyelitis.

Eser et al., in 2007 [2] demonstrated the presence of inflammatory granulation tissue as a reaction due to the presence of bone wax remnants, which was used as a local hemostat. Bone wax was seen within granulation tissue. Histopathological examination revealed infiltration of inflammatory cells and a foreign body granuloma in the connective tissue. The inflammatory cells were composed of lymphocytes, macrophages, and foreign body–type multinucleated giant cells.

To the best of our knowledge and as a result of the findings of this study, we believe that prevention of bone wax application as a local haemostatic agent is mandatory with replacement of it by such recent local haemostatic agent.

5. Conclusion:

Water soluble alkylene copolymer is biodegradable material that does not interfere with bone healing in contrast with bone wax which causes foreign body reaction, leading to interference of bone healing.

Abstract: There is a growing need of frameworks for automatic testing of software product because manual testing of huge software product is very time-consuming and costly. Furthermore, the manually testing of complex software becomes more difficult and a challenging activity. However this can be easily achieved through automatic testing strategies. In this paper we propose a framework for testing software automatically. Now errors and bug finding become simpler and easier. It takes less time to test the whole application rather than testing application modules separately. The proposed framework provides programmatic access to most user interface elements. The main propose of our framework is to make testing phase easier and cost efficient. We validate our framework through a case study. By analyzing the results of testing the correctness and completeness of framework is proved. [Journal of American Science. 2010;6(12):164-173]. (ISSN: 1545-1003).

Keywords: Software testing; test automation; test framework

1. Introduction

The manually testing of complex software is a very difficult and a challenging activity. However this can be easily achieved through automatic testing strategies (Yingxiang, 2008). Nowadays, the user interface (UI) testing automation has become an integral part of software development in all big corporations (Jovic and Hauswirth, 2010). UI Automation means testing any User Interface application in an automated fashion. This method of testing is far more effective than just doing manual testing as it is best to catch the last minute bugs and basically improves overall product quality (Mathew and Spraetz, 2009). The automation runs faster and the benefit is that it doesn't require human input like manual testing. By this large application testing become simpler, easier and less time consuming [9]. As for the evolution of the testing field, there have been some innovations over the years. What's striking about the innovations, however, is how few people know about them, and even fewer people are using them. In terms of evolution, here in Pakistan, we're in the Dark Ages of testing. Many test teams work in isolation, knowing little of the existing literature on the subject, and providing little input to improve UI testing. Due to the importance of testing, most probably in few years it will evolve into a proper engineering discipline.

The rest of paper is structured as follows: The background and the related work are given in Section 2. The functionalities, and design description of proposed framework is given in Section 3 whereas; the different test scenarios used to validate the proposed framework are also listed in the same Section. Finally, the paper ends with conclusion in Section 4.

2. Background and Related Work

There is a growing need of frameworks for automatic testing of software (Riungu et al,2010; Berner et al, 200). Both, the functional and non-functional requirements of the software need to be tested but their manual testing consumes a lot of time and budget resources (Jovic and Hauswirth, 2010; Sarkar et al., 2009; Mesbah and van Deursen, 2009). Furthermore, it rises multiple times for a complex software testing. Furthermore, to measure the quality of software the execution-based testing has its own importance (Viswanathan and Peters, 2010). In (Wang and Damata, 2009), GUI testing toolset is described. This toolset supplements the basic testing tasks required in the common GUI testing process. It generates test cases and has a reporting mechanism. Although it is a good toolset but the target software is not a web-based. The Force.com (Mathew and Spraetz, 2009) framework includes some testing utilities to create test cases and those test cases are applied for the automation of individual modules of software. AUTOWEB (Chai et al., 2009) is an interesting tool, it test the online- assignments submitted by students. It generates demo of failed test cases automatically. It aims to provide help to students in order to solve their assignments.

3. Proposed Work

The basic architecture of our framework is given in Figure 1. There is a UI Automation Tester class which contains all the test cases. User firstly has to start the target UI application. The user task then is to select the test case to which he/she wants to run.

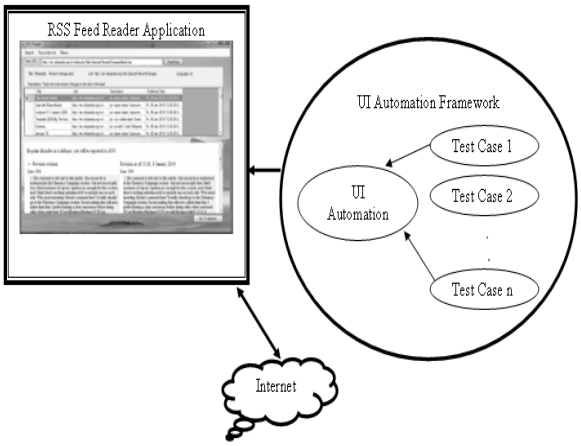

Figure 1: System Architecture of our Proposed Framework

Internet connection should be established to test RSS Feed Reader. RSS Feed Reader needs internet to read latest feed which are continuously upgraded on the sites, regarding the URL specified. The layered architecture of our framework is as given below:

Test Cases
Operational Logics
UI Wrappers – Physical Layer

Figure 2: Layered Architecture of our Proposed Framework

Test cases layer contain the test cases for the application organized by the area names and test names. Each test case represents a user scenario. Some scenarios are higher in priority than others. A test case is collection of a bunch of logical calls that live in logical layer. The test cases use / consume the logical layer in it or interacts with the Logical Layer. Some examples of test case: Reading an RSS Feed and making sure that correct feed is displayed; create a new word document and making sure that a plain document is created without errors.

Logical layer is collection of methods that represents user actions. These are logical methods that do actions needed to complete a test case. For example in order to complete the above mentioned test cases logical methods will be needed to make sure that application is in running state; to read RSS Feed that takes in a custom RSS Feed location. A method in logical layer is merely a collection of calls to physical layer that does physical action e.g. to create a document the physical action that test code will do by clicking the File Menu and then New Document Menu.

Physical layer is also called direct UI Wrappers. Physical layer consists of the wrappers over all the UI Controls that we have in the application. It gives us an interface that we can use to call actions on the UI Controls in the application e.g. Click Read Feed Button, set value in a Location Text box. The mechanism is limited to Testing UI. Applications only developed in C# or VB.Net. The software is application specific; test cases are specific to the application that you want to test. The overall workings of proposed framework have shown in Figure 2 and 3.

For sake of simplicity, the following we have considered the following assumptions and constraints.

- Software is developed for testing a UI application which is RSS feed reader.
- Test cases are specific to the application.
- Test cases are not generic or couldn't run on other UI applications for testing.
- We have developed our software in C# and it is capable of testing UI application.
- We have not purchased any type of software and hardware equipment for our project.

The class diagram of proposed framework is given in Figure 4. We have TestExecution Client App that runs our tests; you can pick a test and run it that class is represented by ExecuteScriptClient. it contains the UI for our execution engine and methods like start app, execute script etc. When a test is selected and executes script is called then we move to Script class or TestCases class. Script class has all our test cases. Script class interacts with Logical Class and Logical Class contains RSS ReaderFunction. RssReaderFuction Class is the one that contains our logical actions. Rss Reader has an association relationship with physicalObjects class.Physical Objects contains wrappers for all the UI controls. Then Physical Objects calls into ScriptFunctons class that has all the methods that help us do actions on these UI controls e.g. click, set text Toggle, Set Value etc.

A selective list of graphical user interfaces used for different requirements are given in the Figures 5-9 followed by their respective input, processing and output. We have used different test scenarios to check the correctness of proposed framework. Some of the scenarios are listed in the Tables 1-8 respectively.

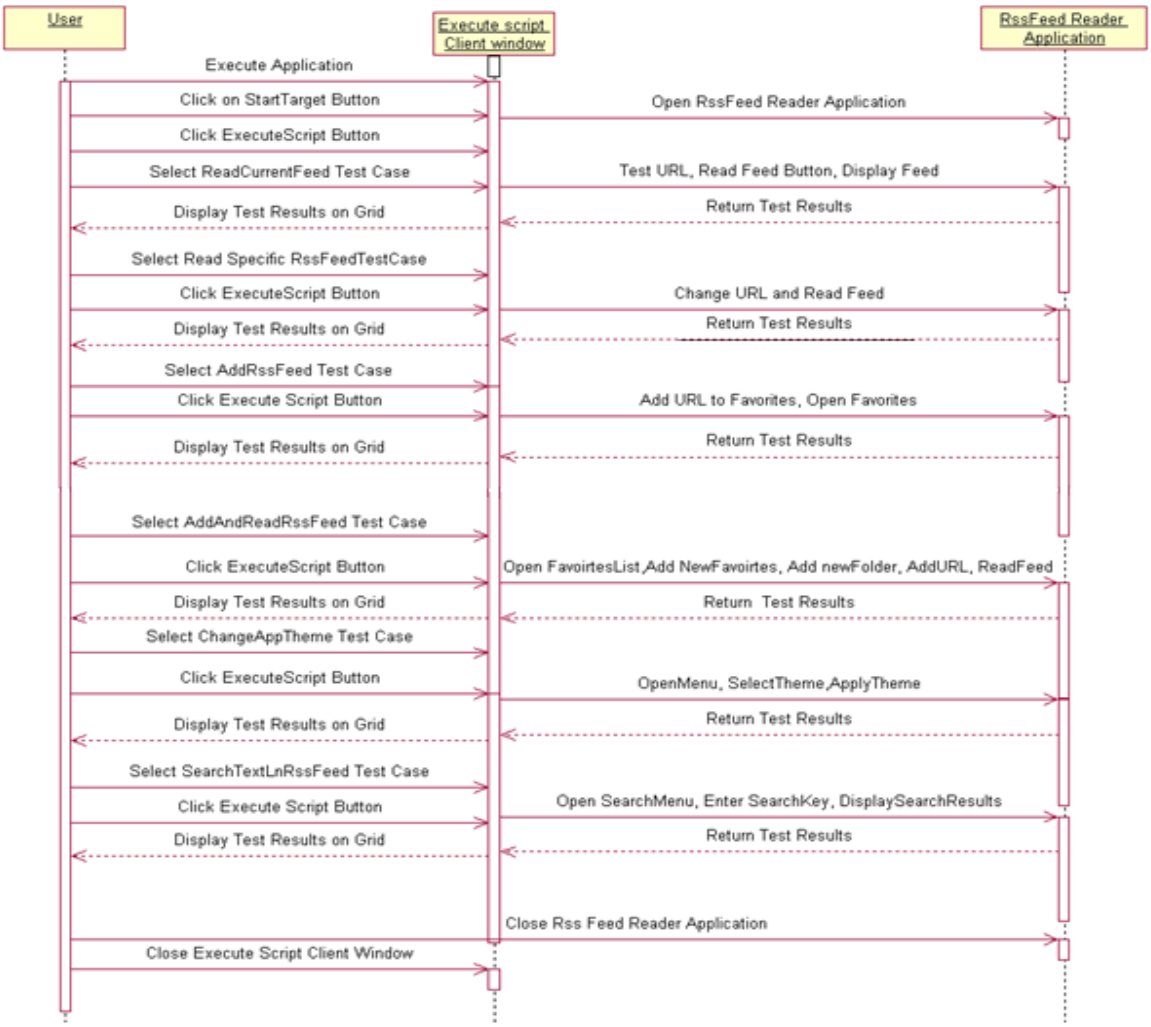

Figure 2: System sequence diagram of proposed framework

Figure 5:Graphical User Interface for adding a Favourite

Input	• Automatically click on Favorites List. • Click on Favorites List. • Write URL in name text box. • Specify folder name in folder text box or select already created folder from drop down list. • Click on Add button. • To cancel this window click on cancel button.
Output	URL added to the favorites list in the specified folder.
Processing	Create folder if specified. Add URL to the favorites list. And close the window.

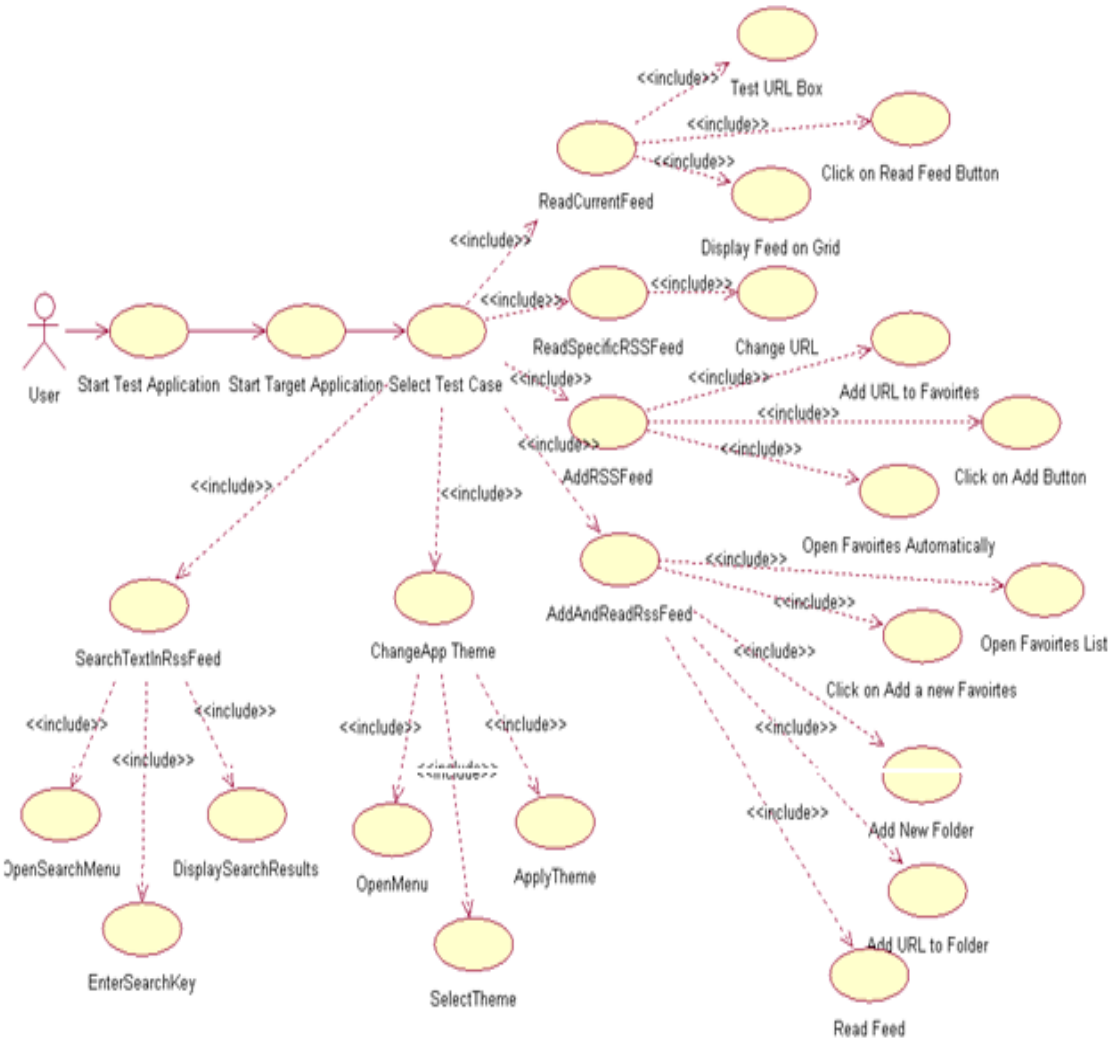

Figure 3: Operations of proposed framework

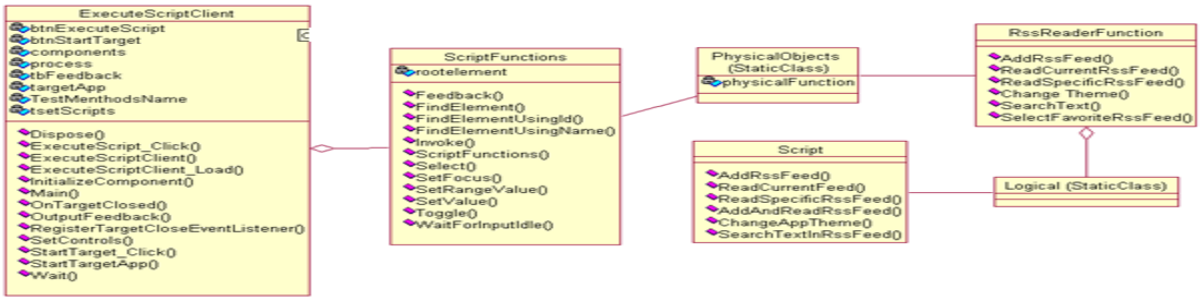

Figure 4: Class Diagram of proposed framework

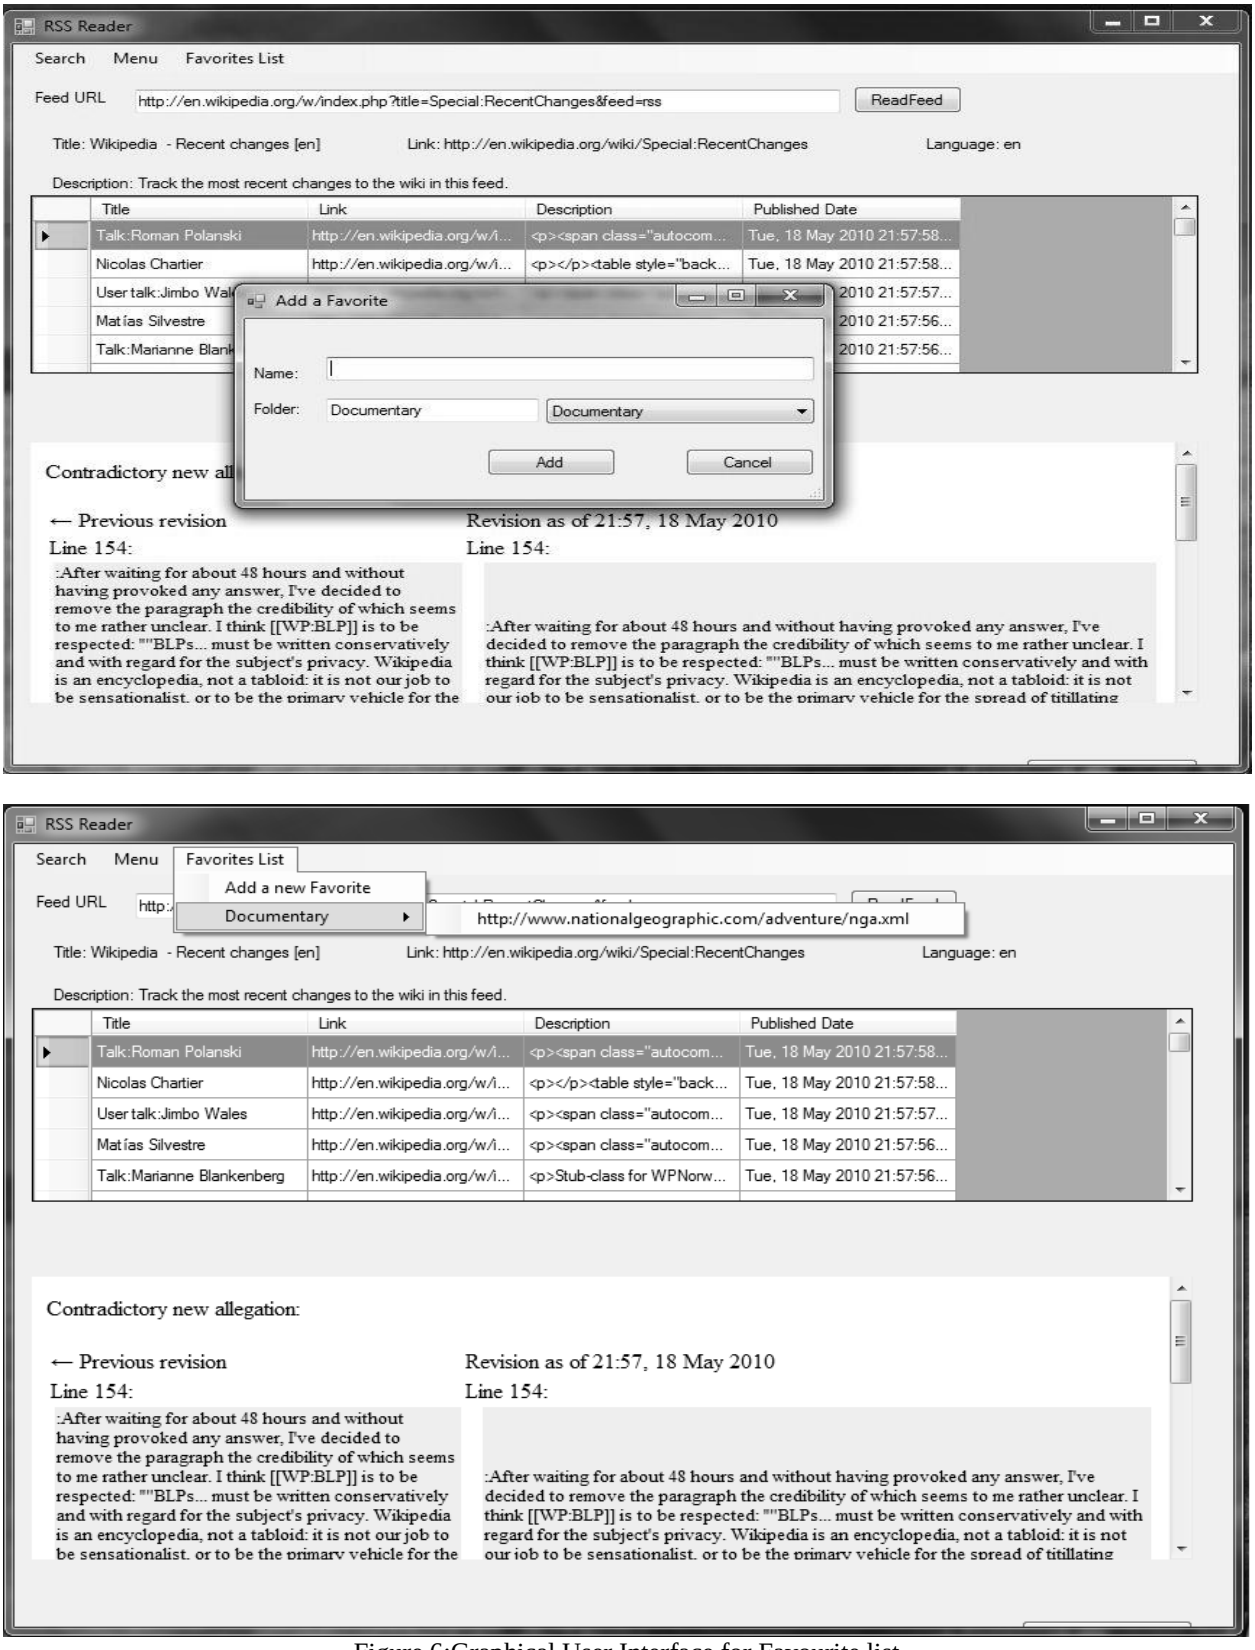

Figure 6:Graphical User Interface for Favourite list

Input	Automatically click on Favorites List from menu bar and then go to the Documentary folder from the list.
Output	Display selected URL in the text box.
Processing	Select the URL from the Documentation list.

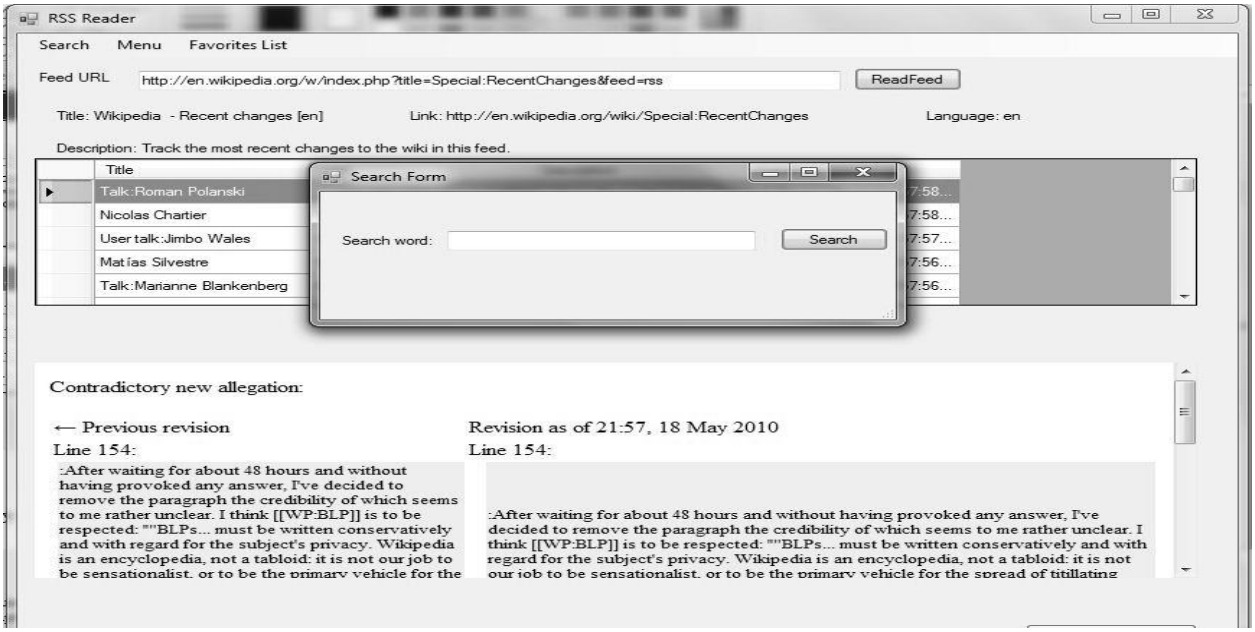

Figure 7:Graphical User Interface for searching

Input	• Automatically click on the search from menu list. • Input what you want to search. • Click on Search button.
Output	Show search results.
Processing	Read input from search word text box and display find the results.

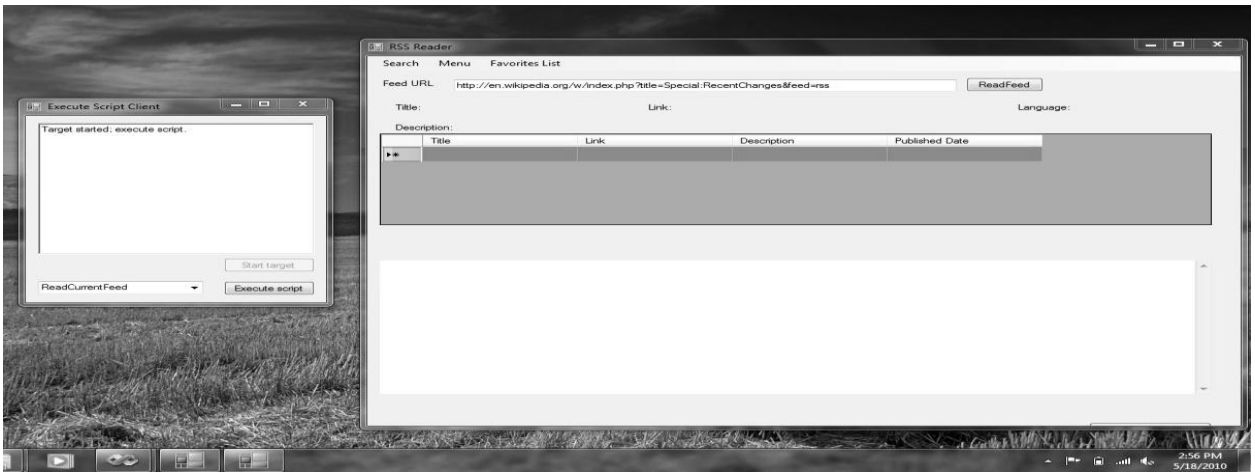

Figure 8:Graphical User Interface for starting the target application

Input	Click on Start Target button.
Output	Display RSS Feed Reader window.
Processing	Open the target application.

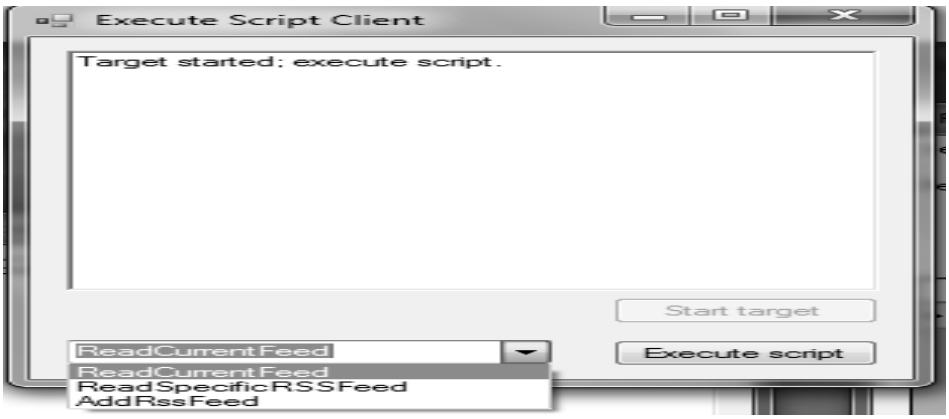

Figure 9:Graphical User Interface for executing script

Input	Select any test case which u wants to run and click on Execute script button.
Output	Display test results on the Data Grid Box.
Processing	Run selected test case to test the target application.

Table 1: Start Test Application

UC-01: Start Test Application		
Actors: User		
Feature: Start application		
Use Case Id:	UC-01	
Pre Condition:	Application should be debugged for starting the application.	
Scenarios		
Step #	**Action**	**Software Reaction**
1.	Start target application.	Software will open target application.
2.	Select test cases from drop down menu.	Run the selected test case and display results in grid box.
Alternative Scenarios:		
Target application should be started before selecting test cases.		

Table 2: Start Target Application

UC-02: Start Target Application		
Actors: User		
Feature: User will start the target application.		
Use Case Id:	UC-02	
Pre Condition:	User should be click on the start target application button.	
Scenarios		
Step #	**Action**	**Software Reaction**
1.	User presses the start target application button.	Software will open the RSS Feed Reader application. Execute Script Client Window will displays a message in grid box “Target started; execute script”.
Alternative Scenarios:		
User should have to click the start target application button in each and every condition.		

Table 3: Select Test Case

UC-03: Select Test Case		
Actors: User		
Feature: User will select test cases from the drop down menu.		
Use Case Id:	UC-03	
Pre Condition:	User should select the test case in order to test the application.	
Scenarios		
Step #	**Action**	**Software Reaction**
1.	User selects the desired test case from the drop down list. Available test cases are: • Read Current Feed • Read specific RSS Feed • Add RSS Feed	
Alternative Scenarios:		
User may directly close the application without running test cases.		

Table 4: Read Current Feed

UC-04: Read Current Feed		
Actors: User, Execute Script Client		
Feature: User will select the "Read Current Feed" test cases from the drop down menu.		
Use Case Id:	UC-04	
Pre Condition:	User should press the Execute Script button in order to run the test case.	
Scenarios		
Step #	**Action**	**Software Reaction**
1.	User will press the Execute script button to run the test case.	Software will automatically test the application and performs the following functionalities. • Test URL Box • Click on Read Feed Button • Display Feed on Grid
Alternative Scenarios:		
User may select any other test case rather than selecting this test case.		

Table 5: Read Specific RSS Feed

UC-05: Read Specific RSS Feed		
Actors: User, Execute Script Client		
Feature: User will select the "Read Specific RSS Feed" test cases from the drop down menu.		
Use Case Id:	UC-05	
Pre Condition:	User should press the Execute Script button in order to run the test case.	
Scenarios		
Step #	**Action**	**Software Reaction**
1.	User will press the Execute script button to run the test case.	Software will automatically test the application and performs the following functionalities. • Change URL
Alternative Scenarios:		
User may select any other test case rather than selecting this test case.		

Table 6: Add RSS Feed

UC-06: Add RSS Feed		
Actors: User, Execute Script Client		
Feature: User will select the "Add RSS Feed" test cases from the drop down menu.		
Use Case Id:	UC-06	
Pre Condition:	User should press the Execute Script button in order to run the test case.	
Scenarios		
Step #	**Action**	**Software Reaction**

1.	User will press the Execute script button to run the test case.	Software will automatically test the application and performs the following functionalities. • Open Favorites Automatically • Click on Add Button • Add URL to Favorites
Alternative Scenarios:		
User may select any other test case rather than selecting this test case.		

Table 7: Execute Client Script

Test Case ID: T-01	**Engineer:** Faiza Aziz,Iram Waheed ,Farah Amjad
Application Name: Testing via UI Automation	**Use Case Id:** UC-Start Test Applcation-01
Purpose: To start the application.	
Scenario: To test target application.	
Environment: Visual Studio .NET 2008, IE 8.0	
Pre-Request: User should debug the program in order to test the application.	
Strategy: 1. User will run the Program. 2. Execute Client Script window will open. 3. Press starts target application. 4. Select required test case from drop down list. 5. Click on execute script button.	
Expected Results: 1. Execute Client Script window will open. 2. RSS Feed Reader window will open. 3. Automated testing regarding the specific test case will start.	
Observations: The testing will start properly and less time is consumed on testing. All results will be displayed in the Data Grid Box.	
Results: No error found. Client Script Window opened properly. All Test cases execute properly and will check all controls of target application RSS Feed Reader. For Example, it will show errors if URL text box is empty.	

Table 8: RSS Feed Reader

Test Case ID: T-02	**Engineer:** Faiza Aziz,Iram Waheed ,Farah Amjad
Application Name: Testing via UI Automation	**Use Case Id:** UC-Start Target Applcation-02
Purpose: To start the target application for testing.	
Scenario: To run all test cases on RSS Feed Reader.x	
Environment: Visual Studio .NET 2008, IE 8.0	
Pre-Request: User should press the Start Target Application button in order to test the application.	
Strategy: 1. Select ReadCurrentFeed from drop down list and click on Execute Script button. 2. Select ReadSpecificRS Feed from drop down list and click on Execute Script button. 3. Select AddRSSFeed from drop down list and click on Execute Script button. 4. Select AddAndReadRSSFeed from drop down list and click on Execute Script button. 5. Select SearchTextlnRSSFeed from drop down list and click on Execute Script button. 6. Select ChangeApp Theme from drop down list and click on Execute Script button.	
Expected Results: 1. RSS Feed Reader window will open. 2. When Read Current Feed test case selected following actions performed automatically ○ Test URL Box ○ Click on Read Feed Button ○ Display Feed on Grid 3. When Read Specific RSSS Feed test case selected following actions performed automatically ○ Change URL 4.When Add RSS Feed test case selected following actions performed automatically ○ Open Favorites Automatically	

○	Click on Add Button
○	Add URL to Favorites
Observations: Different URL is changed to check that whether RSS Feed Reader is properly getting latest feeds from the URL. Different URL is also added to the favorites list to check that it is properly maintaining favorites List.	
Results: No error found. All Test cases execute properly and will check all controls of target application RSS Feed Reader. For Example, it will show errors if URL text box is empty etc.	

5. Conclusion and Future Work

The proposed framework is purely independent and self contained. And there is no other related application or any third party component involved for the development of the framework. We have developed the framework in C# and enabled to test various C# UI Applications. The proposed framework is capable of testing UI application automatically. In our framework user have to start the application, after the UI Automation starts user task now is to start the target application(RSS Feed Reader), which is the application to which user wants to test. After the target application is selected, now user has to select any test case which he/she wants. After the desire test case is selected automated testing will start by testing all controls of the application. It will tell about all bugs/errors in the application automatically. As manual testing was more time consuming, so our application not only reduces time complexity but also make it efficient and convenient for users.

2- Dept. of Hort. Fac. of Agric. Ain Shams Univ., Shobra El-Khiema, Cairo, Egypt

Abstract: This study was carried out through two successive seasons (2007& 2008) on cultivated Picual olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on growth parameters at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA_3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, plant height, stem diameter, lateral shoot number, lateral shoot length, leave numbers per plant, Percentage of plant height increment, whole plant dry weight were determined and recorded. The obtained results revealed that as follow: plant height, shoot number, shoot length, leaves number and stem diameter were not affected by different treatments in both seasons. Meanwhile, whole plant dry weights were improved by humic acid treatment compared with control and all other treatments in Picual cv. [Journal of American Science. 2010;6(12):174-179]. (ISSN: 1545-1003).

Keywords: Nitrogen Fertilization; vegetative growth; Picual Olive.

1. Introduction

The olive tree (*Olea europaea* L.) Family Oleaceae is a widely distributed tree grown in many arid areas of the world. The Mediterranean region is its native habitat. Olive is adapted to extremely arid conditions because of its special leaf structure and ramified root system.The olive tree is an evergreen, one of the oldest cultivated tree, about 8000 years ago.

World olive production perform an important role in the economy of many countries such as Spain, Italy, Greece, Turkey and Tunisia.The olive tree yield has two main products:oil and table olives, produced from several cultivars such as Coratin,Klamata,Picual. Total cultivated area in Egypt with Picual cvs. Represent about60% of total olive cultivation. The Egyptian olive production reached about 507053 tons produced from 110764 Feddan according to the staticics of M.A.L.R (2007a). This investigation aimed to study the effect of some mineral and organic nitrogen fertilization sources as well as some other treatments (humic acid, activated dry yeast, GA3 and sea algae) on some growth parameters and leaf mineral contents of Kalamata young trees at the first two years of planting. However, it is hope also to find out a fertilization program can replace the mineral nitrogen one which will be beneficial for organic production of olives and save human health and environment.

Xiloyannis *et. al.* (2000) working on mineral nutrient uptake from the soil in irrigated olive trees, cultivar Coratina, over six years after planting they recorded that, the nutrient demand was relatively steady during the different stages of the year. The results showed that demand for P and K is minimal during the first four years after planting and can be fulfilled by naturally supplied soils. Low doses of N should be applied through localized fertilization during the year. Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are considering being essential element for plant growth and development. The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio. Monge *et. al.* (2000) reported that, organic wastes fertilization did not lead to significant increases in olive mineral leaf concentrations in the first year trial. Hegazy *et. al.*(2007) studied the effect of organic and bio-fertilization on vegetative growth and flowering of Picual olive trees, they recorded that, N and K contents in leaf increased significantly with applying 100% organic fertilization (poultry manure), but no significant difference was observed on leaf P content in both seasons. The same treatment gave the highest Fe leaf content in both seasons and Mn in the second

season, while leaf Zn content increased in second season with using 100% mineral fertilization.

Fernández-Escobar *et. al.* (1999) mentioned that, under field conditions, foliar application of leonardite extracts (humic substances extracted) stimulated shoot growth and promoted the accumulation of K, B, Mg, Ca and Fe in leaves. However, when leaf N and leaf K values were below the threshold limit for the sufficiency range, foliar application of humic substances was ineffective to promote accumulation of these nutrients in leaves. Abdel Fatah *et. al*.(2008) mentioned that, soil drench application of humic acid to Tifway Bermodagrass hybrid improved growth parameters and NPK leaves cotents.

Mostafa and Abou Raya (2003) recorded that, all dry yeast soil application improved growth parameters of Grand Nain banana cv. Compared with control without dry yeast treatment.

Smith and Schwabe (1984) recorded that, top growth of *Quercus robur* could be further accelerated by application of gibberellic acid (GA_3) as foliar spray. Eman and Abd-Allah (2008) reported that, progressive increase on percentages of N, P, and K in the Superior grapevine leaves was observed as a result of increasing concentration of algae till 50%.

This investigation aimed to study the effect of mineral and organic nitrogen fertilization sources and some other treatments (humic acid, activated dry yeast, GA_3 and sea algae) on growth parameters of Picual young trees at first two years of planting. That to improve and push tree growth through these years.

2. Material and Methods

This study was carried out through two successive seasons (2007& 2008) on newly cultivated Picual olive cv. young trees in the Expermental research station of National Research Center at El Nobarya, El Behera governorate Egypt. The investigation aimed to study the effect of applying mineral, organic nitrogen fertilizers and some other treatments on young Picual cv. trees at the first two years of planting. The soil was characterized by: pH = 8.82, EC =1.11 dS/m, organic matter = 0.31%, $CaCO_3$ =12.8 %, Sand = 63 %, Silt = 13 % and clay = 3%. The soil texture grade was sandy. Drip irrigation system was applied using river Nile water. Planting distance was 5 × 5 meters apart.

In control plots, planting holes were prepared by adding 50 kg cattle manure, 1kg super phosphate, 1/4 kg potassium sulfate and 1/2 kg agricultural sulfur and each treatment received 100 g actual nitrogen/plant/year in each season as recommended by M.A.R.L. (2007a).

3. Results and discussion

The following treatments were applied:

1- Control: recommendation of M.A.R.L. (2007a) (100g actual nitrogen 500 g ammonium sulfate as mineral nitrogen source) + planting holes preparation.
2- Mineral nitrogen only 100 %.
3- Organic nitrogen source 100 % (cattle manure 100g actual nitrogen).
4- Mineral nitrogen source 50 % + organic nitrogen source 50 % (chicken manure).
5- Mineral nitrogen source 100 % + humic acid (monthly doses from March to November each 20 ml/plant).
6- Mineral nitrogen source 100 % + actived dry yeast as drench treatment three times in March, July and October each at 30 g/plant.
7- Mineral nitrogen source 100 % + one spray of GA_3 acid at 50 ppm in March.
8- Mineral nitrogen source 50 % + sea algae in March and June each at 50 g/plant.

- Cattle manure analysis was: N = 1.6%, P = 0 46% and K = 0.51%.
- Chicken manure analysis was: N =3.47%, P =0.67% and K = 0.64%.
- Sea algae analysis: N =8%, P = 2%, K = 4%, chelate microelements = 4% and traces of vitamins + amino acids.

Ammonium sulfate was divided into five equal doses through growing season. All these treatments were repeated in the second season except holes preparation with control plants only in the first season. The treatments were arranged in randomized complete block design in a simple experiment with four replicates for each treatment and each replicate was represented by one plant. At the end of each season at mid November four plants as replicates for each treatment were removed genteelly with their root system to estimate and record the following data for each cv individually:

1- Plant height (cm).
2-Stem diameter (cm) was measured at 10 cm above soil surface.
3- Lateral shoots length average (cm).
4- Leaf number per plant.
5- Lateral shoot number per plant.
6-Percentage of plant height increment
7- Whole plant dry weight (g).

Data obtained throughout this study were statistically analyzed using the analysis of variance method as reported by (Snedecor and Cochran, 1980), and the differences between means were differentiated by using Duncan's range test.

Effect of treatments on growth characters:

Plant height fig. (1) show that, insignificant differences were recorded among treatments in both seasons. But the tallest plants were recorded by control treatment in the first season (85.8 cm) and in the second season (141 cm). while the lowest plant height in both seasons was obtained by cattle manure supply alone (67.8 cm & 137 cm) respectively.

Stem diameter fig. (2) show that, the eighth treatment with sea algae had the lowest significant value (1.23 cm) compared with most other treatments in the first season whereas, in the second season the differences lake significance among treatments .However, the lowest value in the second season was recorded by 100%cattle manure (3.55 cm).

Shoot number fig.(3) show that, number of shoot per plant showed insignificant differences among treatment in both seasons. But we can notice that , control treatment recorded the highest value in first season(18.3) .In the second season the eighth treatment with sea algae had the highest value (38.3) and the lowest value in both seasons was recorded by 100% cattle manure (15.5&37 respectively).

Shoot length fig.(4) show that, average of shoot length is obvious that the sixth treatment with dry yeast recorded the highest significant value .(29.0 cm)as compared with the third one in the first season but in the second season no significant differences could be noticed among treatments. However in the second season the highest value was achieved by fifth treatment with mineral nitrogen+humic acid (57.5 cm) and the lowest value was recorded by the first treatment (37 cm).

Leaf number fig.(5) show that, leaf number per plant, result indicated in table 1 during the first season that the highest number of leaves per plant were significant for treatment of mineral nitrogen only (treatment2) compared to all organic treatments, while humic acid treatment gave the best results compared to improve the vegetative growth of other, however, in second season sea algae was less impact on number of leaves per plant.

Percentage of plant height increment Fig. (6) show that, the seventh treatment recorded the highest significant values in both seasons compared with most of other treatments (120.6% & 89.22% respectively).

Whole plant dry weight fig.(7) show that, the fifth treatment with humic acid showed the highest significant value (183.5 g.) compared with all other treatment in the first season. In addition, in the second season the same treatment had higher significant value (873.3 g.) than those of the third and eighth treatments.

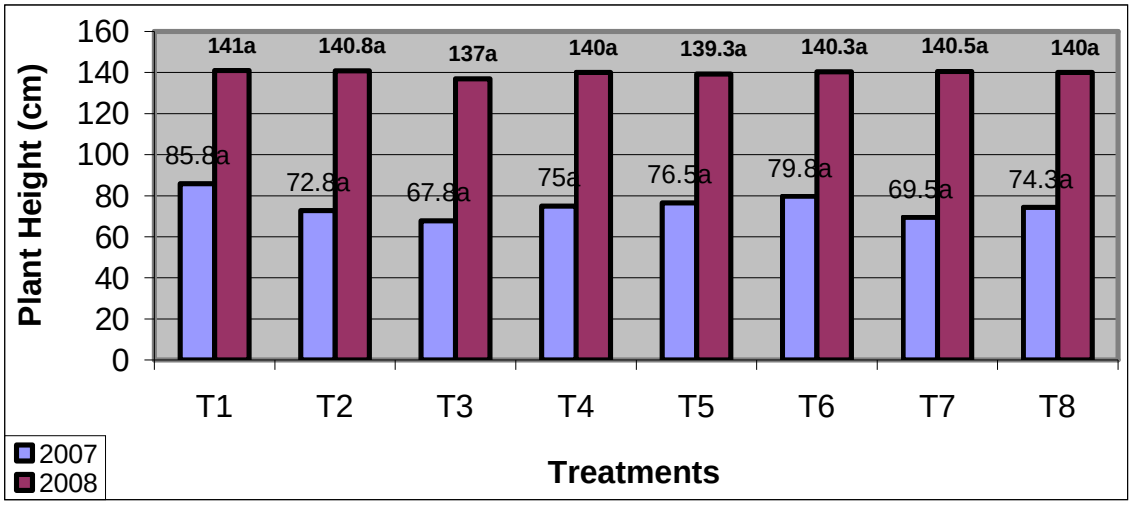

Fig (1): Effect of mineral, organic nitrogen and some other treatments on plant height (cm) of Picual olive cv. young trees in 2007 and 2008 seasons.

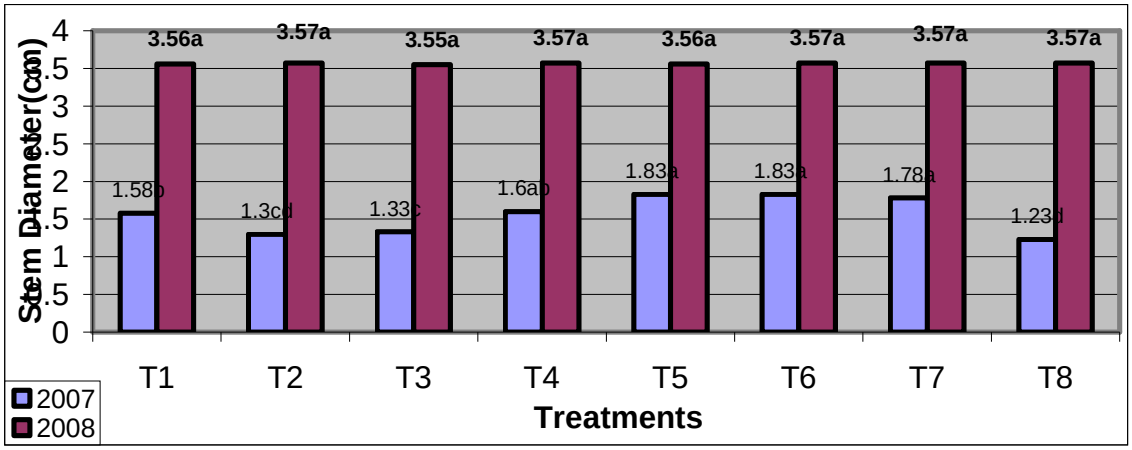

Fig (2): Effect of mineral, organic nitrogen and some other treatments on stem diameter(cm) of Picual olive cv. young trees in 2007 and 2008 seasons.

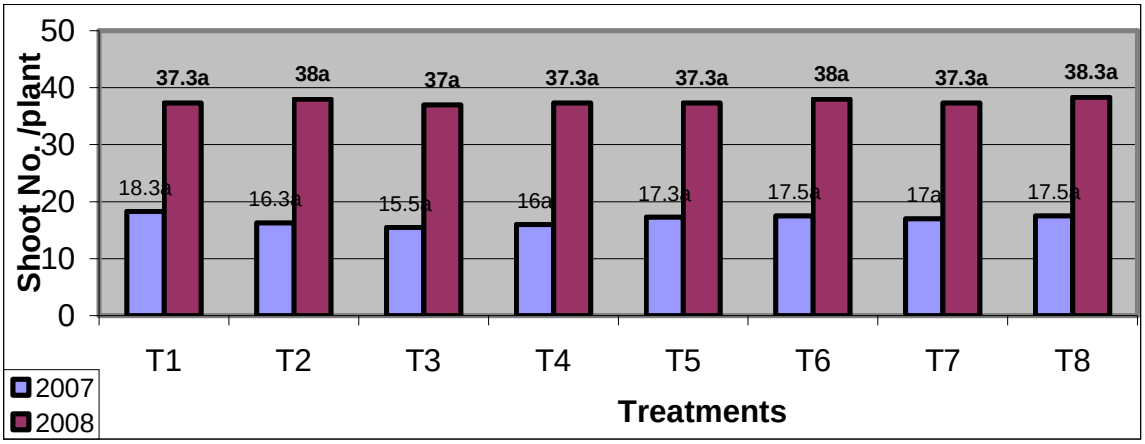

Fig (3): Effect of mineral, organic nitrogen and some other treatments on shoot No./plant of Picual olive cv. young trees in 2007 and 2008 seasons.

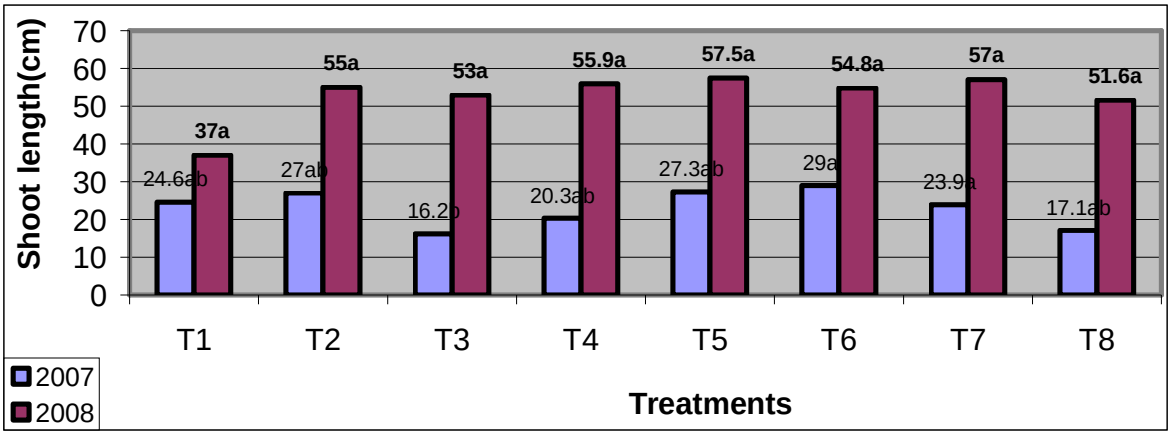

Fig (4): Effect of mineral, organic nitrogen and some other treatments on average shoot length(cm) of Picual olive cv. young trees in 2007 and 2008 seasons.

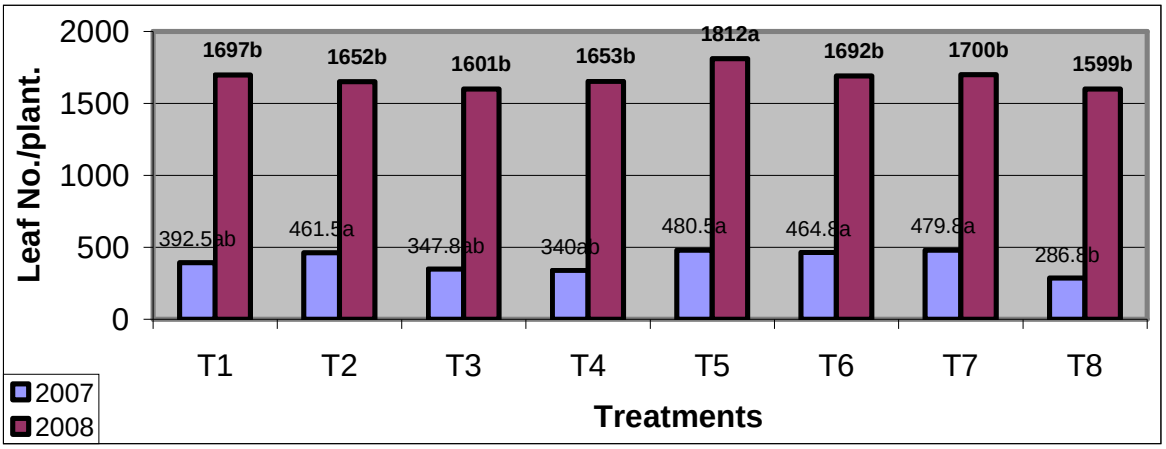

Fig (5): Effect of mineral, organic nitrogen and some other treatments on leaf no. /plant of Picual olive cv. young trees in 2007 and 2008 seasons.

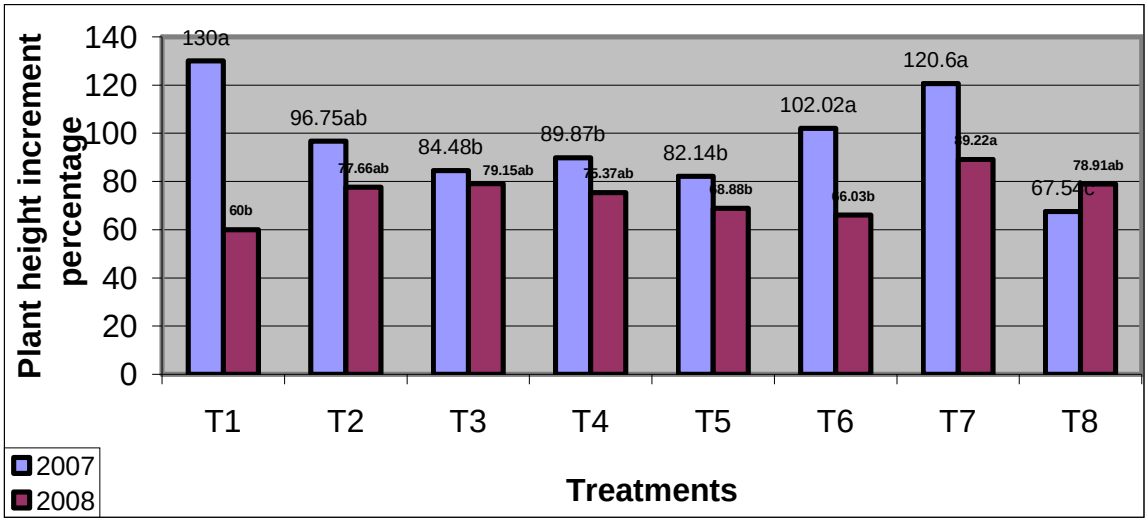

Fig (6): Effect of mineral, organic nitrogen and some other treatments on percentage of plant height increment of Picual olive cv. young trees in 2007 and 2008 seasons.

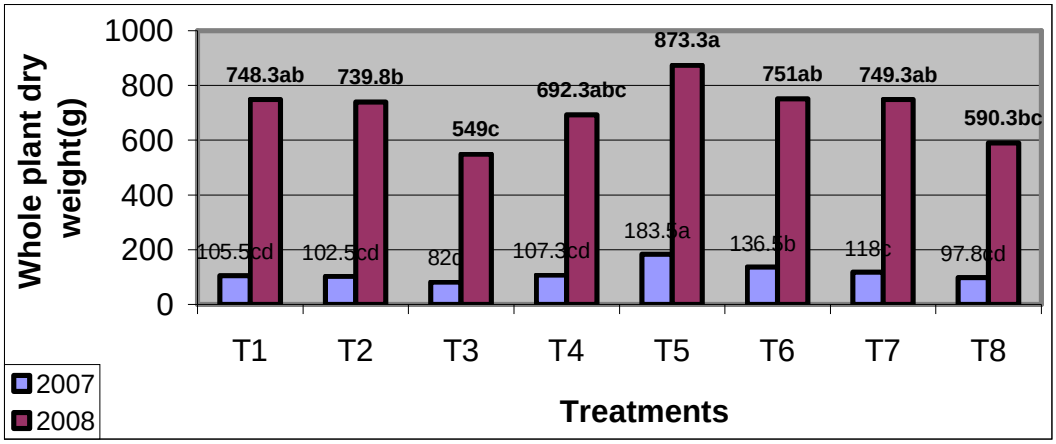

Fig (7): Effect of mineral, organic nitrogen and some other treatments on whole plant dry weight(g) of Picual olive cv. young trees in 2007 and 2008 seasons.

Finally it could be noticed that plant height, shoot number, shoot length, leaves number and stem diameter were not affected by different treatments in both seasons. Meanwhile, whole plants were improved by humic acid treatment compared with control and all other treatments in Picual cv. These results are harmony with those found by Fernández-Escobar *et. al.*(1999) they reported that, foliar application of leonardite extracts(humic substances extracted) under field conditions, stimulated shoot growth of young olive plants. Moreover we can added that, growth parameters were not affected by most treatment may be attributed to low nutritional demand of young olive trees as mentioned by Xiloyannis *et. al.* (2000) they showed that, demand of irrigated olive trees, cultivar Coratina for P and K is minimal during the first four years after planting and can be fulfilled by naturally supplied soils. Low doses of N should be applied through localized fertilization during the year. Moreover Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are consider to be essential element for plant growth and development. The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio.

Abstract: This study was carried out through two successive seasons (2007& 2008) on a cultivated Picual olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on leaf mineral contents at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA_3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, leaves dry weight per plant, and leaf mineral content were determined and recorded. The obtained results revealed that as follow: Effect of treatment on Leaves dry weight (g) per plant, fifth treatment with humic acid and sixth treatment with activated dry yeast gave the highest significant values in the first season, meanwhile in the second season fourth treatment with 50% cattle manure and fifth treatment with humic acid recorded higher significant values. Leaf nitrogen content revealed that first, fifth, sixth and seventh treatments showed higher significant values respectively than those of other treatments in the first season. In the second season, the first treatment had higher significant leaf nitrogen content compared with most of other treatments. [Journal of American Science. 2010;6(12):180-186]. (ISSN: 1545-1003).

Keywords: Picual Olive; Organic Nitrogen; Treatments

1. Introduction

The Egyptian olive production reached about 507053 tons produced from 110764 feddan and the total area reached about 135692 feddan (according to the statistics of M.A.L.R. (2007).

Xiloyannis *et. al.* (2000) working on mineral nutrient uptake from the soil in irrigated olive trees, cultivar Coratina, over six years after planting they recorded that, the nutrient demand was relatively steady during the different stages of the year. The results showed that demand for P and K is minimal during the first four years after planting and can be fulfilled by naturally supplied soils. Low doses of N should be applied through localized fertilization during the year. Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are consider to be essential element for plant growth and development.

The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio.

Monge *et. al.*(2000) reported that, organic wastes fertilization did not lead to significant increases in olive mineral leaf concentrations in the first year trial. Hegazy *et. al.*(2007) studied the effect of organic and bio-fertilization on vegetative growth and flowering of Picual olive trees, they recorded that,. N and K contents in leaf increased significantly with applying 100% organic fertilization (poultry manure), but no significant difference was observed on leaf P content in both seasons. The same treatment gave the highest Fe leaf content in both seasons and Mn in the second season, while leaf Zn content increased in second season with using 100% mineral fertilization.

Fernández-Escobar *et. Al* .(1999) mentioned that, Under field conditions, foliar application of leonardite extracts(humic substances extracted) stimulated shoot growth and promoted the accumulation of K, B, Mg, Ca and Fe in leaves. However, when leaf N and leaf K values were below the threshold limit for the sufficiency range, foliar application of humic substances was ineffective to promote accumulation of these nutrients in leaves.

Abdel Fatah *et. al.*(2008) mentioned that, soil drench application of humic acid to Tifway Bermodagrass hybrid improved growth parameters and NPK leaves cotents.

Mostafa and Abou Raya (2003) recorded that, all dry yeast soil application improved growth parameters of Grand Nain banana cv. Compared with control without dry yeast treatment.

Smith and Schwabe (1984) recorded that, top growth of *Quercus robur* could be further accelerated by application of gibberellic acid (GA3) as foliar spray. Eman and Abd-Allah (2008) reported that, progressive increase on percentages of N, P, and K in the Superior grapevine leaves was observed as a results of increasing concentration of algae till 50%.

This investigation aimed to study the effect of mineral and organic nitrogen fertilization sources and some other treatments(humic acid, activated dry yeast, GA3 and sea algae)on leaf mineral contents of Picual young trees at first two years of planting. That to improve and push tree growth through these years.

2. Material and Methods

This study was carried out through two successive seasons (2007& 2008) on Picual cv. young trees in the Expermental research station of National Research Center at El Nobarya, El Behera governorate Egypt. The investigation aimed to study the effect of applying mineral, organic nitrogen fertilizers and some other treatments on vegetative growth characters and leaf mineral contents of young Picual olive cv. trees at the first two years of planting. The soil was characterized by : pH = 8.82, EC =1.11 dS/m, organic matter = 0.31%, CaCO3 =12.8 %, Sand = 63 %,Silt = 13 % and clay = 3%. The soil texture grade was sandy. Drip irrigation system was applied using river Nile water. Planting distance was 5 × 5 meters apart.

In control plots, planting holes were prepared by adding 50 kg cattle manure, 1kg super phosphate, 1/4 kg potassium sulfate and 1/2 kg agricultural sulfur and each treatment received 100 g actual nitrogen/plant/year in each season as recommended by M.A.R.L. (2007a).

The following treatments were applied:

1- Control: recommendation of M.A.R.L. (2007a) (100g actual nitrogen 500 g ammonium sulfate as mineral nitrogen source) + planting holes preparation.
2- Mineral nitrogen only 100 %.
3- Organic nitrogen source 100 % (cattle manure 100g actual nitrogen).
4- Mineral nitrogen source 50 % + organic nitrogen source 50 % (chicken manure).
5- Mineral nitrogen source 100 % + humic acid (monthly doses from March to November each 20 ml/plant).
6- Mineral nitrogen source 100 % + actived dry yeast as drench treatment three times in March, July and October each at 30 g/plant.
7- Mineral nitrogen source 100 % + one spray of GA3 acid at 50 ppm in March.
8- Mineral nitrogen source 50 % + sea algae in March and June each at 50 g/plant.

- Cattle manure analysis was: N = 1.6%, P = 0 46% and K = 0.51%.
- Chicken manure analysis was: N =3.47%, P =0.67% and K = 0.64%.
- Sea algae analysis : N =8%, P = 2%, K = 4%, chelate microelements = 4% and traces of vitamins + amino acids

Ammonium sulfate was divided into five equal doses through growing season. All these treatments were repeated in the second season except holes preparation with control plants only in the first season. The treatments were arranged in randomized complete block design in a simple experiment with four replicates for each treatment and each replicate was represented by one plant. At the end of each season at mid November four plants as replicates for each treatment were removed genteelly with their root system to estimate and record the following data for each cv individually:

1- Leaves dry weight (g) per plant.
2-Leaf mineral content was determined as follow:

The leaves of each young tree at the end of each season were washed several times with tap water then rinsed with distilled water, dried at 70^{o}C in an electric oven, grounded in electric mill and digested according to (Chapman and Prat, 1961). Nitrogen analyses were determined by Micro Kjeldahl method (Jakson, 1967). Phosphorus was determined by the method of (Truog and Meyer, 1929). Potassium was determined by the the flame photometer according to the method of (Brown and Lilleland, 1946). Calcium and magnesium were determined by titration against versenate solution (Chapman and Pratt, 1961). Iron, zinc and manganese were determined by using Atomic Absorption technique. All these macro and micro elements were determined through the two studied seasons. Data obtained throughout this study were statistically analyzed using the analysis of variance method as reported by (Snedecor and Cochran, 1980), and the differences between means were differentiated by using Duncan's range test.

3. Results and Discussions

1- Effect of treatment on Leaves dry weight (g) per plant. Fig. (1) show that, fifth treatment with humic acid and sixth treatment with activated dry yeast gave the highest significant values (46.5 & 43.5), respectively compared with all other treatments in the first season, meanwhile in the second season fourth treatment with 50% cattle manure and fifth treatment with humic acid recorded higher significant values (255.8 &269.3 respectively) compared with most of other treatments.

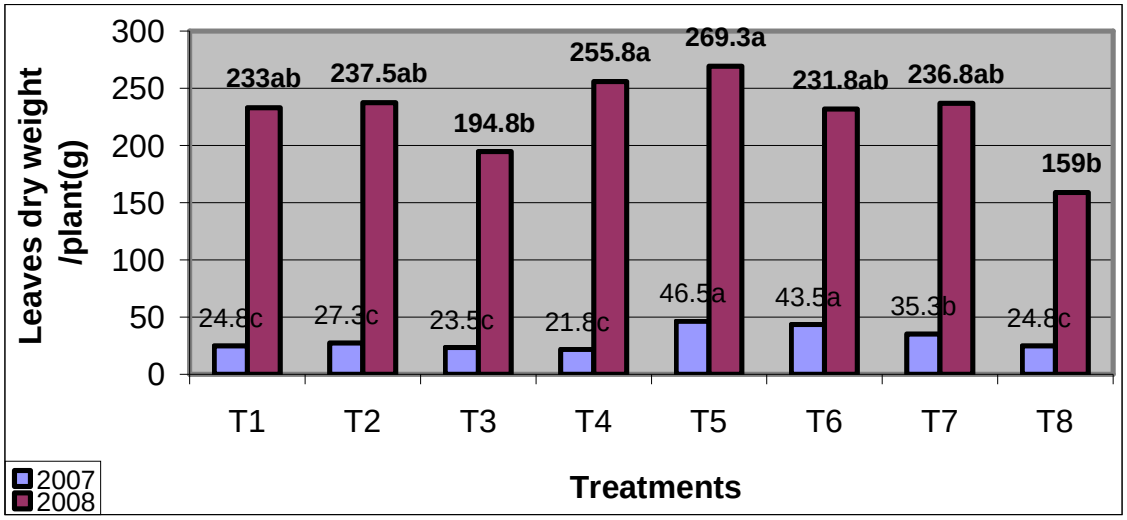

Fig (1): Effect of mineral, organic nitrogen and some other treatments on leaves dry weight/plant(g) of Picual olive cv. young trees in 2007 and 2008 seasons.

2-Effect of treatment on leaf mineral content:

Leaf nitrogen content:

Fig.(2) show that, Leaf nitrogen content revealed that first, fifth, sixth and seventh treatments showed higher significant values (1.51, 1.54, 1.52 & 1.54) respectively than those of other treatments in the first season. In the second season, the first treatment had higher significant leaf nitrogen content (1.54) compared with most of other treatments.

Leaf phosphorus content:

Fig. (3) Show that, Leaf phosphorus content recorded insignificant differences among treatments in both season.

Leaf potassium content:

Fig.(4) show that, Leaf potassium content, differences among treatments lake significances in the first season. In the second season, second treatment with 100% mineral nitrogen gave the highest significant value (0.39) of leaf potassium content compared with all other treatments.

Leaf calcium content:

Fig.(5) show that, Leaf calcium content with the first, fifth, sixth and eighth had higher significant values than those of other treatments in the first season.

In the second season, seventh treatment by GA3 spray showed higher significant leaf calcium content (1.89) compared with most of other treatments.

Leaf magnesium content:

Fig.(6) show that, Leaf magnesium content had lower significant values with the third and eighth treatments (0.17&0.18 respectively), compared with all other treatments in the first season. In the second season, second treatment with 100% mineral nitrogen had the highest significant leaf magnesium content (0.92) compared with all other treatments.

Leaf iron content:

Fig. (7) show that, Leaf iron content differences among treatments lake significance in the first season. In the second season, second treatment with 100% mineral nitrogen recorded higher significant leaf iron content (2373) compared with most of other treatments.

Leaf zinc content:

Fig. (8) show that, Leaf zinc content with the fifth treatment by humic acid recorded highest significant.

In the second season, second treatment with 100% mineral nitrogen showed higher significant leaf zinc content (52) compared with most of other treatments.

Leaf manganese content:

Fig.(9) show that, Leaf manganese content gave insignificant differences among treatments in the first season. In the second season, fifth treatment with humic acid had higher significant leaf manganese content (42.3) compared with all other treatments. Value (40) compared with all other treatments in the first Season.

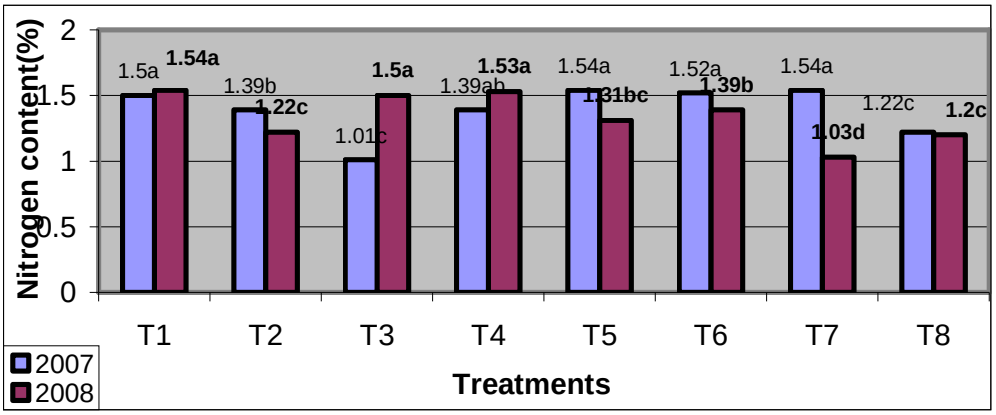

Fig (2): Effect of mineral, organic nitrogen and some other treatments on leaf nitrogen content(%) of Picual olive cv. young trees in 2007 and 2008 seasons.

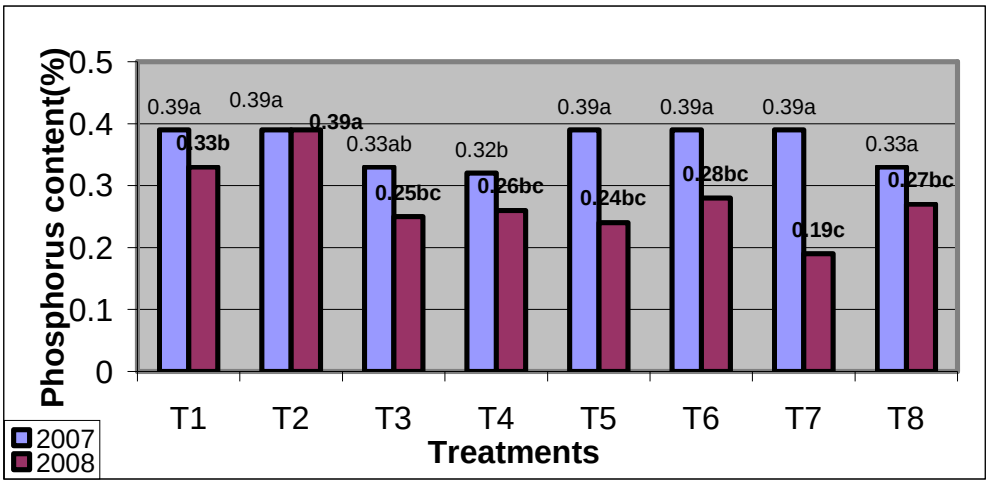

Fig (3): Effect of mineral, organic nitrogen and some other treatments on leaf phosphorus content(%) of Picual olive cv. young trees in 2007 and 2008 seasons

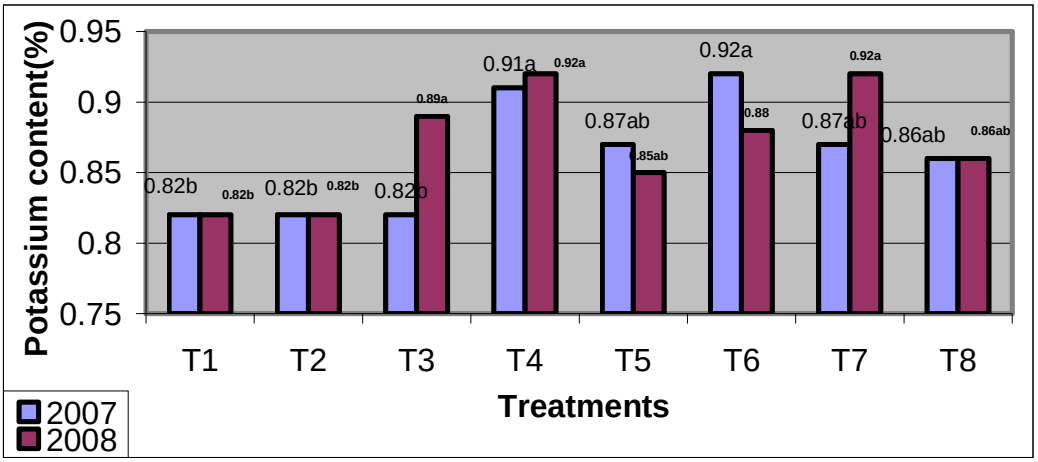

Fig (4): Effect of mineral, organic nitrogen and some other treatments on leaf potassium content(%) of Picual olive cv. young trees in 2007 and 2008 seasons.

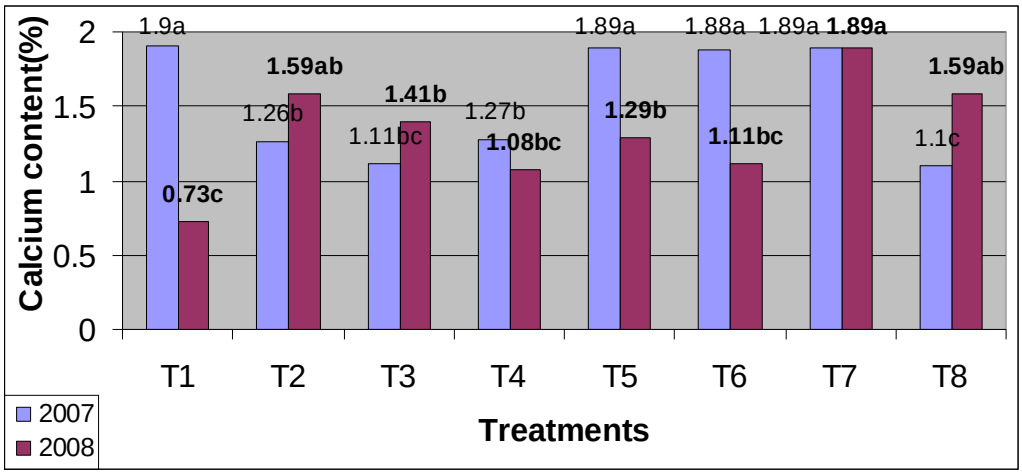

Fig (5): Effect of mineral, organic nitrogen and some other treatments on leaf calcium content(%) of Picual olive cv. young trees in 2007 and 2008 seasons.

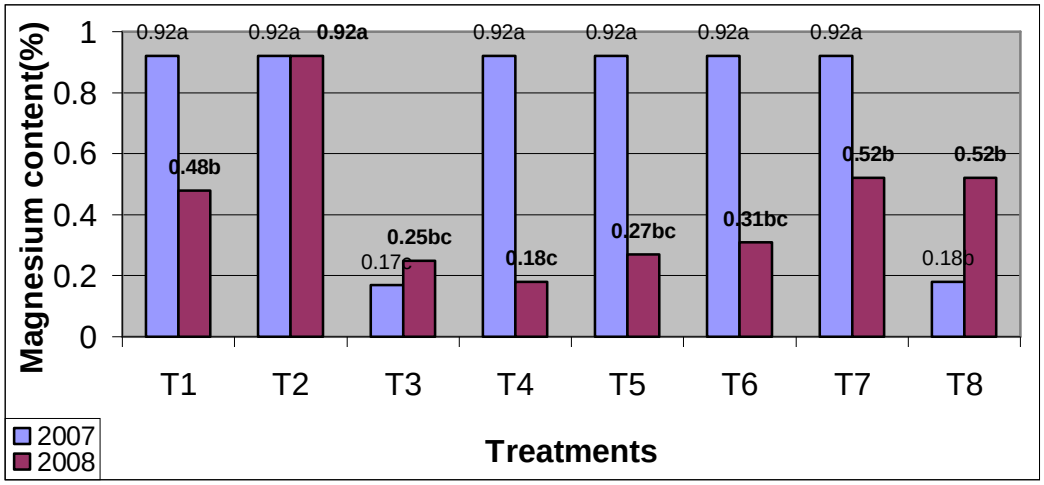

Fig (6): Effect of mineral, organic nitrogen and some other treatments on leaf magnesium content(%) of Picual olive cv. young trees in 2007 and 2008 seasons.

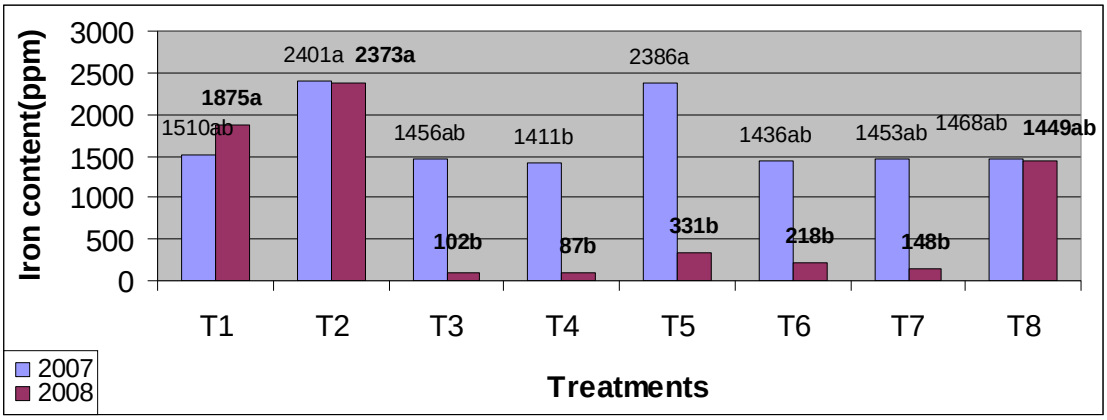

Fig (7): Effect of mineral, organic nitrogen and some other treatments on leaf iron content(ppm) of Picual olive cv. young trees in 2007 and 2008 seasons.

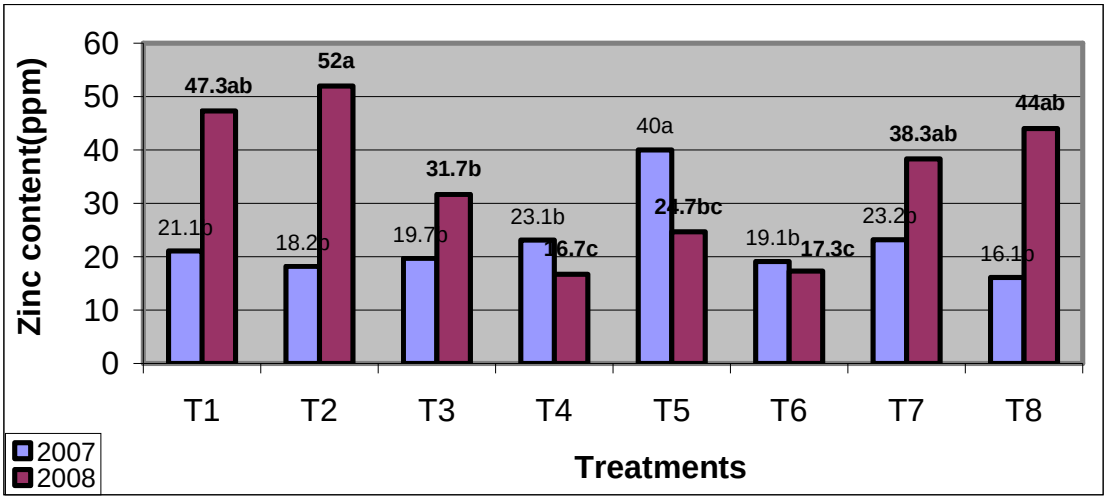

Fig (8): Effect of mineral, organic nitrogen and some other treatments on leaf zinc content(ppm) of Picual olive cv. young trees in 2007 and 2008 seasons

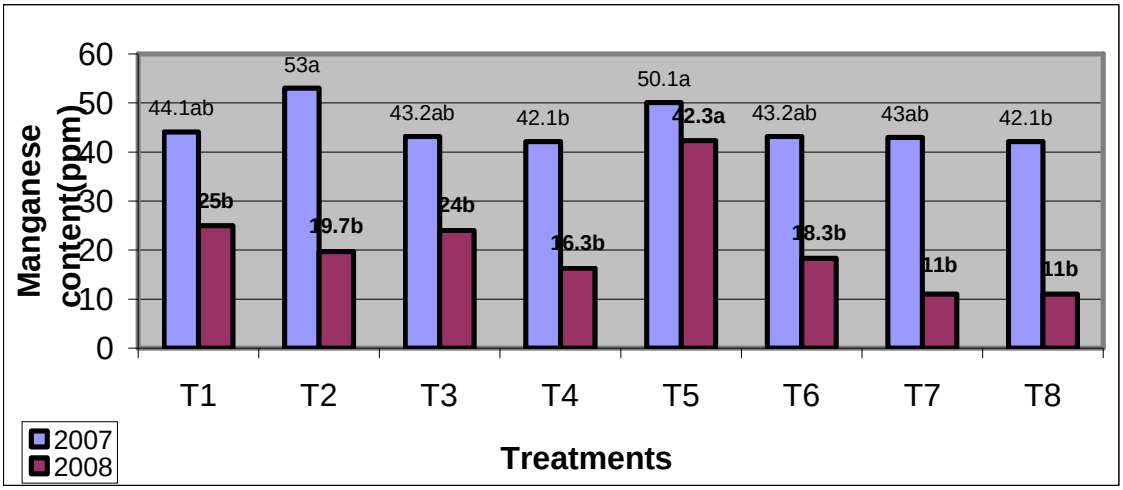

Fig (9): Effect of mineral, organic nitrogen and some other treatments on leaf manganese content(ppm) of Picual olive cv. young trees in 2007 and 2008 seasons.

Finally it could be noticed that, effect of treatment on Leaves dry weight (g) per plant, fifth treatment with humic acid and sixth treatment with activated dry yeast gave the highest significant values in the first season, meanwhile in the second season fourth treatment with 50% cattle manure and fifth treatment with humic acid recorded higher significant values. Leaf nitrogen content revealed that first, fifth, sixth and seventh treatments showed higher significant values, respectively than those of other treatments in the first season. In the second season, the first treatment had higher significant leaf nitrogen content compared with most of other treatments These results are harmony with those found by Fernández-Escobar *et. al.*(1999) they reported that, foliar application of leonardite extracts(humic substances extracted) under field conditions, stimulated plant growth of young olive plants. Moreover we can added that, growth parameters were not affected by most treatment may be attributed to low nutritional demand of young olive trees as mentioned by Xiloyannis *et. al.* (2000) They showed that, demand of irrigated olive trees, cultivar Coratina for P and K is minimal during the first four years after planting and can be fulfilled by naturally supplied soils. Low doses of N should be applied through localized fertilization during the year. Moreover Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are consider to be essential element for plant growth and development. The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due

to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio. From obtained data P, K, Ca and Mg were higher than their critical levels but nitrogen was lower than it's critical level with most treatments especially in the second season that may be attributed to more vegetative growth in second season than first one which need more demand of nitrogen. These results are contrary with those found by Hegazy *et. al.*(2007) Whose reported that the applying 100% organic fertilization (poultry manure) to Picual olive trees gave the highest Fe leaf content in both seasons and Mn in the second season, while leaf Zn content increased in second season with using 100% mineral fertilization.

Effect of Bud Load on Bud Behavior, Yield, Cluster Characteristics and some Biochemical Contents of the Cane of Crimson Seedless Grapevines

[1]Fawzi M. I. F. [1]Shahin M. F. M. and [2]Kandil E. A.

[1]Pomology Department, National Research Center. [2]Horticulture Research Institute agriculture Research Center, Giza, Egypt

Abstract: This study was conducted through the seasons of 2007 and 2008 to determine the optimum bud loads/ vine for Crimson seedless "grapevines. Eight years old uniform vines were chosen and pruned to six different levels of bud load, namely 78, 91, 104, 117, 130 and 143 buds/ vine. Number of buds was fixed at 13 bud/cane. The results showed that the number of bursted buds was increased significantly by increasing bud load /vine in the two seasons of the study, while the percentage of bursted buds decreased. The bud fertility and fruitfulness were decreased by increasing bud load. Data also indicated that 104 or 117 buds/ vine were more suitable for Cirimson seedless grapevines to produce good yield and fruit quality. On the other hand, 78 or 143 buds/vine was unfavorable science it produced rather compact clusters. Increasing bud load increased number of cluster/vine and yield but reduced cluster weight. Vines pruned to 117 bud/vine gave the greatest cluster weight, length, rachis weight, berry weight, berry firmness, adherence, T.S.S and total sugars. Increasing bud load on the vine significantly increased total carbohydrates and protein contents of the canes during the dormant season. In this respect, vines pruned to 143 bud/vine showed higher percent of both total carbohydrate and protein contents than the other levels of bud load. [Journal of American Science. 2010;6(12):187-194]. (ISSN: 1545-1003).

Key words: Grapevine, winter pruning Crimson seedless, bud load, fruit quality.

1. Introduction:

Grape (Vitis vinifera. L.) is considered on of the most important fruits in the world. "Crimson seedless" is one of the new cultivars which were introduced to Egypt. It is a late - ripening cultivar with medium cluster in size (weight = 0.5kg; length 20cm) conical shaped with shoulders the cluster is well filled to slightly compact, the berries are medium in size 4.0g, 16.6mm in diameter (Ramming et. al., 1995) This cultivar holds significant promises for the Egyptian commercial producers and exporters due to its late maturity date as well as its seedless berries and the crispy texture of berries.

Pruning is considered the most important practice through which grape production can be increased and cluster quality improved. The basal 3-4 buds of the cultivar are less fruitful, so using long fruit canes is important for production normal crop.

Bud load is the most important factor affecting yield and cluster quality as well as vine vigor of Thompson seedless grapevines Morris and Cawthon (1980); Fawzi et at., 1984 ; Marwad et. al., (1993); Omar and Abdel-kawi, 2000; Rubio et al, (2002) on Tempranillo variety and El-Baz et. al; (2002) on Crimson seedless grapevines.

The objective of this study is to determine the optimum bud load per vine for Crimson seedless grape and to study the effect of bud load on bud behavior, cluster quality, yield per vine and total carbohydrates and proteins in the mature canes during the dormant season.

2. Materials and Methods:

This work was carried out in a private vineyard located beside the desert road of Alexandria - Cairo on 8 years - old Crimson seedless grapevines. This study extended for two successive years (2007 and 2008) the vines were grown 1.5 X4.0 meters apart in sandy soil under drip irrigation and trained according to cane pruning under, (Gable) trellis system. At pruning time (at winter) seventy two vines of almost similar vigor were selected and pruning to different bud load levels with fixed the length of canes at 13 bud/cane. The vines received the usual and recommended agriculture practices

The experimental treatments applied were as follows:

T1 - 6 canes X 13 bud/cane = 78 buds
T2- 7 canes X 13 bud /cane = 91 buds
T3- 8 canes X 13 bud /cane = 104 buds
T4- 9 canes X 13 bud /cane = 117 buds
T5- 10 canes X 13 bud /cane = 130 buds
T6- 11 canes X 13 bud /cane = 143 buds

In addition to the renewal spur (2 bud) per each cane. Each treatment contained three replicate of four vines per each. The randomized complete block

design was carried out. The following parameters were investigated for each experimental vine.

Bud behavior:

During the spring of each season number of bursted bud and fruitful buds were counted, then the percentages of bud burst, fertility and fruitfulness were calculated according to Bessis (1960) Bud burst % (number of bursted buds divided by total number of bud, per vine X 100); Bud fertility % (number of cluster per vine divided by total number of bud per vine X 100) and Fruitfulness % (number of fruitful buds dividing by number of bursted buds X 100). Also, numbers of clusters per vine were counted.

Yield / vine:

Average yield / vine was determined an average of number of clusters / vine and average weight of cluster / vine in kilograms at harvesting date (first - October) when average T.S.S % in berry juice reached about 19-20% according to Ramming et al., (1995) and Samra (1998).

Representative samples per each replicate were harvested and taken to laboratory to determine the following characters:

Physical characteristics of clusters:

Average of: cluster weight (g); rachis weight (g); cluster length (cm); number of berries/ cluster; cluster index (Av cluster weight divided by Av. weight of rachis/ cluster); compactness coefficient ratio (Av. number of berries/ cluster divided by Av. cluster length (cm)) according to Winkler (1962).

Physical characteristics of berries:

Samples of 100 berries from each replicate were collected at random to determine an average of berry weight (g); berry index (Av. number of berries presented in 100 gm of cluster); berry firmness and adherence by using push-pull (Dynahometer Model DT 101).

Chemical characteristics of berries:

Berry Juice was extracted and filtered through two Layers of cheese cloth to determine: total soluble solids percentage using a hand refractometer and acidity by titrating 10 ml juice sample against. NaoH (0.1 N).

Acidity was expressed as g tartaric acid/ 100 ml juice according to A.O.A.C. (1980); T.S.S / acid ratio was calculated and total sugar (Smith et al., 1956).

Determination of total carbohydrates and proteins in the canes:

At winter pruning sample of ripened canes were collected and used for determination:

Total carbohydrates were determined according to methods of Pulmmer, (1971). The obtained results of total carbohydrates were presented as g/100 J dry weight.

Total proteins were extracted in solution of 10% S.D.S, 1% mercaptoethanol, 65 ml tris/ Hcl, PH 6.8 as described by Dure & Chlan (1981) and Oster et al., (1981). Protein content was determined spectrophotometrically at 595nm according to Bradford (1976) and results were expressed as g/ 100 g dry weight of the canes.

The obtained data were tabulated and statistically analyzed according to Mead et al. (1993) using the new L.S.D at 5% parameter to compare the differences between various treatments.

3. Results and Discussion:

Bud behaviour:

From table (1) it is clear that the number bursted bud was increased significantly by increasing the number of bud load/ vine in the two seasons 2007 and 2008; The highest value was (102.33 & 103.10) for T6 i.e (143 buds/vine) in the two seasons respectively. On the other hand increasing bud load/vine significantly decreased bud burst percentage.

The highest bud burst percentage was associated with the lower bud load 78 and 91 buds/vine. The same results were obtained by Christensen et al., (1994) and Omar& Abdel - kawi (2000) showed that increasing bud load induced lower percentage of bud burst.

In addition, Ramming et al., (1995) reported that pruned Crimson seedless as a spur pruning produced a lower number of shoot/vine compared with the cane pruning. Thus vines pruned to 10 canes resulted in a significant higher number of shoots from canes than those were 6 or 8 canes/vine. Since vines with 6 canes gave a lower number of shoots/ vine.

As regarded percentages of bud fertility and fruitfulness, it is clear from the same table that percentage of bud fertility and fruitfulness were affected by bud load/ vine in this respect, the highest values were (38.32 & 37.32%) for TI (78 bud) per vine in the two seasons, respectively. Thus, vines pruned to (143 buds)/ vine gave lower bud fertility it recorded (28.83 & 29.48%) at the two seasons 2007 and 2008 respectively.

Concerning the data of fruitfulness vines pruned to (78 buds)/vine were the highest, while, vines pruned to (143 buds)/ vine were the lowest one. The obtained data go in line with those reported by Morris and Couthon (1980) they reported that vines with 30 or 60 buds/ per vine produced a higher estimated fruitfulness than that of 90 buds per vine. Recently Salem et al., (1997) mentioned that when Thompson seedless grapevine were pruned to 72, 84, 96, 108

buds per vine, leaving 96 or 108 buds produced the greatest growth and the lowest percentage of fruitful buds. The low fruitfulness of Crimson seedless grape was due to the high vigor vine, whereas moderated vigor it is usually more fruitful. According to the foregoing results, it could be conclude that Crimson seedless grapevines, which have high growth, get low fruitfulness, whereas the moderated vigor ones are usually more fruitful.

Number of clusters and yield/vine

Data of table (2) clearly indicated that number of cluster/vine were increased significantly as bud load was increased. It is obvious that treatment of (143 buds) / vine gave the highest number of clusters/ vine; it recorded (41.23 & 42.16) in the two seasons, respectively. Whereas leaving (78 buds)/ vine gave a lower significantly number of cluster which recorded (28.33 & 29.11) in both seasons, respectively. Yet, there are no clear differences on the number of clusters that had been obtained by leaving 117 buds or 130 buds/ vine. Similar results ware observed by Omar and Abdel-kawi (2000).

From the same table showed that the yield/ vine was significantly increased by increasing bud load. Moreover, the highest yield/ vine was obtained by those vine pruned to 104 buds & 117 buds/ vine which recorded (13.25 & 13.57kg/ vine) and (15.28 & 16.14kg/ vine in the two seasons, respectively. This increment in vine yield may be attributed increase in both number of clusters/ vine and their weight.

These results in this connection agree with those obtained by Ali, et al., (2000) and Omar & Abdel-kawi (2000) on Thompson seedless grapevines.

Physical characteristics of clusters.

Data in table (3) indicated that increasing the bud load/ vine reduced the average weight of cluster, thus, average cluster weight was least in vines pruned to 143 buds/ vine. Furthermore, leaving 104 buds or 117 buds/vine gave a slight increase in average cluster weight, without significantly differences amonge them. These results agreed with those findings of Omar & Abdel-kawi (2000) who reported that number of bunches per vine increased significantly by increasing the bud load per vine of Thompson seedless, but bunch weight decreased by increasing bud load.

Regarding rachis weight and cluster length data presented in Table (3) indicated that the effect of the different used treatment on rachis weight and cluster length were almost to that of cluster weight.

It is clear from Table (3) generally that the number of berries/ cluster of Crimson seedless grape was found to range between 81.34 – 103.05

These results in this respect are harmony with the findings found of El-Buz et. al., (2002) who that the number of berries/ cluster of Crimson seedless grape was found to range between 98 - 10 7.5. It is also clear from table (3) that clusters compactness values were highest in vine pruned to 91 ar 143 buds/vine. However, vines pruned to 104 as 117 buds/vine had recorded the lowest values of cluster compactness it recorded (3.03 & 3.54) and 3.89 & 3.64) in the two seasons, respectively. This means that bud load of 104 ar 117 buds/vine is stubble for Crimson seedless grape vines to good yield and slight compactness of cluster Moreover, Ramming et al., (1995) and Pommer et al. (1990) mentioned that cluster of Crimson seedless are medium in length and therefore are slight compact.

Concerning cluster index, it is clear from Table (3) that the highest values was found for vines pruned to 78 buds/vine it recorded (38.17 and 38.29) in the two seasons, respectively this increase could be attributed to the increases in fruit setting at this treatment (Marwad et. al., (1993); Rizk et al., 1994; Rizk, 1996 and Ali et al., 2000).

Physical characteristics of berries:

Data of table (4) revealed that the highest values of berry weight was obtained by vines pruned to 117 buds/ vine in the two seasons it is recorded (4-10 & 4.30g), respectively, This increase in berry weight was due to the increase of the cluster weight to the same treatment. (Abdel -Fattah, et al., 1993 and Rizk, (1996) and Ali, et al., 2000).

As for berry index it is clear from table (4) that the highest value was found for vines to 78 buds or 143 buds / vine, Data recorded (28.14 & 27.75 and 28.51 & 28.52) in the two seasons 2007 and 2008, respectively.

Table (4) showed that berry firmness of Crimson seedless grape was higher than berry adherence under different bud loads/ vine. Also, vines pruned to 117 buds / vine inhibited a slight effect on both berry firmness and adherence. No significant differences were noticed in berry firmness and adherence between vines pruned 78 buds were obtained by El-Baz et al., (2002).

Chemical characteristics of berries:

From table (5) it is clear that vines pruned to 117 buds/vine gave the highest significant values concerning T.S.S %, This treatment recorded (22.10 & 23.30%) during 2007 and 2008 seasons, respectively. Vines pruned to 104 buds/vine to the second rank. Vines pruned to 78 buds / vine gave the lower values, in this respect which recorded (19.50& 19.83 %) in the two seasons, respectively. The results agreed with those findings of Omar and Abdel -kawi (2000) who reported that increasing bud loads up to 72 buds/ vine

significantly increased berry T.S.S%, and leaving 48 or 120 buds/ vine recorded lower T.S.S % with no significantly differences with them. Similar results was found by Howell et al., (1991) Abdel - Fattah et al., (1993), Marwad (1993); Rizk, (1996) and Howell & Strieglar (1998) who reported a significant increase in T.S.S with pruning vines to short compared with long cane pruning. On the contrary, Ramming (1995) indicated that T.S.S% was not affected markedly by pruning levels of Crimson seedless. As shown table (5) it is evident that acidity % was increased by increasing bud load/vine. Vines pruned to 143 buds/ vine recorded the highest values of acidity % where it was (0.50 & 0.53%) in the two seasons, respectively. In this respect, El-Baz et al., (2002) found that leaving to 10 canes/ vine gave a slight increment of acidity % in berry juice than above that maintained on leaving 8 canes/ vine but the differences between them were not significant. Yet, vines pruned to 8 canes with 12 nodes produced a lower total acidity % than the other pruning severity of Crimson seedless grapevines. Badr (1997) reported that titratable acidity of crimson seedless was not affect markedly either under cane are spur pruning Also, Ramming et al. (1995) mentioned that, pruning levels gave no clear effect on the titratable acidity of berry jucie of Crimson seedless.

It is clear from Table (5) that the effect bud load /vine on T.S.S/ acid ratio similar to that concerning in total soluble solids.

The same table indicated that total suger decreased by increasing bud load/vine. The least values was found in vines pruned to 143 buds/ vine. It recorded (15.36 and % 15.33) in the two seasons, respectively. However total sugar % was higher in vines pruned to 117 buds / vine which recorded (17.59 and 17.98 %) in the both seasons, respectively. The obtained data are similar to that obtained of Tafazol (1977) who found that a decrease in fruit sugar content by increasing the number of buds / vine.

Total carbohydrates and proteins content in the canes.

Data in table (6) indicated that total carbohydrates content in the cane at dormant period was significantly increased by increasing bud load/vine. In this connection, vines which were pruned to 143 buds /vine appeared to assimilate and store higher carbohydrates content than the other ones pruned to 78 buds/ vine, which was recorded a lower carbohydrates content during the two seasons, of the investigation. This is not strange since this treatment produced a lower number of subsequent shoots compared with the treatment having higher bud load 143 buds / vine which in turn produces higher number of shoot. Our results in this connection agree with those obtained by kliewer (1981) and Gao & Cahoon (1994) who reported that increasing leaves lead to heavy canopy with increase in active photosynthesis and stored carbohydrates in the new canes. Similar results were obtained by Omar & Abdel-kawi (2000) on Thompson seedless grapevines and El-Baz et al; (2002) on Crimson seedless grapevines.

Data of table (6) show the effect of different bud load/ vine on total protein content in the cane of Crimson seedless grape during dormant season. Thus it is appeared to increase by increasing the bud load on the vine. In this respect, vines which were pruned to 78 buds/ vine maintained the lowest content of total protein in their canes during the both seasons of this study. These results in agreement with El-Baz et al; (2002) on Crimson seedless grapevines.

Table (1) Effect of bud load on bud behaviour of "Crimson seedless" grapevines in 2007 and 2008 seasons

Treatments (Bud load per vine)	Number of bud burst		Bursted buds (%)		Fertitity buds (%)		Fruitfulness (%)

The Effect of some Slow Release Nitrogen Fertilizers on Growth, Nutrient Status and Fruiting of "Mit Ghamr" Peach Trees

[1] Kandil, E. A., [2]M. I. F. Fawzi, and [2]M. F. M. Shahin

[1]Hortcultural Research Institute, [2] National Research Center, Dokki, Giza, Egypt.

Abstract: This study was conducted for comparing three slow release N fertilizers namely, urea – formaldehyde, phosphorus – coated urea and sulphur coated- urea and that fast release nitrogen namely (urea) at 500, 750 and 1000g/tree/year for vegetative growth, leaf mineral content, yield and fruit quality of "Mit Ghamr" peach tree grown in a private orchard Aga city Dakahlia Governorate, Egypt, during 2008 and 2009 seasons, were studied. Urea was added at two times at the start of spring growth and after fruit set, while slow – release N fertilizers applied once at the start of spring growth. Results showed that supplying the tree of "Mit Ghamr" peach with the three slow release N fertilizers were superior to the application of the fast one in improving shoot length, leaf area, percentage of leaf N, as well as physical and chemical characteristics of the fruits. Application of sulphur – coated urea (SCU), phosphorus- coated urea (PCU) and urea- formaldehyde in a descending order was very favorable. Generally, "Mit Ghamr" peach trees once with sulphur coated urea at 500-750g/trees/year was the best results on vegetative growth, yield nutritional status of trees and fruit quality. In addition saving nitrogen fertilization cost and reducing nitrate pollution. [Journal of American Science. 2010;6(12):195-201]. (ISSN: 1545-1003).

Keywords: N fertilizers; urea; formaldehyde; phosphorus; sulphur

1. Introduction:

Peach is one of the most important deciduous fruit trees grown in Egypt.

Nitrogen is known to be one of the most major elements for plant nutrition and development science it plays an important role in a constituent of all proteins, nucleic acids and enzymes synthesis (Nijjar, 1985).

Recently, new techniques for fertilization of fruit trees grown under sandy soil were arisen. Out of those, the application of controlled release N fertilizers they were developed mainly to reduce the number of replications per year, minimize the cost of production, improve the efficiency of N used by trees, reactions and the rapid denitrification (Nijjar, 1985, Allen, 1986, Alva, 1992, Scuderi et al, 1993 and Wang & Alua, 1996) The control and continues providing of the trees with their requirements from N can be achieved by using controlled release N fertilizers which are responsible for releasing their own N at a longer period and at the critical date of fruit development.

Previous studies showed that using slow release N fertilizers was preferable than using the fast one in improving growth and nutritional status of the trees. (Alvan & Tucker, 1996, Ahmed et al. 1997, Hammam & Assy, 2000; Wassel et al. 2000; Akl et al. 2002 and Mohamed & Sama Ebeed. 2008).

So, the aim of this investigation was to study the effect of three controlled release N fertilizers urea formaldehyde, phosphorus coated urea and sulphur coated urea compared to fast release (urea) on growth, nutritional status and fruit quality of "Mit Ghamr" peach cultivar trees grown in loamy soil, to find out the best one.

2. Materials and Methods:

During 2008 and 2009 seasons, 18 years old "Mit Ghamr" peach trees (Prunus persica L. Batch) grown in a private orchard, Aga city Dakahlia Governorate, Egypt. The selected and uniform in vigour trees were planted at 5×5 meters apart grown in loamy soil and irrigated via flood irrigation, trained to an open – vase system.

Analysis of the tested soil according to (Wilde et al. 1985) and the data are shown in Table (1).

Table (1): Soil physical and chemical analysis.

Size of particles and their distribution	
Sand %	34.50
Silt %	36.50
Clay %	29.00
Texture	Loamy
pH (1: 2.5 extract)	8.10
E.C. (1: 2.5 extract) (mmhos/1cm)	0.85
O.M%	2.30
Total Co_3%	1.73
Avatilable macronutrients	
Total N %	0.09
Available P (ppm olsen).	12.00
Avaiable K (ppm)	285.00

1. This experiment included the following 12 treatments as follows:
2. Application of urea (46.5% N) at 500g/tree.
3. Application of urea at 750 g/tree.
4. Application of urea 1000g/tree.
5. Application of urea formaldehyde (38.37% N) at 500 g N/tree.
6. Application of urea formaldehyde at 750 g N/tree.
7. Application of urea formaldehyde at 1000 g N/tree.
8. Application of phosphorus-coated urea (37.11% N) at 500g N /tree.
9. Application of phosphorus-coated urea at 750 g N /tree.
10. Application of phosphorus-coated urea at 1000g N /tree.
11. Application of sulphur-coated urea (41% N) at 500g N/ tree.
12. Application of sulphur-coated urea at 750g N/ tree.
13. Application of sulphur-coated urea at 1000g N/ tree.

The experiment was set in a completely randomized block design with three replicates each consisted with two trees.

The three slow release N fertilizers at the prementioned amounts were applied once at the start of spring in circular digs around each tree 50cm apart from trunk and covered with soil, while the fast release N fertilizers (urea) was added twice at spring growth start and after fruit stetting. The treated trees received the basal P and K fertilizers. Other horticultural practices were carried out as usual.

The following parameters were recorded for both seasons:

1- Vegetative growth measurements:

Shoot length (cm), and during mid-August of the two seasons, leaf samples were collected from the middle portion of the current season growth to determine leaf area (cm2) by using a leaf area meter (Model C/203 area meter. CID, INC. USA), and to determined percentage of N, P and K according to (Wilde, et al. 1985).

2-Leaf mineral content:

As follows: samples of leaves were taken, and distilled water washed and oven dried at 70oC till constant weight. Dried samples were pulverized separately and samples of 0.2 (g) each was digested with a mixture of sulphuric acid and hydrogen peroxide, to determine the following:

Total nitrogen percentage was measured by the micro-kjeldahl methods described by Pregl (1945).

Phosphorus percentage was determined calorimetrically according to Murphy & Reily (1962).

Potassium was measured according to Jakson (1973) by flame photometer.

3-Yield per tree: At harvesting time in early June in two seasons yield as Wight in (kg) and number of fruit per tree was recorded.

4-Fruit quality:

Fruit physical and chemical characteristics:

Samples of twenty fruits were taken from each replicate for measuring the following characteristics fruit weight (g), fruit volume (ml) and dimensions (cm); total soluble solids %TSS was measured in fruit juice by hand refractometer, total acidity% in fruit juice was determine as malice acid, and T.S.S./ acidity ratio were calculated. Total sugar contents were estimate according to (A.O.A.C (1985).

Statistical analysis:

The obtained data were statistically analyzed. Means were compared using the New L.S.D at 5% level, according to Snedecor and Cochran (1980).

3. Results and Discussion:

1. Vegetative growth:

It is clear from Table (1) that the application of the slow release N fertilizers, urea formaldehyde (UF), phosphorus – coated urea (PCU) and sulpher - coated urea (SCU) were have high positive effective and significantly improved, shoot length and leaf area of "Mit Ghamr" trees compared to application of fast release N fertilizer (Urea) in 2008 and 2009 seasons. The promotion on vegetative growth traits was associated with increasing the level of N from 500 till 1000g/tree.

Raising N levels from 750 to 1000 g/tree from either fast or slow release fertilizers failed to show any significant increase in these traits.

Moreover, the maximum shoot length and leaf area detected on the trees fertilized with SCU at any level. These results were true in both seasons.

Generally, the improving effects of slow release N fertilizer UF, PCU and SCU on vegetative growth might be attributed to their effect on regulating the release of N according to the plants needed. Also they gave the highest values of residual N in soil due to their low activity index, compared fast release (urea) which gave the lowest values of available N left in the soil (Mikkelsen et al. 1994).

In addition, the role of nitrogen in plants, which increase growth and development of all living tissue, also N considered to be an important constituent of chlorophyll, protoplasm, protein and nucleic acid, so that it resulted in an increase in cell number and cell size with an increase (Said, 1998 and El- Naggar et al. 2002). In addition, the substantially

improved the vegetative growth trails due to sulpher – coated urea may be attributed to acidification resulted from S oxidation that decreasing soil pH that enhanced the solubility of nutrients and increases the activity of micro-organisms. These effects increase the nutrients availability uptake and translocation and increase the vegetative growth (Yousry et al 1984). These results are in harmony with those obtained by Jackson & Davies (1984), Puchades et al. (1985), Koo, (1988), Alva & Tucker (1996), Hegab et al. (1999), Hamman & Assy (2000), Wassel et al. (2000).

2. Leaf mineral content:

It is evident from the data presented in Table (2) that application of N via slow release fertilizers was significantly preferable in increasing leaf N, P, K percentages than application of it via fast release.

In general, results indicated that increasing the level of UF, PCU and SCU were followed by a gradual increase in leaf N percentage. A meaningless, high level of leaf N, P, K percentages was detected by using the highest two levels of each slow release treatments. The best results of leaf N percentage observed at 1000g of SCU, while fast release (Urea) at the same level recorded the lowest value.

The intermediate value was shown at PCU and UF respectively. All the slow release N fertilizers gave the same content of P and K in the leaves. The maximum values of N, P and K were recorded in the tree fertilized with sulpher – coated urea (SCU). These results were true in 2008 and 2009 seasons.

Moreover, using SCU at 500 g/ tree significantly increased the growth and leaf N, P and K percentage compared with other slow release and fast fertilizers. This means that using sulpher coated-urea at 500g/tree was sufficient to improve vegetative growth and tree nutritional status as well as useful in saving N fertilization cost and reducing nitrate pollution. The great reduction in the loss of N and the increase in uptake due to the application of slow realese N fertilizers could explain the reason for their effect in improving the leaf content of N. The vice versa was obtained due the application of the fast fertilizers which was mainly attributed due to great leaching of N from soil via drainage water.

Similar results were obtained by Scuderi et al. (1983), Mquireiro et al. (1984), Marler et al. (1987), Balo et al (1988), Ferguson et al. (1988), Wang & Alva (1996), Hammam & Assy (2000) and Wassel et al. (2000).

3. Yield measurement:

Data in Table (3) showed that "Mit Ghamr" Peach yield component as affected by application of some slow releases fertilizers UF, PCU and SCU at level 500, 750 and 1000 g/tree and fast release (Urea). The treatments showed a significant difference among them in this connection. In general, increasing nitrogen level via either fast or slow release fertilizers resulted in increase yield components. Application of SCU was a considerable effect on increasing fruits number and yield/tree, while, UF and PCU recorded the intermediate values. Moreover "Mit Ghamr" Peach trees that fertilized with 500g/tree of sulphur – coated urea (SCU) recorded the highest values of fruits number and yield /tree compared to other slow release and urea. Therefore, it could be concluded that such treatments was sufficient to get satisfactory increased in yield with good quality and also very useful in saving N fertilization cost and reducing nitrate pollution. These findings are in harmony with those found by Koo, (1986), Koo (1988), Boman (1993), Scuderi, et al. (1993), Wassel et al. (2000) and Akl, et al. (2002).

4. Fruit physical and chemical characteristics.

Data in Table (5) obviously showed that fruit weight and volume were positively affected in response to application of slow release nitrogen fertilizers rather than using urea. The promotion in fruit weight and volume were associated with increasing the level of N applied from 500 till 1000g/tree.

The heaviest fruit were recorded on trees fertilized with 1000g/tree sulphur coated urea. Moreover, raising N levels from 750 to 1000g/tree failed to show any significantly increase in fruit weight and volume.

Also, data in Table (5) indicated that the effect of slow release N fertilizers, UF, PCU and SCU used on fruit length and diameter was almost similar to that concerning in fruit weight and volume.

It is clear from the data in Table (6) that the application of the three slow release N fertilizers increasing the total soluble solids and total sugar while reducing the total acidity compared to via urea at the same levels. The best results with regards to chemical fruit quality showing ascending order by using slow realese N fertilizers , while urea showed the lowest value. These results were true in 2008 and 2009 seasons in "Mit Ghamr" cv.

Generally, "Mit Ghamr" peach trees fertilized with sulphur coated urea at 500-750g/trees/year gave the best results on vegetative growth, yield nutritional status of trees and fruit quality. The stimulation effect of SCU on chemical quality was attributed to its action in enhancing the formation of carbohydrates and advancing ripening Nijar, (1985).

These results are in harmony with those obtained by Wiil and Hahdel 1986; Bomom (1993) Hegab et al. (1999) and Hamman & Asay (2000).

Table (2): Effect of soil application of fast and some slow – realease nitrogen fertilizers on some vegetative growth of "Mit Ghamr" peach trees in 2008 and 2009 seasons.

Abstract: The effect of Fertifol Misr (N, P, K, Mg zn, Fe, Mu, Cu, Mo & B) and gibberellic acid on fruit set, drop percentage, yield, fruit quality and leaf chemical composition on "Anna" Apple trees were studied during 2007 and 2008 seasons. Results showed that, fruit set%, drop%,, yield, leaf minerals & chlorophyll contents as well as physical and chemical characters of the fruit were positively effected by single or combined application of Fertifol Misr and gibberellic acid compared to unspraying .There was a slight promotion on such characters with increasing Fertifol Misr concentration from 1.5 – 2.5 g/l. The best results with regard to yield and fruit quality were obtained due to spraying "Anna" apple trees three times with a mixture containing Fertifol Misr at 2.5 g/l and gibberellic acid at 20ppm. [Journal of American Science. 2010;6(12):202-208]. (ISSN: 1545-1003).

Key words: Anna apple, foliar application, nutrients, gibberellic acid.

1. Introduction:

Anna apple (Malus domestica, Borkh) is a low chilling cultivar spreading in many tropic and subtropics area including Egypt. It is considered as one of the most important commercial cultivars planted in Egypt. The adaptation of proper fertilization program is one of the important cultural techniques that greatly promote and enhance the growth and fruit quality. No doubt that the application of soil fertilizers together with foliar feeding solution would probably be of great help in this respect. Amending the apple tree with their requirements from different nutrients via leaves was accompanied by on obvious improvement in both yield and quality of fruit. Many investigations studied the effect of spraying macro and micronutrients an growth, yield and fruit quality. Such as nitrogen, phosphorus, potassium &magnesium (Abd Ela, 1991, Akl, et al., 1993a & 1993b , and Gobara 2001). However zinc (Nijjar 1985 and Kabeel et al., 1998) Cupper and iron (Mohamed et al 1991); boron (Hanson 1991a); manganese (El Shazly, 1999) were highly effective in improving, nutritional status yield and quality of different pear and apple trees.

For instance, Plant growth, flowering fruit quality and yield were improved in apple by gibberellic acid application (El – Fakharany et al. (1995); Makarem & Mokhtar 1996).

The aim of this study was to test the effect of spraying some macro and micronutrient as (Fertifol Misr) and gibberellic acid on fruit set, yield, fruit quality and leaf chemical composition of Anna apple trees.

2. Materials and Methods:

This investigation was carried out during 2007 and 2008 seasons on 12-years old apple trees (Malus domestica, Borkh) budded) on MM 106 rootstock, planted at 3.5x3.5 meters apart and grown in a sandy soil under drip irrigation system in a private orchard located at El-Khatatba, Minufiya governorate, Egypt. Cross pollination was secured by planting Dorset Golden and Ein Shemir as pollinizers which were distributed in the whole orchard.

Soil analysis was carried out according to wiled et. al, (1985) data shown in Table (1). The experiment included six treatments as follows; Control (foliar sprayed with water).

Table (1) Physical and chemical properties of the tested soil.

Character	Volume
Particle size distribution	
Sand %	83.16
Silt %	15.11
clay %	1.73
Texture	Sandy
pH (1:2.5 extract)	7.50
Ec. (mmohs/cm 1:2.5) extract	0.65
Organic Mater %	0.75
Total Ca Co3 %	4.01
Available macro- nutrient	
Total N %	0.058
Available P (ppm,olsen)	5.33

Soluble cations meal 1, 1:5 soil water extract	
Mg++ ppm	
B (hot water extractable)	1.53
	o.16
DTPA extractable micro nutrieties ppm.	
Fe	1.99
Zn	1.30
Mn	1.00
Cu	2.89

- Foliar spray with Fertifol Misr at 1.5 g/l. This product was purchased from El Delta Company for fertilizers and chemical Al industrial.
- Foliar spray with Fertifol Misr 2.5 g./l .
- Foliar spray with gibberellic acid at 20 ppm.
- Foliar spary with Fertifol Misr at 1.5 g/l + gibberellic acid at 20 ppm.
- Foliar spray with Fertifol Misr at 2.5 g/l + gibberellic acid at 20 ppm.
- Fertifol Misr consists of (25 % N 16% P , 12% K, 0.25% Mg, 300 ppm zn, 1900 ppm Mn, 850 ppm cu, 100 ppm Mo & 200 ppm .

Fifty four healthy tress and nearly uniform in growth vigour and fruiting were selected. All trees had received regularly the same common cultural practices already give to the tree. Selected trees were sprayed 3 times at full bloom, after fruit set (fruit diameters 3 cm) and four weeks after fruit set. Foliar sprays were applied using a hand pressure sprayer. Triton B emulsifier at the rate of o.2% was used as surface to each tree received 8l of spraying solution, each treatment was surrounded with two rows as guard trees. The treatments were arranged in a completely randomized blocks design with three replicates for each treatment and three trees per each replicate. The following parameters were determined in the two seasons of the study.

1- Fruit set and fruit drop percentage.

Two main branches from two direction (east and west) of each tree were chosen and tagged in March of the two experimental seasons the number of flowers was recorded and them set fruits on the selected branches were counted for calculation the percentage of fruit set (divided number of fruits per branch/ Total number of flowers per branch x100).

Pre-harvest fruit drop was calculation by counting the number of dropping fruit from the 4th week of May till the commercial harvesting time under the experimental conditions (3rd week in June), then expressed as a percent from the whole number of fruits existed on the tree at the 4th week of May.

2-Yield per tree.

Yield was pressed in weight (Kg) and number of fruits per tree was recorded at harvest time (3rd week of June).

3-Fruit quality.

Fruit sample consisting of twenty fruits were randomly taken at harvest time from each replicate for the determination of both physical and chemical characteristics.

3-1. Physical characteristics:

Fruit weight (g), fruit length (cm), fruit diameter (cm) and fruit firmness (16/ inch) which was measured by fruit pressure tester on the two opposite sides of the fruit.

3-2.Fruit chemical characteristics

Total soluble solids were determined using a hand refractometer, percentage of titratable acidity in fruit juice was determined according to A.O.AC., (1995), total soluble solid / total acidity ratio were calculated and total sugar in the fruit pulp tissues were also determined by phenol sulfuric method according to (Dubois et al., 1956).

4-Leaf chemical composition.

Samples at twenty leaves from the middle part of the shoots (according to Chuntanaparb and Cummings, 1981) were randomly selected from each replicate (at the 2nd week of June to measure their area (cm2) and to determined their content N%, P %, K %, Mg % and Fe, Zn, Mn, Cu at ppm (according to Wilde et al., 1985). Determinations were carried out on dry weight basis. A leaf portion from each sample was kept fresh for chlorophyll determination, chlorophyll a and b (mg/l) was determined according the methods of Arnon (1949).

Statistical analysis was done according to Mead et.al. (1993) using the new L.S.D. test for comparing between means of different treatments.

3. Results and Discussion:

1-Fruit set and fruit drop percentage

Data presented in Table (2) show clearly that all treatments used significantly increased fruit set percent than the untreated trees during both seasons under this study. The data also indicated that the effect of Fertifol Misr 2.5 g/l + GA3 at 20 ppm application was more pronounced than other used treatments or the control. These results were true in both seasons. These results may be attributed the use of plant hormones, i.e. G A3 could lead to an increase in fruit set for deciduous trees (Makarem and Mokhtar, 1996). Similar results were obtained by Awad and Atawia (1995), Khabeel et al., (1998); Gobara (1998) and El Seging and Khalil (2000).

Regarding fruit drop data reported in Table (2) that spraying Fertifol Misr (N, P, K, Mg., Zn, Fe, Mn, Cu, Mo & B) alone or combined with GA3 was very effective in reducing pre-harvest fruit drop of Anna apple trees compared with the control. The differences between treated and untreated trees was significant. The minimum drop value was presented in Anna apple trees sprayed with Fertifol Misr at 2.5 / L + G A3 at 20 ppm. Similar results were observed in both seasons Zn, Cu, B, K and Fe were responsible

for building and moving carbohydrate from leaves to fruits and encourage the biosynthesis of cellulose which positively streng them the cell wall.

In addition, Zn and B Played an important role in biosyntheses and moving of the natural aux in namely IAA to the pedicels of fruits (Nijjar, 1985) . These results are in harmony with those found by Gill et al (1994) who worked on Zn, Cu, K and Fe.

2-Number of fruit and yield porter.

It is clear from the data in Table (3) that foliar application of Fertifol Misr single or combined with GA3 increased number of fruits per tree compared with the control. Such as increasing effect on fruits number per tree was almost similar to that yield per tree. The same table revealed that trees sprayed with Fertifol Misr at 2.5 g/l plus GA3 at 20 ppm resulted in the highest values of fruit number and yield in both seasons. These results agree with obtained by Bach et.al. (1995) on grapes and Awad & Atwaia (1995) on pears. They all stated that foliar sprays of Fe, Zn and Mn increased the total yield of studied fruit trees. Also Makarem & Mokhtar (1996) and El-Seigny & Khalil (2000) mentioned that foliar spray of GA3 increased the fruit set and fruit weight one.

3-Fruit quality

It is clear from the data in Table (4) that quality of Anna apple trees was positively affected by application of Fertifol Misr (macro and micronutrients) and GA3 either single on in combinations compared with unsprayed. The promotion on fruit quality due to applications of these materials appeared in terms of increasing fruit weight, T.S.S., total sugar content and in decreasing total acidity. The promotion on fruit quality was associated with increasing (Fertifol Misr) concentration. Single application with beneficial in enhancing fruit quality than using GA3 alone. The highest significant value of fruit quality was from trees treated with Fertifol Misr (N, P, K, Mg, Zn, Fe, Mn, Cu, Mo and B) at 2.5g/l plus GA3 at 20 ppm in both seasons. The improving of fruit quality in response to application of nutrients was supported by Ranvir and M'sra (1980) , Saraswathi et al., 1998, Zhao et al., (1999), Ahmed and Morsy, (2001); Younes-Randa (2002) and Fawzi and Abd Al-moneim (2004).Concerning the effect of gibberellic acid on fruit quality was emphasized by the results of Awad and Atawia (1995), Ibrahim et al., (1994), Kabeel et al., (1998) , El Shazly (1999), El Hammady et al., (2000) and El-Seginy and Khalil (2000).

4-Leaf aria and leaf chemical composition.

It is obvious from Table (5) that all tested treatments caused high significantly increased leaf area as compared with the control. Moreover, trees sprayed with Fertifol Misr at 2.5 g/l plus GA3 at 20 ppm was only the treatment that induced the highly significant effect on leaf area. Regarding leaf chlorophyll content data presented in Table (5) show that chlorophyll a and b content showed significant increase due to all tested treatments compared with the control. The same table revealed that trees sprayed with (Fertifol Misr) at 2.5 g/l plus GA3 at 20 ppm resulted in the higher values of leaf chlorophyll content. In general, the observe increase in the concentration of nitrogen, magnesium and iron in the leaves of Anna apple trees sprayed with Fertifol Misr and GA3 might help in interpretation the results obtained. The participation of nitrogen and magnesium in the structure and the integrity of the chlorophyll molecules together play indispensable role with iron in chlorophyll synthesis are well documented by numerous physiologists. Such as Bidwell (1979) and Faust (1989) they reported that over 10-20% of leaf magnesium and more than 80% of the iron content of green leaves are located in the chlorophyll. Concerning leaf macro and micronutrients contents, It is clear from the data in Table (6) that sprays Fertifol Misr (N, P, Mg, Zn, Fe, Mn, Cu, Mo and B) either alone or combined with GA3 significantly improved leaf status of these nutrients compared with control. Improved effect of nutrient, on N, K and Mg in the leaves was confirmed by the results of Abo-Shelbaya (1988), Intrighliolo et. al., (1991), Sheo and Singh (1999) and Lovatt (1999). The reduction in leaf p content might be due to the antagonism between Fe and P (Nawar 1991).

The results regarding the effect of gibberellic acid on leaf mineral contents are in agreement with those obtained by Addicot and Addicot (1982). In addition the increase of plant nutrient status resulted from spraying different solution might by due to quick absorption via leaves and the limited loss of the nutrients when they were sprayed (Marschner, 1995).

The data of the present study also revealed that with respect to sprayed by Fertifol Misr had apparently higher levels of Fe, Zn, Mn and Cu than the control. These results are in line with those reported by Hilail (1993) Awad and Atawia (1995); Kabeel at al., (1998), El Seiginy and Khalil (2000) and El-Shobaky at al., (2001) who worked on deciduous fruit trees.

Anti-ulcer Effect of Cinnamon and Chamomile Aqueous Extracts in Rat Models

Amr, A. Rezq* and Maysa, M. Elmallh

Nutrition and Food Science Department, Faculty of Home Economics, Helwan University
*** dr.amr_rezq@yahoo.com**

Abstract: Peptic ulcer disease is a problem of the gastrointestinal tract. Nowadays, drugs are expensive and have many side effects during treatment of any disorders. Therefore, our study aimed to investigate and compare antiulcer effect of cinnamon and chamomile aqueous extracts at doses of 100, 200, 300, 400mg/kg of body weight (b.wt) with antiulcer drug (Zantac ™ Ranitidine). Fifty male rats weighing 160±5g were distributed into ten groups. Group I serves as a positive group. Group II serves as control group (treated with drug). Groups III, IV, V and VI were administered orally the different doses of cinnamon aqueous extract (CIAE). Groups VII, VIII, IX and X were administered orally the different doses of chamomile aqueous extract (CHAE). Values of pH and volume of gastric juice, ulcer area and curative ratio were estimated as well as histopathological examination of stomach. Results revealed that treatment with Zantac and CIAE or CHAE was associated with significant increase in pH values compared to the respective value of the positive group. CHAE was superior to that of CIAE. Oral administration of CIAE or CHAE was associated with significant reduction in the volume of gastric juice compared to positive and control groups. A curative ratio of gastric ulcer was better in rats given CIAE or CHAE over those given Zantac. Furthermore, CHAE was superior over CIAE in its curative ratios of gastric ulcer. Histological study showed necrosis of gastric mucosa associated with congestion of submucosal blood vessels, submucosal edema and hemorrhage in the stomachs of positive rats. The stomachs of group receiving Zantac showed necrosis of gastric mucosa associated with hemorrhage. Whereas, higher dosages of CIAE (300 or 400 mg/kg of b. wt and CHAE dosages i.e., 200, 300 or 400 mg/kg of b.wt were efficient to arrest histopathological changes in the stomachs. In conclusion: results revealed that CHAE and CHAE had potential antiulcer effect, which was superior to the respective effect observed with Zantac. Chamomile extracts were more superior to cinnamon in its protection of the stomach. The antiulcer effect was dose dependent with no adverse effects. [Journal of American Science. 2010;6(12):209-216]. (ISSN: 1545-1003).

Keywords: Chamomile- Cinnamon-Peptic ulcer.

1- Introduction

Peptic ulcer disease is a problem of the gastrointestinal tract characterized by mucosal damage secondary to pepsin and gastric acid secretion. It usually occurs in the stomach and proximal duodenum; less generally, it occurs in the lower esophagus, the distal duodenum, or the jejunum, as in unopposed hypersecretory states such as Zollinger-Ellison syndrome, in hiatus hernias, or in ectopic gastric mucosa (Kalyanakrishnan and Robert, 2007). Some of the causes of these disorders are stress, smoking, nutritional deficiencies and ingestion of non-steroidal anti-inflammatory drugs (Nash et al., 1994; Basil and Howard, 1995). The pathogenesis of gastroduodenal ulcers are influenced by various aggressive and defensive factors, such as acid-pepsin secretion, mucosal barrier, mucus secretion, blood flow, cellular regeneration and endogenous protective agents (prostaglandins and epidermal growth factor) (Salas, 1990).

Nowadays, drugs are expensive and have many side effects during treatment of any disorders. Therefore, the potential of the health promoting and disease preventing properties of plant-derived compounds has received increased attention from researchers in recent years. Plants that have medicinal properties are used to improve symptoms or prevent diseases such as diarrhea, stomach disorder, asthma, hypertension, coughs and other respiratory ailments and urinary tract infections etc.

Cinnamon is a native of Southern Asia and South America. Now it is cultivated in many tropical countries such as China, India, Brazil, Madagascar, Mexico and the Caribbean. Cinnamon (*Cinnamomum cassia*) of the family *Lauracease* is a favorite spice around the world because of its health benefits, flavors and preserves food (Chaudhry and Tariq, 2006). The most favorite chemical constituents of cinnamon are volatile oil (cinnamaldehyde, eugenol, cinnamic acid, and weitherhin), mucilage, diterpenes and proanthocyanidins (Jayaprakasha et al., 2002). Cinnamon possess chemopreventive, antispasmodic, sedative, hypothermic, choleretic, antibacterial, antifungal, antipyretic, antiviral, antiplatelet properties, antiseptic, lipolytic, anesthetic, cytotoxic, anodyne, hypolipidemic, and also stimulate immune system that may be useful adjuncts in helping to reduce the risk of cardiovascular disease and cancer (Cralg, 1999). Medicinally, it is used in the treatment of colic, colds, low vitality, poor appetite, rheumatism, kidney weakness and coldness, fevers,

arthritic angina, and palpitations. It is also used in stimulate of the circulatory system and capillary circulation, spasms, vomiting, controls infections and digestive or stomach complaints related to cold and chills. Cinnamon bark have a potentiating effect on insulin (Khan et al., 1990) and can be useful in the treatment of type 2 diabetes; as well as lowering triglyceride levels and serum cholesterol (Onderoglu et al., 1999; Broadhurst et al., 2000; Khan et al., 2003). Water-based extracts of cinnamon bark might bind endotoxin, thereby protecting against endotoxin-induced organ damage (Azumi et al., 1997), has anti-bacterial effects, clinical trials against *Helicobacter pylori*, associated with gastric ulcer (Martin and Ernst, 2003) and improve symptoms associated with the metabolic syndrome in rodents and humans metabolism and lipid profile (Khan et al., 2003; Kannappan et al., 2006).

Chamomile is one of the most widely used as medicinal plants. It has been included in the pharmacopoeia of 26 countries. Amino acids, polysaccharides, fatty acids, essential oils, mineral elements, flavonoids, and other phenolic compounds are the main constituents of chamomile (McKay and Blumberg, 2006). Chamomile used in modern medicine primarily for their spasmolytic, antiphlogistic, antibacterial properties, and as a multipurpose digestive to treat gastrointestinal disturbances including flatulence, indigestion, diarrhea, anorexia, motion sickness, nausea, and vomiting (Shikov et al., 2008). German chamomile (*Matricaria chamomilla*) is also used to healing wound (Glowania et al., 1997), treat various diseases including diarrhea (de la Motte et al., 1997), and inflammation, cancer (Hernández-Ceruelos et al., 2002). Its extract blocks aggregation of *Helicobacter pylori* and various strains of *Escherichia coli* (Annuk et al., 1999). Chamazulene, alpha-bisabolol, flavonoids, and umbelliferone display antifungal properties against *Trichophyton mentagrophytes* and *Trichophyton rubrum* (Turi et al., 1997). Apigenin, alpha-bisabolol, and the cisspiroethers appear to provide the most significant antispasmodic effects. Other flavonoids and coumarins contribute to smooth muscle relaxation (Achterrath-Tuckermann et al., 1980). The aim of the present study was to investigate and compare the gastroprotective effect of different doses (100, 200, 300 and 400mg/kg of body weight (b.wt.) of cinnamon or chamomile aqueous extracts with antiulcer drug. pH and volume of gastric juice, ulcer area and curative ratio were estimated and a reliable parameter was presented for comparing the data. Histopathological examination of gastric ulcer was achieved.

2. Materials and Methods

2.1 Materials

2.1.1 Herbs

Cinnamon and chamomile were purchased as crude dried material from a local Company for Medicinal Plants and Herbs, Cairo, Egypt.

2.1.2 Animals

Fifty male albino rats, Sprague Dawley strain weighing 160±5g, were obtained from the Laboratory Animal Colony, Helwan, Egypt.

2.1.3 Drugs

Anti-ulcer agent (Zantac ™ (Ranitidine) was obtained in the form of ampoules from Glaxo Smithkline S.A.E., El-Salam City, Egypt.

2.2 Methods:

2.2.1 Preparation of aqueous extract

The aqueous extracts of cinnamon and chamomile were prepared using 10g dried material/100 ml distilled water and boiling for 5 min at 100°C. Then they were filtrated, concentrated at 50 °C under reduced pressure using a Rota vapor. The extracts were kept at -15 °C until it was used in the experiment (Kassi et al., 2004).

2.2.2 Preparation of basal diet

The basal diet (AIN-93M) (Reeves et al., 1993) was formulated to meet recommended nutrients levels for rats as shown in Table (1).

Table (1): Composition of the modified AIN-93M diet.

Ingredient	Content (g/kg)
Casein	140.0
Corn starch	620.69
Sucrose	100.00
Soybean oil	40.0
Fibers	50.0
Mineral mix.	35.0
Vitamin mix.	10.0
L-Cystine	1·8
Choline chloride	2.5
Tert-Butylhydroquinone	0.008

2.2.3 Experimental design

All Animals were fed on the basal diet and water *ad libitum* and they were maintained under healthy conditions of humidity, temperature (20-25°C) and light (12-h light: 12-h dark cycle) for one week before starting the experimental to acclimatization. After acclimatization period, rats were divided into ten groups of equal weight and number (5 rats each). Group (I): kept as positive group and Group (II): service as control group. These two groups fed on the basal diet and given orally saline at volume of 1.0 ml / 100 g b. wt). Groups (III, IV, V and VI) fed on the basal diet and given orally cinnamon aqueous extract (CIAE) by tube feeding for seven days at a dose of 100, 200, 300 and 400 mg/kg b. wt, respectively. Groups (VII, VIII, IX and X): fed on the basal diet and given orally chamomile aqueous extract (CHAE) by tube feeding for seven days at a dose of 100, 200, 300 and 400 mg/kg b. wt, respectively.

At the last day of experimental period (7 days), all rats were starved of food but not of water for 12

hours according to ethanol-induced gastric ulcer protocols. After fasting period, group II (control group) was given (I/P) intraperioteneally Zantac (ranitidine) at a dose 6 mg/100 of body weight, 60 min prior administered ethanol. Groups (I and II) were given orally saline and the other eight groups were given CIAE or CHAE, 120 min prior administered ethanol (Jafri et al., 2001). Then ethanol was administered orally to all groups at 0.5 ml/100g (Hollander et al., 1985).

2.2.4 Gastric ulcer index

The method described by Agrawal et al., (2000) was employed in the present study. In briefly, after 4 hours of administrated ethanol, all rats were sacrificed after using an overdose of diethyl ether and their stomachs removed and washed by saline. The gastric juice was collected in test tube. Then stomachs opened along the greater curvature, washed with saline and examined under dissecting microscope for gastric ulcers. The sum of length for all lesions area for each animal was measured and served as the ulcer index. The curative ratio was calculated for each group using following equation:

Curative ratio (CR) = (LC-LT/LC) x100

LC: The length of gastric ulcer in positive group.

LT: The length of gastric ulcer in treated group.

2.2.5 Determination of gastric juice acidity

Acidity degree (pH) of gastric juice was determined by using pH meter apparatus (HI 9021).

2.2.6 Determination of gastric juice volume

Gastric juices were centrifuged at 500 rpm for 5 minutes, then separated and measured volume by graduated cylinder.

2.2.7 Histopathological examination

The stomachs of the scarified rats were taken and immersed in 10% formalin solution. The fixed specimens were then trimmed, washed and dehydrated in ascending grades of alcohol. Specimens were then cleared in xylol, embedded in paraffin, sectioned at 4-6 microns thickness and stained with Heamtoxylin and Eosin stain for examination of the stomach as described by Carleton, (1979).

2.2.8 Statistical analysis

The obtained results were expressed as Mean ± SE. Data were evaluated statistically using one-way analysis of variance (ANOVA). Significant difference between means was estimated at $p<0.05$ (STATSOFT, 2006).

3. Results

3. 1 pH of gastric juice

Values of pH in rats treated with antiulcer drug and oral administration of CIAE and CHAE at different doses is recorded in Table (2). Results demonstrated that control group given I/P antiulcer drug and groups given orally different doses of CIAE or CHAE (100, 200, 300 or 400mg/kg b.wt) had significant increase in pH value of gastric juice at $p<0.05$ as compared to positive group.

In rats given orally CIAE at doses of 200, 300 and 400mg/kg b.wt, pH values of gastric juice as mean±SE were 7.90±0.19, 8.40±0.37 and 8.60±0.19, respectively and showed significant increase as compared to control group and those given orally 100mg/kg of b. wt CIAE (5.80±0.46 and 6.50±0.45 respectively). In contrast, groups given orally the different doses (100, 200, 300 and 400mg/kg of b.wt.) of CHAE had significant increase in pH values of gastric juice (7.80±0.26, 8.20±0.12, 8.40±0.25 and 8.66±0.19, respectively) compared to control group given I/P anti ulcer drug (5.80±0.46).

The increase in pH values of gastric juice of treated rats with extract was more detectable with increasing the dose. Results revealed that different doses of CHAE caused increase in mean ± SE of pH values than that the similar doses of CIAE.

Table (2): Effect of antiulcer drug and oral administration of CIAE and CHAE on pH value of gastric juice in rats.

Groups		Parameter as Mean ± SE pH of gastric juice	
		Cinnamon	Chamomile
Positive group		c 4.70±0.26	c 4.70±0.26
Control group		b 5.80±0.46	b 5.80±0.46
Treated groups with aqueous extracts at a doses of:	100mg/kg b. wt	b 6.50±0.45	a 7.80±0.26
	200mg/kg b. wt	a 7.90±0.19	a 8.20±0.12
	300mg/kg b. wt	a 8.40±0.37	a 8.40±0.25
	400mg/kg b. wt	a 8.60±0.19	a 8.66±0.19

Different superscript letters in the same column denotes significant differences at $p<0.05$.

3.2 Volume of gastric juice

Volume of gastric juice (cm^3) in rats treated antiulcer drug and oral administration of CIAE and CHAE at different doses is shown in Table (3). Data was obvious that volume of gastric juice (cm^3) as mean±SE of group given I/P antiulcer drug (control group) was not significant decrease (4.30±0.37) at $p<0.05$ as compared to positive group (4.60±0.52). Rats given orally different doses of CIAE or CHAE had significant decrease in volume of gastric juice compared to positive and control rats. Rats given orally CIAE at a dose of 100mg/kg of b.wt. had a significant increase in volume of gastric juice as compared to rats given extracts at doses of 200, 300 and 400mg/kg of b.wt.

Aqueous extract of chamomile at a dose of 400 mg/kg of b.wt caused significant decrease in volume of gastric juice as compared to a dose of 100 mg/kg of b.wt, and there was not significant decrease as compared to treated groups with doses of 200 and 300mg/kg of b.wt. There were not significant differences in volume of gastric juice among groups treated with CHAE at doses of 100, 200 and 300 mg/kg of b.wt.

Tabulated data showed that groups treated with CHAE had the lower volume of gastric juice as mean ± SE (cm^3) compared to those treated with CIAE.

Table (3): Effect of antiulcer drug and oral administration of CIAE and CHAE on the volume of gastric juice (cm^3) in rats.

Groups		Parameter as Mean ± SE	
		Volume of gastric juice (cm^3)	
		Cinnamon	Chamomile
Positive group		a 4.60±0.52	a 4.60±0.52
Control group		a 4.30±0.37	a 4.30±0.37
Treated groups with aqueous extracts at a doses of:	100mg/kg b. wt	b 2.90±0.19	b 2.50±0.16
	200mg/kg b. wt	c 2.00±0.16	bc 1.90±0.19
	300mg/kg b. wt	c 1.70±0.20	bc 1.70±0.12
	400mg/kg b. wt	c 1.60±0.19	c 1.50±0.16

Different superscript letters in the same column denotes significant differences at $p<0.05$.

3.3 Length of gastric ulcer

The length of gastric ulcer (mm) in rats as result of antiulcer drug and oral administration of CIAE or CHAE effect is recorded in Table (4). Tabulated results revealed that the length of gastric ulcer (mm) as mean±SE of treated group with antiulcer drug (control group) was significant decrease (5.90±0.60) at $p<0.05$ compared to untreated group (positive group) (7.40±0.87). Groups given orally different doses of CIAE or CHAE (100, 200, 300 and 400 mg/kg of b.wt) had significant decrease in the length of gastric ulcer at $p<0.05$ as compared to positive and control groups.

Aqueous extract of cinnamon at a dose of 400 mg/kg of b.wt caused significant decrease in the length of gastric ulcer as compared to a dose of 100 mg/kg of b.wt, while there was not significant decrease as compared to doses of 200 and 300 mg/kg of b.wt.

The differences in the length of gastric ulcer in rats given orally CHAE were not significant.

Groups given orally CHAE at different doses had the lower mean±SE values in length of gastric ulcer (mm) as compared to those given orally similar doses of CIAE. The decreases in the length of gastric ulcer (mm) were more detectable with increased doses of CIAE and CHAE.

Table (4): Effect of antiulcer drug and oral administration of CIAE and CHAE on the length of gastric ulcer (mm) in rats.

Groups		Parameter as Mean ± SE	
		Length of gastric ulcer (mm)	
		Cinnamon	Chamomile
Positive group		a 7.40±0.87	a 7.40±0.87
Control group		b 5.90±0.60	b 5.90±0.60
Treated groups with aqueous extracts at a doses of:	100mg/kg b. wt	c 3.20±0.54	c 1.80±0.52
	200mg/kg b. wt	d 1.50±0.16	c 0.88±0.20
	300mg/kg b. wt	d 0.92±0.12	c 0.52±0.01
	400mg/kg b. wt	d 0.70±0.12	c 0.42±0.14

Different superscript letters in the same column denotes significant differences at $p<0.05$.

3.4 Curative ratio

Effect of antiulcer drug and oral administration of CIAE and CHAE at different doses on curative ratio of peptic ulcer in rats is showed in Figure (1). Mean of curative ratio of groups given orally different doses of CIAE or CHAE was higher than that of treated groups with antiulcer drug. Groups treated with CHAE at doses of 100, 200, 300 and 400mg/kg of b.wt had higher mean values of curative ratio (75.68, 88.11, 92.97 and 94.32, respectively) compared to those given orally similar doses of CIAE (56.76, 79.73, 87.57 and 90.54, respectively).

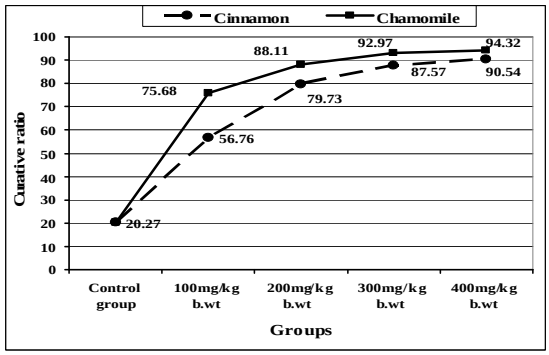

Figure (1): Effect of antiulcer drug and oral administration of CIAE and CHAE on curative ratio of gastric ulcer in rats.

3.5 Histopathological results

Microscopically, stomachs of rats from the positive group showed necrosis of gastric mucosa associated with congestion of submucosal blood

vesselsm, submucosal edema and hemorrhage (Figure 2). Examined stomachs of rats from control group (treated with anti-ulcer drug) revealed necrosis of gastric mucosa associated with hemorrhage as showed in Figure (3).

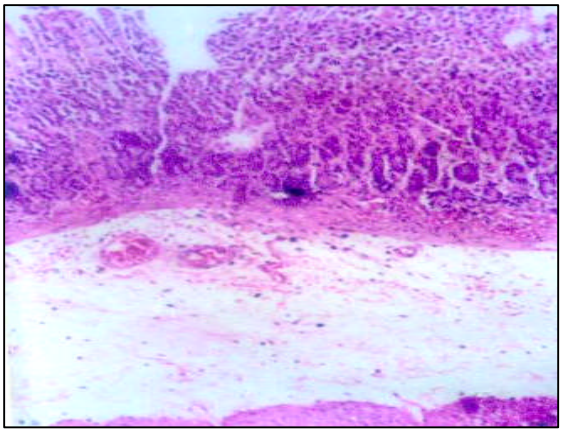

Figure (2): Stomach of positive rat showing necrosis of gastric mucosa, congestion of submucosal blood vessels associated with submucosal edema and hemorrhage (H and E x 100).

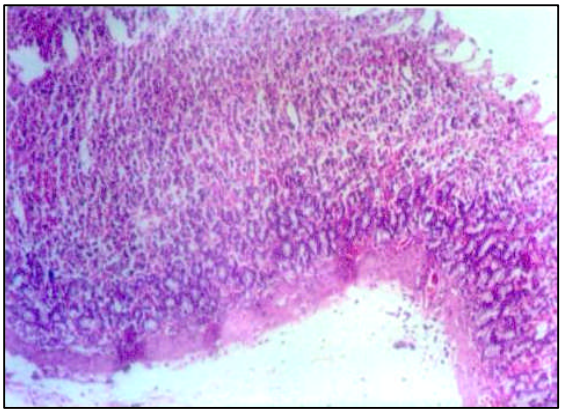

Figure (3): Stomach of control rats showing marked necrosis of gastric mucosa associated with hemorrhage (H and E x 100).

Examined stomachs of rats treated with CIAE at a dose of 100mg/kg of b.wt revealed atrophy of gastric mucosa associated with submucosal edema as showed in Figure (4). Moreover, stomachs of rats from given orally 200mg/kg of b.wt of CIAE showed congestion of submucosal blood vessels associated with edema (Figure 5). Meanwhile, stomachs of rats treated with extract at doses of 300 and 400mg/kg of b.wt showed no histopathological changes (Figure 6).

With regard to the effect of CHAE, histopathological results showed that rats treated with of extract at a dose of 100mg/kg of b.wt showed submucosal leucocytic cells infiltration (Figure 7). Examined sections from treated groups with extracts at doses of 200, 300 and 400mg/kg of b.wt revealed no histopathological changes as showed in Figure (8).

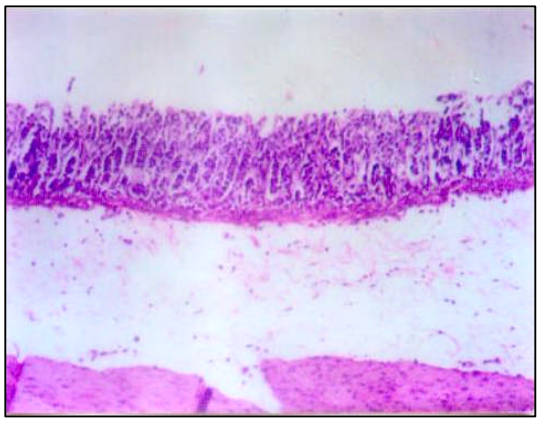

Figure (4): Stomach of rats given orally CIAE at a dose of 100mg/kg of b.wt showing atrophy of gastric mucosa associated with submucosal edema (H and E x 100).

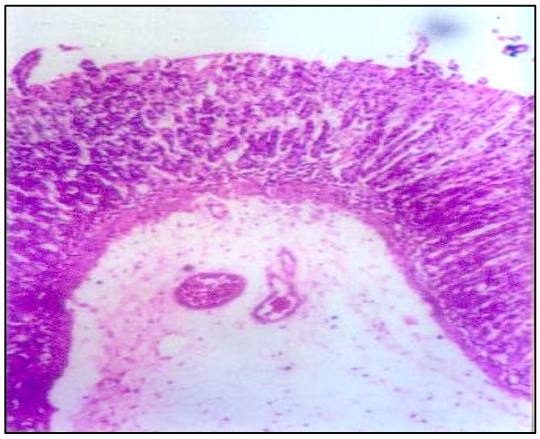

Figure (5): Stomach of rats given orally CIAE a dose of 200mg/kg of b.wt showing congestion of submucosal blood vessels associated with edema (H and E x 100).

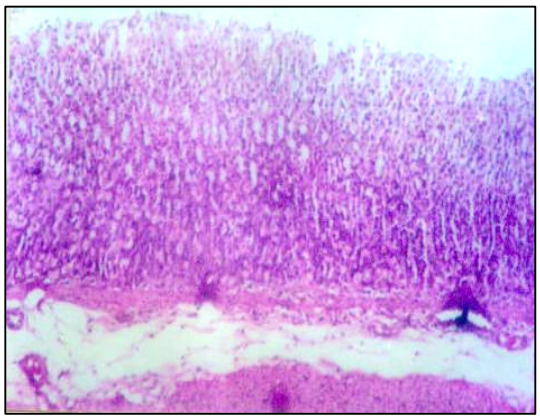

Figure (6): Stomach of rats given orally CIAE at doses of 300 and 400mg/kg of b.wt showing no histological changes (H and E x 100).

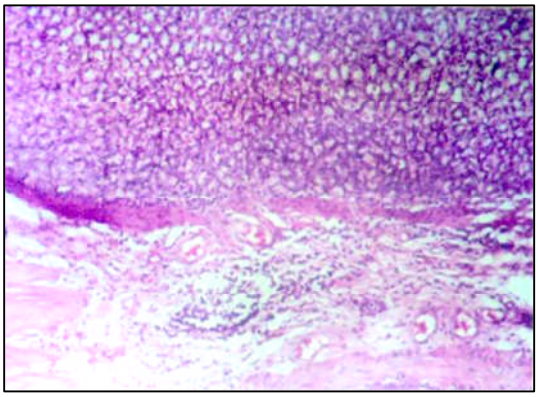

Figure (7): Stomach of rats given orally CHAE at a dose of 100 mg/kg of b.wt showing submucosal leucocytic cells infiltration (H and E x 100).

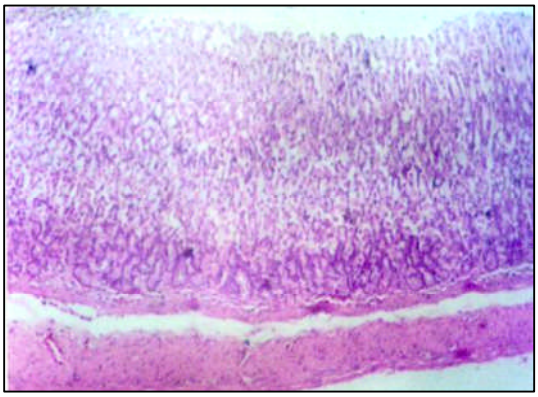

Figure (8): Stomach of rat given orally CHAE at doses of 200, 300 and 400mg/kg of b.wt showing no histological changes (H and E x 100).

4. Discussion

The aim of the present study was to investigate the antiulcer effect of cinnamon and chamomile aqueous extracts and compare them with antiulcer drug as a reference of antiulcer. Our finding showed that cinnamon and chamomile aqueous extracts at the different tested doses (100, 200, 300 and 400 mg/kg of b.wt) had gastroprotective effects on acute experimental gastric ulcer in rats. Antiulcer effect of cinnamon and chamomile aqueous extracts was higher than that of antiulcer drug. Aqueous extract chamomile had much more favorable antiulcer effect, compared to aqueous extract of cinnamon.

Peptic ulcer disease is a problem of the gastrointestinal tract characterized by mucosal damage secondary to pepsin and gastric acid secretion (Kalyanakrishnan and Robert, 2007). Therefore, the major mechanism action of cinnamon or chamomile aqueous extracts as anti-ulcer appears may be due to its effect in the decrease of acid-pepsin secretion and volume of gastric juice, and the promotion of mucosal protection by gastric mucin activity.

In the present study the antiulcer properties of cinnamon, agreed with Akira et al., (1986) who reported that CIAE inhibits gastric secretion and promotes gastric mucosal blood flow. These results confirmed by Tanaka et al., (1989) who demonstrated that cinnamon extract had 3-(2-hydroxyphenyl)-propanoic acid and its O-glucoside that prevent serotonin-induced ulcerogenesis in rats. It inhibits gastric ulcers induced by the ulcerogens such as ethanol, phenylbutazone, and water immersion stress, although it failed to prevent indomethacin-induced ulcers. 3-(2-hydroxyphenyl)-propanoic acid inhibits the secretion of gastric acid and promoted the gastric blood flow. Therefore, the antiulcerogenic effect of this compound is due to the potentiation of defensive factors through the improvement of the circulatory disorder and gastric cytoprotection. Zhu et al., (1993) revealed that water and ether extract of cinnamon had antiulcer effect on four types of experimental gastric ulcer. Aguilar, (1999); Cralg, (1999) also, reported that cinnamon used in the medicine for the treatment of gastric ulcer and digestive or stomach complaints. Recent research demonstrated that cinnamon extract decreased the level of prostaglandin that is associated with gastric ulcers (Jonathan et al., 2008).

On the other hand, the anti-spasmodic and anti-peptic actions of chamomile extract may be due to chamomile flavonoid constituents, apigenin (Achterrath-Tuckermann et al., 1980). In addition to, similar results were observed with alpha-bisabolol and the cis-spiroethers and the small amount of coumarins contribute to smooth muscle relaxation (Holzl et al., 1986). The antiulcer effect of chamomile extract agreed with Mann and Staba, (1986) who reported that chamomile had anti-inflammatory and spasmolytic effects on the stomach and duodenum. Therefore, it is thought to heal ulcers. Previous study reported that chamomile flower extract has a complex effect on the luminal and mucosal environment of the stomach and duodenum. Some of these actions are important in healing the ulcers and others are important in preventing subsequent ulcer relapse. Chamomile flower extract has a direct effect on acid secretion, and increases mucosal resistance against damaging agents such as ethanol and aspirin (Rees, 1992). Recent research revealed that CHAE, singly or combined with other plants have antiulcerogenic activity (Khayyal et al., 2001). Ramos-e-Silva et al., (2006) reported that CHAE had analgesic effect in oral aphtus ulcer.

The anti ulcer action of CHAE may be related to a variety of mineral elements including manganese and magnesium and 1-2% volatile oils including α-bisabolol, α- bisabolol oxides A and B, matricine presented in the chamomile flowers (McKay and Blumberg, 2006). Hwang et al., (2008) demonstrated that chamomilla extract contains many components that may exert antiulcer effects. Phenolic and flavonoids compounds, apigenin, quercetin,

patuletin, luteolin and their glycosides are the major flavonoids present in the flower. The presence of large amounts of cinnamic acid derivatives, frolic and caffeic acid and all of the constituents, may have therapeutic effects. Polysaccharides, amino acids and fatty acids are some of its constituents. Recently, Karbalay-Doust and Noorafshan, (2009) revealed that oral administration of chamomile extract at 400 mg/kg can be effective in preventing gastric ulceration in mice and does not produce toxic effects in doses up to 5000 mg/kg confirmed these results.

5. Conclusion

The present finding concluded that water extracts of cinnamon and chamomile had potential antiulcer effect, which was superior to the respective effect observed with Zantac. Chamomile extracts were more superior to cinnamon in its protection of the stomach. The antiulcer curative ratios were dose dependent with no adverse effects.

Abstract: The present study is concerned with the histological features of Kidney bean plant. The anatomical structure of different vegetative and reproductive organs was investigated fortnightly throughout the whole growing season. Studied organs included main root, main stem (represented by apical and median internodes), different types of foliage leaves developed on the main stem and on lateral shoot; including lamina and petiole, flower bud, fruit and seed. Histological features of various organs of Kidney bean plant were analyzed microscopically and photomicrographed. [Journal of American Science. 2010;6(12):217-229]. (ISSN: 1545-1003).

Keywords: *Phaseolus vulgaris* L., Kidney bean, Fabaceae, Anatomy, Vegetative organs, Reproductive organs.

1. Introduction

In the first part of this study (Nassar *et al.*, 2010), the authors investigated the morphology of vegetative and reproductive growth of Kidney bean plant (*Phaseolus vulgaris* L.) throughout the consecutive stages of its whole life span. Consequently, in this part of the study, it is aimed to bring to light more information about the anatomical structure of vegetative and reproductive organs of the plant during successive ages of its whole life span in order to complement the phytography study of Kidney bean plant which started in the first part.

Obviously, continued acquisition of new information about different botanical aspects of this species, which is of great interest from the economic point of view, are required.

2. Materials and Methods

The present study was carried out to investigate the anatomical structure of vegetative and reproductive organs of Kidney bean plant (*Phaseolus vulgaris* L.) of the family Fabaceae.

Therefore, a field trial was conducted in the Agricultural Experiments and Researches Station, Faculty of Agriculture, Cairo University, Giza, Egypt during the summer growing season of 2009 to provide the experimental plant materials. The work of microtechnique was carried out at the Laboratory of the Agricultural Botany Department, Faculty of Agriculture, Cairo University during the period from May, 2009 till April, 2010.

The field trial included five replicates, each represented by one plot. The plot was 4×5 m with eight ridges 60 cm apart. Date of cultivation was May 12th, 2009. Seeds of Kidney bean plant cv. Giza 6 were sown in hills spaced 25 cm on one side of the ridge. The plants were thinned to two plants per hill. All field practices were carried out as recommended for the studied crop in the vicinity.

A full microscopical study was carried out to investigate the histology of Kidney bean plant. Samples representing different plant organs were taken periodically, fortnightly, throughout the growing season. The following were investigated:

1. The main root, 1 cm below the hypocotyl.
2. The main stem represented by terminal and median internodes.
3. The mature prophyll and the apical leaflet of the foliage compound leaves number 3, 6 and 9 on the main stem, and of compound leaves representing secondary branches. The petiole of the compound leaf.
4. Flower bud.
5. Mature fruit and seed.
6. Type of stomata was defined using epidermal peals.

Microtechnique procedures given by Nassar and El-Sahhar (1998) were followed. Specimens were killed and fixed for at least 48 hrs in FAA solution, (10 ml formalin, 5 ml glacial acetic acid and

85 ml ethyl alcohol 70%), washed in 50% ethyl alcohol and dehydrated in a series of n-butyl alcohol before embedded in paraffin wax (mp 56-58°C). Transverse sections which were cut on a rotary microtome to a thickness of 20 microns were stained with crystal violet/erythrosin before mounting in Canada balsam. Slides were analyzed microscopically and photomicrographed.

3. Results and Discussion

1- Structure of the main root:

The anatomical structure of Kidney bean root system was investigated through transverse sections of the main root at different stages of plant growth. The tap root of two weeks old seedling, as shown in transverse section (Figure 1), is in primary state of growth. It has an uniseriate epidermis of tabular shaped cells. Cuticle on the outer walls and stomata are absent. Some epidermal cells prolong to form the typically unicellular root hairs. The cortex composed of about 6 layers of thin-walled irregular parenchyma cells with well-developed intercellular space system. The innermost layer of the cortex is the endodermis, an uniseriate zone of small barrel-shaped cells forming a distinct layer surrounding the stele. Next to the endodermis lies a layer of thin-walled parenchyma cells forming the pericycle. The vascular bundle is radial. Xylem and phloem occur in separate patches arranged on alternate radii, intervened by small parenchyma cells. The latter forms the conjunctive tissue. The bundle is tetrarch since four patches of xylem alternate with equal number of phloem patches. Protoxylem vessels occur towards the periphery and metaxylem towards the center, thus showing centripetal mode of differentiation from the procambium. This is the typical exarch xylem of roots. Opposite the protoxylem, pericycle is made up of two or three layers showing the point of origin of lateral roots. The center portion of the stele is occupied by a few compactly arranged thin-walled paranchymatous cells without any inter-cellular spaces forming a very small region of pith.

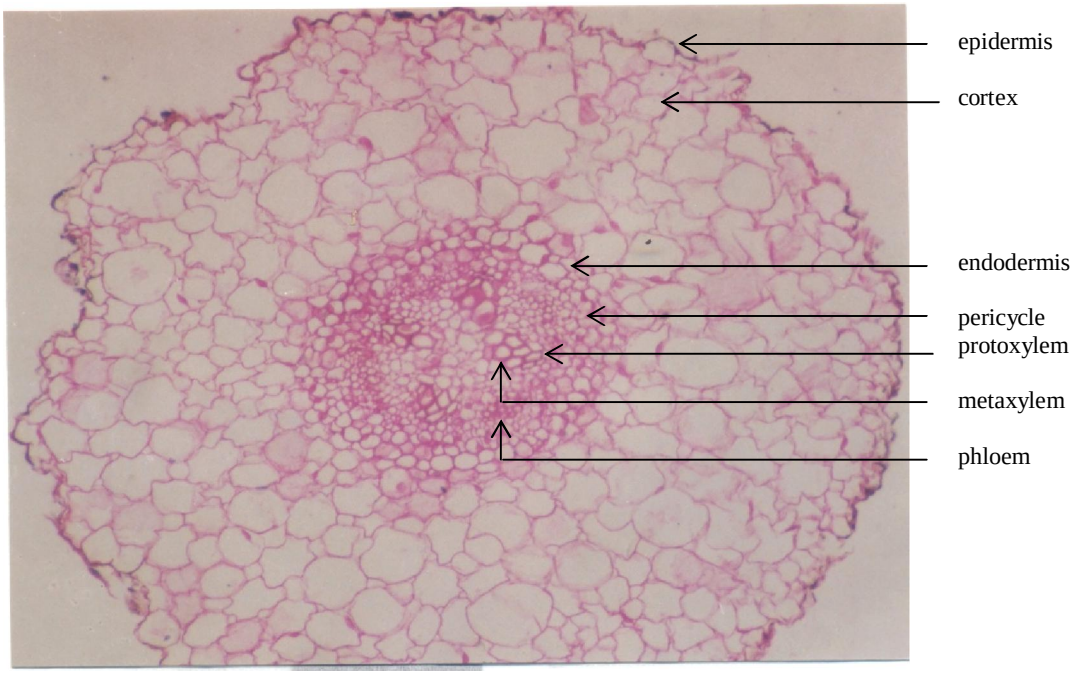

Fig.(1): Transverse section through the main root of *Phaseolus vulgaris* L. plant, aged two weeks, showing its primary structure. (X 144)

At the age of four weeks (Figure 2), the main root is in secondary state of growth, the epidermis as well as the cortex are completely sloughed off and a continuous well defined periderm arising in the pericycle is present. A cambial zone of about four layers is seen and secondary thickening proceeds, the xylem being more in amount than the phloem. The formation of parenchymatous rays from the cambium which was originated in the pericycle opposite to the xylem ridges is clearly obvious in this stage of secondary growth.

The secondary thickening is more prominent as tested plants were six weeks old (Figure 3). At this age, the root comprises mainly of a vascular cylinder surrounded by a periderm. The secondary xylem contains vessels of various diameters which accompanied by fibers and abundant amount of parenchyma cells.

As far as the authors are aware, no detailed study dealing with the anatomical structure of Kidney bean roots was carried out.

2- Structure of the main stem:

a- The apical internode:

The apical internode of the main stem was studied from the anatomical point of view at the age of six weeks to disclose the primary structure of the main stem. The transverse section shown in Figure (4) reveals that the stem surface of Kidney bean plant directly below the shoot apex is strongly ridged and fluted, almost pentagonal in outline. The epidermal cells are nearly square in shape and covered with a thin layer of cuticle. Stomata of paracytic type are present at the same level of the epidermis, each consisting of two guard cells and two accessory ones. Trichomes of nonglandular hairs are observed. The ridges of the stem mainly consist of collenchyma. The cortex at the furrows between the ridges is composed of one or sometimes two layers of collenchyma cells underlying the epidermis followed often by two layers of chlorenchyma and four layers of thin-walled parenchyma cells. A few layers of sclerenchyma forming a nearly continuous band occur next to the last layer of the cortex, it may be called pericycle or perivascular tissue.

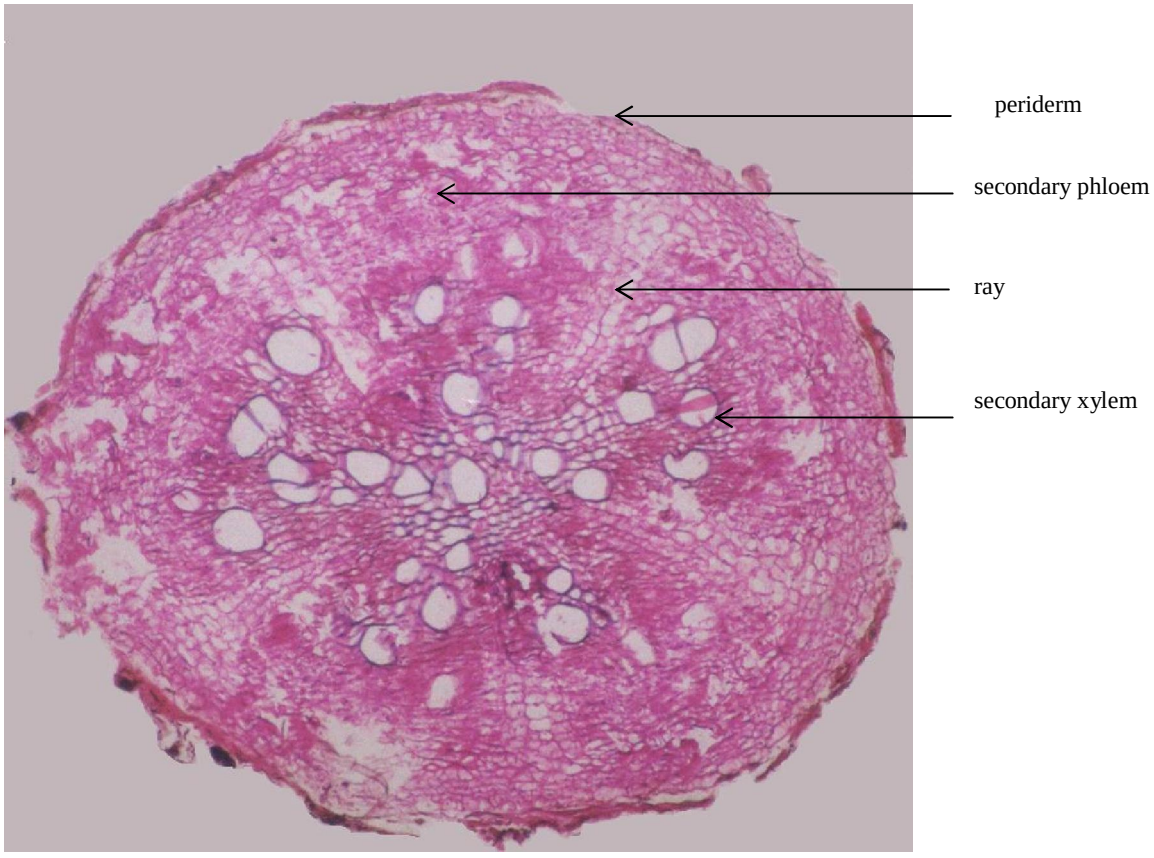

Fig.(2): Transverse section of the main root of *Phaseolus vulgaris* L. plant, aged four weeks, showing its secondary structure. (X 52)

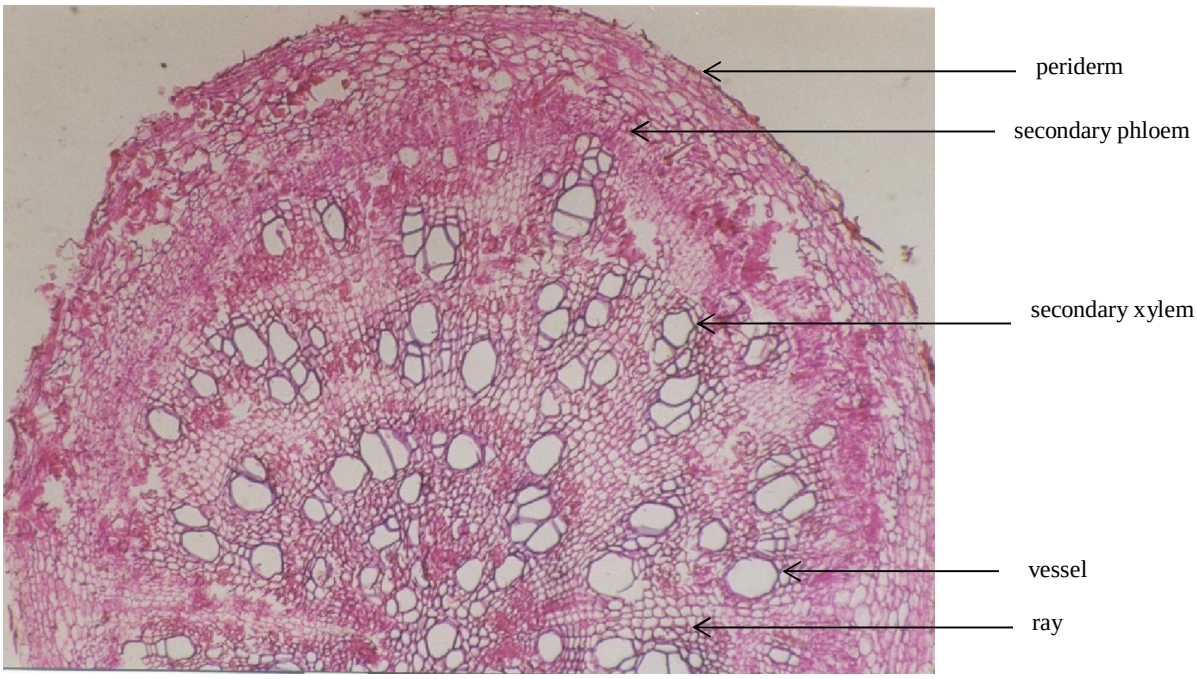

Fig.(3): Transverse section of the main root of *Phaseolus vulgaris* L. plant, aged six weeks, showing an advanced stage of secondary growth. (X 52)

The vascular bundles are almost arranged in a ring, being separated from each other by wide panels of parenchyma tissue which are a part of the ground tissue. There are five major collateral bundles located opposite to the corners. In addition, there are two to four minor collateral bundles between any of two major ones lying opposite to the furrows. The major bundle has 13 to 18 vessels in nearly parallel rows. The minor bundle often comprised of one row contains 3 to 6 vessels.

The pith, which comprises a large portion of the stem core, consists of thin-walled polygonal parenchyma cells which tend to decrease in size towards the periphery.

b- The median internode:

The transverse section through the median internode of the main stem of Kidney bean plant at the age of four weeks is shown in Figure (5). It is obvious that the main stem at its median portion is often ribbed; *i.e.,* polygonal in outline. Worthy to note that the ribs are comparatively smaller in size than those associated with the apical internode and the secondary growth takes place in nearly a continuous cylindrical form.

The epidermis which still having intact cells shows active dilation accompanied by radial division to accommodate with the increase in stem circumference. Also, many of both kinds of cortical cells (collenchyma and parenchyma) show elongation in the tangential direction accompanied sometimes by radial divisions. Stomata are present at the same level of the epidermis. Trichomes are not observed. The cortex composed of about seven layers of which the outer two layers are collenchyma underlying the epidermis and the five rest layers are parenchyma. The innermost layer of the cortex, the starch sheath, is easily recognized. The pericyclic cells show their transformation into fibers abutting on the collateral bundles of the stele. Thus, an incomplete ring of fibrous strands are developed.

The stele consists of 21 collateral bundles arranged in a ring, being separated from one another by two to three rows of well lignified parenchyma cells. The bundles are relatively different in size. There are seven large bundles located opposite to the ridges which being seven in number. There are two intermediate bundles between any of two large ones lying opposite to the furrows. Secondary thickening proceeds and secondary growth takes place in nearly a continuous cylindrical form. The secondary phloem

increases considerably in amount. The secondary xylem has an increased amount of vessels present in nearly radial rows, and the ground tissue where the vessels are embedded is formed of lignified parenchyma cells. The large bundle has 48 to 52 vessels, while the intermediate bundle has 33 to 38 vessels. A complete cambial ring is formed by the continuity of the interfascular cambium with the fascicular one. The primary xylem is recognized abutting on the pith.

The pith consists of polygonal parenchyma cells which tend to decrease in size towards the periphery. Small triangular intercellular spaces are visible.

At the age of 10 weeks, secondary thickening reached its maximum and the stem surface being cylindrical in outline (Figure, 6). The xylem vessels are mostly arranged in radial rows embedded in well lignified parenchyma cells. The vessels are present solitary or in radial groups, each consists of 2-4 vessels. Vascular rays mostly of 2 cells wide are observed and the pith at the center of the section being hollow (destroid).

At the extent of the authors knowledge no detailed studies dealing with the anatomical structure of Kidney bean stem are available.

Fig.(5): Transverse section through the median internode of the main stem of *Phaseolus vulgaris* L. plant at the age of four weeks. (X 52)

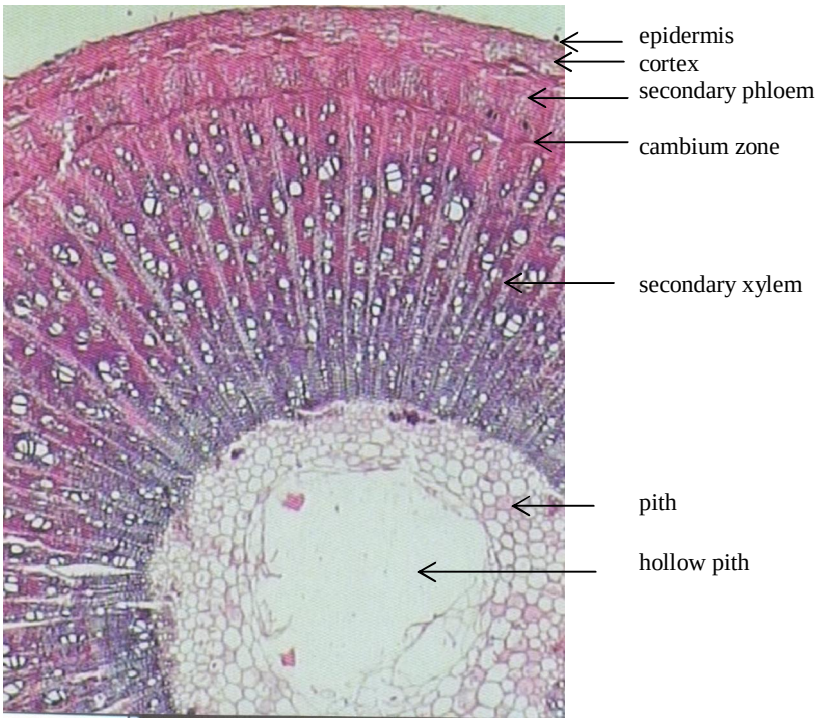

Fig.(6): Transverse section through the median internode of the main stem of *Phaseolus vulgaris* L. plant at the age of ten weeks. (X 52)

3. Structure of the leaf:

a- Leaf blade (lamina):

From the morphological point of view, Kidney bean plant develops two types of leaves as follows:

i- Two simple basal opposite prophylls.
ii- Pinnately trifoliate compound leaves which are alternately arranged on the main stem and the lateral branches.

Therefore, the anatomical structure of leaf blades representing these two different types of leaves were investigated. Transverse sections of mature prophyll as well as of apical leaflet of the compound leaf number 3, 6 and 9 on the main stem and of compound leaves on lateral branches were examined.

It was found that both types of leaves developed by Kidney bean plant almost have the same structure. Generally, they are dorsiventral and composed of three tissue systems as follows:

i- Epidermal tissue system consists of the epidermal layers occurring on the adaxial (upper) and the abaxial (lower) sides.
ii- The ground tissue system, which is known as the mesophyll tissue, is always differentiated into columnar palisade parenchyma on the adaxial side and irregular or isodiametric spongy parenchyma on the abaxial side and this means that the leaves are dorsiventral.
iii- The vascular tissue system is composed of vascular bundles which are usually collateral and form the skeleton of the leaf on which other tissues, the ground tissue, remain inserted. At the midrib, the principle vascular vein develops. In addition, smaller lateral ones constitute the reticulate system of venation.

Transverse section through the median portion of the mature prophyll of Kidney bean plant, two weeks old, (Figure 7) reveals that it consists of two epidermal layers with a mesophyll in between. Both the epidermal layers are uniseriate, composed of nearly compactly arranged rectangular cells with thin rounded cuticularised outer walls. Stomata occur on both sides, being more frequently present on the lower epidermis. Likewise, trichomes of nonglandular hairs, mostly hooked hairs with short basal cells and a large bent terminal cell are present on both surfaces, being more frequently present on the lower epidermis (Figure 7). The mesophyll is differentiated into palisade and spongy cells. The palisade tissue consists of one layer of cells elongate perpendicularly to the surface of the blade being characterized by an abundance of chloroplasts. The palisade tissue occupies ⅓ of the whole thickness of the mesophyll. The spongy tissue occurs towards the lower epidermis and consists of 4 to 5 layers of chlorenchymatous loosely arranged cells with relatively wide intercellular spaces. At the midrib region, both upper and lower epidermis are convex. The bundle in the midrib is the largest in the prophyll and the lateral ones decrease in size towards the margins. The vascular bundle is oriented with the xylem directed toward the adaxial surface and the phloem toward the abaxial one. The vascular bundle of the midvein is embedded in a ground tissue of parenchyma cells with a mass of collenchyma cells underlying the two epidermis. Whereas, the smaller bundles are directly embedded in the mesophyll.

The anatomical structure of leaf blades representing the mature foliage compound leaf of Kidney bean at different stages of plant growth was also investigated. It was found that all investigated leaves have, in general, the same structure. Leaflets are dorsiventral; *i.e.,* the palisade tissue is located on the adaxial side of the blade and the spongy tissue on the abaxial one (Figures 8 and 9). There are two epidermal layers on adaxial and abaxial surfaces of the leaflet. Each is uniseriate, composed of a row of compactly-set tabular cells. The outer walls are cutinised and possess thin cuticle. Stomata occur on both surfaces, being more numerous on the lower epidermis than on the upper one. They are of rubiaceous or paracytic type (Figure 10). The stoma consisting of two guard cells and two accessory ones, subsidiary cells flank the stoma parallel with the long axis of the guard cells. At the midrib region, both the upper and lower epidermis are convex. Trichomes are present on both surfaces, being more numerous on the upper epidermis than on the lower one. They are nonglandular uniseriate with short basal cells accompanied by an elongated terminal cell and most of them being hooked with a large bent terminal cell. The palisade tissue consists of two layers of slender cells of dense plastids, occupying almost one-half of the whole thickness of the mesophyll. The spongy tissue is composed also of 2 to 3 layers of chlorenchymatous cells. There is a mass of collenchymatous cells below the adaxial and abaxial epidermis at the midrib region. Therefore, the included bundle, the principle one, is not directly embedded in the mesophyll as do the smaller ones. The midrib bundle consists of a larger strand opposite to two smaller ones. The midrib is also supported by a fibrous strand, a crescent like cap, abutting on the phloem of its large collateral bundle.

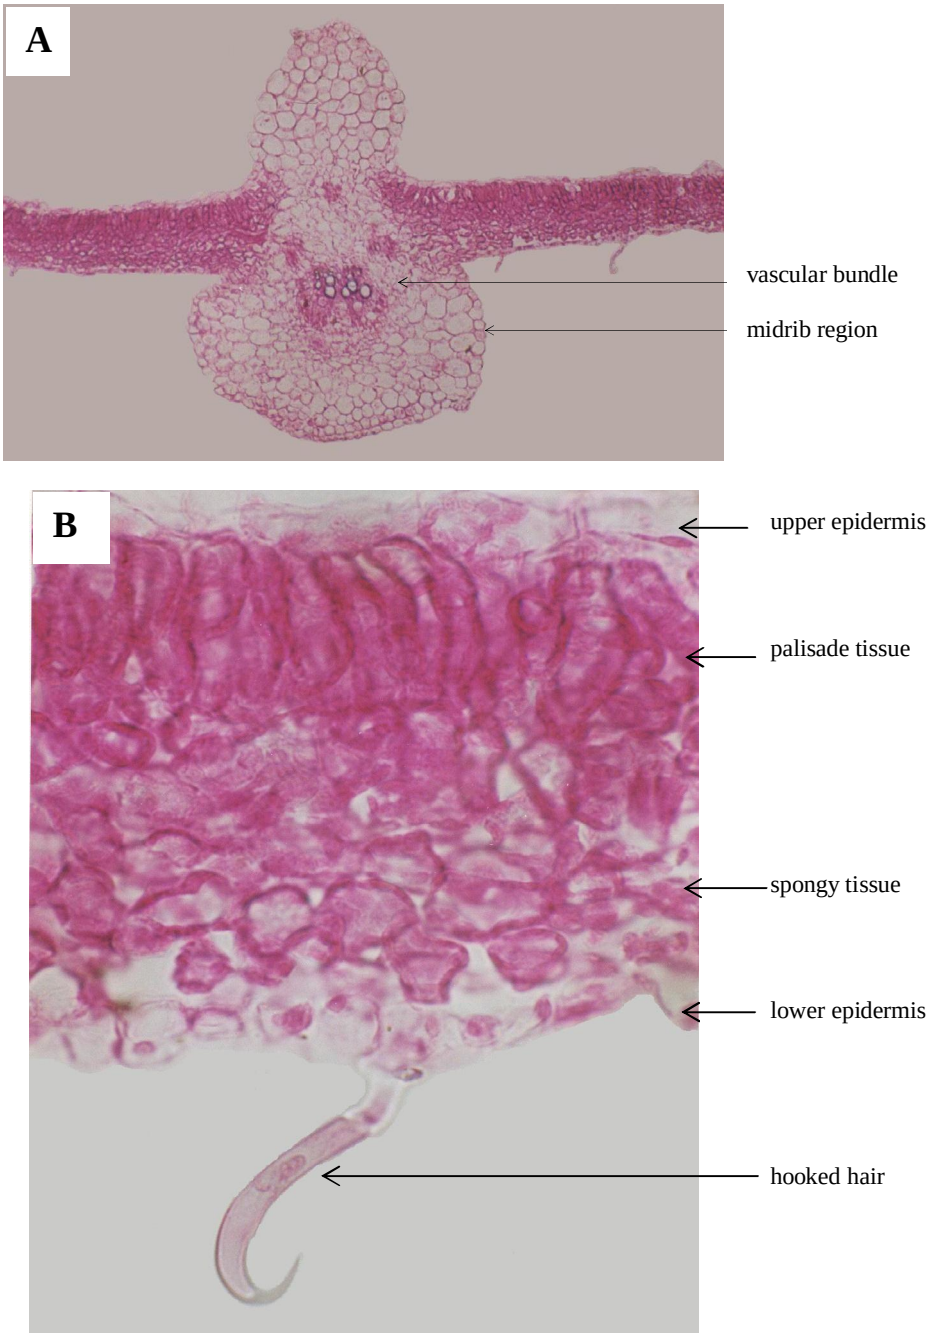

Fig.(7): Transverse section through mature prophyll of *Phaseolus vulgaris* L. plant, two weeks old.

A- Whole section. (X 52)
B- Magnified portion of A. (X 540)

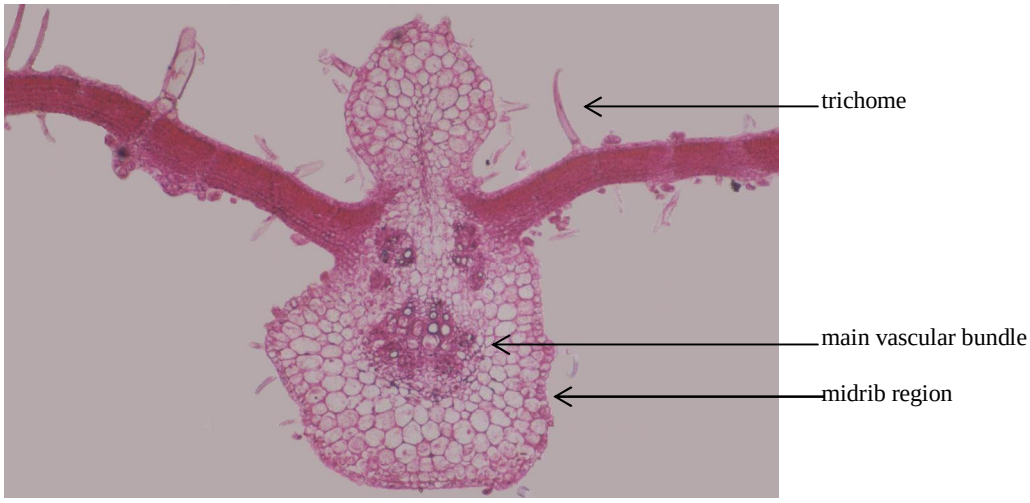

Fig.(8): Transverse section through the apical leaflet of the third foliage compound leaf on the main stem of *Phaseolus vulgaris* L. plant at the age of four weeks. (X 52)

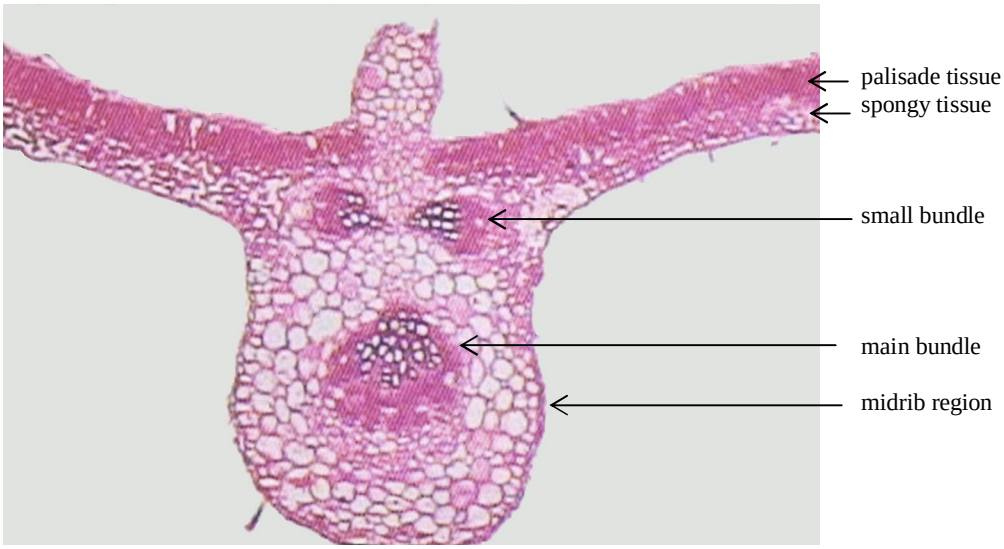

Fig.(9): Transverse section through the apical leaflet of a foliage compound leaf developed on the fourth lateral branch of *Phaseolus vulgaris* L. plant at the age of eight weeks. (X 52)

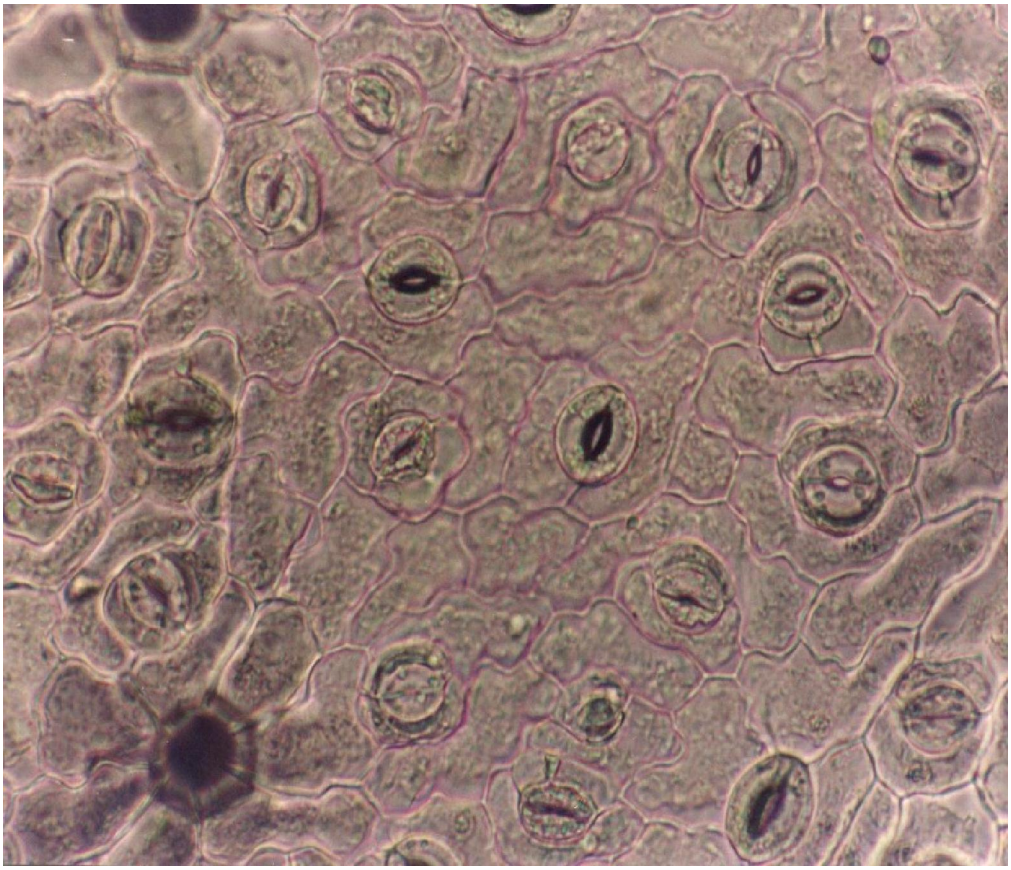

Fig.(10): Epidermal peel showing the paracytic stomata type in leaflet of *Phaseolus vulgaris* L. plant. (X 144)

In this respect, Metcalfe and Chalk (1979) recorded non-glandular hairs in the genus *Phaseolus*. Uniseriate, with a variable number of short basal cells, accompanied by an elongated terminal cell. Hooked hairs, with short basal cells, and a large bent, terminal cell.

b- Leaf petiole:

The petiole of Kidney bean leaf as seen in transverse section (Figure 11) is polygonal in outline (almost pentagonal) with two lateral wings at the corners of the adaxial side. The petiole is bounded by an uniseriate epidermis of nearly square shaped cells. The outer walls of the epidermis are somewhat thickened and covered with a thin layer of cuticle. Stomata and trichomes, similar to those found on the main stem and leaf blades, are present. The ground tissue consists mostly of relatively large parenchyma cells. The angles, beneath the epidermis, consists mainly of collenchyma cells. Inside the collenchyma there is a zone of chlorenchymatous cells ranging from 2 to 3 layers ending at the vascular cylinder. The chlorenchyma cells decidedly smaller than the residual parenchyma cells of the ground tissue.

The vascular tissues are formed of 13 collateral bundles arranged in a ring plus the two accessory small bundles in the ground tissue of the two lateral wings. The bundles are separated from one another by wide areas of ground tissue. The xylem vessels are arranged in radial rows, being in most bundles of one row.

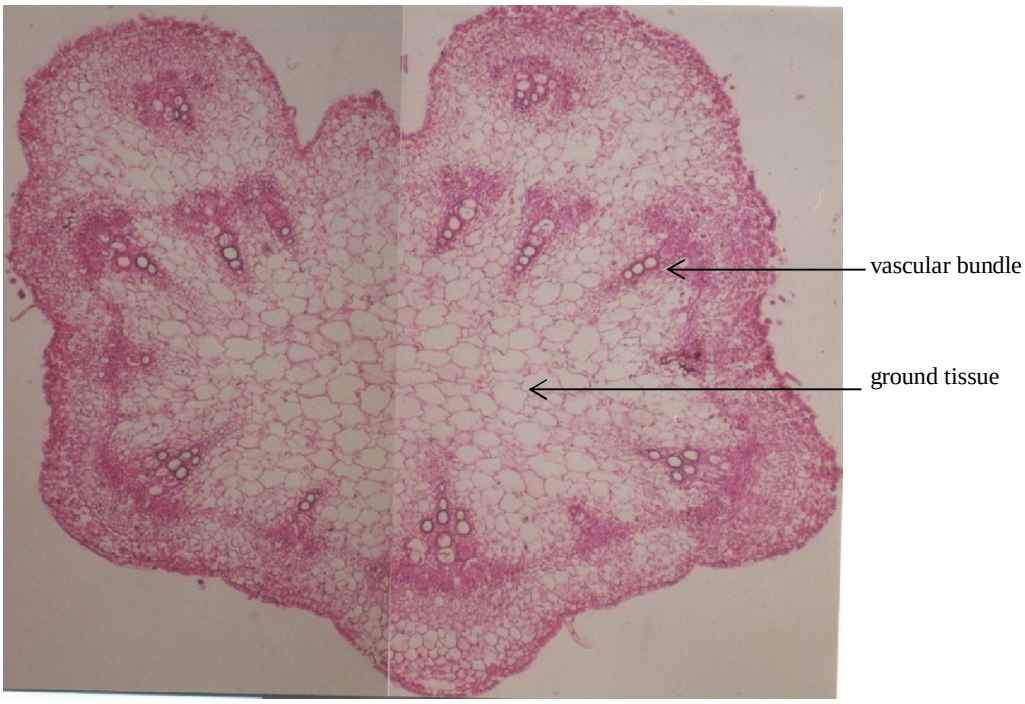

Fig.(11): Transverse section through the petiole of the third foliage compound leaf on the main stem of *Phaseolus vulgaris* L. plant at the age of four weeks. (X 52)

Worthy to note that there are small groups of incompletely differentiated phloem between the bundles and ill differentiated fibrous cap abutting on the phloem of each collateral bundle was observed.

4- Structure of the floral bud:

A transverse section through the floral bud of Kidney bean plant is shown in Figure (12). It is clear that the sepals of the calyx are united and comprised of two epidermal layers and 4-5 layers of ground tissue in between. There are numerous traces which extending through the ground tissue. The corolla is papilionaceous with one posterior petal (the standard), two lateral petals (the wings) and two lower united anterior petals (the keel). Each segment consists of two epidermal layers of nearly square-shaped cells surrounding 2-6 layers of parenchymatous cells forming the mesophyll. Many traces are extending through the mesophyll.

The stamens are ten; each consists of a two-lobed tetrasporangiate anther borne on the filament, a thin stalk with a single vascular bundle. The androecium is diadelphous, since the posterior stamen is free and the other nine stamens are with united filaments from the base to nearly more than half of their length while the anthers are free. The stamens form an open tube enclosing the long ovary. The upper parts of the filaments bend toward the banner.

The gynoecium is composed of a single carple and the ovary is of one locule. Placentation is marginal. The ovary contains two bundles at the placenta side (the dorsal bundles) and a single one at the opposite side (the ventral bundle).

5- Structure of the fruit and the seed:

The fruit of Kidney bean is a simple dehiscent legume which develop from a single carpel, cylindrical, constricted between the seeds, splitting along both sutures at maturity. The legume has two lines of dehiscence; one through the union of the carpel margin and the other along the median vascular bundle.

Transverse section through the mature fruit of Kidney bean is shown in Figure (13). The pericarp, the wall of the matured ovary, consists of three distinct layers; namely, the exocarp, the mesocarp and the endocarp. The exocarp includes the epidermis and a subepidermal layer of 1-2 cells in thickness, both are composed of thick-walled cells. The mesocarp consists of several layers lying next to the exocarp. The component parenchymatous cells of these layers are characterized by their rather thick and slightly lignified walls.

They are tangentially elongated and deeply stained. The mesocarp contains the vascular traces supplying the pod. The endocarp comprises the

remainder of the parenchymatous cells of the fruit wall, the pericarp, and the inner epidermis. The parenchymatous cells are weakly stained being thin-walled and much enlarged in different planes. The inner epidermis though still intact, its constituent cells become weakly outlined and thus could be hardly described.

The seed coat, the integuments of mature ovule, differentiates into a variety of distinct layers. The outermost layer, the epidermis remains uniseriate and develops into the palisade layer characteristic of leguminous seeds. It is composed of macrosclereids with unevenly thickened walls. The cells of the subepidermal layer differentiate into the so-called columnar cells, also termed pillar cells or hourglass cells. The layers beneath the subepidermal layer are of bigger and tangentially elongated parenchyma cells with the innermost layers being largely pressed.

The vascular system is well developed, it is an extension of the vascular bundle from the funiculus to the chlazal region where it branches. Finally, the inner epidermis characterized by very poorly outlined cells, and with rather thick lignified walls. It is worthy to note that, two palisade layers occur in the hilum region. The outer of these is derived from the funiculus and the inner belongs to the seed coat. Moreover, a compact group of cells of unknown role occurs in the hilum region. They are referred to by Esau (1959) to be tracheids. The seed coat envelopes the embryo which consists of two large cotyledons, plumule, nd the radicle. The cotyledons have big thin-walled cells, rich in starch grains of conspicuously large size.

The above description of the seed coat is in agreement with that given by Esau (1959).

Abstract: Intercropping is claimed to be one of the most significant cropping techniques in sustainable agriculture; to its utilization a number of environmental benefits, from promoting land biodiversity to diversifying agricultural outcome. This model integrates low, medium, and tall plants, as well as plants of short, medium, and long life cycles, including trees. Therefore, a study was carried out to evaluate the impact of intercropping mango (*Mangifera indica* L.), Balady mandarin (*Citrus reticulate* Blanco) and Egyptian clover (*Trifolium alexandrinum* L) crops with date palm on soil chemical properties and quality and quantity of date fruits, in comparison with date palm sole. Rhisosphere of palm (pure stand) had a high concentration of N compared to palms intercropped with mango or mandarin. Intercropped mandarin with palms caused a depletion of N from soil by 14.3%, relative to date palm pure stand. High levels of Zn and Mn in soil were recorded in rhisosphere of clover and palms intercropped with mandarin. The effect of intercropping on occurrence and enumeration of microorganisms in the rhizosphere of trees was also studied. The results indicated that the colony count of fungi and bacteria in date palm rhizosphere were fluctuated according to plantation method. Intercropping date palm with mandarin decreased the total fungal count from 21.17 cfu x 10^3g^{-1} in the non-intercropped roots to 16.00 cfu x 10^3g^{-1} (24.4% decrease) in date palm root intercropped with mandarin. While, intercropping date palm with mango and clover increased the total fungal count to 118.32 cfu x 10^3g^{-1} and 52.00 x10^3g^{-1} in date palm root intercropped with mango and clover, respectively. Growing mango or mandarin under date palm resulted in the highest fruit yield/palm. However, intercropping Egyptian clover with date palm caused a significant reduction in fruit diameter. Intercropping mango gave the highest net profit ($8213/ha/yr), followed by the same area intercropped with mandarin ($3992/ha/yr). Evaluation of growing mango, mandarin or Egyptian clover with date palm indicated that growing mango with date palm could be used for combating desertification in sandy soil in arid lands regions and gave the highest net return per unit area. [Journal of American Science. 2010;6(12):230-238]. (ISSN: 1545-1003).

Key words: intercropping, date palm, Egyptian clover, mango, mandarin, fruit

1. Introduction:

In Egypt, date palm ranked the third crop after orange and grape (Agricultural Economic Bulletin, 2005). Date palm trees provide enough space for intercropping even if they are fully grown as they do not cover much area being a very tall tree (Akyurt *et al*. 2002). They reviewed the literature and reported that, it is possible to grow a mixed fruit orchard, such as date intercropped with citrus (Morton 1987 and Anon- 1 2008). Field crops, such as fodders and vegetables may also be grown together with date palms (Anon- 1, 2008; Mahmoudi *et al*. 2008; Shirazi *et al.*, 2008). Intercropping in date palm with suitable crops bring good income and improves the fertility of the soil. During the first few years, intercropping can be practiced with no shortage of irrigation. Intercrops such as gram, peas, mash, moong, moth, senji and lentil can be sown during summer. Intercropping of some vegetables in plantation located near the cities can be practiced if sufficient irrigation and manuring facilities are available. On the other hand, Morton (1987) reported that in mechanized plantations, intercropping is not possible as much as space must be left for the mobile equipment.

In addition, desertification is a worldwide problem that directly affects over 250 million people and a third of the earth's land surface. It is especially concentrated in developing countries. Effectively dealing with desertification will lead to a reduction in global poverty (Millennium Ecosystem Assessment 2005).

The recent report of Egypt indicated that 67.4% of the first class area of the agricultural land was reduced from 1.260 million hectares (in the 2000) to 0.411 million hectares (in 2005). Combating desertification requires an integrated approach. Polyculture is claimed to be one of the most significant cropping techniques in sustainable agriculture, to its utilization a number of environmental benefits, from promoting land biodiversity to diversifying agricultural outcome. This model integrates low, medium, and tall plants, as well as plants of short, medium, and long life cycles, including trees.

Therefore, the tendency for exploitation the land under date palms whether for annual or perennial crops is increasing day by day to better utilization the microclimate and soils under date palm. Little research papers about the impact of intercropping on the date palm were found in the literature, except some reports and fact sheets. Ali *et al*. (1998) reported that the intercropping of legumes, which was found to improve quality and yield, was practiced up to 50%. They add that the inter-cropping of legumes (cowpea and pigeon pea) which was proved to have a positive effect on the soil and consequently dates quality is practiced up to 35%. While 15% of the studied cases practiced the intercropping adversely affects the soil. They also indicated that several crops can be intercropped with date palm utilizing canal irrigation such as alfalfa, okra and tomato that increase the profitability of date palm cultivation when intercropped. While intercropping date palm with other crops is difficult in drip irrigation (Ali *et al*.1998). In the Northern part of the delta and river Nile state date palm is intercropped with wheat, broad beans and fodder. Reyad *et al*. (1997) reported that 70 % of farmers in Umjawasir intercrop alfalfa with date palm. They found that intercropping alfalfa with date palm increases the income of one hectare up to US$ 3085/yr. At the same time, as tomato gained the second most profitable crop that increase the date palm hectare net income to US$ 2740/year. Okra is the third profitable crops when it is intercrop with dates in canal irrigation, which increases the income of one ha up to US$ 1621/yr (ELmakki, 2006). Some farmers growing oil palm intercropping with Cavendish banana (Ong *et al*. 2000).

Date palm is still grown in Egypt at a conventional method and stile cultivated with intercropped crops such as mango, citrus, legume etc. The rhizosphere is the habitat of both bacteria and fungi, which have a negative or positive effect on the growth and development of plants (Kurek and Kobus 1990). Root exudates, which are the main source of amino acids, sugars, vitamins, phenols, organic acids and metal ions, affect the composition of microorganism in the soil, especially in the rhizosphere (Darcy, 1982). Obied (2000) determined mycoflora of date palm associated with some pathological symptoms as *Fusarium moniliforme*, *Mauginiella sp*., *Thiolaviopsis paradoxa*, *Aspergillus sp*. and *Helminthosporium sp.* The distribution and pathogenesis of date palm fungi in Egypt was studied by El-Deeb *et al*. (2008) and in Bahrain by Qaher *et al*. (2005). The fungus *Fusarium oxysporum sp. albedinis* is soilborne; caused Bayoud of date palm (*Phoenix dactylifera* L.), however, the henna bush, when intercropped with date palm, may serve as a symptomless carrier of the fungus (Carpenter and Klotz 1966).

Therefore, a study was carried out to investigate the impact of intercropping mango (*Mangifera indica* L.), Balady mandarin (*Citrus reticulate* Blanco) and Egyptian clover (*Trifolium alexandrinum* L) crops with date palm on the quantity and quality of date fruits. The effect of intercropping on occurrence and enumeration of microorganisms in the rhizosphere of trees was also studied.

2. Material and Methods:

A study was carried out in a 15-yr-old date palm intercropped with mango and mandarin trees (10-yr-old) at a private orchard at Salheia Destricat, Sharkia Governorate, Egypt. The experiments were conducted to evaluate the impact of intercropping mango (*Mangifera indica* L.), Balady mandarin (*Citrus reticulate* Blanco) and Egyptian clover (*Trifolium alexandrinum* L) crops in comparison with date palm sole.

The Intercropping Treatments Were:

1- Date palm (pure stand)
2- Intercropping mango trees with date palm
3- Intercropping mandarin trees with date palm
4- Intercropping Egyptian clover under date palm

Three trees in each treatment were used as a replicate in split-plot Design. Where the date palms occurred in main plot, and the intercropping crops maintained in sub plot. Data recorded: Number of bunches per palm, mean weight of bunch and average yield per palm were recorded.

Physico-chemical characteristics of fruits (length and diameter of fruit, diameter: length ratio, size, percentage of flush weight, average fruit weight and stone criteria (diameter, length, and weight) were studied. Total soluble solids (TSS), total acidity, reducing, non-reducing and total sugars were determined in pulp juice as outlined by A.O.A.C (1995). Tannins content was determined using Indigo carmine indicator after Winton and Winton (1958). For comparison between treatments, approximately net profit ($/ha./yr) was calculated.

Collection of Rhizosphere Samples:

Rhizosphere samples were collected from depth of 15-30 cm adhering very closely to date palm roots. Seven rhizosphere samples from soil of date palm intercropped were obtained from the following treatments:

1. Rhizosphere of non-intercropped date palm (control; pure stand).
2. Rhizosphere of mango (monoculture)
3. Rhizosphere of date palm intercropped with mango
4. Rhizosphere of mango intercropped with date palm
5. Rhizosphere of mandarin (monoculture)
6. Rhizosphere date palm intercropped with mandarin.

7. Rhizosphere date palm intercropped with Egyptian clover

Enumeration of Microorganisms:

To estimate the number of soil microflora, counts were calculated on the basis of serial 10-fold dilutions, in duplicate, using the pour plate method using triplicate samples of 1g soil, and an appropriate dilution (Johnson and Curl, 1972); each value presented here is therefore an average of three individual counts. All petri dishes contained 15ml medium and the plates were incubated at 28-30°C in the dark. Colony-forming unites (CFU) were recorded after 1 week; the average number per gram oven-dry weight of soil was calculated.

For total bacterial flora, soil extract agar medium modified by Mahmoud *et al.*(1964) and Martin's medium (Allen, 1961) for fungi were used.

Microscopic Examination and Identification of Fungal Isolates:

Microscopic examination of mould growth was done by observing the colonial morphology-colour of colony, texture, shape and surface appearance and cultural characteristic- a sexual and sexual reproductive structures like sporangia, conidial head, arthrospores, the vegetative mycelia, septate or non-septate (Gilman, 1957; Nilson et al., 1983 and Barnett and Hunter, 1986). Microscopic examination of the moulds was done by using needle mount method.

A small portion of each colony was picked with sterile needle and teased out in a drop of clean microscopic slide. Slides were prepared likewise, using methylene blue in place of water.

Soil Chemical properties

Electrical conductivity (EC) and pH were measured in a soil 1:10 (w/v) by using a pH meter (WTW Germany, pH 330) and an EC meter (WTW Germany, LF 330), respectively.

To analyze macro and micronutrients in soil (rhisosphere zone), samples were taken from each treatment, and then dried at 70°C. From each sample 0.2 g was digested using 5 cm^3 of the mixture of sulfuric (H_2SO_4) and perchloric ($HCLO_4$) acids (1:1) as described by Peterburgski (1968). Total nitrogen was determined by micro-Kjeldahl method and phosphorus was determined calorimetrically at wavelength 680 nm using spectrophotometer (Spekol) as well as potassium was determined by using Gallen Kamp flame photometer. Micronutrients, i.e., Zn, Fe, Zn and Mn were measured using atomic absorption spectrophotometer Perkin Elmer model 5000 (Cottenie *et al.* 1982).

Statistical Analysis

The obtained data from each season were exposed to the proper statistical analysis of variance according to Gomez and Gomez (1984). The combined analysis of variance for the data of the two seasons was performed after testing the error homogeneity and LSD at 0.05 level of significance was used for the comparison between means.

3. Results and Discussion:

Soil Chemical Properties

Data in Fig.1 indicated that EC, pH and macro and micronutrients were affected by the plant species as well as by the methods of planting i.e. in pure stand or intercropping. Intercropping date palm with mango caused a reduction of EC by 17% (from 0.18 to 0.15 dS/cm), while sowing clover crops and mandarin resulted in increasing the EC value by 61 and 44%, respectively, compared to date palm sole.

Concerning pH value, Data in Fig. (1) indicated that the lowest values of pH were noticed under intercropping date palm with clover or mandarin. Rhisosphere of palm (pure stand) had a high concentration of N compared to palms intercropped with mango or mandarin. This result may be due to that the N not uptake by the palm is uptake by the mandarin or mango trees. Intercropped mandarin with palms caused a depletion of N from soil by 14.3 relative to date palm pure stand (Fig 1). By placing deep-rooted crops intercropping with shallow rooted crops where available N is present in deeper soil layers, nitrogen losses can be reduced (Thorup-Kristensen and Sørensen, 1999). On the other hand sowing clover with palms increased the N availability in soil by 3.6%. The atmospherically-fixed N in mixed swards containing 30-50% clover was estimated as 157kg^{-1}ha yr^{-1} (Kristensen *et al.* 1995).

Phosphorus status in soil was increase under the three intercropping patterns, and the highest level of P in soil was occurred under palm intercropped with clover where it increased by 136.7% than in rhisosphere of palms (sole).Tthis may be that the date palm trees have a high requirement from P nutrient. All intercropping pattern increase the K levels in soil and the highest value was recorded with palm intercropped with mandarin (90% increment). Similar trend was noticed with Fe element (Fig.1). High levels of Zn and Mn in soil were recorded in rhisosphere of clover and palms intercropped with mandarin. We could concluded that the status of nutrients in the soil not affected by the pH value but depends mainly on plant species and intercropping plants (root density, soil microbial activity, root exudates, etc.)

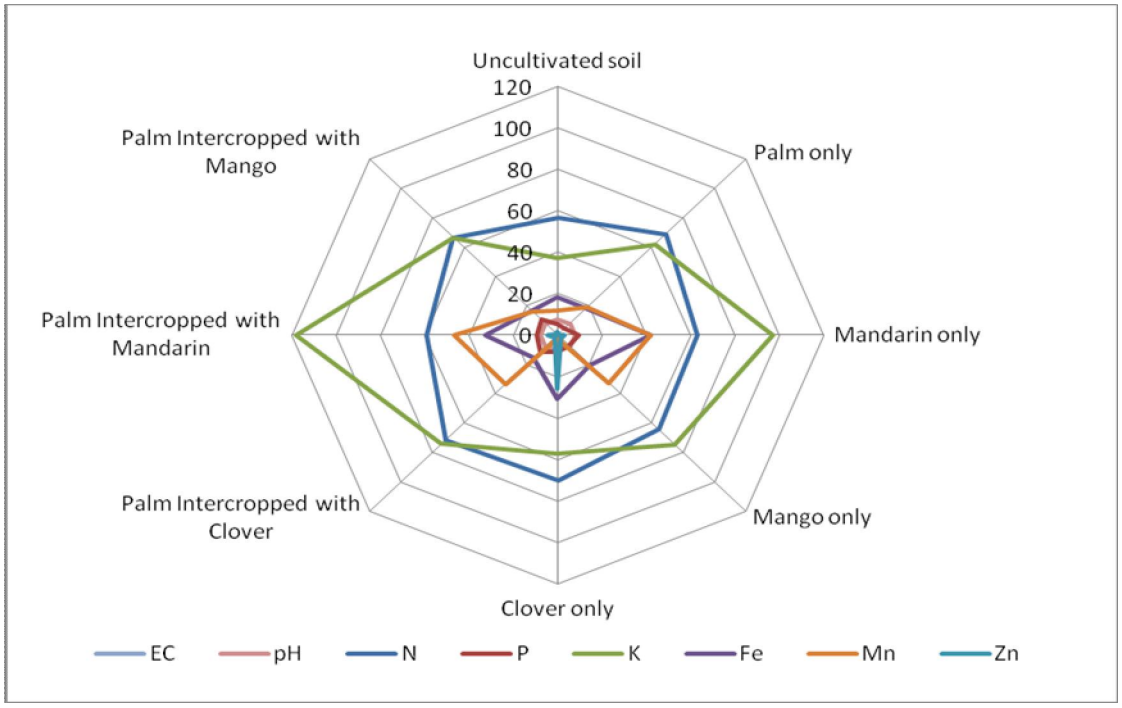

Fig 1: Soil chemical properties as affected by intercropping date palm with clover, mandarin or mango trees.

Rhizosphere Microflora

1-Fungi and Bacteria Occurrence:

Results of a laboratory microbiological analysis of particular rhizosphere samples of date palm showed different numbers of bacteria and fungi (Table, 1). The total number of bacteria in the rhizosphere samples (d.w.) ranged from 56.54 cfu X 10^5 g $^{-1}$to 375.52 cfu x 10^5 g^{-1}. Tyner (1940) reported that the decomposable root debris and root exudates had supplied the microorganisms with available sources of nutrients to grow and proliferate. Similar results were also obtained on date palm rhizosphere by Kurek & Kobus, 1990 and Obied, 2000.

The greatest number of bacteria was observed in the rhizosphere taken from the root of mandarin followed by root of date palm intercropped with mango. One the other hand, the number of bacteria increased from 65.19 cfu x 10^5g^{-1} in the control (non-intercropped palm) to 92.22, 190.82 and 268.15 cfu x 10^5 g^{-1} (41.5%, 192.7 and 311.3% increase) in the roots of date palm intercropped with clover, mandarin and mango, respectively.

The total number of fungi in the rhizosphere of date palm ranged between 16.00 and 128.07 cfu x 10^3g^{-1}. Intercropping date palm with mandarin decreased the total fungal count from 21.17 cfu x 10^3g^{-1} in the non- intercropped roots to 16.00 cfu x 10^3g^{-1} (24.4% decrease) in date palm root intercropped with mandarin. While, intercropping date palm with mango and clover increased the total fungal count to 118.32 cfu x 10^3g^{-1} and 52.00 x10^3 g^{-1}, respectively, compared to date palm sole. On the contrary, Shirazi *et al*., 2008 found that intercropping of date plantations with alfalfa (*Medicago sativa*) and sorghum (*Sorghum vulgaris*) cultivations increased relative humidity in the garden and decreased the disease. They added that alfalfa was more effective than sorghum.

On the other hand, growing clover plants and mango trees under date palms caused increase in the total fungal count by 145.6% and 458.9% respectively. The dynamic increase of the microorganisms in the rhizosphere of date palm intercropped with other cultivations can be explained by the favorable quantitative and qualitative composition of organic compounds provided in the form of root exudates and crop residues. This fact is confirmed by earlier information from the previous investigators (Rovira, 1969 and Funck & Hockenhull, 1984).

2- Frequency and identification of rhizospheric fungi:

The genera and species from the rhizosphere of date palm intercropped with other crops or non- intercropped were isolated and identified (Table, 2). Depending upon their frequency of occurrence genera were grouped as major components and minor components. Major components include most frequently encountered such as *Fusarium sp.*, *Aspergillus niger*, and *Gliocladium sp*. While, minor components include less frequent and sporadic types such as *Alternaria tenuis, Aspergillus sulphoreus, Trichoderma harzianum, harzianum, Rhizoctonia solani* and *Penicillium funiculosum* in descending order.

Fungal species in the rhizosphere of non-intercropped date palm recorded eight fungal species belonging to four genera namely *Aspergillus niger* (30%), *Fusarium sp* (50%), *Mucor mucedo* (10 %) and *Rhizopus nigricans* (10%). On the other hand, some fungi were appeared or disappeared in the rhizosphere of date palm according to the type of intercropped plants. Genearly, the quantitative and qualitative differences in frequent occurrence of fungal genera or species between different treatments were recorded. For example, root of mango intercropped with date palm stimulated the growth *of Phycomycetes* grouping fungi, *Penicillium sp.* and *Rhizoctonia solani* from 0.0 to 7.14%, *Gliocladium sp.* from 0.0 to 4.67% and *T. viride* from 0.0 to 9.52%. While, intercropped mandarin with date palm stimulated the growth of *Fusarium sp* from 50% to 71.43% and *Penicillium sp.* from 0.0 to 21.43 %, but *Mucor mucedo* and *Rhizopus nigricans* disappeared on the roots of date palm (Table.2).

Growing Egyptian clover under date palms led to increased *Gliocladium sp., Penicillium sp.* and *Phycomycetes fungi* from 0.0 to 17.14, 5.72 and 11.43%, respectively. On the other hand, some intercropping mango, mandarin and clover with date palm resulted in reduced or disappearing *A. niger*, *Fusarium sp.*, *R. nigricans* and *Mucor mucedo* that recorded with date palm (non intercropped).

Cultivation of date palm trees intercropped with other crops grow in close proximity to each other and the root exudates may accumulate in the rhizosphere from all sides causing a marked inhibitory or stimulatory effect to microflora in the rhizosphere of date palm. Root exudates are known to either stimulate or inhibit the growth of different species of microorganisms. For example, root exudates of *Crotalaria medicaginea* stimulated the growth of *Penicillium herquei, Aspergillus niger* and *Alternaria humicola* but significantly reduced the growth of *Trichoderma lignorum* (Sulia, 1973). In addition, Hakkou and Bouakka (2004) reported that the spread of the disease is promoted by intercropping, especially by the more water-demanding intercrops.

Table 1: Total bacteria and fungal counts in the rhizosphere of date palm intercropped with some crops.

Intercropped plant	**Bacteria (cfu x $10^5 g^{-1}$)**	**Fungi (cfu x $10^3 g^{-1}$)**
Rhizosphere of palm only (pure stand)	65.19	21.17
Rhizosphere of mango (pure stand)	56.54	31.55
Rhizosphere of palm intercropped with mango	268.15	118.32
Rhizosphere of mango intercropped with palm	136.30	128.07
Rhizosphere of mandarin (pure stand)	375.52	30.16
Rhizosphere of palm intercropped with mandarin	190.82	16.00
Rhizosphere of Palm intercropped with clover	92.22	52.00

Table 2: Fungal genera and species (%) in the rhizosphere of date palm sole or intercropped with (+) other crops

Isolated fungi	Rhizosphere of							Mean
	Palm (Sole)	Mango (Sole)	Mandarin (Sole)	Palm + mango	palm + Mango	Palm + mandarin	Palm + clover	
Alternaria tenuis	-	-	2.38	-	-	-	-	0.34
Aspergillus humicola	-	15.63	-	4.67	7.41	-	-	3.96
A. niger	30.00	6.25	4.77	23.81	24.07	7.14	34.28	18.62
A. sulphoreus	-	6.25	-	-	-	-	-	0.89
Fusarium sp.	50.00	15.63	59.52	19.04	14.81	71.43	22.86	36.18
Gliocladium sp.	-	31.25	9.52	4.67	18.52	-	17.14	11.59
Mucor mucedo	10.00	6.25	9.52	11.90	5.56	-	-	6.18
Penicillium funiculosum	-	3.13	9.52	-	-	-	-	1.81
Penicillium sp.	-	15.63	-	7.14	18.52	21.43	5.72	9.78
Phycomycetes fungi	-	-	-	7.14	-	-	11.43	2.65
Rhizoctonia solani	-	-	-	7.14	-	-	-	1.02
Rhizopus nigricans	10.00	-	4.27	4.76	7.41	-	8.57	4.62
Trichoderma harzianum	-	-	-	-	-	-	-	-
T. viride	-	-	-	9.52	3.70	-	-	1.89

3- Quantity and quality of date fruits:

The fruit quality criteria i.e. fruit weight, fruit diameter and length, pulp thickness, flesh weight, pulp/seed ratio were significantly affected by the intercropping. Monoculture of date palm produced the highest fruit yield/palm, followed by date palm intercropped with mango and mandarin and the lowest fruit yield/palm was obtained from date palms intercropped with clover (Table 3). Data also indicated that no significant differences between sole date palm and that intercropped with mango in number and weight of bunch. This result may be due to that palm tree has a big root system that may extend to 10m from trunk and 3-7m deep or to the water table level. This huge root system makes palm tree resistant to unfavorable conditions (Al-Rawi, 1998).

Concerning intercropping system, growing mango or mandarin under date palm resulted in the highest fruit yield/palm, compared to intercropping with clover. Intercropping Egyptian clover with date palm caused a significant reduction in fruit diameter. Monoculture date palm had the maximum fruit weight (25.8g), which significantly higher than other intercropping system. Intercropping mandarin with date palm caused a significant reduction in fruit diameter, weight and size by 6.2, 6.9 and 5.0%, respectively, compared to sole cropping.

Table 3: Effect of intercropping on date fruits characters(Average of two seasons).

Treatments	Number of bunches /palm	Weight of bunch (kg)	Yield of Palm (kg)	Fruit characters						Stone characters		
				D. (cm)	L. (cm)	D/L	Weight (g)	Size (cm^2)	% of fresh weight	Weight (g)	D. (cm)	L. (cm)
Palm only	9.8	14.86	145.6	2.9	5.2	0.56	25.8	26.50	90.1	2.55	1.1	3.3

Abbreviations: D., Diameter; L., Length;

The lowest stone weight (2.23 g) was recorded when date palm intercropped with mango. Intercropping of mango, mandarin or clover had insignificant effect on bunches number/palm and mean weight of bunch as well as on stone diameter and length (Table, 3). These results may be due to that the date palms were planted 7 meters apart, which provides ample space for intercropping. Steiner (1982) reported that the competition for resources between the crops in an intercropping system could be non-competitive, competitive or complementary.

Data in Table 4 indicated that higher and lower total sugars in fruits were obtained from pure stand date palm (85.3%) and date palm intercropped with mandarin, (68.8%). While higher tannins and total soluble solids were obtained from palms intercropped with Egyptian clover and mango, respectively (Table 4).

Data in Table 4 indicated that intercropping mango gave the highest net profit ($8213/ha./yr), followed by the same area (hectare) intercropped with mandarin ($ 3992/ha/yr) which caused increment by 139% and 16 %, over that date palm (pure stand=$3442/ha./yr), respectively. From our results, it could be concluded that intercrops with date palm can be more profitable than growing pure stands.

Similar finding was reported by Elmakki (2006) who stated that intercropping of alfalfa with date palm increases the income of one hectare up to US$ 3085/yr. they added that tomato gained the second most profitable crop that increase the date palm hectare net income to US$2,740. While, okra is the third profitable crops when intercropped with dates in canal irrigation that increases the income of 1 ha up to US$ 1621/yr.

Traditionally, intercropping with other fruit trees (citrus, pomegranates, olives, grapes, guava) or arable crops (alfalfa, barley, beans etc.) is practiced in many of the main production areas. Without the shade provided by the date palms other crops very often cannot grow.

Al-Yahyai (2009) reported that to make the best use of the farm, it was and still a common practice to grow cotton, maize, alfalfa, wheat, vegetables, and fruits between and under the palm trees. Most commonly in the level land is to interplant palms with citrus and alfalfa. According to the FAO paper, conditions in the old world often favor inter-planting. First, the sensitivity of some fruit crops like citrus to harsh conditions, such as the

high temperature, extremely cold or hot dry winds, and the strong sun make the date palm plantation shade the best way of producing high value fruit trees. Second, inter-planted is favored by small poor farmers who own an inherited a small date garden, thus planting some other fruit trees would provide an alternative income source. In addition, growing some of the fruit or fodder crop to be consumed by the household or provide income throughout the year is another perspective of practicing inter-planting in old palm orchards especially at early years of orchard establishment when the return from it is low. These inter-crops also improve nutrition status and the physical properties of the soil.

Table 4: Effect of intercropping on chemical constituents of date fruits and return per hectare/ year (Average of two seasons).

Treatments	Chemical properties						Return ($/ha/yr)				
	Sugars %			Acidity (%)	Tannins (g/100g FW)	Total soluble solids (%)	Date fruits	Second crop	Total	Costs	Net profit
	Total	Reducing	Non reducing								
Date palm	85.3	55.3	30.0	0.35	0.53	15.47	4459	-	4459	1017	3442
Date palm with mango	80.5	50.5	30.0	0.36	0.54	16.30	4177	6664	10841	2628	8213
Palm with mandarin	68.8	48.1	20.7	0.46	0.64	13.63	4140	2352	6492	2500	3992
Date palm with clover	73.3	41.7	31.6	0.46	0.65	12.35	3895	381	4276	1144	3132
LSD at 0.05	3.7	4.5	2.8	0.07	0.08	1.74	360	521	1215	210	472

Abbreviations: yr, year; FW, fresh weight
Return /hectare = number of trees/hectare X average yield in two seasons X mean price ($/ kg)
Income was calculated as: 204 palms x mean yield per palm for date palm X$0.151 , 204 trees X 74 kg X $0.445, for mango, 600 trees X 37 kg X $ 0.107 for mandarin, and for clover 4 cuttings X $ 128.16/ha.

The data in Table 4 showed that intercropping date palm with Egyptian clover resulted in decrement the net profitable per hectare by 9% (from $3442 to $3132). This reduction was attributed to the decrement of bunch number and weight and consequently decreased the total yield/palm. El –Halawany and Shaltout (1993) reported that date palm plantation which is intercropped with alfalfa, vegetables and fruit trees either lake of weed control or have some hand weeding.

4. Conclusion:

Evaluation of growing mango, mandarin or Egyptian clover with date palm indicated that growing mango with date palm as intercropping could be used for combating desertification in the sandy soil and significant cropping techniques in sustainable agriculture. Intercropping is utilized a number of environmental benefits, from promoting land biodiversity to diversifying agricultural outcome. This model integrates low (Egyptian clover), medium (mandarin or mango), and tall plants (date palm), as well as plants of short, medium, and long life cycles, including trees.

*Elham.sakr@yahoo.com

Abstract: The aim of the present work is to develop the 6201 alloy, which is the most used for conductor cables by adding different amount of Ce into Al-Mg-Si alloy namely (0.0, 0.024, 0.043, 0.054, 0.133, 0.166 and 0.194 wt% Ce) concentration. Sample alloys were homogenized by annealing at 540° C for various duration in range (½ to 5 hours), followed by water quenching. Tensile tests, hardness, electrical conductivity tests, microstructure characterization in Scanning Electron Microscope (SEM) have all been investigated as-cast and annealing. The results indicate that the alloys with Ce content make a more refined structure of grains and have higher tensile properties especially in range (0.043 to 0.054 wt% Ce) content and also hardly increase resistivity rather than the alloy which is free of cerium. [Journal of American Science. 2010;6(12):239-252]. (ISSN: 1545-1003).

Keywords: Tensile test, hardness, electrical conductivity, microstructure characterization

1. Introduction:

Aluminum and its alloys are characterized by a relatively low density, high electrical and thermal conductivities and a resistance to corrosion [1-3]. Many of these alloys are formed by virtue of high ductility [3], its ductility is maintained even at very low temperatures. The primary limitation of aluminum is its melting temperature (660°C). Mechanical strength of aluminum can be enhanced by cold work and by alloying [1,3]. Principle alloying elements are copper, magnesium, silicon, manganese and zinc. Aluminum is being widely used as a conductor material. The suitable alloy for aluminum conductors belong to Al-Mg-Si system with varied composition. Alloy 6201 is (Al- 0.8 Mg- 0.25 Si) designed for overhead conductor cables because it has excellent strength and good conductivity when suitably treated [4,5,6].

The use of rare – earth metal as a beneficial addition to nonferrous alloys has affected considerable interest in recent years. The rare – earth additions such as cerium have been claimed to led refinement of structure and improvement in mechanical properties. Rare – earth additions were also explored as a modifier to Al-Si alloys [7].

The main aim of the present work is the modification of the commercial aluminum alloy, AA6201 [Al- Mg- Si] to be used as conductor cable in our industries. For that a series of ternary master alloys [Al- Mg- Si] with different amount of cerium were prepared. A study of the effect of Ce content and heat treatment on the microstructure, the mechanical and electrical properties was made.

2. Experimental Technique:

Commercial aluminum of 99.8% purity, magnesium and silicon of high purity were used to produce a ternary alloy (Al- Mg- Si) in our investigations. The alloys were melted in a graphite crucibles open to atmosphere in a resistance furnace held at (700 – 800 ºC). The tested alloys were stirred well with a graphite rod, from time to time and long melting times were used to ensure dissolution, homogenization and uniform distribution of the alloying elements (Si & Mg) in aluminum. Cerium was added in the form of Al- Ce master alloy, the estimated amount of Al-Ce master alloy wrapped in aluminum foil, was plunged into the molten to produce a series of ternary alloys (Al- Mg- Si) with different amounts of Ce. The melt was stirred with a graphite rod then was poured in a steel mould to solidify in atmospheric air. The alloys were provided in the form bar of circular cross section of dimension 3 cm and length of 28 cm. Specimens test cut from the as cast rod with different dimensions for the required measurements before heat treatment.

For the tensile testing and resistivity samples were drawing into wires of 1 mm diameter. Solution treatment is the supersaturated solid solution of alloy structure is produced to take advantages of its precipitation hardening characteristics. Series of samples of each alloy were homogenized at a fixed temperature of 540ºC with annealing time of 30 minutes to 5 hours and thereafter immediately (within 30 seconds) quenched in cold water (at room temperature). The samples are then rinsed and left to dry the surface completely. Tensile test measurements were used as an indicator of mechanical response to heat treatment. The tensile machine used in this investigation is of type, (2wick-1425). All tensile measurements were performed on

wire of 40mm length and 1mm diameter at room temperature. All the specimens had been heat treatment before using.

Hardness measurements were used as an indicator of mechanical response to heat treatment. The sample hardness was measured using Vicker's micro Hardness Tester Shemadzu. All hardness measurements were performed on a block of 5mm thickness at load of 200g and the pressing time is 5 seconds. The sample hardness was measured immediately after heat-treatment.

Microstructures of the as cast samples from each alloy were examined by conventional optical microscopy after mechanical polishing of the specimen followed by etching solution is about 20% hydrofluoric acid in distilled water. The etching was done by immersing the samples into the solution and waiting until a suitable contrast of the grains was obtained. The etched samples were washed, dried and scanned with SEM type. Joel JSM, 5410 to identify the existing phases, their shapes, and size distribution. To obtain further micro structural information, SEM is well suited to identify the existing phases, their shapes, and size distribution. Such investigation was carried on a series of Al- Mg- Si alloys without and with different cerium amounts of 0.024, 0.043, 0.054, 0.133, 0.166 and 0.194 wt% respectively. The tested specimens were solution heat-treated at 540º C for different times ranging from 0.5 hour and the water quenched.

Microstructure of both as-cast and solution heat-treatment alloys were characterized by Scanning Electron Microscopy (SEM) after polishing and etching.

3. Results and Discussion:

The microstructures of the tested alloys were examined by SEM as shown in Fig1, a-g. It can be observed that, the addition of cerium affected the microstructure development in the Al- Mg- Si alloy in various ways. Firstly, for Al- Mg- Si alloy without cerium, the alloy is composed of the primary α matrix and a secondary phase that exists in two kinds of morphologies, i.e. a discontinuous network of coarse particles along grain boundaries Mg_2 Si, and many spherical Si particles that distribute both inside grains and at grain boundaries, as shown in Fig.1, a. Secondly, after adding cerium Fig.1, b, β particles were refined. However, a new kind of distribution characteristics from β precipitate in the alloys with Ce, these particles generally have rod-like shaped and do not have an obvious tendency to distribute in grain [8,9]. The β- phase is found at the grain boundaries as a network of precipitates as observed in Fig.1 b-g. These precipitates depend upon the amount of cerium in the alloys with 0.043, 0.054 and 0.194 wt% {Fig.1, c,d and g}, there are less of spherical particles surrounded by much and continuous rod- shaped precipitates at grain boundaries. While, in alloys with (0.024, 0.133 and 0.166 wt%), there are much discrete spherical particles can be observed either in grains or along grain boundaries, furthermore there are still some rod- shaped precipitates at grain boundaries.

The morphology of all tested alloys (without and with Ce) are changed after the homogenization process as shown in the figures from Fig. 2, a-b to Fig. 8, a-d. The rods like β particles are gradually replaced by a uniform dispersion of new particles. With increasing homogenization time these particles are nucleated and grown. Therefore, the microstructure was found to have a new grains formation. The islands of new formed particles are thickened and spherodized at the expense of the remaining β- phase. At certain annealing time for each alloy, the formation of a homogeneous finely dispersed microstructure occurred. We can conclude that, the suitable time for the concentrations (0.024, 0.043, 0.054 and 0.194 wt% Ce) is 3 hours and it is 0.5 hour for the alloys with the concentrations (0.0, 0.133 and 0.16 wt% Ce). While, further annealing time, (i.e. the number of particles become fewer and bigger caused by coarsening [10].

Tensile testing measurements were carried out for as- received wires of each composition at room temperature as shown in Fig.9. It can be seen that the value of tensile testing for the samples containing Ce addition up to 0.194 wt% is higher compared to the Ce free alloy. The tensile strength and hardness increased from (333 and 70.18 N/mm^2) for the Ce-free alloy to (368.65 and 102.28 N/mm^2) for that containing 0.054 wt% Ce. Further additions up to 0.054 wt% Ce, have little effect on the tensile properties and hardness while, the maximum tensile strength was reduced to (337.436 and 71.27 N/mm^2), when the Ce content was further increased to 0.194 wt %.

Meanwhile, with increasing Ce content in the present alloys, the elongation was decreased compared with the Ce- free alloy. The elongation of alloys with contents 0.043 wt% and 0.194 wt% Ce respectively, were generally lower than that of other alloys. It can be concluded that increasing the Ce content increased the tensile strength and hardness but a slightly decreased in the elongation, compared to the alloy without cerium. This can be accounted due to in Al-Mg-Si alloy, to form the stoichiometric constituent the Mg and Si, which is the primary hardening phase. Any excess of silicon above the required Mg_2Si will contribute significantly to hardening [11].

Distribution of the Mg_2Si inter-metallic around the grain boundaries as was indicated in Fig.1, a in SEM. This kind of distribution of the related inter-metallic phases decreases the mechanical properties of the metal [12].

The addition of cerium improves the mechanical properties, this is ascribed to the grain refining effect during casting as previously shown from SEM micrographs. Also showed the best grain refining which can be obtained when the content of Ce is in the range (0.043-0.054 wt%). The structure refinement is one of the most important methods for improving the strength of alloys [13,14] besides the presence of spheroidal silicon particles and inter-metallic compounds of cerium (Al_2Ce, Al_4Ce,SiCe and $SiCe_4$) [15].

Cerium has low resistivity coefficients and atomic radii that are relatively different from that of aluminum. These characteristics cause solute element to react with crystal defects such as dislocations and grain boundaries and enhance the mechanical properties of the base metal favorably [16]. It has also been reported that Ce reduced the interdendritic spacing of the alloy which can resist the movement of dislocation. In addition, the strengthening effects of Ce atoms segregated at the grain boundary have the contribution of keeping the highest tensile properties. That is, to say, the main reason that makes the segregation of Ce atom at grain boundary increases the sliding resistance of the grain boundary increase the mechanical properties. On the other hand, it is found that an excess of Ce > 0.054 wt% can reduce its useful effect [17].

All the alloys investigated which contain Ce have the highest strength accompanied by low ductility compared to alloy without cerium. The low ductility is due to the addition of cerium, which dissolves in the aluminum matrix and contributes to the formation of insoluble inter-metallic phase is after solidification [18].

The influences of solutionizing time on the mechanical properties tensile strength, hardness and ductility of the Al-Mg-Si alloy at different Ce content in the range 0.0 wt% - 0.194 wt% are presented in Fig.10, a-c. It can be clearly observed from the figures that, after the homogenization temperature, the changing tendency of tensile testing is different to that at room temperature (unhomogenized alloy). It was observed that solutionizing time causes decreasing on the mechanical strength although the positive influences may be observed on ductility of these alloys depending on the solutionizing time of each composition as seen in Fig.10, a, b, and c. The ductility reaches its maximum value at 3 hours for 0.024, 0.043, 0.054 and 0.194 wt% Ce alloys and at 0.5 hour for (0.0, 0.133 and 0.166 wt% Ce) alloys. Beyond this time the ductility decreases gradually with annealing time as shown in Fig.10, c.

All alloys homogenized and quenched exhibited reduction in both the tensile strength and hardness but the elongation associated with the measuring of homogenized alloys is higher than the unhomogenized . The observed improvement in ductility and the reduction of strength depends on the solutionizing time or soaking time which is applied at the specified heat-treating temperature to provide the chance for the dissolution of undissolved soluble phases and to achieve a homogeneous microstructure [18]. It was found that the mechanical properties change as a function of time as a result of morphology change as shown from SEM photographs. The micro structural development changes for all alloys during the phase transformation of β to α. The rod-shaped particles (β) are gradually replaced by a new uniform dispersion of particles. The solutionizing time, however, is not a constant but affect on particle size, particle geometry, and depend on overall composition [19]. So, it is important to keep the grain size largely unchanged before anneal, because the size of the grains affects the plastic deformation of materials. Shortened anneal time 3 hours for (0.024, 0.043, 0.054 and 0.194 wt% Ce) alloys at 0.5 hour for (0.0, 0.133 and 0.166 wt% Ce) alloys and at annealing temperature 540ºC were efforts to minimize the grain size as in Table (1). Further increasing in the homogenization time, the thickness of the particles increase as a result of coarsening mechanism, which may have a negative effect on the ductility, because the dislocations only flow around particles smaller than a critical size. It is found that the rate of the transformation is affected by the particles size of the alloy; if the particles are spheroidal and smaller, the dislocation may loop around the particles, thereby increase the ductility, and the material is easier to extrude [20].

The calculated values of resistivity are summarized in Table (2), it can be observed that the resistivity increases but the variation is low for the unhomogenized samples.

The increasing in resistivity can be interpreted as; the resistivity is a consequence of disturbances in the atomic periodicity in a crystal structure according to the Block model [21]. These disturbances can be due to atomic vibrations thermal agitation, other electrons, defects in the crystals such as vacancies dislocations or grain boundaries, or substitution of impurity atom in the pure metal lattice sites. The most important of these effects is from the alloying elements in solid solution. The elements such as : Fe, Co, Ni, Sb, La, Ce, Cd, TH, mischmetal "least detrimental to conductivity" forms eutectic phase diagrams at the aluminum-rich end. The eutectic reactions expressed by L à α + β. This is in agreement with the microstructures observed in SEM investigation. The group of elements least detrimental to conductivity form inter-metallic compounds which remain out of solution. The compounds precipitate in the grain boundaries and leave the alpha aluminum almost pure. This helps the alpha to become pure where, in this pure state, it takes the major burden of the electron transport and thus hardly increases the resistivity [22, 23].

Elements in the solution can only be least detrimental to conductivity if they have similar electronic structure to that of aluminum. The rare earth elements, such as cerium have similar electronic configuration, in the solution in an aluminum matrix, produce a very low differential change in the resistivity of aluminum this gives the best bonding with the largest free energy [24]

Table.1-a: Variation of tensile strength, hardness and ductility of Al-Mg-Si alloys for different Ce contents

Ce content (wt%)	Tensile strength	Ductility	Hardness
0	333	6.603	70.18
0.024	345	6.01	72.38

5	40.96	44.5	39.875	41.025	37.17	47	42.85

Also, the solubility is controlled mainly by the ratio of atomic size solvent and solute. If the difference in atomic radii between two elements is less than 15% then there is a large chance of making extended solid solution. In case the difference is greater than 15% solubility is always low [22]. Thus with unfavorable size factor the alloy element will be out of solution generally as a compound. Elements out of solution form small separate particles of low conductivity, but also occupy a very small volume percent of the alloys, and thus have maximum effect on the conductivity. Ce is an example that elements least detrimental to conductivity generally have atomic radii differing widely from that of aluminum.

The low alloy content, the resistivity can be kept reasonably.

For the homogenized samples as seen from Table (2), the general behavior observed is an increasing in resistivity with annealing time. It has been known for a long time that, the resistivity increases nearly linearly with concentration of the alloying elements in solid solution. This explains the increasing in the resistivity at higher homogenization time [26]. The quench itself often produce lattice strain and this is usually considerably increased the electrical resistance [27] as pointed in Table (2).

5	3.44	3.83	3.98	4.83	3.76	3.55	3.54

4. Conclusion:

SEM shows that Al- Mg- Si alloy (free Ce) has two kinds of morphologies, Mg_2Si along grain boundaries and round particles that distribute both inside and at grain boundaries. The addition of Ce, a new rod-shaped have an obvious tendency to distribute at grain boundaries and grain refinement the alloys.

All the alloys investigated which contain Ce having the highest strength companied by low ductility compared to alloy free Ce. The improvement of mechanical properties is ascribed to the grain refining. On the other hand, the tensile strength and hardness show a more increase with a suitable Ce addition in the range (0.043 to 0.054 wt%) which have major grain boundaries and the best grain refining, excess of Ce > 0.054 wt% reduce its useful effect. Meanwhile the lowest ductility is due to the formation of insoluble inter-metallic compound in the aluminum matrix.

It is found that Ce form eutectic reaction at the aluminum end of the phase diagram and has electronic structure similar to that of in solution, in an aluminum matrix that due to hardly increases resistivity. Although, the large difference in the atomic radii between Al and Ce but a very low contents are less damaging to conductivity. The quench itself often produces lattice strain and this is usually considerably slightly increased the electrical resistance.

The Role of some Natural Soil Conditioner and AM Fungi on Growth, Root Density and Distribution, Yield and Quality of Black Monukka Grapevines Grown on Calcareous Soil.

[*1]Mervat, S. Rizk-Alla and [2]Hager, I. Tolba

[1*]Hortcultural Research Institute, [2]Microbiology Dep., Soils, Water & Environment Research Institute, Agricultural Research Center, Giza, Egypt.

Abstract: The current research was carried out during two successive seasons (2007 and 2008) on ten years old Black Monukka grapevines to disclose the role of some natural soil conditioners namely, humic acid (HA), Nile fertile (NF) and AM fungi (AM) in a single application or in combined mixture growth, root density and distribution, yield and quality of Black Monukka grapevines grown under calcareous soil in a private vineyard in Nobaria at Cairo-Alexandria Desert Road; the results showed that all different soil conditioners were effective but the treatment of humic acid at 15 ml/ vine (HA1) + Nile fertile at 200 g/ vine (NF1) + AM fungi gave the best results in comparison with other treatments and control. This treatment enhanced the growth characters namely total leaf area/ vine, shoot diameter and coefficient of wood ripening, total chlorophyll, NPK% of the leaves and total carbohydrates of the canes. Also, the vines of this treatment produced the heighest fibrous root fresh weight, larger number and longest fibrous root. With respect to microbiological activity in the rhizosphere, it was noticed that the best AM infection %, no. of AM spores /g dry soil, total microbial count, phosphatase and dehydrogenase enzymes activity were obtained by the same treatment. From the economic point of view, this treatment was accompanied by the highest yield and best its components namely physical and chemical characteristics of bunches and berries. Under such promising treatment the adverse effects of calcareous soil on growth and production of vines could be overcome. [Journal of American Science. 2010;6(12):253-263]. (ISSN: 1545-1003).

Keywords: grapevine; humic acid (HA); Nile fertile (NF); AM fungi (AM); microbiological activity

1. Introduction:

In Egypt different types of new reclaimed soils particularly calcareous soils have an alkaline reaction. Application of some mineral fertilizers may be ineffective because of the expected problem of its availability, where phosphorus are fixed in insoluble forms and become unavailable to plants. Phosphorus deficiency may be limit plant growth than do nitrogen deficiency (Awad, 1999). In addition, grape tree grown on calcareous soil developed in many instances chlorotic symptoms. This lime induce chlorosis is due it iron (Fe) deficiency whereas, micronutrients e. g. Fe, Mn and Zn are unavailable under condition of high soil pH and $CaCO_3$ content (Clark and Kajiura, 1986).

Humic acids (HA) have been found to a profound effect on not only the biological activity and soil structure, but also on the plant itself. This is due to their positive effect on plant nutrients uptake, increasing the productivity of fruit crops due to the conversion of unavailable minerals into soluble forms that plants can use (El Fakharani, 1999). Agricultural (HA) are reputed to enhance drought tolerance, seed germination and overall plant performance (Morales-Payar and Stall, 2003).

Cheng *et al.,* (1998) reported that, humic acids decrease the loss of soil moisture, enhance water retention, increase the ability rate of wheat leaves for photosynthetic process and also increase root growth in a manner similar to auxins. Where the soil pH is high, correction of Fe, Mn and Zn deficiency can be attempted by adjusting pH with acidifying compounds such as elemental sulphur (Clark and Smith, 1986). Whereas, sulphur is oxidized by soil microorganisms, such as *Thiobacillus* spp. Bacteria which, consider as the most important microorganisms involved in the bioleaching of sulphide compounds to sulphuric acid in amount enough to decrease soil pH, improve availability of most soil nutrients and uptake by plant, enhancing root development and increasing the activity of soil microorganisms (Kassem *et al.,* 1995). Ibrahiem (2003) found that fertilizing the vines by Nile-fertile (263 g/vine) gave the highest yield and best quality of berries of flame seedless grapevines.

Arbuscular mycorrhizal (AM) fungi are ubiquitous soil organisms that can form mutualistic associations with the roots of the majority of vascular plant species (Lindermann, 1988). The establishment of AM association is often beneficial for plant nutrition especially enhance absorption of phosphours and other relatively immobile micronutrients cations, particulary zinc and copper (Marin *et al.,* 2003) also AM fungi produce plant

growth hormones such as auxines, cytokinines and gibberellins (Zhang *et al.*, 2008), increasing water uptake (Graham *et al.*, 1987). AM fungi may also confer tolerance and resistance to various abiotic and biotic stresses to the host plant (Colla *et al.* 2008).

Black monukka is one of the table grape cultivars; ripens in mid July to late Agust, seedless, sweet, crispy, purplish-black coloured, tender skin. The production of small to medium berries and loose bunches are negatively reflected on bunch quality (Harry *et al.*, 1991)

Therefore, the main objective of this study is to evaluate the possible effects of humic acid, Nile fertile, AM fungi and their combination on growth, vine nutritional status, yield/vine and quality of black Monukka grapevines grown in a calcareous soil.

2. Materials and Methods

The current study was carried out during two successive seasons (2007 and 2008) in a private vineyard in Nobaria using 10 years old Black Monukka grapevines. The chosen vines grown in a calcareous soil (Table 1).

1- Lay out of the experiment:

Spaced between each vine lines at 2X 2.5 meters a part and irrigated by the drip irrigation system, cane-pruned and trellised by the double T shape system. The vines were pruned during the second week of January with bud load of 60 buds/vine. 144 uniform vines were chosen. Each four vines acted as a replicate and each three replicates by one.

All vines were subjected to the normal horticultural practices. Nitrogen (60 kg N/ feddan), potassium (100 Kg K2O/feddan) and phosphorus as phosphoric acid (1 liter/2 weeks) were added. Chelated Fe, Zn and Mn at rats of 200 g, 100 g and 100 g respectively per 600 liter water sprayed two times, once 10 days before anthesis and the other after fruit set (at 3-4 mm berry diameter).

The randomized complete block design was followed the tested treatments that evaluated through the following parameters:

Twelve treatments applied as follows:

- T1- Control (untreated vines).
- T2- P-humex acid at 15 ml/ vine (HA1).
- T3- P-humex acid at 30 ml/ vine (HA2).
- T4- Nile fiertile at 200 g/ vine (NF1).

- T5- Nile fiertile at 300 g/ vine (NF2).
- T6- AM fungi.
- T7- HA1 + AM fungi.
- T8- HA2 + AM fungi.
- T9- NF1 + AM fungi.
- T10- NF2 + AM fungi.
- T11- HA1 + NF1.
- T12- HA1 + NF1+ AM fungi.

Humic acid (HA) content in the liquid organic fertilizer was determined using $BaCl_2$ precipitation method as described by (Fataftah *et al.*, 2001). P-humex acid (HA) contains 25% humic acid, 2% N, 4% P_2O_5, 6% K_2O, 0.2% Fe, 8.9 pH, 45.22 organic matter, 300- 500 meg/ 100g CEC and 1.25 Kg/L density. Humic acid was added at the rate of 15 or 30 ml/vine (according to Ali *et al.*, 2006) on the soil surface after bud buest.

Nile firtile (NF) contains 38% S, some essential elements, (2.7 % N, 3.5% P, 1.2% K, 5% Ca, 2.7% Mg and 1% Fe) and sulphur bacteria, *Thiobacillus* spp. (10^6 CFU/gm). Nile fertile was applied once during winter agricultural management by mixing with soil in the wetting zone adhesive to the root at a recommended rate 200 or 300 g /vine (Ibrahiem, 2003)

AM fungi inoculum: mycorrhizal spores that contained the mixyure of the following genera; *Glomus, Gigaspora* and *Acaulospora* were extracted from Egyptian soil. Extraction and counting of identified mycorrhizal spores were carried out according to the method described by Massoud (2005). The extraeted mycorrhizal spores were mixed with sterilized peat as a carrier (250 spore/gram) and then applied to the soil at a rate of (100 g inocula /m long) so each vine diameter was 2.5 m. so, each vine needed 250 g inoculums.

Growth characters:

Total leaf area /vine (m^2) was determined by multiplying average number of the leaves/ shoot by average leaf area then by the number of shoots per vine. Ten shoots/ vine were labeled to determine the average shoot diameter (mm) and determine the wood ripening coefficient by dividing the length of the mature part of the shoot by total shoot length (Bouard, 1966).

Root system measurements:

Fibrous root density (root fresh weight and total number) was determined in soil samples taken with augar to make a hole of 10 cm in diameter (auger volume = 1153.8 cm^3) and 30 cm depth form four directions at 50 and 100 cm away from vine trunk. Soil sample were taken in late Novamber, average weight per hole was calculated as gm/ hole according to Cahoom *et al.,* (1959). Average length of roots (cm) was determined.

Chemical determinations:

leaf content of total chlorophyll was measured using nondestructive Minolta chlorophyll meter SPAD 502 of the 5^{th} and 6^{th} leaves (Wood *et al.*, 1992) Cane content of total crbohydrates (%) was determined according to (Smith *et al.*, 1956) leaves opposite to the clusters were collected then dried to estimate N, P and K percentages according to (Jackson, 1973).

Yield, clusters and berry characteristics:

Clusters were picked when TSS of each treatment reached about 16- 17% (Tourky *et al.*, 1995). Yield/ vine (kg), cluster weight (g), berry weight (g), berry size (cm^3). Shattering (%) was determined on clusters stored for seven days at room temperature (28 to 32 C^o), Shattering (%) was calculated by dividing weight of Shattering berries by the initial weight of the clusters. T.S.S. (%) was estimated by a hand refracto-meter, total titrable acidity as tartaric acid (%) A.O.A.C. (1985), T.S.S./ acid and total anthocyanin of berry skin (mg/ 100 g fresh weight) was estimated as described by Yildiz and Dikman (1990).

Microbiological parameter:

Arbiscular mycorrhizal infection was determined according to method described by (Massoud, 2005). Spores number after each season was also counted according to (Massoud, 2005). Total microbial count (--- X 10^6 CFU/g soil), dehydrogenase (µg TPF/ g dry soil/ day) and phosphatase enzyme activity(IP /g/ dry soil/ day) were also determined according to the methods described by (Esher and Jensen 1972, Salman 1967 and Drobnikova 1961)

Data obtained were statistically analyzed according to Snedecor and Cochran (1980) using the New L.S.D. test for examining the significant differences between the studied treatments.

3. Results and Discussion:

1- Vegetative growth parameters:

Obtained data in table (2) showed, vegetative growth parameters of Black Monukka cv. as affected by humic acid, Nile fertile and AM fungi and their combinations. The data revealed that, all treatments improved the growth parameters compared to the control. However, it is worthy to notice that, the effect of single application of this soil conditioner was significantly lower compared to the combined application of these materials. However, the highest values of total leaf area/ vine, shoot diameter and coefficient of wood ripening were detected in case of vines treated with (HA1 +NF1+

AM fungi) amounting to 21.8 and 22.5 m^2 for total leaf area/vine, 8.0 and 8.6 mm^2 for shoot diameter and 0.86 and 0.89 for coefficient of wood ripening in both seasons respectively. While, the lowest values were recorded with the control 15.2 and 16.5 m^2 for total leaf area/vine, 6.0 and 5.6 mm^2 for shoot diameter and 0.63 and 0.61 for coefficient of wood ripening in both seasons respectively.

The obtained increasing in vegetative growth parameters recorded with the treatment (HA1 +NF1+ AM fungi) this might be due to the role of humic acid in modifications in the soil-root interface that make the nutrients more available to plants (El Fakharani, 1999) and humic acid improved plant vigour and health (Kassem *et al*., 1995).

Table (2) Effect of soil condition with humic acid, nilefirtile and AM fungi application on some characteristics of vegetative growth of Black Monukka grapevines during 2007 and 2008 seasons.

Treatments	Total leaf area/vine (m^2)		Shoot diameter (mm^2)		Coefficient of wood ripening

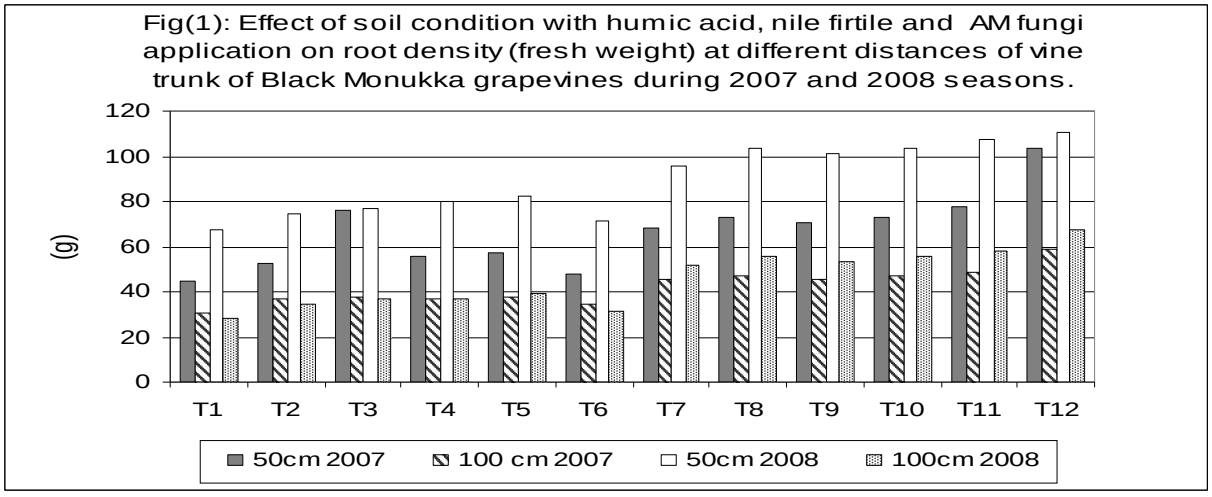
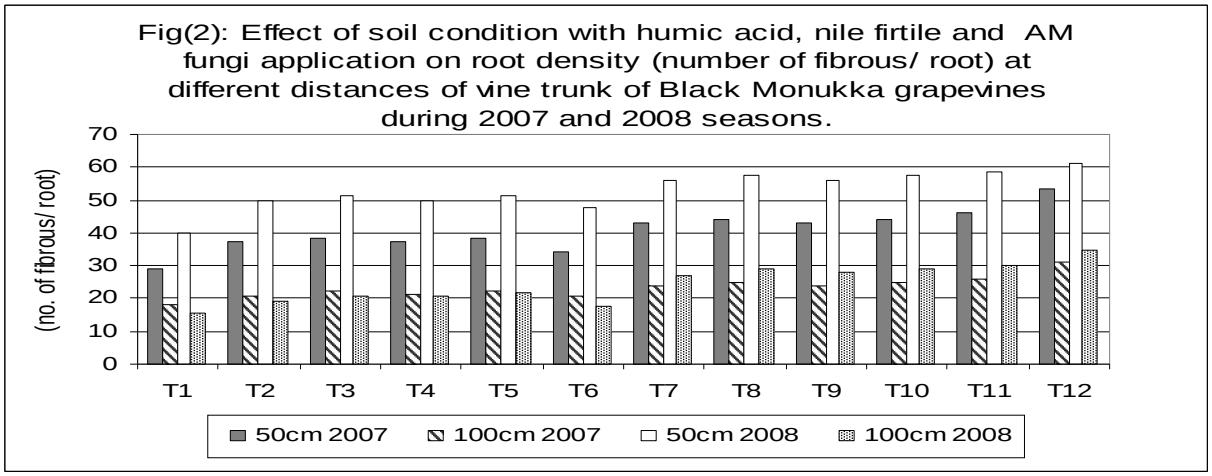
With respect to Nile fertile, it is considered as a soil conditioner, reducing pH, due to acid bacteria that *Thiobacillus* spp. bacteria where, the mechanisms for the growth of *Thiobacillus* spp. bacteria on sulphur is proposed. Initially, the bacteria attach to the sulpher particles and start oxidizing it and the number of attached bacteria increased with time, resulting an increase in the rate of generation of partially simple oxidized sulpher compounds. The sulphur compounds are consumed by plants that contribute on its growth and yield (Bhavaraju *et al.*, 1993). Also increased availability of most nutrients and increasing organic mater (Ibrahiem, 2003) could explain these results with respect to AM fungi that produced enzymes that enhance the respiration efficiency of the root (Zhang *et al.*, 2008) and he also noticed an increase in plant growth due to the improved uptake of elements. However, the colonization with AM fungi gave more repaid growth and increased plant biomass, plant height, leaf area than the non inoculated plants. The findings are in the same line with those of El Shenawy and Fayed (2005), Hussien *et al.*, (2005), Omar (2005) and Ali *et al.*, (2006) who reported that humic acid enhance vegetative growth, Ibrahiem (2003) and Rizh-Alla *et al.*, (2006) who reported that Nile fertile recorded the maximum values of vegetative growth. As for the effect of AM fungi Abd El Wahab *et al.*, (2008) found that dual inoculation with AM fungi increased the vegetative growth parameters.

2- Root system measurements:

a- fresh weight and numbers:

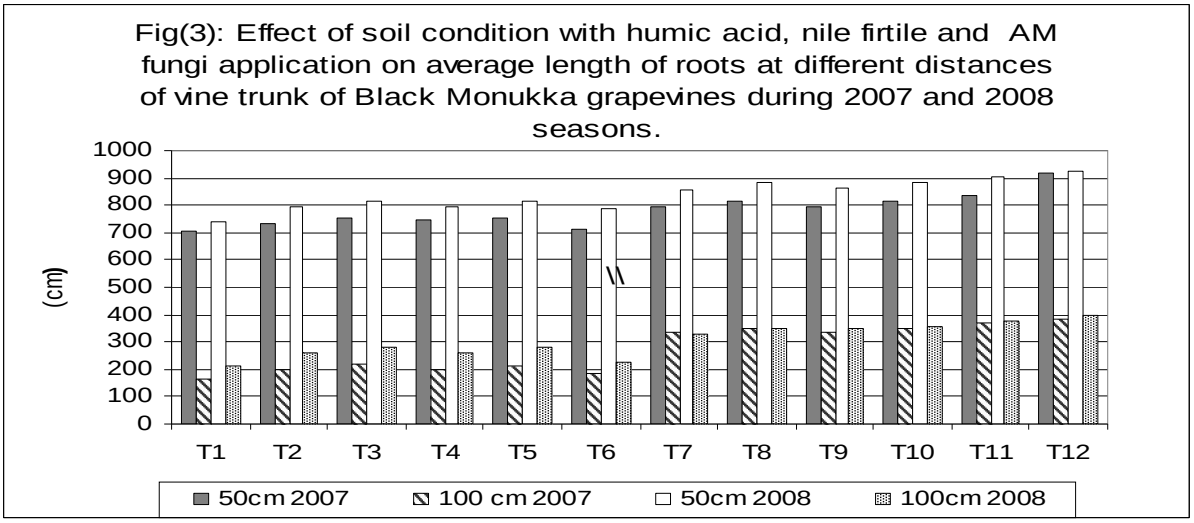
Data of figs (1 and 2) indicate that, vines of applicated with (HA1 +NF1+ AM fungi) produced the highest fibrous roots fresh weight (gm/ hole) at 50 and 100 cm a way from vine trunk and gave highest numbers of fibrous roots in both seasons. On the other hand, untreated vines produced the least fibrous roots fresh weight. While, the other treatments were intermediate.





b- Root distribution:

Distribution of the roots in the soil profile are important to know the volume of wetted root zone, fig (3) show that the treatment (HA1 +NF1+ AM fungi) recorded the longest roots. On the other hand untreated vines had the least values, while the other treatments gave intermediate values in this respect.



Generally, this treatment gave better and larger rooting area in soil. The greatest amount of roots and longest was observed in the 50 cm distance from the vine trunk compared with in the 100 cm distance from the vine trunk.

The obtained root results of this treatment could be attributed to the humic acid has high water-holding and affects the physicochemical properties of soil, which are important in controlling the uptake of nutrients, their retention and counteracting soil acidity (Hartwigsen and Evans, 2000).

The beneficial effect of Nile fertile on increasing the root formation could give an explanation for the present results. These results are in agreement with those obtained by Ahmed *et al.,* (1994) and Ibrahiem (2003).

Vitagliano *et al.,* (1999) showed that, AM fungi increased the growth of rooted cutting of olive cultivar, via an increase in lateral root frequency. It has been recognized that AM fungi symbiosis play role in nutrient cycling in the ecosystem and also protect plants against environmental conditions and stress (Barea and Jeffries, 1995).

3- Chemical determination:

Results presented in Table (3) revealed that total chlorophyll, total carbohydrate content of the canes and percentages of total nitrogen, phosphours and potassium of the leaves were increased significantly by the different treatments. Also, it can be noticed that the application of (HA1 +NF1+ AM fungi) generally resulted in higher values of these parameters as compared to uninoculated vines and the other single application of these materials in the both seasons.

Table (3) Effect of soil condition with humic acid, nile firtile and AM fungi application on total chlorophyll, total charbohydrates, leaf N, P and K % contents of Black Monukka grapevines during 2007 and 2008 seasons.

Treatments	Total chlorophyll (mg/ g F.W)		Total carbohydrates (%)		N%		P%		K%

The obtained results could be interpreted in view of the effect of humic acid and Nile fertile on enhancing the metabolism process of carbohydrates as well as its effect on reducing soil pH which by their turn could be responsible for increasing the availability of nutrients. Also, AM fungi produced enzymes that enhance the respiration of root (Edrees, 1982). AM fungi are able to absorb and translocate elements to host root tissues (Mona, 2001), AM fungi increase nutrient uptake by reducing the distance at which nutrients must diffuse to plant roots (Rhodes and Gerdemann, 1975). AM fungi improved nutrition mode possible by extensive hyphae network. This not only allows the plant to overcome phosphorus depletion from the zone around the root, but also allows it to reach immobile phosphorus that the fungus can solubilize. This phenomenon is most apparent in soils low in phosphorus. (Zarb *et al.,* 1999).

The obtained results are nearly similar to those achieved by several investigators who reported that humic acid enhance these contents El Shenawy and Fayed (2005); Hussien *et al.,* (2005); Omar (2005) and Ali *et al.,* (2006).

As for the effect of Nile fertile, Ibrahiem (2003) and Rizk-Alla et al., (2006) pointed that Nile fertile significantly increased these contents. In addition, some researcher found that AM fungi increased chlorophylls content of leaves El-Sharkawy (1989) and increased carbohydrate content of canes

and leaf mineral content Abd El-Wahab *et al.,* (2008).

4- Yield, cluster weight and some physical characteristics of berries:

Yield and cluster weight in general was significantly increased by all applications compared with control Table (4). The application of (HA1 +NF1+ AM fungi) resulted in the highest values of this estimate (9.0, 9.5 kg/ vine and 422.5, 451.3 g) for both seasons respectively. Whereas, the lowest values were obtained from untreated vines, this recorded (7.91, 8.36 kg/ vine and 383.7, 401.1 g 0for both seasons respectively.

Also, this application gave the best results of physical properties of the berries in terms of increased berry weight, berry size and reduced berry shattering compared to the control. However, it is worthy to note that, the single application of humic acid, Nile fertile or AM fungi were significantly lower compared to the combined application of these natural soil conditioner.

The beneficial effect of these materials on yield, cluster weight and some physical properties of berries could be attributed to its vital role in lowering soil pH. Consequently, vine growth and nutritional status (tables, 2 and 3) are being improved cluster weight, increasing yield/ vine and improved the physical properties of berries.

The obtained results are in agreement with those reported by Zhu and Zhu (2000); Hussien *et al.,* (2005) and Ali *et al.,* (2006) who found that humic acid applications significantly increased berry physical properties. As for the effect of Nile fertile Ibrahiem, (2003) found that Nile fertile improved physical properties of berries. Moreover, Abd El-Wahabe *et al.,* (2008) pointed out that yeast and AM fungi gave the best physical properties of berries.

Table (4): Effect of soil condition with humic acid, nile firtile and AM fungi application on yield and some physical characteristics of berries of Black Monukka grapevines during 2007 and 2008 seasons.

5- Chemical properties of berries:

Data in table (5) indicated that, there were significant differences between all treatments than control concerning the chemical properties of berries. Moreover, the application of (HA1 +NF1+ AM fungi) improved the chemical quality of berries in terms of increasing the total soluble solids, total soluble solids/ acid ratio and anthocyanin contents of berry skin and reducing the total acidity than the sole application of these materials in the two seasons of the study.

The enhancing of humic acid, Nile fertile and AM fungi on chemical properties of the berries may be ascribed to its role in achieving a good balance between growths and fruiting through nutrients availability in soil which is reflected by its turn on increasing the accumulation of total carbohydrate and resulting the stimulation of ripening. These results are in accordance with those obtained by Li-Nan *et al.,* (1999) Zhu and Zhu (2000) and Ali *et al.,* (2006) who found that humic acid improved the chemical properties of berries. Moreover, Ibrahiem (2003) found that Nile fertile enhancing the chemical properties of berries. As for the effect of AM fungi, Abd El-Wahab *et al.,* (2008) pointed out that AM fungi gave the best chemical properties of berries.

Table (5): Effect of soil condition with humic acid, nile firtile and AM fungi application on chemical characteristics of berries of Black Monukka grapevines during 2007 and 2008 seasons.

6- Microbiological studies:

Regarding to data in table (6) all treatments caused a significant increase in AM infection % in comparison to control, the best increase was caused by the application of (HA1 +NF1+ AM fungi) in the two seasons of the study, this was recorded 95.33 and 100.00 respectively. This finding indicates that AM fungi may solublize the surrounding weatherable mineral through execration of organic acids such as α-ketoglutraic acid. These organic acids could exert a selective influence on soil microbial communities (Abd El-Wahab *et al.*, 2008).

Moreover, no. of AM spores in soil was significantly increased especially in treatment (HA1 +NF1+ AM fungi) in the two seasons of the study; this was recorded 1022.2 and 1340.0 respectively. These findings are in the same line with those obtained by (Turk et al., 2006) who pointed out that AM fungi colonize plant roots and mainly in the surrounding soil extending the roots depletion zone around the root system and consequently completed its life cycle and obtained plenty of resting spores in soil.

The total microbial count was the same line of increasing especially in the application of (HA1 +NF1+ AM fungi) in the two seasons; this was recorded 81.60 and 93.61 respectively. These results are in agreement with those obtained by (Linderman and Pfleger, 1994) who explained that AM fungi is capable of increasing nutrient content which act as a suitable media for most rhizopheric microorganisms in general. On the other hand, Godeas *et al.*, (1999) explained that the increases in populations of rhizospheric microorganism in roots of most plants are influenced by a combined inculation of microorganism and AM fungi.

Also, phosphatase enzyme activity was significantly increased in all treatments especially in treatment (HA1 +NF1+ AM fungi) in the two seasons of the study, this was recorded 35.33 and 38.00 respectively. These results are in agreement with those obtained by (Hetick, 1989) who found that mycorrhizal hyphae can provide access to insoluble nutrient sources through enzyme activity or some physical or chemical modification of the rhizosphere. The inorganic phosphours compounds can first be hydrolyzed by phosphatase enzyme which mostly originates form plant roots, through the action of fungi and bacteria.

The same increase was observed in dehydrogenase enzyme activity in all treatments in comparison to control where the best increase was caused by the application of (HA1 +NF1+ AM fungi) during the two seasons, this was recorded 113.67and 133.67 respectively. The increase in dehydrogenase enzyme activity was attributed to the intense activity of microflora as a mixture of biomass (Massoud, 2005).

Table (6): Effect of soil condition with humic acid, nilefirtile and AM fungi application on AM infection %, No of AM spores , No of AM spores and Phosphatase enzyme activity and Dehydrogenase activity in rhizospheric zone of Black Monukka grapevines during 2007 and 2008 seasons.

Treatments	AM infection %		No of AM spores /g dry soil.		Total microbial countX106 CFU/gdry soil		Phosphatase enzyme activity(P /g/ dry soil)		Dehydrogenase enzyme activity (µg TPF/ day/ g dry soil).

7-Econimical evaluation of the recommended treatment (HA1 +NF1+ AM fungi) compared with control:

Data shown in table (7) clearly indicate that the application of (HA1 +NF1+ AM fungi) gave the maximum net profit compared with the control in both seasons. The very slight raise in the cost of production/ feddan over control for this treatment is economically justifiend in view of the higher price of the yield obtained from this treatment.

Table (7): Some economical data on costs and profit per fed of the recommended treatment (humic acid, nile firtile and AM fungi) compared to control.

Season	Price of humic acid (L.E.)	Price of nile firtile (L.E.)	Price of AM fungi	Labour cost (L.E.)	Total cost (L.E.)	Increase in yield over control per fed (kg)	Price of increase in yield over control (L.E.)	The net profit (L.E.)
2007	160	70	200	50.0	480	763.0	2098.25	1618.25
2008	160	84	-----	50.0	294	798.0	2234.4	1940.4

As a conclusion it could be concluded that, adding humic acid (HA) at 15 cm/ vine plus nile firtile (NF) at 200 g/ vine and AM fungi (AM) this recommended under the calcareous soil having high pH values to obtain the highest yield besides improving the fruit quality and improving microbiological activity.

Abstract: To test the ability of microbial strains *Pseudomonas flourescence* strain 843 and *Azospirillum brasilense* strain W24 to improve Washington navel orange fruit quality and to control the persistence of nematode in the soil, strains were applied one time monthly during the period of experiment to trees at two levels 300 ml and 500 ml per tree with 10^{-8} cells ml^{-1}. Bio-fertilizer inoculation with strain *Pseudomonas fluorescence* strain 843 growth promoting rhizobacteria was significantly improve fruit quality as well as increased fruit yield, fruit weight, fruit length, TSS and juice volumes, while inoculation with strain *Azospirillum brasilence* strain W24 increase but not significantly improve fruit quantity and quality of Washington navel orange. Commonly, three types of nematode were detected in the roots including *Tylenchulus Spp*, saprophytic nematode and *Pratylenchulus* while the dominant species was *Tylenchulus semipenetrans*. Generally there is a reduction in the number of nematode with the two examined strains while the addition of *Pseudomonas f.* strain 843 was successfully greater to inhibit the growth of nematode than *Azospirillum b.* strain W24 suggesting that this strain can be use as a bio-fertilizer for promoting citrus growth and bio-control for reducing the distribution and propagation of nematode associated with citrus. Enhancement and maintenance of soil fertility and conservation of the soil's health through bio-fertilizer applications will be a vital role and occupy significant concern for many of researcher in the future as a unique key for sustainable agriculture in developing countries. [Journal of American Science. 2010;6(12):264-271]. (ISSN: 1545-1003).

Key words: Citrus, Bio-fertilizers, *Azospirillum brasilence*, *Pseudomonas fluorescence*, *Tylenchulus semipenetrans* and biological control.

1. Introduction

Citrus (*Citrus spp.*) is one of the most important fruit crops grown in many tropical and subtropical countries. At the moment there is a bout 1.5 million hectares of citrus fruits cultivated for commercial scale in the world yielded nearly 40 million metric tons of oranges, lemons, limes, etc (Anonymous, 2008).

In Egypt, citrus has great attention due to its importance for local consumption or as a main source for foreign currencies by exportation to the European country. The area of citrus cultivated in Egypt was increased rapidly with the reclamation of new desert lands reaches about 35.59 hectare (Anonymous, 2008).

According to the annual report of the ministry of Agriculture in Egypt (2004), the production rate of citrus is mainly low as affected by different factors such as the nitrogen fertilization and soil born diseases like nematode. Nitrogen fertilizer is playing an important role for producing orange fruits due to its accumulative harmful as nitrate or nitrite in fruit juice (Montasser *et al.,* 2003). Thus is giving a special importance for optimizing the nitrogen requirements of citrus through different strategies. One of those strategies is the use of bio-fertilizers. The use of bio-fertilizers in enhancing plant growth and yield has gained momentum in recent years because of higher cost and hazardous effects of chemical fertilizers. Organic and/or bio-fertilizers improved vegetative growth, nutritional status and reduced the residuals of nitrate and nitrite in banana and grape fruits (Gomaa, 1995). Farag, (2006) and Saleh and Ahmed (1988) they noted that organic fertilizers and humic acid significantly decreased nitrogen as nitrate and nitrite content and improved yield and fruit quality of treated vines. Aseri *et al* (2008) found that the use of bio-fertilizers gave a significant improvement of fruits of pomegranate in India as well as enhancing the rhizosphere microbial activity and concentration of various nutrients. Ashokan *et al* (2000) reported a significant enhancement of banana plants as a result of dual inoculation of Arbscular mycorrhizal fungi (AMF) and Azotobacter.

Plant diseases caused by soil borne plant pathogens such as nematode (Duncan, 2005; Abd-

Elgawad *et al*., 2010) are considered major problems in agricultural production throughout the world, reducing yield and quality of crops. The nematode of the citric fruits probably infests more than 50% of the citrus production areas. The losses attributable to this nematode are estimated in the entire world at approximately 10% (Duncan, 2005 and Duncan *et al.*, 1995). There are several species of nematode that known to attack citrus including *Tylenchulus semipenetrans, Belonolaimus longicaudatus, Pratylenchus coffeae* and *P. brachyurus* (Duncan, 2005; Duncan *et al.*, 1995). Controlling of nematode diseases on citrus depends mainly on chemical applications mean while, these chemical substances are always undesirable due to their high cost and their hazard potentials to the environment. Therefore the view of scientists are directed to use bio-control instead of the chemical forms of fungicides or mineral fertilizers that can be a beneficial way to control soil borne plant pathogens and produce the natural clear fruits free from mineral residues (Russo and Berlyn 1990). In this respect, application of bio-fertilizers for controlling soil borne pathogenic fungi has been applied to several plants (Aaltan *et al*., 2003 and Siddiqui *et al*., 2009).

Consequently, the present investigation was outlined to study the effect of inoculation of citrus trees with *Azospirillum brasilense* and *Pseudomonas fluorescence* as growth promoting substances and bio-control on the yield and quantity of Washington navel orange as well as inhibiting the survival of nematode in the soil which causes considerable losses in citrus production in Egypt.

2. Materials and Methods:

2.1 Bacterial strains and growth

Strains of *Azospirillum brasilense* W24 and *Pseudomonas fluorescence* 843 DZM were kindly dedicated by D. Werner, Philipps University of Marburg, Germany. Strains of *Azospirillum* were grown on Doberiner medium but strains of *Pseudomonas* were grown on nutrient broth medium. Strains were grown in liquid medium on a rotary shaker at 30 °C and 120 rpm and the optical density of culture adjusted to 1 at 550 nm, then the culture were added to the trees once per month at a rate of 300 ml or 500 ml per tree.

2.2 Field Experiment:

Experiments were conducted in a silty clay soil in the middle of Delta Nile Valley characterized by high pH (8.9) and salinity level (3.28 mmohs cm^{-1}). The study was carried out in a private orchard at Al–Menoufia Governorate during 2008 and 2009 season on 10 years old Washington Navel orange trees, budded on sour orange (*C. ourantium* L.) rootstock, spaced at 5x5m. Completely block randomize design with four replicates was used for each treatment.

2.3 Collection of samples:

During spring and summer of 2008 and 2009 planted sites representing different habitat types in reclaimed and old parts of El-Menoufia governorate surveyed for the presence of entomopathogenic nematodes (EPN) using a design similar to Mrácek and Webster (1993) samples were taken with a hand trowel to a 20 cm depth and a volume of 1000 cc (cubic mete) per soil sample was collected. Samples were transported to the laboratory in sealed and labeled polyethylene bags within an ice chest.

2.4 Extraction of nematode from the soil and microscopic examination

250 g of the collected soil washed with tape water to remove the residues of roots then precipitated. The precipitate sieved through sieve of 325 mesh three times, then the water removed and the suspension containing nematode transferred to 50 ml beaker. The beaker agitated well then left for one minute for precipitating and 1 ml taken from the suspension and accounted using the 10x lenses of light microscopy and the number of nematode population accounted using this equation.

Number of nematode 250 ml= number of cells per ml x volume of the suspension

2.5 Determination of (N; P and K):

Methods for analyses and determination of (N; P and K):

To determine leaf mineral content, forty leaves were collected in the late of August in each season from tagged non-fruiting and non-flushing spring growth cycle (Jones and Embleton, 1960). Leaf samples were washed with tap water then distilled water several times, dried at 70°C, grinded and digested with percholoric acid to estimate N, P and K contents as percent refers to dry weight according the methods described by Cottenie *et al*. (1982).

2.6 Determination of horticulture aspects:

Fruit quality

At maturity stage, 10 representative fruits were taken from each tree and both the physical and chemical characteristics were determined.

Physical characteristics

Average fruit weight (g) fruit volume (cm3), fruit peel thickness (cm) and fruit firmness (by means Manges Taglor Pressure Tester) were measured. The

fruit length and diameter (cm) were measured by a vernier calliper and the fruit shape index (length/diameter ratio) was calculated.

Rate of fruit weight increase = Fruit weight of inoculated plant- fruit weight of un-inoculated plant÷fruit weight of uninoculated plantx100.

Reduction rate of nematode= Population of nematode in inoculated plant-population of nematode in un-inoculated plant ÷population of nematode in uinoculatedx100.

Chemical characteristics

Juice volume, total soluble solids, acidity content and vitamin C (mg/100 ml juice) were calculated adopting the standard procedures (A. O. A. C., 1990). The total soluble solids (TSS/acid ratio) for each sample were estimated.

Statistical Analysis:

The means and standard deviations of four replicates were estimated and an analysis of variance was carried out using the ANOVA procedure with SPSS software while the comparison of mean effects was based on least significant difference (LSD) multiple-comparison tests. Significant differences were considered at $P < 0.05$.

3. Results and Discussion:

3.1 Effect of bio-fertilizer inoculation on quantity and quality of Washington navel orange fruits

Production of horticultural crops has taken significant increase in the last decade due to development of innovative technologies including integrated nutrient management practices involving bio-fertilizers aiming to reduce the cost of agricultural process and the reduction of environmental pollution that happened due to the extravagant of fertilizers use. These bio-fertilizers include different kinds of microorganisms such as phosphate-solubilizing bacteria (PSBs), symbiotic (*Rhizobium*; *Bradyrhizobium* etc) and non-symbiotic (*Pseudomonas*; *Azospirillum* and *Azotobacter*) N_2-fixing bacteria and arbuscular mycorrhizal fungi (AMF). AMF and *Azospirillum* were found to enhance the growth and production of various vegetable crops (Ghazi, 2006 and Paramaguru *et al*., 1993) while *Azospirillum* and *Azotobacter* were found to increase significantly the production of some fruit plants such as banana and sweet orange (Jeeva *et al*., 1988; Tiwary et al., 1999 and Singh and Sharma, 1993), Besides improving the microbiological activity in the rhizosphere (Kohler *et al*., 2007). Therefore we aimed in our research to study the effect of biofertilizer application on the production of Washington navel orange tree to encourage the clean or green agriculture in order to help small farmers in developing countries such as Egypt to depend on the biofertilizer as a main source to increase the soil fertility in their farming system and to confront the over increase in synthetic fertilizer prizes. Results in Table (1) show the effect of inoculation with bio-fertilizers on fruit characteristics including yield, fruit weight, fruit volume and fruit length. It is clearly shown that inoculation with 500 ml $tree^{-1}$ of strain *Pseudomonas fluorescens* 843 resulted in significant increase of the number of fruit $tree^{-1}$ in the two seasons as well as increasing the yield. The increasing rate in the number of fruits $tree^{-1}$ was 12.3% (231.48-206.18÷206.18x100) over the un-inoculated trees (control) in the first season while the increasing rate was 8.7% in the second season. The fruit weight also increased with the inoculation of this strain by a rate of 49.6% where the increase of fruit weight was 42.9% in the second season. Our results are not only in agreement with those obtained by Abd El-Migeed *et al* (2007) who reported that inoculation of Washington navel orange trees with *Azospirillum lipoferum* as a source of bio-fertilizer improved average fruit weight, and also agree with those published by Aseri *et al*. (2008) who noted that combined inoculation with *Azotobacter chroococcum* and *Glomus mosseae* (AMF) increased the microbial activity in the rhizosphere and yield of Pomegranate.

Bio-fertilizer inoculation with strain of *Pseudomonas fluorescens* had enhanced fruit weight, fruit volume and fruit length by a rate of (33.25% and 31.6%), (4.1% and 9.9%) and (6.2% and 11.7%) for the first and second season on respectively. However non significant results were not observed in fruit diameter and fruit shape index except in fruit diameter in the first season (2008). Results in Table 2 summarize the effect of microbial inoculation on the total soluble salts, acidity, juice volume and vitamin C. As noted from the previous results that strain *Pseudomonas fluorescens* was superior for promoting the TSS, juice volumes in the whole duration of experiment while this strain promoted significantly vitamin C in the second season only. There is no significant results were observed as a result of microbial biofertilization on the fruit shape index (Table 1) and peel thickness (Table 2) as reported by Bassal (2009) who stated that the use of rootstocks were not significantly increase of both the peel thickness and fruit shape. The positive effect of inoculation with strain *Pseudomonas fluorescens* on the quality and quantity of Navel orange may be due synthesis of phytohormones (Xie *et al*., 1986), reduction of membrane potentials of the roots (Bashan and Levanony 1991), synthesis of some enzymes that modulate the level of plant hormones (Glick *et al*. 1998) and solubilizing of inorganic

phosphate (Krasilnikov, 1961). On the other hand, strain *Azospirillum brasilense* was less effective than *Pseudomonas* strain for increasing the fruit quantity (Table 1) and fruit quality (Table 2) although this strain was repeatedly reported as a PGBR in many different publications. The little effect of *Azospirillum brasilense* strain was reported by *Burdman et al. (1997)* who found that high titer (10^{-8} cfu ml^{-1}) like in our case of this strain reduced the shoot and root weight of common bean when it is dual inoculated with *Rhizobium* and *Azospirillum* strain. Perotti and Pidello (1999) stated that the inoculation with *Azospirillum brasilense* strain reduces the activity of urease in the soil and this led to decrease the available nitrogen.

Table (1) Effect of microbial biofertilizers On yield, fruit weight ,fruit volume, fruit length ,fruit diameter and fruit shape index of Washington navel orange trees

3.2 Effect of bio-fertilizer inoculation on NPK leaf contents of Washington navel orange

Results presented in Table (3) explain the effect of microbial bio-fertilizer on percentage of macro-elements (NPK) in leaves. Both the two examined strains gave significant increase in nitrogen percent, by a rate of (13.7% mean) with strain W24 while this rate was (6.8% mean) with strain 843 in the first year. In the second year the increasing rate was 39.6% and 26.7% with the examined strains on respectively. Strain of *Azospirillum brasillence* gave high nitrogen percent than the pseudomonas strain because this strain is a free living nitrogen fixing bacteria (Perotti, and Pidello, 1999). The P and K contents were also increased due to the application of bio-fertilizer with the two examined strains compared by control.

3.3 Effect of bio-fertilizer inoculation on the reduction of nematode associated with Washington navel orange

Plant-parasitic nematodes cause serious crop losses worldwide and are among the most important agricultural pests (Koenning *et al*., 1999). The management of nematodes is more difficult than that of other pests because nematodes mostly inhabit the soil and usually attack the underground parts of the plants (Stirling, 1991). Although chemical nematocides are effective, easy to apply, and show rapid effects, they have begun to disappear from the market in some developed countries owing to concerns about public health and environmental safety (Schneider *et al*., 2003). The search for novel, environmentally friendly alternatives with which to manage plant-parasitic nematode populations has therefore become increasingly important. The nematode of the citric fruits probably infests more than 50% of the citrus production areas leading to a rate of 10% losses approximately in the entire world (Duncan, 2005 and Duncan *et al.*, 1995). Consequently, one of our main targets was to test the possibility of these strains to reduce citrus infected nematode in the field. Results in Table (4) revealed that there were number of nematode types detected in the roots of Navel orange including *Tylenchulus Spp*, saprophytic nematode and *Tylenchulus semipenetrans* while the dominant species was *Tylenchulus semipenetrans*, therefore results show the reduction in population numbers of *Tylenchulus semipenetrans* nematode as a result of bio-fertilizer inoculation. Generally, the number of infected roots with nematode was increased at low temperature in the winter while it reduced in the summer months due to hot weather. The inoculation with *Pseudomonas fluorescens* strain 843 (500 ml tree^{-1}) did significantly reduce the number of infected roots with nematode after two months by a rate of 56.6% than the control while the reduction rate was 45.5% with the inoculation doze (300 ml tree $^{-1}$). The retardation of the beneficial effect of this strain to reduce the nematode may be due to the time that needed until the strain adapted and multiply in the soil. Several investigators (Shanmugan *et al*. 2002; Aalten *et al*., 2003; Siddiqui *et al*., 2009) have been used strains belong to this species as a bio-control for large numbers of soil borne diseases including nematode. The reduction in nematode infections due to the inoculation with *Pseudomonas fluorescens* strain 843 may be due to decreasing or preventing the deleterious effect of pathogenic microorganisms by produce antibiotics (Sivan and Chet 1992; Mel'nikova *et al*. 2002) or siderophores (Leong 1986), different species of *Pseudomonas* produce *N*-acylhomoserine lactones which is involved in the cell-density dependent control of secondary metabolite and virulence gene expression (Lau *et al*., 2000) or by regulating nematode behavior (Sikora and Hoffmann-Hergarten, 1993), interfering with plant–nematode recognition (Oostendorp and Sikora, 1990), competing for essential nutrients (Oostendorp and Sikora, 1990), promoting plant growth (El-Nagdi and Youssef, 2004), inducing systemic resistance (Hasky-Günther *et al*., 1998) and directly antagonizing by producing of toxins, enzymes and other metabolic products (Siddiqui and Mahmood, 1999). Other authors were reported to produce hydrogen cyanid that kill the eggs of nematode (Aalten *et al*, 2003) or protease enzyme that responsible for inhibiting cell walls (Siddiqui et al, 2005). The work in the future will focus on studying the mode of action of *Pseudomonas fluorescens* strain 843 that helps it to enhance the growth of fruits or decreasing the number of nematode in the soil. This is the first field trial that give promising results for reducing the nematode so that many numbers of farmers ask us to supply them with strains but we need to do the experiments in other area like the north and south of Delta to evaluate this strains correctly before going to the large scale of field application to increase the confidence between researchers and farmers that was missing in the past.

4. Conclusion:

Under Egyptian soil conditions the inoculation of Washington navel orange with *Pseudomonas flourescence* strain 843 was not only highly effective to increase the production of Washington navel orange as well as improving the quality of fruits but also inhibited the survival of nematode in the soil concluding that this strain can be used as bio-fertilizer and bio-control of pathogenic nematode infected citrus trees.

Experimental Natural Prints And The Re-Calculated General Equations Of The Electrical Parameters For Buried Bare Pipe -Soil- Earth System With And Without Applying Cathodic Protection System

Dr. Ashraf Abdel Raouf Mohamed Fouad Ahmed
Canadian International College CIC – Egypt
Ashrafahmed9000@yahoo.com

Abstract: The rate of discharge through the stray electrolytic capacitor between the pipe and the remote earth is to be considered as the corrosion current. The electrochemical properties of the soil, which are the soil resistivity of the soil volume, the relative permittivity of the soil layer around the pipe and the chemical properties which could be considered as the pH of the soil film layer around the pipe, are affected directly by the humidity change. When considering the room temperature and by neglecting the effect of CO_2 content in the soil, these values of the electrochemical properties of any soil returns back to its initial conditions after soil dryness to its initial condition. This means that corrosion rate will also be changed during the humidity change around the pipe segment. So, when considering the fact that the pipeline will not be changed or replaced and the surrounding medium around it will not be changed or replaced by another kind of soil, then the behavior of the electrical parameters (stray electrolytic capacitance, stray potential, surface created charge) of the pipe-soil-earth system will act as a print of this combination of this pipe and this soil. This paper recalculates the general form of the equations of the electric parameters and obtains the print curves & constants at natural condition with and without applying cathodic protection system in terms of the electrochemical properties around the pipe. The average error reduced to be less than ± 5%. This will help to study both the corrosion problem and cathodic protection by an electric concept with an electric analogue circuit which is the aim of this study. [Journal of American Science. 2010;6(12):272-283]. (ISSN: 1545-1003).

Keywords: Electrical study of pipe – soil – earth system

1. Introduction:

At humidity equal to zero, the soil medium around pipeline could be considered as a dielectric material which has its relative permittivity. If the humidity is increased, the soil medium is considered to be as an electrolyte associated with a change happened in the values of the relative permittivity, resistivity and pH of the soil. These changes which happened in soil electrochemical properties will continue by increasing the humidity but these values will return back to their original values, or nearby initial values, after the humidity returns back to its initial value. The change of the soil medium between isolation medium and conduction medium according to the percentage of the humidity could be studied electrically. Then, based on the new proposed electrical concept of corrosion which state that: "Due to surrounding medium effect around metal structure buried in the ground, the charge created on metal o.s.a builds up a potential through an electrolytic stray capacitor between metal o.s.a and an imaginary coaxial earthing cylinder " [1][2] , The proposed electric concept of corrosion is depending on the concept of the positive charge created on the outer surface area (o.s.a) of the buried bare pipe line segment due to the building up potential between the pipe and the remote earth. The created charge is dissipated to the surrounding medium (corrosion process) through a stray electrolytic capacitor between the pipe and an imaginary coaxial earthing cylindrical.

In case of coated pipe segment, the dielectric constant of the soil K_S acts with the dielectric constant of the pipe coating material K_C as a coaxial cylindrical capacitor with compound dielectric. As K_C of the coating material is decreased, the total capacitance is decreased (two capacitors are in series) then charge Q = C x V is decreased .That's to say that corrosion process is decreased. If deterioration of coating material occurred, then K_C is increased. That's to say that the total capacitance of the compound dielectric is increased .This means that the corrosion process is increased as the created charge on metal outer surface area Q = C x V will be increased [1][2].

In other words, if two dissimilar electrodes buried in a box which is containing a soil medium, a circulating current will take place between these electrodes due to the difference in electrodes' natural potential while a capacitance in nano farad could be measured between these two dissimilar electrodes (through the soil). The potential difference, the capacitance and the corrosion current between the positive electrode and the negative electrode are

electric quantities. Then, it may be possible to understand the corrosion and cathodic protection by an electrical concept beside the electrochemical and thermodynamic concepts. .

The corrosion may be described electrically (electrons losses) by the equation: $Q = C \times V$, while the rate of discharge dQ/dt is equal to the corrosion current from the +ve electrode to the –ve one [1] [2]. The same concept could be applied on the system of buried pipeline and the surrounding soil medium. The pipeline may be considered the +ve electrode while the remote earth may be considered the –ve electrode. In case of pipe-soil-earth system that it is not subjected to any external interference, if it is possible to find a correlation between the electrical parameters and the electrochemical properties of the soil at different humidity with and without applying cathodic protection system, then the result will be considered as an electrical print or as a data sheet of this pipe-soil-earth system. These electrical prints will be recalculated if any essential values are changed in the pipe-soil-earth system. The importance of these electrical prints are to define both the electrical parameters and the cathodic protection level of any buried pipe segment of the pipe-soil-earth system if the protection current and the electrochemical properties are measured at the pipe segment directly from the field.

Now, as the electrochemical properties of any soil are changed by the change of humidity but returns back to its initial conditions after some time required for soil dryness, we can define a new factor named the soil factor as: "The soil factor (S_f) is the instantaneous value of the electro-chemical properties of the soil based on the electrical properties at Humidity equal to 10% "[1] [2] and is equal to:

$S_f = (1 / K_S)$ pH H log ρ at room temperature (1)

Dimension of $[S_f] = [1 / K_S]$ [pH] [H] [log ρ] = Ω.m %

Where:

S_f = soil factor Ω.m %

K_S = dielectric constant of the soil at H = 10%

pH = power of Hydrogen of the soil

H = humidity of the soil %

ρ = soil resistivity in Ω.m at H = 10%

The importance of the soil factor is that it is combining all parameters which can affect directly on the cathodic protection level or in corrosion process. Such factors which can be obtained by a direct measurements from the field. This means that if it is possible to study the relationship between the soil factor and the electrical parameters of the bare pipe segment, then the print curves and the print constants of the electrical parameters of the pipe-soil-earth system could be obtained at natural condition with and without applying cathodic protection system. The soil factor can be considered to be as the key of many studies based on the new proposed electrical concept of corrosion. For an example, the general equation of the natural stray capacitance between external surface area of bare pipe segment and earth is obtained in terms of the soil factor with an average error ± 30% and its print curves and constants are obtained for pipe-soil system for 10 different soils [3]. Also, the general equation of both the natural stray potential and the natural created charge are obtained in terms of the soil factor with an average error ± 30% and their print curves and constants are obtained for pipe-soil system for 10 different soils [4] [5]. In this paper, we will continue to use the soil factor, to complete such study concerning the natural electrical parameters of pipe-soil-earth system with and without applying cathodic protection system to reduce the average error of the equations of electrical parameters to be less than ± 5%.

2. Case1:

2.1 Pipe – Soil – Earth System Without C.P System

2.1.1 The Experiment

At natural condition system without any influence of any external systems such as cathodic protection systems, pipe crossing.... (only bare pipe + soil + point earth), the experiment is consisting of a system with bare pipe segment (2.1cm diameter, 1mm thickness and 31.1cm length), buried in a soil with humidity equal to 10% and the soil have soil resistivity equal to ρ Ω.m, soil power of hydrogen pH and soil relative permittivity K_S. Table 1 shows the different kind of soils used in this experiment and the range of humidity.

When considering the system pipe-soil-earth for ten different kind of soil as shown in table 1, the test procedures are as follow:

1) Calculate the value of the soil factor according to the eq.1 :
2) Measure both the stray potential $V_{P\text{-}PE}$, the stray capacitance $C_{P\text{-}PE}$ and the correspondent pipe to soil potential $V_{H\text{-}C}$ by using $Cu/CuSO_4$ half cell. Calculate total surface charge $Q = V_{P\text{-}PE} * C_{P\text{-}PE}$
3) Increase the Humidity and calculate the new value of the soil factor.
4) Repeat steps 2 & 3 until humidity around the pipe segment reaches its maximum as shown in table 1.
5) Change this type of soil by another kind of soil and repeat all the steps done before.
6) Repeat again the steps for 10 different kind of soil shown in table 1.

7) Build up the results table.

2.1.1 The Results

If we plot the measured electric quantity (natural stray potential $V_{P\text{-}PE,}$ natural stray capacitance $C_{P\text{-}PE}$ and surface total charge Q) individually as y axis in terms of the correspondent measured soil factor as x axis, we will obtain such following curves as shown in figures 1&2. Except box 4 and box 13, the curves and equations show eight boxes which could be expressed by a 4th degree polynomial equation with an average error equal to zero percent. Table 2 shows the error table for the 10 different soil resistivity.

2.2 Electrical Parameters Print Curves For Pipe – Soil – Earth Under Test

By considering the measured soil factor as x axis against the measured electrical parameter (stray potential $V_{P\text{-}PE,}$ stray capacitance $C_{P\text{-}PE}$, surface total charge Q) as y axis, the next following print curves were obtained for the pipe - soil - earth systems under test as shown in figures 1&2. The stray capacitance is illustrated by group a, figures 1a & 2a. The stray potential is illustrated by group b, figures 1b & 2b.. The surface total charge is illustrated by group c, figures 1c & 2c.. All points resulting from the experiment could be represented by a trend line for each measured electric quantity and could be represented by a PRINT for each pipe-soil-earth under test, with 4th degree polynomial equation. The average error for all equations is less than ± 5%. The above result is very important. This proves that it may be possible to complete this electrical study of pipe-soil-earth system to find an electric circuit diagram of this combination of pipe segment-soil-earth system which is the real target. This means that, beside the electrochemical and thermodynamic concepts of corrosion, it is possible to have an electric concept of the corrosion process and to convert both the corrosion and cathodic protection problems into an electric problem.

2.3 Stray Potential General Equation For Pipe – Soil – Earth Under Test

For each soil under test and from natural stray potential curves and equations, it can easily observe that the general equation of the natural stray potential from pipe segment to the remote earth during humidity change is a 4th degree polynomial equation which is function of the soil factor, $V_{n\ stray} = f(X = S_f)$. For each soil under test, the general stray potential equation is function of the measured soil factor $V_{n\ stray} = f(X=S_f)$, 4th degree polynomial. The stray potential general equation is given by Eq.2:

$$\mathbf{V_{n\ stray}} = A_{4vn}\mathbf{X^4} + A_{3vn}\mathbf{X^3} + A_{2vn}\mathbf{X^2} + A_{1vn}\mathbf{X} + A_{0vn} \quad (2)$$

Where:

A's: = $A_{(\ )V}$ are the natural stray potential print constants of the pipe soil under test

X = is the value of the soil factor at certain humidity

2.4 Stray Capacitance General Equation For Pipe – Soil – Earth Under Test

For each kind of soil under test and from stray capacitance curves and equations, it can easily observe that the general equation of the stray capacitance, at natural condition without applying cathodic protection, to the remote earth during humidity change is a 4^{th} degree polynomial equation which is function of the soil factor, $C_{n\ stray}$ = f(soil factor **X**)

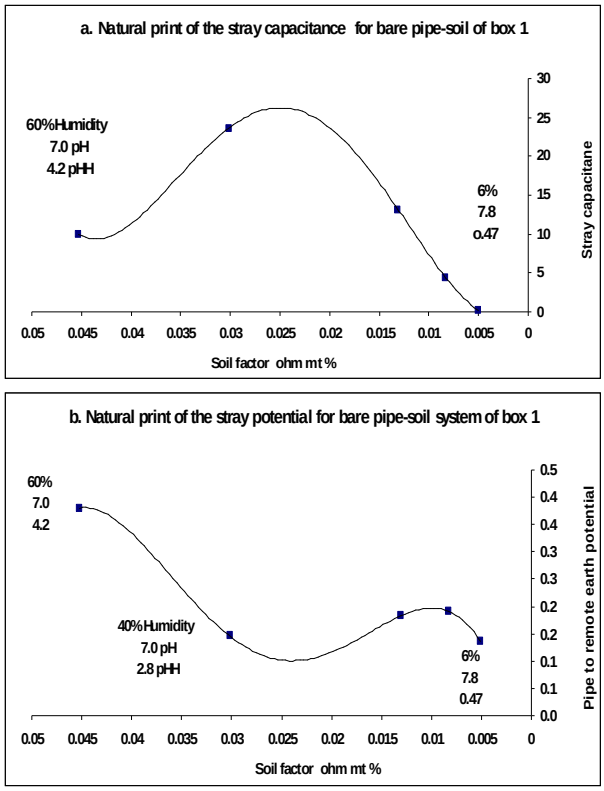
For each soil under test, the general stray capacitance equation is function of the measured soil factor, $C_{\ stray}$ = f(X=S_f), 4^{th} degree polynomial. The stray capacitance general equation is equal to Eq. 3:

$$\mathbf{C}_{\mathbf{n\ stray}} = A_{4cn}\mathbf{X}^4 + A_{3cn}\mathbf{X}^3 + A_{2cn}\mathbf{X}^2 + A_{1cn}\mathbf{X} + A_{0cn} \quad (3)$$

Where:

A's: = $A_{\ ()CN}$ are the stray capacitance print constants of the pipe soil under test

X = is the value of the soil factor at certain humidity



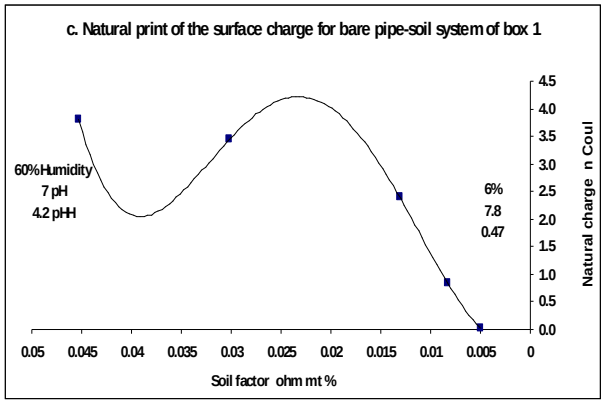


Figure 1: Natural prints of the electrical parameters for buried bare pipe-soil-earth of box 1

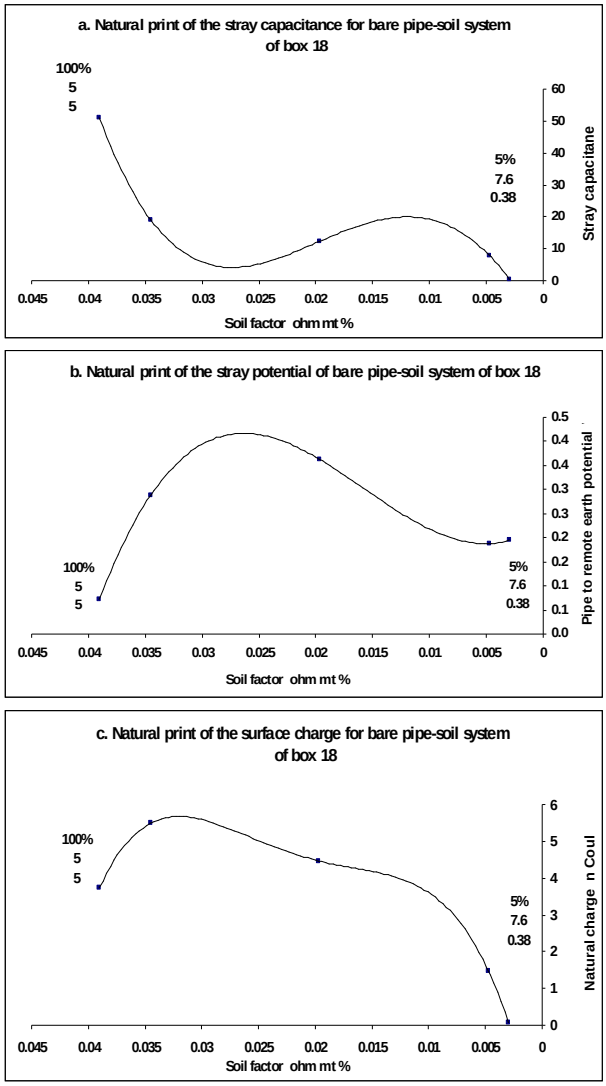

Figure 2: Natural prints of the electrical parameters for buried bare pipe-soil-earth of box 18

2.5 Surface Total Charge General Equation For Pipe – Soil – Earth Under Test

For each kind of soil under test and from the natural surface charge curves and equations, it can easily observe that the general equation of the surface charge, at natural condition without applying cathodic protection, is a 4^{th} degree polynomial equation which is function of the soil factor $Q_N = f$ (X = soil factor). For each soil under test, the general surface natural charge equation is function of the measured soil factor, $Q_N = f(X=S_f)$, 4^{th} degree polynomial. The surface natural charge general equation is equal to Eq. 4:

$$\mathbf{Q}_N = A_{4qn}\mathbf{X}^4 + A_{3qn}\mathbf{X}^3 + A_{2qn}\mathbf{X}^2 + A_{1qn}\mathbf{X} + A_{0qn} \quad (4)$$

Where:

A's: = A ( ) q are the surface natural charge print constants of the pipe - soil under test

X = is the value of the soil factor at certain humidity

2.6 The Electrical Parameter General Equation Of Pipe-Soil-Earth System At Natural Condition Without Applying CP System

We can observe clearly that the general form of any electrical parameter equation is function of the measured soil factor, 4^{th} degree polynomial but the A's print constants are different. From equations 2, 3 and 4, we can easily summarize the natural electrical parameters equations for the pipe-soil-earth under test, without applying cathodic protection system, as follow:

$$\mathbf{C}_{\text{n stray}} = A_{4cn}\mathbf{X}^4 + A_{3cn}\mathbf{X}^3 + A_{2cn}\mathbf{X}^2 + A_{1cn}\mathbf{X} + A_{0cn}$$

$$\mathbf{V}_{\text{n stray}} = A_{4vn}\mathbf{X}^4 + A_{3vn}\mathbf{X}^3 + A_{2vn}\mathbf{X}^2 + A_{1vn}\mathbf{X} + A_{0vn}$$

$$\mathbf{Q}_{\text{n stray}} = A_{4qn}\mathbf{X}^4 + A_{3qn}\mathbf{X}^3 + A_{2qn}\mathbf{X}^2 + A_{1qn}\mathbf{X} + A_{0qn}$$

We can observe clearly that the general form of any electrical parameter equation, at natural condition without applying cathodic protection, is function of the measured soil factor, 4^{th} degree polynomial but the A's PRINT constants are different. Then, the general form of any electrical parameters equation of the pipe-soil-earth system under test at natural condition without applying cathodic protection with the same amount of soil volume will be as shown by the following equation :

Natural electrical parameter of pipe-soil-earth system under test = $A_4\mathbf{X}^4 + A_3\mathbf{X}^3 + A_2\mathbf{X}^2 + A_1\mathbf{X} + A_0$

The A's are obtained from the correspondent print table and **X** is the measured soil factor

The natural electric parameters general equation and PRINT curves show the following important results:

a) Buried pipe in a soil which generates the minimum natural created charge at bare pipe surface at normal steady humidity is defining the most suitable choice of soil to be around the pipe.

b) In case of space or vacuum is the medium which is surrounding the pipeline instead of soil medium, the value of the soil factor will be zero as $K_S = 1$, H = 0% , ρ = infinity. That's to say that the natural created charge will equal to zero (A_O will equal to zero for pipe-vacuum system) which is the ideal case of corrosion prevention.

c) In case of air is the medium which is surrounding the pipeline instead of soil medium, the value of the soil factor will be smaller than that of the soil at same humidity as $K_S \approx 1$ (it is not almost that $K_S \approx 1$ if the humidity exists in air), H = 10% up to 60% or more, pH = 7 & ρ = value according to H%. Consequently, the natural created charge exists in air but with smaller amount than that of soil at same humidity. That's to say that air is most proper surrounding medium for a pipe than soil at same humidity condition.

2.7 Natural Stray Potential Print Constants For Pipe-Soil-Earth Under Test

Now, the natural stray potential print constants of the pipe-soil-earth system under test are A_{4VN}, A_{3VN}, A_{2VN}, A_{1VN} and A_{0VN}. This means that these print values are valid for these pipe-soil systems under test at any time at the correspondent electrochemical properties (soil factor). Table 3 shows result example of the natural stray potential print.

Table 3: PRINT constants of the stray potential for 10 different soil under test

2.8 Natural Stray Capacitance Print Constants For Pipe-Soil-Earth Under Test

Now, the stray capacitance print constants of the pipe-soil-earth system under test are A_{4CN}, A_{3CN}, A_{2CN}, A_{1CN} and A_{0CN}. This means that these print values are valid for these pipe-soil systems under test at any time at the correspondent electrochemical properties (the soil factor). Table 4 shows the natural stray capacitance print constants.

Table 4: PRINT constants of natural stray capacitance for 10 different soils under test

Soil	ρ_1	ρ_2	ρ_3	ρ_4	ρ_5	ρ_6	ρ_7	ρ_8	ρ_9	ρ_{10}

2.9 Surface Natural Charge Print Constants For Pipe-Soil-Earth Under Test

Now, the surface natural charge print constants of the pipe-soil-earth system under test are A_{4q}, A_{3q}, A_{2q}, A_{1q} and A_{0q}. This means that these print values are valid for these pipe-soil systems under test at any time at the correspondent electrochemical properties (soil factor). Table 5 shows surface natural charge print constants.

Table 5: Natural charge PRINT at the pipe surface for 10 different soils under test

3. Case 2:

3.1 Pipe – Soil – Earth System With applying Cathodic Protection System

3.1.1The Experiment

At natural condition system without any influence of any external systems such as cathodic protection systems, pipe crossing.... (only bare pipe + soil + impressed current system + point earth), the experiment is consisting of a system with bare pipe segment (2.1cm diameter, 1mm thickness and 31.1cm length), buried in a soil with humidity equal to 10% and the soil have soil resistivity equal to ρ Ω.m, soil power of hydrogen pH and soil relative permittivity K_S. The impressed current system is consisting of a nail as an anode which is connected to the positive terminal of variable d-c source while the negative terminal is connected to the bare pipe segment. Table 1 shows the different kind of soils used in this experiment and the range of humidity.

When considering the system pipe-soil-earth for ten different kind of soil as shown in table 1, the test procedures are as follow:

1) Calculate the value of the soil factor according to the Eq.1 :
2) Measure both the stray potential $V_{P\text{-}PE}$, the stray capacitance $C_{P\text{-}PE}$, the protection current I_P and the correspondent pipe to soil potential $V_{H\text{-}C}$ by using $Cu/CuSO_4$ half cell. Calculate total surface charge $Q = V_{P\text{-}PE} * C_{P\text{-}PE}$
3) Increase the c.p protection current I_P
4) Repeat step 2&3 up to $V_{H\text{-}C}$ = -2 volt
5) Increase the Humidity and calculate the new value of the soil factor.
6) Repeat steps 2, 3&4 until humidity around the pipe segment reaches its maximum as shown in table 1.
7) Change this type of soil by another kind of soil and repeat all the steps done before.
8) Repeat again the steps for 10 different kind of soil as shown in table 1.

9) Build up the results table.

3.1.2 Results

If we plot the measured electric quantity (stray potential $V_{P\text{-}PE,}$ stray capacitance $C_{P\text{-}PE}$, surface total charge Q and protection current I_P) individually as y axis in terms of the correspondent measured soil factor as x axis at the correspondent different levels of pipe to soil potential $V_{H\text{-}C}$ by using $Cu/CuSO_4$ half cell from -0.2 v to -2 volt, we will obtain such following curves as shown in figures 3, 4 & 5. Except box 4 and box 24, the curves and equations of the electrical parameters show eight boxes which could be expressed by a 4^{th} degree polynomial equation with an error equal to zero percent. Table 6 shows the error table for the 10 different soil resistivity under test.

Table 6: Average error table for 10 different kinds of soil and operating range of Humidity

3.2 Stray Potential For Pipe-Soil-Earth Under Test

From the stray potential PRINT curves and trend lines equations, as shown in figures 3b, 4b and 5b, it can easily observe that the general equation of the stray potential of a cathodically protected bare pipe segment during humidity change under multi level of cathodic protection levels is a 4^{th} degree polynomial equation which is function of the soil factor $V_{Str.}$ = f (X = soil factor). For each soil under test, the general stray potential equation is function of the measured soil factor, $V_{Str.}$ = f(X=S_f), 4^{th} degree polynomial. The stray potential general equation is equal to Eq. 5:

$$\mathbf{V_{Str.}} = A_{4V}\mathbf{X}^4 + A_{3V}\mathbf{X}^3 + A_{2V}\mathbf{X}^2 + A_{1V}\mathbf{X} + A_{0V} \quad (5)$$

Where:
A's: = $A_{(\ )V}$ are the stray potential print constants of the pipe - soil under test
X = is the value of the soil factor at certain humidity

3.3 Stray Capacitance For Pipe-Soil-Earth Under Test

From the stray capacitance PRINT curves and trend lines equations, as shown in figures 3a, 4a and 5a, it can easily observe that the general equation of the stray capacitance of a cathodically protected bare pipe segment during humidity change under multi level of cathodic protection levels is a 4^{th} degree polynomial equation which is function of the soil factor $V_{Str.}$ = f (X = soil factor), the same equation as that of pipe – soil – earth system without applying cathodic protection. For each soil under test, the general stray capacitance equation is function of the measured soil factor,

$C_{Str.}$ = f(X=S_f), 4^{th} degree polynomial. The stray potential general equation is equal to Eq. 6:

$$\mathbf{C_{Str.}} = \mathbf{C}_{\mathbf{n\ stray}} = A_{4cn}\mathbf{X}^4 + A_{3cn}\mathbf{X}^3 + A_{2cn}\mathbf{X}^2 + A_{1cn}\mathbf{X} + A_{0cn} \quad (6)$$

Where:
A's: = $A_{(\ )cn}$ are the stray capacitance print constants of the pipe - soil under test
X = is the value of the soil factor at certain humidity

3.4 Surface Total Charge For Pipe-Soil-Earth Under Test

From the surface total charge PRINT curves and trend lines equations, as shown in figures 3c, 4c and 5c it can easily observe that the general equation of the surface total charge of a cathodically protected bare pipe - segment during humidity change under multi level of cathodic protection levels is a 4^{th} degree polynomial equation which is function of the soil factor $Q_{tot.}$ = f (X = soil factor).
For each soil under test, the general surface total charge equation is function of the measured soil factor, $Q_{tot.}$= f(X=S_f), 4^{th} degree polynomial. The surface total charge general equation is equal to Eq. 7:

$$\mathbf{Q_{tot.}} = A_{4q}\mathbf{X}^4 + A_{3q}\mathbf{X}^3 + A_{2q}\mathbf{X}^2 + A_{1q}\mathbf{X} + A_{0q} \quad (7)$$

Where:

A's: = A ( ) q are the surface total charge print constants of the pipe - soil under test
X = is the value of the soil factor at certain humidity

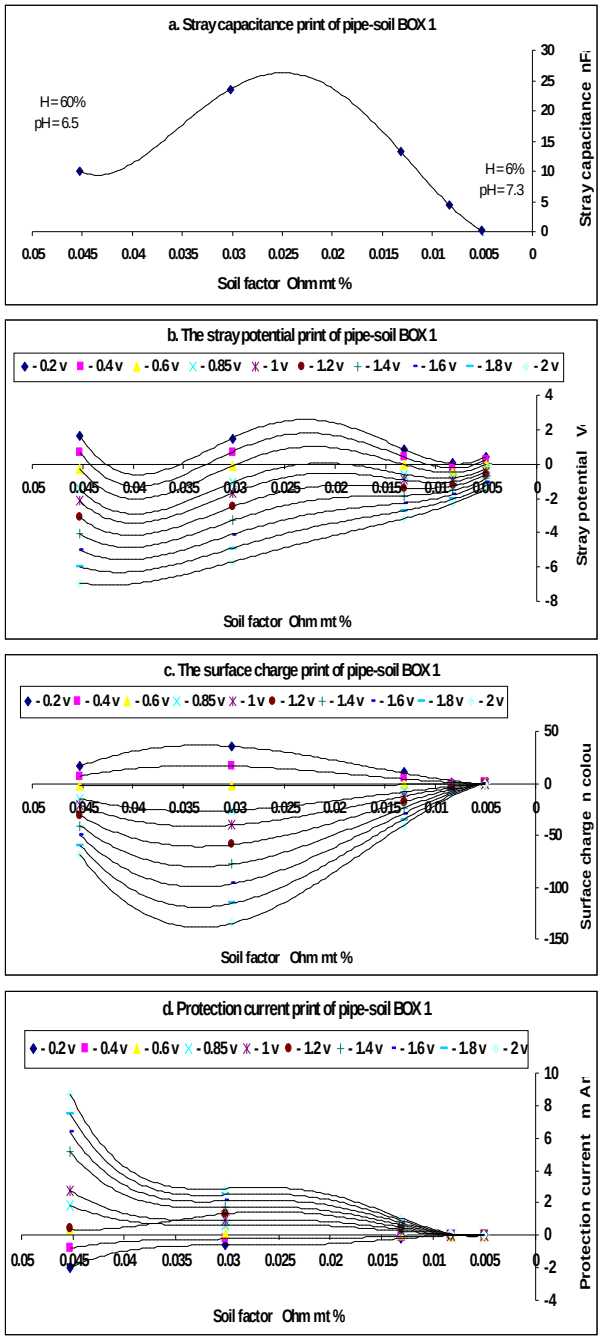

Figure 3: Electrical Parameters PRINT curves of pipe-soil-earth of BOX 1

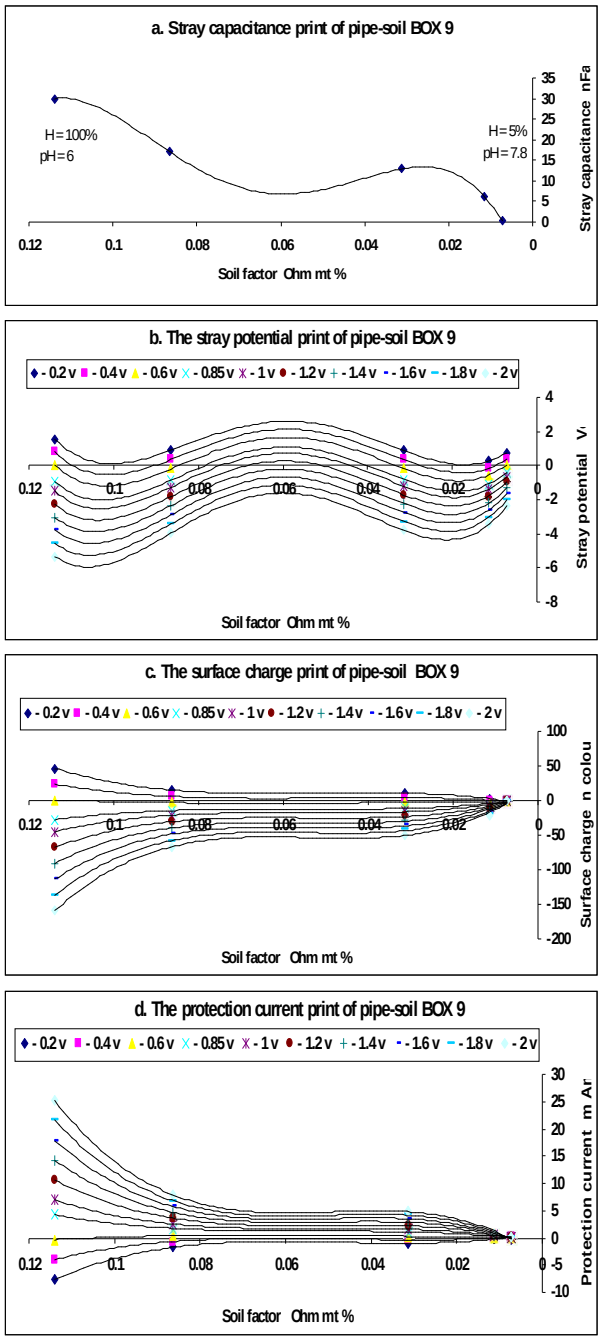

Figure 4: Electrical Parameters PRINT curves of pipe-soil-earth of BOX 9

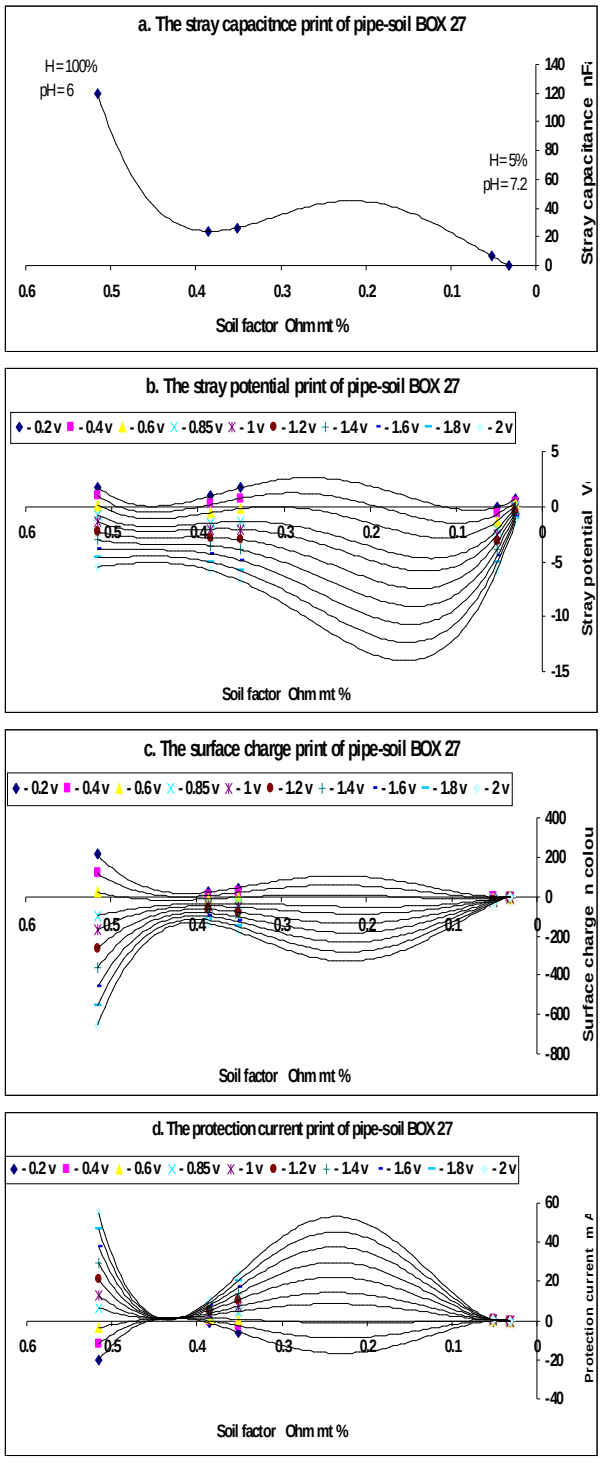

Figure 5: Electrical Parameters PRINT curves of pipe-soil-earth of BOX 27

3.5 Protection Current General Equation For Pipe – Soil – Earth Under Test

Definition: "The ONION curves are the curves of the protection current I_P in terms of the soil factor S_f at different half cell voltage $V_{H.C}$ levels". From the PRINT ONION curves, , as shown in figures 3d, 4d and 5d and trend lines equations, it can easily observe that the general equation of the protection current of a cathodically protected bare pipe segment during humidity change under multi level of cathodic protection levels is a 4th degree polynomial equation which is function of the soil factor, $I_P = f$ (X = soil factor)

For each soil under test, the general protection current equation is function of the measured soil factor $I_P = f(X=S_f)$, 4th degree polynomial. The protection current general equation is equal to Eq. 8:

$$\mathbf{I_P} = A_{4I}\mathbf{X}^4 + A_{3I}\mathbf{X}^3 + A_{2I}\mathbf{X}^2 + A_{1I}\mathbf{X} + A_{0I} \quad (8)$$

Where:
A's: = $A_{(\,)I}$ are the protection current print constants of the pipe soil under test
X = is the value of the soil factor at certain humidity

3.6 The Electrical Parameter General Equation Of Pipe-Soil-Earth System With Applying C.P System

We can observe clearly that the general form of any electrical parameter equation is function of the measured soil factor, 4th degree polynomial but the A's constants are different and are dependant on the pipe to soil potential except the stray capacitance which is independent of the pipe to soil potential . From equations 5, 6, 7 and 8, we can easily summarize the electrical parameters trend lines equations for the pipe-soil-earth under test, with applying c.p system, are in the form as follow:

$$\mathbf{C_{stray}} = A_{4cn}\mathbf{X}^4 + A_{3cn}\mathbf{X}^3 + A_{2cn}\mathbf{X}^2 + A_{1cn}\mathbf{X} + A_{0cn}$$

$$\mathbf{V_{stray}} = A_{4v}\mathbf{X}^4 + A_{3v}\mathbf{X}^3 + A_{2v}\mathbf{X}^2 + A_{1v}\mathbf{X} + A_{0v}$$

$$\mathbf{Q_{tot.}} = A_{4q}\mathbf{X}^4 + A_{3q}\mathbf{X}^3 + A_{2q}\mathbf{X}^2 + A_{1q}\mathbf{X} + A_{0q}$$

$$\mathbf{I_P} = A_{4IP}\mathbf{X}^4 + A_{3IP}\mathbf{X}^3 + A_{2IP}\mathbf{X}^2 + A_{1IP}\mathbf{X} + A_{0IP}$$

Then, the general form of any electrical parameters equation of the pipe-soil-earth system under test, with applying cathodic protection, will be as shown in the following general equation which is the same as that of the system without applying cathodic protection:

$$\mathbf{EP} = A_4\mathbf{X}^4 + A_3\mathbf{X}^3 + A_2\mathbf{X}^2 + A_1\mathbf{X} + A_0$$

The A's are obtained from the print constant tables and the **X** is the measured soil factor.

3.7 Stray Potential Print Constants For Pipe-Soil-Earth Under Test

Now, the stray potential PRINT constants of the pipe-soil-earth systems under test are A_{4V}, A_{3V}, A_{2V},

A_{1V} and A_{0V} at a definite cathodic protection level. This means that these print values are valid for these CP levels for these pipe soil systems under test at any time at the correspondent electrochemical properties (the soil factor). Table 7 shows result example of the stray potential print constants at CP level equal to -0.85 volt.

Table 7: Stray potential finger print constants at pipe to soil potential equal to -0.85 volt

3.8 Stray Capacitance Print Constants For Pipe-Soil-earth Under Test

The stray capacitance PRINT constants of the pipe-soil-earth systems under test are A4C, A3C, A2C, A1C and A0C at any cathodic protection level. This means that these print values are valid at any CP levels for these pipe-soil systems under test at any time at the correspondent electrochemical properties (the soil factor). Table 8 shows the stray capacitance print constants at all CP levels.

Table 8: Stray capacitance print constants at any pipe to soil potential

3.10 Protection current Print Constants For Pipe-Soil Under Test

The protection current PRINT constants of the pipe-soil-earth systems under test are A4I, A3I, A2I, A1I and A0I at a definite cathodic protection level. This means that these print values are valid for these CP levels for these pipe-soil systems under test at any time at the correspondent electrochemical properties (the soil factor). Table 10 shows result example of the protection current print constants at CP level equal to -0.85 volt.

Table 10: The PRINT constants of the pipe current at pipe to soil potential equal to -0.85 volt

4. Conclusion:

The behavior of the electrical parameters (stray potential $V_{P\text{-}PE,}$ stray capacitance $C_{P\text{-}PE}$, surface total charge Q and protection current I_P) of the pipe-soil-earth system, during the change of the electrochemical properties of the soil, with and without applying cathodic protection system, could be plotted as an electrical parameter PRINT which will be always valid in all times as the pipe-soil system is maintained and without any external interference. Once the system is changed by replacement another pipe with different dimension and/or the replacement of the soil, there will be another new electrical parameter PRINT for the new pipe-soil-earth system. Also, after completing electrical studies of pipe-soil-earth system in the near future, the buried pipe line segment with soil surrounding medium could be simulated electrically by an electric circuit where the system is subjected to the law: ($Q=C\times V$) between the pipe surface and remote earth. This is where each of circuit electric parameter could be obtained by an equation as a function of the measured electrochemical properties of the soil (soil factor), 4^{th} degree polynomial at room temperature but the A's constants are different for each electric quantity .The constants of each equation (A's) considered to be as a PRINT of such pipe-soil-earth system and valid until pipe and/or soil is changed with of course new print values. For buried bare pipe segments in different kind of soils with and without applying cathodic protection level, the PRINTS of the electrolytic stray capacitor between pipe & earth, the stray potential across the stray capacitance, surface charge and the protection current of the cathodic protection system passed through the pipe segment were obtained in terms of the new parameter, the soil factor. The useful of these PRINTS is to obtain complete electrical data correlated with many cathodic protection levels which help, after complete erection of the pipeline, in defining the c.p level of any pipe line segment through its length by measuring the protection current and calculating the soil factor at the pipe segment from direct field measurements. The average error of the electrical parameters equations reduced to be less than ± 5%. The most important advantage of such prospective electrical analogue circuit of pipe-soil-earth system is the possibility to simulate a complete pipeline – soil system by an electric circuit and to convert the corrosion problem and cathodic protection of the pipeline to an electric problem. In the near future after completing such electrical studies of the pipe-soil-earth systems, this will help in corrosion monitoring and the maintenance of c.p systems.

A Systematic Approach for Mobile Agent Design Based on UML (Class and Sequence Diagrams)

M. S. Al_Kholy, A. R. Khalifa and M. G. Alsaied

Systems and Computer Engineering Department, Faculty of Engineering, Al-Azhar University, Cairo, Egypt

Abstract: Agent researchers are still trying to determine useful ways to represent agents and agent-based systems. So, this paper presents a proposal for a Systematic Approach for Agent Design by using a Unified Modelling Language (UML) diagram. Here we illustrate notions for the behavior of an agent using and extending UML class diagrams. Focus on representing the agent migration from take requests and between other hosts. In this case study, we explain one variant of notation that is the most suitable for given scenario, show that it is easier to design agent applications based on agent UML, by developing software for our case study generated by UML software package. [Journal of American Science. 2010;6(12):284-290]. (ISSN: 1545-1003).

Keywords: Mobile Agent Design, Class Diagram ,Sequence Diagram, UML, A Systematic Approach

1. Introduction:

Since a long time people have been using each other's and sometimes animals as their agents. Developments in information processing technology, computers and their networks, have made it possible to build and use artificial agents. These agents are the advanced tools that people can use to achieve different goals and to solve various problems. The main difference between ordinary tools and agents is that agents can function independently from those who delegated agency to the agents. Now, the most popular approach in artificial intelligence is based on agents. Intelligent agents form a basis for many kinds of advanced software systems that incorporate varying methodologies, diverse sources of domain knowledge, and a variety of data types. The intelligent agent approach has been applied extensively in business applications, and more recently in medical decision support systems [1, 2] as well as ecology [3]. In the general paradigm, the human decision maker is considered to be an agent and is incorporated into the decision process. The overall decision is facilitated by a task manager who assigns subtasks to the appropriate agent and combines conclusions reached by agents to form the final decision. This paper is structured as follows. Section 1 is this introduction. Section 2 gives the concept of agent (definitions). Section 3 represents related work that includes Historical overview and answer the question (why UML?). Section 4 shows the different UML diagrams and their applications for agent-based systems, basically concerning with class diagrams. Section 5 provides a case study with a searcher scenario. Section 6 represents a Class

Diagram for the Case Study. Section 7 concludes the paper.

2. The Concept of an Agent

There are several definitions of intelligent and software agents. Some of the major definitions and descriptions of agents are given as follows:

- Agents are semi-autonomous computer programs that intelligently assist the user with computer applications. This is achieved by employing artificial intelligence techniques to assist users with daily computer tasks, Such as reading electronic mail, maintaining a calendar, and filing information. Thus Agents can learn through example-based reasoning and can improve their performance over time.
- Agents are computational systems that inhabit some complex, dynamic environment, and sense, and thus act autonomously to realize a set of goals or tasks.Agents are software robots that think and act on behalf of a user to carry out tasks. An agent helps meet the growing need for more functional, flexible, personal computing and telecommunications systems. The usage of intelligent agents includes self-contained tasks, operating semi-autonomously, and communication between user and systems resources.
- Agents are software programs that implement user delegation. Agents manage complexity, support user mobility, and lower the entry level for new users. Agents are a design model similar to client-server computing, rather than being strictly a technology, program, or product [4].

- An agent is anything that can be viewed as perceiving its environment through sensors and acting upon that environment through effectors, (Russel and Norvig, [5]).
- Intelligent agents continuously perform three functions: perception of dynamic conditions in the environment; action to affect conditions in the environment; and reasoning to interpret perceptions, solve problems, draw inferences, and determine actions, (Hayes-Roth, [6]).
- Intelligent agents are software entities that carry out some set of operations on behalf of a user or another program, with some degree of independence or autonomy, and in so doing, employ some knowledge or representation of the user's goals or desires [7].
- People, animals, and robots are examples of physical agents. Software agents and Ego in the sense of psychoanalysis are examples of mental agents. The head of a Turing machine (cf., for example, Burgin, [2]) is an example of a structural agent.

3. Related Work

3-1 Historical overview

A considerable number of agent-oriented methodologies and tools are available today, and the agent community is facing the problem of identifying a common vocabulary to support them (for details see the work in [9], on which this section is based). There is a considerable interest in the agent R&D community in methods and tools for analyzing and designing complex agent-based software systems, including various approaches to formal specification (see [10] for a survey). Since 1996, agent-based software engineering has been in the focus of the ATAL Workshop series; it also was the main topic of the 1999 MAAMAW Workshop [11]. Various researchers have developed methodologies for agent design, touching on representational mechanisms, like the GAIA methodology [12] or the extensive program underway at the Free University of Amsterdam on compositional methodologies for requirements [13], design [14], and verification [15]. In [16,17], Kinny et al. propose a modelling technique for BDI agents. The close affinity between design mechanisms employed for agent-based system and those used for object-oriented systems is shared by a number of authors, for example, [18]. In particular, since 2000, the Agent-Oriented Software Engineering Workshop (AOSE) has become the major forum for research carried out on these topics, including new methodologies such as Tropos [19], Prometheus [20], and MESSAGE [21]. Currently, most industrial methodologies are based on the Object Management Group's (OMG) Unified Modelling Language (UML) accompanied by process frameworks such as the Rational Unified Process (RUP), see [22] for details. The Model-Driven Architecture (MDA [23]) from the OMG allows a cascade if code generations from high-level models (platform independent model) via platform dependent models to directly executable code. Another approach for agile software engineering that has been receiving active coverage is Extreme Programming [24].

The UML is a standard modelling language for visualizing, specifying, constructing, and documenting the elements of systems in general, and software systems in particular [25]. UML has a well-defined syntax and semantics. It provides a rich set of graphical artefacts to help in the elicitation and top-down refinement of object-oriented software systems from requirements capture to the deployment of software components.

In UML, systems can be modelled by considering three aspects, the behavioural, the structural and the architectural aspects; each aspect is concerned with both the static and dynamic views of the system. The static view represents a projection onto the static structures of the complete system description. However, the dynamic view represents a projection onto the dynamical behaviour of the system. Finally, views are communicated using a number of diagrams including information emphasizing a particular aspect of the system.

3-2 Why UML

As an OMG standard, UML 2.0 has been considered a "final" standard, as of November 2004 [26]. In other words, many of the errors and inconsistencies of the original submission have been rectified. More than 3000 issues were files and resolved by the UML 2.0 Finalization Task Force. As such, software vendors can begin to build software tools that support the UML 2.0 Superstructure and Infrastructure. In addition, a firmer foundation is now available to adequately support the extensions for agent-based system modelling. The FIPA Modelling Technical Committee [27] and the OMG Agent Special Interest Group are actively working on extending UML for agent-based system modelling. These efforts are primarily supported by the work of more than a dozen software tool vendors.

4. Agent modelling with (UML)

UML is adequate for modelling object-oriented (OO) systems. But UML lacks the capability to readily model and specify agent systems. Unlike [Odell 2001a]'s Agent UML, we feel that every component of the UML must be extended. UML has a long history and is the result of a standardization

effort on different modelling languages (like Entity-Relationship-Diagrams, the Booch-Notation, OMT, OOSE), namely Unified Modelling Language. The most popular versions of UML are UML 1.x, but now UML 2.0 is the upcoming new specification for development of systems. (UML) is a standard modelling language for visualizing (using the standardized graphic UML notations), specifying the static structure, dynamic behaviour and model organization as well as constructing system, by mapping UML to programming environment, generating some code automatically, and documenting every phase of the lifecycle from analysis and design through deployment and maintenance. UML consists of a notation, describing the syntax of the modelling language, a graphical notation, and a meta model describing the semantics of UML, namely the static semantics of UML, but no operational semantics. However, UML defines no software process, since a software process describes the development activities, the dependencies of these activities and how they are applied.

<<Agent>>

<<Host 1>> <<Host 2>>

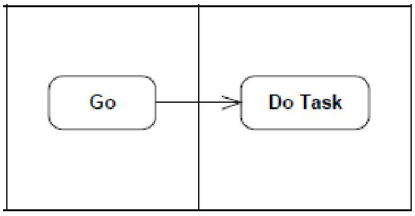

Figure1. Go action in UML

UML 2.0 supports the following diagrams: class, object, component, deployment and composite structure diagrams for modelling the static aspects of the systems and use case, state machine, sequence, activity, interaction overview, timing and communication diagrams for modelling dynamic aspects and packages, models and subsystems for modelling the model management [27]. Figure 1 shows an agent moving from location "host 1" to "host 2" and represented using "Go" activity.

Class diagram

In this section we focus on the first diagram (Class Diagram Figure 2) defined in the Superstructure Specification. We will use this distinction to present the diagram type and how it can be applied for modelling agent-based systems.

A Class Diagram describes on the one side a data model, i.e. collection of declarative (static) model elements, like classes and types, and on the other side their contents and relationships. Moreover the static structure of the system to be developed and all relevant structure dependencies and data types can be modelled with this class diagram [25]. They are applied in various phases of the project, e.g. analysis (conceptual modelling of the domain), design (platform independent description) of the implementation, detailed design (platform specific description) and to bridge the gap to the behavior diagrams. Class diagrams describe classes and interfaces with their attributes and operations, as well as associations between them (including aggregation and composition), but also generalization (a specific kind of inheritance) and dependencies among them. New to UML 2.0 is that attributes have ordering, graphical notations for associations are defined, graphical interface notation are introduced using lollipops, some unification on the notations for e.g. visibility, names and types has been done [26,28]. Moreover attributes have no implicit composition associations and dependencies are completely redefined. Class diagrams are illustrated in Figure 2. An agent model can be defined using class names, inheritance (generalization) of classes and adding name, type, position/role, capabilities and constrains, either directly or via associations. A role hierarchy can be defined using generalization. However, roles cannot be modeled in the necessary detail with any UML 2.0 diagram. Service models can also be done by this diagram type, e.g. defining services with input/output parameters and pre-/post-conditions as classes with attributes and functions (the service interface).

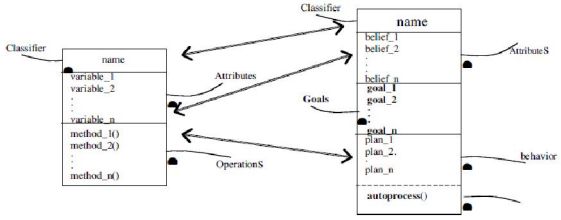

Figure2. Specifying agent behaviour using UML class diagram

5. Case Study: Book Searcher

The case study includes three network nodes: Home, Host 1 (British Library) and Host 2 (Congress Library) Figure 3. On Host 1 and Host 2 resides library agent, which is responsible for providing the books List. The searcher agent is created on the Home node. The input parameter is the item. The Searcher agent migrates from home node to Host1 node and requests library1 agent to give the books list. The library1 agent responds with the whole books list. The searcher extracts the book and migrates to the next node. After visiting all nodes the

Searcher agent migrates back to the Home node and informs the user where it has found the specified item.

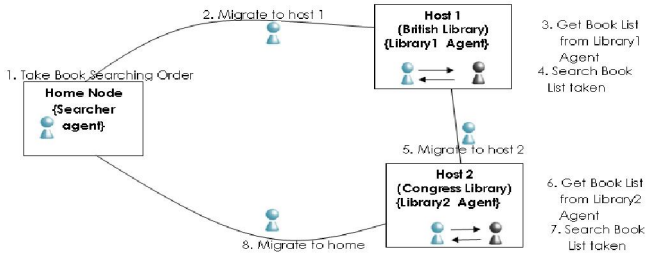

Figure3. Book searcher scenario

The mobile agent one-to-one relationship is the simplest; where the mobile agent (library agent) is placed between two negotiators (user searcher agent and the library) in this case. Similarly, one-to-many and many-to-one relationships; where the mobile agent (library agent) is placed between one negotiator at one side and more than one negotiator at the other side (a user searcher agent and more than one library) in this case.

The user inputs his demand through the Graphical User Interface (GUI) where it is going to be placed as a search_query. The user searcher agent then scans the network in order to build a list of available libraries.

The user searcher agent then takes the search_query and starts the journey by visiting the first library in the list.

Before the user searcher agent can reach the server of the library, it must pass the library's security check. While the user searcher agent enquires about the book needed, a local library agent, residing in the library server, is activated. There will be two scenarios with respect to the library: book found and book not found. The local library agent returns the results to the user searcher agent if the book is found then terminates the communication with the user searcher agent. If the book is not found, then the local library agent informs the user searcher agent that the book wasn't found and then terminates the communication with the user searcher agent. The user searcher agent then follows the itinerary and moves to the next library. Finally, the user searcher agent returns back to the user with the librarie's list where it found the book needed.

6. Sequence Diagram for the Case Study:

Before the user searcher agent can reach the server of the library, it must pass the library's security check. While the user searcher agent enquires about the book needed, a local library agent, residing in the library server, is activated. There will be two scenarios with respect to the library: book found and book not found. The local library agent returns the results to the user searcher agent if the book is found then terminates the communication with the user searcher agent. If the book is not found, then the local library agent informs the user searcher agent that the book wasn't found and then terminates the communication with the user searcher agent. The user searcher agent then follows the itinerary and moves to the next library. Finally, the user searcher agent returns back to the user with the libraries list where it found the book needed figure 4 illustrate Sequence diagram for case study.

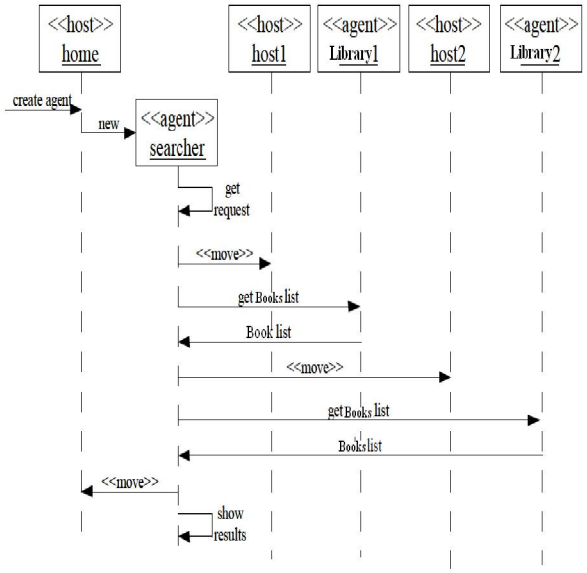

Figure. 4 Agent-Sequence diagrams applied to example

7. Class Diagram for the Case Study

In this section we show how usual UML class diagrams can be used and extended in the framework of agent oriented programming development. We will use the following notation to distinguish between different kinds of agent classes and instances. The first one denotes some agent class, the second some agent class satisfying distinguished roles and the last one defines some agent instance satisfying distinguished roles. The roles can be neglected for agent instances. According to the statement given above what has to be specified for agent classes we specify agents by the agent class diagram.

The usual UML notation can also be used to define such an agent class, but for more understandable reasons we have introduced the above

notation. Using stereotypes, an agent class written as a class diagram can look as shown in Figure.2.

The Class and the Activity diagrams are generated as the static and dynamic aspects of objects by represented the attributes and operations of the object. Figure 5 shows the Class diagram and Activity diagram applied to our example. The Activity diagram shows how to search the information and find the best solution. In the Class diagram, there are four classes for our problem. Each class has attributes and operations, showing their roles as follows:

User_Interface class:

- read_search_query: This method is for reading the search criteria from the user through the GUI of the searcher agent.
- display_results: This method is for displaying the results found.
- trace: This method is for displaying any messages.

Agent Class:

- start_agent: This method is for starting the user searcher agent.
- stop_agent: This method is for stopping the user searcher agent after accomplishing the task.
- terminate: This method is for ending the code.

Agent_Control Class:

- scan_network: This method is for scanning the network to find the libraries servers.
- return_results: This method is for sending the results to the user.
- stop_agent_control: This method is for ending the Agent Control.

Library_Agent Class:

- start_agent: This method is for starting the library agent.
- stop_agent: This method is for stopping the library agent after accomplishing the task.
- find_item: This method is for searching the library server's database for the book needed.
- return_results: This method is for sending the results to the user searcher agent.
- terminate_communication: This method is for ending the communication between the library agent and the user searcher agent.
- inform_termination: This method is for informing the user searcher agent that communication is terminated with the library agent.

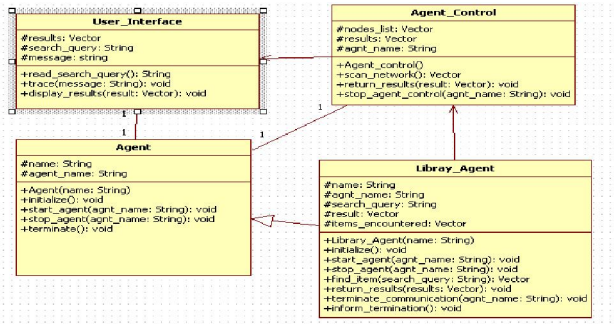

Figure. 5 Agent-class diagrams applied to example

8. Evaluation and Conclusion

This paper presents a Systematic Approach for Agent Design to support the modeling and the implementation of an agent using UML profile which defines a class diagram. From the end user's perspective, the goal is to provide a personal travel assistant, i.e., a software agent that uses information about the users' schedule and provides preferences in order to assist users in travel, including preparation as well as on-trip support. This requires providing ubiquitous access to assistant functions for the user, in the office, at home, and while on trips, using PCs, notebooks, information terminals, PDAs, and mobile phones.

The requirements for artifacts to support the analysis and design became clear, and the material described in this paper has been developed incrementally, driven by these requirements. So far, no empirical tests have been carried out to evaluate the benefits of the Agent UML framework. However, from this paper, we see two advantages as a result: First, they make it easier for users who are familiar with object-oriented software development but new to developing agent systems to understand what multi agent systems are about, and to understand the principles of looking at a system as a society of agents rather than a distributed collection of objects. Second, our estimate is that the time spent for design can be reduced by a minor amount, which grows with the number of agent-based projects. However, we expect that as soon as components are provided to support the implementation based on Agent UML specifications, this will widely enhance the benefit. In our work we use the star UML package to develop software for our case study by generating a code from star UML software package. This software can generate a code by more than one languages such as Java, C++, and others.

As for future work, we are looking forward to implement MA-UML diagrams. Also we plan to the

design and implement of a mobile agent security based on A Systematic Approach for modelling Agent Mobility with other UML Diagrams.

Abstract: The effect of dietary carbohydrates and vanadium toxicity on haematalogical profile, blood chemistry and hormonal level was studied in fry *Clarias Lazera*. Fry fish were divided into 3 groups (n=10) and exposed to different doses of vanadium sulfated and carbohydrate. Group1 was served as control, group 2 was fed with carbohydrate and vanadium sulfate (10 mg/ Kg diet ration), group 3 was fed with carbohydrate and vanadium sulfate (15 mg/Kg diet ration). There is a significant decrease in hemoglobin and P.C.V in group (3). There is a significant increase in serum cortisol, cholestrol, AST, ALT, urea, creatinine and alkaline phosphatase in group (3), also there is a significant decrease in serum phosphorous, sodium and potasium in treated fish. There is a significant high level of vanadium content in kidney muscles, heart and spleen in group (3) suggesting toxic effects of vanadium on cat fry fish *Clarious Lazara.* The total viable count of bacteria identified higher in fry fish fed on carbohydrate vandium. Predominate bacteria were identified as *Aeromonas, E. coli, Staph aureus. Pseudomonas, Fluorscences* and *Lacto bacilus* species. We emphasize the finding that increase in carbohydrate concentration causes harmful pathological effects which reduces humoral immune responses and enhances dietary vanadium toxicity. [Journal of American Science. 2010;6(12):291-296]. (ISSN: 1545-1003).

Keywords: Fry *Clarias Lazera,* Vanadium Pollution, Haematological, Biochemical, Clinicopathological, Bacterial count.

1. Introduction

Fry fish plays an important role, not only in human food diets but also in animal and poultry rations. It is a palatable and easily digested food which is rich in vitamins, calcium, phosphorus and iodine. In Egypt, fry fish is considered as a cheap food article if compared with other foods of animal origin. The flesh of healthy fry fish is considered as a marker for the natural aquatic environment.

Vanadium is a rare element found combined in certain minerals and used mainly to produce certain alloys. Most of the vanadium (about 80%) produced is used as ferrovanadium or as a steel additive. Mixed with aluminium in titanium alloys is used in jet engines and high speed air-frames, and steel alloys are used in axles, crankshafts, gears and other critical components. Vanadium oxide (V_2O_5) is used as a catalyst in manufacturing sulfuric acid and in making ceramics. It is added to glass to produce green or blue tint [1].

Vanadium was first discovered in 1971 as a trace element that is essential for normal growth. Since then, vanadium has been found to regulate the activity of various enzymes that induce pronounced changes in metabolic functions.

Vanadium is never found unbound in nature, Vanadium occurs in carbon containing deposits such as crude oil, coal, oil shale and tar sands. Vanadium is abundant in most soils, in variable amounts, especially in areas where chemicals or petrochemicals complex were located, where these areas showed a significant increase in its concentration [2].

Humans may be exposed to excessive vanadium in several situations for example, overconsumption of vanadium-rich foods (e.g: seafood) [3], ingestion of certain dietary regimens specially that of body building, or inhalation of vanadium-rich environmental pollutants in certain occupations including boilermakers and power plant workers, who are often exposed to high levels of vanadium-rich compounds at work.

Because vanadium is vasoactive, individuals exposed to excessive vanadium may develop adverse vascular effects [4] especially pulmonary vascular diseases [5] as well as nanoparticulate of vanadium oxide potentiated vanadium toxicity in human lung cells [6] and Nickel and vanadium rich pollutant dust could be responsible for the respiratory problems reported [7].

Chronic exposure to vanadium pentoxide dust and fumes may cause severe irritation of the eyes, skin, upper respiratory tract, persistent inflammations of the trachea and bronchi, pulmonary edema, and systemic poisoning. Signs and symptoms of overexposure include; conjunctivitis, nasopharyngitis, cough, labored breathing, rapid heart beat, lung changes, chronic bronchitis, skin pallor, greenish-black tongue and an allergic skin rash [1] and [7]

In animals, vanadium causes the inhibition of certain enzymes, which has several neurological effects. Next to the neurological effects vanadium can cause breathing disorders, paralyses and negative effects on the liver and kidneys. Laboratory tests with test animals have shown, that vanadium can cause harm to the reproductive system of male animals, and that it accumulates in the female placenta. Vanadium can be found in fry fishes and many other species. In mussels and crabs vanadium strongly bioaccumulates, which can lead to concentrations of about 10^5 to 10^6 times greater than the concentrations that are found in seawater [8].

In recent years, much attention had been paid to the possible danger of metals poisoning in human as a result of consumption of contaminated fry fishes. So, the present study was carried out to elucidate the impact of vanadium on cat fry fish *Clarias Lazera*. Its haematological, biochemical and hormonal parameters were studied as well as the bacteriological and clinicopathological investigations.

2. Material and Methods

Experimental design

Thirty cat fry fish fry *Clarious Lazera* were used to assess the effect of vanadium sulfate. Fry fish weighing from 15-25g were obtained from Nile River and were kept in glass aquaria supplied with dechlorinated tap water at rate of one liter for each cm of fry fish's body. Fry fish were acclimated to the laboratory conditions for two weeks before the beginning of the experiment, they were fed with a commercial fry fish diet [9], the experiment was determined after 4 weeks. Fry fish were divided into 3 groups (n=10) and exposed to different doses of vanadium sulfated and carbohydrate. Group1 was served as control, group 2 was fed with carbohydrate and vanadium sulfate (10 mg/ Kg diet ration), group 3 was fed with carbohydrate and vanadium sulfate (15 mg/Kg diet ration). Mean of the initial body weight of each examined fry fish was at the beginning of the experiment then after 2-4 weeks of exposure.

Blood samples

Blood samples were collected from the caudal vein after 4 weeks of exposure. Each sample was divided into two parts the first one was heparinized for haematological investigations, while the second was centrifuged at 3000 rpm for 5 minutes to obtain serum for biochemical studies.

Hematological Analysis:

Haematological studies were performed according to Sandnes *et al* 1988 [10], where blood haemologlobin (Hb) and haematocrit (Ht) values were evaluated.

Biochemical Analysis:

The activities of alkaline phosphatase, aspartic aminotransferase (AST) and alanine aminotransferase (ALT) as well as cholesterol, urea and creatinine level were determined according to the method of Varley *et al*. [11] by using commercial kits (Bio Merieus, France).

Total serum protein was estimated according to Drupt [12]. Serum cortisol was analyzed by a Gamma counter using 125 I cortisol radioimmunassay Kit (Baxter Health Care Corporation USA) according to the method described by Pickering and Pottinger [13]. Potassium, Sodium and Phosphorous concentrations were determined by atomic absorption spectrophotometry [11].

Tissue analysis:

Liver, kidney and spleen samples were washed with distilled water then dried in hot air oven, sulphuric acid and hydrogen peroxide were added on samples then heated until the mixture became transparent after performing a wet ash digestion according to the method of Issac and Kerber [14].

Identification of bacteria:

The liver, kidney, spleen, muscle, stomach and gill from each examined fry fish were diluted immediately after sampling in sterile 0.9% saline and 0.1 ml volumes of appropriate dilutions and were spread over the surface of the typtic soy agar (oxoid). The plates were incubated at 22°C and inspected daily for up to 4 weeks.

The isolates were classified and identified according to Stevenson [15] and Quinn *et al*. [16].

The data were evaluated statistically according to Gad and Weil [17].

Water samples

Two water samples were collected from River Nile (Helwan) as well as two water samples

free from any heavy metal pollution El-Kasr El-Eini (control) were analyzed for vanadium concentration by atomic absorption spectrophotometry.

3. Results and Discussion:

Data in table 1 showed that, the vanadium level in Helwan region was clearly higher than the maximum allowable concentration for human consumption as recommended internationally according to WHO (World Health Organization) . Nadal et, al.concluded that the occurrence of vanadium in nature and its use in various industrial processes has increased its inputs in the environment [2]. From the present study it is clear that the low vanadium levels were reported in water samples collected from areas far from industrial discharges, while high vanadium levels in the present study may be due to the collection of samples from areas subjected to industrial pollution.

In table 3 there is a significant decrease in body weight in group 3 (fry fish fed 15 mg vanadium for 4 weeks) than in group 1 (control) and group 2 (fry fish fed 10 mg vanadium), this results agree with that report [18].

The results present in table 6 showed the comparison of cholesterol levels between groups. The level was significantly increased in group 3 (fry fish fed on 15 mg vanadium) than in group 1(control). Hyperchrolestremia might be due to necrotic changes occurring in liver with liberation of cholesterol as a by-product of cell destruction. The present data suggest that impaired liver function lead to increased serum levels of alkaline phosphate, AST and ALT among group 3 (fry fish fed on 15 mg vanadium) and among group 2 (fry fish fed 10 mg vanadium) compared to group1 (control). In this concern Khalaf-Allah concluded that ALT and AST enzymes are good indices for the health status of liver parenchymatous, tissue necrosis is considered as the main source of AST and its increase in the serum of cat fry fish Clarias Lazera declared these necrotic changes [18]. In addition, exposure of fry fish to environmental pollutants might result in stimulation or depression of the enzyme activity depending on the concentration of pollutant and the duration of exposure [19] and [20].

Regarding the effect of vanadium on serum cortisol level in cat fry fish Clarias Lazera, highest level was obtained in group 3 (fry fish fed on 15 mg vanadium) then in group 2 (fry fish fed on 10 mg vanadium) as compared to that obtained in group 1 (control) . The significant increase of cortisol level is probably due to the activation of hypothalamus pituitary internal axis [21].

From the data present in table 6, it is clear that elevation of vanadium level in the diets fed to Clarias Lazera was positively correlated to hemoglobin (Hb) levels and haematocrit (Ht). A marked decrease in the Hb and Ht was recorded after feeding diet containing 15 mg and 10 mg vanadium, respectively. Reduced Hb may reflect metabolic adjustment according to reduced need for oxygen by change in blood pH.

Moyle and Ceeh, Hall and Cliffs recorded, actived acetylcholinesterase of erythrocytes [22], [23]. Further more, Pickering and Dusten concluded that a consistent effect of cortisol was the reduction in the hemoglobin and iron levels as a result of decrease in appetite in rainbow trout fry fish or more likely to be the direct result of catablolic effect of cortisol in the fry fish tissues [24].

The mean phosphorus, sodium and potasium values in the serum of fry fish of group 3 (fry fish fed 15 mg vanadium) were significantly increased respectively than those recorded in the group 1 (control). This retention may be attributing to kidney dysfunction, whereas, the kidney is the normal pass for sodium and potassium. This kidney dysfunction may also explain the increase in serum urea and creatinine especially in group 3, but little known about the mechanisms involved in this association.

The results displayed also in table 6 showed that, there was general decrease in the mean total protein value in serum samples collected from the fry fish of group 3 and 2, respectively. The mean value of these parameters was lower than in group 1. Jagadeesh et al. estimated marked decrease in glycogen in tissues of fresh water fry fish after exposure to vanadium [25].

This experiment showed that the body weight of the examined fry fish was significantly decreased than the initial body weight after 4 weeks of exposure to 15 mg Vanadium. Also, Hilton and Better recorded a significantly reduced growth and increased mortality among the fry fish feeding diets of Vanadium (0,10,100,1000 or 10000 mg/kg) [26]. The increase in muscles and tissue lactic acid (2-12 fold) in association with decrease in pyruvic acid (72% in muscles +26% in liver) reflect a shift towards an anaerobic metabolism of fry fish following long term exposure to vanadium. [26]

Table 4 showed that, the bacterial isolates and counts were increased by feeding the fry fish with CHO and vanadium. The carbohydrates affect immunity and resistance to infection as recorded by Waagbo et al. [9]. Utility of vanadate mimetic protein phosphates inhibitors, to protect fry fish from microorganism [27]. The increase of bacterial count among the fry fish fed on vanadium may be related to the increased level of cortisol which decreases the host immunity.

In the course of experiment, a high concentration of vanadium levels has been found in

kidney, liver, spleen, heart and muscles of cat fry fish Clarias Lazera fed 15 mg vanadium table 5. This suggests that these organs could be useful as a marker for vanadium in the aquatic environment. In this concern, Ray et al. recorded a high concentration of vanadium in kidney, liver and other organs of cat fry fish as the concentration of vanadium in the tissues increased with its concentration in the aquatic environment and exposure time [28]. After exposure of fry fish to increased doses for 4 days, the vanadium content increase in the muscle then increased in all tissues [20], [25] and [26]. The capability of vanadium to be present in fry fish muscles is of particular interest in assessing the exposure of man to environmental vanadium as ingested by food.

Clinicopathological observations:

Abnormal swimming, lighting of the skin, scale loss and haemorrhages, were seen on the external body surface. In addition to congestion of gills, eyes, mouth, liver, kidney, spleen and intestine. This was noticed in fry fish exposed to vanadium sulphate 15 mg (group 3) but not in fry fish exposed to vanadium sulphate 10 mg (group 2)

In conclusion we emphasize that, the reported finding increase of carbohydrate concentrations causes harmful physiological effects, reduces humoral immune responses and enhances dietary vanadium toxicity.

Abstract: Third and fourth order convergent methods based on cubic nonpolynomial spline function at midknotes are presented for the numerical solution of a second order two-point boundary value problem with Neumann conditions. Using this spline function a few consistency relations are derived for computing approximations to the solution of the problem. Convergence analysis of these methods is discussed two numerical examples are given to illustrate practical usefulness of the new methods. [Journal of American Science. 2010;6(12):297-302]. (ISSN: 1545-1003).

Keywords: Cubic nonpolynomial spline; two-point boundary value problem; Neumann boundary conditions.

1. Introduction:

In approximation theory spline functions occupy an important position having a number of applications, especially in the numerical solution of boundary-value problems. We shall consider a numerical solution of the following linear second order two-point boundary value problem, see [5].

$$y^{(2)} + f(x)y = g(x), \quad x \in [a,b] \qquad (1.1)$$

Subject to Neumann boundary conditions:

$$y^{(1)}(a) - A_1 = y^{(1)}(b) - A_2 = 0 \qquad (1.2)$$

Where A_i , $i = 1, 2$ are finite real constants. The functions $f(x)$ and $g(x)$ are continuous on the interval $[a,b]$. The analytical solution of (1.1) subjected to (1.2) cannot be obtained for arbitrary choices of $f(x)$ and $g(x)$.

The numerical analysis literature contains little on the solution of second order two-point boundary value problem (1.1) subjected to Neumann boundary conditions (1.2).while The linear second order two-point boundary value problem (1.1) subjected to Dirichlet boundary conditions solved by different types of spline functions, see [1, 7, 8, 9].

Ramadan et al. [5] solved the problem (1.1) subjected to (1.2) using quadratic polynomial spline, cubic polynomial spline and quadratic nonpolynomial spline at midknotes.

In this paper, we develop cubic nonpolynomial spline at midkontes to get smooth approximations for the solution of the problem (1.1) subjected to Neumann boundary conditions (1.2).

2. Derivation of the method:

We introduce a finite set of grid points x_i by dividing the interval $[a, b]$ into n equal parts.

$x_i = a + ih$, $i = 0, 1, \ldots, n$

$$x_0 = a\ ,\ x_n = b \ \text{ and } \ h = \frac{b-a}{n} \qquad (2.1)$$

Let $y(x)$ be the exact solution of the system (1.1) and (1.2) and S_i be an approximation to $y_i = y(x_i)$ obtained by the spline function $Q_i(x)$ passing through the points (x_i, s_i) and (x_{i+1}, s_{i+1}).

Each nonpolynomial spline segment $Q_i(x)$ has the form.

$$Q_i(x) = a_i \sin k(x - x_i) + b_i \cos k(x - x_i) + c_i(x - x_i) + d_i \ , i = 0,1,\ldots.n-1 \qquad (2.2)$$

Where a_i , b_i , c_i and d_i are constants and k is the frequency of the trigonometric functions which will be used to raise the accuracy of the method and equation (2.2) reduces to cubic polynomial spline function in $[a,b]$when $k \to 0$, Choosing the spline function in this form will enable us to generalize other existing methods by arbitrary choices of the parameters α and β which will be defined later at the end of this section. Thus, our cubic nonpolynomial spline is now defined by the relations:

$$(i)\ S(x) = Q_i(x), x \in [x_i, x_{i+1}], i = 0,1,\ldots\ldots,n-1$$
$$(ii)\ S(x) \in C^{\infty}[a,b] \qquad (2.3)$$

The four coefficients in (2.2) need to be obtained in terms of

$S_{i+1/2}, D_i, M_{i+1/2}, T_i \text{ and } T_{i+1}$ Where

$$\begin{aligned}
&(i)\ Q_i\left(x_{i+1/2}\right) = S_{i+1/2}\\
&(ii)\ Q_i^{(1)}(x_i) = D_i\\
&(iii)\ Q_i^{(2)}\left(x_{i+1/2}\right) = M_{i+1/2}\\
&(iv)\ Q_i^{(3)}(x_i) = \frac{1}{2}\left[T_i + T_{i+1}\right]
\end{aligned} \tag{2.4}$$

We obtain via a straightforward calculation

$$a_i = \frac{-1}{2k^3}\left[T_{i+1} + T_i\right],\quad b_i = \frac{\tan\theta/2}{2k^3}\left[T_{i+1} + T_i\right] - \frac{\sec\theta/2}{k^2} M_{i+1/2}$$

$$C_i = D_i + \frac{1}{2k^2}\left[T_{i+1} + T_i\right],\quad d_i = S_{i+1/2} + \frac{1}{k^2} M_{i+1/2} - \frac{h}{2} D_i - \frac{h}{4k^2}\left[T_{i+1} + T_i\right] \tag{2.5}$$

Where $\theta = kh$ and $i = 0, 1, 2 \ldots n-1$

Now using the continuity conditions (*ii*) and (2.3), that is the continuity of cubic nonpolynomial spline $S(x)$ and its first and second derivates at the point (x_i, s_i), where the two cubics $Q_{i-1}(x)$ and $Q_i(x)$ join, we can have

$$Q_{i-1}^{(m)}(x_i) = Q_i^{(m)}(x_i),\ m = 0, 1, 2 \tag{2.6}$$

Using Eqs. (2.2), (2.4), (2.5) and (2.6) yield the relations:

$$\frac{h}{2}\left[D_i + D_{i-1}\right] = \left(S_{i+1/2} - S_{i-1/2}\right) + \frac{1}{k^2} M_{i+1/2}\left[1 - \sec\theta/2\right] + \frac{1}{k^2} M_{i-1/2}\left[\cos\theta\sec\theta/2 - 1\right] + \left(\frac{\tan\theta/2}{2k^3} - \frac{h}{4k^2}\right)\left(T_{i-1} + 2T_i + T_{i+1}\right) \tag{2.7}$$

$$\frac{h}{2}\left[D_i + D_{i-1}\right] = \frac{h \sin\theta \sec\theta/2}{2k} M_{i-1/2} \tag{2.8}$$

And

$$\frac{\tan\theta/2}{2k^3}\left(T_{i-1} + 2T_i + T_{i+1}\right) = \frac{\sec\theta/2}{k^2} M_{i+1/2} - \frac{\cos\theta\sec\theta/2}{k^2} M_{i-1/2} \tag{2.9}$$

From Eqs. (2.7) – (2.9) we get the following relation:

$$S_{i-3/2} - 2S_{i-1/2} + S_{i+1/2} = h^2\left(\alpha M_{i-3/2} + \beta M_{i-1/2} + \alpha M_{i+1/2}\right), i = 2,3,\ldots,n-1 \tag{2.10}$$

Where

$$\alpha = \frac{\theta - 2\sin\theta/2}{2\theta^2 \sin\theta/2} \quad And \quad \beta = \frac{2\theta\sin^2\theta/2 + 4\sin\theta/2 - \theta(1+\cos\theta)}{2\theta^2 \sin\theta/2}$$

And

$$M_i = -f_i S_i + g_i \ \ with\ \ f_i = f\left(x_i\right) and\ g_i = g\left(x_i\right)$$

The relation (2.10) gives *(n-2)* linear algebraic equations in the *(n)* unknowns $S_{i+1/2}$,i = *0,1,2, ... n-1*, so we need two more equations, one at each end of the range of integration for direct computation of $S_{i+1/2}$. These two equations are deduced by Taylor series and the method of undetermined coefficients. These equations are

$$-hS_0^{(1)} - S_{1/2} + S_{3/2} = h^2\left(w_0 M_{1/2} + w_1 M_{3/2} + w_2 M_{5/2} + w_3 M_{7/2}\right) at\ i = 1 \tag{2.11}$$

And

$$S_{n-3/2} - S_{n-1/2} + hS_n^{(1)} = h^2\left(w_0 M_{n-1/2} + w_1 M_{n-3/2} + w_2 M_{n-5/2} + w_3 M_{n-7/2}\right), at\ i = n \tag{2.12}$$

Where w_i*'s* will be determined later to get the required order of accuracy.

The local truncation errors t_i, *i = 1, 2, ...n* associated with the scheme (2.10) – (2.12) can be obtained as follows, we rewrite the scheme(2.10) – (2.12) in the form

$$-h y_0^{(1)} - y_{1/2} + y_{3/2} = h^2\left(w_0 y_{1/2}^{(2)} + w_1 y_{3/2}^{(2)} + w_2 y_{5/2}^{(2)} + w_3 y_{7/2}^{(2)}\right) + t_1, at\ i = 1 \tag{2.13}$$

$$y_{i-3/2} - 2y_{i-1/2} + y_{i+1/2} = h^2\left(\alpha y_{i-1/2}^{(2)} + \beta y_{i-1/2}^{(2)} + \alpha y_{i+1/2}^{(2)}\right) + t_i, at\ i = 2,3,\ldots,n-1 \tag{2.14}$$

And

$$y_{n-3/2} - y_{n-1/2} + h y_n^{(1)} = h^2\left(w_0 y_{n-1/2}^{(2)} + w_1 y_{n-3/2}^{(2)} + w_2 y_{n-5/2}^{(2)} + w_3 y_{n-7/2}^{(2)}\right) + t_n, at\ i = n \tag{2.15}$$

The terms $y_{i-1/2}$ and $y_{i-1/2}^{(2)}$ …in Eq. (2.14) are expanded around the point x_i using Taylor series and the expressions for t_i, *i = 2, … n-1* can be obtained. Also, expressions for t_i *; i = 1, n* are obtained by expanding Eqs. (2.13) and (2.15) around

the point x_0 and x_n, respectively, using Taylor series and the expressions for t_i ; $i = 1, n$ can be obtained as

$$t_i = \begin{cases} \left[1-(w_0+w_1+w_2+w_3)\right]h^2y_i^{(2)} + \left[\frac{26}{48} - \frac{(w_0+3w_1+5w_2+7w_3)}{2}\right]h^3y_i^{(3)} \\ + \left[\frac{80}{384} - \frac{(w_0+9w_1+25w_2+49w_3)}{8}\right]h^4y_i^{(4)} + \left[\frac{242}{3840} - \frac{(w_0+27w_1+125w_2+343w_3)}{48}\right]h^5y_i^{(5)} \\ + \left[\frac{728}{46080} - \frac{(w_0+81w_1+625w_2+2401w_3)}{384}\right]h^6y_i^{(6)} + O(h^7); i = 1, n \\ (1-2\alpha-\beta)h^2y_i^{(2)} + \left(\alpha + \frac{\beta}{2} - \frac{1}{2}\right)h^3y_i^{(3)} + \left(\frac{5}{24} - \frac{5\alpha}{4} - \frac{\beta}{8}\right)h^4y_i^{(4)} \\ + \left(\frac{-1}{16} + \frac{26\alpha}{48} + \frac{\beta}{48}\right)h^5y_i^{(5)} + \left(\frac{91}{5760} - \frac{82\alpha}{384} - \frac{\beta}{384}\right)h^6y_i^{(6)} + O(h^7); i = 2, \ldots\ldots n-1 \end{cases} \quad (2.16)$$

The scheme (2.10) – (2.12) gives rise to a family of methods of different orders as follows:

For $\alpha = \frac{1}{12}$ *and* $\beta = \frac{10}{12}$

2.1 Third order method

For $(w_0, w_1, w_2, w_3) = (24, -1, 1, 0)/d_1$ where $d_1 = 24$

Then the local truncation errors given by equation (2.16) are

$$t_i = \begin{cases} \frac{-247}{5760}h^5y_i^{(5)} + O\left(h^6\right), \; i = 1, n \\ \frac{-1}{240}h^6y_i^{(6)} + O\left(h^7\right), \; i = 2, 3, \ldots\ldots, n-1 \end{cases} \quad (2.17)$$

2.2 Fourth order method

For $(w_0, w_1, w_2, w_3) = (6007, -981, 981, -247)/d_2$ *where* $d_2 = 5760$

Then the local truncation errors given by equation (2.16) are

$$t_i = \begin{cases} \frac{23}{576}h^6y_i^{(6)} + O\left(h^7\right), \; i = 1, n \\ \frac{-1}{240}h^6y_i^{(6)} + O\left(h^7\right), \; i = 2, 3, \ldots\ldots, n-1 \end{cases} \quad (2.18)$$

Remark

(1) When $\alpha = \frac{1}{8}$ *and* $\beta = \frac{6}{8}$, then the scheme (2.10) is reduced to quadratic polynomial spline in [2, 3].

(2) When $\alpha = \frac{1}{24}$ *and* $\beta = \frac{22}{24}$, then the scheme (2.10) is reduced to cubic polynomial spline in [4]

(3) When $\alpha = \frac{1}{12}$ *and* $\beta = \frac{10}{12}$, we get new scheme that produces numerical results better than both quadratic and cubic polynomial splines in [2, 3, 4].

3. Spline solutions:

The spline solution of (1.1) with the boundary condition (1.2) is based on the linear equations given by (2.10) – (2.12), let

$Y = \left(y_{i+\frac{1}{2}}\right), S = \left(S_{i+\frac{1}{2}}\right), C = (C_i), T = (t_i) E = \left(e_{i+\frac{1}{2}}\right) = Y - S$

Be n-dimensional column vectors, then we can write the standard matrix equations for the nonpolynomial spline method in the form.

(i) $NY = C + T$

(ii) $NS = C$ (3.1)

(iii) $NE = T$

We also have $N = N_0 + h^2BF$; $F = \text{diag}\left(f_{i+\frac{1}{2}}\right)$ (3.2)

The three band symmetric matrix N_0 has the form:

$$N_0 = \begin{pmatrix} -1 & 1 & & & & & \\ 1 & -2 & 1 & & & & \\ & 1 & -2 & 1 & & & \\ & & \ddots & & & & \\ & & & 1 & -2 & 1 & \\ & & & & 1 & -2 & 1 \\ & & & & & 1 & -1 \end{pmatrix} \quad (3.3)$$

The matrix B has the form:

$$B = \begin{pmatrix} w_0 & w_1 & w_2 & w_3 & & & \\ \alpha & \beta & \alpha & & & & \\ & \alpha & \beta & \alpha & & & \\ & & \ddots & & & & \\ & & & \alpha & \beta & \alpha & \\ & & & & \alpha & \beta & \alpha \\ & & & w_3 & w_2 & w_1 & w_0 \end{pmatrix} \quad (3.4)$$

For the vector C, we have

$$C_i = \begin{cases} hA_1 + h^2\left[w_0 g_{1/2} + w_1 g_{3/2} + w_2 g_{5/2} + w_3 g_{7/2}\right], & i = 1 \\ h^2\left[\alpha g_{i-3/2} + \beta g_{i-1/2} + \alpha g_{i+1/2}\right], & i = 2,3,.....,n-1 \\ -hA_2 + h^2\left[w_0 g_{n-1/2} + w_1 g_{n-3/2} + w_2 g_{n-5/2} + w_3 g_{n-7/2}\right], & i = n \end{cases} \quad (3.5)$$

Set $N_0 = M_0 + J_0$ (3.6)

Where

$$M_0 = \begin{pmatrix} -3 & 1 & & & & \\ 1 & -2 & 1 & & & \\ & 1 & -2 & 1 & & \\ & & \ddots & & & \\ & & 1 & -2 & 1 & \\ & & & 1 & -2 & 1 \\ & & & & 1 & -3 \end{pmatrix} \quad (3.7)$$

And

$$J_0 = \begin{pmatrix} 2 & 0 & & & 0 & 0 \\ 0 & 0 & & & & 0 \\ \vdots & & & & & \\ \vdots & & & & & \\ 0 & & & 0 & & \\ & & & & 0 & 0 \\ 0 & 0 & & & 0 & 2 \end{pmatrix} \quad (3.8)$$

4. Convergence analysis

Our main purpose now is to derive a bound on $\|E\|_\infty$. We now turn back to the error equation (*iii*) in (3.1) and rewrite it in the form

$$E = N^{-1}T = \left(M_0 + J_0 + h^2BF\right)^{-1}T = \left(I + M_0^{-1}\left(J_0 + h^2BF\right)\right)^{-1}M_0^{-1}T$$

This implies that

$$\|E\|_\infty = \left\|\left(I + M_0^{-1}\left(J_0 + h^2BF\right)\right)^{-1}\right\|_\infty \left\|M_0^{-1}\right\|_\infty \|T\|_\infty \quad (4.1)$$

In order to derive the bound on $\|E\|_\infty$, the following two lemmas are needed.

Lemma 4.1 ([10]). If G is a square matrix of order n and $\|G\| < 1$, then $(I+G)^{-1}$ exists and

$$\left\|(I+G)^{-1}\right\| < \frac{1}{1 - \|G\|}$$

Lemma 4.2; the matrix $\left(M_0 + J_0 + h^2BF\right)$ is nonsingular if $\|f\| < \dfrac{h^2 - 2w}{h^2 w(\beta + 2\alpha)}$ where

$$w = \frac{1}{8}\left((b-a)^2 + h^2\right)$$

Proof. Since,

$N = \left(M_0 + J_0 + h^2BF\right) = \left(I + M_0^{-1}\left(J_0 + h^2BF\right)\right)M_0$ and the matrix M_0 is nonsingular, so to prove N nonsingular it is sufficient to show $\left(I + M_0^{-1}\left(J_0 + h^2BF\right)\right)$ nonsingular.

Moreover,

$$\|F\|_\infty \le \|f\| = \max_{a \le x \le b} |f(x)| \quad (4.2)$$

$$\left\|M_0^{-1}\right\|_\infty \le \frac{h^{-2}}{8}\left[(b-a)^2 + h^2\right], \text{ see [6]} \quad (4.3)$$

$$\|J_0\|_\infty = 2 \quad (4.4)$$

And $\|B\|_\infty = 2\alpha + \beta$ (4.5)

Also,

$$\left\|M_0^{-1}\left(J_0 + h^2BF\right)\right\|_\infty = \left\|M_0^{-1}\right\|_\infty \cdot \left(\|J_0\|_\infty + h^2\|B\|_\infty\|F\|_\infty\right) \quad (4.6)$$

Therefore, substituting $\|F\|, \left\|M_0^{-1}\right\|, \|J_0\|$ and $\|B\|$ in (4.6) we get

$$\left\|M_0^{-1}\left(J_0 + h^2BF\right)\right\|_\infty \le \frac{h^{-2}}{8}\left((b-a)^2 + h^2\right)\left[2 + h^2(2\alpha + \beta)\|f\|\right] \quad (4.7)$$

Since, $\|f\| < \dfrac{h^2 - 2w}{h^2 w(\beta + 2\alpha)}$ (4.8)

Therefore, Eq. (4.8) leads to

$$\left\|M_0^{-1}\left(J_0 + h^2BF\right)\right\|_\infty \le 1 \quad (4.9)$$

From Lemma 4.1, it shows that the matrix N is nonsingular. Since , $\left\|M_0^{-1}\left(J_0 + h^2BF\right)\right\|_\infty < 1$ so using Lemma (4.1)and Eq. (4.1) follow that

$$\|E\|_\infty \le \frac{\left\|M_0^{-1}\right\|_\infty \|T\|_\infty}{1 - \left\|M_0^{-1}\right\|_\infty \left\|J_0 + h^2BF\right\|_\infty} \quad (4.10)$$

From Eq. (2.17) we have

$$\|T\|_\infty = \frac{247}{5760}h^5 M_5; M_5 = \max_{a \le x \le b} \left|y^{(5)}(x)\right|$$

Then

$$\|E\|_\infty \le \frac{\left\|M_0^{-1}\right\|_\infty \|T\|_\infty}{1 - \left\|M_0^{-1}\right\|_\infty \left\|J_0 + h^2BF\right\|_\infty} \cong O\left(h^3\right) \quad (4.11)$$

Also, from Eq. (2.18) we have

$$\|T\|_\infty = \frac{23}{576}h^6 M_6; M_6 = \max_{a \le x \le b} \left|y^{(6)}(x)\right|$$

Then

$$\|E\|_\infty \le \frac{\|M_0^{-1}\|_\infty \|T\|_\infty}{1 - \|M_0^{-1}\|_\infty \|J_0 + h^2 BF\|_\infty} \cong O(h^4) \tag{4.12}$$

We summarize the above results in the next theorem.

Theorem 4.1

Let $y(x)$ is the exact solution of the continuous boundary value problem (1.1) with the boundary condition (1.2) and let $y_{i+1/2}, i = 0,1,..... n-1$, satisfies the discrete boundary value problem (*ii*) in (3.1). Further, if $e_{i+1/2} = y_{i+1/2} - S_{i+1/2}$ then

1- $\|E\|_\infty \cong O(h^3)$, for third order convergent method

2- $\|E\|_\infty \cong O(h^4)$, for fourth order convergent method

Which are given by (4.11) and (4.12), neglecting all errors due to round off.

5. Numerical examples and discussion:

We now consider two numerical examples illustrating the comparative performance of cubic nonpolynomial spline method (*ii*) in (3.1) over quadratic nonpolynomial spline method and the two polynomial spline methods (quadratic and cubic). All calculations are implemented by MATLAB 7

Example 1

Consider the boundary value problem, see [5]

$$y^{(2)} + y = -1 \tag{5.1}$$

$$y^{(1)}(0) = \frac{1-\cos(1)}{\sin(1)} = -y^{(1)}(1)$$

The analytical solution of (5.1) is

$$y(x) = \cos(x) + \frac{1-\cos(1)}{\sin(1)}\sin(x) - 1 \tag{5.2}$$

Example 2

Consider the boundary value problem, see [5]

$$y^{(2)} + xy = (3 - x - x^2 + x^3)\sin(x) + 4x\cos(x) \tag{5.3}$$

$$y^{(1)}(0) = -1, \; y^{(1)}(1) = 2\sin(1)$$

The analytical solution of (5.3) is

$$y(x) = (x^2 - 1)\sin(x) \tag{5.4}$$

The numerical results of examples 1 and 2 are presented in tables 1 and 2, respectively, for our fourth order method. A comparison between the method (2.10) and the existing methods in Ramadan et al. [5] are provided in tables 3 and 4.

6. Conclusion:

Two new methods are presented for solving second order two-point boundary value problem with Neumann conditions. These methods are shown to be optimal third and optimal fourth orders which are better than the two polynomial spline methods (quadratic and cubic splines) and quadratic nonpolynomial spline method. Moreover, nonpolynomial spline method has less computational cost over other polynomial spline methods. The obtained numerical results show that the proposed methods maintain a remarkable high accuracy which make them are very encouraging over other existing methods.

Abstract: Second and fourth order convergent methods based on Quartic nonpolynomial spline function are presented for the numerical solution of a third order two-point boundary value problem. The proposed approach gives better approximations than existing polynomial spline and finite difference methods and has a lower computational cost. Convergence analysis of the proposed method is discussed; two numerical examples are included to illustrate the efficiency of the method. [Journal of American Science. 2010;6(12):303-309]. (ISSN: 1545-1003).

Keywords: Quartic nonpolynomial spline; third order two-point boundary value problem; convergence analysis, finite difference.

1. Introduction:

Many problems in mathematical and engineering sciences are formulated in boundary value problems for third order differential equations as in physical oceanography and in the frame work of variational inequality theory and in many branches of pure and applied mathematics. For more details show [1, 2]

We shall consider a numerical solution of the following linear third order two-point boundary value problem

$$y^{(3)}+f(x)\,y=g(x),\ x\in[a,b] \qquad (1.1)$$

Subject to the boundary conditions

$$y(a)=k_1,\ y^{(1)}(a)=k_2,\ y^{(1)}(b)=k_3 \qquad (1.2)$$

Where $k_i, i=1,2,3$ are finite real constants, the functions $f(x)$ and $g(x)$ are continuous on the interval $[a, b]$, the analytical solution of (1.1) and (1.2) cannot be obtained for arbitrary choices of $f(x)$ and $g(x)$. The numerical analysis literature contains other methods developed to find approximate solutions of these types of boundary value problems. Al-Said and Noor [3, 4] developed a second order method for solving a system of third order two-point boundary value problems using cubic and quartic polynomial spline functions respectively; Al-Said and Noor [5] have developed a second order finite difference method at midpoints. A.Khan and T.Aziz [6] established and discussed convergent fourth order method for this problem with the change in the boundary conditions $y(a)=k_1,\ y^{(1)}(a)=k_2,\ y(b)=k_3$ using quintic polynomial spline functions.

S.ul.Islam et al. [8] have developed a smooth approximation for solving a system of third order obstacle problem based on nonpolynomial spline which provides bases for our method.

In the present paper, Quartic nonpolynomial spline functions are applied to develop a new numerical method for obtaining smooth approximations to the solution of such third-order differential equation. The method is of order two for arbitrary α and β along with $\alpha+\beta=\frac{1}{2}$ and $\alpha\neq 0$, Which will be defined later at the end of the next section and better results will be obtained for choosing α less than β as we will see from the analysis of the local truncation error. And the method of order four for $\alpha=0$ along with $\alpha+\beta=\frac{1}{2}$, in section 2, we derive the consistency relations and develop the quartic nonpolynomial spline method for solving (1.1) subject to (1.2). In section3 and 4 are devoted for the spline solution and convergence analysis of the method. The numerical experiments are given in section 5.

2. Derivation of the method:

We introduce a finite set of grid points x_i by dividing the interval $[a,b]$ into (n+1) equal subintervals where

$$x_i = a + i\,h,\ i = 0, 1, 2, \ldots\ldots, n, n+1$$
$$x_0 = a,\ x_{n+1} = b \text{ and } h = \frac{b-a}{n+1} \qquad (2.1)$$

Let $y(x)$ be the exact solution of the system (1.1) and (1.2) and S_i be an approximation to $y_i=y(x_i)$ obtained by the spline function $Q_i(x)$ passing through the points (x_i, s_i) and (x_{i+1}, s_{i+1}).

Each quartic nonpolynomial spline segment $Q_i(x)$ has the form:

$$Q_i(x) = a_i \cos k(x - x_i) + b_i \sin k\,(x - x_i) + c_i(x - x_i)^2 + d_i(x - x_i) + e_i \quad , i = 0,1, \ldots \ldots n \qquad (2.2)$$

Where a_i, b_i, c_i, d_i and e_i are constants and k is the frequency of the trigonometric functions which will be used to raise the accuracy of the method and equation (2.2) reduces to quartic polynomial spline function in $[a,b]$when $k \rightarrow 0$, Choosing the spline function in this form will enable us to generalize other existing polynomial spline methods for arbitrary choices of the parameters α and β which will be defined at the end of this section. Thus, this quartic nonpolynomial spline is now defined by the relations:

$$(i)\ S(x) = Q_i(x), x \in [x_i, x_{i+1}], i = 0,1, \ldots \ldots, n$$
$$(ii)\ S(x) \in C^{\infty}[a,b] \qquad (2.3)$$

Following the technique of S.ul.Islam et al. [8] we let:

$$Q_i(x) = S_i \ , Q_i(x_{i+1}) = S_{i+1}$$

$$Q_i^{(1)}(x_i) = D_i \qquad (2.4)$$

$$Q_i^{(3)}(x_i) = T_i, \ Q_i^{(3)}(x_{i+1}) = T_{i+1}$$

For $i = 0,1, \ldots\ldots,n$, to obtain via a straight forward calculations

$$a_i = h^3\left[\frac{T_{i+1} - T_i \cos\theta}{\theta^3 \sin\theta}\right]$$
$$b_i = -h^3\left[\frac{T_i}{\theta^3}\right]$$
$$c_i = \left[\frac{S_{i+1} - S_i}{h^2}\right] - \frac{D_i}{h} - \frac{h}{\theta^2}T_i + \frac{h\,[1-\cos\theta]\,[T_{i+1} + T_i]}{\theta^3 \sin\theta}$$
$$d_i = D_i + \frac{h^2 T_i}{\theta^2}$$
$$e_i = S_i - h^3\left[\frac{T_{i+1} - T_i \cos\theta}{\theta^3 \sin\theta}\right] \qquad (2.5)$$

Where $\theta = kh$, $i = 0, 1, \ldots\ldots, n$

Using the continuity conditions (ii) and (2.3) of the first and second derivatives at the point (x_i, s_i) that is $Q_{i-1}^{(m)}(x_i) = Q_i^{(m)}(x_i), m = 1,2$ (2.6)

Using Eqs. (2.2), (2.4), (2.5) and (2.6) yield the relations:

$$D_i + D_{i-1} = \frac{2}{h}[S_i - S_{i-1}] + \frac{2h^2[1-\cos\theta][T_i + T_{i-1}]}{\theta^3 \sin\theta} - \frac{h^2[T_{i-1} + T_i]}{\theta^2} \qquad (2.7)$$

$$D_i - D_{i-1} = \frac{1}{h}[S_{i-1} - 2S_i + S_{i+1}] + \frac{h^2[1-\cos\theta]}{\theta^3 \sin\theta}[T_{i+1} - T_{i-1}] + \frac{h^2}{\theta^2}[T_{i-1} - T_i] + \frac{h^2 \cos\theta}{\theta \sin\theta}T_i - \frac{h^2}{2\theta \sin\theta}[T_{i+1} + T_{i-1}] \qquad (2.8)$$

Adding Eqs. (2.7) and (2.8) we get

$$D_i = \frac{1}{2h}[S_{i+1} - S_{i-1}] - \frac{h^2}{\theta^2}T_i + \frac{h^2[1-\cos\theta]}{2\,\theta^3 \sin\theta}[T_{i+1} + 2T_i + T_{i-1}] + \frac{h^2 \cos\theta}{2\theta \sin\theta}T_i - \frac{h^2}{4\theta \sin\theta}[T_{i+1} + T_{i-1}] \qquad (2.9)$$

Similarly

$$D_{i-1} = \frac{1}{2h}[S_i - S_{i-2}] - \frac{h^2}{\theta^2}T_{i-1} + \frac{h^3[1-\cos\theta]}{2\,\theta^3 \sin\theta}[T_i + 2T_{i-1} + T_{i-2}] + \frac{h^2 \cos\theta}{2\theta \sin\theta}T_{i-1} - \frac{h^2}{4\theta \sin\theta}[T_i + T_{i-2}] \qquad (2.10)$$

D_i And D_{i-1} are eliminated from equation (2.7) with the help of Eqs. (2.9) and (2.10) to get the following scheme:

$$-S_{i-2} + 3S_{i-1} - 3S_i + S_{i+1} = h^3\left[\alpha(T_{i-2} + T_{i+1}) + \beta(T_{i-1} + T_i)\right], i = 2,3,\ldots,n-1 \qquad (2.11)$$

Where

$$T_i = -f_i S_i + g_i \quad with \ f_i = f(x_i)\ and\ g_i = g(x_i)$$

And

$$\alpha = \left[\frac{1}{2\theta \sin\theta} - \frac{1-\cos\theta}{\theta^3 \sin\theta}\right]$$

$$\beta = \left[\frac{1-2\cos\theta}{2\theta \sin\theta} + \frac{1-\cos\theta}{\theta^3 \sin\theta}\right]$$

The relation (2.11) gives $(n-2)$ linear algebraic equations in the (n) unknowns S_i , $i = 1, 2, \ldots\ldots,n$, so

we need two more equations, one at each end of the range of integration for direct computation of S_i. Here, for our system (1.1) and (1.2) we also derive these two equations by Taylor series and the method of undetermined coefficients, these equations are:

$$-4S_1+S_2=-3S_0-2hS_0^{(1)}+h^3\left(w_0T_0+w_1T_1+w_2T_2+w_3T_3\right) at\ i=1 \tag{2.12}$$

And

$$-3S_{n-2}+8S_{n-1}-5S_n=-2hS_{n+1}^{(1)}+h^3\left(\sigma_0T_n+\sigma_1T_{n-1}+\sigma_2T_{n-2}+\sigma_3T_{n-3}\right), at\ i=n \tag{2.13}$$

Where $w_i's$ and $\sigma_i's$ will be determined later to get the required order of accuracy.

The local truncation errors t_i, $i = 1,2 \ldots n$ associated with the scheme (2.11)– (2.13) can be obtained as follows:

First we rewrite the scheme (2.11) – (2.13) in the form

$$-4y_1+y_2=-3y_0-2hy_0^{(1)}+h^3\left(w_0y_0^{(3)}+w_1y_1^{(3)}+w_2y_2^{(3)}+w_3y_3^{(3)}\right)+t_1, i=1 \tag{2.14}$$

$$-y_{i-2}+3y_{i-1}-3y_i+y_{i+1}=h^3\left[\alpha\left(y_{i-2}^{(3)}+y_{i+1}^{(3)}\right)+\beta\left(y_{i-1}^{(3)}+y_i^{(3)}\right)\right]+t_i, i=2,3,4,\ldots,n-1 \tag{2.15}$$

And

$$-3y_{n-2}+8y_{n-1}-5y_n=-2hy_{n+1}^{(1)}+h^3\left[\sigma_0y_n^{(3)}+\sigma_1y_{n-1}^{(3)}+\sigma_2y_{n-2}^{(3)}+\sigma_3y_{n-3}^{(3)}\right]+t_n, i=n \tag{2.16}$$

The terms $y_{i-2}^{(3)}$, $y_{i+1}^{(3)}$, *etc* in Eq. (2.15) are expanded around the point x_i using Taylor series and the expressions for t_i, $i = 2, \ldots n-1$ can be obtained. Also, expressions for t_i, $i = 1, n$ are obtained by expanding Eqns. (2.14) and (2.16) around the point x_0 and x_n, respectively, using Taylor series and the expressions for t_i, $i = 1, n$ can be obtained as follow:

$$t_i=\begin{cases} h^3y_0^{(3)}\left[\frac{2}{3}-(w_0+w_1+w_2+w_3)\right]+h^4y_0^{(4)}\left[\frac{1}{2}-(w_1+2w_2+3w_3)\right]+h^5y_0^{(5)}\left[\frac{7}{30}-\left(\frac{w_1+4w_2+9w_3}{2}\right)\right] \\ +h^6y_0^{(6)}\left[\frac{1}{12}-\left(\frac{w_1+8w_2+27w_3}{6}\right)\right]+h^7y_0^{(7)}\left[\frac{31}{1260}-\left(\frac{w_1+16w_2+81w_3}{24}\right)\right]+O\left(h^8\right), i=1 \\ \\ h^3y_i^{(3)}[1-(2\alpha-2\beta)]+h^4y_i^{(4)}\left[(\alpha+\beta)-\frac{1}{2}\right]+h^5y_i^{(5)}\left[\frac{1}{4}-\left(\frac{5\alpha+\beta}{2}\right)\right] \\ +h^6y_i^{(6)}\left[\frac{-1}{12}+\left(\frac{7\alpha+\beta}{6}\right)\right]+h^7y_i^{(7)}\left[\frac{1}{40}-\left(\frac{17\alpha+\beta}{24}\right)\right]+O\left(h^8\right), i=2,\ldots n-1 \\ \\ h^3y_n^{(3)}\left[\frac{11}{3}-(\sigma_0+\sigma_1+\sigma_2+\sigma_3)\right]+h^4y_n^{(4)}\left[\frac{-4}{3}+(\sigma_1+2\sigma_2+3\sigma_3)\right]+h^5y_n^{(5)}\left[\frac{49}{60}-\left(\frac{\sigma_1+4\sigma_2+9\sigma_3}{2}\right)\right] \\ +h^6y_n^{(6)}\left[\frac{-43}{180}+\left(\frac{\sigma_1+8\sigma_2+27\sigma_3}{6}\right)\right]+h^7y_n^{(7)}\left[\frac{39}{504}-\left(\frac{\sigma_1+16\sigma_2+81\sigma_3}{24}\right)\right]+O\left(h^8\right), i=n \end{cases} \tag{2.17}$$

The scheme (2.11) – (2.13) gives rise to a family of methods of different orders as follows:

2.1 Second order method

For arbitrary values of α and β along with

$$\alpha+\beta=\frac{1}{2}\ ,\ \alpha\neq 0$$

$$(w_0, w_1, w_2, w_3)=\left(\frac{2}{15}, \frac{7}{12}, \frac{-1}{15}, \frac{1}{60}\right)$$

And

$$(\sigma_0, \sigma_1, \sigma_2, \sigma_3)=\left(\frac{157}{60}, \frac{19}{30}, \frac{11}{20}, \frac{-2}{15}\right)$$

Then the local truncation errors given by equation (2.17)are

$$t_i=\begin{cases} \frac{-29}{2520}h^7y_0^{(7)}+O\left(h^8\right), & i=1 \\ (-2\alpha)h^5y_i^{(5)}+O\left(h^6\right), & i=2,3,\ldots,n-1 \\ \frac{677}{5040}h^7y_n^{(7)}+O\left(h^8\right), & i=n \end{cases} \tag{2.18}$$

So, better results occurred for choosing α less than β whose sum is $\frac{1}{2}$

2.2 Fourth order method

For $\alpha=0$ and $\beta=\frac{1}{2}$

$(w_0, w_1, w_2, w_3)=\left(\frac{2}{15}, \frac{7}{12}, \frac{-1}{15}, \frac{1}{60}\right)$ And

$(\sigma_0, \sigma_1, \sigma_2, \sigma_3)=\left(\frac{157}{60}, \frac{19}{30}, \frac{11}{20}, \frac{-2}{15}\right)$ Then the local truncation errors given by equation (2.17) are

$$t_i = \begin{cases} \frac{-29}{2520} h^7 y_0^{(7)} + O\left(h^8\right), & i = 1 \\ \frac{1}{240} h^7 y_i^{(7)} + O\left(h^8\right), & i = 2, \ldots\ldots, n-1 \\ \frac{677}{5040} h^7 y_n^{(7)} + O\left(h^8\right), & i = n \end{cases} \tag{2.19}$$

Remark

(1) When $\alpha = \frac{1}{12}$ and $\beta = \frac{5}{12}$ then the scheme (2.11) reduces to Al-Said and Noor method based on cubic polynomial spline [3].

(2) When $\alpha = \frac{1}{24}$ and $\beta = \frac{11}{24}$ then the scheme (2.11) reduces to Al-Said and Noor [4], Usmani and Sakai [7] methods based on quartic polynomial spline.

3. Spline solutions:

The spline solution of (1.1) with the boundary condition (1.2) is based on the linear equations given by (2.11) – (2.13).

Let $Y = (y_i)$, $S = (S_i)$, $C = (C_i)$, $T = (T_i)$, $E = (e_i) = Y - S$
Be n-dimensional column vectors, then we can write the standard matrix equations for the nonpolynomial spline method in the form:

$$\begin{aligned} &(i) \quad NY = C + T \\ &(ii) \quad NS = C \\ &(iii) \quad NE = T \end{aligned} \tag{3.1}$$

We also have $N = N_0 + h^3 BF$; $F = \text{diag}\left(f_i\right)$, (3.2)

And the matrices N_0 and B are defined by

$$N_0 = \begin{pmatrix} -4 & 1 & & & & & \\ 3 & -3 & 1 & & & & \\ -1 & 3 & -3 & 1 & & & \\ & -1 & 3 & -3 & 1 & & \\ & & & & & & \\ & & & & -1 & 3 & -3 & 1 \\ & & & & & -3 & 8 & -5 \end{pmatrix} \tag{3.3}$$

The matrix B has the form:

$$B = \begin{pmatrix} w_1 & w_2 & w_3 & & & \\ \beta & \beta & \alpha & & & \\ \alpha & \beta & \beta & \alpha & & \\ & & & & & \\ & & & \alpha & \beta & \beta & \alpha \\ & & & \sigma_3 & \sigma_2 & \sigma_1 & \sigma_0 \end{pmatrix} \tag{3.4}$$

For the vector C,

$$C_i = \begin{cases} -3k_1 - 2hk_2 + h^3\left[w_0(-f_0 k_1 + g_0) + \sum_{J=1}^{J=3} w_J g_J\right], & i = 1 \\ k_1 - h^3 \alpha k_1 f_0 + h^3\left[\alpha(g_0 + g_3) + \beta(g_1 + g_2)\right], & i = 2 \\ h^3\left[\alpha(g_{i-2} + g_{i+1}) + \beta(g_{i-1} + g_i)\right], & i = 3,4,\ldots\ldots,n-1 \\ -2h k_3 + h^3\left[\sum_{J=0}^{J=3} \sigma_J g_{n-J}\right], & i = n \end{cases} \tag{3.5}$$

4. Convergence analysis

Our main purpose now is to derive a bound on $\|E\|_\infty$. We now turn back to the error equation (*iii*) in (3.1) and rewrite it in the form

$$E = N^{-1}T = \left(N_0 + h^3 BF\right)^{-1} T = \left(I + N_0^{-1} h^3 BF\right)^{-1} N_0^{-1} T$$

which implies that:

$$\|E\|_\infty = \left\| I + N_0^{-1} h^3 BF \right\|_\infty \left\| N_0^{-1} \right\|_\infty \|T\|_\infty \tag{4.1}$$

In order to derive the bound on $\|E\|_\infty$, the following two lemmas are needed.

Lemma 4.1, ([9]). If G is a square matrix of order n and $\|G\|_\infty < 1$, then $(I+G)^{-1}$ exists and

$$\left\|(I+G)^{-1}\right\|_\infty < \frac{1}{1 - \|G\|_\infty}$$

Lemma 4.2, the matrix $\left(N_0 + h^3 BF\right)$ is nonsingular, if $\|f\| < \frac{243}{w}$ where:

$$w = 11(b-a)^3\left[2 + \frac{3h^2}{(b-a)^2}\right]$$

Proof. Since,

$N = N_0 + h^3 BF = \left(I + N_0^{-1} h^3 BF\right) N_0$ and the matrix N_0 is nonsingular, so to prove N is

nonsingular it is sufficient to show $\left(I + N_0^{-1}h^3BF\right)$ nonsingular. Moreover,

$$\|F\|_\infty \le \|f\| = \max_{a\le x\le b}|f(x)| \quad (4.2)$$

$$\left\|N_0^{-1}\right\|_\infty \le \frac{2h^{-3}}{81}\left[(b-a)^3 + \frac{3h^2}{2}(b-a)\right], \text{ see [7]} \quad (4.3)$$

$$\|B\|_\infty = \sigma_0 + \sigma_1 + \sigma_2 + \sigma_3 = \frac{11}{3} \quad (4.4)$$

Also, $\left\|N_0^{-1}h^3BF\right\|_\infty = h^3\left\|N_0^{-1}\right\|_\infty \|B\|_\infty \|F\|_\infty$ (4.5)

Therefore, substituting $\|F\|_\infty, \left\|N_0^{-1}\right\|_\infty$ and $\|B\|_\infty$ in (4.5) we get

$$\left\|N_0^{-1}h^3BF\right\|_\infty \le \frac{22}{243}\left[(b-a)^3 + \frac{3h^2(b-a)}{2}\right]\|f\| \quad (4.6)$$

Since, $\|f\| < \frac{243}{w}$ (4.7)

Therefore, Eq. (4.7) leads to

$$\left\|N_0^{-1}h^3BF\right\|_\infty \le 1 \quad (4.8)$$

From Lemma 4.1, it shows that the matrix N is nonsingular. Since $\left\|N_0^{-1}h^3BF\right\|_\infty < 1$, so using Lemma (4.1) and Eq. (4.1) follow that

$$\|E\|_\infty \le \frac{\left\|N_0^{-1}\right\|_\infty \|T\|_\infty}{1 - h^3\left\|N_0^{-1}\right\|\|B\|\|F\|} \quad (4.9)$$

From Eq. (2.18) we have

$$\|T\|_\infty = 2\alpha h^5 M_5; M_5 = \max_{a\le x\le b}\left|y^{(5)}(x)\right|$$

Then

$$\|E\|_\infty \le \frac{\left\|N_0^{-1}\right\|_\infty \|T\|_\infty}{1 - h^3\left\|N_0^{-1}\right\|_\infty \|B\|_\infty \|F\|_\infty} \cong O\left(h^2\right) \quad (4.10)$$

Also, from Eq. (2.19) we have

$$\|T\|_\infty = \frac{677}{5040}h^7 M_7; M_7 = \max_{a\le x\le b}\left|y^{(7)}(x)\right|$$

Then

$$\|E\|_\infty \le \frac{\left\|N_0^{-1}\right\|_\infty \cdot \|T\|_\infty}{1 - h^3\left\|N_0^{-1}\right\|_\infty \|B\|_\infty \|F\|_\infty} \cong O\left(h^4\right) \quad (4.11)$$

We summarize the above results in the next theorem.

Theorem 4.1

Let $y(x)$ be the exact solution of the continuous boundary value problem (1.1) with the boundary condition (1.2) and let $y_i, i = 1,2,.....n$, satisfy the discrete boundary value problem (*ii*) in (3.1), further, if $e_i = y_i - S_i$ then

1- $\|E\|_\infty \cong O\left(h^2\right)$, for second order convergent method

2- $\|E\|_\infty \cong O\left(h^4\right)$, for fourth order convergent method

Which are given by (4.10) and (4.11), neglecting all errors due to round off.

5. Numerical examples and discussion:

In this section we illustrate the numerical Techniques discussed in the previous sections by the following two boundary value problems of (1.1) and (1.2), in order to illustrate the comparative Performance of our method (*ii*) in (3.1) over other existing methods. All calculations are implemented by MATLAB 7 .

Example 1:

Consider the boundary value problem

$$y^{(3)} - x\,y = (x^3 - 2x^2 - 5x - 3)e^x \quad (5.1)$$

$$y(0) = 0,\ y^{(1)}(0) = 1,\ y^{(1)}(1) = -e$$

The analytical solution of (5.1) is

$$y(x) = x(1 - x)e^x$$

Example 2

Consider the boundary value problem

$$y^{(3)} + y = (x-4)\sin x + (1-x)\cos x \quad (5.2)$$

$$y(0) = 0,\ y^{(1)}(0) = -1,\ y^{(1)}(1) = \sin(1)$$

The analytical solution of (5.2) is

$$y(x) = (x - 1)\sin x$$

The numerical results for our fourth and second orders are summarized in tables 1-4 and compared with the other existing polynomial splines and finite difference methods.

Table 1: ***The observed maximum absolute errors for Example 1***

h	*Fourth order method* $\alpha = 0 \ , \ \beta = \frac{1}{2}$	*Second order method* $\alpha = \frac{1}{128} \ , \ \beta = \frac{1}{2} - \alpha$
$\frac{1}{16}$	5.2992 – 7	1.5540 – 4 [a]
$\frac{1}{32}$	2.6127 – 8	4.1551 – 5
$\frac{1}{64}$	1.4999 – 9	1.0575 – 5
$\frac{1}{128}$	8.9762 – 11	2.6562 – 6

[a] 1.5540 – 4 = $1.5540*10^{-4}$

Table 2: ***The observed maximum absolute errors for Example 1***

$\frac{1}{16}$	2.3819 – 8	9.0774 – 6
$\frac{1}{32}$	1.1184 – 9	2.4289 – 6
$\frac{1}{64}$	6.3020 – 11	6.1842 – 7
$\frac{1}{128}$	3.7640 – 12	1.5534 – 7

Table 4: ***The observed maximum absolute errors for Example 2***

h	**Our fourth order method** $\alpha = 0, \beta = \frac{1}{2}$	**Islam et al. [8]**	**Al-Said and Noor [5]**	**Al-Said and Noor [4]**	**Al-Said and Noor [3]**
$\frac{1}{16}$	2.3819–8	9.2517–7	4.5978–5	4.8237–5	9.7501–5
$\frac{1}{32}$	1.1184–9	6.8079–8	1.2530–5	1.2948–5	2.5965–5
$\frac{1}{64}$	6.3020–11	4.5822–9	3.2356–6	3.2980–6	6.6004–6
$\frac{1}{128}$	3.7640–12	2.9515–10	8.1999–7	8.284–7	1.6573–6

It is verified from the Tables 1- 4 that on reducing the step size from h to $\frac{h}{2}$ the maximum error $\|E\|$ is approximately reduced by a factor $\frac{1}{2^p}$, where p is the order of the method which confirms that our method is a second and fourth orders convergent as predicted in section 4.

6. Conclusion:

Two new methods are presented for solving third order two-point boundary value problem using quartic nonpolynomial spline functions. These methods are shown to be optimal second and optimal fourth orders which have better accuracy compared with Al-Said and Noor [3-5] and S.ul.Islam et al [8]. The obtained numerical results show that the proposed methods maintain a very remarkable high accuracy which make them are very encouraging for dealing with the solution of two-point boundary value problems.

Abstract: In this paper we develop a class of accurate methods based on quartic nonpolynomial spline function at midknots for the numerical solution of a fourth order two point boundary value problems associated with plate deflection theory. Using this spline function a few consistency relations are derived for computing approximations to the solution of the problem. Existing second and fourth order finite difference and spline functions based methods developed at midknots become special cases of the new approach. Convergence analysis of the proposed method is discussed. Two numerical examples are included to illustrate the practical usefulness of our method. [Journal of American Science. 2010;6(12):310-316]. (ISSN: 1545-1003).

Keywords: Quartic nonpolynomial spline; two point boundary value problem; plate deflection theory; convergence analysis.

1. Introduction:

It is well known that the elastic beam is one of the most used elements in structures of aircrafts, buildings, ships and bridges. Beam deflection under certain load can be modeled by a fourth order two point Boundary value problems. We consider the problem of bending a rectangular simply supported beam of length L resting on an elastic foundation the vertical deflection U of the beam satisfies the system:

$$U^{(4)} + \left(Z/D\right)U = D^{-1}q(x) \quad (1.1)$$

$$U(0) = U(L) = U^{(2)}(0) = U^{(2)}(L) = 0 \quad (1.2)$$

Where D is the flexural rigidity of the beam, Z is the spring constant of the elastic foundation, and the load $q(x)$ acts vertically downwards per unit length of the beam. The details of the mechanical interpretation are given in [1]. Mathematically the system (1.1) and (1.2) belongs to a general class of boundary value problems of the form

$$y^{(4)} + f(x)\, y = \mathrm{g}(x) \quad , \quad x \in [a, b] \quad (1.3)$$

Subject to the boundary conditions

$$y(a) = A_1 \ , y(b) = A_2 \ , y^{(2)}(a) = B_1 \ , y^{(2)}(b) = B_2 \quad (1.4)$$

Where $f(x)$ and $\mathrm{g}(x)$ are continuous on $[a, b]$ and A_i, B_i $(i = 1,2)$ are finite real arbitrary constants. The analytical solution of (1.3) subject to (1.4) cannot be obtained for arbitrary choices of $f(x)$ and $\mathrm{g}(x)$. The numerical analysis literature contains other methods developed to find an approximate solution of this problem using spline functions and finite difference.

Usmani [2], Usmani and Warsi [3] solved linear fourth order two point boundary value problems using quartic, quinitic and sextic polynomial spline functions. Al-Said et al. [4,5] solved fourth order obstacle problems using cubic and quartic spline functions, respectively. Usmani [6] solved this problem with the boundary conditions involving first derivatives using quintic and sextic polynomial spline functions. Also, Rashidinia and Golbabaee [7] and Siddiqi and Ghazala [8] solved the preceding problem using quintic spline functions. VanDaele et al. [9] solved the above boundary value problem with the boundary conditions involving first derivatives using nonpolynomial spline function. Zhu [10] introduced optimal quartic spline collocation methods for the numerical solution of this problem based on perturbation technique which gives rise to two optimal quartic spline one step and three step collocation methods.

Al-Said et al. [11] developed a fourth order finite difference method for the system (1.3) and (1.4). Ramadan et al. [12, 13] solved this problem using quintic nonpolynomial spline function. The aim of this paper is to construct a new spline method based on a nonpolynomial spline function that has a polynomial part and a trigonometric part to develop numerical methods for obtaining smooth approximations for the solution of the system (1.3) and (1.4); the paper is organized as follows: in section 2, we present the derivation of our method. The method is formulated in a matrix form in section 3. Convergence analysis for second, fourth and six order methods is established in section 4. Numerical results are presented to illustrate the applicability and accuracy in section 5. Finally, in section 6, the results of the proposed methods are concluded to illustrate their practical usefulness and accuracy.

2. Derivation of the method:

We introduce a finite set of grid points x_i by dividing the interval $[a,b]$ into n equal parts.

$$x_i = a + ih \ , \ i = 0,1, \dots \dots, n$$
$$x_0 = a \ \ , x_n = b \ and \ h = \frac{b-a}{n} \qquad (2.1)$$

Let $y(x)$ be the exact solution of the system (1.3) and (1.4) and s_i be an approximation to $y_i = y(x_i)$ obtained by the spline function $Q_i(x)$ passing through the points (x_i, s_i) and (x_{i+1}, s_{i+1}).

Each nonpolynomial spline segment $Q_i(x)$ has the form:

$$Q_i(x) = a_i \sin k\,(x - x_i) + b_i \cos k\,(x - x_i) + c_i\,(x - x_i)^2 + d_i\,(x - x_i) + e_i \qquad (2.2)$$

$i = 0,1,2, \dots \dots, n-1$,where a_i ,b_i ,c_i d_i, and e_i are constants and k is the frequency of the trigonometric functions which will be used to raise the accuracy of the method and Eq. (2.2) reduces to quartic polynomial spline function in $[a,b]$ when $k \to 0$ choosing the spline function in this form will enable us to generalize other existing methods by arbitrary choices of the parameters α , $\beta$and γ which will be defined later in the end of this section. Thus, our quartic nonpolynomial spline is now defined by the relations:

$$(i)\ S(x) = Q_i(x)\ ,\ x \in [x_i, x_{i+1}], i = 0,1, \dots n-1$$
$$(ii)\ S(x) \in C^{\infty}[a,b] \qquad (2.3)$$

First, we develop expressions for the five coefficients of (2.2) in terms of $S_{i+1/2}, D_i, M_{i+1/2}\ and\ T_i, W_{i+1/2}$, where

$$(i)\ Q_i\left(x_{i+1/2}\right) = S_{i+1/2}, Q_i^{(1)}(x_i) = D_i$$
$$(ii)\ Q_i^{(2)}\left(x_{i+1/2}\right) = M_{i+1/2} \qquad (2.4)$$
$$(iii)\ Q_i^{(3)}(x_i) = T_i \ \ , \ \ Q_i^{(4)}\left(x_{i+1/2}\right) = W_{i+1/2}$$

We obtain via a straight forward calculation the following expressions:

$$a_i = \frac{-T_i}{k^3} \ \ ; \ \ b_i = \frac{T_i}{k^3}\tan(\theta/2) + \frac{1}{k^4\cos(\theta/2)}\,W_{i+1/2}$$
$$c_i = \frac{1}{2}\,M_{i+1/2} + \frac{1}{2k^2}\,W_{i+1/2} \ \ ; \ \ d_i = D_i + \frac{T_i}{k^3} \qquad (2.5)$$
$$e_i = S_{i+1/2} - \frac{h}{2}D_i - \frac{h^2}{8}M_{i+1/2} - \frac{h}{2k^2}T_i - \left[\frac{1}{k^4} + \frac{h^2}{8k^2}\right]W_{i+1/2}$$

Where $\theta = kh\ and\ i = 0,1,2, \dots \dots, n-1$ Now using the continuity (ii) in (2.3) that is the continuity of quartic nonpolynomial spline $S(x)$ and its derivatives up to order three are involved at the point (x_i,s_i) where the two quartics $Q_{i-1}(x)$ and $Q_i(x)$ join. Thus, $Q_{i-1}^{(m)}(x_i) = Q_i^{(m)}(x_i)$, $m = 0,1,2\ and\ 3$ which on using Eqs. (2.4) and (2.5) yield the following consistency relations:

$$\frac{h}{2}[D_i + D_{i-1}] = \left(S_{i+1/2} - S_{i-1/2}\right) - \frac{h^2}{8}\left[M_{i+1/2} + 3M_{i-1/2}\right] + \left[\frac{\tan\theta/2}{k^3} - \frac{h}{2k^2}\right][T_i + T_{i-1}] + \left[\frac{1}{k^4\cos(\theta/2)} - \frac{1}{k^4} - \frac{h^2}{8k^2}\right]W_{i+1/2} + \left[\frac{1}{k^4} - \frac{\cos(\theta)}{k^4\cos(\theta/2)} - \frac{3h^2}{8k^2}\right]W_{i-1/2} \qquad (2.6)$$

$$\frac{h}{2}[D_i - D_{i-1}] = \frac{h^2}{2}M_{i-1/2} + \left[\frac{h^2}{2k^2} - \frac{h\sin(\theta/2)}{k^3}\right]W_{i-1/2} \qquad (2.7)$$

$$\frac{\tan(\theta/2)}{k}\,[T_i + T_{i-1}] = \left[M_{i+1/2} - M_{i-1/2}\right] + \left[\frac{-1+\cos(\theta/2)}{k^2\cos(\theta/2)}\right]W_{i+1/2} + \left[\frac{\cos\theta - \cos(\theta/2)}{k^2\cos(\theta/2)}\right]W_{i-1/2} \qquad (2.8)$$

$$\frac{\tan(\theta/2)}{k}\,[T_i - T_{i-1}] = \frac{2\sin^2(\theta/2)}{k^2\cos(\theta/2)}W_{i-1/2} \qquad (2.9)$$

Adding Eqs. (2.6) and (2.7) then use equation (2.8), it follows that

$$hD_i = \left(S_{i+1/2} - S_{i-1/2}\right) + \left[\frac{1}{k^2} - \frac{h}{2k\tan(\theta/2)} - \frac{h^2}{8}\right]\left(M_{i+1/2} - M_{i-1/2}\right) + \left[\frac{h^2}{8k^2} + \frac{h}{2k^3\tan(\theta/2)} - \frac{h}{2k^3\sin(\theta/2)}\right]\left(W_{i-1/2} - W_{i+1/2}\right) \qquad (2.10)$$

Adding Eqs. (2.8) and (2.9), it follows that

$$T_i = \frac{k}{2\tan(\theta/2)}\left(M_{i+1/2} - M_{i-1/2}\right) + \left(\frac{1}{2k\sin\theta/2} - \frac{1}{2k\,tan\theta/2}\right)\left(W_{i-1/2} - W_{i+1/2}\right) \qquad (2.11)$$

Eliminating $T's$ from Eqs. (2.9) and (2.11), it follows that:

$$\left(\frac{1}{2k\,tan\theta/2} - \frac{1}{2k\,sin\theta/2}\right)\left(W_{i-3/2} + W_{i+1/2}\right) + \left(\frac{1}{k\sin\theta/2} - \frac{1}{k\,tan\theta/2} - \frac{2\sin\theta/2}{k}\right)W_{i-1/2} = \left(\frac{k}{2tan\theta/2}\right)\left(-M_{i+1/2} + 2M_{i-1/2} - M_{i-3/2}\right) \qquad (2.12)$$

Eliminating $D's$ from Eqs. (2.7) and (2.10) then use equation (2.12) it follows that:

$$h^2 M_{i-1/2} = \left(S_{i-3/2} - 2S_{i-1/2} + S_{i+1/2}\right) + \left(\frac{1}{k^4 cos^{\theta}/_2} - \frac{h^2}{8k^2 cos^{\theta}/_2} - \frac{1}{k^4}\right)\left(W_{i-3/2} + W_{i+1/2}\right)$$

$$+\left(\frac{2+4\tan^{\theta}/_2 sin\,^{\theta}/_2}{k^4} + \frac{h^2}{4k^2 cos^{\theta}/_2} - \frac{h^2 sin^{\theta}/_2\, tan^{\theta}/_2}{2k^2} - \frac{2}{k^4 cos^{\theta}/_2} - \frac{h^2}{k^2}\right) W_{i-1/2} \quad (2.13)$$

Eliminating $M's$ from the Eqs. (2.12) and (2.13), it follows that:

$$S_{i-5/2} - 4S_{i-3/2} + 6S_{i-1/2} - 4S_{i+1/2} + S_{i+3/2} = h^4\left[\alpha\left(W_{i-5/2} + W_{i+3/2}\right) + \beta\left(W_{i-3/2} + W_{i+1/2}\right) + \gamma W_{i-1/2}\right], i = 3,.,n-2 \quad (2.14)$$

Where $W_i = f_i S_i + g_i$, with $f_i = f(x_i)$ and $g_i = g(x_i)$,

$$\alpha = \frac{-8\,tan^{\theta}/_2 + \theta^2 tan^{\theta}/_2 + 8\,sin^{\theta}/_2}{8\,\theta^4\,sin^{\theta}/_2}$$

$$\beta = \frac{8\ + 3\,\theta^2 - 16\,cos^{\theta}/_2 + (8-\theta^2)\cos\theta}{4\,\theta^4\,cos^{\theta}/_2}$$

$$\gamma = \frac{-8\ + \theta^2 + 24\,cos\left(^{\theta}/_2\right) + (16+6\,\theta^2)\cos\theta}{4\,\theta^4\,cos^{\theta}/_2}$$

If $k \to 0$ that is $\theta \to 0, (\alpha, \beta, \gamma) \to \left(\frac{1}{384}, \frac{76}{384}, \frac{230}{384}\right)$ So that the relation (2.14) reduce to quartic polynomial spline relation [2].

Eq. (2.14) gives (n-4) linear algebraic equations in the (n) unknowns $S_{i+1/2}, i = 0,1,2,\ldots\ldots,n-1$, so we need four more equations, two at each end of the range of integration for direct computation of $S_{i+1/2}$. These four equations are deduced by Taylor series along with the method of undetermined coefficients.

$$10S_{1/2} - 5\,S_{3/2} + S_{5/2} = 6\,S_0 - \frac{5}{4}\,h^2 S_0^{(2)} + h^4\left[\alpha_0 S_0^{(4)} + \sum_{j=1}^{5}\alpha_J S_{J-(1/2)}^{(4)}\right], for\ i = 1 \quad (2.15)$$

$$-5S_{1/2} + 6\,S_{3/2} - 4S_{5/2} + S_{7/2} = -2\,S_0 - \frac{h^2}{4}\,S_0^{(2)} + h^4\left[\sum_{J=1}^{6}\beta_J S_{J-(1/2)}^{(4)}\right], for\ i = 2 \quad (2.16)$$

$$S_{n-7/2} - 4\,S_{n-5/2} + 6S_{n-3/2} - 5S_{n-1/2} = -2\,S_n - \frac{h^2}{4}\,S_n^{(2)} + h^4\left[\sum_{J=1}^{6}\beta_{7-J} S_{n+J-(13/2)}^{(4)}\right], for\ i = n-1 \quad (2.17)$$

$$S_{n-5/2} - 5\,S_{n-3/2} + 10S_{n-1/2} = 6S_n - \frac{5}{4}\,h^2 S_n^{(2)} + h^4\left[\alpha_0 S_n^{(4)} + \sum_{J=1}^{5}\alpha_{6-J} S_{n+J-(11/2)}^{(4)}\right], for\ i = n \quad (2.18)$$

The local truncation errors $t_i, i = 1,2,\ldots\ldots,n$ associated with the scheme (2.14 – 2.18) can be obtained as follows: first we rewrite the scheme (2.14 – 2.18) in the form:

$$10y_{1/2} - 5\,y_{3/2} + y_{5/2} = 6\,y_0 - \frac{5}{4}\,h^2 y_0^{(2)} + h^4\left[\alpha_0 y_0^{(4)} + \sum_{J=1}^{5}\alpha_J y_{J-(1/2)}^{(4)}\right] + t_1;\ at\ i = 1 \quad (2.19)$$

$$-5y_{1/2} + 6\,y_{3/2} - 4y_{5/2} + y_{7/2} = -2\,y_0 - \frac{h^2}{4}\,y_0^{(2)} + h^4\left[\sum_{J=1}^{6}\beta_J y_{J-(1/2)}^{(4)}\right] + t_2;\ at\ i = 2 \quad (2.20)$$

$$y_{i-5/2} - 4y_{i-3/2} + 6y_{i-1/2} - 4y_{i+1/2} + y_{i+3/2} = \left[\alpha\left(y_{i-5/2}^{(4)} + y_{i+3/2}^{(4)}\right) + \beta\left(y_{i-3/2}^{(4)} + y_{i+1/2}^{(4)}\right) + \gamma\, y_{i-1/2}^{(4)}\right] + t_i;\ at\ i = 3,4,\ldots\ldots,n-2 \quad (2.21)$$

$$y_{n-7/2} - 4\,y_{n-5/2} + 6y_{n-3/2} - 5y_{n-1/2} = -2\,y_n - \frac{h^2}{4}\,y_n^{(2)} + h^4\left[\sum_{J=1}^{6}\beta_{7-J}\,y_{n+J-(13/2)}^{(4)}\right] + t_{n-1};\ at\ i = n-1 \quad (2.22)$$

$$y_{n-5/2} - 5\,y_{n-3/2} + 10y_{n-1/2} = 6y_n - \frac{5}{4}\,h^2 y_n^{(2)} + h^4[\alpha_0 y_n^{(4)} + \sum_{J=1}^{5}\alpha_{6-J}\,y_{n+J-(11/2)}^{(4)}] + t_n;\ at\ i = n \quad (2.23)$$

The terms $y_{i-1/2}\ and\ y_{i-1/2}^{(4)}, \ldots\ldots\ldots$ in Eq. (2.21) are expanded around the point x_i using Taylor series and the expressions for $t_i, i = 3,4,\ldots,n-2$ can be obtained. Also, expressions for $t_i, i = 1,2,n-1,n$ are obtained in a similar manner by expanding around $x_0, for\ i = 1,2$ and around $x_n, for\ i = n-1,n$, The local truncation errors $t_i, i = 3,4,\ldots,n-2$ associated with the scheme (2.14) are

$$t_i = \left(1-(2\alpha+2\beta+\gamma)\right)h^4\, y_i^{(4)} + \frac{1}{2}(-1+2\alpha+2\beta+\gamma)h^5\, y_i^{(5)} + \frac{1}{24}\left(7-3(34\alpha+10\beta+\gamma)\right)h^6\, y_i^{(6)} + \frac{1}{48}(-5+98\alpha+26\beta+\gamma)h^7 y_i^{(7)} + \frac{1}{1920}\left(69-5(706\alpha+82\beta+\gamma)\right)h^8 y_i^{(8)} + \frac{1}{11520}(-115+84646\alpha+726\beta+3\gamma)\,h^9 y_i^{(9)} + \frac{1}{967680}\left(2497-21(16354\alpha+730\beta+\gamma)\right)h^{10}\, y_i^{(10)} + O(h^{11}),\quad at\ i=3,..,n-2 \tag{2.24}$$

The scheme (2.14 – 2.18) gives rise to a class of methods of different orders as follows:

(I) Second order method

For any choice of arbitrary α and β with $\gamma = 1-2(\alpha+\beta)$

And $(\alpha_0,\alpha_1,\alpha_2,\alpha_3,\alpha_4,\alpha_5) = \left(\frac{-77}{192}, \frac{192}{192}, 0,0,0,0\right)$

$(\beta_1,\beta_2,\beta_3,\beta_4,\beta_5,\beta_6) = \left(\frac{-3}{384}, \frac{385}{384}, 0,0,0,0\right)$

Then the local truncation errors for $(\alpha,\beta,\gamma) = \left(\frac{3}{200}, \frac{30}{200}, \frac{134}{200}\right)$ are

$$t_i = \begin{cases} \frac{623}{4608}\, h^6\, y_i^{(6)} + O(h^7)\ ;\ i=1,n \\ \frac{1897}{11520}\, h^6\, y_i^{(6)} + O(h^7)\ ;\ i=2,n-1 \\ \frac{-13}{300}\, h^6\, y_i^{(6)} + O(h^7)\ ;\ i=3,\dots\dots,n-2 \end{cases} \tag{2.25}$$

(II) Fourth order method

For any choice of arbitrary α with $\beta = \frac{1-24\alpha}{6}$ and $\gamma = 1-2(\alpha+\beta)$

And

$$(\alpha_0,\alpha_1,\alpha_2,\alpha_3,\alpha_4,\alpha_5) = \left(\frac{-108}{5760}, \frac{2410}{5760}, \frac{1195}{5760}, \frac{-47}{5760}, 0, 0\right)$$

$$(\beta_1,\beta_2,\beta_3,\beta_4,\beta_5,\beta_6) = \left(\frac{3575}{23040}, \frac{15629}{23040}, \frac{3677}{23040}, \frac{39}{23040}, 0, 0\right)$$

Then the local truncation errors for $(\alpha,\beta,\gamma) = \left(\frac{-7}{4850}, \frac{2509}{14550}, \frac{4787}{7275}\right)$ are

$$t_i = \begin{cases} \frac{9587}{3096576}\, h^8\, y_i^{(8)} + O(h^9)\ ;\ i=1,n \\ \frac{-44761}{15482880}\, h^8\, y_i^{(8)} + O(h^9)\ ;\ i=2,n-1 \\ \frac{19}{349200}\, h^8\, y_i^{(8)} + O(h^9)\ ;\ i=3,\dots\dots,n-2 \end{cases} \tag{2.26}$$

(III) Six order method

For $(\alpha,\beta,\gamma) = \left(\frac{-1}{720}, \frac{124}{720}, \frac{474}{720}\right)$ and $(\alpha_0,\alpha_1,\alpha_2,\alpha_3,\alpha_4,\alpha_5)=$

$$\left(\frac{-622}{589935}, \frac{856}{2265}, \frac{358}{1416}, \frac{-790}{18878}, \frac{354}{28317}, \frac{-395}{226534}\right)$$

$(\beta_1,\beta_2,\beta_3,\beta_4,\beta_5,\beta_6) =$

$$\left(\frac{108}{719}, \frac{253}{360}, \frac{458}{3995}, \frac{661}{239720}, \frac{-120}{7192}, \frac{661}{239720}\right)$$

Then the local truncation errors are

$$t_i = \begin{cases} \frac{833}{902891}\, h^{10}\, y_i^{(10)} + O(h^{11})\ ;\ i=1,n \\ \frac{-3307}{1538523}\, h^{10}\, y_i^{(10)} + O(h^{11})\ ;\ i=2,n-1 \\ \frac{1}{3024}\, h^{10}\, y_i^{(10)} + O(h^{11})\ ;\ i=3,\dots\dots,n-2 \end{cases} \tag{2.27}$$

Remark:

(i) When $\alpha = \frac{1}{384}, \beta = \frac{76}{384}$ and $\gamma = \frac{230}{384}$ then the scheme (2.14) is reduced to Usmani method based on quartic polynomial spline [2].

(ii) When $\alpha = 0, \beta = \frac{62526}{375156}$ and $\gamma = \frac{250104}{375156}$ then the scheme (2.14) is reduced to Al-Said and Noor based on finite difference method [11].

(iii) When $\alpha = 0, \beta = \frac{1}{24}$ and $\gamma = \frac{22}{24}$ then the scheme (2.14) is reduced to Al-Said and Noor based on cubic polynomial spline method [5].

3. Spline solutions:

The spline solution of (1.3) with the boundary condition (1.4) is based on the linear equations given by (2.14 – 2.18) , Let $Y = \left(y_{i+1/2}\right), S = \left(s_{i+1/2}\right), C = (c_i), T = (t_i), E = e_{i+1/2} = Y - S$ be n-dimensional column vectors, then we can write the standard matrix equations in the form:

$$(i)NY = C+T$$
$$(ii)NS = C \tag{3.1}$$
$$(iii)NE = T$$

We also have $N = N_0 + h^4 BF, F = diag\ \left(f_{i+1/2}\right)$

(3.2)

Where

$$N_0 = \begin{bmatrix} 10 & -5 & 1 & & & & \\ -5 & 6 & -4 & 1 & & & \\ 1 & -4 & 6 & -4 & 1 & & \\ & & 1 & -4 & 6 & -4 & 1 \\ & & & 1 & -4 & 6 & -5 \\ & & & & 1 & -5 & 10 \end{bmatrix} \quad (3.3)$$

The matrix B has the form

$$B = \begin{bmatrix} \alpha_1 & \alpha_2 & \alpha_3 & \alpha_4 & \alpha_5 & & \\ \beta_1 & \beta_2 & \beta_3 & \beta_4 & \beta_5 & \beta_6 & \\ \alpha & \beta & \gamma & \beta & \alpha & & \\ & & & & & & \\ & & \alpha & \beta & \gamma & \beta & \alpha \\ & \beta_6 & \beta_5 & \beta_4 & \beta_3 & \beta_2 & \beta_1 \\ & & \alpha_5 & \alpha_4 & \alpha_3 & \alpha_2 & \alpha_1 \end{bmatrix} \quad (3.4)$$

For the vector C, we have

$$C_i = \begin{cases} 6A_1 - \frac{5}{4}h^2\beta_1 + h^4\left[\alpha_0(-A_1 f_0 + g_0) + \sum_{J=1}^{5}\alpha_J g_{J-(1/2)}\right], & i=1 \\ -2A_1 - \frac{h^2}{4}\beta_1 + h^4\left[\sum_{J=1}^{6}\beta_J g_{J-(1/2)}\right], & i=2 \\ h^4\left[\alpha\left(g_{i-5/2}+g_{i+3/2}\right)+\beta\left(g_{i-3/2}+g_{i+1/2}\right)+\gamma\left(g_{i-1/2}\right)\right], & i=3,.....,n-2 \\ -2A_2 - \frac{h^2}{4}\beta_2 + h^4\left[\sum_{J=1}^{6}\beta_{7-J}\ g_{n+J-(13/2)}\right], & i=n-1 \\ 6A_2 - \frac{5}{4}h^2\beta_2 + h^4\left[\alpha_0(-A_2 f_n + g_n) + \sum_{J=1}^{5}\alpha_J g_{n+J-(11/2)}\right], & i=n \end{cases} \quad (3.5)$$

4. Convergence analysis

Our main purpose now is to derive a bound on $\|E\|$ where $\|\ .\ \|$ represents the infinity norm. Now we turn back to the error equation (iii) in (3.1) and rewrite it in the form

$$E = N^{-1}T = (N_0 + h^4BF)^{-1}T$$
$$= (I - N_0^{-1}h^4BF)^{-1}\ N_0^{-1}\ T$$

We get

$$\|E\| \le \frac{\|N_0^{-1}\|\ \|T\|}{1-h^4\|N_0^{-1}\|\ \|B\|\ \|F\|} \quad (4.1)$$

Provided that $h^4\|N_0^{-1}\|\ \|B\|\ \|F\| < 1$

It was shown in [2] that N_0 is nonsingular and its inverse satisfies the inequality

$$\|N_0^{-1}\| \le \frac{5(b-a)^4+10(b-a)^2\ h^2+9h^4}{384\ h^4} = O(h^{-4}) \quad (4.2)$$

Lemma 4.1. The matrix N given by (3.2) is nonsingular, provided that $\|B\|\ |f(x)|\ \tilde{w} < 1$ (4.3)

Where $\tilde{w} = \frac{5(b-a)^4+10(b-a)^2\ h^2+9h^4}{384}$ and $\|B\|$ is a finite number; the proof of this lemma follows from the following statement [14]; if G is a square matrix of order n and $\|G\| < 1$ then $(I+G)^{-1}$ exists and $\|(I+G)^{-1}\| < \frac{1}{1-\|G\|}$

As a consequence of lemma 4.1, the discrete boundary value problem has a unique solution if $\|B\|\ |f(x)|\ \tilde{w} < 1$.

Now from Eqs. (2.25 – 2.27) we investigate the following three cases:

Case (*i*): second order convergent method

We have from Eq (2.25)

$$\|T\| = \frac{1897}{11520}\ h^6\ M_6, M_6 = max_{a\le x\le b}\left|y^{(6)}(x)\right| \quad (4.4)$$

And then it follows that:

$$\|E\| \le \frac{1897\tilde{w}M_6\ h^2}{11520[1-\tilde{w}\ \|B\|\ |f(x)|]} = G_2\ h^2\ \cong O\ (h^2) \quad (4.5)$$

Where $G_2 = \frac{1897\tilde{w}M_6}{11520[1-\tilde{w}\ \|B\|\ |f(x)|]}$

Case (*ii*) : fourth order convergent method

We have from Eq (2.26)

$$\|T\| = \frac{9587}{3096576}\ h^8\ M_8, M_8 = max_{a\le x\le b}\left|y^{(8)}(x)\right| \quad (4.6)$$

And then it follows that:

$$\|E\| \le \frac{9587\ \tilde{w}M_8\ h^4}{3096576[1-\tilde{w}\ \|B\|\ |f(x)|]} = G_4\ h^4\ \cong O\ (h^4) \quad (4.7)$$

Where $G_4 = \frac{9587\ \tilde{w}\ M_8}{3096576[1-\tilde{w}\ \|B\|\ |f(x)|]}$

Case (*iii*): six order convergent method

We have from Eq (2.27)

$$\|T\| = \frac{3307}{1538523}\ h^{10}\ M_{10}, M_{10} = max_{a\le x\le b}\left|y^{(10)}(x)\right| \quad (4.8)$$

And then it follows that:

$$\|E\| \le \frac{3307\ \tilde{w}M_{10}\ h^6}{1538523[1-\tilde{w}\ \|B\|\ |f(x)|]} = G_6\ h^6\ \cong O\ (h^6) \quad (4.9)$$

Where $G_6 = \frac{3307\ \tilde{w}\ M_{10}}{1538523[1-\tilde{w}\ \|B\|\ |f(x)|]}$

We summarize the above results in the next theorem

Theorem 4.1
Let $y(x)$ be the exact solution of the continuous boundary value problem (1.3) with the boundary condition (1.4) and let $y_{i+1/2}, i = 0, 1, \ldots, n-1,$ satisfy the discrete boundary value problem (*ii*) in (3.1). Further, if $e_{i+1/2} = y_{i+1/2} - S_{i+1/2}$ then

(1) $\|E\| \cong O(h^2)$, is a second order method which is given by (4.5).
(2) $\|E\| \cong O(h^4)$, is a fourth order method which is given by (4.7).
(3) $\|E\| \cong O(h^6)$, is a six order method which is given by (4.9).

5. Numerical examples and discussion:

We now consider two numerical examples to illustrate the comparative performance of our method (*ii*) in (3.1) over other existing methods. All calculations are implemented by MATLAB 7 .

Example 1. Consider the boundary value problem

$$y^{(4)} - y = -4(2x\cos(x) + 3\sin(x)) \quad (5.1)$$
$$y(0) = y(1) = 0, y^{(2)}(0) = 0, y^{(2)}(1) = 2\,sin(1) + 4\cos(1)$$

The analytical solution of (5.1) is

$$y(x) = (x^2 - 1)\sin x \quad (5.2)$$

The numerical results for our second, fourth and six orders are summarized in Table 1.

*Table1: The observed maximum errors for Example*1

h	Six order method	Fourth order method	Second order method
$\frac{1}{8}$	5.07 – 10	3.77 – 8	5.10- 5 [a]
$\frac{1}{16}$	7.81 – 12	3.18 – 10	2.97 – 5
$\frac{1}{32}$	1.02 – 13	9.11 – 12	9.92 – 6

[a] $5.10 - 5 = 5.10 \times 10^{-5}$

Example 2. Consider the boundary value problem

$$y^{(4)} + xy = -(8 + 7x + x^3)e^x \quad (5.3)$$
$$y(0) = y(1) = 0, y^{(2)}(0) = 0, y^{(2)}(1) = -4e$$

The analytical solution of (5.3) is

$$y(x) = x(1 - x)e^x \quad (5.4)$$

Table 2: The observed maximum errors for example 2

h	Six order method	Fourth order method	Second order method
$\frac{1}{8}$	1.48 – 9	1.08 – 7	1.91 – 4
$\frac{1}{16}$	2.22 – 11	1.13 – 9	6.98 – 5
$\frac{1}{32}$	5.79 – 13	2.92 – 11	2.54 – 5

Table 3: The observed maximum errors for example 2

h	$\frac{1}{8}$	$\frac{1}{16}$	$\frac{1}{32}$
Our six order method	1.48 – 9	2.22 – 11	5.79 – 13
Ramadan et al. [13]	1.76 – 8	2.98 – 10	4.75 – 12
Ramadan et al. [12]	1.91 – 7	3.12 – 9	5.02 – 11
Al-Said and Noor [11]	2.86 – 7	2.27 – 8	1.49 – 9
Zhu [10]	6.90 – 7	1.30 – 8	2.20 – 10
Usmani and Warsi [3]	1.26 – 6	7.87 – 8	4.91 – 9
Al-Said et al. [5]	5.69 – 4	1.47 – 4	3.71 – 5
Usmani [2]	4.24 – 4	1.08 – 4	2.70 – 5
Usmani and Warsi [3]	8.67 – 4	2.16 – 4	5.40 – 5
Al-Said and Noor [4]	1.62 – 3	6.39 – 4	5.88 – 5

The numerical results for our six, fourth and second ordered methods are summarized in Tables 1-3 and compared with other existing methods. The results in Table 3 clearly show superiority over the

existing methods and also confirm that on halving the step size h , the $\|E\|$ is approximately reduced by a factor of $\frac{1}{2^p}$ where p is the order of the numerical method.The proposed quartic nonpolynomial spline method generalizes other existing methods through arbitrary choices of $\alpha, \beta \; and \; \gamma$ where we get six, fourth and second ordered methods.

6. Conclusion:

Three new methods are presented for solving fourth order two point boundary value problem using quartic nonpolynomial spline. These methods are shown to be optimal second, fourth and six ordered methods which are better than other existing methods [2-5, 10-13]. Introduction of the parameter k in the trigonometric part of the nonpolynomial spline function of the present methods improves the accuracy of the schemes which is evident from the numerical results given in tables 1-3, and these results show that the proposed methods maintain a very remarkable high accuracy which make them are very encouraging for dealing with the solution of two point boundary value problems.

Lambda, the pyrethroid insecticide as a mutagenic agent in both somatic and germ cells.

Abdel Aziz K.B. and Abdel Rahem H.M.

Cell Biology Department, National Research Center, Cairo, Egypt.
k.badrakhan@yahoo.com

Abstract: Cytogenetic evaluations of pyrethroid insecticide cyhalothrin (lambda) were investigated in mice *in vivo* by recording chromosomal aberrations in bone marrow cells and in primary spermatocytes. Cyhalothrin (lambda) insecticide was orally administrated with 2, 2.5, 5 mg/kg b.wt. (1/10, 1/8, 1/4 LD50 doses respectively) for repeated treatment. Cyhalothrin (lambda) was found to produce a significant structural and numerical chromosomal damage after subacute treatment in both bone marrow cells and primary spermatocytes. This effect was dose and time-dependent. For studying sperm abnormalities, mice were orally treated with the highest dose, 1/4 LD50. Cyhalothrin (lambda) insecticide was found to induce a significant increase in the percentage of sperm abnormalities which was mainly in the head. The present study clearly indicates that Cyhalothrin (lambda) insecticide is genotoxic to the different kinds of cells analyzed. Accordingly, much more care should be taken during the use of these pesticides. [Journal of American Science. 2010;6(12):317-326]. (ISSN: 1545-1003).

Keywords: Pyrethroid insecticides; Lambda-cyhalothrin; chromosomal aberrations; Sperm abnormalities; genotoxicity.

1. Introduction

Problems associated with pesticide hazards to man and the environment are not confined only to the developing countries. Developed nations have already suffered these problems, and still facing some problems in certain locations. For many reasons, the severity of pesticide hazard is much pronounced in Third World Countries. The misuse of pesticides by concerned individuals, in addition to lack of or weak national controlling plans is behind the outbreak of adverse effects in developing countries (Mansour, 2004). The indiscriminate use of pesticides and herbicides to increase crop productivity has aroused a great concern among the environmental and health scientists due to their adverse effects in both targets as well as non-target species. Although substantial information is available regarding their environmental and ecological impact, not much is known in regard to its toxicity in the mammalian system (Patel *et al*., 2007).Pyrethroids (also known as synthetic pyrethroids) are neurotoxic insecticides widely used to control agricultural and domestic insect pests, chemically similar to pyrethrins found in natural pyrethrum extracted from the flowers of chrysanthemum, known for centuries for their insecticidal activity, but are often more toxic to insects, as well as to mammals, and last longer in the environment than pyrethrins (WHO, 2005, 2003).

Apart from their use in agriculture, pyrethroids play an important role in public health programmes. Globally, more than 520 tonnes of active ingredient of pyrethroids is annually used in vector control programmes alone (Zaim & Jambulingam, 2004). The general population is potentially chronically exposed to pyrethroids through food consumption (Fortina *et al*., 2008). All these compounds are widely distributed in the market and used continuously in our houses. Thus, risks of these pesticides surround us and our sons daily (Kaya *et al.*, 2010). Probabilities of their accumulation in the human bodies are increasingly elevated. Cyhalothrin (lambda), a synthetic pyrethroid type II insecticide, is widely used in Egypt valued for its broad-spectrum control a wide range of pests in variety of applications such as the protection of cotton, cereals, hops, ornamentals and vegetables as well as in public health application against insect, ticks and flies which may act as disease vectors. So, the aim of the present study is to evaluate *in vivo* the genotoxicity of the most commonly used pyrethroid insecticide Cyhalothrin (lambda) in Egypt. The cytogenetic evaluations were conducted on male laboratory mice on three levels: Bone marrow cells as a model of mitotic chromosome abnormalities, Spermatocytes as a model for meiotic chromosome abnormalities and Sperm count and morphological abnormalities.

2. Material and Methods

In this work adult male swiss albino mice (mas muscles) weighing from 25 to 30 gm were used.

Cyhalothrin (lambda) 5%EC was chosen to be detected as a broad spectrum synthetic pyrethroid insecticide, used in Egypt. The insecticide under test was administered orally at three different doses 5, 2.5 and 2 mg/kg (bodyweight). To study the effect on both somatic and germ cells, six groups of mice in each case were used each contained six animals. The first and the second groups were treated with the high dose (5mg/kg) for 2 and 4 months respectively. The third and the fourth ones with the median dose (2.5 mg/kg), the fifth and sixth ones with the low dose(2mg/kg),in addition to untreated group which acted as control. Mice were sacrificed 24 hours after the last injection. Each one of these doses was studied as a sub-acute treatment, the dose was given once a week for two different times 2 and 4 months for both somatic and germ studies. Chromosomes were prepared from bone marrow cells to study the abnormalities in somatic cells according to the method of (Yosida and Amona 1965). Chromosomes from germ cells (spermatocytes) were prepared according to (Brewen and Preston 1978) method. Slides were prepared and stained, then so good metaphase spreads for each animal were examined for recording abnormalities in both somatic and germ cells. In the same time sperm morphology was examined for recoding morphological abnormalities using the method of (Wyrobek and Bruce, 1978). Mice were orally administrated with the insecticide (5mg/kg), Cyclophosamide as a positive control (20mg/kg), and a negative control group was used (non-treated) for this experiment. Finally statistical analysis was carried out using analysis of variance (ANOVA) according to (Snedcor and Cochran 1980) and least significant difference (LSD) test according to (Steel and Torrie, 1981).

3. Results

Cytogenetic effect on somatic cells:

As listed in (table I), the observed types of structural and neumerical abnormalities showed highly significance, even in the low dose (2mg/kg) which showed statistically significant over the control after the two times used 2 and 4 months. In the case of median dose, the significance level was over control and the low dose in most types of structural and numerical aberrations (table1). The high dose effect showed statistically significance at a level of $P \leq 0.05$ over the control and the other two treatments for the numerical aberrations (hypoploidy and hyperploids), the increased significance was compared to control and low dose treatment but no significance over the median dose treatment was observed (table1). Also the effect of time was listed in the same table (2 and 4 months) which showed that the increase in the duration of oral treatment increased significantly in all types of structural and numerical aberrations except in the case of centromeric attenuation, which was statistically decreased as the time of duration increased (table1) Also, the same table demonstrated the interaction between doses and times which showed that after the sub acute treatments for 2 months, there was a gradual increase in the number of cells with structural and numerical aberrations as the dose increased which demonstrated high significant increase in the total cells with aberrations as the dose increased (table1). After the sub acute treatment for 4 months, the abnormal cells showed obvious increase as the dose increased.

Cytogenetic effect on germ cells:

The cytogenetic effect of insecticide under test on germ cells was listed in (table2) which illustrated this effect in the following: there was a statistical significance increase in both structural and numerical aberrations over control even with the low dose (2mg/kg) except the cells with polyploidy which showed non- significant comparing to the control (table2). In the case of median dose, the significant level also was over the low dose. In the case of high dose the statistical analysis demonstrated high significance over control and the other two treatments except a chain aberration which showed insignificant when compared with median dose treatment (table2). The effect of time of treatment showed, structural aberrations increased significantly as the time of treatment increased but numerical aberrations showed slight significant decrease as the duration time increased. The genotoxic effect of the insecticide under test showed, gradual increase in number of abnormal germ cells as the duration time of treatment increased, 4 months were more than 2 months. Also, total cells with aberrations showed a dose- dependent increase. I.e. increasing the dose increased the total number of abnormal cells significantly over control (Table 2).

Cytogenetic effect on sperm morphology:

(Table 3 and fig1) illustrated the harmful effects of cyhalothrin, the insecticide under test on sperm morphology and sperm count. The results showed that sperm counts were significantly high decreased after treatment with the insecticide than positive and negative controls. The Cyhalothrin (lambda) with highest tested dose (5mg/kg) and

Cyclophosphamide (20mg/kg) produced a higher rate of aberrations than the negative control. Cyhalothrin (lambda) under test induced a highly significant increase over the control group in many types of sperm abnormalities which include: amorphous, without hook, banana, small and big for head abnormalities, also for tail abnormalities include coild tail and two tails, which increased over the control. Cyhalothrin (lambda) also showed a statistically significant increase when compared with Cyclophosphamide treatment in different types of sperm abnormalities. In contrast, it showed statistically non-significant for heads without hook, small head abnormalities and tail abnormalities.

4. Discussions

The use of pesticides in food production cannot be avoided especially in developing over populated countries. On the other hand, the application of such chemicals is a major risk due to the danger of being genotoxic and/or carcinogeneic and the complete danger is transmitting the mutations to the next generations. Raynauda *et al.* (2008) suggested that carcinogenesis is a multistep process involving multiple mutations and chromosomal aberrations. Also, Au *et al*. (1990) hypothesized that chromosomal aberrations were in the background of carcinogenesis and that the determination of their incidence was an important parameter for the effect of various agents on the health status of mammals and man. Awa (1983) detected a positive correlation between the risk of genetic diseases in populations and the level of cytogenetic damage. The short-term tests for genotoxicity are widely used increasing the potential hazards of such chemicals. In this chapter the results are discussed in an attempt to shed more light on the genotoxicity of Cyhalothrin (lambda) 5% EC (the active substance:λ-Cyhalothrin, a type II synthetic pyrethroid insecticide), which is widely used in Egypt.

Effect of insecticide on somatic cell abnormalities:

As the results showed, Cyhalothrin (lambda) insecticide caused an increase in many types of chromosomal aberrations. Gaps, breaks, deletions, centric fusions, fragments; hypoploidy, centromeric attenuations, polyploidy and endomitosis were the main types of aberrations, which were dose-and time-dependent. The observed significant chromosomal aberration after treatment with Cyhalothrin (lambda) insecticide in the present study are in keeping with the results obtained from the experiments performed using formlated lambda-cyhalothrin (Campana, 2003; Celik *et al*., 2003, 2005,Naravaneni and Jamil, 2005; Georgieva, 2006 and El-Demerdash, 2007). Similar types of aberrations were also detected in mammals under the effects of pyrethroids (Giri *et al*. 2002, Gabbianelli *et al*. 2004, El Khatib *et al* 2006, Farag *et al* 2001, 2007 and Quan et al 2010). The presence of gaps and breaks are both indicators of genetic damage as other types of aberrations (Koller, 1973, Anderson & Richardson 1981 and Brogger, 1982 and). Concerning numerical aberrations, according to (Pati and Bhunya 1989) the induction of aneuploidy and polyploidy may be a result of mitotic arrest due to disturbance of spindle which causes a malsegration. Aneuploidies are the most serious and frequent chromosomal defect in humans. Numerical chromosomal abnormalities are associated with congenital defect (Griffin, 1996) and are critical in both the early initiation stages and the progression of a wide array of malignant tumors (parry *et al*., 2002) Adose-and-time dependent decrease in mitotic index was observed following Cyhalothrin (lambda) insecticide administration. Similar findings were obtained by El-Khatib *et al*. (2006) and Farag *et al*. (2007) who found significant decrease in the mitotic activity after treatment with cypermethrin (a type II synthetic pyrethroid insecticide) and permethrin (a type I synthetic pyrethroid insecticide). The observed

dose and time-dependent depression of mitotic activity in the present study may be attributed to the cumulative and cytotoxic effects of Cyhalothrin (lambda) insecticide. Thus in the present study, it has been found that cyhalothrin (lambda) insecticide has the ability to induce chromosomal abnormalities in bone marrow cells which could be an indicator that it may induce chromosomal abnormality in spermatocytes.

Effect on Germinal cells (meiotic) abnormalities:

It is particularly relevant to study the genotoxic effects of pesticides in germinal cells because this is the only system in which transmissible genetic damage from one generation to another takes place (Brewen and prestone, 1978 and William and Hsu, 1980). In the present study, the insecticide under test induced chromosomal abnormality in mice spermatocytes. The abnormalities were in the form of autosomal and X-Y univalent, chain, fragment aneuploidy and polyploidy. Up to our knowledge, there are not any previous study reports regarding the genotoxicity of Cyhalothrin (lambda) insecticide on spermatocytes of animal. Abnormalities in spermatocytes can result in producing abnormal sperms which can affect the fertility (Ibeh *et al*., 1994) Alterations in the testis after the insecticide treatment in mice could be due to the direct effect of the substance under test on the testis or indirect effect through the reduction in serum testosterone concentration which is very important for its function (Verma and Nair, 2001). (Muthuviveganandavel *et al*. 2008 and Wang *et al.* 2009), found that cypermethrin one of pyrithroid insecticides used in Egypt increased the malondialdehyde (MDA) content of testis of male rats. Additional to chromosomal abnormalities, a reduction of meiotic division after cyhalothrin (lambda) treatment was also observed. This could be explained by two reasons: the first is the ability of the insecticide to reduce DNA synthesis, which subsequently affect cell division (Sotomayor *et al*., 2003). The second reason is the toxic effect of the substance under test which affects the rate of cell division (Verma and Nair. 2001). The present study revealed that somatic cell chromosomes were more sensitive to the induced aberrations by cyhalothrin (lambda) pesticide than the germ cell chromosomes. Similar findings were also recorded in mammalian cells (Abd El-Aziz and El Ashmawy, 1989, Abd El-Aziz; El Nahass, 1990, Abd El Aziz *et al*., 1993;Farag *et al*., 2001;). Russel(1978) explained that the germ cells are protected from any exposure of chemicals in blood stream by gonadal barriers, which reduce the risk of exposure on germ cells compared to somatic cells.

Effect on sperm morphology:

In the present study cyhalothrin (lambda) insecticide was found to induce abnormalities in sperm shape either in head or tails. The sperm head deformities affect the size of nuclear mass (DNA content) (Wyrobek & Bruce, 1978 and Wyrobek *et al*., 1984) whereas the tail deformity gives an impression of limitation of sperm movement which causes reduction of fertility in human and experimental animals (Lancranijan *et al*., 1975). A statistically significant increase in the number of abnormal sperms occurred after treatment with the high dose (5mg/kg) of cyhalothrin (lambda) insecticide compared with the control. This increase was mainly in the head rather than in the tail.

The reduction in sperm count and motility after the insectide cyhalothrin (lambda) treatment means, increase incidence of sperm abnormalities and subsequently reduction in fertility according to the regardation of (Agnes and Akborsha, 2003). Previous studies reveld that exposure to pesticides has been associated with reproductive dysfunction, such as spontaneous abortions, infant prematurity, congenital malformations, reduced fertility, sperm mortality decrease and hyperploidy/polyploidy in the spermatozoa of exposed men (Oliva *et al*., 2001, Recio *et al*., 2001, Crisosotomo and Molina, 2002;; Chauhan *and* Gupta 2005, qua *et al.,* 2008 and Nada et al., 2010). The positive correlation between cytogenetic damage and sperm abnormality in the present study was also reported by (Bernardini *et al*., 1998 and Xia *et al*., 2004).

In conclusion, cyhalothrin (lambda) insecticide was found to be genotoxic on both somatic and germinal cells; which was dose and time dependent, also the statistical analysis revealed that cyhalothrin (lambda) insecticide is more genotoxic on bone marrow cells than germinal cells. It was shown that cyhalothrin (lambda) insecticide has a damaging effect on the sperm morphology, which may be the cause for infertility and abnormal embryos. Thus care must be taken when handling this insecticide. Educating people about pesticide safety is important and encourage them to buy fresh and processed organic foods thorough system of administration has been put in place to control the advertisement, sale, storage, supply and use of pesticides.

[3]Protistology and Aquatic Ecology Research Laboratory, University of Ghent, Belgium

Abstract: The chlorophyll-*a* dynamics and environmental factors of the Ologe lagoon, Lagos were investigated for 2 years (Feb., 2002 – Jan., 2004). The environmental indices reflected seasonal changes related to rainfall distributive pattern and tidal seawater incursion. Air temperature (27-34 ^{0}C), surface water temperature (25-32^{o}C), transparency (24-76cm), total dissolved solids (48-294mg/l), salinity (0-0.5‰), conductivity (83-631µS/cm), pH (5.8-8.1), total alkalinity (42-162mg/l), biochemical oxygen demand (0-28mg/l), chemical oxygen demand (6-39mg/l), total hardness (62-342mg/l), cations, and heavy metals recorded increasing values in the dry season than the wet months, while dissolved oxygen (7-12.7mg/l), total suspended solids (7-378mg/l), nitrate-nitrogen (0.02-1.02mg/l), phosphate-phosphorus (0.03-1.79mg/l) and silicate (2.05-9.54mg/l) had higher values in the wet season than the dry season. Estimation of phytoplankton biomass by chlorophyll-*a* concentration ranged from 0.1 to 64.5ug/l with mean value of 16.99ug/l. Values for chlorophyll-*a* were higher in the dry than wet season for the lagoon. Analysis, using Pearson correlation co-efficient recorded positive relationship between chlorophyll-a values and air temperature, surface water temperature, salinity, conductivity, total dissolved solids, pH, transparency, biochemical oxygen demand, chemical oxygen demand, alkalinity, total hardness and cations. Analysis using ANOVA showed significant differences in the sample means of physico-chemical parameters of effluent discharge station (OL4) and the other stations within the lagoon at 5% level of probability. Recorded chlorophyll-*a* values placed the Ologe lagoon between the mesotrophic and eutrophic status. It is suggested that increasing tidal influence associated with reduction in rain events may have encouraged elevated salinities and created conditions for the development of more algal cells, hence higher chlorophyll *a* records. [Journal of American Science 2010;6(12):327-337]. (ISSN: 1545-1003).

Keywords: Chlorophyll-a, environmental factors, mesotrophic, eutrophic, Ologe

Introduction

Lagoons are ecologically and economically important aquatic ecosystems in South-western Nigeria. They provide natural food resources rich in protein which includes an array of fish and fisheries. They are also important in water transportation, energy generation, exploitation and exploration of some mineral resources including sand (FAO, 1969; Kirk and Lauder, 2000; Onyema *et al.,* 2003, 2007; Chukwu and Nwankwo, 2004; Onyema, 2008a). Lagoons also inadvertently serve as sinks for the disposal of both domestic, municipal and industrial wastes in the region. There are nine lagoons in South-western Nigeria namely: Yewa, Ologe, Badagry, Iyagbe, Lagos, Kuramo**,** Epe, Lekki and Mahin lagoons from the west to the east (FAO, 1969, Webb, 1958a; Nwankwo, 2004b; Onyema, 2008).

Furthermore, chlorophyll *a* is an essential plant and concentrations of it could be used to reflect algal biomass and hence, level of primary production. Chlorophyll *a* can be an effective measure of trophic status (Lee, 1999). However, elevated chlorophyll *a* concentrations often indicate poor water quality and low levels often suggest good conditions (Ogamba *et al.,* 2004). According to Lee (1999), higher phytoplankton biomass would directly reflect in higher level of chlorophyll *a* in such regions method to determine the amount of plant materials present in a water sample is to filter out the phytoplankton, count the cells and multiply the number counted by the average mass per individual cell from a sample (Sverdrup *et. al.,* 2006).

The immense ecological significance of phytoplankton diversity studies especially in relation to aquatic trophic relationships cannot be understated (Smith, 1950; Lee, 1999; Nwankwo, 1984, 2004a). Coastal areas are generally more productive than the open oceans because rivers and land run-offs supply nutrients along coasts and adjoining estuarine systems. With regard to the annual rates of global primary production and productivity, Lagos offshore falls under the high productivity category (=300 gC/m) (Sverdrup *el al.,* 2006).

Determination of primary production in the Lagos

Lagoon has primarily been by biomass estimation using cells number of phytoplankton (Nwankwo, 2004). With regard to chlorophyll *a* in Nigeria, there exist a report by Kadiri (1993) on the Ipkoba reservoir in Benin and another by Ogamba *et al.*, (2004) on chlorophyll *a* levels and variations in the Niger Delta region. Hence studies in Nigeria suing chlorophyll *a* method are limited.

At present, there is no report on any of the nine lagoons of South-western Nigeria with regard to the chlorophyll *a* method of estimation. The aim of this study was to investigate the seasonality in chlorophyll *a* concentration and relate findings to environmental factors in the Ologe lagoon.

Material and Methods

Description of Study Site

The Ologe lagoon (Fig 1) is located in Lagos State, Nigeria and is one of the nine lagoons in South-western Nigeria (Webb, 1958; Nwankwo, 2004b). It is pressumbaly the smallest of the lagoons in South Western Nigeria with a surface area of 9.4km^2, and lies at the distal end of Badagry creek between longitudes 6° 26'N to 6° 30'N and latitudes 3° 01'E to 3° 07'E. The main body of the lagoon lies within Badagry Local Government Area and it opens up to the Atlantic ocean via the Lagos Harbour and Dahomey in the Republic of Benin. The major source of water are River Owo with a source in a town called Toto Owo where River Ore and Illo form a confluent with River Oponu in Ogun State (Akanni, 1992). Seventeen stations were chosen for sampling within the lagoon. The lagoon is shallow at most points and is open all year round via the Lagos habour to the sea (Hill and Webb, 1958; Sandison, 1966; Sandison and Hill, 1966). Like all parts of South-western Nigeria, the Ologe lagoon is exposed to two distinct seasons namely the wet (May – October) and the dry (November – April) (Nwankwo, 2004b). Like all parts of South-western Nigeria, the Ologe lagoon is exposed to two distinct seasons namely the wet (May – October) and the dry season (November – April) (Nwankwo, 2004b; Sandison and Hill, 1966). The harmmattan, a short season of dry, dusty North-East Trade winds experienced sometimes between November and January in the region reducing visibility and lowering assemblages is the common macrofloral assemblages especially in areas with reduced anthropogenic influence. The lagoon deposits are varied, and are reflected in the pattern and type of vegetation in the region. Most parts of the Ologe lagoon are colonized by recognizable riparian dense swamp rainforest community dominated by raphia palms especially *Raphia hookeri, Elaeis guineensis, Acrotiscum aureum* and *Cocos nucifera* (Akinsoji *et al.*, 2002).Very few mangrove communities are recognizable around the Badagry creek end. Notable fauna of the area includes amphipods, Oligochaetes, few polychaetes, isopods, barnacles, oysters, periwinkle, nematodes, fiddler crabs, crabs, among others (Sandison and Hill, 1966; Onyema, 2008b).

Collection of samples

Collection of water samples

Twelve sampling stations were selected to cover the lagoon area and for the collection of sample. Table 1 shows the G.P.S location, names and number of sampling stations. Monthly surface water sample was collected for twenty-four consecutive months for physico-chemical characteristics analysis using 500ml plastic containers with screw caps. Collection of samples from the stations was always between 10 and 15hr each time. Water samples were collected just a few centimeters below the water surface at each of the twelve stations. The plastic containers was then labeled appropriately and transported to the laboratory immediately after collection for further analysis. Water samples for dissolved oxygen was collected also in 50cl bottles and fixed on site with white and black ampoules.

The Pearson correlation Co-efficient matrix (Ogeibu, 2005) for the relationship between the different environmental parameters and chlorophyll *a* were obtained using SPSS 4.0.

Results

The minimum and maximum values obtained for the estimates of environmental factors, their means and standard deviation are presents in Table 3. Also in Table 3 is whether each parameter recorded higher values in the wet or dry season for the two (2) years of study. Fig. 2 showed seasonal variations in some environmental factors at four selected stations each at the Ologe lagoon from Feb., 2002 to Jan., 2004. Stations represented were selected based on their importance as confluence points and areas exposed to possible anthropogenic stresses or not.

Air temperature values ranged between 27^{o}C to 33.5^{o}C among all the sampled stations within the study period. The highest air temperature (33.5^{o}C) was recorded at station OL1 (Idolowu) in March 2002, while the lowest was recorded at station OL14 (center of lagoon between Otto-Ijaniki and OL6) in August the same year. The lowest surface water temperature estimated was 25.2^{o}C (August, 2002), the highest value obtained was 31.8^{o}C (March, 2002. The highest transparency value (76cm) was recorded at station OL8 (between Ibiye and Obele) in March

2002, while the lowest values (24cm) was recorded at stations OL16 and OLI0 (Asepe Mushin) in the months of August and September 2003. Total dissolved solids ranged between 48 to 294mg/l, with the lowest value recorded in station OL5 (confluence between Owo River and Ologe lagoon) in September 2003. The highest total dissolved solids value (294mg/l) value was recorded at station OL1 (Idolowu) in March 2002. Total suspended solids valued ranged between 10 to 378mg/l,10 (OL3-Otto jetty in March 2003) and 378mg/l (OL10-Asepe Mushin in September 2003). Rainfall volumes showed both monthly changes and varied from one year to the next. In the first year the highest rainfall volume was recorded: highest rainfall volume (372.1 mm) was recorded in June 2002 and the lowest rainfall volume (41 mm) was in February 2002. In the second year the highest rainfall as in highest rainfall volume (383 mm) was recorded in July 2004 and the least (0.6 mm) was in December 2003.

Hydrogen ion concentration (pH) values ranged between 5.8 (station OL4-Owo River point effluent discharge in the month of July 2002) to 8.16 (station OL11 in the month of March 2002). throughout the sampling period. Whereas the lowest conductivity estimated was 83 µS/cm and recorded in OL5 (confluence between Owo River and ologe lagoon) in September 2003, the highest value obtained was621 µS/cm recorded in station OL11 (Gbanko) in March 2002, Salinity values ranged between 0.00 (station OL4 (point of effluent discharge), and 0.5 ‰ at station OL11 (Gbanko) in March, 2002. Alkalinity values were between 42 (station OL4 -Owo river- point of effluent discharge in September 2003) to 162 mg/l (station OL1 (Idolowu) in April 2002).

Dissolved Oxygen values ranged between 7 (station OL6 in March 2003) to 12.7mg/l (station OL14 -centre of Ologe lagoon between Otto-Ijaniki and OL6 in the month of June 2002). Biological Oxygen Demand values ranged between 3 (stations OL12 (Ajido) and OL13 (between Ajido and Idolowu) in September and October 2003 respectively) to 28mg/l (station OL3 (Otto jetty) in April 2002). Nitrate-nitrogen values were between (0.01 station OL4 (Owo river- point of effluent discharge) in January 2003) to 1.02mg/l (station OL3 (Otto jetty) in June 2003). Phosphate-phosphorus recorded between 0.03 (station OL17 in the month of March 2002) to 1.79mg/l (station OL10 in the month of June 2003). Silica values fell between 2.05 (station OL15 (between Ibiye and Idolowu) in March 2002) and 9.54mg/l (OL11 (Gbanko) in the month of May 2003). Calcium levels were between 34mg/l (station OL6 and OL8 (between Ibiye and Obele) in September and October, 2003 respectively) to 228mg/l (station OL1 (Idolowu) in April 2002). Magnesium estimates were between 10(at station OL8 (between Ibiye and Obele) in September 2003) and 76mg/l(station OL1 (Idolowu) in the month of April 2002). Copper values was between 23.1(station OL8 (between Ibiye and Obele) in July 2003) to 56.9µg/l(station OL11 (Gbanko) in the month of March 2002).Iron levels ranged between106(station OL17 in the month of September 2002) and 987µg/l(station OL4 (point of effluent discharge) in the month of March 2002) Zinc values ranged between 2.62 station OL7 (Ibiye) in August 2003) and 30.88µg/l(station OL4 (Owo river end receiving effluent) in the month of March 2002).

Fig 3 showed the spatio-temporal variations in chlorophyll-*a* values at the different stations in the Ologe lagoon from Feb., 2002 to Jan., 2004. Chlorophyll-*a* values ranged between 0.1 to 64.5ug/l. The highest concentration of chlorophyll-a (64.5µg/l) was recorded at station OL1 (Idolowu) in the month of December 2002 while the lowest value (0.1 µg/l) was observed at station OL4 (point of effluent discharge) and OL5 (confluence between Owo River and Ologe lagoon) in the month of June 2003. Mean values for this parameter were comparatively higher during the dry season than the wet season among all sampling stations during the study period.

Analysis with correlation co-efficient matrix (table 4), showed that chlorophyll-a concentration had positive relationship with the following parameters; air temperature, water temperature, chemical oxygen demand, chemical oxygen demand , pH, salinity, conductivity, alkalinity, Nitrate-nitrogen, Phosphate-phosphorous, silicate, total dissolved solids, transparency, total hardness, calcium, potassium, sodium, magnesium, copper, iron, chromium and zinc, while negative association were observed with dissolved oxygen and total suspended solids.

Discussion

The characteristics of environmental factors from this study shows clearly that the Ologe lagoon experiences environmental gradients likened to a tropical estuarine aquatic environments from year to year (Hill and Webb, 1958; Webb, 1960; Sandison and Hill, 1966; Kjerfve, 1994; Kirk and Lauder, 2000). Furthermore environmental factors of the lagoon exhibited seasonal changes that were closely related to the distributive pattern of rainfall of the region. For instance during the wet season, reduced levels for air and water temperatures, transparency, salinity, pH, total dissolved solids, conductivity, chloride, total hardness, sulphate, calcium, magnesium, total dissolved solids and alkalinity were recorded. Conversely, in the dry season the values for these parameters increased. Reduced rain events and its associated input of floodwaters from rivers, creeks, adjoining wetlands and the effect of tidal seawater incursion probably lead to this trend of environmental gradients. Reduced phytoplankton densities as reflected in chlorophyll *a* values in the wet season may be linked to the low water clarity which reduces the amount of light getting to planktonic algal component for photosynthesis. Higher chlorophyll *a* values recorded in the dry season is a pointer to improved water clarity at this time which probably allowed greater light penetration. According to Suzuki *et al.* (2002), low chlorophyll *a* values reflecting limited phytoplankton growth in an investigation of a Mexican lagoon were associated to dark water which reduced light penetration into the lagoon considerably.

Pearson correlation co-efficient showed positive correlation between chlorophyll *a* values, salinity, total dissolved solids, alkalinity, pH, conductivity, and total hardness values among others. The flushing of planktonic algal forms towards the sea through Badagry creek during the rains by flood waters and hence dilution, could also account for the low chlorophyll *a* values (phytoplankton densities) recorded at such times. The range of chlorophyll *a* values for the Ologe lagoon was between o.1 and 55µg/l i.e between the mesotrophic and eutrophic productivity status (Suzuki *et al.*, 2002, APHA, 1998). Furthermore, Ogamba *et al.*, (2004) reported a chlorophyll *a* range of 0.15 – 37.4µg/l for the wet season and 0.10 and 40.28µg/l for the dry season in the Elechi creek in the Niger delta. Kadiri (1993) also reported a range of 4.20 – 35.20 mgm-3 for chlorophyll *a* for the Ikpoba reservoir in Benin. Kadiri (1993) reported on the seasonal changes in the chlorophyll *a* situation of a shallow reservoir in Benin, Nigeria.

Higher cloud cover situations attributed to the rainy season have been noted to impair chlorophyll *a* estimates (Kadiri, 1993) and phytoplankton biomass (Nwankwo, 1988) in some parts of the country. On the other hand, increases in insolation usually noted in the dry season likely encourage higher productivity, as recorded for this study. Furthermore, Onyema *et al.* (2003, 2007), are of the view that higher insolation, increased hydrological stability and marine situation are important encouraging factors for primary production in the Lagos lagoon. According to Kadiri (1993) seasonal fluctuation in abundance of phytoplankton is influenced by changes in the physical and chemical properties of the water which themselves can be dependent on rainfall. Similarly, rainfall and salinity are known to regulate the occurrence and distribution of biota in the Lagos lagoon and its associated creeks (Nwankwo and Onyema, 2003; Nwankwo, 2004).

Besides the ample availability of nutrients in this region, values for chlorophyll *a* were comparatively low especially in the peak of wet season which likely indicated limited phytoplankton production. Similarly, Dissolved oxygen levels throughout the period of study were high, though comparatively higher in the wet season than the dry season as result heavy influx of freshwater from adjoing rivers and creeks and lower temperature. It is possible that higher primary productivity which resulted in higher chlorophyll *a* values during the dry season, did not revealed a similar trend in dissolved oxygen values, as a result of masking of high dissolved oxygen by higher biochemical oxygen demand and higher temperature during this period . It could therefore be inferred that variations in chlorophyll-*a* values from this study were largely determined by the trend and continuum of

environmental characteristics of the lagoon which varies seasonally.

Abstract: This study was carried out through two successive seasons (2007& 2008) on Klamata olive young trees grown at the Research Station Farm of National Research Center, El Nobarya, El Behera governorate. The investigation aimed to study the effect of applying mineral, organic fertilizers and some other treatments on growth parameters at the first two years of planting. Planting holes were prepared for control plants in the first season only. Each treatment received 100 g actual nitrogen/plant/year as recommended by M.A.R.L. (2007). The following treatments were applied: T1 : control (mineral nitrogen + planting hole preparation), T2(100%mineral nitrogen), T3(100% organic N as cattle manure), T4(50% mineral N + 50% organic N as chicken manure), T5 (100%mineral nitrogen + humic acid as soil application), T6(100% mineral nitrogen + activated dry yeast as soil application), T7 (100%mineral nitrogen + GA_3 spray) and T8 (100% mineral nitrogen + sea algae as soil application).At the end of each season, plant height, stem diameter, lateral shoot number, lateral shoot length, leaves numbers per plant, percentage of plant height increment, whole plant dry weight were determined and recorded. The obtained results revealed that plant height, shoots number, shoot length, leaves number and stem diameter were not affected by different treatments. However the fifth treatment with humic acid and seventh treatment with GA_3 spray gave highest significant values of leaf numbers per plant compared with all other treatments in the first season, but in the second one, the differences among treatments lake significance. As for Whole plant dry weight, no significant differences among treatments could be noticed in both seasons. [Journal of American Science 2010;6(12):338-343]. (ISSN: 1545-1003).

Keywords: Klamata olive; mineral fertilizer; organic fertilizer; growth parameter; plant

1. Introduction:

The Egyptian olive production reached about 507053 tons produced from 110764 feddan and the total area reached about 135692 feddan (according to the statistics of M.A.L.R. (2007).

Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are consider to be essential element for plant growth and development. The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio.

Monge *et. al.*(2000) reported that, organic wastes fertilization did not lead to significant increases in olive mineral leaf concentrations in the first year trial. Hegazy *et. al*.(2007) studied the effect of organic and bio-fertilization on vegetative growth and flowering of Picual olive trees, they recorded that, the highest values of the studied growth characters were obtained with 100% organic fertilization (poultry manure).

Fernández-Escobar *et. al.*(1999) mentioned that, foliar application of leonardite extracts(humic substances extracted) to young olive plants stimulated shoot growth when they were growing without the addition of mineral elements to the irrigation water, but did not promote growth when applied to plants watered with a nutrient solution, although growth of fertilized plants was greater than that of unfertilized ones. Under field conditions, foliar application of leonardite extracts stimulated shoot growth and promoted the accumulation of K, B, Mg, Ca and Fe in leaves. Abdel Fatah *et. al.*(2008) mentioned that, soil drench application of humic acid to Tifway Bermodagrass hybrid improved growth parameters and NPK leaves cotents.

Mostafa and Abou Raya (2003) recorded that, all dry yeast soil application improved growth parameters of Grand Nain banana cv. Compared with control without dry yeast treatment.

Sidahmed (1987) working on eight-month-old seedlings of sour orange were sprayed with 0, 25, 50, 75, 100 and 200 ppm of the water soluble salt of gibberellic acid at 15-day intervals.Data collected two months later revealed that GA_3 significantly increased ($P < 0.05$) seedling height by internodal expansion and that the seedling height was positively

correlated with GA_3 level. The percentage increase in height was 13.95, 18.68, 19.63, 25.90, 31.80 and 38.80 respectively for 0, 25, 50, 75, 100 and 200 ppm GA_3 treatments. Smith and Schwabe (1984) recorded that, top growth of *Quercus robur* could be further accelerated by application of gibberellic acid (GA3) as foliar spray. Sheo (1999) mentioned that, the seedling growth of Karun Jamir (*C. aurantium*) and Cleopatra mandarin (*C. reshni*) was significantly increased by spraying with urea and GA_3 alone or in combination. However, $ZnSO_4$ alone did not have any significant effect on growth. Seedling growth of both the species was greater with the combinations 0.5% urea + 50 ppm GA_3 + 0.2% ZnSO4 and 0.5% urea + 50 ppm GA_3. The results indicated that the seedling growth of Karun Jamir and Cleopatra mandarin can be increased considerably by two sprays of 0.5% urea + 50 ppm GA_3 in the 3rd and 8th months after sowing.

This investigation aimed to study the effect of mineral and organic nitrogen fertilization sources and some other treatments (humic acid, activated dry yeast, GA_3 and sea algae) on growth parameters of Kalamata young trees at first two years of planting.

2. Materials and Methods:

This study was carried out through two successive seasons (2007& 2008) on Kalamata olive young trees grown at the Expermental research station of National Research Center at El Nobarya, El Behera governorate Egypt. The investigation aimed to study the effect of applying mineral, organic nitrogen fertilizers and some other treatments on vegetative growth characters of young Kalamata olive trees at the first two years of planting. The soil was characterized by: pH = 8.82, EC =1.11 dS/m, organic matter = 0.31%, $CaCO_3$ =12.8 %, Sand = 63 %,Silt = 13 % and clay = 3%. The soil texture grade was sandy. Drip irrigation system was applied using river Nile water. Planting distance was 5 × 5 meters apart.

The following treatments were applied:

1- Control: recommendation of M.A.R.L. (2007a) (100g actual nitrogen 500 g ammonium sulfate as mineral nitrogen source) + planting holes preparation.
2- Mineral nitrogen only 100 %.
3- Organic nitrogen source 100 % (cattle manure 100g actual nitrogen).
4- Mineral nitrogen source 50 % + organic nitrogen source 50 % (chicken manure).
5- Mineral nitrogen source 100 % + humic acid (monthly doses from March to November each 20 ml/plant).
6- Mineral nitrogen source 100 % + actived dry yeast as drench treatment three times in March, July and October each at 30 g/plant.
7- Mineral nitrogen source 100 % + one spray of GA_3 acid at 50 ppm in March.
8- Mineral nitrogen source 50 % + sea algae in March and June each at 50 g/plant.

Cattle manure analysis was: N = 1.6%, P = 0 46% and K = 0.51%.
Chicken manure analysis was: N =3.47%, P =0.67% and K = 0.64%.
Sea algae analysis: N =8%, P = 2%, K = 4%, chelate microelements = 4% and traces of vitamins + amino acids.

Ammonium sulfate was divided into five equal doses through growing season. All these treatments were repeated in the second season except holes preparation with control plants only in the first season. The treatments were arranged in randomized complete block design in a simple experiment with four replicates for each treatment and each replicate was represented by one plant. At the end of each season at mid November four plants as replicates for each treatment were removed genteelly with their root system to estimate and record the following data for each cv individually:

1- Plant height (cm).
2- Stem diameter (cm) was measured at 5cm above the grafting zone.
3- Lateral shoot length average (cm).
4- Leaf number per plant.
5- Lateral shoot number per plant.
6-Percentage of plant height increment
7- Whole plant dry weight (g).

Data obtained throughout this study were statistically analyzed using the analysis of variance method as reported by (Snedecor and Cochran, 1980) and the differences between means were differentiated by using Duncan's range test.

3. Results and Discussion:

Effect of treatments on growth characters:

In control plots, planting holes were prepared by adding 50 kg c

Fig.(1) show that, Insignificant differences among treatment were found in both seasons in values of plant height But one can notice that the second treatment (100% mineral nitrogen) gave the highest value in the first season(38.8 cm) and the lowest value was obtained by humic acid and sea algae treatments (35 cm &35 cm). In the second season the sixth treatment recorded the highest value (78.3 cm) and the lowest values were shown by the forth treatment with 50% chicken manure and seventh treatment with GA_3 (77 cm &77 cm).

Stem diameter fig.(2) show that, data showed insignificant differences among treatments in

both seasons . In addition all treatments recorded the same value in the second season (1.5 cm).

Lateral shoot number per plant, fig.(3) show that, insignificant differences among treatments in both seasons. However, the first treatment (control) recorded the lowest value in first season (3.5) compared with other treatments. In the second season sixth treatment with yeast showed the lowest value (7.3).

Lateral shoot length fig.(4) show that, Insignificant differences among treatments in both seasons were recorded. But one can notice that, the sixth treatment with yeast gave the highest value in both seasons (18.3 cm &68.7 cm respectivly).

On the other hand, fig (5) showed that the fifth treatment with humic acid and the seventh treatment with GA3 spray gave the highest significant values of leaf number fig.(5) show that, per plant compared with all other treatments in the first season, but in the second season, the differences among treatments lake significance.

Percentage of plant height increment fig.(6) show that, The seventh and the eighth treatments gave lower significant values than other treatments in the first season .But in the second season differences among treatments lake significant .

Whole plant dry weight fig.(7) show that, result indicated that treat.5(100% mineral N+HA) showed the significantly greatest value (80g) compared with treat. 8 (50%mineral N +sea algae)(34g) in the first season. Differences among other studied treatments were insignificant. In the second season, no significant differences could be detected, although the eighth treatment showed the lowest value (144.30 g.).

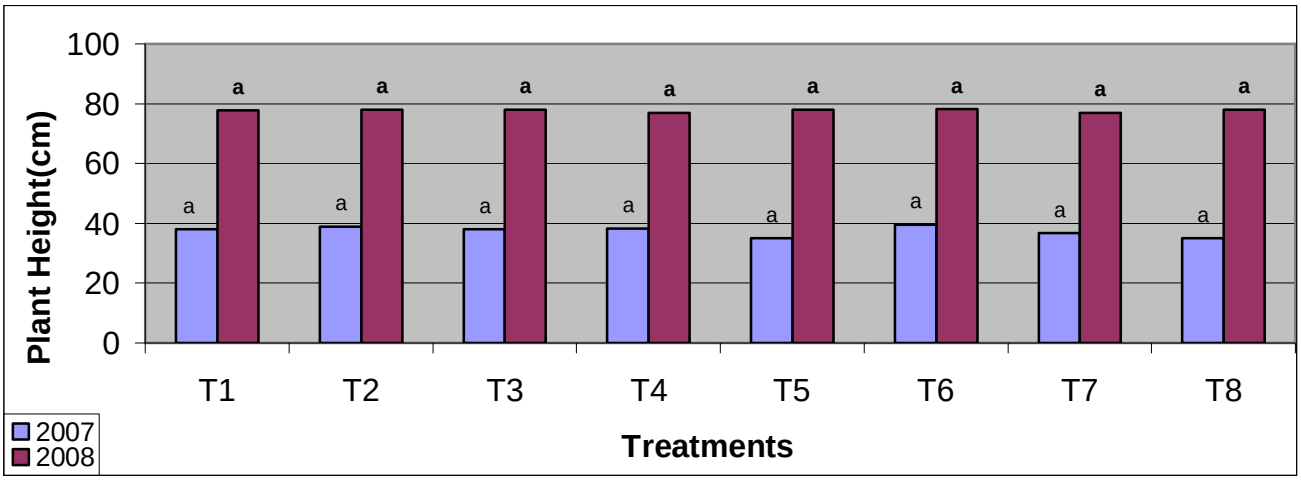

Fig. (1): Effect of mineral, organic nitrogen and some other treatments on plant height(cm) of Klamata olive cv. young trees in 2007 and 2008 seasons.

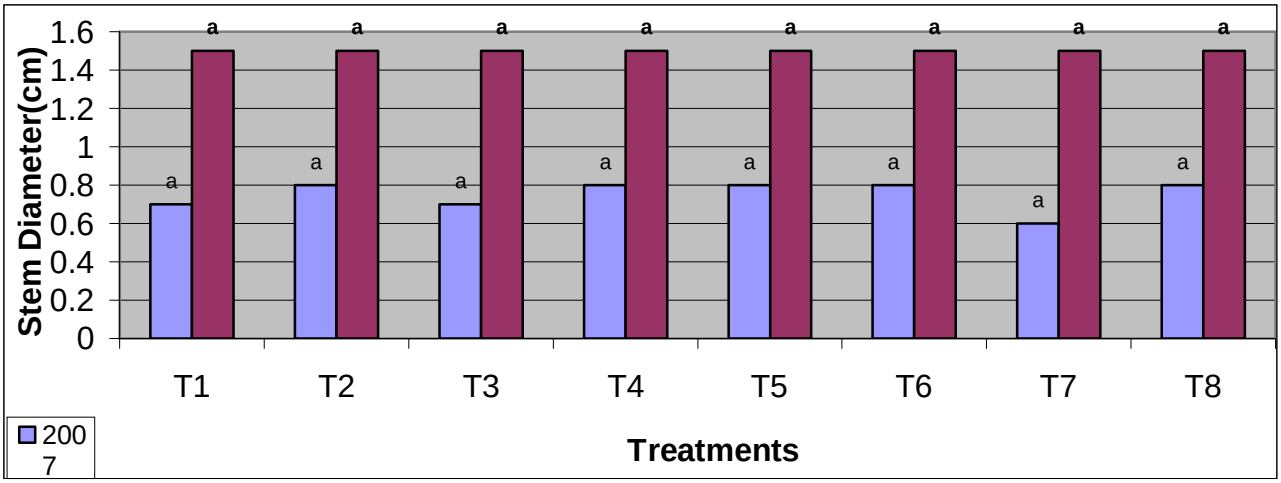

Fig. (2): Effect of mineral, organic nitrogen and some other treatments on stem diameter(cm) of Klamata olive cv. young trees in 2007 and 2008 seasons.

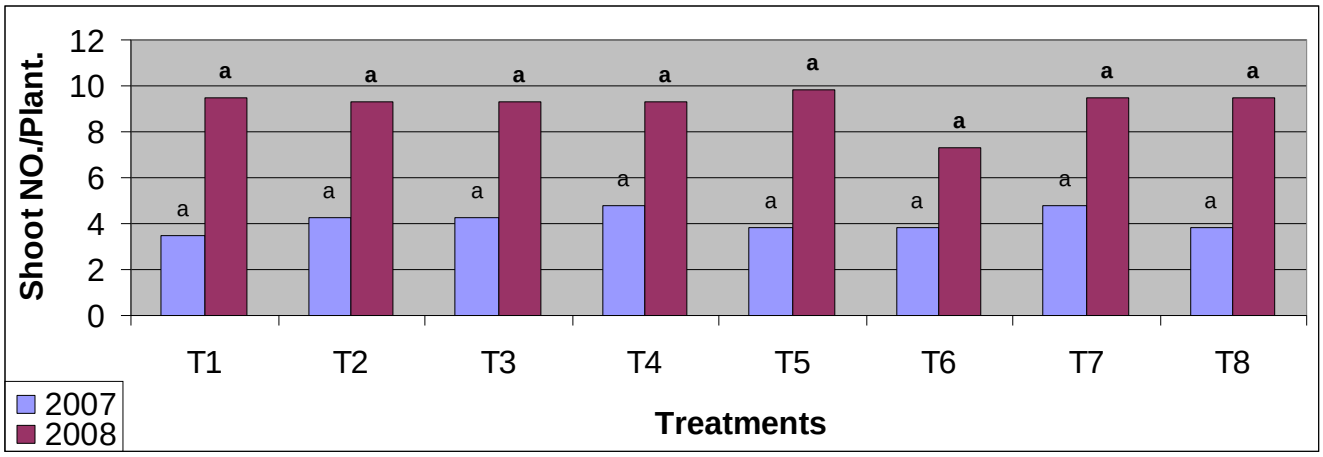

Fig. (3): Effect of mineral, organic nitrogen and some other treatments on shoot No./plant of Klamata olive cv. young trees in 2007 and 2008 seasons.

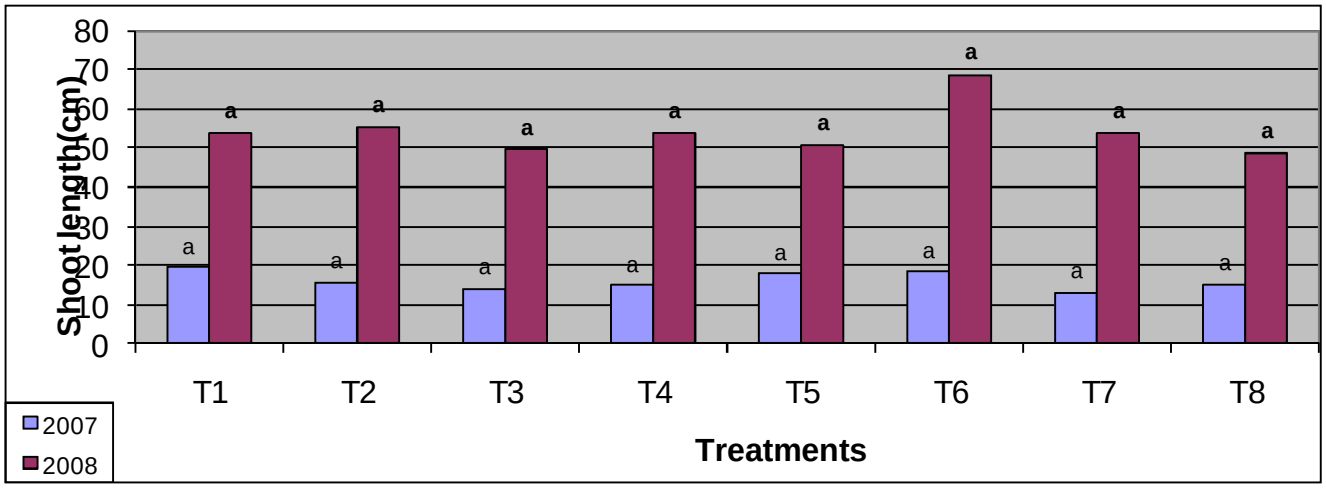

Fig. (4): Effect of mineral, organic nitrogen and some other treatments on average shoot length(cm) of Klamata olive cv. young trees in 2007 and 2008 seasons.

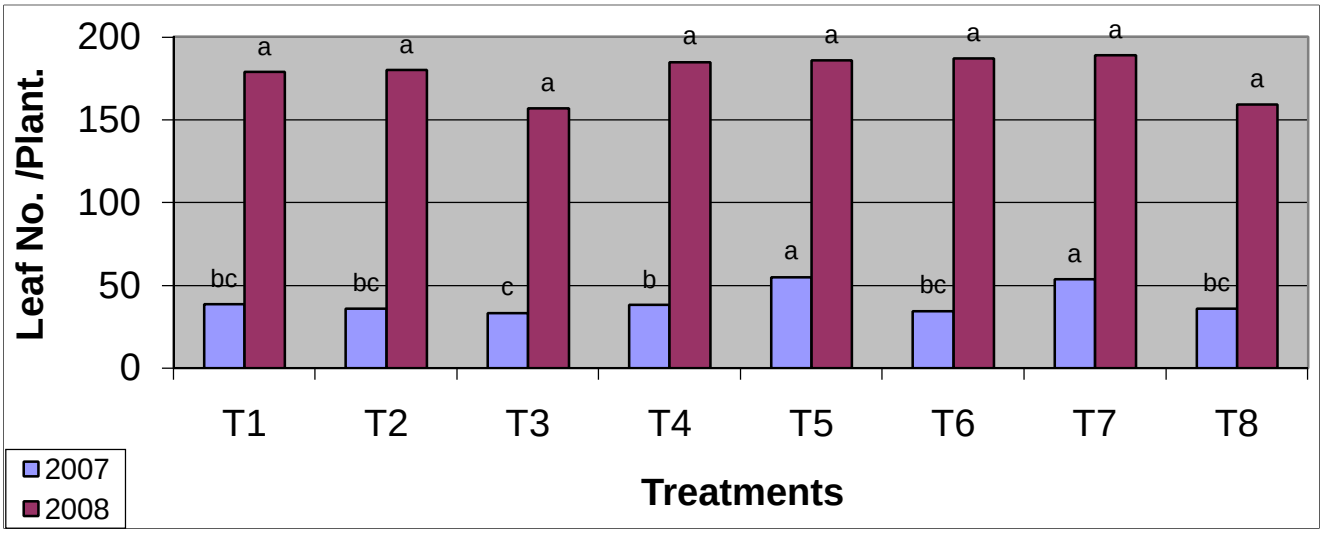

Fig. (5): Effect of mineral, organic nitrogen and some other treatments on leaf No. /plant of Klamata olive cv. young trees in 2007 and 2008 seasons.

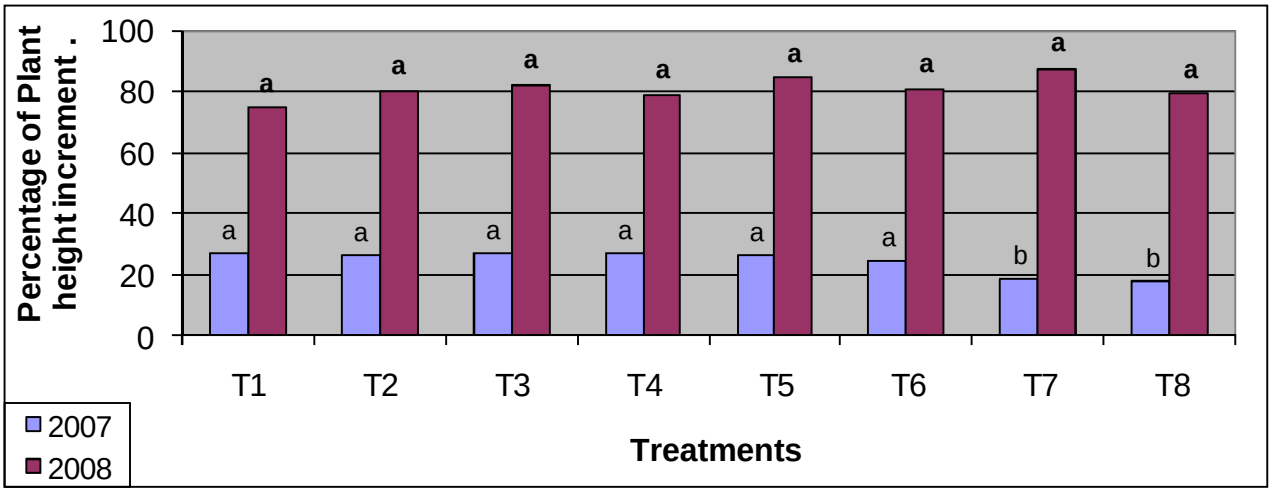

Fig. (6): Effect of mineral, organic nitrogen and some other treatments on percentage of plant height increment of Klamata olive cv. young trees in 2007 and 2008 seasons

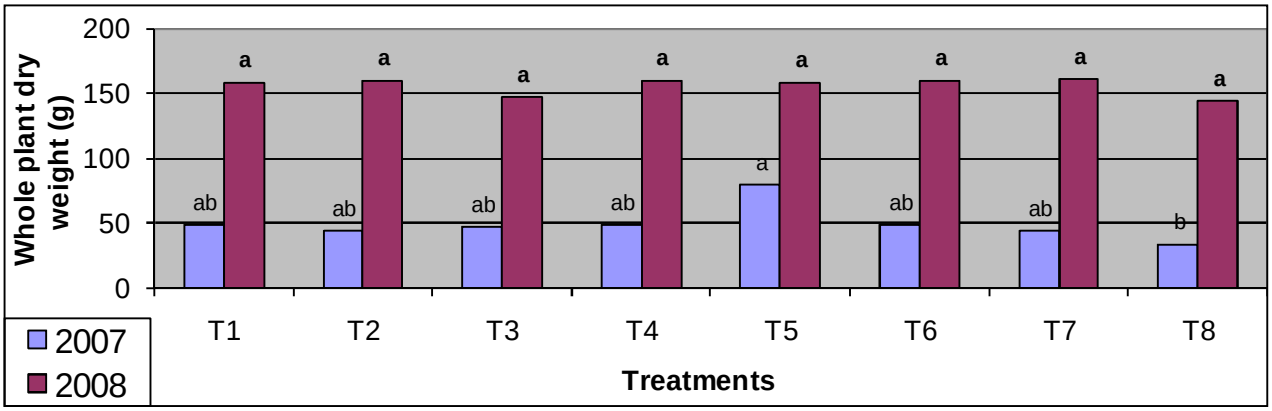

Fig. (7): Effect of mineral, organic nitrogen and some other treatments on whole plant dry weight (g) of Klamata olive cv. young trees in 2007 and 2008 seasons.

Finally it could be noticed that plant height, shoot number, shoot length, leaves number and stem diameter were not affected by different treatments Insignificant differences among treatment in both seasons in values of plant height, , stem diameter lateral shoot number per plant and lateral shoot length average. Meanwhile, the fifth treatment with humic acid and seventh treatment with GA_3 spray gave highest significant values of leaf number per plant compared with all other treatments in the first season, but in the second season, the differences among treatments lake significance. Concerning the whole plant dry weight, no significant differences among treatments could be noticed in both seasons. These results are in harmony with those found by Fernández-Escobar *et. al.*(1999), they reported that, foliar application of leonardite extracts(humic substances extracted) under field conditions, stimulated shoot growth of young olive plants. Moreover we can added that, growth parameters were not affected by most treatments, this may be attributed to low nutritional demand of young olive trees as mentioned by Xiloyannis *et. al.* (2000) they showed that, demand of irrigated olive trees, cultivar Coratina for P and K is minimal during the first four years after planting and can be fulfilled by naturally supplied soils. Low doses of N should be applied through localized fertilization during the year. Moreover, Nawaf and Yara (2006) found that, young olive trees benefit from low levels of NPK and N alone and additional fertilizers would not be significant. However, NPK are consider to be essential element for plant growth and development. The 16 g NPK and 32 g N significantly gave the highest shoot and root dry weight, this probably due to nitrogen concentration which increased dry matter accumulation in roots and decreased shoot: root ratio.

The Proposed Electric Circuit Diagram Of The Buried Bare Pipe Segment-Soil - Earth System With And Without Applying Cathodic Protection System

Dr. Ashraf Abdel Raouf Mohamed Fouad Ahmed

Canadian International College CIC – Egypt
Ashrafahmed9000@yahoo.com

Abstract: Based on proposed electrical concept of corrosion process, it is possible to simulate buried bare pipe segment with the surrounding soil medium by an electric circuit where the circuit electric quantities are function of the electrochemical properties of the soil as 4th degree polynomial equations. The equivalent cylindrical electrolytic capacitor between the pipe and the remote earth and the potential across it, verifies the equation that charge Q = C × V at natural condition with & without applying cathodic protection system. The created positive charges consists with an equivalent negative charge (electrons losses) a charged stray electrolytic capacitor between the pipe and the earth through thin film soil layer around the pipe as cylindrical capacitor. The amounts of these charges are depending on the electrochemical properties of the soil which are surrounding the pipe segment, the length of the pipe segment and its diameter. The rate of discharge (equivalent to capacitor self discharge) is to be considered as the corrosion current. That's beside the facts deduced before that all electrical parameters prints & equations are function of the electrochemical properties of soil medium around the pipe at different cathodic protection levels. The error of these new equations of the electrical parameters reduced to be less than ± 5%. This will help to study both the corrosion problem and cathodic protection for a complete pipeline by an electric concept with an electric analogue circuit which is the aim of this study. This will help, in the future, in the choice of pipeline route, pipeline cathodic protection design and cathodic protection maintenance process for the pipe line along its route, however long it is. [Journal of American Science 2010;6(12):344-354]. (ISSN: 1545-1003).

Keywords: Electrical study of pipe – soil – earth system

1. Introduction

At humidity equal to zero, the soil medium around pipeline could be considered as a dielectric material which has its relative permittivity. If the humidity is increased, the soil medium is considered to be as an electrolyte associated with a change happened in the values of the relative permittivity, resistivity and pH of the soil. This change happened in the electrochemical properties of the soil will continue by increasing the humidity but these values will return back to their original values, or nearby initial values, after the humidity returns back to it's initial value. This nature of the soil medium between isolation medium and conduction medium according to the percentage of the humidity could be studied electrically.

In other words, if two dissimilar electrodes buried in a box which is containing a soil medium, a corrosion current will take place between these electrodes due to the difference in electrodes' natural potential while a capacitance in nano farad could be measured between these dissimilar electrodes (through the soil). The potential difference, the capacitance and the corrosion current between the positive and negative electrodes are electric quantities. Then, it may be possible to understand the corrosion and cathodic protection by an electrical concept beside the electrochemical and thermodynamic concepts. Now the corrosion may be described electrically by the equation: (Q = C × V), while the rate of discharge dQ/dt is equal to the corrosion current from the +ve electrode to the –ve one [1] [2]. The same concept could be applied on the system of buried pipeline and the surrounding soil medium. The pipeline may be considered the +ve electrode while the remote earth may be considered the –ve electrode. In case of pipe-soil-earth system which is not subjected to any external interference, it is possible to find a correlation between the electrical parameters and the electrochemical properties of the soil at different humidity and at many cathodic protection levels with the results to be considered as an electrical parameters print or as a data sheet of this pipe-soil-earth system [6] [7] [8] [9] [10]. These electrical prints will be recalculated if the pipe and/or soil are changed. The importance of these electrical prints are not only to help to deduce the proposed electrical circuit of the combination pipe-soil-earth system but also to define both the electrical parameters and the cathodic protection level of any buried pipe segment if the protection current and the electrochemical properties are measured at the pipe segment directly from the field.

2. Literature Review

The only way in which atoms of the metal may detach themselves from the surface and enter the solution is in the form of positively charged ions. In electrochemical concept of corrosion process, for buried metal pipe in the ground, the following equations describe the corrosion process:

At the anode

Fe (solid) → Fe^{++} (ion) + $2e^{-}$ (electrons)

At the cathode

$2H^{+}$ (hydrogen ions) + $2e^{-}$ → H_2 (gas)
Or $2H^{+}$ + ½ O_2 (air) + $2e^{-}$ → H_2O
Or O_2 + 2 H_2O + $4e^{-}$ → 4 OH^{-} (hydroxyl ion)

Then,

Fe^{++} + 2$(OH)^{-}$ → Fe $(OH)_2$
Fe^{+++} + 3$(OH)^{-}$ → Fe $(OH)_3$

In the proposed electrical concept of the corrosion process of bare pipe-soil system, the anodic reaction and the surrounding soil around the pipe may be represented, electrically, by formation of a charged electrolytic stray capacitor as shown in Fig.1 and Fig.2a [1] [2]. The electrolytic capacitor is consisting of pipe segment as the positive electrode, thin film of soil layer as the dielectric material of the capacitor and an imaginary co-axial earthing cylinder as the negative electrode. This is while for coating pipe-soil system, the stray capacitor may be considered as cylindrical capacitor with compound dielectric materials (coating of the pipe + thin film soil layer) as shown in Fig.2b [1] [2]. The formation of Fe $(OH)_2$ & Fe $(OH)_3$ in the electrochemical concept may be understood electrically by the positive charge discharged through the electrolytic stray capacitor to the imaginary co-axial earthing cylinder of radius r_3 (self discharge of the capacitor). The rate of discharge is equal to the stray corrosion current (equivalent to electron loss).

In other words, the cathodic reaction at the imaginary co-axial earthing cylinder (the negative electrode) and formation of hydroxyl ion (OH^{-}), detach the positive ion from metal surface and form ferric oxides. Electrically, it may be understood as the discharge of the positive charge from the positive electrode to the imaginary grounded negative electrode through thin film of soil layer as shown in Fig.1. The above clarification could be summarized as follow:

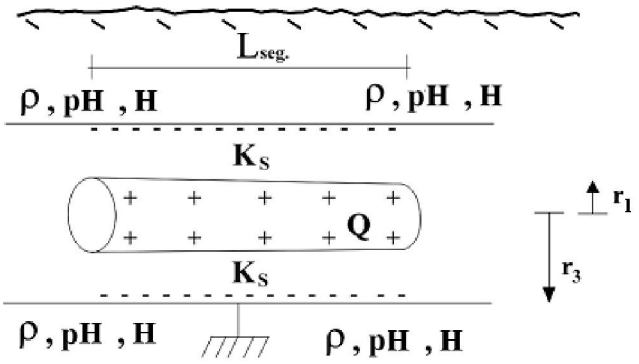

Figure 1: Proposed electrical concept of bare pipe segment with soil medium

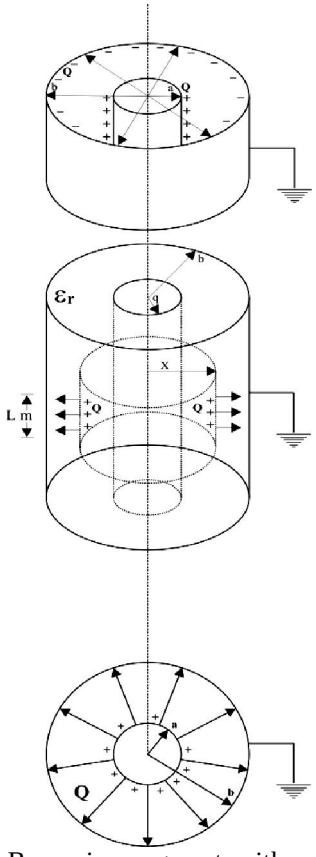

Figure 2a: Bare pipe segment with an imaginary Coaxial earthing cylinder form a charged electrolytic capacitor

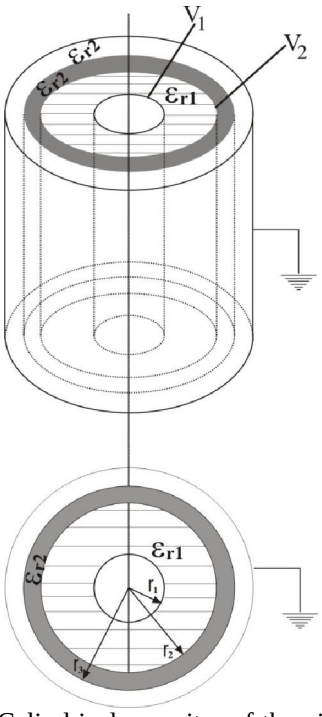

Figure 2b: Cylindrical capacitor of the pipe segment and the compound dielectric of coating material and soil layer

The electric concept of corrosion for pipe-soil-earth system may be written by the following proposed concept:

"Due to surrounding medium effect around metal structure buried in the ground, the charge created on metal outer surface area (o.s.a) builds up a potential through a stray electrolytic capacitor between metal o.s.a and an imaginary coaxial earthing cylinder where rate of discharge is equal to the corrosion current "[1][2].

The dielectric constant of the soil layer around the pipe K_S acts with the dielectric constant of the pipe coating material K_C as a coaxial cylindrical capacitor with compound dielectric. As K_C of the coating material is decreased, the total capacitance value is decreased (two capacitors are in series) then charge is decreased .That's to say, the corrosion process (electrons losses) is decreased. If deterioration of coating material occurred, then K_C is increased i.e. total capacitance value of the compound dielectric is increased .That's to say that corrosion process (electrons losses) is increased as the created charge on metal outer surface area *Q* will be increased . This paper deduces the equivalent electrical circuit of bare pipe segment-soil-earth system with and without applying cathodic protection system.

3. The Soil Factor

As the values of the electrochemical properties of any soil medium are changed by the change of humidity, they return back to their initial conditions, or nearby the initial values, after some time, when humidity returns back to its initial value. Then we can define a new factor named the soil factor as:

"The soil factor is the instantaneous or present value of the electro-chemical properties of the soil based on the electrical properties at Humidity equal to 10% "[1] [2]

The soil factor is equal to:

$S_f = (1 / Ks)\ pH\ H \log \rho$ at room temperature (1)

Dimension of $[S_f] = [1 / K_S]\ [pH]\ [H]\ [\log \rho] = \Omega.m\ \%$

Where:

S_f = soil factor

Ks = Dielectric constant of the soil at H = 10%
(a reference value of this property)

pH = power of Hydrogen of the soil

ρ = Soil resistivity in Ω.m. at H = 10%
(a reference value of this property)

H = Humidity of the soil %

Fig. 3 shows the range of the soil factor S_f and the range of humidity for ten soils under test.

The importance of this new parameter, the soil factor, is that it is combining all parameters which can affect directly on the cathodic protection level or in corrosion process (the effect of temperature and CO_2 could be added in future studies). Such parameters which can be obtained by a direct measurement from the field only one time then use the humidity in the soil factor calculations. This means that if it is possible to study the relationship between the soil factor and the electrical parameters of the pipe-soil system at natural condition with and without applying cathodic protection system, then the electrical parameters PRINTS of the pipe-soil-earth system could be obtained.

The soil factor can be considered to be as the main key of many studies based on the proposed electrical concept of corrosion. For an example, the general equation of the natural stray capacitance, without applying CP, between external surface area of bare pipe segment and earth is obtained in terms of the soil factor with an average error less than ± 5% and its print curves are obtained for pipe-soil-earth system for 10 different soils [3][10]. Also, the general equation of both the natural stray potential and the natural surface charge, without applying CP,

are obtained in terms of the soil factor with an average error less than ± 5% and their print curves are obtained for pipe-soil-earth system for 10 different soils [4] [5] [10]. Also, by the use of this new parameter, the soil factor, it is possible to find a correlation between the electrical parameters and the electrochemical properties of the soil, with applying CP, at different humidity and at many cathodic protection levels with the results to be considered as an electrical parameters print or as a data sheet of this pipe-soil-earth system [6] [7] [8] [9] [10].

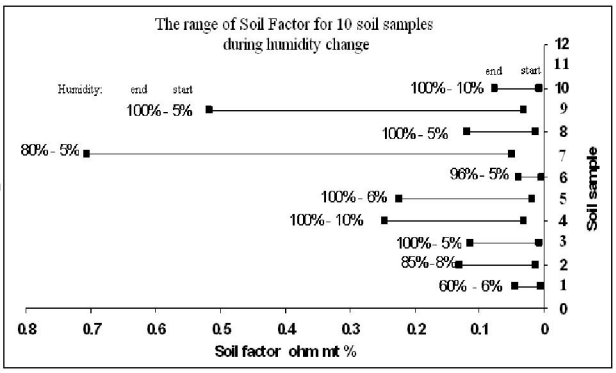

Figure 3: The range of the soil factor & humidity range for the soils under test

4. Case 1:

4.1 Proposed Electrical Analogue Circuit of The Pipe Segment – Soil - Earth System Without CP System [1] [2]

In a corrosion process, the metal pipe could be considered as a current source (stray corrosion current) to the surrounding medium (stray capacitor to the remote earth). The electrical analogue circuit of the pipe line segment with the surrounding medium effect could be represented as a current source connected in series with the stray capacitance between metal o.s.a and the remote earth. Consequently, the corrosion process could be electrically simulated for both bare pipe and at bad condition of coating material as shown in Fig.4.

The general electrical analogue circuit of pipe segment-soil-earth system will consists of current source in series with an equivalent impedance $Z_{eq.}$ correlated to humidity (R_{eq} in parallel with C_{eq}) which is connected from pipe to the remote earth as shown in Fig.5. The importance of this proposed electrical circuit is that it converts both the corrosion and/or cathodic protection process into an electric problem. As we obtained before the electric parameters C, V and Q of the bare pipe segment-soil-earth system in terms of the electrochemical properties of the soil i.e. the general equations of the natural stray capacitance [3],[10], the natural stray potential [4][10], the surface natural created charge[5][10]. All electrical parameters are deduced in terms of the soil factor, 4th degree polynomial equations with an average error less than ± 5%. In this paper, we will continue and use the results obtained before to deduce the electric analogue circuit of the natural condition pipe-soil-earth system without applying cathodic protection system.

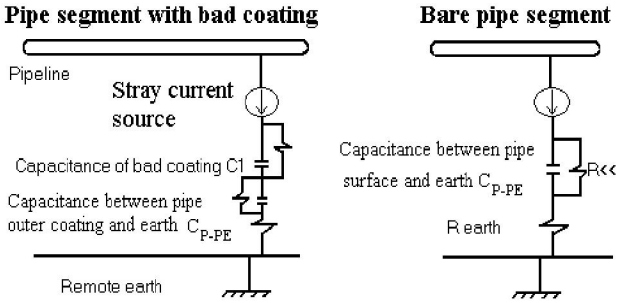

Figure 4: Proposed electrical analogue circuit of the pipe segment – soil system at the corrosion process

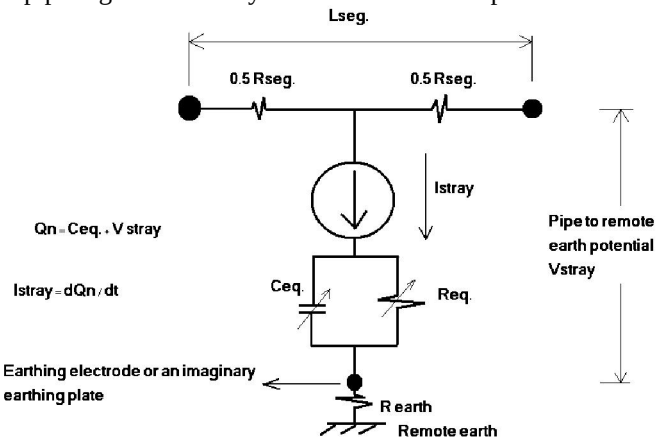

Figure 5: The proposed general electrical analogue circuit of pipe-soil system

4.2 Calculations Of The Electrical Parameters Of The Pipe-Soil-Earth system Without Applying CP System

Now, to obtain the pipe segment natural electric parameters without applying cathodic protection system, we have for the pipe-soil-earth system the following results:

4.2.1 General Equation Of The Natural Stray Electrolytic Capacitor [3],[10]

This is equal to Eq. 2:

$$\mathbf{C}_{\mathbf{n\ stray}} = A_{4cn}\,\mathbf{X^4} + A_{3cn}\,\mathbf{X^3} + A_{2cn}\,\mathbf{X^2} + A_{1cn}\,\mathbf{X} + A_{0cn} \quad (2)$$

Where:

A's = $A_{(\ )CN}$ are the stray capacitance PRINT constants of the pipe soil under test

X = instantaneous value of the electrochemical value of the soil, the soil factor

4.2.2 General Equation Of The Natural Stray Potential [4],[10]

This is equal to Eq. 3:

$$\mathbf{V_{n\ stray}} = A_{4vn}\,\mathbf{X^4} + A_{3vn}\,\mathbf{X^3} + A_{2vn}\,\mathbf{X^2} + A_{1vn}\,\mathbf{X} + A_{0vn} \quad (3)$$

Where:

A's: = $A_{(\ )V}$ are the natural stray potential print constants of the pipe soil under test

X = instantaneous value of the electrochemical value of the soil, the soil factor

4.2.3 General Equation Of The Natural Surface Charge [5],[10]

This is equal to Eq. 4:

$$\mathbf{Q_N} = A_{4qn}\,\mathbf{X^4} + A_{3qn}\,\mathbf{X^3} + A_{2qn}\,\mathbf{X^2} + A_{1qn}\,\mathbf{X} + A_{0qn} \quad (4)$$

Where:

A's: = $A_{(\ )qn}$ are the surface natural charge print constants of the pipe - soil under test

X = instantaneous value of the electrochemical value of the soil, the soil factor

4.2.4 General Equation Of The Protection Current:

As we consider the natural condition without applying cathodic protection system, then the rectifier output will equal to zero.

$$I_P = 0 \quad (5)$$

4.2.5 The Earthing Resistance

The earthing resistance R_E could be easily measured from the field by the use of earth tester.

$$R_E = \text{Measured from the field} \quad (6)$$

4.2.6 The Pipe Segment resistance

The resistance of the pipe segment will equal to:

$$R_{SEG.} = (¼\ \pi\ (D_O^2 - D_I^2) \times L_{SEG.} \times \sigma_{IRON}) \quad (7)$$

Where:
D_O = Outer diameter of the pipe segment
D_I = Inner diameter of the pipe segment
L_{SEG} = Length of the pipe segment
σ_{IRON} = Iron specific resistance (pipe material)

4.2.7 The Natural Stray Corrosion Current Calculation

As per Eq. 4:

$$\mathbf{Q_N} = A_{4qn}\,\mathbf{X^4} + A_{3qn}\,\mathbf{X^3} + A_{2qn}\,\mathbf{X^2} + A_{1qn}\,\mathbf{X} + A_{0qn}$$

Then, rate of discharge $\mathbf{dQ_N/dt}$ will equal to the corrosion current

$$\mathbf{dQ_n/dt} = \dot{\mathbf{X}}\,[(\,4A_{4qn}\,\mathbf{X^3} + 3A_{3qn}\,\mathbf{X^2} + 2A_{2qn}\,\mathbf{X}\,) + A_{1qn} \quad (8)$$

As **X** = soil factor as per Eq.1, applying the **X** value in Eq. 8,
Then $\mathbf{I_{STRAY}}$:

$$\mathbf{dQ_n/dt} = \dot{\mathbf{X}}\,[4A_{4qn}((1/K_S)\log\rho)^3_{H=10\%}\,\mathbf{(pH.H)^3} + 3A_{3qn}((1/K_S)\log\rho)^2_{H=10\%}\,\mathbf{(pH.H)^2} + 2A_{2qn}((1/K_S)\log\rho)_{H=10\%}\,\mathbf{(pH.H)} + A_{1qn}]$$

Now, for bare pipe segment-soil-earth system under test, without applying any c.p system, without any external interference, at room temperature, with soil volume under test and by neglecting CO_2 effect, the natural corrosion current from pipe surface to the surrounding medium could be obtained from an electrical concept of the corrosion and will equal to third order polynomial equation function of measured humidity and pH of the soil as shown in equation 9.

Natural corrosion current of the bare pipe segment to the surrounding medium I_{STRAY}

$$\mathbf{I_{STRAY}} = \dot{\mathbf{X}}[B_{3qn}\mathbf{(pH.H)^3} + B_{2qn}\mathbf{(pH.H)^2} + B_{1qn}\mathbf{(pH.H)} + A_{1qn}\,\mathbf{]} \quad (9)$$

Where:
pH.H = Variable quantity equal to (pH *Humidity) measured around the pipe segment
$\dot{\mathbf{X}}$ = Rate of soil factor change by time dx/dt = $d(S_f)/dt$
B_{3qn} = Constant print equal to $4A_{4qn}((1/K_S)\log\rho)^3_{at\ H=10\%}$
B_{2qn} = Constant print equal to $3A_{3qn}((1/K_S)\log\rho)^2_{at\ H=10\%}$
B_{1qn} = Constant print equal to $2A_{2qn}((1/K_S)\log\rho)_{at\ H=10\%}$
A_{1qn} = Constant print from natural charge equation
A_{2qn} = Constant print from natural charge equation
A_{3qn} = Constant print from natural charge equation
A_{4qn} = Constant print from natural charge equation
K_S = Constant equal to the dielectric constant of the soil at H = 10%
ρ = Constant equal to the soil resistivity in Ω.m at H = 10%

Referring to the proposed electrical circuit of bare pipe segment-soil-earth system in figures 5, the stray current source may be represented by equation 9. Then, the final proposed electric circuit of such system may be as the circuit diagram shows in figure 6 taking into account that the pipe-soil-earth system is without applying cathodic protection system and without any external interference i.e. natural condition.

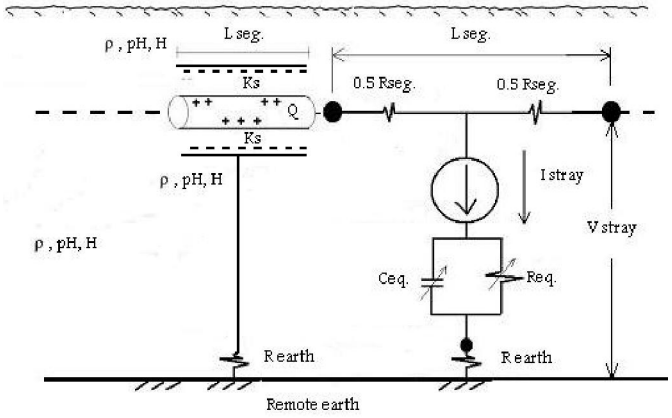

Figure 6: Final proposed electric circuit diagram of bare pipe segment-soil-earth system at natural condition without applying CP system

5. Case 2:

5.1 Proposed Electrical Analogue Circuit Of The Pipe Segment – Soil - Earth System With CP System [1] [2]

In case of cathodic protection process, the protection current either it is greater than the stray current (net current will flow through the pipe) or less than the stray current (net current will flow through the stray capacitor to the remote earth). The c.p level of the pipe line segment could be determined if the protection current before and after the pipe line segment is measured by using the proposed voltage drop canister pigged with an intelligent pig tool [1] [2]. For well coated pipe line segment, the electrical analogue circuit is as in Fig.7a. Also, Fig.7b shows the electric analogue circuit of the pipe segment which is cathodically protected by galvanic system or impressed current system Fig.7c.

The general electrical analogue circuit of pipe segment-soil-earth system will consist of current source in series with an equivalent impedance $Z_{eq.}$ correlated to humidity (R_{eq} in parallel with C_{eq}) which is connected from pipe to the remote earth as shown in figure 8. The importance of this proposed electrical circuit is that it converts both the corrosion and/or cathodic protection process into an electric problem. As we obtained before the electric parameters C, V and Q of the bare pipe segment-soil-earth system in terms of the electrochemical properties of the soil i.e. the general equations of the stray capacitance at many CP levels [6][10], the stray potential at many CP levels [7],[10], the surface total charge at many CP levels [8],[10] and finally the amount of the protection current at many CP levels [9],[10]. All electrical parameters deduced in terms of the soil factor, 4th degree polynomial equations with an average error less than ± 5%. In this paper, we will continue and use the results obtained before to deduce the electric analogue circuit of the natural condition pipe-soil-earth system with applying cathodic protection system.

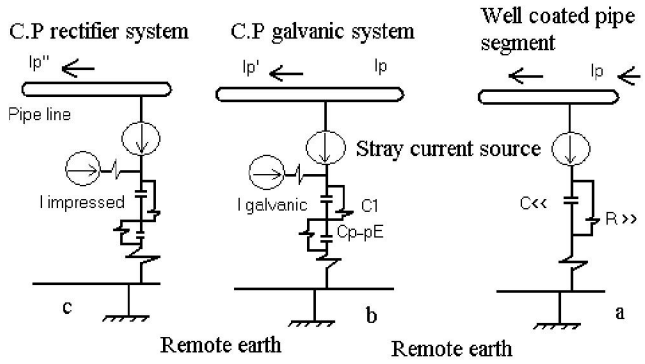

Figure 7: Proposed electrical analogue circuit of the pipe segment-soil system at the cathodic protection process (a) By well coating material (b) By galvanic system (c) By using impressed current system

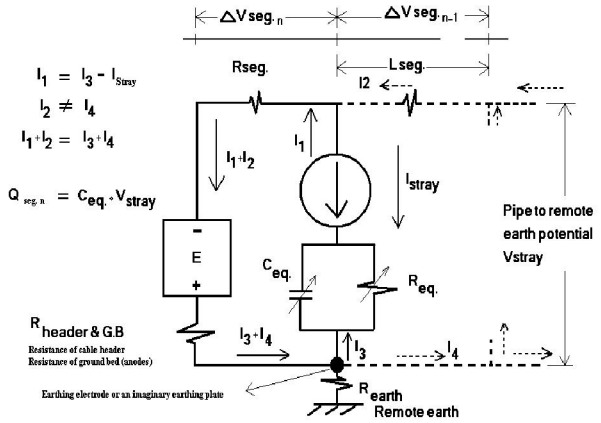

Figure 8: The proposed general electrical analogue circuit of pipe-soil system

5.2 Calculations of The Electrical Parameters Of The Pipe-Soil-Earth system With Applying CP System

Now, to obtain the pipe segment natural electric parameters with applying cathodic protection system, we have for the pipe-soil-earth system the following results:

5.2.1 General Equation Of The Electrolytic Capacitance [6][10]

This is equal to Eq. 10:

$$\mathbf{C_{stray}} = A_{4C}\,\mathbf{X^4} + A_{3C}\,\mathbf{X^3} + A_{2C}\,\mathbf{X^2} + A_{1C}\,\mathbf{X} + A_{0C} \quad (10)$$

Where:
A's: = $A_{(\ )C}$ are the stray capacitance print constants of the pipe soil under test
X = instantaneous value of the electrochemical value of the soil, the soil factor

5.2.2 General Equation Of The Stray Potential [7][11] This is equal to Eq. 11:

$$\mathbf{V_{stray}} = A_{4V}\,\mathbf{X^4} + A_{3V}\,\mathbf{X^3} + A_{2V}\,\mathbf{X^2} + A_{1V}\,\mathbf{X} + A_{0V} \quad (11)$$

Where:
A's = $A_{(\ )V}$ are the natural stray potential print constants of the pipe soil under test
X = instantaneous value of the electrochemical value of the soil, the soil factor

5.2.3 General Equation Of The Surface Charge [9],[10]
This is equal to Eq. 12:

$$\mathbf{Q} = A_{4q}\,\mathbf{X^4} + A_{3q}\,\mathbf{X^3} + A_{2q}\,\mathbf{X^2} + A_{1q}\,\mathbf{X} + A_{0q} \quad (12)$$

Where:
A's: = $A_{(\ )q}$ are the surface charge print constants of the pipe - soil under test
X = instantaneous value of the electrochemical value of the soil, the soil factor

5.2.4 General Equation Of The Protection Current Flow To The Pipe Segment (I_3) [10]
This is equal to Eq. 13:

$$\mathbf{I_3 = I_P} = A_{4I}\,\mathbf{X^4} + A_{3I}\,\mathbf{X^3} + A_{2I}\,\mathbf{X^2} + A_{1I}\,\mathbf{X} + A_{0I} \quad (13)$$

Where:
A's: = $A_{(\ )I}$ are the protection current print constants of the pipe soil under test
X = instantaneous value of the electrochemical value of the soil, the soil factor

5.2.5 Natural Stray Corrosion Current I_{STRAY} [10]
This is equal to Eq. 14:

$$\mathbf{dQ_n/dt} = \dot{\mathbf{X}}\,[\,B_{3qn}\mathbf{(pH.H)^3} + B_{2qn}\mathbf{(pH.H)^2} + B_{1qn}\mathbf{(pH.H)} + A_{1qn}\,] \quad (14)$$

Where:
pH.H = Variable quantity equal to (pH* Humidity) measured around the pipe segment
$\dot{\mathbf{X}}$ = Rate of soil factor change by time dx/dt = $d(S_f)/dt$
B_{3qn} = Constant print equal to $4A_{4qn}((1/Ks)\log\rho)^3_{at\ H=10\%}$
B_{2qn} = Constant print equal to $3A_{3qn}((1/Ks)\log\rho)^2_{at\ H=10\%}$
B_{1qn} = Constant print equal to $2A_{2qn}((1/Ks)\log\rho)_{at\ H=10\%}$
A_{1qn} = Constant print from natural charge equation
A_{2qn} = Constant print from natural charge equation
A_{3qn} = Constant print from natural charge equation
A_{4qn} = Constant print from natural charge equation
Ks = Constant equal to the dielectric constant of the soil at H = 10%
ρ = Constant equal to the soil resistivity in Ω.m at H = 10%

5.2.6 Earthing Resistance

The earthing resistance RE could be easily measured from the field by the use of earth tester.

R_E = Measured from the field
(15)

5.2.7 Pipe Segment Resistance

The resistance of the pipe segment will equal to:

$$R_{SEG.} = (¼\,\pi\,(D_O^2 - D_I^2) * L_{SEG.} * \sigma_{IRON}) \quad (16)$$

Where:
D_O = Outer diameter of the pipe segment
D_I = Inner diameter of the pipe segment
L_{SEG} = Length of the pipe segment
σ_{IRON} = Iron specific resistance (pipe material)

5.2.8 Calculation Of The Net Current Flow Through The Pipe Segment ($I_1 + I_2$) [9]

5.2.8.1Calculation of Pipe Segment Flow Current

As total surface charge is equal to;

$$\mathbf{Q_{surface}} = A_{4q}\,\mathbf{X^4} + A_{3q}\,\mathbf{X^3} + A_{2q}\,\mathbf{X^2} + A_{1q}\,\mathbf{X} + A_{0q}$$

Then, the pipe segment flow current, ($I_1 + I_2$) components as shown in Fig.8 is equal to:
$dQ_{surface}/dt$

$$\mathbf{dQ_{surface}/dt} = \dot{X} \; [\; 4A_{4q}\,\mathbf{X^3} + 3A_{3q}\,\mathbf{X^2} + 2A_{2q}\,\mathbf{X} + A_{1q} \;]$$

From Eq. 1, applying the value of the soil factor as $X = S_f = (1 / K_S)\ pH\ H \log \rho$
Then:

$$\mathbf{dQ_{surface}/dt} = \dot{X}\,[\; 4A_{4q}\,((1 / Ks) \log \rho)^3_{at\ H = 10\%}\mathbf{(pH.H)^3} + 3A_{3q}\,((1 / Ks) \log \rho)^2_{at\ H = 10\%}\mathbf{(pH.H)^2} + 2A_{2q}\,((1 / Ks) \log \rho)_{at\ H = 10\%}\mathbf{(pH.H)} + A_{1q}\;]$$

$$\mathbf{dQ_{surface}/dt} = \dot{X}\,[\; C_{3q}\mathbf{(pH.H)^3} + C_{2q}\mathbf{(pH.H)^2} + C_{1q}\mathbf{(pH.H)} + A_{1q}\;] \quad (17)$$

Now, for bare pipe segment-soil-earth system under test which applying c.p system, without any external interference, at room temperature, with soil volume under test and by neglecting CO_2 effect, the flow current of the pipe segment-soil under test could be obtained from an electrical concept of the corrosion and will equal to third order polynomial equation function of the measured (pH*humidity) as shown in equation 18.

Flow current of the pipe segment under test

$$\mathbf{I_1 + I_2} = \dot{X}\,[C_{3q}\mathbf{(pH.H)^3} + C_{2q}\mathbf{(pH.H)^2} + C_{1q}\mathbf{(pH.H)} + A_{1q}\;] \quad \mathbf{(18)}$$

Where:
pH.H = Variable quantity equal to (pH*Humidity) measured around the pipe segment
$\dot{X}$ = Rate of soil factor change by time $dx/dt = d(S_f)/dt$
C_{3q} = Constant print equal to $4A_{4q}\,((1/Ks) \log \rho)^3_{at\ H=10\%}$
C_{2q} = Constant print equal to $3A_{3q}\,((1/Ks) \log \rho)^2_{at\ H=10\%}$
C_{1q} = Constant print equal to $2A_{2q}\,((1/Ks) \log \rho)_{at\ H=10\%}$
A_{1q} = Constant print from surface charge equation
A_{2q} = Constant print from surface charge equation
A_{3q} = Constant print from surface charge equation
A_{4q} = Constant print from surface charge equation
Ks = Constant equal to the dielectric constant of the soil at H = 10%
ρ = Constant equal to the soil resistivity in Ω.m at H = 10%

5.2.8.1Calculation of the Current Reaches the Pipe Segment from d-c Source (I_3)

We have: Total surface charge $\mathbf{Q_{surface}}$ = charge supplied by cathodic protection $\mathbf{Q_{C.P}}$ – natural charge

i.e $\mathbf{Q_{surface} = Q_{C.P} - Q_n}$

Then:

$$\mathbf{dQ_{CP}/dt} = \mathbf{dQ_{surface}/dt} + \mathbf{dQ_n/dt}$$

As:

$$\mathbf{dQ_n/dt} = \dot{X}\,[\; B_{3qn}\mathbf{(pH.H)^3} + B_{2qn}\mathbf{(pH.H)^2} + B_{1qn}\mathbf{(pH.H)} + A_{1qn}\;] = \mathbf{I_{stray}}$$
from Eq.(9)

$$\mathbf{dQ_{surface}/dt} = \dot{X}\,[\; C_{3q}\mathbf{(pH.H)^3} + C_{2q}\mathbf{(pH.H)^2} + C_{1q}\mathbf{(pH.H)} + A_{1q}\;] = \mathbf{I_1 + I_2}$$
from Eq.(17)

$$\mathbf{I_1} = \mathbf{I_3} - \mathbf{I_{stray}}$$

$$\mathbf{I_{DC}} = \mathbf{I_3} + \mathbf{I_4}$$

In our case of pipe segment study, $I_4 = 0$ & $I_2 = 0$
Then $\mathbf{I_{DC}}$ will equal to:

$$\mathbf{dQ_{CP}/dt} = \dot{X}\,[\; (B_{3qn}+C_{3q})\,\mathbf{(pH.H)^3} + (B_{2qn}+C_{2q})\,\mathbf{(pH.H)^2} + (B_{1qn}+C_{1q})\,\mathbf{(pH.H)} + (A_{1qn} + A_{1q})\;]$$

$$\mathbf{dQ_{CP}/dt} = \dot{X}\,[\; D_3\mathbf{(pH.H)^3} + D_2\mathbf{(pH.H)^2} + D_1\mathbf{(pH.H)} + D_0\;]$$

Now, for bare pipe segment-soil-earth system under test which applying c.p system, without any external interference, at room temperature, with soil volume under test and by neglecting CO_2 effect, the amount of rectifier current reaches the pipe – soil system under test could be obtained from an electrical concept of the corrosion and will equal to third order polynomial equation function of the measured (pH*humidity) as shown in Eq.19.

Amount of rectifier current reaches the pipe segment under test

$$\mathbf{I_{DC}} = \dot{X}\,[D_3\mathbf{(pH.H)^3} + D_2\mathbf{(pH.H)^2} + D_1\mathbf{(pH.H)} + D_0] \quad (19)$$

Where:
pH.H = Variable quantity equal to (pH* Humidity) measured around the pipe segment
$\dot{X}$ = Rate of soil factor change by time $dx/dt = d(S_f)/dt$
D_3 = Constant equal to $(B_{3qn}+C_{3q}) = 4(A_{4q} + A_{4qn})\,((1/Ks) \log \rho)^3_{at\ H=10\%}$

D_2 = Constant equal to $(B_{2qn}+C_{2q}) = 3(A_{3q} + A_{2qn})$ $((1/Ks) \log \rho)^2$ at H=10%

D_1 = Constant equal to $(B_{1qn}+C_{1q}) = 2(A_{2q} + A_{2qn})$ $((1/Ks) \log \rho)$ at H=10%

D_0 = Constant equal to $(A_{1qn} + A_{1q})$

Ks = Constant equal to the dielectric constant of the soil at H = 10%

ρ = Constant equal to the soil resistivity in Ω.m at H = 10%

Referring to the proposed electrical circuit of the bare pipe segment-soil-earth system in figure 8, all current values are now determined for the pipe segment-soil-earth system under test. Also the values of the equivalent stray electrolytic capacitor, the potential across it, the natural stray current source from the pipe segment, pipe segment net current flow and finally the amount of DC current share for the pipe segment are determined. Then, the final proposed electric circuit of such system may be as the electrical circuit diagram shown in figure 9a & 9b.

The electrical parameters of the bare pipe segment-soil-earth system under test with applying CP system are as follow:

$$C_{eq.} = C_{stray} = A_{4cn}\mathbf{X^4} + A_{3cn}\mathbf{X^3} + A_{2cn}\mathbf{X^2} + A_{1cn}\mathbf{X} + A_{0cn}$$

$$V_{stray} = A_{4v}\mathbf{X^4} + A_{3v}\mathbf{X^3} + A_{2v}\mathbf{X^2} + A_{1v}\mathbf{X} + A_{0v}$$

$$I_{stray} = \dot{\mathbf{X}} [B_{3qn}(\mathbf{pH.H})^3 + B_{2qn}(\mathbf{pH.H})^2 + B_{1qn}(\mathbf{pH.H}) + A_{1qn}]$$

$$I_1 = \dot{\mathbf{X}} [C_{3q}(\mathbf{pH.H})^3 + C_{2q}(\mathbf{pH.H})^2 + C_{1q}(\mathbf{pH.H}) + A_{1q}]$$

$$I_{DC} = I_3 = \dot{\mathbf{X}} [D_3(\mathbf{pH.H})^3 + D_2(\mathbf{pH.H})^2 + D_1(\mathbf{pH.H}) + D_0]$$

$I_2 = I_4 = 0$ for pipe segment under test

Where:

A's, B's, C's and D's: are the PRINT constants of the bare pipe-soil-earth system

X : instantaneous value of the electrochemical value of the soil, the soil factor (Eq.1)

$\dot{\mathbf{X}}$ = Rate of soil factor change by time d**x**/dt = $d(S_f)/dt$

H: is the measured humidity

pH: is the measured power of hydrogen

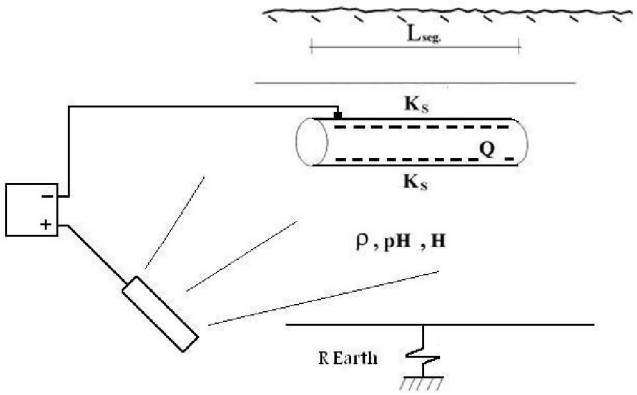

Figure 9a: shematic diagram of buried bare pipe segment with applying cathodic protection

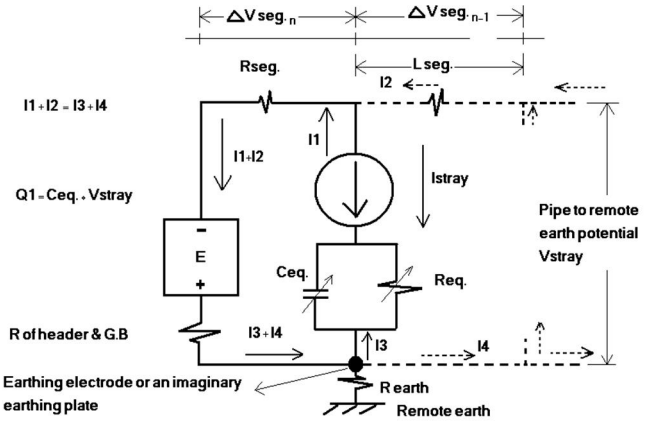

Figure 9b: The final proposed electric circuit diagram of bare pipe segment – soil – earth system with cathodic protection system

6. Circular ΔV PIG Idea: [1][2]

This is a new idea of the voltage drop technique to measure the protection current I_P passed through the buried pipeline. By considering a pipe line with total length L m, if such length is divided into segments with length L m./segment

Then: Total length L = segment length L_{Seg} x number of segments n

Electrically, the pipe line could be considered as: total resistance = segment resistance × n as shown in Fig.10.

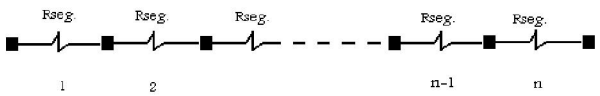

Figure 10: Electrical analogue resistance of the total pipe line length

Now if the voltage between points a & b of the segment is measured, as shown in figure 11, then the

instantaneous measured protection current will equal to:

$$Ip = \frac{\Delta V}{R_{seg.}}$$

That means that an additional circular voltage drop canister could be added with the available intelligent pig to measure the protection current I_P. Figure 11 shows such canister, and in the meantime by using GPS technology to determine the segment position.

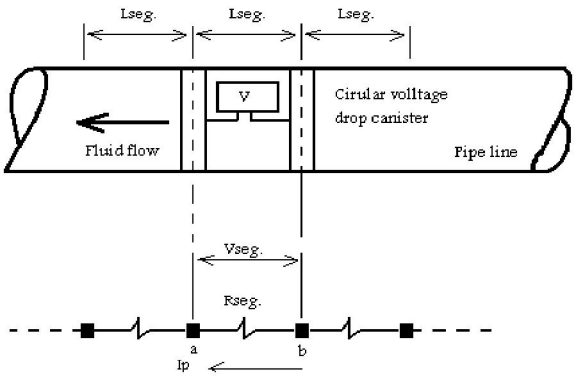

Figure 11: Idea of voltage drop canister to be pigged with the fluid through the pipeline

By the use of this voltage drop canister which pigged with the intelligent pig and by the use of GPS system, each segment flow current I_P could be measured. Then by measuring the humidity around this pipe segment, the soil factor could be determined. Finally, from the ONION curves obtained before [9] (which correlate I_P, S_F and $V_{H.C}$), the equivalent pipe to soil potential of this buried pipe segment could be determined without the need of test point and without the need of $Cu/CuSO_4$ half cell. The most important result is that: the pipe to soil potential of any buried pipeline could be obtained segmental along its route without the need of any test points.

7. Conclusion

The behavior of the electrical parameters of the pipe-soil-earth system during the change of the electrochemical properties of the soil could be plotted in electrical parameters PRINT which will be always valid in all times as the pipe-soil system is maintained and without any external interference. Once the system is changed by replacement another pipe with different dimension and/or the replacement of the soil, there will be another new electrical parameters PRINT for the new pipe-soil-earth system. Also, the buried pipe line segment with soil surrounding medium could be simulated electrically by an electric circuit where the system is subjected to the law: (charge = capacitance × volt) between the pipe surface and the remote earth. This is where each of circuit electric parameter could be obtained by an equation as a function of the measured electrochemical properties of the soil (soil factor), 4th degree polynomial at room temperature but the A's constants are different for each electric quantity .The constants of each equation (A's) considered to be as a PRINT of such pipe-soil-earth system and valid until pipe and/or soil is changed with of course new print values. For buried bare pipe segments in different kind of soils at different cathodic protection level, the PRINTS of the electrolytic stray capacitor between pipe & earth, the stray potential across the stray capacitance, surface charge and the protection current of the cathodic protection system passed through the pipe segment were obtained in terms of the new parameter, the soil factor. The useful of these prints is to obtain complete electrical data correlated with many cathodic protection levels which help, after complete erection of the pipeline, in defining the c.p level (pipe to soil potential) of any pipe line segment through it's length by measuring the protection current and calculating the soil factor at the pipe segment from direct field measurements. Not only has that but also to define the most suitable route of the pipe line, before the erection process, which generates the minimum surface charge. The error of electric parameters equations reduced to be less than ± 5%. The most important advantage of such electrical analogue circuit of pipe segment-soil-earth system is the possibility to simulate a complete pipeline – soil system by an electric circuit and to convert both the corrosion and cathodic protection problems of the pipeline to an electric problem. This will help in corrosion monitoring and the maintenance of c.p systems. The most important result is that: the pipe to soil potential of any buried pipeline could be obtained segmental along its route without the need of any test points. This is by the use of the new electric concept of pipe-soil-earth system.

Molecular Markers for New Promising Drought Tolerant Lines of Rice under Drought Stress *via* RAPD-PCR and ISSR Markers

Youssef; M. A., Mansour A. and Solliman S. S

Genetics Department, Faculty of Agriculture, Zagazig University, Zagazig, Egypt, bakr2000us@yahoo.com

Abstract: Random amplified polymorphic DNA polymerase chain reaction (RAPD-PCR) and inter simple sequence repeats (ISSRs) markers were performed to detect the genetic diversity among 6 new rice lines and 4 cultivars with different responses to drought tolerance and establish specific DNA markers associated with drought tolerance. Among 16 RAPD primers tested, only 5 produced bands polymorphic between lines with an average of 5.2 bands per primer (ranging from approximately 252 to 1232 bp) and 73.02 % were polymorphic. Among the tested ISSR primers, only five amplified polymorphic ISSR loci with an average number of 4.4 bands per primer (ranging from approximately 80 to 813 bp) and the mean percentage of ISSR polymorphism was 90.91. Based on band polymorphisms generated by RAPD-PCR and ISSR after using the primers, the highest similarity value (0.93) was found between P-5-3-b line and P-5-3-a line and the lowest value (0.44) was found between P-5-3-b line and Giza 172. The dendrogram separated all cultivars and new lines into two clusters and indicated that the cross of tolerant line (P-5-3-b) and susceptible cultivar (Giza 172) is suggested as the most suitable cross for drought tolerance analysis studies as they have the lowest similarity value (0.44) and also grouped in distinct cluster. Since two fragments of about (315 and 505 bp) were visualized using HP15 primer in the genomic DNA of the drought tolerant lines while were absent in the sensitive cultivars, they can be considered as positive drought tolerant markers. [Journal of American Science 2010;6(12):355-363]. (ISSN: 1545-1003).

Key words: RAPD-PCR, ISSRs, rice, drought stress, dendogram.

1. Introduction:

Rice (*Oryza sativa*), one of the important food crops, is grown on 154 million hectares world-wide in a wide range of environments and about 45% of the world's rice is cultivated in rainfed ecosystems (Nazari and Pakniyat, 2008). These areas often experience severe water deficits due to low and uneven rainfall distribution patterns and yields are largely reduced by drought. Drought stress is a serious limiting factor to rice production and yield stability in rainfed areas and 18 million tons of rice valued at US$ 3600 millions is lost annually to drought (Ribaut and Poland, 1999). Development of drought resistant cultivars will considerably improve rainfed rice production. However, little progress has been made in improving the genetic potential of rice for drought resistance because lack of phenotyping facilities to precisely screen large germplasm for drought resistance, inherent variation in the field and only one experimentally droughted crop per year (Ribaut *et al*., 1997).

In Egypt, the cultivated varieties require large amount of water irrigation (16500 m3/ha).The available amount of irrigation water from River Nile is not only limited (55.5 million m3/year) but liable to decrease year after year due to competition between the agriculture, industry and human consumption in the fixed amount of water from River Nile, in addition to the competition between groove countries of River Nile. As well as about 15.20% from rice areas was suffering a decreasing of yield due to short of water (Mahasson *et. al*, 1999). Accordingly, the future of rice cultivation in Egypt depends upon breeding for drought resistance because the cultivated varieties (lowland) require large amount of water and susceptibility of water deficits. The first trial for breeding drought tolerance in Egypt initiated at 1986 by ours obtaining on rice breeding for drought stress project (NARP No. 329). Investigations at this project included on genetical and physiological studies on the drought tolerance related characters as well as grain yield and its components (Soliman 1993a, Soliman 1993b). The effect of drought stress on disease infections and quality characters susceptible and drought tolerance genotypes were studied also (Abou-zaid *et. al*, 1993**,** Wafaa *et. al*, 1998). In the same time the breeding was done and we obtained on new promising drought tolerant lines of rice. These lines were evaluated for grain yield and its attributes as well as quality characters (Tables 1 and 2).cultivation of new drought tolerant lines in the large scale at sandy soil (light) by using microjectsprinkler irrigation as well as cultivation of its lines under heavy soil on large scale (Ghazi and Soliman, 2008). The findings of these experiments confirmed that the importance of these lines for solving of rice cultivation in Egypt and gave higher grain yield under drought stress than under normal irrigation (traditional method).

Molecular tools facilitate the identification of genomic locations linked to traits of interest and help

in indirect selection of such complex traits without the need for difficult phenotypic measurements. In the last few decades, new DNA molecular markers, based on the PCR technique, such as random amplified polymorphic DNA (RAPD; Williams *et al*. 1990) and inter simple sequence repeats (ISSRs; Zietkiewicz *et al*. 1994), among others, have become excellent tools for plant breeders (Lima-Brito *et al*. 2006). When there is insufficient information about the genome sequence of a wild species, or there are economic constraints, one of the most adequate marker systems is RAPD amplification (Lima-Brito *et al*. 2006). This technique gives fast results but also has limitations, such as dependence on the genetic background, low reproducibility, and level of polymorphism obtained (Zietkiewicz *et al*. 1994; Godwin *et al*. 1997 and Fern´andez *et al*. 2002). In contrast to RAPD amplification, the ISSR markers are more feasible and reproducible (Godwin *et al*. 1997), and the distribution of ISSRs in the eukaryotic genome makes them highly informative (Tautz and Renz 1984). They are also highly polymorphic and their use is cost effective, requiring no prior information of the sequence (Bornet *et al*. 2002). In cereals, ISSR markers have been used to study genetic diversity and phylogenetic relationships (Kantety *et al*. 1995; Matos *et al*. 2001 and Fern´andez *et al*. 2002), for gene mapping (Kojima *et al*. 1998), for gene tagging in molecular assisted selection (Akagi *et al*. 1996 and Kaushik *et al*. 2003), and for DNA fingerprinting (Carvalho *et al*. 2005).

The objectives of this study were to use RAPD-PCR and ISSR markers to assess genetic diversity and identification of 6 new rice lines and 4 cultivars with different responses to drought tolerance by comparison of local cultivation and establish specific DNA markers associated with drought tolerance using RAPD-PCR and ISSR markers to assessed of breeders to selection drought tolerant genotypes on the molecular level at the laboratory only subsequently acceleration and facilitates of drought breeding programs.

2. Materials and Methods

This work was carried out in Molecular Genetics Lab. Genetic Dept., Fac. of Agric., Zagazig Univ.

Plant materials:

Six new drought tolerant lines and four sensitive cultivars were used in this study under drought stress (Table 3).

RAPD and ISSR amplification

Total genomic DNA was extracted from young leaves by the CTAB (cethyltrimethylammonium bromide) method followed by an RNase-A treatment (Sigma, St. Louis, MO; R-4875) for 30 min at 37°C.

Primers:

A set of sixteen 10-mer oligonucleotides was analyzed for RAPD-PCR and a total of twenty primers were tested for ISSR. Based on the accurate amplified bands profiles and the produced polymorphic patterns of DNA fingerprinting selected five different primers were chosen for RAPD-PCR and another five primers for ISSR (Table 4).

RAPD- PCR reactions

The RAPD amplification reactions were carried out in 50 µl containing 20 ng/µl of template DNA, 10× buffer (NH4)2SO4; Fermentas, St. Leon-Rot, Germany), 2.5mM MgCl2 (Fermentas), 2.5mM dNTPs, 0.25 µM primer and 1 Unit *Taq* DNA polymerase (Fermentas). The RAPD amplifications occurred under the following conditions: an initial denaturation step at 94◦C for 7 min and 30 cycles at 94◦C for 1 min, 35◦C for 1 min and 72◦C for 2 min; the final elongation step was at 72◦C for 6 min.

ISSR- PCR reactions

The ISSR amplification reactions were carried out in 25µl per tube, containing 2µl DNA (20 ng), 1 unit of *Taq* DNA polymerase enzyme, 2µl 10X buffer, 2 µl $MgCl_2$ (25 mM), 2µl $dNTP_s$ (2.5 mM of each), 2 µl primer (10 pmol) and 14.8µl H_2O. The following conditions were used for ISSR amplifications: an initial denaturation step of 94◦C for 5 min, followed by 45 cycles of denaturation at 94◦C for 30 s, a primer annealing step at 52◦C for 45 s, and an extension at 72◦C for 2 min; then a final extension was carried out at 72◦C for 5 min. The annealing temperature varied according to the melting temperature of each primer.

Both RAPD and ISSR amplification reactions were carried out on a Perkin-Elmer Gene Amp PCR system (model 2400), and each reaction was repeated twice.

Band analysis:

The reaction products were analyzed by electrophoresis on 1.4% agarose gels, stained with ethidium bromide, and photographed under UV transilluminator by digital camera with UV filter adaptor. The synthetic DNA, ladder 100 bp (Pharmacia) was employed as molecular markers for bands molecular weight. Each amplified band profile was defined by the presence or absence of bands at particular positions on the gel. Profiles were considered different when at least one polymorphic band was identified. Fragments were scored as 1 if

present or 0 if absent based on standard marker using GelAnalyzer 3 (Egygene) software. Pairwise combinations, genetic similarity and genetic distances were estimated following Lynch (1990 and 1991). The computer package SPSS was used to construct a dendrogram based on the matrix of distance using Unweighted Pair Group Method with Arithmetic averages (UPGMA) (Sneath and Sokal 1973).

3. Results:

RAPD and ISSR analysis

The total number of amplified fragments, number of monomorphic fragments, number of polymorphic fragments and percentage of polymorphism obtained per each RAPD and ISSR primer are shown in table (5). Among the 16 RAPD primers tested, only 5 produced bands polymorphic between lines. An average of 5.2 bands per primer was amplified (ranging from approximately 252 to 1232 bp) and 73.02 % were polymorphic. The oligonucleotide OPA-05 and OPA-11 presented the highest percentage of RAPD polymorphism (100 %; table 5). OPB-10 oligonucleotides, presented one unique band (665 bp) to Giza177 cultivar and OPD-07 oligonucleotides, presented one unique band (589 bp) to Giza 159 cultivar while, OPA-11 oligonucleotides, presented two unique bands (252 and 292 bp) to P-2-1-2-1 line and P-58-1-2 line respectively (Table 6).

Among the tested ISSR primers, only five amplified polymorphic ISSR loci. An average number of 4.4 bands per primer were amplified (ranging from approximately 80 to 813 bp) and the mean percentage of ISSR polymorphism was 90.91 (table 5). The oligonucleotide HP12 amplified the highest number of ISSR loci (6 bands) but primers HP9, HP12 and HP14 gave the highest percentage of polymorphism (100 %; table 5). HP12 oligonucleotides, presented two unique bands (519 and 773 bp) to P-5-3-b line while, HP14 and HP15 oligonucleotides, presented one unique band (783 and 453 bp) respectively to P-72-11-1-1 line (Table 7).

The patterns obtained with HP15 oligonucleotide for lines suggested that this primer has the ability to produce drought tolerant markers. Since two fragments of about (315 and 505 bp) were visualized using HP15 oligonucleotide in the genomic DNA of the drought tolerant lines while were absent in the sensitive lines, they can be considered as positive drought tolerant markers (Table 7 and Figure 1).

Phylogenetic relationship among new drought tolerant lines and local cultivars (Susceptible) based on amplified RAPD-PCR and ISSR fragments (bands):

The similarity coefficient values among all cultivars and new lines based on band polymorphisms generated by RAPD-PCR and ISSR after using the primers are presented in Table (8). The highest similarity value (0.93) was found between P-5-3-b line and P-5-3-a line and the lowest value (0.44) was found between P-5-3-b line and Giza 172.

The dendrogram of genetic distances among all tested genotypes based on band polymorphisms generated by RAPD-PCR and ISSR after using the primers is shown in (Fig. 2). The dendrogram separated all cultivars and new lines into two clusters. First cluster divided into two subclusters, first subcluster included P-58-1-2, P-5-3-b, P-5-3-a and second subcluster formed a separate subcluster with P-58-1-2-1. Second cluster was further divided into two subclusters. Among the two subclusters, first subcluster formed a separate subcluster with P-2-1-2-1, Sakha 104 and Giza177and second subcluster included Giza172, Giza159 and P-72-11-1-1.

Table (1): The average mean of quality characters and days to heading for new promising drought tolerant lines and local varieties of rice under drought stress.

	Day heading	Protein content	Milling characters			
			Brown rice	Brain and germ	Hask	White rice
P-58-1-2	96.0	9.81	68.0	9.9	32.0	58.1

4. Discussion

Molecular characterization revealed 73.02 % polymorphism of RAPD markers and 90.91 % polymorphism of ISSR markers between lines (table 5). The difference is perhaps explained by the difference in the DNA segments targeted by the two methods, and is consistent with some previous studies which reported that ISSR markers are more polymorphic than RAPD markers (Zietkiewicz et al. 1994; Godwin *et al*. 1997 and Nagaoka and Ogihara 1997). Fern´andez et al. (2002) used RAPD and ISSR markers for DNA fingerprinting, because they provide a quick, reliable and highly informative system and can also be used to establish genetic relationships. Although in our work the ISSR markers showed higher percentage of polymorphism than RAPD markers, we believe that both could be useful for DNA and genomic fingerprinting.

Regarding to fingerprinting of new drought tolerant lines with comparison of local cultivars (drought susceptible), four unique bands were detected between genotypes at RAPD-PCR. The first unique band posses 292 bp length with OPA-11

primer and it was found in P-58-1-2 line (drought tolerant), the second unique band (252 bp) with OPA-11 distinguish P-2-1-2-1 line (drought tolerant). The third and fourth unique bands, i.e., 665 bp with OPB-10 and 589 bp at OPD-O7, they identified of Gisa 174 and Giza 159, respectively. While, ISSR results gave four unique bands also but for drought tolerant lines. The first and second unique bands identified P-5-3-b line; these bands were 773 bp and 519 bp with HP-12 primer. As well as, P-72-11-1-1 line posse two unique bands (783 bp with HP-13 primer and 454 bp with HP-15 primer). These results determine the fingerprinting of very important drought tolerant lines because they interred into confirmed experiments in season 2010 under seed production and possess height yield under drought stress.

There was close relationship between some of the cultivars and new lines used in this study, presumably they might have been collected from similar locations or these cultivars and new lines may have been derived from the same pedigree. The high similarity between P-5-3-b line and P-5-3-a line indicating, that these lines are closely related because they were developed from the same genotype (IR 4786-13-2-1).

If there is possibility of several crosses, two patents should be crossed in order they have the QTLs involved in drought tolerance. On this basis, the cross of tolerant line (P-5-3-b) and susceptible cultivar (Giza 172) is suggested as the most suitable cross for drought tolerance analysis studies as they have the lowest similarity value (0.44) and also grouped in distinct cluster.

Nagaoka and Ogihara (1997) have reported that the ISSR primers produced several times more information than RAPD markers in wheat.

Fern´andez *et al*. (2002) have studied 16 barley cultivars form different countries and they have found high similarity index by ISSRs than by RAPDs. It may be due to highly polymorphic, abundant nature of the microsattelites due to slippage in DNA eplication.

Galvan *et al*. (2003) concluded that ISSR would be a better tool than RAPD for phylogenetic studies.

Through RAPD and ISSR techniques, which are relatively cheap and require small quantities of DNA, it was possible to identify one primer (HP15) from ISSR that generated polymorphic bands in tolerant and non-tolerant lines (315 and 505 bp).These bands can be considered as potential markers to identify drought tolerant lines or may even be more useful when converted into a simple-sequence PCR-based marker that can be used for large-scale drought tolerance screening of cultivars. On the other hand, RAPD-PCR did not detect positive drought marker. Present results suggest that one characteristic is not good predictor of genetic marker.

Polymorphic bands were determined drought tolerance in rice at present study confidence as a very important results because it is the first molecular markers for drought tolerance in Egyptian rice genotypes. These molecular markers could be assessing to acceleration of detection to drought tolerant genotypes on the bases of molecular markers at laboratory conditions only with comparison to field screening, which is very difficult and less accuracy.

Pakniyat *et al*. (2004) introduced markers linked to salt tolerance in cultivated and wild barley using RAPD-PCR. Pakniyat and Tavakol (2007) found markers related to drought tolerance in bread wheat genotypes using these markers. Also Nazari and Pakniyat (2008) found markers associated with drought tolerance in wild and cultivated barley genotypes using RAPD markers.

Genetic Evaluation and Molecular Markers for Heat Tolerance in Tomato (*Lycopersicon esculentum* Mill.)

M.A. Kamel*[2], S.S.Soliman[1], A.E. Mandour[1] and Mahassen S. S. Ahmed[1]

[1]Genetics Department, Fac. Agric., Zagazig University, Egypt, [2] Samtrade trials station, Samtrade, Samir Fahmy Group, Egypt

*kamel_moh77@yahoo.com

Abstract: Genetic evaluation was performed on twenty three genotypes of tomato (*Lycopersicon esculentum* Mill.) under high temperature at summer season to determine the variation between them for heat tolerance. Heat tolerance related criteria, i.e., pollen viability, fruit setting, osmotic pressure and fruit yield per plant. LSSS1, Homestead 24, Black Russian Plum, Super Marmand and Money Maker possess more tolerance of heat. In contrast, Super Stain B, Castle Rock, Cherokee Purple, Moskvich and Nicholevna Pink were more susceptible of heat. The pollen grain viability and fruit setting criteria consider as suitable morphological markers for heat tolerance than other heat tolerant related criteria as osmotic pressure. Heritability was high and moderately whereas, the genetic improvement of new strains could be done. From previous evaluation, Lsss1 as tolerant line and Super Strain B as sensitive cultivar of heat tolerance was crossed for study of molecular markers related to heat tolerance by using bulk segregant analysis (BSA). Crossing was carried out between these two genotypes to obtain the F_1 seeds which were left for selfing to obtain the F_2 seeds. The two selected genotypes, their F_1 and F_2 plants were evaluated for their response to heat stress by recording some heat stress related traits. Bulk of the two extremely F_2 plants (most tolerant and most sensitive F_2 groups), the two contrasting parents and their F_1, were used to develop some molecular genetic markers associated with heat tolerance in tomato by using ten RAPD and six ISSR primers. two RAPD markers (with molecular sizes of 100 bp for primers A16 and 500 bp for primer Z13)and one ISSR marker(with molecular size of 650 bp) were considered as reliable markers for heat tolerance as well as susceptible genotypes possessed eight RAPD markers (with molecular sizes 500 and 1500 bp for primer C02, 1750 and750 bp for primer C03, 2400 bp for primer C05, 550 bp for primer C08, 400 bp for primer C14 and 650 bp for primer C15). [Journal of American Science 2010;6(12):364-374]. (ISSN: 1545-1003).

Keywords: Tomato, Heat stress, Heat related traits, Molecular markers, RAPD-PCR, ISSR-PCR. Bulked segregant analysis (BSA), Marker assisted selection (MAS).

1. Introduction:

Heat tolerance is generally defined as the ability of the plant to grow and produce economic yield under high temperatures. However, while some researchers believe that night temperatures are major limiting factors others have argued that day and night temperatures do not affect the plant independently and that the diurnal means temperature is a bitter predictor of plant response to high temperature with day temperature having a secondary role (Peet and Willits, 1998).

Heat stress due to high ambient temperatures to a serious threat to crop production worldwide (Hall, 2001). Gaseous amissions due to human activities are substantially adding to the existing concentrations of greenhouse gases, particularly CO_2, methane, chlorofluorocarbons and nitrous oxides.

Different global circulation models predict that greenhouse gases will gradually increase world´s average ambient temperature. According to a report of the Intergovernmental panel on Climatic Change (IPCC), global mean temperature will rise 0.3C° per decade (Jones *et al*., 1999) reaching to approximately 1 and 3C ° above the present value by years 2025 and 2100, respectively, and leading to global warming. Rising temperatures may lead to altered geographical distribution and growing season of agricultural crops by allowing the threshold temperature for the start of the season and crop maturity to reach earlier (Porter, 2005).

Tomato (Lycopersicon esculentum Mill.) belongs to the family Solanaceae and is an important vegetable crop all over the world. Tomatoes, although originating from elevated regions of the Andes, can be adapted to various conditions. In the last years, interest through the cultivation of this produce has steadily increased in tropical and subtropical zones. Therefore, tomatoes from these regions should be resistant or tolerant to heat, while the most common problem is the abortion of flowers due to high temperatures.

A threshold temperature refers to a value of daily mean temperature at which a detectable reduction in growth begins upper under lower

developmental threshold temperature have been determined for many plant species through controlled laboratory and field experiments. In tomato, for example, when the ambient temperature exceeds 35 C°, its seed germination, seedling and vegetative growth, flowering, fruit set and fruit ripening are adversely affected (Miller *et al*., 2001). The criteria, which more affecting than the other for heat stress are, pollen grain viability, osmotic pressure, fruit setting and fruit yield (Saeed *et al*. 2007, Abdul-Baki 1991, Peter *et al*. 2002, Adul-Baki and John 1995, Firon *et al*., 2006).

Traditional breeding methods provide little information on the chromosomal regions controlling these complex traits, the simultaneous effects of each chromosomal region on other traits (epistasis, pleiotropy,or linkage), or the genetic basis of such yield related traits (dominance or over-dominance) (Semel *et al*. 2006). If based only on phenotype analyses, selection by traditional breeding methods is difficult under conditions of large genotype–environment interactions. There is no reliable field screening technique that can be used year after year or generation after generation.

Molecular markers can be used not only for estimating the genetic diversity of germplasm collections but also for distinguishing genotypes within population. Kantety *et al*.,(1995) showed that ISSR technology was able to detect differences between the closely related inbred lines of corn. Thin ISSR should be very useful for studying tomato genotypes.

One approach to facilitate the selection and breeding of polygenic traits is to identify genetic markers linked to the traits of interest. DNA markers have facilitated quantitative trait locus (QTL) mapping studies in segregated populations, and showed that certain genomic regions derived from wild germplasm have the potential to improve fruit-related traits (Gur and Zamir 2004). The application of molecular markers in plant breeding programs facilitates the improvement of many crop species (Williams *et al*.,1990). The detection of RAPD markers on the genomic map of different field crop is beneficial to improve breeding programs of these crops. It offers the simplest and fastest method for detecting a great number of genomic markers in less period of time (Edwards *et al*., 1992). Michelmore *et al*. (1991) developed the bulked segregant analysis of F_2 plants as a simpler alternative technique to isogenic line analysis where the highest and lowest extremes of the F_2 population are bulked for the development of RAPD and SSR molecular markers needed for QTL-assisted selection. ISSR markers have recently found to be highly variable, require less investment in time, money and labor than other methods, and have the ability to be inherited (Wolfe and Liston, 1998).

Therefore the present study aimed to genetic evaluation of twenty three introduced local lines and cultivars for heat tolerance, as well as trial to discovery of some molecular genetic markers associated with heat stress (RAPD and ISSR markers) using bulk segregant analysis (BSA) to be used in marker assisted selection (MAS) program and to develop a database which will enable the utilization of genetic markers as selection tools to improve crop characterization.

2. Materials and Methods

1- Evaluation of genotypes for heat tolerance

1.1. Materials

Twenty cultivars and three lines of tomato were used for this study Table (1). These genotypes was evaluated for heat tolerance during late summer season 2007 at experimental farm of the Faculty of Agriculture, Zagazig University. The seeds of twenty cultivars were kindly obtained from Horticulture Department, and three lines were selected previous study at Genetic Department, Faculty of agriculture, Zagazig University, Egypt.

1.2. Methods:

Seeds of genotypes were sown on may 15th, 2007 in nursery in multi-pot transplant trays field with a mixture of peat-moss and vermiculite (1:1, v/v) medium. After one month from sowing, transplants were transferred to the filed. The mean monthly air temperature in the cultivated area during the growing season are indicated in Table (2).

1.3.Measured characters

- osmotic pressure:

The osmotic pressure was estimated from transforming the total soluble solids (TSS) to osmotic pressure as air pressure (bar) and multiplied by the factor (1.013) to represent osmotic pressure (bar). The total soluble solids was determined as refraction index using zeiss refractometer after 90 days from transplanting at room temperature (morgan,1977).

- Percentage of fruit set per plant was determined as the total number of fruit divided by the total flower number on clusters 2-6 of plant.
- Pollen viability by staining of pollen grains with acetocarmine dye and estimation of pollen viability according to the method followed by (Moreira and Gurgel 1941).

Total yield (kg/plant.) was estimated from total weight of harvested fruits from each plant.

Table 1 : Name , source and characterization of tomato genotypes.

July	45	17	40	19
August	45	19	39	19
September	40	16	35	16

1.4. Statistical analysis

Collected data were analyzed using the statistical software SPSS version 9.0. One-way analysis of variance (ANOVA) was used to determine differences among genotypes. Relationships between variable characters were estimated as correlation coefficient. Heritability in broad sense were done as follows:

$$h^2 \text{ (in broad sense)} = \frac{\text{genotypic variance}}{\text{genotypic variance + environmental variance}} \text{ X } 100$$

2. Bulk Segregant analysis (BSA)

2.1. Materials

Two genotypes of tomato namely; Lsss1 line (heat tolerant) and Super Strain B (heat sensitive) were chosen after evaluation for heat tolerance of twenty three genotypes in above experiment. The seeds of these genotypes were kindly obtained from Horticulture Department, Faculty of Agriculture, Zagazig Universtiy, Egypt.

2.2. Methods

2.2.1. Sand culture experiment

The two selected genotypes (Lsss1 and Super Strain B) were grown in field and crossed to obtain the F_1 seeds. Some of the F_1 seeds were transplanting in the field and selfed to obtain the F_2 seeds.

Seeds of genotypes, i.e., two parents, F_1'S and F_2 generations were sown on may 15th, 2009 in nursery in multi-pot transplant trays field with a mixture of peat-moss and vermiculite (1:1, v/v) medium. After one month from sowing, transplants were transferred to the filed. The mean monthly air temperatures in the cultivated area during the growing season are indicated in Table (2).

Data were recorded for ten plants for each genotype of the following related traits; Percentage of fruit set, Pollen viability and total yield per plant. The F_2 plants represented by 200 plants were classified into groups according to their behavior under heat stress.

Samples of the two parents, their F_1 and the two extreme groups of F_2 individuals (the most ten plants heat tolerant and the most ten plants heat sensitive) were taken for further molecular analysis.

2.3. Molecular genetic studies

2.3.1 Genomic DNA extraction.

DNeasy™ Plant Mini Kit (Qiagen Inc., Cat. No. 69104) was used for DNA isolation as described in the manufacturer manual from plant samples (the two parents; F_1 and the two extreme groups of F_2 plants) using bulked segregant analysis (BSA) technique.

2.3.2. RAPD-PCR analysis

PCR reactions were performed according to Williams *et al.*(1990) using ten 10-mer primers (Operon Technology, USA) table (3).

Amplification reactions were performed in a volume of 25 µl containing 1X Reaction buffer, 2 mM MgCl2, 0.2mM dNTPS, 0.2 mM primers, 25 ng of genomic DNA, and 1 units of Taq DNA polymerase.

Amplification was performed on a top quality thermal cycler programmed for 45 cycles of 1 minute at 94°, 1 minute at 36°, and 2 minutes at 72°. Amplification products were analyzed by electrophoresis in 1.4% agarose gels and detected by staining with ethidium bromide.

2.3.3. ISSR-PCR analysis

ISSR-PCR reactions were conducted according to Sharma *et al.* (1995) using six primers Table (3).

Amplification reactions were performed in a volume of 25 µl containing 1X Reaction buffer, 1.5 mM MgCl2, 0.2mM dNTPS, 50 pmol primers, 25 ng of genomic DNA, and 1 units of Taq DNA polymerase.

PCR amplification was performed in a hybrid Cycler programmed to fulfill 35 cycles after an initial denaturation cycle for 4 min at 94° C . Each cycle consisted of denaturation step at 94° C for 45 sec, an annealing step at 50° C for 30 sec. and an elongation step at 72° C for 2 min and 30 sec. The primer extension segment was extended to 5 min at 72° C in the final cycle. Agarose gel (1.4 %) electrophoresis was used for separating the PCR products.

2.3.4. Desitometric scanning

All bands resulting from RAPD and ISSR gels were detected on an UV-transilluminator filter. All gels were photographed under UV light with Polaroid film 667 and scanned with Bio-Rad video densitometer Model 620 at waveltngth of 577. Software data analysis for Bio-Rad Model 620 USA densitometer and computer were used.

Table (3): list of primers RAPD and ISSR

No.	Primer	Sequence (5' to 3')

3. Results and Discussion:

1. Genetic evaluation of heat tolerance related traits.

1.1 Genetic variation and heritability of tomato heat tolerance

Highly significant differences between studied genotypes were recorded for osmotic pressure, pollen viability, fruit setting and total yield per plant, as well as high heritability in broad-sense (h^2_{bs}) for these traits (Table 4). These results confirmed that genetic improvements were done of heat tolerance through related characters of it. These results are similar to those obtained by Grilli *et al.*(2003), where the fruit set of various tomato genotypes at high temperatures had about 89.5 % broad sense heritability, thus suggesting that the selection of individuals based on characteristic evaluated can be efficient.

Table 4: The mean squares of four studied characters of twenty three genotypes in tomato.

S.V.	d.f.	**Osmotic pressure**	**Pollen viability**	**Fruit setting**	**Total yield/plant**

1.2 Mean performance for studied traits of twenty three genotypes in tomato.

The mean performance for four studied characters of twenty three genotypes (Table 5) confirmed the wide difference between genotypes under study for heat tolerance related characters. Higher values of four traits were recorded for Black Russian Plum, Homstead 24, Super Marmand, Mony Maker, LSSS1 and LSSS3 than the other genotypes suggested as a donor for heat tolerance by using of them in hybridization, with remark to some more tolerant cultivars possess small fruit size as Black Russian Plum and Mony Maker. In contrast several heat susceptible genotypes were recorded, i.e., Moskvich, Nicholevna Pink, Super Strain B, Castle Rock. In addition, the most of studied genotypes consider as intermediate heat tolerance as Manitoba, Marion Red, Khazahk Schalavije, Plum Lemon, Walter Red, Falcon, Aledo, Red Star, Peto 86, Super Queen, VF145-B52 and LSSS2. From these results may be concluded that the high tolerant genotypes possess high values for four studied traits, and vise versa, susceptible heat genotypes possess low values for four studied traits. No obvious trend were recorded in intermediate heat tolerant genotypes for four studied traits. Comparable study was done by Saeed *et al*.(2007) who suggested that genotype, which will produce better yield under high temperature conditions, would be heat tolerant. The value of high broad sense heritability (0.9715) that showed that about 90% of the variation observed was genetically determined. Abdul-Baki (1991) who assessed fruit yield of tolerant and sensitive tomato lines and cultivars in field under high temperature condition. The heat tolerant lines produced higher fruit yield than heat sensitive cultivars. Peter *et al*. (2002) who reported that high temperatures fruit set (heat tolerance) was a critical trait of tomato. In the same trend for pollen grain viability, Adul-Baki and John (1995) demonstrated that using pollen viability as a selection criterion for high temperature tolerance was genotype effect as well as Firon *et al*., (2006) reported that heat stress caused a reduction in number of pollen grains in heat – sensitive cultivars, caused reduced fruit set. In heat tolerant cultivars, however, number and quality of pollen grains, number of fruits were less affected by high temperatures.

1.3 Relationship between four studied criteria related to heat tolerance in tomato.

Correlation coefficient (r) for four characters in tomato are shown in (Table 6). Osmotic pressure was positively and significantly correlated to pollen viability (r = 0.46), fruit set (r = 0.48) and yield (r = 0.54). positive correlation was also observed between pollen viability and both of fruit set and yield (r = 0.95 and 0.77 respectively). As well as correlation between fruit set and yield were positive and highly significant (r = 0.74). These results confirmed that, increased yield under heat stress might be obtained by breeding genotypes that were high in osmotic pressure, pollen viability or fruit set under heat stress. These results agreed with Weaver and Timm (1989) whose reported a positive correlation between heat tolerance and pollen viability maintenance after briefly exposing flowering tomato plants in the greenhouse to high temperatures.

2. Bulk Segregant Analysis (BSA)

2.1 Responses of the F_2 plants

F_2 plants presented by 200 individuals were classified into groups according to their behavior under high temperature stress. The first group refers to the best growing F_2 plants and the last group refers to the worst ones under high temperature stress. The F_2 plants were arranged in descending order according to their frequency, so plants with high frequency in group one were chosen as the most tolerant F_2 plants. While the plants in the last group were taken to represent the most sensitive F_2 plants.

According to these classifications, ten F_2 plants were taken to represent the most tolerant and the most sensitive ones to high temperature stress for each trait as shown in Table (7).

These twenty plants were used for bulked segregant analysis to obtain molecular ($RAPD_S$ and $ISSR_S$) markers linked with high temperature stress.

2.2 Molecular genetic markers for heat tolerance.

2. 2.1 RAPD molecular markers

DNA isolated from the two contrasting parents, LSSS1 as a heat tolerant parent and Super Strain B as a heat sensitive parent, their subsequent F_1 and DNA bulks of the tolerant and sensitive groups of F_2 segregating population were tested against ten preselected primers.

All primers gave polymorphisms with the studied genotypes, while 8 primers developed molecular markers for heat and sensitive tolerance as shown in table(8). Primers A16 and Z13 exhibited 2 positive molecular markers which were found only in the tolerant parent (LSSS1), F_1 and the tolerant F_2 bulk with molecular sizes of 100 bp for primers A16 and 500 bp for primer Z13, while there were absent in the sensitive parent (Super S train B) and the sensitive F_2 bulk Fig(1). On the other hand, primers C02, C03, C05, C08, C14 and C15 exhibited eight molecular markers which were found only in the sensitive F_2 bulk with molecular sizes 500 and 1500 bp for primer C02, 1750 and750 bp for primer C03, 2400 bp for primer C05, 550 bp for primer C08, 400 bp for primer C14 and 650 bp for primer C15 Fig(2).

Table 5: Mean performance and least significant difference (LSD) of four studied characters of twenty three genotypes in tomato under heat stress at summer season, 2007.

These two positive and eight negative RAPD markers could be considered as reliable markers for heat tolerance in tomato. These results agreed with (Zhang *et al*. 1994 and Mackay and Caligari 2000) whose reported that RAPD analysis combined with BSA has been used to screen for markers linked to genes of interest. Moreover Lin *et al*. (2006) identified random amplified polymorphic DNA (RAPD) markers linked to heat tolerance traits in tomatoes under heat stress by using the bulked segregant analysis. In addition, bulked segregant analysis was used to identify RAPD markers linked to the Sw-5 gene for resistance to tomato spotted wilt virus (TSWV) in tomato (Chague *et al*. 1997).

2.2.2 ISSR molecular markers

DNA isolated from the two contrasting parents, LSSS1 as a heat tolerant parent and Super Strain B as a heat sensitive parent, their subsequent F_1 and DNA bulks of the tolerant and sensitive groups of F_2 segregating population were tested against six preselected primers.

All primers gave polymorphisms among the studied genotypes, while only one primer developed molecular markers for heat tolerance Table(9). Primer 844A showed one positive molecular marker which were found only in the tolerant parent (LSSS1), F_1 and the tolerant F_2 bulk with molecular size of 650 bp Fig. (3).

Our results were in harmony with those of Lin *et al*. (2010) who used the 160 F_2 tomato plants segregating population to identification of ISSR markers linked to fruit related traits in the tomato subjected to high temperatures. ISSR were useful for finding markers associated with major and minor genes controlling agronomical important traits in wheat (Ammiraju *et al*., 2001). Also several ISSR markers had been found to be tightly linked to the gene that determined the ratio of fructose to glucose in mature tomato fruits (Levin *et al*., 2000).

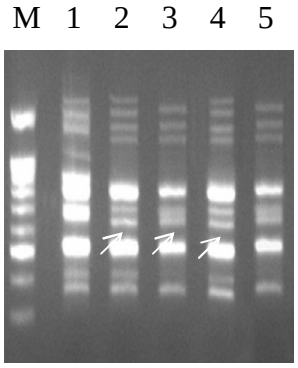

Fig. 3: Amplification patterns using ISSR primers to identify the 844A markers linked to resistance alleles. Lane M 100 bp molecular- weight ladder, 1 susceptible parent Super Strain B, 2 tolerant parent LSSS1, 3 F_1, 4 tolerant F_2 bulk, 5 susceptible F_2 bulk.

TP: tolerant parent MT: marker type

These results confirmed that the possibility for breeding of new Egyptian lines and hybrids possess high tolerance of heat and simultaneously high fruit yield for cultivation of summer season, which the temperature up to 40°C in about two months July and August per year.

The present discovered molecular markers for heat tolerance and sensitively in Egyptian cultivars will be acceleration of breeding program for development of new lines and subsequently new hybrids having more tolerance to heat and high fruit yield at the summer season.

The highly significant correlation between four heat tolerance related characters under study by using discovered molecular markers for pollen grain viability, osmotic pressure, fruit set and fruit yield per plant and recent study trial to determine the relationships between new molecular markers and quantitative trait loci (QTL) from database and subsequently, helpful to determine the controlling genes for heat tolerance, as well as the study by Lin *et al*. (2010) , which to determine the quantitative trait loci influencing fruit- related characteristics of tomato grown in high temperature.

In conclusion, our goal was to find RAPD and ISSR markers linked to heat tolerance genes in order to use them in marker-assisted breeding programs. BSA allowed us to rapidly find marker linked to heat tolerance. The results showed that only two RAPD and one ISSR markers were linked to heat tolerance. Thus, BSA allowed us to directly target the gene, as demonstrated by Michelmore et al.(1991). The level of polymorphism detected in molecular marker followed by using marker-assisted selection (MAS) has been proven to be good alternative method of the agronomic selection, where it provides plant breeders with environmental- independent genetic markers for certain economic traits.

Abstract: Purpose: Glaucoma, the second leading cause of blindness, is characterized by changes in the optic disc and visual field defects. The elevated intraocular pressure was considered the prime factor responsible for the glaucomatous optic neuropathy involving death of retinal ganglion cells and their axons. Extensive investigations into the pathophysiology of glaucoma now reveal the role of multiple factors in the development of retinal ganglion cell death. Genetic factors and oxidative damage have been shown to have a role in the development of primary open angle glaucoma (POAG). Glutathione S-transferases (GSTs) are a family of enzymes that inactivate xenobiotics and endogenous end products formed as secondary metabolites during oxidative stress. In humans, GSTT1 and GSTM1 deletion genotypes are associated with a variety of pathologic processes including certain ophthalmologic diseases. The aim of this study was to determine the effects of genetic polymorphisms of glutathione S transferase GSTM1 and GSTT1 on the risk of POAG in an Egyptian population. Methods: We compared the prevalence of GSTT1 and GSTM1 deletion genotypes, which were determined by multiplex polymerase chain reaction, in 32 patients with primary open angle glaucoma to 16 age, sex, and ethnically matched controls. Results: The GSTM1 positive genotype had an increased risk of developing POAG ($p< 0.05$, OR 4.681, 95% CI 1.190 – 18.412). The risk of glaucoma also increased significantly in subjects with a combination of GSTM1 positive and GSTT1 null genotypes ($p< 0.05$, OR 4.700, 95% CI 0.959 – 23.033). Conclusion: The GSTM1 positive genotype or the combination of both GSTM1 positive and GSTT1 null genotypes may be associated with the increased risk of development of POAG in the Egyptian population. The overall results indicate a possible variable association between various GSTT1 and GSTM1 genotypes and primary open angle glaucoma. Decreased GST function might interfere with the metabolism of oxidative intermediates and exacerbate the direct or indirect damaging effects of oxidative stress on the optic nerve. It is possible that these GST polymorphisms may be risk factors for primary open angle glaucoma [Journal of American Science 2010;6(12):375-381]. (ISSN: 1545-1003).

Keywords: Glaucoma; optic disc and visual field defects; primary open angle glaucoma (POAG); Glutathione S-transferases (GSTs)

1. Introduction

Glaucoma is the most common optic neuropathic process affecting human and the second most common cause of blindness worldwide (1).

It is a disease in which progressive loss of retinal ganglion cells is characterized by a recognizable pattern of both visual function loss and optic nerve head pallor and excavation. If, untreated, the natural course is towards blindness, or at least significant visual loss disability (2).

Primary open angle glaucoma (POAG), which affects almost 2% of the world population, accounts for most of the glaucoma cases. Although the pathophysiology of POAG is not precisely known, its causes are clearly multifactorial. It is a result of multiple interactive genetic and environmental effects. Although the most prominent known risk factor for developing POAG is elevated intraocular pressure, there are also other suspected risk factors such as positive family history, age, hypertension and diabetes. Its prevalence increases with age. It is well known that POAG is an age-related disorder. There is a general consensus that cumulative oxidative damage is responsible for aging, and may, therefore, play an important role in the pathogenesis of an age-related disorder such as glaucoma. Oxidant stress and antioxidant systems are potentially important for ocular tissues. Exposure to light by photosensitizing mechanisms may lead to the formation of reactive oxygen species. Many of the ocular tissues regenerate slowly, causing an increase in the risk for an accumulation of oxidant-inflicted damage in the tissue components. The damage caused by xenobiotics and oxidants can result in a number of molecular changes that contribute to the development of glaucoma, cataract, and other age related diseases. Therefore the eye must posses efficient reducing systems, as well as, detoxification enzymes such as

catalase, superoxide dismutase, glutathione peroxidase and glutathione S-transferase (GST) for protection from oxidative damage. The ocular ciliary epithelium expresses genes coding for GST and other enzymes involved in the glutathione cycle, such as glutathione peroxidase. Several epidemiological studies suggested that individual susceptibility to several disorders, including eye diseases might be connected with the GST system (2).

The glutathione S-transferases (GSTs) are a family of enzymes consisting of numerous cytosolic, mitochondrial, and microsomal proteins capable of multiple reactions with endogenous and xenobiotic substrates. They catalyze the conjugation of reduced glutathione to electrophilic centers via the sulfhydryl group on a wide variety of substrates. GSTs bind toxins, function as transport proteins, detoxify endogenous compounds such as peroxidized lipids, and inactivate endogenous end products formed as secondary metabolites during oxidative stress (1).

The GST isoenzymes expressed in human tissues comprise the alpha, mu, pi, theta, kappa, sigma, zeta and omega gene families. As many GST genes are polymorphic, there has been considerable interest in determining whether particular allelic variants are associated with altered risk (or outcome) of a variety of pathologies including cancers, cardiovascular diseases and respiratory diseases. Of these classes of GSTs, five (GSTM1, GSTM3, GSTT1, GSTP1 and GSTZ1) have been shown to be polymorphically distributed. Five mu-class genes (GSTM1–GSTM5) are situated on chromosome 1.11 Polymorphisms identified in GSTM1 are GSTM1*0, GSTM1*A and GSTM1*B. GSTM1*0 is deleted, and homozygotes (GSTM1 null genotype) express no protein. GSTM1*A and GSTM1*B differ by a single base, and thecatalytic effectiveness of the enzymes encoded by these alleles is similar. There are two theta-class genes, GSTT1 and GSTT2, located on chromosome 22.6 GSTT1 is represented by two alleles: a functional or wild allele (GSTT1*1), and a nonfunctional or null allele (GSTT1*0). Studies have shown that the GSTT1*0 allele corresponds to a total or partial deletion of the gene, causing a deficiency in enzymatic activity (3).

Because of the role of GSTs in inactivating endogenous end products formed as secondary metabolites during oxidative stress, we decided to compare the distribution of *GSTM1* and *GSTT1* polymorphisms in Egyptian patients with POAG, compared to the distribution in matching healthy controls so as to explore the possible association between different GST variants and the incidence of POAG.

2. Subjects and Methods

Patient and Control Selection:

This case–control study was comprised of 48 subjects; thirty two patients with POAG and sixteen disease-free controls. The studied subjects were recruited from the Research Institute of Ophthalmology and Fayoum University Teaching Hospital in the period from January 2009 to January 2010. A complete examination was done to detect other abnormalities, a full medical history was taken and a thorough pedigree analysis was conducted to determine consanguinity and other affected family members. An informed consent was obtained from all subjects after explanation of the nature of the study.

The sixteen age-matched healthy volunteers were selected as control group; they were non smokers and had neither diabetes nor any systemic illness. They had no family or personal history of glaucoma. They had clinical healthy appearing optic discs as demonstrated by indirect ophthalmoscope with a cup-to-disc ratio of 0.3 or lower, and glaucoma hemifield test (GHT) within normal limits. Mean intraocular pressure (IOP) level of the controls was 13.1 ± 3.0 mmHg (range 10 and 21 mmHg).

Diagnosis of POAG required all of the following: open angle: intraocular pressure higher than 21 mmHg ; characteristic optic changes (e.g., vertical cup -to-disc ratio higher than 0.6); thin or notched neuroretinal rim or disc hemorrhage ; and characteristic visual field changes. The mean IOP level was 24.2 ± 2.1 mm Hg (range 22 –28 mm Hg) at the time of diagnosis. Cup-to-disc ratios were between 0.6 and 0.9. Patients with a history of eye surgery before the diagnosis of glaucoma, or with evidence of secondary glaucoma, such as exfoliation, pigment dispersion or uveitis, were excluded. The patients with POAG who met the inclusion criteria were selected consecutively

Statistical Analysis:

Age of the patient and the control group was compared with student's *t* test. The chi-square test was applied to compare differences in gender between patients and controls. All values were represented as mean ± S.D. GSTT1 and GSTM1 genotypes were classified as either null (homozygous deletion) or non-deleted. Odds ratio (OR) with 95% confidence limits calculated by logistic regression was used to analyze the occurrence of frequencies of the GSTM1 and GSTT1 genotypes. P-values were two-tailed and a value of < 0.05 was considered statistically significant. All analyses were performed using SPSS v. 11.5 statistical analysis software.

Specimen Collection:

Two ml venous blood was collected by venapuncture in a tube containing ethylenediamine tetraacetate (EDTA) as an anticoagulant for DNA extraction.

Method:

Genomic DNA was extracted from peripheral venous blood using a salting out protocol, as described by Miller et al., 1988 (4). GSTM1 and GSTT1 genetic polymorphisms were evaluated using multiplex polymerase chain reaction (PCR) technique. The PCR primers were synthesized according to Arand et al., 1996, (5). Primers for GSTM1 were 5' – GAA CTC CCT GAA AAG CTAA AGC and 5' GTT GGG CTC AAA TAT ACG GTG G and for GSTT1 were 5' – TTC CTT ACT GGT CCT CAC ATC TC and 5' – TCA CCG GACAT GGC CAG CA. The ß – globin locus was used as an internal control to avoid false-negative readings. Primers for ß – globin were 5' – CAA CTT CAT CCA CGT TCA CC and 5' – GAA GAG CCA AGG ACA GGT AC. PCR reaction was carried out in a total volume of 25 ul containing 10 pmol of each primer, 2.5 mmol / L of MgCl2, 0.2 mmol/L of each deoxynucleotide triphosphate, 1 unit of Taq polymerase. And 100 ng of genomic DNA. Amplification was performed by initial denaturation at 94 ^{0} C for 5 minutes, followed by 30 cycles at 94 ^{0} C for 1 minute, 64 ^{0} C for 1 minute and 72 ^{0} C for 1 minute and a final extension of 72 ^{0} C for 7 minutes. The amplified products were identified by electrophoresis in a 1.5% agarose gel and stained with 0.5 ug/ml ethidium bromide. The product lengths were 215 bp, 480 bp, and 268 bp for GSTM1, GSTT1 and ß – globin, respectively. Absence of PCR product for GSTM1 or GSTT1 in the presence of the ß – globin band was indicative of a null genotype for GSTM1 or GSTT1. Individuals with one or two copies of the relevant gene were classified as a positive genotype and individuals with homozygous deletions as a null genotype.

3. Results:

Table (1) shows the demographic data for POAG patients and the control group. The mean age of the control group was 47.30 ± 11.60 years, 7 of them (43.5 %) were males and 9 of them (56.5 %) were females. The mean age of the POAG group was 51.03 ± 14.68 years, 15 of them (47.5 %) were males and 17 of them (53.5 %) were females. The groups were not statistically different with respect to age and gender ($p > 0.05$).

Table (2) shows the GST genotype distribution among all POAG patients and the control group. The frequencies of GSTT1 and GSTM1 – null genotypes were 25 % and 31.5 % respectively in the POAG patients. The proportion of GSTT1 null genotypes was higher in the POAG patients as compared to controls but with no significant difference (25% versus 6.25%) (OR: 0.183, 95% CI: 0.02–1.683). The proportion of GSTM1 null genotypes was higher in the control group as compared to the POAG group (62.5% versus 31.5%), $p<0.05$. The GSTM1 present genotype had an increased risk of developing POAG (OR: 4.681, 95% CI: 1.190-18.412).

Table 3 shows the association between GST genotype profile and the development of POAG. The data suggested a trend of decreasing risk of POAG with the combination of GSTM1 null genotype and GSTT1 positive genotype. (p: <0.05, OR: 4.700, 95% CI: 0.959-23.033).

Table (1) Demographic Data of the Study Groups

Study Groups	Control Group	POAG Group
Number of Subjects	16	32
Sex Male, n (%) Female, n (%)	 7/16 (43.5%) 9/16 (56.5%)	 15/32 (47.5 %) 17/32 (53.5%)
Age (years) Mean ± SD	 47.30 ± 11.60	 51.03 ± 14.68
Hypertension, n (%)	----	5/32 (17.5%)
Diabetes, n (%)	----	11/32 (34.5%)
Smoker, n (%)	----	10/32 (31.5%)
Consanguinity, n (%)	----	11/32 (34.5%)
Family history, n (%)	----	5/32 (17.5%)

POAG = primary open angle glaucoma

Table (2) Glutathione S Transferase (GST) Genotypes and the Risk of Developing Primary Open Angle Glaucoma (POAG).

Genotype	Control Group (N = 16)	POAG (N= 32)	OR	95% CI	P value

OR: odds ratio CI: Confidence interval from binary logistic regression
POAG: primary open angle glaucoma

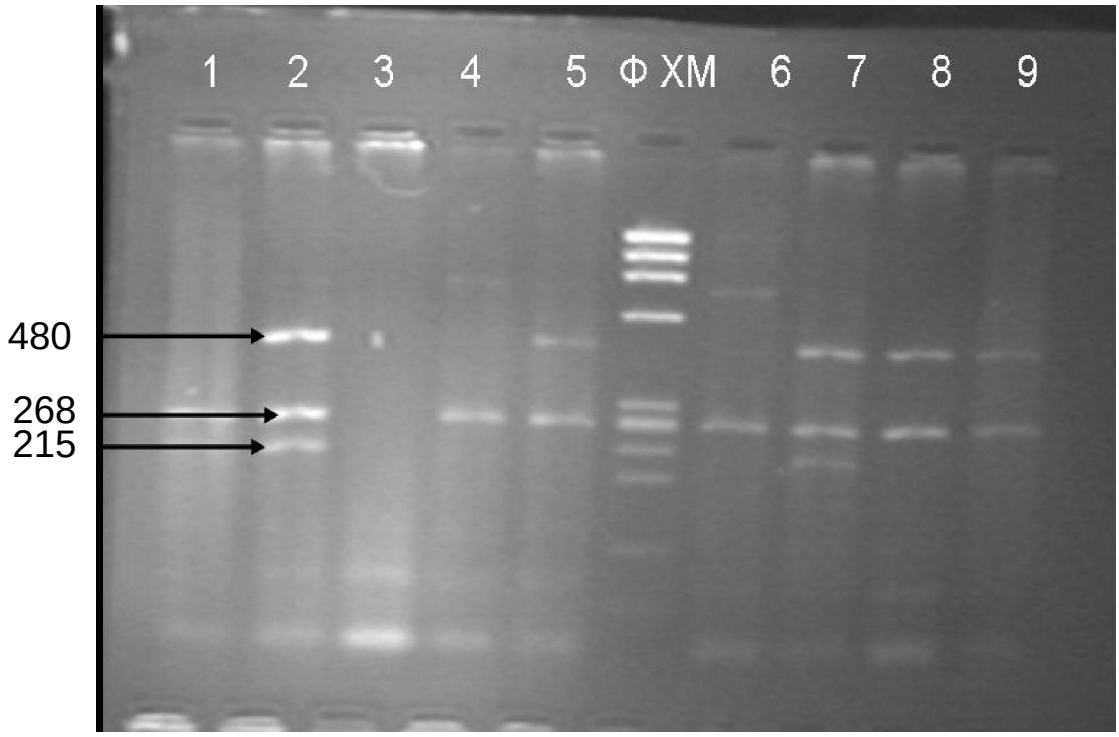
Figure (1): Amplified PCR products of the GSTT1 and GSTM1 gene polymorphism in the patients with primary open angle glaucoma (POAG). The product lengths were 215bp for GSTM1, 480bp for GSTT1 and 268bp for Beta globin. Lanes (1,2,4,5&7) heterozygous for GSTT1and GSTM1. Lanes (3&8) were homozygous deletion for GSTT1. Lane 6 was homozygous deletion for GSTM1 and then lane M was ØX marker.



Fig(2) 1.5% Agarose gel stained with ethidium bromide illustrating different band sizes in the control group Lane 1 homozygous deletion for GSTT1, Lanes (2 & 7) heterozygous for GSTT1 and GSTM1. Lanes (8&9) homozygous deletion for GSTM1.In Lane 3 there was no band due to failure in DNA extraction or in the PCR process.

4. Discussion:

The basic cause of glaucoma is largely unknown. First degree relatives of glaucoma cases have 8–10 times increased risk of developing the disease, making genetic predisposition a strong risk factor (2). Most genetic polymorphisms do not cause a recognizable change in the organism in which they occur. However, some either cause a disease or alter disease susceptibility. A large number of studies had attempted to show links between disease susceptibility and GST polymorphic variants. In addition, some studies have focused on the risk of association between the GST polymorphisms and ocular diseases including cataract, senile macular degeneration and glaucoma. In this study, we aimed to determine the effects of genetic polymorphisms of GSTM1 and GSTT1 on the risk of POAG in an Egyptian population.

As the pathogenic role of ROS in glaucoma has been suggested by many studies, cellular defense mechanisms alleviating the toxic manifestations of oxidative insult must have an important role in protection against the development of glaucoma. As GST enzymes are one of the important families of enzymes against oxidative stress, their genetic polymorphisms may alter the critical function of the enzymes in protecting against electrophiles and the products of oxidative stress in glaucoma (3).

The results presented in this study imply that defects in GST activity may well be risk factors for developing POAG. The exact mechanisms by which this occurs are not clear, which is not surprising given that the exact mechanisms of GST activity have yet to be elucidated.

Glaucoma patients in this study met strict criteria for POAG. Controls in this study were well matched to patients for age, sex and ethnicity.

In our study the GSTM1 positive genotype was significantly more common in the POAG group compared to the control group which shows a correlation between the GSTM1 positive genotype and the incidence of POAG. The results of our study are in concordance with a previous study by Unal et al, 2007 (3) in the Turkish population who found that GSTM1 positive genotype was a risk factor for developing POAG. Juronen et al, 2000 (6), who were the first to examine the possible association between the polymorphic GST genotypes and adult-onset POAG in an Estonian population, also found a similar relationship between the GSTM1 genotype and the incidence of POAG. They found that the

frequency of GSTM1 positive individuals was significantly higher in the glaucoma group compared with the control group. They suggested that the GSTM1 positive phenotype might be a genetic risk factor for the development of POAG. The same results were reported in the study by Khaled et al., 2008 (1) among an Arab population. We believe that several factors might explain the association between the GSTM1 positive genotype and POAG. Although GST enzymes catalyse detoxification reactions, they also take part in reactions that result in toxic products, which may cause structural changes in the proteins present in the trabecular meshwork and aqueous humor. This can lead to aggregation or modification of the proteins in the trabecular meshwork and promote the development of POAG (6). In addition, subjects with the GSTM1 null genotype have been shown to express fewer GST mu-class enzymes than subjects with the GSTM1 positive genotype (7 & 8). This may selectively cause stimulation of other non-toxic end products producing biotransformation enzyme systems to detoxify the substrates that were originally detoxified by the GST enzymes. Further evidence for involvement of GSTM in glaucoma comes from studies on autoimmunity. Yang et al., 2001 (9) showed that GST antigen was found in 52% of cases with glaucoma and in 20% of controls. The patients had significantly higher titres of anti-GST antibody compared with controls. Furthermore, the related retinal antigen belonged to the GST mu class (9). Thus, it may be hypothesized that people who express GSTM1 are at increased risk of developing autoantibodies against this protein, which is connected to an increased risk of developing glaucoma.

Contrary to our results Izzotti et al, 2004 (10) reported that POAG was associated with the GSTM1 null genotype in an Italian population. In addition, in another study by Yildirim et al., 2005 (2), the GSTM1 null genotype has been found to be associated with an increased incidence of POAG in a Turkish population. Another study by Jansson et al., 2003 (11) reported that there was no evidence of association between GSTM1 polymorphism and glaucoma in the Swedish population.

In our study the frequency of the GSTT1 null genotype was not statistically different between the POAG cases and the controls. The results of our study supports the study of Yildrim et al., 2005 (2) and the study by Izzotti et al., 2003 (10). Our results are contrary to Unal et al., 2007 (3) and Khaled et al., 2008 (1) where they reported that GSTT1 null genotype was significantly associated with POAG.

The combination of GSTM1 null genotype and GSTT1 positive genotype in our study showed a 4.7 fold decreased risk of glaucoma. It has been already suggested that combination of the GST polymorphisms rather than individual polymorphism make humans more susceptible to genotoxic insults (12).

Many factors might account for the difference in results between similar studies. Firstly, it may reflect the differences in the ethnic, genetic and environmental background of the populations studied. For instance, GSTT1 deficiency is less frequent than GSTM1 deficiency, but in both cases the frequency in the population varies between different ethnic groups (13). There may be differences even in the same population because of genetic and environmental factors. Secondly, the differences in the number of subjects studied in genetic researches may also lead to different outcomes. Thirdly, methodological issues should also be considered. For example, Jansson et al, 2003 (11), who reported that there was no evidence of association between GSTM1 and glaucoma in the Swedish population, used two methods for genotyping: multiplex PCR and pyrosequencing. In contrast, Juronen et al., 2000 (6), performed their analysis using only ELISA. The GST genes are located in complex genomic regions that could be affected by copy number variation and rearrangements, so different genotyping methods could give different results.

The present study suggests that the GSTM1 positive genotype may be a genetic risk factor for the development of POAG. The combination of GSTM1 null genotype and GSTT1 positive genotype decreased the risk of POAG. It has already been suggested that the combination of the GST polymorphisms rather than individual polymorphisms makes humans more susceptible to genotoxic insults.

In conclusion, this study is only one in a series of case-control studies of the possible association between glaucoma and GST. Some find evidence of GST positive genotypes being predisposing to glaucoma and others that GST positive genotypes being protective from glaucoma. These results imply that further studies of the precise mechanisms by which genetic polymorphism of metabolizing enzymes influences the nature history of glaucoma development are merited.

Abstract: Milk urea nitrogen (MUN) equilibrates with and is proportion to blood urea nitrogen. So, it is an excellent indicator of urea nitrogen status in dairy cows. The objective of this study was to determine the MUN during the summer (with a temperature range of 35-40°C) and winter (with a temperature range of 18-22°C) seasons. Forty hetero- parity lactating cattle twenty of each cows and buffaloes, at different stages of lactation were used to collect milk samples. All animals received the diet consisting of concentrate, fodder, and rice straw as 2:1:1 on DM basis. The fodder was berseem(*Trifolium alexandrium*) and rayana corn(*Zea mays mexicana*) in the winter and summer, respectively. The dietary crude protein was 11.38 and 8.97 % and the dietary gross energy was 3.86 and 3.83 Mcal/kg DM for the winter and summer diets, respectively. The results indicated, milk protein content was 3.06 and 3.18 % and MUN was 24.57 and 28.00 mg/dl for cows, while milk protein was 3.96 and 2.67 % and MUN was 19.60 and 28.03 mg/dl for buffaloes during the winter and summer seasons, respectively .This study revealed that the heat- summer significantly (P<.05) increased MUN of lactating buffaloes and this phenomenon needs further studies. [Journal of American Science 2010;6(12):382-384]. (ISSN: 1545-1003).

Keywords: dietary protein, cow, buffaloes, milk urea nitrogen.

1. Introduction

Milk urea nitrogen is the major single contributor to milk non – protein – nitrogen. Milk urea is derived primarily from blood urea which is produced from excess ruminal ammonia and amino acids catabolism in the liver (De Peters and Ferguson, 1992). In the mammary gland, urea diffuses into and out of the mammary gland cells, equilibrating with urea in the blood. Because of this process, milk urea nitrogen (MUN) equilibrates with and is proportional to blood urea nitrogen. This equilibration allows MUN to be an excellent indicator of urea nitrogen status in dairy cows (Roseler et al.1993)

Several studies have shown an association between MUN and fertility reporting that increasing MUN levels appear to be negatively related to dairy cow fertility and are associated with a lower risk of detectable pregnancy at herd checks (Butler et al .1996) and Rajala – Schultz et al . (2001) .

MUN concentrations provided a reliable estimate of dietary crude protein content, and provided an accurate prediction of urinary – nitrogen – excretion (Ciszuk and Gebregziabher, 1994, Kohn, et al. 1997, Jonker, et al. 1998, Froidmont, et al. 2003, Nousiamen, et al. 2004 and Huhtanen, et al .2008) .

Concerning the factors affecting the MUN in cattle, it could be reported that dietary concentrations of crude protein and the value of ruminal protein balance (PBV) were the main nutritional factors influencing MUN. It is of interest to define PBV by the difference between the ruminal degradable protein (RDP) supply and microbial requirements of RDP (Nousiamen, et al .2004 and Huhtanen et al .2008).

The purpose of this study was to determine the MUN concentrations for lactating cattle fed the summer and winter diets in Egypt.

2. Material and Methods

Forty hetero –parity lactating cattle, twenty of each cows and buffaloes, at different stages of lactation were used to collect milk samples during the winter and summer months, in the Atfih village of the Helwan governorate.

The day of winter months (January and February) was with a temperature range of 18-22°C, while it of the summer months (June and July) was with a temperature range of 35-40°C. All animals received the same diet consisting of concentrate, green fodder, and rice straw at 50:25:25 (on DM basis), respectively. The green fodder was berseem (*Trifolium alexandrium*) and rayana corn *(Zea mays mexicana*) for the winter and summer, respectively .Drinking water was available *ad. lib.* The chemical composition of feed ingredients is shown in Table 1. The analytical methods were performed according to A.O.AC., 1995.

All animals were milked individually twice daily .For each animal ,milk yield was daily recorded .Milk samples were taken biweekly and frozen at -18°C until analysis for the milk protein and urea by the infra red spectro photometry (Foss 120 Milko Scan, Foss Electric, Hillered, Denmark) according to A.O.A.C., 1995.

The dietary crude protein content, dietary gross energy, and the average of the daily milk yield are shown in Table 2. The gross energy was calculated by the equation suggested by Blaxter, 1968, as follows:
Gross energy (Mcal/ Kg DM)= 4.15 CF+ 5.65 CP + 9.40 EE + 4.15 NFE.
Dietary CF,CP,EE,and NFE were calculated on the basis of contents illustrated in Table 1.

Analysis of variance was conducted according to Snedecor and Cochran, (1982). Since, four replications of a 2 ×2 factorial arrangement of groups were used . The applied model was:

$y_{ijk} = \mu + A_i + D_j + W_k + (AD)_{ij} + E_{ijk}$

whereas, y_{ijk} is an observation, μ is a population mean, A_i is effect of animal type (cow or buffalo), D_j is an effect of diet (summer of winter diet), W_k is an effect of sampling time (biweekly), $(AD)_{ij}$ is an interaction effect between animal and diet, and E_{ijk} is a residual error. The differences among means were tested using Tukey test according to the same reference.

3. Results

Data of Table 2 clearly indicated that the CP content of the summer diet (8.97 %) decreased by 20 % of that for the winter diet (11.38 %). It is a reliable result attributing to having the winter fodder (berseem) CP (13.8 %) as three times of that of the summer fodder (rayana corn) (4.15 %).

Also, it could be reported that both diets contained equal calories. The winter diet had 3.86 Mcal/kg DM, and the summer diet had 3.83 Mcal/kg DM.

Milk protein and milk urea nitrogen

Data of Table (3) indicated that milk of lactating Baladi cows contained 3.06 and 3.18 g protein / 100 ml milk for cows fed the winter and summer diets, respectively. The data showed, also, the average of milk protein content was 3.96 and 2.67 % for buffaloes fed berseem and rayana corn during the winter and summer, respectively. Statistically, non significant difference (P > .05) was noticed between the cows averages, while a high significant variance (P<.05) was detected between the buffaloes means.

Obviously, the values of milk urea nitrogen (MUN) have taken the same trend of milk protein contents for lactating Baladi cows during the winter and summer (24.57 vs. 28.00 mg/ dl, respectively) .However, there was a high significant difference between the MUN averages (19.60 and 28.03 mg/ dl milk) of lactating buffaloes during the winter and summer, respectively.

Table 1. The chemical composition of feed ingredients

Ingredients	DM %	Contents on DM basis %				
		CF	CP	EE	NFE	Ash
Concentrate[1]	93.49	15.23	14.10	04.08	53.14	13.45
Berseem	18.00	27.40	13.80	02.60	42.04	14.16

Milk yield Kg/h/d	05.55	05.21	06.90	5.7

Table 3. Milk protein and milk urea nitrogen of lactating cattle fed winter and summer diets .

Item	Cows Diet		Buffaloes Diet		SE
	winter	summer	winter	summer	
Milk protein content %	3.06^{cb}	3.18^{ab}	3.96^{a}	2.67^{d}	0.47
Average %	3.12		3.31		0.095
Milk urea nitrogen (mg/dl)	24.57^{cb}	28.00^{ab}	19.60^{d}	28.03^{a}	3.45
Average (mg/dl)	26.28		23.82		1.23

a,b,c,d means in the same row with different superscripts differed significantly at (P ≤ 0.05) .

4. Discussion

First of the all, it could be reported that buffaloes not cows exposed to heat – stress when an ambient temperature ranged from 28 to 44°C (Ross Cockrill, 1974). In the present work, the summer was with a temperature range of 35-40°C.

The significance increasing of MUN for buffaloes may possibly be related to a change in the acid – base balance caused by the heat- stress. Also, MUN increasing in buffalo milk can reflect adverse effects on the buffalo fertility and on the nitrogen emission during the hot summer in Egypt.

5. Conclusion

The heat – summer had an adverse effect only on the lactating buffaloes not cows, whereas, their MUN significantly increased ($P \leq 0.05$) by ≈ 40% in the summer comparing with that in the winter.

6. Comment

In our opinion an additional research is needed to explain why MUN level was high for buffaloes in the summer and to decrease this level - may be - by the DCAD tool or by the urease inhibitors tool . DCAD means the dietary- cation – anion – difference .

In Vitro Propagation of *Tylophora indica*-Influence of Explanting Season, Growth Regulator Synergy, Culture Passage and Planting Substrate

Sulekha Rani, J S Rana*

Department of Bio & Nano Technology, Guru Jambheshwar University Of Science & Technology
Hisar, Haryana (India) -125001, jogenderrana@yahoo.co.uk

Abstract: An efficient protocol for rapid clonal propagation of an endangered medicinal plant, *Tylophora indica* (Burm. *f.*) Merrill through *in vitro* culture is described. High frequency bud break (85%) and multiple shoot formation were induced from nodal segments explanted between September through November and cultured on MS medium supplemented with 2.0mg/l BAP. Although callus- free multiple shoot formation was a function of cytokinin activity alone, faster bud break coupled with enhanced frequency of shoot development (95%) and internode elongation were dependent on the synergistic effect of GA_3(0.2mg/l). By repeated sub culturing of nodal segments harvested from the newly formed axenic shoots, prolific shoot cultures, free of proximal callusing, showing a high frequency multiplication rate were established within three months. The percentage shoot multiplication as well as the number of shoots per node attained the highest values (100%, 7 shoots/node) during the first two culture passages; beyond this there was a gradual decline in shoot bud differentiation. Rooting of the excised shoots from secondary or subsequent cultures was best induced on ½ strength MS medium containing 0.5 mg/l IBA. Vermi-compost was the most suitable planting substrate for hardening and its use ensured high frequency survival (96%) of regenerated plantlets prior to outdoor transfer. Regenerated plants get established in pots containing garden soil followed by their transfer to natural soil under full sun. The *in vitro* regenerated plants were uniform and identical in growth characteristics and morphology to the donor plants. [Journal of American Science 2010;6(12):385-392]. (ISSN: 1545-1003).

Keywords:*Tylophora indica,* medicinal plant, micropropagation, culture media, explants, growth regulators

1. Introduction

Biotechnology has provided several unconventional techniques for crop improvement and its use is revolutionizing traditional plant breeding methods. Plant propagation *via* organogenesis is one of the techniques used in plant tissue culture to obtain large number of plants, irrespective of season and with conservation of space and time. Organogenesis has been reported in many species and factors influencing it has also been studied intensively (Koroch *et al*., 2002; Thao *et al*., 2003; Yemets *et al*., 2003).

Tylophora indica (Burm *f.*) Merrill (Asclepiadaceae) is a threatened medicinal climber shrub native to the plain and hill forests of eastern and southern India up to an altitude of 900 m. The plant has been traditionally exploited by tribes in certain regions of India for the treatment of various ailments (Anonymous, *1976*). The plant contains several phenanthroindolizidine alkaloids (Gellert, *1982*) and pharmacological investigations have confirmed the anti-asthmatic effects of its leaf extracts (Shivpuri *et al*., *1972*). The major alkaloid present—tylophorine—has been reported to have immunosuppressive, anti-inflammatory (Gopalakrishnan *et a*l., *1980*) and anti-tumor (Donaldson *et al*., *1968*) properties. The powdered leaves, stems and roots also contain other minor alkaloids (Rao and Wilson, 1971) including tylophorinine, cryptopleurine, antofine and ficuseptine C which are pharmacologically active and anticancer tylophorinidine has also been isolated from the roots of three-year old plant (Mulchandani *et al*., 1971). Thus the plant is in great demand for the production of traditional and modern medicines.

Owing to large scale and uncontrolled exploitation of this natural resource in order to meet its ever-increasing demand in the pharmaceutical companies, wild stock of this plant species has been markedly depleted over past few years. Unfortunately, efforts for its replenishment by conventional cultivation have been handicapped, because it is not amenable to vegetative propagation through cuttings, and propagation through seeds would result in variation. Therefore, the application of a reliable, *in vitro* clonal propagation system would provide an alternative method of propagation to meet the pharmaceutical needs and for effective conservation of this precious plant species. It is advantageous for conservation of germplasm and multiplication of best genotypes with high alkaloid contents.

Although micro propagation of *T. indica* by axillary shoot induction and adventitious shoot production (Sharma and Chandel, *1992;* Faisal *et al.*,

2007) and callus-mediated somatic embryogenesis from leaf (Jayanthi and Mandal, *2001;* Chandrasekhar *et al*., 2006) and inter nodal (Thomas, *2006*) explants have been previously reported but these studies were of preliminary nature and more studies and further refinements of techniques were absolutely necessary. Hence in the present investigation we evaluate various factors influencing *in vitro* axillary shoot proliferation and resulted in an efficient and reproducible procedure for rapid clonal multiplication of this pharmaceutically important plant species.

2. Material and Methods

2.1 Plant material and sterilization

During different month's healthy nodal explant (0.4-0.6 cm) were collected from plants of *T. indica* from 5-year-old plants grown in the medicinal plant garden of CCS HAU, Hisar (Haryana, India). The explants were initially soaked in 5% (v/v) liquid detergent (Teepol, Reckitt and Colman, India) for 10 min, then washed under running tap water for 30 min and rinsed in distilled water. The explants were surface sterilized with 0.1% (w/v) $HgCl_2$ for 10 min and thoroughly rinsed four or five times with sterile double distilled water.

2.2 Culture media and conditions

The basal culture medium used for the present study was MS (Murashige and Skoog, 1962) medium supplement with 100mg/l (w/v) myo-inositol and 3% (w/v) sucrose. To this medium was further added 0.25-5.0 mg/l BAP(6-Benzylaminopurine) or Kin (Kinetin) and 0.1-0.5 mg/l GA_3 (Gibberellic acid)) was tested either individually or in combination with BAP or KIN. The pH of the media was adjusted to 5.8±0.1 before gelling it with 0.8% (w/v) agar (Merck, India) and dispensed in 25-ml aliquots into 200 ml screw capped glass jars (Excel glasses Ltd. Allepey, India) or 150 ml Erlenmeyer flasks (Borosil, India) prior to autoclaving at 121°C for 20 min. The surface disinfected explants were implanted horizontally on the culture medium (5 explants per jar or flask). Cultures in all experiments were incubated in a growth chamber maintained at 24±1°C and 60-65% relative humidity under a 16/8-h (light/dark) photoperiod with light supplied by cool-white fluorescent tubes (Philips, India) at an intensity of 48 µmol m^{-2} s^{-1}.

2.3 Multiplication of shoots

Primary shoots formed *in vitro* were isolated and sectioned into one-node pieces after removing the leaves. These nodal segments, each containing the axillary bud, were cultured on MS medium fortified with 2.0 mg/l BAP+0.2mg/l GA_3 for further multiplication. Subsequent subcultures were in the same medium at a periodic interval of 4 weeks.

2.4 Rooting of shoots

For root induction, the shoots (ca. 4-5 cm high) with three to five leaves were harvested from secondary cultures and transferred to ½ strength MS medium containing 2% (w/v) sucrose and 0.8% (w/v) agar. The medium were further supplemented with 0.5-2.0 mg/l IAA (Indole-3-Acetic Acid), NAA (α-Napthaleneacetic Acid) or IBA (Indole Butyric Acid). Data were recorded on the percentage of rooting, the mean number of roots per shoot and the root length after four weeks of transfer onto the rooting medium.

2.5 Acclimatization and transfer of plantlets to soil

Plantlets with well developed roots were removed from the culture medium and after washing the roots gently under running tap water; the plantlets were transferred to plastic pots containing autoclaved garden soil or artificial soil or vermi-compost moistened with autoclaved tap water. Two different types of artificial soil were examined viz. vermiculite and soilrite mix. The potted plantlets were maintained inside the plant growth chamber set at 25±1°C, 80–85% relative humidity under a 16/8-h (light/dark) photoperiod with light supplied by cool-white fluorescent tubes (Philips, India) at an intensity of 50 µmol m^{-2} s^{-1}. After 30 days the plantlets were transplanted to earthenware pots containing garden soil and kept under shade in green house for another 2 weeks before transferring to outdoors under full sun.

3. Results

3.1 Shoot Proliferation

Bud breakage and development of shoots from nodal explants was a function of cytokinin activity. The morphogenic responses of nodal explants collected during September through November to various concentrations of cytokinins are shown in Table 1. There was no sign of bud break even after 30 days on MS basal medium without any growth regulator supplement. Of the two cytokinins tested BAP was more effective than Kin in inducing bud break as well as multiple shoot formation. There was a linear correlation between the increase in concentration of BAP up to the optimum level (2.0 mg/l) and percentage shoot development. The number of shoots per explant also increased with increments in BAP concentrations up to the optimum level (2.0 mg/l). MS containing 2.0 mg/l BAP induced bud break in ca. 84% of the nodal explants. The explants cultured on the medium showed their first response by an initial enlargement of the existing axillary bud following bud break within 10-12 days. From each developing bud a single shoot elongated within 12-15 days. These shoots attained a height averaging 4.20 cm in 30 days bearing 4-6 leaves (Table 1). All

regenerated shoots were free from callus formation at their proximal ends. The percentage bud break and induction declined with the increase in BAP concentration beyond the optimal level (2.0 mg/l, Table 1). Above 2.0 mg/l, BAP caused a suppression of sprouting. Multiple shoots were induced from each sprouted bud at higher concentrations of BAP (5.0 mg/l), but these failed to elongate (Table 1). On the other hand, when MS containing a singular supplement of GA_3 was used, the sprouting period was lengthened, but percentage bud break and shoots/explant were substantially reduced. A medium of only 14-16% of the axillary buds sprouted within 18-20 days of culture on MS with an optimal concentration of GA_3 (0.2 mg/l) alone. Only one or two shoots were formed which attained a height averaging 4.5 cm within 30 days of culture. Concentrations of GA_3
higher than 0.2 mg/l had no promotive influence on percentage shoot development and on shoot number per explant. However, there was a progressive increase in shoot length at increasing GA_3 concentrations. A combination of optimal concentration of BAP (2.0 mg/l) and GA_3 (0.2 mg/l) in the culture medium not only induced a faster bud break (within 7 days) but also enhanced the frequency of bud break (ca. 95%). In addition a BAP-GA_3 coupling had a synergistic effect on multiple shoot formation (Fig. 1A) as well as on internode elongation (6.5 cm high shoots after 30 days, Table 1). The synergistic effect was also noticed in a combination of Kin (2.0 mg/l) and GA_3 (0.3 mg/l), but with respect to percentage shoot development, shoot number and shoot length it was inferior to BAP- GA_3 coupling.

3.2 Influence of Explanting Season on Culture Establishment

The shoot proliferation was greatly influenced by the month of the year during which the explants had been collected. Highest frequency bud break (95%) coupled with maximum number of shoots formed (four to five shoots/explant) occurred with nodal explants excised between September through November representing autumn season in India. Other explanting periods were comparatively less suitable (Table 2), the period between December to February (winter season) being the least responsive.

3.3 Nodal Multiplication of Axenic Shoots

Nodal segments excised from the primary, *in vitro* raised shoots cultured on MS containing 2.0 mg/l BAP plus 0.2 mg/l GA_3 produced six to eight shoots per node within 4 wk. By repeated subculturing of nodal segments from the newly formed axenic shoots harvested from each culture passage at every 4 week interval, prolific shoot cultures free from basal callusing was established within three months. The percentage shoot multiplication as well as the number of shoots per node attained the highest values (100%, 7 shoots/node) during the first two culture passages, beyond which there was a gradual decline in shoot bud differentiation (Fig.2).

3.4 Rooting of regenerated shoots

The *in vitro* regenerated shoots were transferred to ½ MS medium with or without auxins. Root formation from the basal cut portion of the shoots was observed one week after transfer to the rooting medium and rooting frequency gradually increased over time & reached a maximum after four weeks of culture. The presence of an auxin (IAA, IBA or NAA) at a low concentration in ½ MS medium was found to be more effective for rooting (Fig.1B) and the best rooting was achieved in the medium fortified with 0.5 mg/l IBA; fairly good shoot numbers (4.55 ± 0.40) and root lengths per shoot (5.25 ± 0.08) were obtained (Table 3).

3.5 Evaluation of Planting Substrates for Acclimatization Prior to Outdoor Transfer

Plantlets with five to six leaves and well developed roots were successfully hardened off in the environmentally controlled growth chamber in the selected planting substrates for 5 wk and eventually established in natural soil. Of the four different types of planting substrates used, the highest survival rates for the micropropagated plants were achieved in vermi-compost (96%, Fig.1C), followed in decreasing order by that in soilrite mix (82%), vermiculite (68%) and garden soil (66%) (Table 4). All plants survived following transfer from the vermi-compost to natural soil (Fig. 1D). There was no detectable variation among the potted plants with respect to morphological and growth characteristics.

Table 1. Morphogenic Response of Nodal Explants of *T. indica* to Different Concentrations of Cytokinins (KIN, BAP) and/or GA_3

Growth Regulator(mg/l)	Shoot Development (%)	Shoot Number/Explant	Shoot Length (cm)
0.0	-	-	-
KIN			
0.25	28.86 ± 1.76	1.80 ± 0.00	1.38 ± 0.07
0.5	43.52 ± 1.32	1.12 ± 0.12	1.82 ± 004

4. Discussions

Nodal segments containing axillary buds have quiescent or active meristems depending upon the physiological stage of the plant. These buds have the potential to develop into complete plantlets. In nature, these buds remain dormant for a specific period depending on the growth pattern of the plant. However, using tissue culture techniques, the rate of shoot multiplication can be greatly enhanced by performing axillary bud culture in a nutrient medium containing suitable combinations and concentrations of growth regulators.

In the present study, the stimulatory effect of a singular supplement of BAP on bud break and multiple shoot formation in *T.indica* was similar to that reported earlier in other medicinal species including *Chlorophytum borivilianum* (Purohit *et al*., 1994) and *Ocimum spp.* (Pattnaik & Chand, 1996 and Sahoo *et al*., 1997). Our observations on the suppression of sprouting at higher BAP concentrations were in accordance with those of Pattnaik & Chand (1996) in *O. americanum* and *O. sanctum*. In another species of *Ocimum viz. O. basilicum*, although the nodal segments required the presence of BAP at 1.0 mg/l at the initial stage of bud break their further growth and proliferation demanded transfer to a medium containing BAP at a relatively low concentration (0.25 mg/l) (Sahoo *et al*. ,1997).

Singular supplement of GA_3 at an optimal concentration (0.2 mg/l) had promotive influence on shoot development but in *Plumbago indica* (Nitsch & Nitsch, 1967) and *Duboisia myoporoides* (Kukreja & Mathur, 1985), GA_3 has been shown to suppress shoot bud differentiation. Thus the role of GA_3 in shoot induction and development in medicinal plant species remains controversial.

The synergistic effect of BA in combination with an auxin has been demonstrated in many medicinal plants from the Asclepiadaceae family, such as *Gymnema sylvestre* (Reddy *et al*., *1998*), *Holostemma annulare* (Sudha *et al*., *1998*), *Hemidesmus indicus* (Sreekumar *et al*., *2000*), *Holostemma ada-kodien* (Martin ,*2002*), *Leptadenia reticulata* (Arya *et al., 2003*), and *Ceropegia candelabrum* (Beena *et al., 2003*). In accordance with these reports, the present work studied the effect of low concentration of cytokinin (BAP and Kin) in combination with GA_3 on shoot induction efficiency and BAP- GA_3 coupling had shown a noticeable synergistic influence on multiple shoot formation. The promotive effect of GA_3 in combination with BAP on shoot bud induction was also reported earlier in other perennial medicinal herbs including *O. americanum* and *O. sanctum* (Pattnaik & Chand, 1996 and Sahoo *et al*., 1997) and *Tridax procumbens* (Sahoo & Chand, 1998).

Fluctuations in environmental factors in different seasons had a definite effect on shoot bud differentiation from explanted nodal segments in *T. indica* as similarly shown in other medicinal herbs including *Ocimum* species (Pattnaik & Chand 1996).

The multiplication rate of the shoot cultures derived from the nodal explants of the primary shoots was dependent on the number of the subsequent culture passages. The gradual decline in the frequency of shoot development and the number of the shoots per node was also reported earlier for *Tridax procumbens* (Sahoo & Chand, 1998), is indicative of a gradual loss of the morphogenic potential with advance in culture.

To optimize the rooting response of plantlets raised *in vitro*, different auxins(IAA,IBA and NAA) were tested at various concentrations. IBA was found to induce a strong rooting response. The success of IBA in promoting efficient root induction has been reported earlier in other species by Sreekumar *et a*l., *2000* ; Fracaro and Echeverrigaray, *2001;* Martin, *2002*; Beena *et al*,. 2003; Faisal *et al*., 2006 and also in *Tylophora indica* by Faisal *et al*., 2007.

The period of transition after transfer from lab to land is the most critical step in the tissue culture techniques as during the process of *in vitro* regeneration in the lab, plants are subjected to heterotrophic mode of nutrition and there is lack of adaptation or exposure to the outside environment. So, during the period of hardening care is taken over the physical (temperature, light intensities, relative humidity, air current, atmospheric CO_2) and other factors (mineral nutrition, pH etc.) employed. Another

important factor during acclimatization is the type of potting material used. In the present study, Vermi-compost was found to be most suitable planting substrate for hardening and its use ensured high frequency survival (96%) of regenerated plantlets prior to outdoor transfer.

In conclusion, the present investigation has resulted in a protocol, which could be used for ex situ conservation and true to type mass propagation of this shrub of immense pharmaceutical relevance.

Kinetic and Electrolytic Conductivity of C.I. Acid Orange 15 and C.I. Acid Red 97 dyes in Different Media

A.M. Gamal

Chemistry Department, Faculty of Science, Al-Azhar University (Girls), Nasr City, Cairo, Egypt

Abstract: The electrolytic conductivities for C.I. Acid Orange 15 and C.I. Acid Red 97 have been studied. The electrolytic conductivities have been analyzed by Deby HUckel-Onsager theory, The degree of ionization, α, Van't Hoffs factor, i, and thickness of ionic atmosphere, X^{-1}. were calculated. Each value diminishes with increasing dye concentration. The dye anion transport number, t, mobility's, μ were also computed at infinite dilution. The results provide evidence for the presence of interionic attraction and association. Furthermore the kinetics of two acid dyes has been studied using spectrophotometric and conductimetric methods. The former study was carried out at 28°C at different percentage of solvents. The results revealed that the reaction rate was govemed by a pseudo-first order. [Journal of American Science 2010;6(12):393-399]. (ISSN: 1545-1003).

Keywords : C.I. Acid Orange 15, C.I. Acid Red 97, solvents, electrolytic conductivity, spectrophotometry, kinetics.

1. Introduction

Since the environmental pollutions are increasing day-by-day, the need to reduce the imparities particularly in wastewaters of textile industry is important.

Effluents from the dyeing industry contain highly colored species, such wastes are not only aesthetically displeasing but also hinder light penetration and may in consequence disturbiological processes in water bodies. Dyes are toxic to some organisms and hence harmful to aquatic animals. The expanded uses of azo dyes have shown that some of them are highly carcinogenic. Therefore, removal of dyes before disposal of wastewater is necessary [1,2].

Acid dyes are so called as normally applied from acidic dye liquor. The good sunlight resistance of acid dyes wool textile materials is due to the electron stability of the acid dyes chromophore. This enables the acid dye molecule to resist the photochemical degradation which the ultraviolet rays of sunlight might cause [3]. Some of the dyes were found to have a remarkable mutaganicity, bearing similarities with some antibiotics [4].

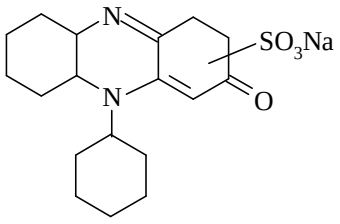
Also azo dye is an interesting and commercially important class compounds that are used for many years as acid-base and redox indicators, stains for bacteriological and histological investigations[5]. Conductivity measurements arc recommended for studying the behavior of dyes in aqueous solution, thus the variation of conductance with concentration in dilute solution provide powerful support for the presence of interionic attraction[6-9]. The mobility of dyes were investigated because its importance in nature and inverious technologies such as adsorption and measurement the drift velocity which can be used to obtain an expression for the ionic current density flowing through a solutions[10]. Mobility has proved to be an important property for providing an insight into the size, fractional coefficients [11] and it is successfully utilized for the control of precipitation.

Kinetic and calorimetric studies have been carried out to determine rate constants for the hydrolysis for some acid dyes at different media. The hydrolysis reactions were carried out in hemogenous media using acetone, dioxane the calorimetric data have been obtained using a sensitive rating-period calorimeter. The results indicate that, irrespective of whether the rate constants k are dependent on percentage of solvents. Taking into consideration both the kinetic and condutimetric data, it is suggested that, for the hydrolysis reaction [4].

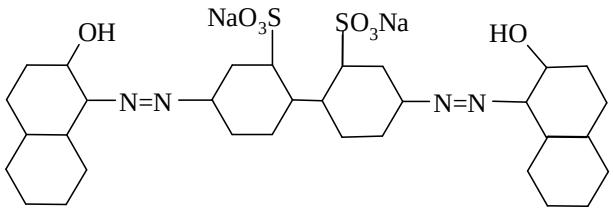
2. Experimental

Reagents

C.I. Acid Orange 15 and C.I. Acid Red 97 were provided by CIBA-GEIGY (Seitzerland), purified by recrystalization twice from 30% ethanol-water mixture and then dried under vacuum at 30°C. Solutions of different concentrations of the dye were prepared by dilution with triply distilled water from stock dye solution (1.0×10^{-2}M).



Mol. wt: 375.65 g/mol C.I. Acid Orange 15



Mol. wt.: 698:.04 g/mol, C.I. Acid Red 97, Fig. (1)

The organic solvents used were dioxiane and acetone being of analytical grade.

Apparatus and techniques

A perkin-Elmer lambda 3A. double beam spectrophotometer digital was used. It is a reading and recording instrument operating at the wave length range 190-900 nm (made in Germany).

The conductivity-meter type jenway 4010/REVC (made in United Kingdom) laboratory model with digital, supplied with dipping type conductivity cell with platinized electrodes was used. The cell constant 1.02 and the instrument were provided with a direct reading scale expressed in Siemens (ohm^{-1}).

The equivalent conductance and physical parameters such as, mobility, transport number and thickness of ionic atmosphere were described according to Robinson and Yadav[12].

Calculation:

In spectrophotometer measurements the kinetic study was carried out by mixing with the dye solution appropriate quantities with solvents. The absorbance was then recorded at the maximum wavelength ($\lambda_{max.}$ 410nm for C.I. Acid Orange 15 and $\lambda_{max.}$ 520 nm for C.I. Acid Red 97) every 2 mints till attaining equilibrium (constant reading) over a period of 120 mints. All the measurements were performed at 28°C (room temperature). The solubility of dye under different conditions was checked during 48 hours. The variation of the dye concentration with time at different percentage of solvents with varying polarity was found to fit a straight line of a pseudo-first order rate constant. From slope of these plots, the rate constant of the hydrolysis reaction was calculated using the relation[13].

$$k = \frac{1}{t} \ln \frac{a}{a-x} \qquad (1)$$

Where "k" is rate constant, "x" is the amount of the reactant used up after time "t" and "a" is the initial concentration of the reactant.

The conductimetric measurements the kinetic study of hydrolysis were carried out under the above conditions using time t_1 and t_2, for time intervals, L_1 and L_2 for the respective conductance, one for equation the (1) relation[13].

$$k = \frac{1}{(t_2 - t_1)} \ln \frac{a - L_1}{a - L_2} \qquad (2)$$

If (t_2-t_1) is a constant time interval, then

$$\frac{a - L_1}{a - L_2} = C \qquad (3)$$

where C is constant, rearranging eq. (3) are gets.

$L_1 = CL_2 - a(C-1)$ (4)

Thus, if L_1 is plotted against L_2, a straight line should be obtained with slope C. The logarithm of this value multiplied by $2.303/\Delta t$ gives k.

3. Results and Discussion:

I- Conductimetric study[14]

1-Specific Conductance

The specific conductance of aqueous solution for the mono sulphonic azo dye, C.I Acid Orange 15 at various concentration ranging from 1.0 - 9.0 x 10^{-4}g.eq.dm^{-3} and disulphonic azo dye C.I Acid Red 97 covering the concentration range 1.0-9.0x10^{-4} g.eq. dm^{-3} at different percentage of solvents were measured and collected in Figs (*2,3).* The values of the specific conductance for C.I. Acid Red 97 were high, which may be attributed to the presence of the disulphonic groups attached to the dye with high charge and the presence of more counter ions surrounded the ionisable groups. The plot of the specific conductance, as a function of the concentration for the two dyes at different percentage of solvents Figs (2,3) indicate that in very dilute solutions, specific conductance, increases sharply with increasing dye concentration. "This behaviour may be attributed to the ionization of dyes into sodium ion and dye anions.

$$RNa \longrightarrow R' + Na^+ \qquad (5)$$

$$R(Na)_2 \longrightarrow R' + 2Na^+ \qquad (6)$$

Due to the mutual affinity of ions of different signs surrounding the dye anion. A slight increase in, specific conductance, for monosulphonic and disulphonic azo dyes re-spectively may be attributed to an increase in entropy which arises from the melting of ice-berg" structure around the polar molecules.

Experimental data show that the specific conductance; decreases as the percentage of solvents increase Figs (2,3). This may be explained in terms of the increase in the effective degree of ionization with different percentage of solvents, or it may lower the restricting potential

for migration on raising the percentage of solvents. The specific conductance values can be represented by excellent straight line over the entire different percentage of solvents for each concentration

2-Equivalent conductance, A

The equivalent conductance; A for the investigated dyes in aqueous solutions at different percentage of solvents Figs (4,5) diminishes with increasing dye concentration which either due to the influence of the ionic atmosphere salvation of ions or decrease in mobility and partial dissociation of dyes[15]. The relation between equivalent conductance and square root of concentration is shown in Figs (4,5).

This behaviour may be due to the increase in viscosity [16] and degree of dye aggregates or hindering in the movement of the contour ions. Estimation of, A (equivalent conductance at infinite dilution) where a definite charged ion depends only on its nature and the inter ionic effect disappears. These done by extrapolation to zero concentration The .values of A at different percentage of solvents for the two dyes are to be found in Tables (1,2). These values increase with increasing percentage of solvents represents a high mobility of ions due to the increase in thermal energy and breaking of high number of hydrogen bond. The vibrational, rotational and translation energy also vary with percentage of solvents [17]. The limiting equivalent conductance of an ionic dye molecule λ_o^- is obtained by subtracting the limiting equivalent conductance of sodium ion, λ_o^+ at different percentage of solvents from the conductance at infinite dilution. The acquired values of λ_o at different percentage of solvents are given in Tables (1,2)

3-Van't Hoffs factors i, and thickens of ionic atmosphere,X^{-1}.

Van't Hoffs factors, i Tables (3,4) were computed from the relation i =α (v-l)+l where v is the number of ions and α degree of ionization at different concentrations and different percentage of solvents were estimated as discussed previously. The data in Tables (3,4) indicate those values of Van't Hoffs factors, i decrease with increasing dye concentration indicating incomplete ionization and repulsion between ionic species. This may be due to the decrease in thickness of ionic atmosphere, X^{-1} (Deby length).

To confirm this explanation calculation of, X^{-1} was obtained. The results in Tables (3,4) denoted that the values of X^{-1} decreases as the concentration of the dye increases, which confirms that dye molecules interact with each other and prefer to be in the aggregate form[18].

4- Mobility of dye anion and transport number.

Mobility μ_o is a most important characteristic of ions reflecting their specific participation in electrical conductance of an electrolyte. The mobility's of anionic dye molecule μo at different % of solvents were obtained from the relation μo = λo/zF. Tables (1,2) indicate that mobilities of C.I Acid Orange 15 anions are higher than C.I Red 97 since it has smaller molecular weight than the latter. Further, the lower mobility of C.I Acid Red 97 may be due to the presence of donor and acceptor function groups [19]. This is attributed to the disaggregation and change in the intermolecular bonding. The value of the transport numbers were calculating according to Yadav[12] and recorded in Tables (1,2). The fraction of the total current carried by dye anion is higher than the sodium ion and the values are almost equal at all solvents.

II- Spectrophotometric studies

1- Effect of concentration

The UV-visible spectra of solutions for C.I. Acid Orange 15 and C.I. Acid Red 97 in water were recorded at 28°C within the wavelength range 600 to 350 nm at different concentrations (1.0-9.0x10^{-4}g.eq. dm^{-3}). The spectra showed increase in absorbance on increasing the dye concentrations.

2- Effect of solvent

The spectra of C.I. Acid Orange 15 and C.I. Acid Red 97 in presence of solvents of varying polarities of dioxane (2.7), aetone (17.9). they dye exhibit similar band in the blue region in absence and presence of solvents. A slight-red shift was notices with different solvents polarity, which may be due to solute-solvent interactions.

3- Kinetic study

The kinetic data of the hydrolysis of dye in presence solvents, fitted pseudo-first order behaviour. This was accomplished by a computer program designed for linear and non linear least squares method, correlation coefficient (r=0.99- 1). The rate constant of hydrolysis k_{abs}., calculated from the slopes of straight lines are recorded in Table (5, 6) results revealed an increase in the rate constant with the increase of the water content of a given solvent system. This may be probably due to the increase of the free hydroxyl ion concentration. Since, it is known that the proton in water has the structure H^+ $(H_2O)_4$ may be left free OH^- in the medium[20].

4.Conclusions

- The specific conductance increase with concentration of dye increase and decrease in presence of solvent.
- The equivalent conductance decrease with concentration of dye increase and decrease in presence of solvents.
- The dye anion mobility and transport number decrease on solvents than H_2O and in monosulphonic large than disulphonic.
- The Van Hoff's factors i, and thickness of ionic atmosphere decrease on solvents than H_2O and in monosulphonic large than disulphonic .
- The rate constant obeys pesudo first-order reaction in kinetic and conductimentric.

Adsorption of Cadmium (II) and Mercury (II) onto Natural Adsorbent Rice Husk Ash (RHA) from Aqueous Solutions: Study in Single and Binary System

A.G. El-Said, N.A. Badawy, and S.E. Garamon

Chemistry Department. Faculty of Science, Al-Azhar University (Girls), Nasr City, Cairo, Egypt
asrargoma@yahoo.com

Abstract: The present study deals with the competitive adsorption of cadmium (Cd(II)) and mercury (Hg(II)) ions onto rice husk ash (RHA) from single component and binary systems. Equilibrium adsorption is affected by the initial pH (pH_0) of the solution. The $pH_0 \approx 6.0$ is found to be the optimum for the individual removal of Cd(II) and Hg(II) ions by RHA. The pH of the system, however, increases during the initial sorption process for about 60 min and, thereafter, it remains constant. The equilibrium adsorption data were obtained at different initial concentrations (C_0 = 10–100 mg/l), 6 h contact time, 25 °C temperature, RHA dosage of 10 g/l at pH_0 6. The single ion equilibrium adsorption data were fitted to the non-competitive Langmuir and Freundlich isotherm models. The Freundlich models represent the equilibrium data better than the Langmuir model in the studied initial metal concentration range (10–100 mg/l). The adsorption capacity of Cd(II) is higher than that for Hg(II) for the binary metal solutions and is in agreement with the single-component adsorption data. The equilibrium metal removal decreases with increasing concentrations of the other metal ion and the combined action of Hg(II) and Cd(II) ions on RHA is generally found to be antagonistic. Equilibrium isotherms for the binary adsorption of Cd(II) and Hg(II) ions onto RHA have been analyzed by using Langmuir and Freundlich models.. Desorption with various solvents showed that the nitric acid is the best solvent; the maximum elution being about 28.41 % for Cd(II) and about 31.53 for Hg(II).

1. Introduction:

Most of the metals are known to be toxic and half of these, including cadmium, chromium, copper, lead, mercury, nickel, selenium, silver and zinc, are released into the environment in quantities that pose a risk to human health [1].

Heavy metal contamination exist in aqueous waste streams from diverse industries such as metal plating, manufacturing, batteries, as well as agricultural sources where fertilizers and fungicidal sprays are intensively used. Cu, Zn, Hg, and Cd are harmful wastes produced by industry that pose a risk of contamination groundwater and other water resources. Heavy metals are not biodegradable and tend to accumulate in living organisms, causing various diseases and disorders [2-11]. For example, Cadmium causes serious renal damage, anemia, hypertension and itai-itai [2].

The reduction of the pollutant to an acceptable level is necessary when toxic metals are present in aquatic system [12]. Adsorption and ion exchange processes are the most useful methods to remove them. These methods explore the availability of different kinds of adsorbents associated with convenient procedures for obtaining high efficiency [13-14]. A large number of different adsorbent materials containing a variety of attached chemical functional groups have been reported for this purpose. For instance, activated carbon is the most popular material; however, its high cost restricts its large-scale use [15, 16].

In recent years, special attention has been focused on the use of natural adsorbents as an alternative to replace the conventional adsorbents, based on both the environmental and the economical points of view [15, 16]. Natural materials that are available in large quantities, or certain waste products from industrial or agricultural operations, may have potential as inexpensive sorbents. Due to their low cost, when these materials the end of their lifetime, they can be disposed of without expensive regeneration. The abundance and availability of agricultural by-products make them good sources of raw materials for natural sorbents. Rice husk is used as a fuel by a number of industries to produce steam, thus, conversing both energy and resources. During the burning of rice husk, the residue ash, called rice husk ash (RHA) is collected from the dust collection

device attached upstream to the stacks of rice husk – fired boilers and furnaces. RHA has good adsorptive properties and has been used previously for the adsorptive removal of metal ions [17] and dye [18], and filtration of arsenic from water [19]. RHA, obtained from heating rice husk at 300 C, has been shown to adsorb more gold – thiourea than the conventionally used activated carbon [20].

The main techniques used to remove heavy metal ions from aqueous streams include ion-exchange chromatography, reverse – osmosis, Chemical precipitation and adsorption. Adsorption as a waste water treatment process has aroused considerable interest during recent years [21].

Much of the work on the adsorption of heavy metal ions by various kinds of adsorbents has focused on the uptake of single metal ions. Since industrial effluents can contain several metals, it is necessary to study the simultaneous sorption of two or more metal ions. Since industrial effluent can contain several or more metal ions and also to quantify the interactive affect of one metal ion on the other. Thus, the study of adsorption of heavy metal ions from binary and ternary system is important. No information is available in literature for the simultaneous removal of mercury (II) and cadmium (II) ions by rice husk ash.

In this paper the work aims to study the feasibility of using RHA as an adsorbent for the single and binary removal of Hg (II) and Cd (II) metal ions from aqueous solution, study the effect of initial pH, determine the applicability of adsorption isotherm models (e.g. Langmiur and Freundlich) for single component, and gather experimental data on adsorption equilibrium for the binary system containing Hg (II) and Cd (II) ions.

2. Materials and Methods

2.1. Adsorbent and its characterization

The rice husk used was obtained from agriculture land in kaluobia governmental, Egypt. The rice husk were crushed and sieved with 30-mesh siever. Then, the husks were thoroughly washed distilled water to remove all dirt and were dried at 100 °C till constant weight. The dried husks were stored in desiccator until used. The rice husk ash (RHA) obtained from burning of rice husk in electrical oven at 700 °C for 1 hour. The rice husk ash was sieved [with Retsch Prufsieb / sieve, Type (ASTM), practical size was found to be 40% (0.18mm), 44 %(0.355mm) and 16% (0.855mm)] and stored with a desiccators until used. The particular chemical and physical properties are shown previous show the x-ray diffraction analysis, which indicates that the RHA mainly consist of amorphous materials [22].

2.2. Adsorbates

All the chemical used in the study were of analytical reagent (AR) grade, cadmium sulphate octahydrate ($3CdSO_4.8H_2O$), mercury chloride ($HgCl_2$), NaOH and HCl. Stock solution having concentrations of 1000mg/l of Cd(II) and Hg(II) were prepared by dissolving exact amount of $CdSO_4.8H_2O$ and $HgCl_2$ in double-distilled water (DDW), respectively.

2.3. Batch adsorption studies

For each experimental run, 100 ml aqueous solution of known concentration of Cd (II) and Hg (II) for the single and binary mixture of these components was taken in 250 ml conical flask containing fixed amount of RHA. These flasks were agitated at a constant shaking rate of 150 rpm in a temperature controlled orbital shaker(VOR TEX MVOR-03, Spain) maintained at 30°C .The initial pH (pH_0) of the adsorbate solution was adjusted using 1 N (36.5 g/l) HCl or 1 N (40 g/l) NaOH aqueous solution without any further adjustment during the sorption process. The samples were withdrawn from the flasks at different time intervals to check whether equilibrium has been attained. The sample were centrifuged using research centrifuge (Hettich, Germany, EBA-20 Baujahr E xin) at 5000 rpm for 5 min and the supernatant liquid was analyzed for residual concentration of metal ions using inductively coupled plasma .

2.4. Effect of initial pH (pH_0)

The effect of (pH_0) on the sorption was studied by adjusting the (pH_0) in the range of 2.0-8.0. In these experiments, the RHA loading was kept at 10 g/l of solution containing 100 mg/l each of Cd (II) and Hg (II) at 30 °C. The contact time (t) was kept as 6 hr for Cd (II) and Hg (II), since equilibrium was found to have been attained in 6 hr contact time for Cd (II) and Hg (II).

2.5. Adsorption isotherm experiments

For single metal-ion-RHA systems, initial metal ion concentration was varied from 10 to 100 mg/l. In binary metal ion mixture RHA systems, for each initial concentration of Cd(II) and Hg(II) solution : viz., 10,20,30,50 and 100 mg/l, the Cd(II) or Hg(II) concentration was varied in range of 10-100 mg/l (viz., 10, 20, 30, 50 and 100 mg/l). In all cases, the (pH_0) of solution was maintained at 6.0 for Cd (II) and Hg (II).

2.6. Desorption studies

For batch desorption experiments, a series of 250 ml Erlenmeyer flask containing 100 ml of DDW or aqueous solution of HCl, H_2SO_4, HNO_3 and

CH_3COOH of know concentration were conducted with metal-loaded RHA (1 g) at 30 °C the mixtures were agitated at 150 rpm for 6 hr in the orbital shaker. Thereafter, the mixture was centrifuged and the supernatant was analyzed for metal ion released into the solvent.

2.7. Analysis of cadmium (II)and mercury (II)

The concentration of Cd (II) and Hg (II) and in the sample was determined by Inductively Coupled Plasma, (ICAP), 6500 DUO, Thermo Scientific England. 1000 mg/l multi-element certified standard solution, Merck, Germany was used as stock solution for instrument standardization.

Percentage metal ion Removal,

$$(\%) = 100\ (Ci - Ce)/Ci \quad (1)$$

where Ci and Ce are the initial and equilibrium metal ion concentrations, respectively.

Amount of adsorbed metal ions per g of solid,

$$qe(mg/g) = V(Ci - Ce)/m \quad (2)$$

where, Ci is the initial metal concentration in solution (mg/l) V is the volume (l) and m is the mass of adsorbent (mg)[23].

3. Results and Discussion:

3.1 Effect of initial pH (pH_o)

The pH of the solution affects on the surface charge of the adsorbents as well as the degree of ionization and speciation of different pollutants [24]. It is known that metal species [M(II)= Cd(II), Hg(II)] are present in deionized water in the form of M^{+2}, $M(OH)_2$, M(OH) (S), etc.[25].

It is obvious that the adsorption of M (II) must be higher in alkaline solution. But at higher pH, the precipitation as $M(OH)_2$ (S) plays the main role in removing the M (II) ions. Therefore, all the experiments were conducted at $pH \leq 8.0$.

The influence of the pH of metal ion solution on the extent of adsorption of Cd (II), and Hg (II) ions onto RHA is shown in Fig. 1. The adsorption of metal ions increases with an increase in pH. Up to pH 4, the increase in adsorption is gradual, which however, increase drastically at $pH > 4$. At higher $pH \geq 6.0$, Cd (II) and Hg (II) ions adsorption become nearly constant. During the initial stage of the sorption process up to 30 min., the pH of the solution was found to rise sharply. Thereafter, the pH of the solution remained invariant with time.

. Fig. 1. Shows the final pH values (pH_f) as a function of pH,the pH_f values are higher than the pH_o values for $pH < 7.5$ for Co =100 mg/l. Although the metal removal increases sharply with an increase in pH_o, the pH_f values were almost constant for $6 \leq pH_o \leq 7.5$. The pH_f values, are therefore, considered to indicate the equilibrium pH values [26]. Surface charge developed at low pH_o is not favorable to adsorption of the RHA. Besides, a higher concentration of H^+ in the solution competes with Cd (II) and Hg (II). However, it was found that with pH_o 6.0, the pH_o of the solution rises sharply and stabilizes at pH 7.2 and 7.6 for Hg (II) and Cd (II) respectively. Therefore, it may be concluded that the H^+ in the solution competes with Hg (II) and Cd (II) for the adsorption sites of RHA at pH_o 6.0. Also, the rise in pH for Cd-RHA system is lower than that of Hg-RHA system. It means that the amount of H^+ adsorption is more than that of Cd (II) and Hg (II) ions. The lower adsorption value observed for Hg (II) it can also be presumably due to the stronger interaction of Hg (II) with Cl^- species such as $HgCl^+$ and $HgCl_2$ in solution phase while for Cd (II) this interaction is negligible. The effectiveness of the process can be expressed by the quantity adsorbed (q_e (mg/g)) versus pH_o plot for the cations involved, as represented in Fig. 2.

The metallic ion (Cd) could be suffering hydrolysis, starting at pH higher than 6, forming Cd $(OH)^+$ species, which promotes a reduction of the adsorption capacity, due to the diminution of the formal charge of the metallic ion. In case of Hg (II) in solution, these ions are extensively hydrolyzed and the specie formed is HgO, and require acidification to prevent the formation of poly nuclear hydroxyl-bridged species or the precipitation of basic salts [27]. This specie does not present electrostatic interaction with active site of the RHA.

3.2 Effect of adsorbent dosage (m)

The effect of adsorbent dosage on the uptake of cadmium (II) and mercury (II) ions onto rice husk ash (RHA) was studied and is shown in Fig. 3. This figure reveals that the removal of metal ions increases with an increase in the adsorbent dosage from 1 to 10 g/l. The removal remains unchanged above 10 g/l of rice husk ash; dosage can be attributed to the larger availability of greater surface area and more adsorption sites. At $m < 7$ g/l, the adsorbent surface becomes saturated with metal ions and the residual metal ion concentration in the solution is large. At $m > 7$ g/l, the incremental metal ions removal becomes very low, and at m = 10 g/l, the removal efficiency becomes almost constant [23]. Maximum removal of metal ions at C_o = 100 mg/l was found to be (53.68 %) for Cd (II) and (35.06 %) for Hg (II).

3.3 Effect of initial metal ion concentration (C_o)

There are various possible interaction effects between different species in solution and, in particular, potential interactions on the surface depending on the adsorption mechanism. Factors that

affect the binding sites (e.g. functional groups, structures, surface properties, etc.), the properties of the adsorbates (e.g. concentration, ionic nature or standard redox potential, etc.) and the solution chemistry (e.g. pH, ionic strength, etc.). In the context of adsorption, a number of properties have been suggested for use in the ordering of affinity rank, including ionic radius and solubility product constant as hydroxides [28], puling electro negativity and standard reduction potential [29], first hydrolysis constant [30] . The properties may play an important role in metal ion adsorbent interaction, but can only partly explain high- or low-adsorption capacities.

The atomic weight of Hg(II) is highest as compared to Cd (II), and the ionic radius of Hg(II) is highest (1.02 A^o) as compared to Cd(II) (0.96 A^o). Both the tested adsorbent showed higher adsorption capacity for Cd (II) ions as compared to Hg (II).

However, the adsorption order is found to be in the order of increasing molecular weight and ionic radius, e.g. Cd(II) > Hg(II)..

The increase in C_o also enhances the interaction between the metal ions in the aqueous phase and the adsorbents. Therefore, an increase in the C_o of the metal ions enhances the adsorption uptake of Cd (II) and Hg (II) and ions onto RHA as shown in Fig 4.

3.4 Effect of contact time (t)

At pH 6, aqueous metal ion solution with C_o = 100 mg/l were kept in contact with the RHA for 24 hr. The residual concentrations at 6 hr. Contact time were found to be higher by a maximum of ≈ 1 % than those obtained after 24 hr. Contact time, a steady state approximation was assumed and equilibrium situation was accepted. Accordingly all the batch experiments were conducted with a contact time of 6 hr. under vigorous shaking conditions. Fig. 5. Show the effect of (t) on the uptake of Cd (II), and Hg (II) ions from aqueous metal ion solutions. The rate of metal ion removal is found to be very rapid during the initial 15 min and there fore, the rate of metal ion removal decreases. No significant change in metal ion removal is observed after about 120 min. During the initial stage of sorption, a large number of vacant surface sites are available for adsorption. After laps of some time, the remaining vacant surface sites are difficult to be occupied due to repulsive forces between the solute molecules adsorbed on the solid surface and the bulk phase. Besides, the metal ions are adsorbed into the meso-pores that get almost saturated with metal ions during the initial stage of adsorption. Thereafter, the metal ions have to traverse farther and deeper into the pores encountering much larger resistance. This results in the slowing down of the adsorption during the later period of adsorption. Da Fonseca et al; [31] have reported 12 hr. Equilibrium contact time for removal of Cd (II) by vermiculiteat.

3.5. Single and binary adsorption of cadmium (II), and mercury (II) ions

Binary adsorption studies are particularly important for assessing the degree of interference posed by common metal ions in adsorptive treatment of wastewaters.

The equilibrium uptakes and the adsorption yield obtained for single component (Cd (II) and Hg (II)) solution at pH_o are shown in Fig (6,7). As seen from the figures, an increase in the initial metal concentration up to 100 mg/l increases the equilibrium uptake and decreases the adsorption yield of both the components. When the initial ion concentration increase from 10 to 100 mg/l, the loading capacity of RHA increases from 0.875 to 5.316 mg/g for Cd (II)and from 0.807 to 3.401 for Hg (II). The initial concentration provides the necessary driving forces to over come the resistance to the mass transfer of Cd (II) and Hg (II) ions between the aqueous and the RHA. The increase in initial concentration also enhances the interaction between the metal ions in the aqueous phase and the RHA [32]. Therefore, an increase in initial concentration of metal ions enhances the adsorption uptake of the Cd (II) and Hg (II) ions. Also, it is observed that the adsorption capacity of RHA for Cd (II) is greater than that for Hg (II). Binary component adsorption systems were prepared by solubilizing a combination of either Cd (II)-Hg (II), with presence of each metal [Cd (II)/ Hg (II)]. Binary adsorption of metal ions was conducted with the same operating conditions as for mono-component adsorption in terms of volume (100 ml.), RHA weight (1 g.), agitation time (2 hr.) and agitation rate (150 rpm). Initial individual concentration of three metal ions in binary system ranged from 10 to 100 mg/l.

The simultaneous adsorption of Cd (II) and Hg (II) ions from binary mixtures also investigated at pH_o 6.0 . In the first stage of adsorption studies, while initial Hg (II) concentration was changed from 0 to 100 mg/l, at each initial Cd (II) ion concentration of 0, 10, 20, 30, 50, and 100 mg/l. The non –linear adsorption isotherms of Hg (II) ions in the absence and presence of increasing concentration of Cd (II) ions are shown in Fig 7. It is seen that the equilibrium Hg(II) uptake increase with an increase in the initial Hg(II) concentration up to 100 mg/l at all Cd(II) ion concentration. The equilibrium uptake of Hg (II) decrease continuously with increasing Cd (II) ion concentration. The individual and total adsorption equilibrium uptakes and yields of Hg (II) and Cd (II) ions on RHA as obtained at different Hg (II)

concentration in the absence of Cd (II) or the presence of Cd (II) ions with increasing concentration are also listed in Table 1.

In general, an increasing in Cd (II) ion concentration decreases the individual adsorption yield of Hg (II) and total adsorption yield for each experiment run. The results also show that the equilibrium uptake of Hg (II) ion decreases with increasing initial Cd (II) ion concentration. At 100 mg/l initial Hg (II) concentration, without Cd (II) ions and in the presence of 100 mg/l Cd (II) ion concentration, adsorbed Hg (II) quantities at equilibrium are found to be 3.401 and 1.806 mg/g, respectively. Fig. (6) depicts the variations in the uptake of Cd (II) at equilibrium with increasing initial Cd (II) concentration (from 0 to 100 mg/l) at a constant initial Hg (II) concentration (10-100 mg/l) at pH_o 6.0. Similar adsorption pattern are observed both in the individual –Cd(II) ion and binary Cd(II)-Hg(II) ion systems; Cd(II) ion equilibrium uptake increase with an increase in the initial Cd(II) concentration up to 100 mg/l. Increase in Hg(II) concentration decrease the equilibrium uptake of Cd(II) ions. With no Hg (II) present in the solution, equilibrium uptake of Cd (II) ion is found to be 5.316 mg/g at 100 mg/l initial Cd (II) ion concentration. When the Hg (II) concentration is kept at 100 mg/l at the same initial Cd (II) ion concentration, the equilibrium Cd (II) uptake decreases to 2.248 mg/g.

In general, multi-component adsorbates – adsorbents generally exhibit three possible types of behavior:

- Synergism (the effect of the mixture is greater than that the single components in the mixture).
- Antagonism (the effect of the mixture is less than that of each of the components in the mixture).
- Non-interaction (the mixture has no effect on the adsorption of each of the adsorbates in the mixture), [33].

The combined effect of the binary mixture of Cd (II) and Hg (II) seems to be antagonistic. To analyze the antagonistic sorption behavior of the two components, the adsorption yield of single and binary component systems were also compared. The experimental equilibrium sorption data obtained for the single component and the binary systems indicate that the adsorption capacity of RHA for Hg (II) is, in general, less than that of Cd (II). Kandah et al, Singh and Yenkie, Flogeac et al, and Sharma et al, has reported similar results using waste ship manure waste, granular activated carbon columns, franc soil and shelled moringa oleifera seeds, respectively, as adsorbents [34-37].

3.6. Single-component adsorption isotherm models

The individual Langmiur and Freundlish adsorption isotherm parameters [23] for Cd(II) and Hg(II) at pH_o 6.0 obtained from the fitting of experimental data are listed in Table (2) along with the regression coefficients, R^2 . The R^2 values are closer to unity for the Freundlish models in comparison to that for Langmiur model. Therefore, the equilibrium adsorption data of Cd(II) and Hg (II) –RHA can be represented more appropriately by the Freundlish models in the studied concentration range.

Langmiur: $q_e = q_m K_L C_e / 1 + K_L C_e$ (3)

Freundlich: $qe = K_F C_e^{1/n}$ (4)

The data in Table (2) also indicate that the amount of Cd(II) ions per unit weight of RHA for the complete monolayer surface coverage was higher than that of Hg(II). A large value of K_L also implies the strong affinity of Cd(II) ions to RHA. K_F and n, the single-component Freundlish constants, indicate the adsorption capacity and adsorption intensity, respectively.. It is found from Table (2) that the RHA shows greater heterogeneity for Cd(II) than that for Hg(II) ions. Since $1/n < 1$; both the Cd (II) and Hg (II) ions are favorably adsorbed by RHA. The magnitude of K_F also showed the higher uptake of Cd(II) that than of Hg(II) ions by RHA at pH_o 6.0. The comparison of the single component experimental equilibrium adsorption. Uptake and the predicted uptake (q_e) from the Langmiur and Freundlich models for Cd(II) and Hg(II) onto RHA at pH_o 6.0 are presented in Table (3) .

3.7. Binary- component adsorption isotherm models

Adsorption behaviors of metal ions in binary system have been modeled using Langmiur and Freundlich equation as presented in Table (3). As depicted in the Figures (6,7) for each metal ion, co-adsorption induces a decrease in equilibrium adsorption capacity but the percentage depends on co-metal ion present in the system . Adsorption behavior of metal ions in binary system was modeled using Langmiur and Freundlich isotherm equation as predicted in mono-component system. Values of Langmiur and Freundlich parameter for each metal ion of binary system, that is, Cd(II) + Hg(II), and their respective determination coefficient R^2 value are presented in Table (4).

3.8. Desorption study and disposal of spent RHA

The regeneration of the adsorbent and/or disposal of the adsorbate-loaded adsorbent (or spent adsorbent) is very important. For the desorption experiments, several solvents (acids and bases) have been used. Batch desorption experiments were carried out and the desorption efficiencies are compared in Fig 8 .Acetic acid showed the maximum desorption efficiency of 17.53 % for cadmium (II)

and 24.58 % for mercury (II). On the other hand, mineral acids, HCl, H_2SO_4, and HNO_3 showed almost equal but higher recovery efficiency (≈ 31.5 %) for Hg (II). However, for Cd (II), H_2SO_4 proved to be the best. Hydrogen ions released from the acids replace metal cations on the RHA. Overall, any of the mineral acids can be selected as the optimal eluting agent for the system studied, however, the desorption efficiency is not very significant. Several authors have demonstrated that the sorption process of trace metals is not completely reversible. Several explanations have been proposed for such observations, including diffusion of trace metals within oxide particles or into micro-pores [38-40], precipitation [41], incorporation of metals into oxides [42], and re-adsorption [43]. For the present study, it seems that the chemisorptive adsorption of metal ions onto RHA hinders the desorption of metal ions from the spent RHA.

Table 1. Comparison of individual and total adsorption equilibrium uptake and yields found at different mercury (II) concentrations at varying concentration of cadmium(II) ions onto rice hush ash.

4. Conclusion

The present study shows that the rice husk ash is an effective adsorbent for the removal of Cd(II) and Hg(II) metal ions from aqueous solution. Maximum sorption for both mercury (II) and cadmium (II) metal ions was found to occur at pH_o 6.0. Higher percentage of metal ion removal was possible provided that the initial adsorbate concentration in the solution was low. Frendlich isotherm show very good fits with experimental single component adsorption equilibrium data. The. affinity of rice husk ash for cadmium (II) ions was greater than that for mercury (II), for both single component and the binary solutions under similar experimental conditions**.**

Impact of Gibberellic Acid Enhancing Treatments on Shortening Time to Budding of Citrus Nursery Stocks

HODA, M.MOHAMED; ABD EL-RAHMAN, G.F. and ABD EL-RAHEEM, M.E.

Horticultural institute, Agricultural Research Center, GIza, Egypt.

Abstract: Screen house experiment was conducted to study the application of gibberellic acid (GA_3) at different concentrations on budding shortening time of Volkamer lemon (*C.Volkameriana* Ten & Pasq) and Sour orange (*C.aurantium L.)* rootstocks in two seasons (2008-2009). Shortening the period to reach suitable diameter for budding seedling would benefit nurserymen by reducing various production inputs and their costs. The results indicated that, the highest success rate of suitable seedlings for budding was in mid-July. This time led to shortening the period for budding about 8 months, whereas, resulting seedlings could be budded because their stem diameter reached of a pencil size (5.4 mm) or larger. Also, this study revealed that, Volkamer lemon rootstock was superior as compared to sour orange rootstock in terms of vegetative growth, root distribution, leaf mineral content and percent of suitable seedlings for budding, while leaves of sour orange contained higher chlorophyll and total carbohydrate. It could be recommended to use T_5 (Soaked seeds and seedling treated with GA_3 at 200 ppm) for giving the best vegetative growth and suitable seedlings for budding in mid July. [Journal of American Science 2010;6(12):410-422]. (ISSN: 1545-1003).

Keywords: Screen house; gibberellic acid (GA_3); lemon; vegetative growth

1. Introduction

Citrus seedlings are normally used as rootstocks for the more desirable varieties; Citrus seed germination is usually slow and erratic. A number of reasons can contributed to the slow germination of citrus seeds, e.g. presence of growth inhibitors and physical resistance of seed coat to radical protrusion (Cohen, 1956). There is considerable evidence that gibberellins may promote the germination of various seeds in different ways. Several workers reported that gibberellic acid (GA) increases either germination rates (i.e. the rapidity of germination) for instance in Sweet orange (Burns and Coggins, 1969), Cleopatra mandarin and Sour orange (Rawash, *et al*, 1980). Also, a concentration of 500 ppm has been reported as having improved the germination of sweet lime (*C.Limettoides Tan.*) (Achituv and Mendal, 1973) , as well as 1000 ppm that of Sweet orange (Burns and Coggins, 1969). Moreover, 250ppm of GA, improve germination (Though not significant) on Trifoliate orange rootstock (Suzuki and Konakahara, 1985). The time required to grow citrus seedlings to a suitable size for budding may be as long as 1 or 2 years, therefore, shortening this time is considered very important.

Application of gibberellic acid (GA) to plants influences on growth vigor. Increased plant height (Misra, *et al*, 1982) on Malta common seedlings (*Citrus Sinensis*), (Suzuki and Konakahara, 1985) on Trifoliate orange seedlings, (Mehouochi, *et al*, 1996) on Carrizo Citrange rootstock , internode length, (Monselise and Halevy, 1962) and (Eshghi and Tafazoli, 2007) on citrus seedlings and stem diameter (Ismael and Young, 1982) on Sour orange seedlings have been reported.

Also, spray of GA_3 on citrus seedlings decreased chlorophyll content of leaves on Sweet lime (Monselise and Halevy, 1962), moreover, (Mauk, *et al*, 2004) showed that spray of Sour orange and Trifoliate orange seedlings with both BA and GA_3 decreased chlorophyll (a,b) . Concerning the effect of spray GA_3 on citrus seedlings on root system, (Monselise and Halevy, 1962) indicated that dry weight of leaves and roots were decreased on sweet lime seedlings sprayed with gibberellic acid, also, GA_3 decreased root tip width and reduced all parameters related to radial expansion (Tadeo, *et al.*, 1997).

Regarding the effect of GA_3 on total carbohydrates of leaves, the action of GA_3 in stimulating growth is mediated by an accumulation of sugars in shoots and consequently an increase in carbon supply (Mehouachi *et al.*, 1996) on "Carrizo" Citrange rootstock seedlings, (Miyamoto, *et al*, 1993) on Pea seedlings and (Mostafa and Baninasab, 2008) on two almond rootstock seedling (*Prunus amygdaluw and P.Webbii).* Respecting, the effect of application of GA_3 on leaf mineral content, (Monge *et al*, 1994) studied that foliar sprays of 1000 mg L-1 GA_3 to adult peach trees and found that leaves had a significantly lower concentration of N and Ca and Mn and slightly greater concentration of K.

This study aims to assess effect GA3 at different concentrations on budding shortening period

of some citrus rootstocks (Sour orange and Volkamer lemon) to be benefit for nurserymen by reducing various production inputs and their costs.

2. Materials and Methods

The present study was carried out during 2007/2008 and 2008/2009 seasons to investigate the effect of different concentrations of gibberellins on budding shortening period to of two citrus rootstocks e.g. Sour orange (*C.aurantium)* and Volkamer lemon (*C.Volkameriana*) in Screen house in the experimental farm of the Horticulture Research Institute, Giza, Egypt.

Mature fruits of citrus rootstocks were collected. Freshly extracted seeds were shade dried and treated with Rizolex-T ® 50 % WP as a fungside and stored in 5°C tell planting time (mid April), some seeds (300 seeds for rootstock each) were soaked in GA_3 at 750 ppm for 24 h. before planting and other untreated (control). The time limit for germination was after 23 days from planting for Volkamer lemon and after 30 days from planting for sour orange. At the end of September for each season (2008 and 2009) experimental seedling rootstocks were individually planted in plastic black bags (17 x 30 cm) filled with (25% peat-moss +75% sandy soil) in the screen house and were routinely irrigated whenever it is needed. Moreover, ammonium sulfate (20.6 %) solution (1.0 gm / L) was added weekly as liquid fertilizer with tap water. Also Greenzit* (* Ciba- Geigy , Basel , Switzerland, a foliar nutrient solution) was sprayed fortnightly at 1 ml / L were applied to all seedlings under study.

All seedlings were topping (cut their stem top about 5 cm) when stem length reached in about 55 cm and stem diameter >3.00 mm. ,and all lateral shoots removal when they were growing (Suckering process) .Some seedlings were foliar spray of GA_3 at 200 ppm and other at 400 ppm after one month from transplanting in plastic bags. In foliar spray treatments, each treatment contained a wetting agent (0.1% triton B) and was applied by spraying each seedling to run-off. Seedlings were budded with "Valencia" orange (*Citrus Sinensis* L. Osbeck) using T-budding method at a height of 30-35 cm above soil surface in the pot at three time intervals (mid June, mid July and mid August) according for stem diameter of seedlings in both seasons of the study.

Treatments: Treatments were carried out for 2 rootstocks (Sour orange, Volkamer lemon) under study as follow:

1- T_1 - Control (untreated seeds and seedlings by GA_3).
2- T_2 - Seedlings were treated by GA_3 at 200 ppm from untreated seeds.
3- T_3 - Seedlings were treated by GA_3 at 400 ppm from untreated seeds.
4- T_4 - Seedlings were untreated and soaked seeds by gibberellins (750 ppm).
5- T_5 - Seedlings were treated by GA_3 at 200 ppm and soaked seeds by gibberellins (750 ppm).
6- T_6 - Seedlings were treated by GA_3 at 400 ppm and soaked seeds by gibberellins (750 ppm).

The GA_3 source was Berelex 10% w/w powder formulation, a trademark of imperial Chemical Industries Pic Frenhurst, Haselemer Surney, England.

Measurements:

1- Germination percentage: Percent germination of two citrus rootstock seeds after pre-plant soaking of gibberellins was count and measured for two studied seasons.

2- Vegetative growth parameters: It has been carried out at the end of every season for both rootstock and scion.

a. Rootstock measures: Stem length, leaf numbers, leaf area and stem diameter. Stem length was estimated from the soil surface to the end of the growing point. All leaves on each seedling were numbered and measured. Leaf area was measured (cm^2) according to (Singh and Snyder, 1984). Stem diameter was measured at 30-35 cm above the soil surface. Rootstock measures were taken just before budding time.

b. Scion measures: Stem length, leaf number, leaf area and shoot number. All shoots on each scion were numbered and measured.

3- Total root dry weight (gm). The seedlings from each treatment were dissected at the end of study. The planting media was carefully removed from the plastic black bag then roots were washed thoroughly with tap water. Total roots were oven dried at 70° for 48 hr. and total root dry weight were recorded.

4- Leaf chlorophyll a, b (μ/cm^2): Leaf samples from two citrus seedling rootstocks were washed three times with tap water, and then washed again with distilled water, and it was determined according to (Moran and Porath, 1980) method and then total chlorophyll was calculated.

5- Leaf total carbohydrates (%): Total carbohydrates content of two citrus seedling rootstocks were determined as percent of dry weight according to (Dubois *et al.*, 1956).

6- Leaves mineral content: Leaf samples six months age from two citrus seedling rootstocks were individually collected. These samples were washed several times with distilled water and then dried at 70°c for dry matter estimation. Dried samples has

been milled for determine leaf content of N, P, K, Fe, Zn and Mn .

a. Total nitrogen (%): was determined in 0.2 g of dried substance of the leaves as percentages using microkjeldahl method according to (Pregl, 1945); (Chapman and Pratt, 1978).

b. Phosphorus (%): was determined as percentages colourimetrically using stannous chloride- sulfuric acid method according to (Troug and Meyer, 1939).

c. Potassium (%): was determined as percentages using the flame photometric method according to (Brown and Lilliland, 1966).

d. Iron, Zinc and Manganese (ppm): were determined as PPM Using Atomic Absorption according to (Carter, 1993).

7- Percent of suitable seedlings amenable for budding: Percent of suitable seedlings amenable for budding were count and measured at three time intervals (mid June, mid July and mid August).

Statistical analysis of the data: The experiment was designed in a completely randomized block design and the study comprised six treatments for each rootstock and each treatment was presented by three replicates (20 seedlings per replicate).The obtained data of both seasons were subjected to analysis of variance according to (Clarke and Kempson, 1997) and the means were differentiated using Duncan multiple range test at 5% level (Duncan, 1955).

3. Results and Discussion:

1- Percent Germination of two citrus rootstock seeds. It is clear from Table (1) that, there were no significant differences effect in final percentage germination for Volkamer lemon and Sour orange rootstock seeds. It is also noticed that, the soaked seeds by gibberellins (at 750 ppm) improved germination but not significant. These results might be attributed to that there is no dormancy in citrus seeds which make a problem for germination (Schneider, 1968). Similar results were reported by (Suzuki and Konakahara, 1985) who found that, the application of GA_3 at 250 ppm did not affect in the final percentage of germination on Trifoliate orange rootstock. Also, (Soetisna *et al.*, 1985) reported that GA_3 has little or no effect on lemon seed germination. Moreover the same results were found by (Muhammad, *et al.*, 2002) on some citrus species.

Table (1). Percent germination of two citrus rootstock seeds after pre-plant soaking of gibberellins.

Treatments(T)	Season, 2008			Season, 2009

Means (R)	81.89 a	83.93 a		80.72 a	82.79 a	

Mean separation within columns by Duncan's multiple range test, 5% level. Values that don't share the same letter are significantly different

2- Vegetative growth of rootstocks.

Data concerning vegetative growth of the two studied rootstock seedlings, i.e. Sour orange (SO) and Volkamer lemon (VO) as affected by foliar GA_3 indicated that, there were significant differences between all treatments in the two seasons of study.

a. Stem length (cm): Data in Table (2a) showed that, the maximum values of stem length were produced by Volkamer lemon (122.51 and 124.51 cm) with T6 treatment followed by Volkamer lemon (115.44 and 117.44 cm) with T5 treatment, while, the lowest significant values were with Sour orange (40.31 and 42.31 cm) under control treatment followed by (67.53 and 65.97 cm) under T2 treatment (Seedlings were treated by GA_3 at 200 ppm) in the first and second seasons, respectively.

b. Leaf number: Data presented in Table (2a) showed that, GA_3 application did not influence number of leaves and there were no significant differences between all treatments and rootstocks during the two studied seasons (2008 and 2009).

c. Leaf area (cm^2): Data in Table (2b) showed that, GA_3 application decreased leaf area, whereas, Sour orange recorded the greatest average of leaf area (35.51 and 33.59 cm^2) under control treatment. Meanwhile, the lowest vigorous were belonged to Volkamer lemon (25.75 and 23.75 cm^2) with T6, but the other treatments gave the intermediate values for the first and second seasons respectively, Table (2).

d. Stem diameter (mm): Data tabulated in Table (2b) showed that, GA_3 application increased stem diameter whereas; the higher significant values for stem diameter were belonged to Volkamer lemon (7.22 and 7.55 mm) with T6 followed by Volkamer lemon (6.68 and 7.50 mm) under T3 (seedlings were treated by GA_3 at 400 ppm), while the lower significant values for stem diameter were belonged to Sour orange (4.53 and 4.00 mm) under control treatment. Meanwhile, the other treatments gave the intermediate values in this regard in the two seasons under study.

3- Vegetative growth of Valencia orange scion.

Data concerning the vegetative growth of Valencia orange scion on the two studied rootstocks, i.e. Sour orange (SO) and Volkamer lemon (VO) as affected by foliar spray of GA_3 are presented in Table (3a&b).

a. Stem length (cm): Data in Table (3a) indicated that, application of GA_3 increased stem length of Valencia orange scion, whereas, stem length of Valencia orange scion on Volkamer lemon with T6 had higher significant values (30.35 and 36.26 cm) while, scion on Volkamer lemon under control

treatment had lower values (20.44 and 25.41 cm). Meanwhile, the other treatments scored the intermediate values in this regard for 2008 and 2009 seasons, respectively Table (3a).

b. Leaf number: Data tabulated in Table (3a) indicated that, GA_3 application did not show any distinctive effect on leaf number of Valencia orange scion during 2008 and 2009 seasons.

c. Leaf area (cm^2): Data presented in Table (3b) showed that, leaf area of Valencia orange scion decreased by increasing GA_3 concentrations, whereas, the highest significant values was in scion on Sour orange under control treatment (26.59 and 27.62 cm^2) while, the lowest values was in scion on Volkamer lemon (17.58 and 19.38 cm^2) with T6.

d. Shoot number: Data presented in Table (3b) showed that, shoot number of Valencia orange scion increased by increasing GA_3 concentration. However, scion on Volkamer lemon with T6 scored the greatest values(3.07 and 3.30) followed in descending order by scion on Sour orange with T5 (Seedlings were treated by GA_3 at 200 ppm and soaked seeds by gibberellins.) (2.43 and 2.50) while, scion on Sour orange under control treatment gave the lowest values (1.67 and 2.00). On the other hand, the other treatments had the intermediate values for this regard in 2008 and 2009 seasons, respectively.

Generally, the above results clarified that increasing concentrations of GA_3 as shown in T6 (Seedlings were treated by GA_3 at 400 ppm and soaked seeds by gibberellins 750 ppm) progressively increased stem length, shoot number and stem diameter, did not influence number of leaves and decreased leaf area. These results are in harmony with (Suzuki and Konakahara, 1985) they reported that the application of GA_3 on Trifoliate orange increased plant height. Also, the same results were found by (Mehouochi, *et al*., 1996) on Carrizo Citrange rootstock.

Moreover, (Ismael and Young, 1982) indicated that, Sour orange seedlings treated by GA_3 increased stem diameter. Furthermore, the same trend was observed by (Monselise and Halevy, 1962) who found that, spraying of GA_3 on sweet lime seedlings decreased leaf area.

Also, our results indicated that Volkamer lemon was superior for giving the highest values for vegetative growth as compared with Sour orange rootstock. These results are in line with those obtained by (Dawood, 1996 and Mohamed-Hoda, 2007). They mentioned that, Volkamer lemon is suitable citrus rootstock for most citrus scion varieties for their vigorous growth.

4- Total root dry weight (gm.).

Data presented in Table (4) showed the effect of foliar spray GA_3 on total root dry weight of Sour orange (SO) and Volkamer lemon (VO) rootstock seedlings in 2008 and 2009 seasons and indicated that, total root dry weights were decreased over all GA_3 concentrations. However, Volkamer lemon under control treatment had the highest significant values (8.50 and 9.50 gm), while, Sour orange produced the lowest significant values (3.79 and 5.17 gm) with T6 (Seedlings were treated by GA_3 at 400 ppm and soaked seeds by gibberellins) and the other treatments gave in between significant values for total root dry weight in 2008 and 2009 seasons, respectively. Table(4).

Mean separation within columns by Duncan's multiple range test, 5% level. Values that don't share the same letter are significantly different

Generally, it could be concluded that, foliar spray GA_3 of Sour orange and Volkamer lemon rootstocks reduced total root dry weight and there were differences between rootstocks in this response.

These results are in line with those reported by (Monselise and Halevy, 1962) who studied the effect of foliar spray of gibberellins (GA_3) at concentrations ranging between (50 and 1600 ppm) for sweet lime seedlings and found that dry weights of roots were decreased for all concentrations.

Also, (Tadeo *et al*., 1997) indicated that GA_3 decreased root tip width and reduced all parameters related to radial expansion.

Furthermore, the effect of GA_3 on root growth is indirect, by means of its effect on the growth of the aerial part, because of the action exerted by GA_3 on cell elongation (Tanimoto, 1990).

5- Leaf chlorophyll content (μ/cm^2): Data presented in Table (5) showed the effect of GA_3 application on chlorophyll (a,b) of two citrus rootstocks (Sour orange and Volkamer lemon) in 2008 and 2009 seasons, data indicated that chlorophyll content of leaves decreased by increasing GA_3 concentrations.

It is also clear that Sour orange under control treatment gave the greatest averages for chlorophyll (a, b), While the lowest averages were belonged to Volkamer lemon with T6, on the other hand, the other treatments gave the intermediate values for the first and second seasons, respectively, Table (5).Our results showed that, reduction of chlorophylls (a) and (b) as a result of foliar spray of gibberellins GA_3 on leaves of citrus rootstock seedlings. These results are in harmony with those obtained by (Monselise and Halevy 1962) who reported that chlorophyll content was decreased when sweat lime seedlings treated by GA_3. Moreover, (Mauk *et al.*, 1987) found that GA_3 enhanced chlorophylls (a, b) but sharply reduced on Trifoliate orange and Sour orange rootstocks. Similar results were reported by (Monge, *et al.*, 1994), they studied the effect of spray of 1000 mg/L^{-1} GA_3 on adult peach trees {*Prunus persica (L.) Batsch}* and found that GA_3 significantly reduced the concentrations of chlorophylls (a, b).On the other hand, our results indicated that Sour orange rootstock had higher leaf chlorophyll content as compared with Volkamer lemon; these results are in line with the conclusion of (Mohamed-Hoda, 2007).

6- Leaf total carbohydrates (%):

The results were given in Table (6) showed the leaf total carbohydrates of two citrus rootstock seedlings as influenced by foliar spray of GA_3 in 2008 and 2009 seasons.

Data indicated that, GA_3 application increased leaf total carbohydrates, whereas, Sour orange with T6 scored the highest significant values for leaf total carbohydrates (35.72 and 37.76 %).While, Volkamer lemon under control treatment had the lowest values (20.59 and 22.27 %), meanwhile, the other treatments scored in between values of leaf total carbohydrate for the first and second seasons, Table (5).

Generally, it seems from the foregoing results that GA_3 application increased vegetative growth and leaf total carbohydrates, also topping and suckering processes led to carbohydrate accumulation in rootstock stem. These finding agree with those obtained by (Miyamoto *et al.*, 1993) who reported that, there is positively correlation between

vegetative growth and carbohydrate accumulation in leaves, whereas, seedling growth is enhanced by trans located sucrose, also, GA_3 promoted growth may be mediated by accumulation of soluble sugars, starch and cell wall polysaccharides. Also, (Mehouachi, *et al*, 1996) reported that GA_3 stimulated growth and synthesis and turnover of sugars, increasing carbon supply in shoots, furthermore GA_3 shifted the assimilates to the shoot which probably resulted in increased shoot growth and development in Carrizo Citrange rootstock. Moreover, (Mostafa and Baninasab, 2008) studied the effect of GA_3 on carbohydrate accumulation in shoots and roots of two almond rootstock seedlings and found that high level of soluble sugars and starch in the shoot and root were observed when GA_3 application on both rootstocks. On the other hand, our results indicated that Volkamer lemon scored the lowest significant values for leaf total carbohydrates as compared with Sour orange rootstock this decrease in carbohydrate values could be attributed to active vegetative growth which consumes higher amounts of carbohydrates.

Similar pattern of response was found by (Dawood, *et al*., 2002) who reported that, leaves of scions on Volkamer lemon and Rough lemon had lower carbohydrate level. However, trees on Sour orange like Troyer Citrange rootstock recorded intermediate values in this respect. These conclusions agree with those obtained by (Abdel-Kader and Hayat, 1989) and (Mohamed- Hoda, 2007).

7- Leaf mineral content:

a. Macro element (N, P and K). It is clear from Table (7a) that, the effect of GA_3 application on two citrus rootstock seedlings did not show any distinctive effect on leaf Nitrogen and Phosphorus contents during 2008 and 2009 seasons. It is also noticed that, leaves of Volkamer lemon with T5 had higher of (K) content (0.96 and 0.99 %) followed in descending order by Volkamer lemon with T2 (0.90 and 0.91%) and Sour orange with T5 (0.90, 0.90 %) while, Sour orange under control treatment gave the lowest values (0.64 and 0.63 %) in this regard. Anyhow, the differences between the different rootstocks and treatments in this regard were so high to be significant. Table (7a)

b. Micro elements

Iron (Fe ppm). The concentration of iron (Fe) in leaf tissues of Volkamer lemon and Sour orange seedlings in response toGA_3 application were presented in Table (7b). It was cleared that, Fe content of leaves was decreased by increasing GA_3 concentrations. Also, it is noticed that leaves of Sour orange had higher concentrations of (Fe) (80.20 and 85.27 ppm) than Volkamer lemon (63.63 and 63.18 ppm). Regarding the interaction between rootstocks and treatments data also revealed that, Sour orange under control treatment gave the highest significant values (108.4 and 105.00 ppm). Meanwhile, Volkamer lemon with T6 produced the lowest significant values (40.66 and 43.54 ppm) in this respect and the differences between different rootstocks and treatments were so high to be significant in the first and second seasons, Table (7b). Zinc (Zn ppm). Data in Table (7b) showed that, the higher values for leaf content were on Sour orange with T5 (82.30 and 80.20 ppm) and the lower values were on Volkamer with T6 (65.80 and 60.70 ppm), Besides, leaves of other treatments seedlings scored in between values of zinc content in two seasons under study.

Manganese (Mn ppm). Data presented in Table (7b) indicated that, leaves of Sour orange with T6 gave the highest significant values for leaf content (167.3 ppm) in 2008 season and with T4 (172.4 ppm) in 2009 season. Meanwhile, the lowest significant values were belonged for Volkamer lemon with T3 (102.7 ppm) in the first season and on T6 (103.7 ppm) in the second season. Anyhow, the differences between different rootstocks and treatments were so high to be significant in both seasons, respectively. Table (7b).

Generally, our results of in the present study indicated that there were no significant differences between leaf N and P contents. While, leaf K content was increasing as a result for spray of GA_3. These results are in harmony with those obtained by (Monge, *et al*., 1994); they studied effect of spray of GA_3 to adult peach trees and found that the concentrations of P, Mg and K were unaffected. For micronutrient our data revealed that leaf Fe content was decreased by increasing GA_3 concentrations, and there were positively correlation between leaf Fe concentrations and leaf chlorophyll content. Also, there were significant differences between all treatments for leaf Zn and Mn. Several researches have reported on antagonism between Fe and Mn, which could lead to Fe chlorosis (Bindra, 1980) and (Casero and Carpena, 1987) probably due to a substitution of Fe by Mn in the biosynthesis of chlorophyll (Clairmont, *et al.*, 1986). Anyhow, using standard values of citrus seedling leaves mineral nutrient concentration (Chapman, 1960) the nutritional status of our citrus seedlings was good except for Fe, which was slightly above normal levels and increasing GA_3 concentrations.

Also, our results indicated that leaves of Volkamer lemon scored the highest significant values for K content and leaves of Sour orange recorded the highest significant values for Fe content, while, there were no significant between rootstocks for other element contents. This is in agreement with (Abou-Rawash, *et al.*, 1995) and (Eid, *et al.*, 2000); they mentioned that citrus rootstocks varied in their uptake of nutrients, since some rootstocks such as Volkamer lemon can absorb more macronutrient.

8- Percent of suitable seedlings amenable forbudding.

Data tabulated in Table (8) showed the average percent of suitable seedlings amenable for budding of Sour orange and Volkamer lemon which influenced by foliar spray of GA_3 and were taken at

three time intervals (mid June, mid July and mid August) during 2008 and 2009 seasons.

At mid June. Data in Table (8) showed that, Volkamer lemon seedlings under T2, T3, T4 and T5 gave the highest significant values (62.65, 62.60, 63.61 and 64.58 %) with no significant between them, while the lowest percent was in Sour orange with control treatment (45.53 and 47.53 %) in two seasons under study.

It is noticed that, Sour orange with T3 (Seedlings were treated by GA_3 at 400 ppm) recorded the highest percent of suitable seedlings amenable for budding (62.46 and 60.62 %), while the lowest value was in Sour orange under control treatment (45.31 and 47.53 %) respectively in both seasons 2008 and 2009.

At mid July. Data of Table (8) indicated that increasing rate of suitable seedlings amenable for budding as compared with the obtained results from the previous time (mid June) because in this time, stem diameter of resulting seedlings reached of a pencil size or larger. Data also showed that, Volkamer lemon with T5 had the highest averages (97.25 and 98.17%) and Sour orange (90.65 and 93.38 %) followed by Volkamer lemon with T2 (94.68 and 95.30%) and Sour orange (86.60 and 87.72 %), while the lowest significant values were on Sour orange (71.63 and 74.47%) under control treatment for the first and second seasons, respectively. Table(8).

At mid August. Data tabulated in Table (8) showed that decreasing rate of percent of suitable seedlings amenable for budding compared with the previous time (mid-July). It is also clear that, Sour orange had the highest values (75.78 and 71.75 %) under T_3 in both seasons. But, Volkamer lemon gave the most vigorous values under T3 (76.96%) in the first season, and (72.65%) under T5 in the second season. Meanwhile, Sour orange and Volkamer lemon under T6 produced the lowest values (65.47 and 59.58 %) and (60.78 and 58.52%) for two seasons, respectively. Anyhow, the differences between all treatments were so high to be significant in 2008 and 2009, seasons.

From the above results it could be concluded that, there is positively correlation between the percent of suitable seedlings amenable for budding and vigorous growth, stem diameter and leaf mineral content of the rootstocks. These results can be attributed to the vigorous growth of Volkamer lemon rootstock which possessed the highest values for stem diameter and leaf mineral content. These results are in line with those obtained with (Mohamed-Hoda, 2007) who studied the behavior of Valencia orange buddlings grafted on
some citrus rootstocks growing in various soils and found that the highest percent of suitable seedlings amenable for budding were obtained with Volkamer lemon followed by Sour orange, while Troyer Citrange had the lowest values in this respect.

Moreover, our results reported that, the highest success rate of suitable seedlings amenable for budding was in mid-July for two seasons. This time led to shortening the period for budding in citrus seedlings about 8 months, whereas, resulting seedlings could be budded because their stem diameter reached of a pencil size (5.4 mm or larger). Shortening this time would benefit nurserymen by reducing various production inputs and their costs.

Prognostic Impact of Elevated Serum Hyulronic Acid, Ferritin and Interleukin-6 in Patients with Acute Myeloid Leukemia

Nabila Abd El Maksoud,[1] Halla M. Ragab[1], Maha M. Abd El Latif[2] and Sh. Abdalla[3]

Absract

Background: Acute myeloid leukemia (AML) is a clonal disease of hematopoiesis with poor clinical outcome despite recent improvements in chemotherapy and stem cell transplantation regimens. It is the most common acute leukemia in adults. Hyaluronic acid, ferritin and Interleukin-6 are involved in the pathogenesis of acute myeloid leukemia , but their prognostic significance in these diseases is unknown. In the current study, the authors assessed the serum levels of these parameters in different stages of the disease to predict their prognostic value, which might therefore represent interesting target for immunotherapy in patients with different hematological malignancies.
Methods: Serum levels of. hyaluronic acid, ferritin and Interleukin-6 were measured using a commercially available sandwich Enzyme Linked Immune Sorbent Assay (ELISA) kit in patients with AML who were attending for treatment at National Cancer Institute, Cairo University from September 2006 through January 2009.
Results: Newly diagnosed and relapsed patients with AML had significantly higher serum levels of hyaluronic acid, ferritin and Interleukin-6 compared with both control group and leukemic patients in remission stage. Serum levels of hyaluronic acid, ferritin and interleukin–6 in patients with AML (at diagnosis and at relapse) correlated inversely with the hemoglobin concentration. While their serum levels correlated positively with both total leukocyte count and with the % of blast cells in bone marrow in patients with AML

Conclusions: It could be concluded that serum levels of hyaluronic acid, ferritin and Interleukin-6 can be used as prognostic markers at diagnosis of adult AML and it could be used as follow up parameters for early detection of relapse. Furthermore, they might represent interesting target for immunotherapy in patients with different hematological malignancies. [Journal of American Science 2010;6(12):423-432]. (ISSN: 1545-1003).

Keywords: Acute myeloid leukemia (AML), Hyaluronic acid (HA), Ferritin (Fe), Interleukin–6 (IL-6).

1. Introduction:

Acute myeloid leukemia is a hematological disease characterized by the clonal proliferation of undifferentiated myeloid progenitor cells. AML is the most common variant of acute leukemia occurring in adults, comprising approximately 80 to 85% of cases of acute leukemia diagnosed in individuals greater than 20 years of age. Most of the patients with AML achieve a complete hematological remission by chemotherapeutical regimes. However, the long-term prognosis for all AML patients is rather poor with a 5-year overall survival of only 20-25% depending on the individual risk profile and the treatment option chosen. This clinical outcome suggests that the majority of the patients in complete hematological remission have minimal residual disease, subsequently leading to relapse. Obviously the leukemia-bearing host is immunologically tolerant to the remaining leukemia cells and therefore fails to eradicate the disease **(Li *et al.*, 2003).**

Hyaluronic acid (HA) is a nonsulfated glycosaminoglycan (molecular weight of 10^6 dalton). It is the only glycosaminoglycan that is not attached to any protein core. It is a component of tissue matrix and tissue fluids, it maintains the cartilage integrity and osmotic balance. Also it regulates cell adhesion, migration and proliferation. It is produced mainly by fibroblasts and other specialized connective tissue cells. It plays a structural role as part of the connective tissue matrix (proteoglycan) and participates in various cell-to-cell interactions. Synovial hyaluronic acid passes into plasma via the lymphatic system, and is quickly removed from the blood by a receptor dependent mechanism in sinusoidal epithelial cells of the liver and by the enzymatic action of hyaluronidase . Thus, hyaluronan is a glucosaminoglycan synthesized by the mesenchymal cells and

degraded by hepatic sinusoidal endothelial cells by a specific receptor-mediated process **(Plevris *at al.* 2000).**

It has been reported that HA is synthesized mostly by tumor stromal fibroblasts and that tumor cells activate the fibroblasts to synthesize a high levels of hyaluronic acid .The concentration of HA is elevated in several carcinomas (e.g., lung, breast, colon, Wilms' tumor **(Delpech *et al.*, 1997).** More importantly, it was shown that the HA concentration is elevated in the urine of bladder cancer patients and serves as a diagnostic marker for detecting bladder tumor regardless of its grade **(Lokeshwar *et al.*, 1997).**

Hyaluronan (HA) has been reported to bind specifically and with high affinity to various cell types and to directly modify cell behaviour. It was demonstrated that both high molecular weight molecules (HAH) and HA-derived oligosaccharides were efficient at triggering terminal differentiation of acute myeloid leukemia (AML) blasts, in vitro **(Marie *et al.*, 2004).**

Iron-storage compounds in the body include hemoglobin, hemosiderin, myoglobulin and the cytochromes **(Adams, 1998).** In most tissues, ferritin is a major iron storage protein with a molecular weight of 45 kd. Each molecule contains as many as 4000 iron atoms. Ferritin represents 25% of the total iron found in the body. High concentrations of ferritin are found in the cytoplasm of the reticuloendothelial system, the liver, spleen and bone marrow. Methods previously used to measure iron in such tissues are invasive, cause patient trauma and lack adequate sensitivity. Ferritin levels in serum have been used to evaluate clinical conditions not related to iron storage, including inflammation, chronic liver disease and malignancy **(Casaril *et al.*, 2000).** In normal conditions ferritin is mainly expressed in red cell precursors and reticuloendothelial cells, and this is in keeping with the peculiar role of these cells in iron metabolism. Abnormal cell ferritin contents can be observed in both iron overload and malignancy. Elevated serum ferritin might indicate the presence of malignant disease . It was reported that serum ferritin was elevated in breast carcinoma, different urologic malignancies, and acute and chronic leukemia and in M1 and M2 myeloid leukemia **(Ulbrich *et al.*, 2003, Ahlawat *et al.*, 1994 and Aulbert *et al.*, 1991).**

Cytokines are involved in the pathogenesis of acute myeloid leukemia (AML) and high-risk myelodysplastic syndromes (MDS), but their prognostic significance in these diseases is unknown **(Tsimberidou *et al.*, 2008)**.

Interleukin-6 (IL-6) is a pleiotropic cytokine produced by a variety of cell types, including fibroblasts, endothelial cells, monocytes, normal hematopoietic cells, and lymphocytes. Serum IL-6 levels have been correlated with an increased risk for development of lymphoma in patients with AIDS and in renal transplant recipients. Serum IL-6 levels are increased in diffuse large cell lymphomas, associated with adverse prognostic features, and predictive of a poor failure-free and overall survival in multivariate analysis. Interestingly, serum IL-6 levels may also be elevated and correlate with poor prognostic features and an inferior outcome in Hodgkin disease, indolent non-Hodgkin lymphomas (NHLs), renal cell carcinoma, prostatic cancer, ovarian cancer, and multiple myeloma (**Kawano *et al.*, 1988)**.

2. Aim of the work:

The present study was planned to estimate the serum levels of hyaluronic acid, ferritin and interleukin-6 in patients with acute myeloid leukemia in different stages of the disease and to assess their prognostic value.

3. Subjects and Methods:

The subjects of this study were (115) divided into two groups:

Group A: Patients group consisted of 80 with AML attending the National Cancer Institute, Cairo University. They were 48 males and 32 females. They included 32 patients (group A I*)*, at diagnosis before starting therapy with age range between 25 and 56 years (mean 44.2 ± 8.6). 28 patients in remission (group A II), but still under therapy with age range between 29 – 58 years (mean 47.5 ± 9.3). and 20 patients (group A III),with bone marrow relapse with age range between 35 – 58 years (mean 48.3 ± 9.5).

Group B: (Control group) 35 healthy volunteers were used for comparison with AML patients, 20 males and 15 females with age range between 32 - 57 years (mean 45.7 ± 4.7). They were free from any acute or chronic disease (e.g., Liver dysfunction, diabetes, infection, etc.) at the time of samples withdrawal.

3.1. Methods

All patients included in this study were subjected to:

1- Full medical history with particular stress on age at diagnosis, sex, bone aches, neurological complications (for evidence of CNS involvement).

2 -Thorough clinical examination was done with special emphasis on the weight, height, temperature, lymph node enlargement,

organomegaly, the presence of any mass as well as central nervous system and chest examination.

3 -Investigations included:

- Complete hemogram (using Automated Coulter Counter T-660).
- Examination of bone marrow aspiration and/or biopsy for morphology, FAB classification and immunophentyping done for the patients.
- Examination of CSF for evidence of CNS involvement.
- Radiological investigations included chest X-ray, bone survey, ultra-sonic and computed tomography scanning to chest and abdomen, and others as indicated.

3.2. Laboratory investigations:

All patients were subjected to :

3.2.1. Determination of serum Hyaluronic Acid: Serum samples were analyzed for Hyaluronic Acid (HA) using a commercially available sandwich Enzyme Linked Immune Sorbent Assay (ELISA) kit obtained from Corgenix, inc., USA **(Chichibu *et al.*,1989).** HA levels in patients and control samples were determined against a reference curve. Each standard and sample was assayed in duplicate.

3.2.2. Determination of serum Ferritin: Samples were analyzed for Ferritin using a commercially available sandwich ELISA kit obtained from DRG International inc., USA **(White *et al.*, 1986).** Each standard and sample was assayed in duplicate.

3.2.3. Determination of serum IL-6: Analysis was performed using commercially available kit (IL-6 ELISA Kit), Diaclone Research, (URS), - France. The minimum detectable dose of IL-6 is less than 2 pg/ml. Intra and Inter - Assay coefficients of variation of the assay were 0.83-3.86% and 1.89-5.84% **(Robak *et al.*, 1999)**.

4. Statistical analysis:

Data were analyzed with standard program of SPSS, Echo Soft corporation, USA, 1995 statistical package. Student t test was applied to the data conforming to normal distribution. For non-parametric data Mann Whitney U test was applied. Correlation coefficient (r) was used to determine the relationships between different quantitative values. For all tests a probability <0.05 was considered significant (**Saunders and Trapp 1995)**.

5. Results:

The results of this study are demonstrated in the tables (1,2, and 3) and figures (1,2, and 3).

Table (1) shows descriptive data of the patients with acute myeloid leukemia and control groups. Newly diagnosed and relapsed AML patients had statistically significant lower hemoglobin and platelet count compared to control group ($p< 0.001$). TLC was statistically high among newly diagnosed and relapsed AML patients compared to control group and patients with AML at remission stage ($p < 0.001$). There was no significant difference between AML patients in remission and control group.

The results showed that newly diagnosed and relapsed patients with AML had significant high serum levels of hyaluronic acid, ferritin and interleukin–6 compared to both control group and leukemic patients in remission stage (Table 2).

There was no significant difference in serum levels of hyaluronic acid, ferritin and interleukin–6 between newly diagnosed and relapsed AML patients, as well as between leukemic patients in remission stage and control group, also there was no significant difference as regards FAB morphological classification and immunophenotype .

Serum levels of hyaluronic acid, ferritin and interleukin–6 in patients with AML (at diagnosis and at relapse) correlated inversely with the hemoglobin concentration ($p < 0.05$). While their serum levels correlated positively with both total leukocyte count (TLC) ($p < 0.05$) and with the % of blast cells in bone marrow in patients with AML.

6. Discussion :

Acute myeloid leukemia (AML) is the most common acute leukemia in adults. With intensive induction therapy, most patients younger than 60 years achieve complete remission. However, even if these younger patients were treated intensively, more than 50% will relapse. Clinical results of patients older than 60 years are more unfavorable. Therefore, in all patients with AML, the overall survival is still low **(Tamm *et. al,* 2007).**

In our study, we demonstrated that adults with AML group (A) have higher plasma levels of hyaluronic acid, ferritin and Interleukin 6 when compared to control group. As regard Serum levels of hyaluronic acid, this study used an HABP based sandwich ELISA to show that serum HA level is raised in patients with AML in newly diagnosed and relapsed patients. In remission, serum levels of hyaluronic acid concentration decreased to the normal range. Hyaluronan (HA) has been reported to bind specifically and with high affinity to various cell types and to directly modify cell behaviour.

In a previous report **Courel *et. al,* 2004** demonstrated that both high molecular weight molecules (HAH) and HA-derived oligosaccharides were efficient at triggering terminal differentiation of acute myeloid leukemia (AML) blasts, in vitro. There have been a few reports of raised serum levels of HA in advanced cancer; **Delpech *et. al,* (1985)**. These studies confirm that a raised serum HA may accompany malignant disease. As yet, the mechanism of increased serum levels of HA in cancer is unclear. However, there are some clues from the case reports. Greatly increased levels of serum HA have been observed in Wilms' tumour **(Wu *et. al,* 1984; and Bracey *et. al,* 1987)** and neuroblastoma **(Pusch *et. al,* 2010).** In a few patients the rise of serum HA was associated with increased viscosity.

Our results agree with **Sanada *et. al,* 1999** who reported that levels of serum hyaluronic acid (HA) in adult T-cell leukemia (ATL) patients moved in parallel with the clinical activity of their disease. A hyaluronan-rich environment often correlate with tumor progression and may be there is one mechanism for the invasive behavior of malignancies. Eradication of hyaluronan by hyaluronidase administration could reduce tumor aggressiveness and would provide,therefore, a new anti-cancer strategy **(Adamia *et. al,* 2005).**

Giannopoulos *et. al,* 2009 reported that receptor for hyaluronic acid-mediated motility expression appears to be of prognostic value, as well as may reflect the proliferative capacity of chronic lymphocytic leukemia cells, and might therefore represent interesting target for immunotherapy in patients with different hematological malignancies **(Greiner *et. al,* 2010).**

In our study serum ferritin concentrations in patients with AML were found to increase in newly diagnosed and relapsed patients. This agree with findings of **Worwood *et. al,* 1974** who reported that the increased capacity for ferritin synthesis shown by myelogenous cells from patients with AML suggests that these cells themselves are the source of the increased amount of circulating protein. While patients during remission, the serum ferritin concentration decreased but still higher than the normal range. **White *et. al,* 1974** have shown that the increase in cirulating ferritin during chemotherapy could be due to an increased release from damaged leukaemic cells and this increase in serum ferritin

concentration was not correlated with the amount of blood transfused or the degree of liver damage .

Similar results were obtained by **Garcia-Manero in (2008)**and confirm the previous study of serum ferritin concentrations in acute leukaemia**.** It shows that serum ferritin is a marker of acute phase reactions and iron storage. In addition, hematologic malignancies are associated with elevated serum ferritin levels. There are a number of factors which are likely to contribute to raised serum ferritin concentrations in leukaemia: (1) Most of the patients are anaemic and have increased amounts of storage ferritin which are reflected by increased serum ferritin concentrations. (2) Increased synthesis of ferritin in the large mass of leukaemic cells is also reflected in high serum ferritin concentrations. In the earlier study, there was a significant correlation between leucocyte and serum ferritin concentration. (3) Abnormal release of ferritin from damaged cells is another possible cause of high serum ferritin concentrations **(Cragg *et. al,* 1977).**

Data from 90 patients with a variety of hematologic malignant neoplasms were studied by **Patel *et. al,* 1980** to determine the relation between changes in serum ferritin concentration and the clinical status of the patients. Patients with Hodgkin's disease, non-Hodgkin's lymphoma, multiple myeloma, blastic crisis of chronic myelocytic leukemia, acute myeloblastic leukemia and acute lymphoblastic leukemia were found to have significantly elevated serum ferritin levels. The serum ferritin level reflects acute phase reactions and is usually associated with iron storage. Iron overload increases the susceptibility to organ damage and the risk for infection **(Miceli *et. al,* 2006).** Other recent studies have suggested that ferritin is a surrogate for advanced disease and has an impact on relapse, because elevated serum ferritin predicts overall survival (OS) and relapse-free survival following autologous stem cell transplantation for lymphomas **(Armand *et. al,* 2007, Mahindra *et. al,* 2008 and Moo-Kon Song *et. al,* 2009) .**

However, **Patel *et. al,*** in their study in **(1980)** showed that patients with hematologic malignancies have significantly higher serum ferritin levels. Another study showed that the intensity of the 99 mTc-MIBI scan correlates with the serum ferritin level as a marker of disease activity **(Alexandrakis *et. al,* 2001). Papadaki *et. al,*** in their study in **(1997)** found that elevated serum sIL-6R levels were related to the growth of myeloma cells and that the concentration was an indicator of disease activity; the sIL-6R level was correlated with the serum ferritin concentrations as a marker of disease activity. However, the low serum ferritin concentrations found in patients with AML in remission suggest that ferritin concentration may be a useful index for the prediction of relapse and as a prognostic sign.

Several cytokines have been shown to promote the growth of malignant cells in vitro and are therefore believed to contribute to the aggressiveness of the disease **(Tsimberidou *et. al,* 2008).** In our study increased serum IL 6 concentrations were found in newly diagnosed and relapsed patients with AML. In remission, serum IL 6 concentration fall within the normal range. Several studies by **Lauta, 2003, Sohara *et. al,* 2005,and Hong *et. al,* 2007** reported that IL-6 is a pleiotropic cytokine with many ascribed effects including stimulation of acute phase reactants, immune regulation, angiogenesis, and osteoclast activation, and it originates from a multitude of cell types, including mononuclear phagocytes, vascular endothelial cells, fibroblasts, hepatocytes, B-cell lymphomas, and the neoplastic plasma cells of multiple myeloma. It appears to serve as a stimulatory factor in multiple myeloma; produced by both the malignant cells and bone marrow stromal cells**(Lauta, 2003).**

Our results agreed with **Tsimberidou *et. al,* 2008** who concluded that interleukin-6 (IL-6) may play a relevant role in the pathogenesis of several hematologic malignancies. IL-6 has diverse effects on the growth of AML blasts, including stimulation and maintenance of their growth through the IL-6/ IL-6 receptor signaling system. Also our results agreed with **Thomas *et. al,* 1997** who reported that AML relapse is suggested to result from treatment failure due to leukemic cells being resistant to chemotherapy and/or escaping immune surveillance. Due to the association of IL-6 expression with disease progression reported in previous studies, and it is conceivable that IL-6 may play an active role in relapse of ALL by supporting chemoresistance and inhibition of immunocompetent cells. Also they concluded that serum levels of IL-6 are a powerful prognostic factor in diffuse large cell lymphoma and chronic lymphocytic leukemia.

In the current study serum levels of hyaluronic acid, ferritin and interleukin–6 in patients with AML (at diagnosis and at relapse) correlated inversely with the hemoglobin concentration ($p < 0.05$). While their serum levels correlated positively with both total leukocyte count (TLC) ($p < 0.05$)

and with the % of blast cells in bone marrow in patients with AML. So, these parameters may be useful and sensitive tumour markers.

Our results agree with **Sanada *et. al,* 1999** who reported that levels of serum hyaluronic acid (HA) in adult T-cell leukemia (ATL) patients moved in parallel with the clinical activity of their disease. **Papadaki *et. al,* 1997** concluded that the sIL-6R level was correlated with the serum ferritin concentrations as a marker of disease activity. Also they reported that low serum ferritin concentrations found in patients with AML in remission suggest that ferritin concentration may be also a useful index for the prediction of relapse and as a prognostic sign. This also agree with **Tsimberidou *et. al,* 2008** who found that IL-6 correlated inversely with Hb % and positively with the absolute number of circulating myeloblasts and the proportion of bone marrow myeloblasts in patients with high risk AML. Also **Preti *et. al,* 1997 and Fayad *et. al,* 2001** reported that serum levels of IL-6 are a powerful prognostic factor in diffuse large cell lymphoma and chronic lymphocytic leukemia. Also multiple studies have been done to explain the role for elevated IL-6 levels at diagnosis as a marker of poor prognosis in various cancers including multiple myeloma **(Lauta, 2003),** malignant melanoma **(Mouawad *et. al,* 2002 and Soubrane *et. al,* 2005)**, non-Hodgkin's lymphoma **(El-Far *et. al,* 2004 and Pedersen *et. al,* 2005)**, prostate cancer **(George *et. al,* 2005)**, squamous cell carcinoma of the head and neck **(Riedel *et. al,* 2005)**, and various sarcomas **(Rutkowski *et. al,* 2002).**

In conclusion, our data suggest that serum levels of hyaluronic acid, ferritin and interleukin–6 can be used as prognostic serum markers at diagnosis of adult acute myeloid leukemia and it could be used as follow up parameters for early detection of relapse.Understanding their roles may therefore represent interesting target for designing new therapeutic strategies for patients with different hematological malignancies.

Abstract: Aim of the work: Assessing the Effect of green, roasted and decaffeinated coffee on serum glucose, insulin and serum lipid profile in diabetic rat models. Methods: Design of the Study: Thirty female wistar rats weighing 124.5 ±5.41g (mean ±S.D) were divided into 5 groups. The first group served as a control and consumed a standard diet according to (AIN – 93). The other 4 groups were injected intraperitoneally with 105 mg / kg body weight of alloxan . One group was kept without further treatment and served as a positive diabetic control. Groups 3, 4, 5 consumed 5% green, roasted and decaffeinated coffee in drinking water, respectively. The feeding trial continued for four weeks. At the end of the experiments, the animals were sacrificed, blood samples were collected, and the liver, kidney, spleen and heart were separated, washed, dried and weighed. Laboratory investigations Consisted of serum glucose, insulin, calcium, phosphorus and complete lipid profile was determined to test the magnitude of antioxidant potential green, roasted and decaffeinated coffee. Results: The present study show a significant difference ($p < 0.05$) in body weight gain and food intake between all treatment groups , with non significant difference in water intake , relative weight of organs including liver , kidney , spleen and heart . the study also shows significant elevation ($p < 0.05$) in serum glucose and insulin in diabetic control group as compared to normal control group. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ($p < 0.05$) .There is a significant decrease ($p < 0.05$) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green, roasted and decaffeinated coffee respectively indicating an association between coffee consumption and bone health. our results also shows that alloxan injection produced a significant increase($p < 0.05$) in serum total- cholesterol(TC); triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio however a significant decrease ($p < 0.05$) in serum HDL-C is observed ; In diabetic rats compared to normal control .green, roasted and decaffeinated coffee resulted in a significant decrease ($p < 0.05$) in triacylglycerol (TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ($p < 0.05$) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study . Conclusion: The observed improvement in glucose, insulin profile, triacylglycerol and HDL-C confirm the potent biological action of green, roasted and decaffeinated coffee and suggest that chlorogenic acid (a component in coffee) might have an antagonistic effect on glucose transport. Suggesting a novel function of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

Keywords: Green, roasted, decaffeinated coffee, glucose, insulin and lipid profile.

1. Introduction:

Type 2 diabetes is a chronic disease associated with high rates of morbidity and premature mortality(Nathan , 1993)1 An alarming increase in the prevalence of type 2 diabetes is expected,(Wild et al ., 2004) and the need for preventive action is widely acknowledged. While increased physical activity and restriction of energy intake can substantially reduce the incidence of type 2 diabetes (Tuomilehto et al., 2001 Knowler et al., 2002) , insight into the role of other lifestyle factors may contribute to additional prevention strategies for type 2 diabetes.

Coffee is considered one of the most popular beverages consumed in the world due to its pleasant flavor and pharmacological properties(DÓREA and COSTA ., 2005). Prospective and epidemiologic studies of green and especially of roasted coffee consumption has been carried out to investigate its biological effects on lipids, blood pressure and

glycaemia(CORTI et al ., 2002 ; DAGLIA et al ., 2000 and ROBINSON et al. ,2004) . Scientific evidences have demonstrated that green and regular coffee beverages present high antioxidant properties in vivo and in vitro (KARAKAWA, 2004 and SOMOZA et al. ., 2003). Few recent studies have indicated that soluble extracts of green coffee were effective against the high blood pressure in mice(SUZUKI, A. et al. ,2000) and in human(KOZUM. et al. , 2005 and OCHIAI, . et al. 2004). It is possible that its antihypertensive action be related to vasoreactive factors produced and released from the vascular endothelium (OCHIAI, R. et al. 2004).

The roasting process causes a loss of water from the green bean and degradation of many of the compounds including the antioxidant polyphenols; however, there is very little difference in total antioxidants between the different roasts of a bean (Daglia et al., 2000).

There are three main methods of coffee preparation; boiled unfiltered coffee, filtered coffee, and decaffeinated coffee, the latter primarily consumed as instant coffee.

There are over a thousand compounds, many formed during the roasting process,which produce the unique taste and smell of coffee(Parliament et al ., 2005). However, from the point of view of concentration in coffee, prior detection of the parent compound or metabolites in the body, and physiological effects, there are essentially only three ingredients that are important; caffeine, the diterpene alcohols cafestol and kahweol, and chlorogenic acid and other polyphenols. In specialty coffees consumed outside the home the range is 18–80 mg/cup and decaffeinated coffees averaged 5 mg/cup(McCusker et al ., 2003). Coffee is an important source of caffeine; it provides 71% of the caffeine in the US diet (Frary et al., 2005). The diterpenoid alcohols are the oils in coffee and their concentration depends on the how the coffee is prepared. Filtered coffee has less than 0.1 mg/100 ml, i.e. essentially none, and unfiltered coffee can have between 0.2 and 18 mg/100 ml depending on the method.

High consumption of unfiltered types of coffee, such as French press and boiled coffee has been shown to increase low-density-lipoprotein-cholesterol concentrations. In addition, limiting caffeinated coffee intake during pregnancy seems a prudent choice. However, evidence has been accumulating that frequent consumption of coffee may reduce risk of type 2 diabetes and liver cancer(van Dam ., 2008).

Higher habitual coffee consumption was associated with higher insulin sensitivity (Arnlov et al ., 2004) and a lower risk for type 2 diabetes(van Dam et al ., 2002 ; Rosengren et al ., 2004 ; Salazar-Martinez et al ., 2004 ; Tuomilehto et al ., 2004 and Carlsson et al ., 2004) in diverse populations. In contrast, short-term metabolic studies showed that caffeine intake can acutely lower insulin sensitivity (Keijzers et al ., 2002 and Thong et al ., 2002) and increase glucose concentrations(Mougios et al ., 2003 and Lane et al ., 2004)

Tunnicliffe and Shearer, 2008 found that Coffee consumption may also mediate levels of gut peptides (glucose-dependent insulinotropic polypeptide and glucagon-like peptide-1), hormones intimately involved in the regulation of satiety and insulin secretion. Finally, coffee may have prebiotic-like properties, altering gut flora and ultimately digestion.

It has been reported that Coffee intake might have an antiatherogenic property by increasing of ATP-binding cassette transporter (ABC)G1 and scavenger receptor class B type I (SR-BI) expression and enhancing HDL-mediated cholesterol efflux from the macrophages via its plasma phenolic acids(Uto-Kondo et al ., 2010).

2. Materials and methods

Materials:

Chemicals:

All chemicals including alloxan were fine grade, chemicals purchased from local distributer (Sigma chemical) Cairo.Egypt.

Green, roasted and decaffeinated coffee where purchased from a local market ,Cairo, Egypt and was added to drinking water at a concentration of 5 g% after following preparation : 5g of green , roasted and decaffeinated coffee dissolved in 100 ml boiled water for 10 minutes .

The basal standard diet was prepared in accordance with AIN-93 formulation (Revees et al., 1993).

Composition of diet (g/100g)

Corn starch 62.07;casein 14 ;sucrose 10 ;cellulose 5 ;corn oil 4 ;salt mixture 3.5 ; vitamin mixture 1;L-cystine0.18; choline bitratrate 0.25 and tert.butylhydroxy quinine 0.008.

Animals

In the present study 30 female rats of wistar strain weighing (124.50 ±5.41 g) obtained from Institute of Ophthalmology(Cairo, Egypt) were used in this study . The rats were maintained under standard laboratory conditions in an air conditioned room and housed in stainless steel cages one per cage at temperature 22±3 °C and relative humidity 30-70 %. The animal diet was given ad libitum . Animals were acclimatized for one week prior to experiment.

Thirty rats were divided into 6 groups each of 6 rats.

Group 1(G1): Served as normal control and received standard diet.

Group 2(G2): Diabetic control group. Green, roasted and decaffeinated coffee

Group 3(G3): Diabetic group which received 5 % green coffee in drinking water.

Group 4(G4): Diabetic group which received 5 % roasted coffee in drinking water.

Group 5(G5 Diabetic group which received 5 % decaffeinated coffee in drinking water.

The experiment lasted for 4 weeks.

Assays:

At the end of experimental period, all rats were fasted overnight and then anesthetized by ether and sacrificed. Blood was collected and allowed to clot; serum was separated by centrifugation at 3000 rpm for 15 minutes serum was then transferred into properly labeled sterile vials and stored at -20° C till the performance of Laboratory analysis.

liver , kidney and spleen and heart were excised, rinsed in chilled saline solution and then blotted on filter paper ,weighed separately to calculate the relative weight.

$$\text{The relative weight of organ} = \frac{\text{absolute weight of organ}}{\text{Final body weight of rat}} \times 100$$

Serum was used for determination of seum glucose according to Barham and Trinder , (1972) . Serum insulin was determined according to Vuppugalla et al., (2003). Serum total cholesterol was assayed by the method of Richmond , (1973) , serum triacylglycerol according to Fossati and Prencipe , (1982) , serum HDL by the method of Steele et al ., (1976) while serum LDL-cholesterol by the use of the equation of Friedewald et al ., (1972) .

Statistical analysis:

Statistical analysis: were performed using SPSS for Windows 10.0(SPSS Inc,Chicago.IL.USA). Data were expressed as mean ± S.D. One way analysis of variance (ANOVA) at ($p < 0.05$) was used to compare mean values of continuous variable in cases and control.

3. Results

The present study show a significant difference ($p < 0.05$) in body weight gain and food intake between all treatment groups, with non significant difference in water intake, relative weight of organs including liver , kidney , spleen and heart .these data suggesting that green, roasted and decaffeinated coffee did not influence the relative organ weight and caused the reduction in food intake and gain weight in diabetic rats as compared to normal control group.(Table 1).

Table 2 shows significant elevation ($p < 0.05$) in serum glucose and insulin in diabetic control group as compared to normal control group at the end of experiment. This indicates uncontrolled hyperglycemia in alloxan diabetic rats. While consumption of green, roasted and decaffeinated coffee resulted in a decrease in serum glucose and insulin ($p < 0.05$) with the lowest glucose value observed with green coffee and with decaffeinated coffee for insulin.

There is a significant decrease ($p < 0.05$) in serum calcium and serum phosphorus in groups 3,4 and 5 fed green and roasted coffee respectively indicating an association between caffeine consumption and bone health.(Table 3)

Table (4) shows that alloxan injection produced a significant increase($p < 0.05$) in serum total- cholesterol(TC);triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio however a significant decrease ($p < 0.05$) in serum HDL-C is observed ; In diabetic rats compared to normal control .

Green, roasted and decaffeinated coffee resulted in a significant decrease ($p < 0.05$) in triacylglycerol(TAG); LDL-C ; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio .on the other hand a significant increase ($p < 0.05$) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats with the highest value for green coffee .Non significant effect on serum total- cholesterol(TC) reported in this study .

4. Discussion:

In this study the observed decrease in body weight is in agreement with animal studies and the prospective epidemiologic studies on weight loss (Muroyama et al ., 2003 and van Dam et al., 2006) suggest that long-term caffeine and coffee consumption could decrease body weight in humans.

Shimod et al., (2006) showed that consumption of green coffee bean extract (GCBE) for 14 days caused a suppressive effect on weight gain and visceral fat accumulation in mice. GCBE contains 10% caffeine and 27% chlorogenic acid as the principal constituents, and these constituents showed a tendency to suppress body weight gain and visceral fat accumulation. Thus, these constituents are suggested to be partially involved in the suppressive effect of GCBE on body weight gain and visceral fat accumulation. Caffeine is known to be a lipolytic compound. On the other hand, the effect of

chlorogenic acid on body weight gain has not yet been established.

Elevated serum glucose and insulin in diabetic control group as compared to normal control group confirm uncontrolled hyperglycemia, whereas green, roasted and decaffeinated coffee decreased serum glucose and insulin ($p < 0.05$) with the lowest glucose value observed with green coffee and with decaffeinated coffee for insulin.

These results are with the line of van Dam., (2008) who found that frequent consumption of coffee may reduce risk of type 2 diabetes and liver cancer.

Several plausible mechanisms for a beneficial effect of coffee on glucose metabolism exist. Coffee has been shown to be a major contributor to the total in vitro antioxidant capacity of the diet (Pulido et al ., 2003) which may be relevant as oxidative stress can contribute to the development of type 2 diabetes. Coffee is the major source of the phenol chlorogenic acid.(Clifford 2000) Intake of chlorogenic acid has been shown to reduce glucose concentrations in rats(Andrade-Cetto and Wiedenfeld ., 2001 and Rodriguez de Sotillo and Hadley 2002 and intake of quinides, degradation products of chlorogenic acids, increased insulin sensitivity in rats.(Shearer et al ., 2003) Chlorogenic acid contributes to the antioxidant effects of coffee, (Clifford 2000) may reduce hepatic glucose output through inhibition of glucose-6-phosphatase, (Arion et al ., 1997)and may improve tissue mineral distribution through its action as a metal chelator. (Rodriguez de Sotillo and Hadley 2002). In addition, chlorogenic acid acts as a competitive inhibitor of glucose absorption in the intestine. (Clifford 2000)Indeed, decaffeinated coffee seemed to delay intestinal absorption of glucose and increased glucagon-like peptide-1 concentrations in an intervention study in humans.(Johnston et al ., 2003) Glucagon-like peptide-1 is well known for its beneficial effects on glucose-induced insulin secretion and insulin action.(Drucker 1998) This effect may explain the observation that higher coffee consumption was associated with lower postload, rather than fasting, glucose concentrations.(Yamaji et al ., 2004 and)

Caffeine ingestion can acutely reduce glucose storage, but beneficial effects of caffeine on lipid oxidation and uncoupling protein-3 expression have also been suggested.(Yoshioka et al ., 2004) In US studies, decaffeinated coffee consumption was inversely associated with risk of type 2 diabetes.(Salazar-Martinez et al., 2004) In addition, in a Japanese study, the inverse association with hyperglycemia was stronger for coffee than for caffeine.(Isogawa et al ., 2003) These observations suggest that coffee components other than caffeine may have beneficial effects on risk of type 2 diabetes. Coffee also contains substantial amounts of magnesium, which has been linked to better insulin sensitivity and insulin secretion.(de Valk 1999) However, adjustment for magnesium intake did not explain the association between coffee consumption and risk of type 2 diabetes(Salazar-Martinez et al., 2004)

As the beneficial effects of coffee consumption exist for both decaffeinated and caffeinated coffee, a component of coffee other than caffeine must be responsible. Tunnicliffe and Shearer2008 reported that, being plant-derived; coffee contains many beneficial compounds found in fruits and vegetables, including antioxidants. In fact, coffee is the largest source of dietary antioxidants in industrialized nations. When green coffee is roasted at high temperatures, Maillard reactions create a number of unique compounds. Roasting causes a portion of the antioxidant, chlorogenic acid, to be transformed into quinides.

Decreased serum insulin in this study is in agreement with The decreased insulin secretion reported by Tianying et al., (2005) is consistent with

the increased insulin sensitivity observed by Arnlov et al.,(2004). In contrast, Arnlov et al., 2004 did not observe a decrease in insulin secretion as assessed by early insulin response under glucose stimulation. However, C-peptide has a longer half-life than insulin and thus may better represent insulin secretion than insulin levels do (Chen et al., 1999).The independent association between decaffeinated coffee and C-peptide indicates active ingredients other than caffeine. Antioxidants may improve insulin sensitivity Bruce et al., 2003 (in type 2 diabetes and decrease insulin levels in rats (Thirunavukkarasu., 2004).

Tianying et al., (2005) concluded caffeinated and decaffeinated coffee consumption might prove to be an effective strategy for reducing insulin resistance, especially in overweight women.

Oka, 2007 demonstrated that the prophylactic effects of coffee on diabetes involve pleiotropy of plural components in accordance to the degree of the roasting. A new concept of nutritional blended coffee may be important to optimize the prophylactic effects of coffee on lowering the risk factors of diabetes and delaying the progress of diabetes complications as well.

On the other hand Contrary to our study Kempf et al., 2010 demonstrated that coffee consumption led to an increase in coffee-derived compounds, mainly serum caffeine, chlorogenic acid, and caffeic acid metabolites. , Whereas no changes were seen for markers of glucose metabolism in an oral-glucose-tolerance test.

On the other hand Robinson et al ., 2004 found evidence of a non significant caffeine-induced increase in insulin secretion in men with type 2 diabetes, and Petrie et al ., 2004 found no increase in such insulin secretion in obese men.

In this study the significant decrease in serum calcium and serum phosphorus in groups 3, 4 and 5 fed green, roasted coffee respectively is in agreement with the finding of Barrett-Connor et al., (1994) who reported that caffeinated coffee intake equivalent to two cups per day is associated with decreased bone density in older women who do not drink milk on a daily basis.

Also are in agreement with those of Rapuri, et al ., (2001) who reported that Intakes of caffeine in amounts >300 mg/d (≈514 g, or 18 oz, brewed coffee) accelerate bone loss at the spine in elderly postmenopausal women. They found a significant negative correlation between caffeine intake and calcium intake and suggested that high caffeine consumption per se has a negative effect on bone mineral density (BMD), which may be further accentuated by low calcium intakes. However, they could not gain insight into the mechanism of how caffeine exerts its negative effect because we found no significant changes in any of the biochemical indexes measured.

The decrease in serum calcium may be due to the effect of coffee consumption which caused an increase in endogenous fecal calcium and urinary calcium excretion.

our results on the other hand disagree with those of Sakamoto et al ., (2001) reported that strongly indicates that coffee does not stimulate bone loss in rats. They clarify the relationship between coffee consumption and bone metabolism using male Wistar rats. assigned to three treatment groups including a control-diet group , a 0.62% coffee-diet group, and a 1.36% coffee-diet group. They indicated no significant differences in body weight change, serum and urinary biochemical markers of bone metabolism, and bone histomorphometry were found between the coffee-diet groups and the control-diet group, except that urinary phosphorus excretion after 140 days of both coffee diets was significantly increased compared with controls ($p < 0.05$). In addition, the coffee diets were not associated with differences in tumor necrosis factor-α and interleukin-6, which have been implicated in the pathogenesis of bone loss together with interleukin-1β.

Green, roasted and decaffeinated coffee resulted in a significant decrease ($p < 0.05$) in triacylglycerol (TAG); LDL-C; VLDL-C and in LDL\ HDL ratio and TC \ HDL ratio. on the other hand a significant increase ($p < 0.05$) in serum HDL-C is observed in green, roasted and decaffeinated coffee groups compared to diabetic rats compared to normal control with the highest value for green coffee ,with non significant effect on serum total- cholesterol(TC) reported in this study .

Our results are in agreement with those of Kempf et al., 2010 who reported that coffee consumption led to an increase in coffee-derived compounds, mainly serum caffeine, chlorogenic acid, and caffeic acid metabolites. Significant changes were also observed for serum concentrations of interleukin-18, 8-isoprostane, and adiponectin (8 compared with 0 cups coffee/d). Serum concentrations of total cholesterol, HDL cholesterol, and apolipoprotein A-I increased significantly by r, whereas the ratios of LDL to HDL cholesterol and of apolipoprotein B to apolipoprotein A-I decreased significantly by 8% and 9%, respectively (8 compared with 0 cups coffee/d), this indicate that coffee consumption appears to have beneficial effects on subclinical inflammation and HDL cholesterol.

In accordance to our study Shimod et al.,(2006) reported that serum and hepatic TG levels were lowered with intravenous administration of chlorogenic acid in Zucker fa/fa rats. However, the TG level in the adipose tissue was not lowered. Therefore, chlorogenic acid is suspected to be effective on hepatic TG, and not adipose TG. Chlorogenic acid is also a dietary polyphenolic compound with antioxidative activity. Thus, it is suggested that caffeine, chlorogenic acid and other polyphenolic compounds in GCBE act synergistically to suppress body weight gain and visceral fat accumulation in mice.

Uto-Kondo et al. (2010) hypothesized that coffee may enhance reverse cholesterol transport (RCT) as the antiatherogenic properties of high-density lipoprotein (HDL). Caffeic acid and ferulic acid, the major phenolic acids of coffee, enhanced cholesterol efflux from THP-1 macrophages mediated by HDL, but not apoA-I. Furthermore, .they concluded that Coffee intake might have an antiatherogenic property by increasing of ATP-binding cassette transporter (ABC)G1 and scavenger receptor class B type I (SR-BI) expression and enhancing HDL-mediated cholesterol efflux from the macrophages via its plasma phenolic acids.

Lee ., 2009 demonstrated that coffee may guard against Alzheimer's disease and other forms of dementia and somehow soften the blow of a heart attack.

Ozercana et al. (2006) found that lipid peroxidation products that increased in the plasma and liver tissue of the CCl4 group decreased by (instant coffee) IC administration. There was an increase in the measured antioxidant parameters, which were total antioxidant capacity (TAOC), sulphydryl (SH) and ceruloplasmin levels. They concluded that IC had a protective role in acute liver injury induced by CCl4, but did not affect steatosis.Lopez-Garcia et al., (2006) reported that there is no evidence that coffee consumption increases the risk of CHD.

Our results on the other hand disagree with the fnding of Rodrigues and Klein. (2006) who found that Caffeine is the most widely consumed psychostimulant drug in the world that mostly is consumed in the form of coffee. They examined the effects of caffeine intake, both alone and via coffee consumption, on key blood markers of CVD risk: lipoproteins (cholesterol, triglycerides), fibrinogen (a biomarker of blood clotting) and C-reactive protein (CRP; a biomarker of inflammation). They indicated a strong relationship between boiled, unfiltered coffee consumption and elevated cholesterol levels. Also disagree with those of Ricketts et al. (1993) who suggest that caffeine consumption is associated with increased serum cholesterol and/or low density lipoprotein cholesterol. They confirmed that when consumption of caffeine reaches 200 mg or more total cholesterol significantly increased in males. Low density lipoprotein cholesterol concentrations were somewhat increased in males who consumed 200 mg or more. In women, triglyceride levels significantly increased when dietary caffeine intake was 200 mg or higher. Dietary caffeine intake may be a factor to consider when evaluating serum lipid levels.

5. Conclusion
