The Journal of American Science

The Journal of American Science

The ***Journal of American Science*** is an international journal with a purpose to enhance our natural and scientific knowledge dissemination in the world. Any valuable paper that describes natural phenomena and existence or any reports that convey scientific research and pursuit is welcome. Papers submitted could be reviews, objective descriptions, research reports, opinions/debates, news, letters, and other types of writings that are nature and science related. All the manuscripts will be processed in a professional peer review. After the peer review, the journal will make the best efforts to publish all the valuable works as soon as possible.

Editor-in-Chief: Hongbao Ma (mahongbao@gmail.com)
Associate Editors-in-Chief: Shen Cherng (cherng@msu.edu), Jingjing Z Edmondson (jjedmondso@gmail.com), Qiang Fu (fuqiang@neau.edu.cn), Yongsheng Ma (ysma66@163.com)
Editors: George Chen (chengu@msu.edu), Mark Hansen, Mary Herbert, Wayne Jiang (jiangwa@msu.edu), Chuan Liang, Mark Lindley, Margaret Ma, Mike Ma, Jagmohan Singh Negi (negi_js1981@yahoo.co.in), Da Ouyang (ouyangda@msu.edu), Xiaofeng Ren, Ajaya Kumar Sahoo, Shufang Shi, Tracy X Qiao, Pankaj Sah, George Warren, Qing Xia, Yonggang Xie, Shulai Xu, Lijian Yang, Yan Young, Mona Saad Ali Zaki (dr_mona_zaki@yahoo.co.uk), Tina Zhang, Ruanbao Zhou, Yi Zhu
Web Design: Jenny Young

Introductions to Authors

1. General Information
(1) Goals: As an international journal published both in print and on internet, *The Journal of American Science* is dedicated to the dissemination of fundamental knowledge in all areas of nature and science. The main purpose of *The Journal of American Science* is to enhance our knowledge spreading in the world. It publishes full-length papers (original contributions), reviews, rapid communications, and any debates and opinions in all the fields of nature and science.
(2) What to Do: *The Journal of American Science* provides a place for discussion of scientific news, research, theory, philosophy, profession and technology - that will drive scientific progress. Research reports and regular manuscripts that contain new and significant information of general interest are welcome.
(3) Who: All people are welcome to submit manuscripts in any fields of nature and science.
(4) Distributions: Web version of the journal is opened to the world. The printed journal will be distributed to the selected libraries and institutions. For the subscription of other readers please contact with: editor@americanscience.org or americansciencej@gmail.com or editor@sciencepub.net
(5) Advertisements: The price will be calculated as US$400/page, i.e. US$200/a half page, US$100/a quarter page, etc. Any size of the advertisement is welcome.

2. Manuscripts Submission
(1) Submission Methods: Electronic submission through email is encouraged and hard copies plus an IBM formatted computer diskette would also be accepted.
(2) Software: The Microsoft Word file will be preferred.
(3) Font: Normal, Times New Roman, 10 pt, single space.
(4) Indent: Type 4 spaces in the beginning of each new paragraph.
(5) Manuscript: Don't use "Footnote" or "Header and Footer".
(6) Cover Page: Put detail information of authors and a short title in the cover page.
(7) Title: Use Title Case in the title and subtitles, e.g. "**Debt and Agency Costs**".
(8) Figures and Tables: Use full word of figure and table, e.g. "**Figure 1.** Annul Income of Different Groups**", Table 1. Annual Increase of Investment**".
(9) References: Cite references by "last name, year", e.g. "(Smith, 2003)". References should include all the authors' last names and initials, title, journal, year, volume, issue, and pages etc.

Reference Examples:
Journal Article: Hacker J, Hentschel U, Dobrindt U. Prokaryotic chromosomes and disease. Science 2003;301(34):790-3.
Book: Berkowitz BA, Katzung BG. Basic and clinical evaluation of new drugs. In: Katzung BG, ed. Basic and clinical pharmacology. Appleton & Lance Publisher. Norwalk, Connecticut, USA. 1995:60-9.

(10) Submission Address: editor@sciencepub.net, Marsland Company, P.O. Box 21126, Lansing, Michigan 48909, The United States, 517-980-4106.
(11) Reviewers: Authors are encouraged to suggest 2-8 competent reviewers with their name and email.

2. Manuscript Preparation
Each manuscript is suggested to include the following components but authors can do their own ways:
(1) Title page: including the complete article title; each author's full name; institution(s) with which each author is affiliated, with city, state/province, zip code, and country; and the name, complete mailing address, telephone number, facsimile number (if available), and e-mail address for all correspondence.
(2) Abstract: including Background, Materials and Methods, Results, and Discussions.
(3) Key Words.
(4) Introduction.
(5) Materials and Methods.
(6) Results.
(7) Discussions.
(8) References.
(9) Acknowledgments.

Journal Address:

Abstract. In this paper, some physical and mechanical properties of banana fruits at different level of ripeness were investigated. Relation between various stages of ripeness and these properties were determined and correlation coefficients were calculated. The color of the fruit skin was measured as $L*$, $a*$ and $b*$ in *CIELAB* system. The mechanical properties were extracted from plotted force-deformation curve. A significant difference at 5% level was found between the level of ripeness and these properties. Duncan's multiple range test was conducted and results were reported. Results showed that changes in $L*$, $b*$ and C was similar, also variation of color index (CI) was similar to $a*$. The firmness, rupture energy and hardness decreased as banana fruit ripened. All measured physico-mechanical properties of banana fruit except deformation had High correlation with stage of ripeness. Result of deformation analysis showed no significant difference at various stages of ripeness. The correlation between deformation and stage of ripeness was obtained as 0.2.

Key words: Banana fruit, Physical, Mechanical, Ripening

Neural Network and Wavelet Transform For Classification and Object Detection

Afshin Shaabany [1], Fatemeh Jamshidi [1]

[1] Islamic Azad University, Fars Science and Research Branch, Shiraz, Iran
afshinshy@yahoo.com, Fjamshidi59@yahoo. com

Full Text

Abstract: The practical utilization of object detection and classification, in high-performance structural mine detection or proximity fuses is somewhat impeded due to some complicated phenomena such as: existence of multiple wave modes, jamming, high susceptibility to diverse interferences, bulky sampled data, clutters and difficulty in signal interpretation. An intelligent signal processing approach using the wavelet transform and artificial neural network algorithms was developed; this was actualized in a signal processing package. The intelligent signal processing technique comprehensively functions as signal filtration, data compression and pattern recognition, capable of extracting essential features from acquired raw wave signals and further assisting in structural mine detection or proximity fuses evaluation. For validation, the algorithm was applied to the detection and classification of 10 different objects.

[Afshin Shaabany, Fatemeh Jamshidi. Neural Network and Wavelet Transform For Classification and Object Detection. Journal of American Science 2011;7(5):20-25]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: Wavelet; Classification; Mine detection; intelligent signal processing

Pharmacokinetic of florfenicol (Water soluble formulation) in healthy and Pasteurella infected broiler chickens

H. A. El-Banna and H.Y. El-Zorba

Department of Pharmacology, Faculty of Veterinary Medicine, Cairo University
Corresponding author :elzorba1@hotmail.com

Full Text

Abstract: Florfenicol has been approved in the European Union for use in cattle and pigs as an injectable solution for treatment of respiratory diseases in cattle through injection .But now, it was introduced in some countries as an oral solution for the treatment of several poultry diseases. **The aim** of the present study is to describe the Pharmacokinetics of florfenicol (water soluble formulation)in broiler chickens after either a single intravenous and oral administration (by a dose of 30 mg/kg^{-1} body weight). Meanwhile, comparing its disposition in control healthy and *Pasteurella*-infected broilers. Following the IV

4

5

administration of the drug in healthy and diseased birds, the drug plasma concentration declined in a biphasic pattern. The maximum plasma concentration of florfenicol in control healthy and diseased was reached one hour after its oral administration. But the peak level detected in control broilers was higher than that detected in infected birds. **Conclusion:** Data of the present study showed that volume of distribution, total body clearance in infected birds were higher than that determined in healthy ones. On the other hands, systemic bioavailability were significantly lower (F %,55.6 %) in diseased broiler compared to values determined in healthy ones (F % ,71.5).

Rural women participation in extension activities

Sharareh Khodamoradi [1] and Mohammad Abedi[2]

[1] Department of Agricultural Extension Education, Science and Research Branch, Islamic Azad University, Tehran, Iran
[2]Department of Agricultural Management, Islamic Azad University, Qaemshahr Branch, Iran
*Corresponding author: abedi114@yahoo.com

Abstract: In all communities, rural women are considered as an important factor in achieving rural development goals and in fact are half of the manpower needed for rural development. However, in the rural community of Iran, there are gaps between the ruling class (capital owners) and villagers, between literate and illiterate, and between men and women. Especially in villages women have fewer possibilities in terms of investment and less power and credit. Role of rural women, over of men, is more influenced with different economic, social, cultural and ecologic factors. Rural women are considered as a noticeable potential in the community either directly (crops production, livestock, handicrafts, cottage industries) or indirectly by helping the agricultural sector (as labor).

Effect of Oleozon on Healing of Exposed Pulp Tissues

Rania Sayed Mosallam; Amany Nemat; Ahmed El-Hoshy and Shiro Suzuki.
Lecturer, Department of Operative Dentistry, Faculty of Oral and Dental Medicine, Cairo University, Egypt.
Professor of Oral Pathology, Department of Oral surgery and Medicine, National Research Center
Lecturer of Operative dentistry, Faculty of oral and Dental medicine, Cairo university.
Visiting Professor, Department of Prosthodontics, University of Alabama at Birmingham, School of Dentistry
dr_anemat@hotmail.com

Abstract: Objective: To compare the healing effect of Oleozon and calcium hydroxide on experimentally exposed pulp tissue. **Method:** Direct pulp exposures were conducted in nine dogs, i.e., three dogs were prepared for each experimental period of 7, 30 and 90 days. In each dog the upper and lower canines of the right side were capped with calcium hydroxide (Dycal), while those of the left side were capped with ozonated olive oil (Oleozon). After the observation periods, the teeth were prepared for histomorphological examination. **Results:** The tissues capped with Oleozon revealed inflammation with dilated blood vessels and hemorrhages at 7 days, a slight inflammatory response at 30 days, and the increase of collagen fibers and fibroblast with dilated blood vessels at 90 days. While, the tissues capped with calcium hydroxide exhibited medium degree of inflammation and necrosis adjacent to the exposure site at 7 days, remarkable absorption of necrotic tissues with few collagen fibers and fibroblast at 30 days, and a localized connective tissue capsule with depositions of reparative dentin at 90 days. **Conclusion:** Based upon the results and the limitations of the study, it was concluded that direct pulp capping with Oleozon induced less degrees of

7 | | 7

Full Text

	irritation to the dental pulp compared to that with Dycal. **Clinical significant:** The application of Oleozon paste for direct capping to exposed pulp could have a possibility to serve as a therapeutic method to enhance pulp tissue healing. [Rania Sayed Mosallam; Amany Nemat; Ahmed El-Hoshy and Shiro Suzuki. **Effect of Oleozon on Healing of Exposed Pulp Tissues.** Journal of American Science 2011;7(5):38-44]. 8	**Assessing Advantages and Disadvantages of Distance Learning** [1] Ali Badragheh, [2] Mohammad Abedi [1, 2] Department of Agricultural Extension and Education, Varamin Branch, Islamic Azad University, Varamin, Iran *Corresponding author: abedi114@yahoo.com **Abstract:** most distance education courses offered by traditional colleges and universities that are semester and classroom oriented, with courses offered by most of the DETC-accredited institutions you can study any time and anywhere. Distance education is especially suited for busy people who wish to increase their knowledge and skills without giving up their jobs, leaving home, or losing income. You learn while you earn. Many courses provide complete vocational training; others prepare you for upgrading in your present job, without losing wages, experience or seniority. You receive individual attention, and you work at your own pace. In recent years, technology has played a significant role in transforming the traditional distance education school into a dynamic, interactive distance learning method using toll-free telephone lines, as well as a diverse array of personal computers, video devices, CD and DVD ROMs, online courses over the Internet, interactive devices, and other modern technological innovations. The future for distance study promises to be exciting. The paper is based on the study carried out among 400 citizens of Torbat-Heydarieh. The analysis of data uses Pearson correlation to determine the relationship between variables involved. The findings reveal that two levels of participation (tokenism and citizen-power) have positive and significant relationship with civic engagement, while there is no significant relationship between non-participation level and civic engagement. The findings of the study imply that those respondents who engage more in civic activities would participate in high level of participation in local government. 	Use of Medicinal Plants in the Treatment of Premenstrual Syndrome: A Review	

Use of Medicinal Plants in the Treatment of Premenstrual Syndrome: A Review

Nahid Golmakani [1], Samira Ebrahimzadeh Zagami [2]

[1,2.] Instructor of Midwifery, School of Nursing and midwifery, Mashhad University Of Medical Science, Mashhad Iran. ebrahimzadehzs@mums.ac.ir

Abstract: Premenstrual syndrome is a common condition in women and includes a range of emotional, psychological, and physical symptoms triggered by the menstrual cycle. Complementary and alternative medicine use is more prevalent in the treatment of diseases, and many women use medicinal plants without a physician's prescription. Modified diet and use of herbal medicine may be one effective method in the treatment of premenstrual syndrome. The purpose of this study was to collect information about medicinal plants used in the treatment of premenstrual syndrome. This review studied articles obtained from data bases, *Pubmed, Science Direct, MD Consult, Inter Science,* and *Iran Medex* from 2000-2010. Several studies and trials have shown a reduction of premenstrual syndrome symptoms after consumption of *Hypericum perforatum*, *Vitex agnus castus*, saffron, ginkgo, and soy rather than the placebo group. Medicinal plants can be used in the treatment of premenstrual syndrome if certain precautions are followed. More studies are needed about these and other plants.
[Nahid Golmakani, Samira Ebrahimzadeh Zagami. **Use of Medicinal Plants in the Treatment of Premenstrual Syndrome: A Review.** Journal of American Science 2011;7(5):60-64]. (ISSN: 1545-1003). http://www.americanscience.org.

Effect of Green Tea Extract on the Rat Liver; Histoarchitectural, Histochemical and Ultrastructural Studies

Amal A.A. El Daly

Department of Zoology, Faculty of science, Benha University, Benha, Egypt
ml_eldaly@yahoo.com

Abstract: Green tea consumed worldwide since earliest time considered beneficial to human health due to its specific metabolic activity along with antioxidant effect. This study was headed for investigate the effect of green tea on histoarchitecture and histochemistry as well as the fine structure of rat liver. For this purpose, male albino rats (*Rattus norvegicus*); 3 months age weighing between 100 –120 g were used. The animals group-housed six for each in wire mesh cages fed ad libitum divided into two groups: control and experimental group. The latter was divided into three subgroups; 1%, 1.5% and 3% green tea extract feeding animals. Green tea was received instead of drinking water for 25 days using feeding bottles. After the experimental period, the animals were sacrificed and liver pieces were prepared for both light and electron microscopic examination. The results depicted hypertrophied hepatocytes associated with cloudy swelling. There were some pyknotic and karyorrhectic hepatic nuclei in comparison to the control. Blood vessels appear congested and Blood sinusoids contracted. There was an indication of few collagen fibrils in the hepatic stroma. Hepatocytes had PAS positive deposits in their cytoplasm. Furthermore, hyalinization of the hepatocytes was distinct in the animal's liver feeding on higher doses. The ultrastructural results revealed destructed hepatocytic organelles as well as hypertrophied and irregular contoured hepatocytic nuclei. Moreover, many lipid droplets, few profiles of granular endoplasmic reticulum and destructed mitochondria in the hepatocytes cytoplasm were apparent especially after higher doses of treatment. Though, it was fulfilled that green tea consumption induced an alteration in the liver tissues and its fine structure as well as carbohydrate metabolism. Consequently, another aspect was providing into the cellular response of rat liver toward green tea extract property. It must be carefully using for it's harmfully outcome on long term.

	[Amal A.A. El Daly. **Effect of Green Tea Extract on the Rat Liver; Histoarchitectural, Histochemical and Ultrastructural Studies**. Journal of American Science 2011;7(5):65-73]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Green tea extract, Histoarchitecture, Histochemistry, Ultrastructure, Liver, Rat		
12	**Disadvantages of Online Education: Drawbacks to Consider** Ali Badragheh Department of Agricultural Extension Education, Islamic Azad University, Garmsar Branch, Garmsar, Iran *Corresponding author: badraghehali@yahoo.com **Abstract:** Distance education delivers classes (live or pre-taped) to students in their home, office, or classroom. It is used by K-12, higher education, continuing education and business. As the cost of delivering quality education increases, institutions find that limited resources prevent them from building facilities, hiring faculty, or expanding curricula. They are using distance education to maximize resources and are combining their assets with others to produce programming. Distance education is offered internationally, nationally, regionally, and locally over all forms of conferencing technology. Distance learning is expanding and examples of it are increasing dramatically. Fewer than 10 states were using distance learning in 1987; today, virtually all states have an interest or effort in distance education. Distance learning systems connect the teacher with the students when physical face-to-face interaction is not possible. Telecommunications systems carry instruction, moving information instead of people. The technology at distant locations are important and affect how interaction takes place, what information resources are used, and how effective the system is likely to be. [Ali Badragheh. **Disadvantages of Online Education: Drawbacks to Consider.** Journal of American Science 2011;7(5):74-80]. (ISSN: 1545-1003). http://www.americanscience.org. **Keywords:** Online Education, distance education	Full Text	12
13	**Pros and Cons of Online Classes: Advantages and Disadvantages of Online Courses** Ali Badragheh Department of Agricultural Extension Education, Islamic Azad University, Garmsar Branch, Garmsar, Iran *Corresponding author: badraghehali@yahoo.com **Abstract:** Distance education can be used for some aspects of most disciplines. For example, several institutions of higher education already have developed certificate programs, undergraduate programs, and graduate programs in health and physical education that are delivered using distance education methods. Eastern Oregon University, Emporia State University, Kutztown University, LaSalle University, the Medical College of Wisconsin, University of Wisconsin at Stevens Point, and Virginia Tech are among institutions integrating distance technology into their physical education programs. Traditional programs that are heavily based in skill development and demonstration or require laboratory work can be offered in a distance education framework using interactive video interfaced with computers to facilitate a hands-on learning approach at a distance. Classes that use lecture and laboratory experiences are easily adapted to a distance education situation. Course materials, including animals for dissection, are sent to class participants with video and written instructions and assignments. [Ali Badragheh. **Pros and Cons of Online Classes: Advantages and Disadvantages of Online Courses**. Journal of American Science 2011;7(5):81-87]. [1, 2] Mahabad Branch, Islamic Azad University, Mahabad, Iran
*Corresponding author: fereshteh12150@yahoo.com

Abstract: Diverse agricultural extension funding and delivery arrangements have been undertaken since the mid-1980s by governments worldwide in the name of "privatization." When agricultural extension is discussed, privatization is used in the broadest sense – of introducing or increasing private sector participation, which does not necessarily imply a transfer of designated state-owned assets to the private sector. In fact, various cost-recovery, commercialization, and other so-called privatization alternatives have been adopted to improve agricultural extension. The form and content of decentralization has dominated development discourse and public sector reform agenda in Kenya in the last two decades. The evolution of public agricultural extension arrived at a worldwide turning point in the 1980s, one that represented the end of a major phase in the growth of publicly funded extension in both the developed and developing world. Agricultural extension increasingly has become defined as one or other of (apparently) differentiated activities of technology transfer or rural development. In many situations, the transfer of technology, heretofore considered the purview of public sector systems, has been reconceived. Such changes suggest a refocussing of paradigms for the delivery of public sector extension.

Abstract: The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that. This paper uncovers a whole plethora of ICT emergence as a technology of the new millennium. Against the backdrop of the ongoing ICT boom, this paper makes an attempt towards studying its applications and usage planning process and policy making for the rural communities focusing on how it helps in aligning the key factors and reduce the problems of alienation, fragmentation and dislocation of knowledge. Policy makers and service providers have increasingly come to view information and communication technologies (ICT), and particularly the Internet, as an important tool in providing disadvantaged groups and areas with access to information, services and markets that would otherwise be inaccessible. The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that.

Abstract: Availability of water is the most limiting factor for agricultural sector. More than 90% of the renewable water in the country is used for agriculture, but the sector still cannot provide enough production to meet the demand of the population. On the other hand, with the current conditions the total agricultural

	products from irrigated farming are 56 million ton and total water used for irrigated agriculture is 83 bm^3, therefore water productivity is 0.7 kg/ m^3. For the supply of food for the year 2020 the agricultural production should increase to 160 million ton. Therefore the water productivity should increase to 1.6 kg/ m^3. Therefore, focus on efficient use of water through irrigation efficiency and improvements in management of water use will be the major challenges in the coming years. [Ahmad Reza Ommani. **Water Scarcity and Need for Sustainable Water Use**. Journal of American Science 2011;7(5):98-105]. Multiple studies in Iran showed that, although extension services has played a positive role in agricultural development of Iran, but there are difficulties, barriers, misunderstandings, and weaknesses in the transfer of new technology and information to farmers**.** Lacking the suitable linkage between extension and research organizations has been a barrier for transfer of appropriate new technology to farmers. This problem exists in water sector of agriculture. The major consumer of water in Iran is the agriculture sector. Identifying suitable extension mechanisms have important role to developing extension system. Therefore, identifying extension mechanisms for supporting sustainable water resources management in agriculture of Iran is the one of the major approaches needs to be carefully thought and accurately implemented for the extension system development. Abstract: The most important role of health is providing physical and mental well-being for people of society. Today, the waste problem is focused less than any other environmental hazards such water and air pollution. Purpose of this study is recognition review and analysis state of waste production resources in rural areas of central rural sub city areas of Shiraz and Zabol counties. Research method in this study based on field observation, interviews, obtains data, from the questionnaire, and analyze data by SPSS software. Findings show that most produced rubbish in rural of Shiraz is paper and textile with 63%, maximum street rubbish is animal stool with 42%, and most market waste is vegetable with 69%. In comparing with rural of Zabol, maximum domestic waste is paper 38% and major rubbish production research is dust with 64%, maximum market rubbish is vegetables 58% and major amount of street rubbish is paper with 54%. There is a significant relationship between waste production amount and rural distance to city and between waste component and method of dispose it and distance to city. the studies done in the waste management in studied rural level, shows great part of human and finance resources spend collecting and transport and no action don in the fields of production, storage, recycling and disposal.

20	**Key Characteristics of Adult Education and Literacy Programs** [1]Ali Badragheh, [2]Mohammad Abedi [1, 2] Department of Agricultural Economic, Islamic Azad University, Marvdasht Branch, Marvdasht, Iran *Corresponding author: abedi114@yahoo.com **Abstract:** A distinguishing characteristic of adult education programs is that program content and language must be suitable and respectful of adult clients. For example, instead of using the word "student" which may imply a traditional teacher/student relationship where a student is subservient to the teacher, all state program materials use the word "learner" or "customer." Using this type of language acknowledges the adults' existing knowledge and real-world experience and makes them the focus of the program. The Pennsylvania Adult Basic and Literacy Education Indicators of Program. Quality emphasize the importance of customer satisfaction and learner progress on individualized goals One quality area explicitly states that "program staff and learners jointly develop, regularly evaluate, and update an instructional plan that incorporates the individual's learning styles and preferences" . This is just one example of how learners and staff are equals and collaborate on the learners' participation in the program. [Ali Badragheh and Mohammad Abedi. **Key Characteristics of Adult Education and Literacy Programs.** Journal of American Science 2011;7(5):136-141]. 21	**Learning styles in adult education** [1] Mohammad Abedi, [2] Ali Badragheh [1, 2] Department of Agricultural Economic, Islamic Azad University, Marvdasht Branch, Marvdasht, Iran. *Corresponding author: abedi114@yahoo.com **Abstract:** In the best of all possible worlds, you would incorporate all three learning styles into each of	Full Text	21

	your lessons. However, this is just not possible in the real world of teaching. In truth, it is often not hard to include both auditory and visual learning styles in your lessons. For example, you can have instructions written on the board and say them out loud. However, it is not always as easy to include the tactile/kinesthetic learning style into your lessons. The sad truth is that many students have this as their strongest learning style. It is best to not force the issue but instead find natural places to include kinesthetic learning. If your class warrants it, you could include simulations, role-playing, debates, or the use of manipulative. [Mohammad Abedi and Ali Badragheh. **Learning styles in adult education.** Journal of American Science 2011;7(5):142-146]. 22	**Advances of biological taxonomy and species identification in Medicinal Plant Species by DNA barcodes** Chong Liu [1] Zhengyi Gu[1] Weijun Yang [1]* Li Yang [2] Dilnuer[1] [1.]Xinjiang Institute of Materia Medica/Key Laboratory of Xinjiang Uygur Medicine Urumqi 830004 China liu_chong02@163.com [2.] Pharmacy school of Xinjiang Medical University Urumqi 830004 China **Abstract:** Medicinal Plant Species taxonomy is authenticated according to morphological features. It is a long-standing problem of mixing authentic species with their adulterants in medicinal preparations. However, DNA barcoding is a new technique that uses a short DNA sequence as a molecular diagnostic for species-level identification, Our purpose is to briefly expose DNA Barcode of Life principles, relevance and universality. Barcode of life framework has greatly evolved, giving rise to a flexible description of DNA barcoding and a larger range of applications. Similarly, a variety of single locus or combined loci have been propose as DNA barcodes for the plant identification, which are the coding regions or non-coding regions in plastids or the nuclear genome, such as $rbcL$, $matK$, $rpoB$, $rpoc1$, $psbA$-$trnh$, ITS and $rbcL+psbA$-$trnH$. 23	**Analysis situation of Activity Status in Urban and Rural Area Population of Iran** Mortaza tavakoli PhD, Faculty Member; Department of Geography, University of Zabol, zabol, Iran tavakoli@uoz.ac.ir or tavakoly52@gmail.com **Abstract**: The study has looked into the population of Iran aged 10 and above by activity status and sex including the urban and the rural areas. An analysis of the country's population and activity status could explain the economic and social situations of the state and its people. The increasing unemployment and reduction of goods and productive services may cause some detrimental effects in the society and country's economy. Through the study's assessment on the country's population and activity status, the collaboration of the government and its various sectors can set forth to strengthen human development by investing in human resources and employment. A significant increase in the population rate of male and female students in the rural areas and with the decrease in the rate of homemakers for both sexes is a good sign. This implies that these individuals have seen the potentials of education in empowering them to develop their skills and abilities and obtain necessary knowledge of making a living and becoming a productive individual. Population growth forms formidable barriers to a country's progress and development and this phenomenon is usually attributed to socio-cultural, religious and environmental	[Full Text](#)	23

	factors but with a better understanding of its occurrence will help regulate and control its growth. [Tavakoli mortaza. 24	**Physical and Mechanical Properties of beans** Alireza Shirneshan Mechanical Engineering Group, Faculty of Engineering, Islamic Azad University, Najafabad Branch, Iran arshirneshan@yahoo.com **Abstract:** Food properties are needed and play a significant role to predict and define the quality and behavior of seeds. In this study physical (dimension, weight, volume, sphericity, static coefficient of friction) and mechanical (maximal impact deformation, dynamic coefficient of friction) properties of four common beans are reported. As static coefficient of friction is equal to tangent of slip angle, a suitable apparatus was constructed and static coefficient of friction for four genotypes Daneshkadeh and Dehghan (white color) Naz and Sayyad (Red color) on three surfaces (rubber, tarpaulin and steel galvanized) were measured. Also dynamic coefficient of friction was determined at surface moving velocities of 4, 8 and 12 m/min. Mechanical behavior under impact load were determined in terms of average rupture force in pendulum impact, that is design and constructed. Randomize complete block design showed that, static and dynamic coefficient of friction had major difference between beans genotypes, surfaces and velocity. Mean values showed that the lowest static coefficient (0.32) occurred with steel galvanized surface and highest (0.44) on tarpaulin surface. The lowest dynamic coefficient of friction (0.24) occurred with steel galvanized surface and highest (0.385) on tarpaulin surface. It was observed that the magnitudes of physical damage in Sayad beans were higher than Naz, Daneshkadeh and Dehghan respectively. The average loss of germination to beans decreased with increasing impact energy. Naz and Dehghan had minimum mean volume and weight and Daneshkadeh had maximum sphericity and geometric mean. 25	**Stimulation effect of some bioregulators on flowering, chemical constituents, essential oil and phytohormones of tuberose (*Polianthes tuberos L.*).** [1] Lobna, S. Taha and [2] Rawia, A.Eid Department of Ornamental Plant and Woody Trees.National Research Centre,Dokki, Cairo, Egypt * Corresponding author, emil, lobnasalah82@yahoo.com **Abstract:** Bulbs of tuberose plants were soaked (24h) or sprayed with solutions of spermidine and ATP at 50, 75 or 100ppm for each. Both bioregulators (especially at 100 ppm) augmented plants bulblets and flowering characteristics (No. of bulblets, fresh and dry weights of bulblets, no of days to flowering, No of florets/spike, spike length, length of rachis and fresh and dry weights of spike) Spermidine was more effective than ATP for bulblets parameters but ATP was preferred for flowering parameters, photosynthetic pigments (Chl a, b and carotenoides), chemical constituents of plants (Indoles, phenols and total carotenoides). Essential oil content of flowers was significantly improved by soaking or spraying of ATP at 50, 75 or 100ppm. The highest amount of endogenous GA3 produced with ATP at 100ppm. However, spermdine (100ppm) caused the highest amount of cytokinins. Using ATP as soaking or spraying treatment at 75 or 100ppm resulted in the highest amount of ABA. [Lobna, S. Taha and Rawia, A.Eid. **Stimulation effect of some bioregulators on flowering, chemical constituents, essential oil and phytohormones of tuberose (*Polianthes tuberos L.*).** Journal of American Science 2011;7(5):165-171]. 26	**Lens Protein Changes Associated With Cigarette Smoking** Eman M.Aly * and Eman S. Elabrak Biophysics and Laser Science Unit, Research Institute of Ophthalmology, Giza, Egypt. *e.Aly@hotmail.com **Abstract: Purpose**: Smoking is an independent risk factor that has dose-response effect. The goal of the present work is to study the biophysical and biological effects of smoking on the crystalline lens of the rabbits. **Materials and methods**: Twenty New Zealand albino rabbits used in this study were classified into five groups in which group I (n=4) served as control. The other groups were exposed to different durations of cigarette smoke (five cigarettes per day). Animals were decapitated after 2, 4, 6 and 8 weeks and soluble lens proteins were separated and the following measurements were carried out: estimation of total soluble protein, refractive index measurement, sodium dodocyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) and determination of sodium, calcium and potassium concentrations. **Results**: The results showed that, exposure of the animals to cigarette smoke resulted in decrease of the protein concentration and potassium content that was accompanied by an increase in the refractive index of the soluble lens proteins and an increase in sodium and calcium content. In addition, there were changes in the molecular structure of soluble lens proteins demonstrated by SDS-PAGE. **Conclusion**: smoking causes morphological and functional changes to the lens that may lead to cataract. [Eman M.Aly and Eman S. Elabrak. **Lens Protein Changes Associated With Cigarette Smoking.** Journal of American Science 2011;7(5):172-177]. 27	**Effect of prophylactic antibiotics (Cephalosporin versus Amoxicillin) on preventing post caesarean section infection** Walaa H. Ibrahim [1], A. M. Makhlouf [2], Mervat A. Khamis[1], and Entisar M.Youness*[1]. **[1]Department of Obstetrics and Gynecological Nursing, Faculty of Nursing, Assuit University** [2]Obstetrics & Gynecological Medicine Dept., Faculty of Medicine, Assuit University *entisarmohamedyones@yahoo.com **ABSTRACT:** Prophylactic antibiotics have been shown to be effective in reducing the incidence of febrile morbidity associated with cesarean section after labor. However, the relative effectiveness of different single antibiotics has been studied infrequently. Several new broad spectrum antibiotics are now available, and any further benefit from more traditional antibiotics for surgical prophylaxis remains untested. A randomized clinical trial for testing the efficacy of cephalosporin versus Amoxicillin in preventing post cesarean section infection, and to identify the role of health education about wound care in reducing post cesarean section wound infection. This study conducted at emergency unit of the Obstetrics &Gynecological department, Woman's Health Center, Assuit University Hospital, between 2008 to 2009. Women's undergoing emergency and elective cesarean section were recruited into the study and given either drug as prophylaxis. The sample comprised 200 pregnant women. 100 pregnant women received Amoxicillin and the other 100 pregnant women received Cephalosporin as a prophylactic antibiotic. For each group, 50 women received routine hospital wound care and the other 50 women received health education about wound care. Random assignment was done by computer generated tables. Concealed envelopes containing the random number made to be opened after deciding to include the case in the study. the -present study reported that the percent of surgical site infection (SSI) of elective cesarean section was 2.5% (0.5% in Amoxicillin group and 2% in cephalosporin group) with no significant difference between both groups. We can concluded that use of Amoxicillin as a prophylactic antibiotic as effective as Cephalosporin in preventing post cesarean section wound infection. And women that received health education about wound care are less likely to expose to wound infection than those who receive only routine hospital care, in spite that the comparative results are not significant. 28	**Role of Fine Needle Aspiration Cytology in Diagnosis of Soft Tissue Tumors** Hassan A.Maher Wael[1], Khamis N.Nehal[1] and Hammam M. Makram[1] [1.] Pathology Department, Faculty of Medicine, Suez Canal University, Ismailia, Egypt wael_hassan2@med.suez.edu.eg, **Abstract:** Fine needle aspiration cytology has many advantages that make it a first-choice diagnostic approach in many tumors. However, its role in diagnosing soft tissue tumors has been debated and at times discouraged. The aim of the study is to review the role of fine needle aspiration cytology in diagnosing soft tissue tumors and to establish cytological criteria for the most encountered soft tissue tumors. The databases were searched up to 2010 and a comprehensive review of the relevant literature was performed, focusing on the followings: utility and limitations of fine needle aspiration cytology in the diagnosis of soft tissue tumors, diagnostic efficacy of fine needle aspiration cytology in the diagnosis of soft tissue tumors, the cytological features of the most commonly encountered soft tissue tumors, the role of fine needle aspiration cytology in differentiating benign soft tissue tumors from soft tissue sarcomas and its role in grading and exact subtyping of soft tissue sarcomas. The findings of this review showed that fine needle aspiration cytology in conjunction with ancillary studies, especially immunohistochemistry, along with the clinical and/or radiographic data can approach a diagnostic accuracy of 95% for the diagnosis of soft tissue tumors. Also, placing the sarcoma into one of the five cytomorphological group (pleomorphic, spindle, myxoid, small round/ovoid and epithelioid) is useful to reach a confident diagnosis of benignity or malignancy and to suggest a type-specific diagnosis. However, subtyping or grading spindle cell sarcomas as well as lipomatous tumors are often challenging and the use of immunohistochemistry is mandatory for proper diagnosis of these tumors. [Hassan A.Maher Wael, Khamis N.Nehal and Hammam M. Makram. Role of Fine Needle Aspiration Cytology in Diagnosis of Soft Tissue Tumors. Journal of American Science 2011;7(5):188-199]. 29	**Behavioral Responses of Castrated Buck Kids at Different Ages By Using Different Methods of Castration** **Souad A. Ahmed and Essam A. Ahmed** Department of Animal Hygiene, Behavior and Management, Faculty of Veterinary Medicine, Benha University. Egypt. *souadahmed45@yahoo.com **Abstract:** To evaluate the behavioral responses of kids to castration by burdizzo (Bur), rubber ring (RR) or control handled, 90 buck kids were used. Behavioral responses of kids throughout the 180 minutes after castration or control handled were assessed by using a video camera Castration of younger kids (7 and 21 days) took significantly shorter time than 42 days old. RR produced the highest values of active pain behavior, frequency of elimination, less frequently suck, teat seeking or nibble at feed. The scrotal sloughing was delayed in older kids. Results of questionnaire indicated that most castrations were done at the farm; castration failure was only in some of Burdizzo especially those older than 8 weeks. It was concluded that kids castration must be done as early as possible to reduce the total pain response and for achievement of animal welfare, and Burdizzo method is the preferable technique for castration of kids at all ages. [Souad A. Ahmed and Essam A. Ahmed. **Behavioral Responses of Castrated Buck Kids at Different Ages By Using Different Methods of Castration.** Journal of American Science 2011;7(5):200-209]. Diagnosis of Nutrient Status in Balady Mandarin Orchards of a Newly Reclaimed Area in Egypt

Khalifa, R. Kh. M.; El-Fouly, M.M.; S.H.A. Shaaban[*] and H.A. Hamouda

Department of Fertilization Technology, National Research Centre
[*]shashaaban@yahoo.com

Abstract: The present work aimed to determine the nutritional status of Balady mandarin orchards, through soil testing and leaf analysis, in order to work out a proper fertilization programs. A field study was conducted at El-Tall El-Kepeer, Ismailia governorate, covering 19 Balady mandarin orchards grown on sandy soils under drip irrigation. These soils are of poor fertility. However, fertilization of these orchards still depends upon the grower's inherited knowledge and in very small scale on the extension information. The trees were fifteen years old. The orchard soils had very high pH values, low to high level of EC and Na and were low in total $CaCO_3$ and very low in O.M. The values for available nutrients in soil were found to be as very low of P, Fe, Mn, Zn and Cu. Values of K, Mg ranged between very low to medium levels. However values of Ca ranged between medium to high levels. The leaf macronutrient values were low in N, ranged between optimum to high in P and Mg, ranged between low to high in K, However values of Ca was ranged between low and optimum. The leaf micronutrient contents were as follow, Fe ranged from optimum to high; Mn, Zn and Cu were ranged from low to the beginning of optimum levels. The nutrient correlations of the leaves revealed some antagonisms between K and Ca, Mg and both of Mn and Zn. Also, the nutrient correlations of the leaves and fruits revealed some antagonisms between N in leaves and Zn in fruits, P and K in leaves and Mn in fruits, K in leaves and N, Cu in fruits, Ca in leaves and K in fruits.

Abstract: One of the most aspects of managing of agricultural machinery is control and estimating of repair and maintenance costs. So, this is necessary to introduce mathematical methods to define repair time and machine condition. It reduces repair costs and increases the chance of machine service. In this research, condition monitoring was established to introduce this mathematical model for tractors in Iran. The study was done on MF285 and MF399 as the most conventional tractors in Iran. 120 tractors were selected randomly and their repairing and maintenance costs as well as working time were recorded. The costs for usual methods and control monitoring methods were compared by F test in SPSS software. Results show that the effects of CM can reduce costs in comparison with usual method significantly (Sig=0.002). Finally by assuming cumulative working time (X) as independence and cumulative costs based on definite percent of initial price (Y) as dependence variable a mathematical model was introduced. Powered regression introduced this model as $Y=0.0028\ X^{0.981}$ which can used to estimate repairing and maintenance costs for selected tractors.

34	**The role of indigenous knowledge for sustainable development** Khatereh siyar Department of Agricultural Economic, Islamic Azad University, Qaemshahr Branch, Iran *Corresponding author: khaterehsiyar@yahoo.com	Full Text	34

Abstract: Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources . Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation , and new generation would be adapted with them and add to it . Many experts believe that for making a sustainable development, Indigenous and modern knowledge should be combined. Nowadays, so much efforts have done to make use of Indigenous knowledge but main part of these efforts were done for derivation and making it scientific.

36	### Clinical value of transforming growth factor beta as a marker of Fibrosis in adolescents with Chronic Liver Diseases Elham Abdel Ghaffar, Bahaa El-Din Hassanin, Mona EL-Tokhy* Pediatric & Clinical Pathology* Depart., Faculty of Medicine, Benha University **Abstract: Background:** Hepatic fibrosis is the final common path of liver injury in most chronic liver diseases and can lead to cirrhosis, which is responsible for the majority of clinical complications. Our aim is to asses the clinical value of serum Transforming growth factor (TGF) as a fibrogenesis marker in adolescents with chronic Liver Diseases**. Methods:** We measured serum levels of TGF- in 25 adolescents with chronic liver disease and 25 healthy controls, and determined their relationship to frequently used liver function tests and liver biopsy findings. **Results:** Serum Transforming growth factor was significantly higher in patients than in controls as (P < 0.001). Significant positive correlation between TGF and TSB as r is 0.4682 and p is < 0.05. High significant positive correlation between TGF and (stage, grade of liver fibrosis, PT and duration of illness)as p is < 0.001and r is 0.9409, 0.7447, 0.5293 and 0.5952 respectively. Highly significant negative correlation with prothrombin concentration (PC) and serum albumin level as p is < 0.01 and r is -0.6460 and -0.5371 respectively. Sensitivity of TGF in diagnosis of fibrosis was 65% , specificity 94% and area under curve (AUC) was 0.812.The cut-off value of TGF used to discriminate significant fibrosis was 22.6 ng/ml and it was a dependant predictor factor for diagnosis of fibrosis with positive predictive value 75.5% and negative predictive value 90.4 %.	Full Text	36

	Conclusions: TGF- had the ability to discriminate patients with significant fibrosis. and may be useful in reducing but not replacing the need for liver biopsy. E-mail: a_rajabzadeh@pnu.ac.ir. [3] MSc Student of Industrial Engineering, Department of Industrial Engineering, University of Amirkabir Technology, Tehran, Iran. E-Mail: behravesh@aut.ac.ir. **Abstract:** One of the issues which hinder the execution of strategies in organizations is that it remains in a general level of actions and orientations. In response to this problem, the strategy map attempts to illustrate the organization strategies in terms of cause-effect relations and show how these strategies can change into measurable objectives and specified operations which must be followed by organizational units and also employees. By translating its strategy into the logical structure of the strategy map, Sahand Khodro Company created a common, tangible reference point for all its employees and personnel. In this study, we have translated the strategy of Sahand Khodro Company into operational objectives and evaluators from four aspects of the strategy map. By codifying the strategy map, Sahand Khodro Company was able to achieve greater profitability and better response in relation to all the beneficiaries involving customers, employees, director and owner of the company and the society. [Samad Khabbaz Bavil and Armin Rajabzadeh and Mohammad Behravesh. **Codification of the Strategy Map in Small, Auto-parts Manufacturing Companies (Case Study: Sahand Khodro Company of Tabriz).** Journal of American Science 2011;7(5):260-267]. 38	Prediction of Traditional Climatic Changes Effect on Pomegranate Trees Under Desert Condition in EL-Maghara, Egypt **Seidhom, S.H. and Abd-El-Rahman, G.** ater Requirements and Meteorology Unit, Chemistry and Soil Physics Department, Desert Research Center, El-Matareya, Cairo, Egypt. **Abstract:** The main aim of this study is to combat and forecasting climate changes, with some soil managements in El-Maghara Research Station at North Sinai, Egypt, on pomegranate trees. The applied treatments were irrigation intervals and soil mulching with drip irrigation in the desert sandy soils and its impact on the water use efficiency and saving of irrigation water. A field experiment was carried out through split plot design during the three seasons 2008, 2009 and 2010 with pomegranate trees have 9 years age, planted at distances 3.6 X 3.6 meters (324 tree/fed). Experiments included 72 test unit consists of three irrigation intervals (2, 4 and 6 days) and three soil mulching practices under the trees (control without mulch, bitumen mulch and olive pomace mulch) and four replicates each have two trees, as the	Full Text	38

amount of irrigation water was calculated according to Penman - Monteith equation for data the last 10 years of the meteorological data of the region. The results were analyzed statistically, which were as follows: (1) There is a detected local climatic change for the main meteorological data of the site compared either with 10 or 30 years recorded data. These changes are partially caused by the global climatic change in one hand and to the local Oasis effect in the site in the other hand. These changes play a positive role in enhancing the yield of pomegranate trees referring to the horticulture references. (2) A significant increase of the values of pomegranate fruit yield, crop water use efficiency, water economy, water saving, total revenue and total profit by increasing of air temperature and humidity of the atmosphere and increasing the irrigation period to 6 days. Olive pomace mulch under the trees, gave a higher yield than bitumen mulch, and without mulch. (3) Significant decrease values of water consumptive use, crop coefficient of pomegranate, irrigation water use efficiency coefficient and environmental stress coefficients by increasing the irrigation period to be 6 days. Olive pomace mulching under the trees gave a higher yield than bitumen mulch and then without mulch. (4) The highest for the application of economic olive pomace mulch under irrigation with a period of 6 days. In all cases, the applied treatments get higher investment ratios (IR) than the traditional one (2.25 LE/IL). The study recommends with using drip irrigation every 6 days by the amount of irrigation water calculated according to Penman-Monteith equation without addition leaching requirements, with plants residues mulch such as olive pomace under the trees, which gave the highest return of one pound investment with ~ 3.07 LE., taking into account the vulnerability of the study area to the phenomenon of the Continental and Oasis effect, under conditions similar to the study area.

Deterioration and Diffusion Studies of Radioactive Wastes from the Concrete Matrix by Dynamic Method

A. El- Dakroury
Hot lab. Center and waste management
Atomic Energy Authority, P.O. 13759 Cairo Egypt
Aishaw95@yahoo.com

Abstract: In designing radioactive waste repositories, it is necessary to predetermine the degree of cement performance change due to leaching degradation. Cement is a porous material and consists of solid phases in contact and in equilibrium with a pore water solution. The progress of degradation can be expressed in terms of water exchange cycles or speed of diffusion of ions in the pore solution. Cementitious materials are fundamentally unstable in water and will change properties with time. High pH conditions of aqueous solutions in a radioactive waste repository can be brought about by dissolution of cementitious materials. In order to clarify the mechanisms involved in maintaining this high pH for long time, the dissolution phenomena of cement hydrate was investigated. In the present research, leaching tests on powdered cement hydrates were conducted by changing the ratio of mass of leaching water to mass of cement hydrate Ordinary Portland cement hydrate was contacted with pour water and placed in a sealed bottle. After a predetermined period, the solid was separated from the solution. Calcium hydroxide is one of the main reaction products resulting from the hydration of Portland cement with water. It is also one of the more soluble phases found in hydrated cement systems. Study's the influence of calcium hydroxide dissolution and its effect under the dynamic leaching system .From the results of XRD analysis on the solid phase and the calcium concentration in the aqueous phase, it was confirmed that Ca (OH) $_2$ was preferentially dissolved when the liquid/solid ratio was 30 to 35 %, and that C–S–H gel as well as Ca (OH) $_2$ were dissolved when the liquid/solid ratio was 45% or larger. The crystalline phases were identified using X-ray diffraction .The leaching of ^{137}Cs was carried out according to the ANSI/ ANS -16.1.

41	**Serum Fetuin-A levels in type 2 diabetes patients with early diabetic nephropathy: Its relation to diabetes control** Ayman Ramadan[1], Amira Shoukry[1], Mabrouk Ibraheim Ismail[1], Maher Borai[2] [1]Internal Medicine and [2]clinical Pathology Departments, Zagazig University, faculty of medicine, Zagazig, Egypt. Aymedman@yahoo.co.uk **Abstract: Background and objective:** Fetuin-A is a circulating calcium-regulatory glycoprotein that inhibits vascular calcification. In the present study, serum fetuin-A was studied as a novel risk factor for the development of diabetic nephropathy and the relation between its levels with the state of diabetes control. **Patients and Methods:** 50 patients with type 2 diabetes mellitus (DM) and early diabetic nephropathy, 25 patients of them have well controlled diabetes on treatment (the first group), the other 25 patients have uncontrolled diabetes (the second group), and another 25 healthy volunteers (control group)) were enrolled in this cross sectional study. Serum fetuin-A, Fasting plasma glucose(FP glucose) , glycated hemoglobin A1c, lipid profile (total cholesterol, HDL, triglycerides), Serum creatinine, Glmerular filtration rate (GFR), Albumin excretion in urine were measured. **Results:** There was a significant reduction in Serum fetuin-A levels in controlled diabetic patients (314 ± 66.8) and uncontrolled diabetic patients (252.4 ± 55.6) patients compared to control group (478.6 ± 74.4). A significant decrease was also detected in uncontrolled diabetic patients when compared to controlled diabetic patients ($P<0.001$). A strong inverse correlation was found between serum fetuin-A and each of F P glucose , glycated HBA1c, serum creatinine,and albumin excretion in urine ($P<0.001$). whereas; GFR was significantly positively associated with serum fetuin-A levels ($r = 0.53$, $P<0.001$). **Conclusion:** The results of this study demonstrate that diabetic nephropathy, especially with uncontrolled diabetes, is linked to low fetuin-A which represents a novel risk factor for the development of vascular complications. This factor could be responsible for the development and progression of accelerated nephropathy especially with uncontrolled diabetes. Mohammad* And Hani M. Abd El-Aal** Departments of Community Medicine and Obstetric & Gynecology**,** Faculty of Medicine, Al-Azhar University. dr_elmoselhy@hotmail.com **ABSTRACT: Introduction**: Pre-eclampsia (PE) represents a major cause of morbidity and mortality in mother, fetus and infant in many parts of the world. **Objectives**: The aim of this study was to investigate the behavioral, socio-demographic and clinical risk factors of PE among pregnant mothers and to define the impact of PE on health of the fetuses and neonates. **Subjects and methods**: A case-control, hospital based study design was used. All the cases and controls were interviewed and examined; clinically and laboratory. **Results**: Multiple gestations, rural residence, mothers married more than once, inter pregnancies' interval <3 years, primi-gravida, low social level and maternal age group 26-30 years were significant socio-demographic and personal risk factors (OR=9.79, 4.16, 4.0, 2.73, 2.16, 2.16 and 1.98, respectively). Further, much salty diet intake, no adequate fresh fruits/vegetables and much fat were significant dietary risk factors (OR=1.99, 1.85 and 1.83, respectively). Also; urinary tract infection, vaginal infection/ vaginosis, asymptomatic bacteriuria, polyhydraminos, diabetes and stress were significant medical and obstetric/gynecologic risk factors (OR=5.59, 4.41, 3.62, 3.59, 3.35 and 2.98, respectively). Fetal growth restriction, preterm labor, neonate birth weight <2.5 kg and neonate intensive care admission were more common in pre-eclamptic mothers compared to controls with statistically significant differences (P=0.00, 0.04, 0.03 and 0.02, respectively). The mean of 1- and 5-minute Apgar scores were significantly lower in newborns of pre-eclamptic mothers compared to controls (P=0.00 for each of them). Also, the mean Hb level was significantly lower in newborns of PE cases compared to controls (P=0.00). **Recommendations**: Improving ante-natal care for pregnant mothers in Egypt. Population based studies are needed in different areas in Egypt and on large numbers of mothers to understand the full epidemiology of PE. [Essam A. El-Moselhy; Hamed O. Khalifa; Soliman M. ABSTRACT: Introduction: Pre-eclampsia (PE) is a multi-factorial and a multi-system disease. Selenium (Se) may be one of the disease causes. **Objectives**: The aim of this study was to find out the mean level of amniotic fluid selenium and the biochemical profile among the pre-eclamptic mothers and controls in Cairo, Egypt. **Subjects and methods**: A case-control, hospital based study design was used. All the cases and controls were examined laboratory. **Results**: The mean amniotic fluid Se level was lower among pre-eclamptic cases; total, mild and severe compared to controls with a statistically significant differences ($P=0.00$, 0.00 and 0.00, respectively). Further, the difference was statistically significant between mild and severe cases ($P=0.00$). Also, the mean hemoglobin level, mean hematocrit percent and mean platelet count were lower among pre-eclamptic cases compared to controls with statistically significant differences ($P=0.00$ for each of them). While; the mean lipid profile (except SHDL- cholesterol), mean liver enzymes levels, mean blood urea level, mean fasting blood glucose level and indicators of infections and/or inflammatory processes, mean total leucocytic count and mean C-reactive protein level were higher among pre-eclamptic mothers compared to controls with statistically significant differences ($P=0.00$ for each of them). On the other hand, the mean serum createnine level was higher among pre-eclamptic cases compared to controls with a statistically insignificant difference. Further, these differences were also present between the mild and severe PE cases. Lastly, the most important significantly correlated factors of severe PE were low amniotic fluid Se, high total leukocytic count, high fasting blood glucose and C-reactive protein levels ($P=0.01$, 0.02, 0.02, 0.03, respectively). **Recommendations**: Early ante-natal care, including health education, and treatment of pre-eclamptic women are recommended. Se supplementation may be a way to prevent PE. Population based studies are needed in different areas in Egypt on large number of pregnant women to determine their biochemical profile and to find out other possible trace element deficiencies that might be risk factors for PE.

gamalthabet@gmail.com

Abstract: Background: Mercaptopurine is one of the most important drugs used in cancer treatment. Its elimination depends mainly on the enzyme Thiopurine S-methyl Transferase (TPMT). A number of known genetic polymorphisms can affect the activity of this enzyme. **Aim of the work**: to study the pattern of TPMT polymorphisms in a cohort of Egyptian patients with ALL and its impact on response to therapy and toxicity. **Patients and methods**: the study included 52 low-risks pediatric ALL patients treated by (PNCI XIII LR Protocol). TPMT genotype was done for common mutations using polymerase chain reaction-based assays. Clinical follow-up, documentation of events, and 6-MP dose reductions were performed throughout the maintenance phase in a double blinded fashion. **Results:** TPMT genotyping showed that 40 patients (76.9%) have the wild type and 12 patients (23.1%) have the mutant type, two (3.85 %) of which were homozygous for G238C and ten were heterozygous (19.25%). TPMT mutant patients, especially homozygous, were at greater risk of 6-MP toxic effects and needed more frequent dose reductions. Mean duration of missed therapy was 50.250 weeks for the mutant patients vs. 25.825 weeks for wild-type patients (**P < 0.001**). **Conclusion:** TPMT heterozygous and homozygous patients require lower doses of 6-MP.These results justify performing TPMT genotyping before initiating 6-MP therapy in all children with ALL to minimize consequent toxicity through dose modifications.

46	**Assessing of Adult Learning Principles** Ali Badragheh Department of Agricultural Extension Education, Garmsar Branch, Islamic Azad University, Garmsar, Iran *Corresponding author: badraghehali@yahoo.com **Abstract:** Transfer of learning is the result of training and is simply the ability to use the information taught in your program but in new settings and contexts. As with reinforcement, both types of transfer: positive and negative should be used in the program approach. Positive transference, like positive reinforcement, occurs when the learner uses the skill learnt in your program. It is very important for any learner's orientation to the new skills they develop that they can practice in their own situations. Using knowledge from financial literacy training to work out the best way to use (or not use) credit in their lives is an important tool that many participants could use immediately. Participants can check how much credit debt they have, what interest they are paying and what alternatives there may be. Negative transference, again like negative reinforcement, occurs when the learners applying the skill do not do what they are told not to do. This also results in a positive (desired) outcome. This means it's important to find out what the participants in your program have been using their new skills for. Check to see if they are applying the techniques properly or whether they have misunderstood a key aspect of the program. Once wrong information is absorbed and used again and again it simply becomes another bad habit that could make financial decision-making worse instead of better. [Mohammad Abedi, Ali Badragheh. **Assessing of Adult Learning Principles.** Journal of American Science 2011;7(5):347-353]. 47	**Principles of Adult Learning in agricultural education** Ali Badragheh Department of Agricultural Extension Education, Garmsar Branch, Islamic Azad University, Garmsar, Iran *Corresponding author: badraghehali@yahoo.com **Abstract:** As we know reinforcement is a very necessary part of any teaching/learning process. Through it, trainers encourage correct modes of behaviour and performance and discourage bad habits. Your program should use both reinforcement techniques throughout. Positive reinforcement is normally used when participants learn new skills. As implied, positive reinforcement is "good" and reinforces "good" (or positive) behaviour. Negative reinforcement is useful in trying to change bad habits or inappropriate modes of behaviour. The intention is extinction -- that is, the trainer uses negative reinforcement until the "bad" behaviour disappears or the learner understands why past practice is not beneficial to them. Examples could be ensuring participants always compare different rates of interest available to them before signing up for any new debt (a positive reinforcement) and not considering credit purchases that leave them with no income safety net for unforeseen circumstances (negative reinforcement). [Ali Badragheh, Mohammad Abedi. **Principles of Adult Learning in agricultural education.** Journal of American Science 2011;7(5):354-361]. (ISSN: 1545-1003). http://www.americanscience.org. Development Partnership in Practice: The Sawah Technology

[1]Oladele O. I and [2]Wakatsuki T

[1]Department of Agricultural Economics and Extension, North-West University, Mafikeng Campus, South Africa, oladele20002001@yahoo.com,[2]Faculty of Agriculture, Kinki University Nara Japan wakatuki@nara.kindai.ac.jp

Abstract: This paper examines the process of technology development and dissemination with respect to sawah rice production. The term sawah refers to man-made environment for rice production that includes levelling and bunding of rice fields with inlet and outlet connecting irrigation and drainage. It has been hypothesized that sawah rice production technology holds the ace to the expected green revolution in West Africa as a yields of 5t/ha have been obtained. The process of sawah rice technology development and dissemination is exploring strategic synergy and partnership among Japanese institutions, research institutes, Ministry of agriculture, extension agencies, farmers groups, Millennium Village and Universities in Nigeria and Ghana which can be described as an emerging innovation system for rice production in West Africa. The partnership was empirically ascertained in terms of involvement, kind of involvement and intensity of involvement of the various stakeholders in the areas of joint problem identification (JPI), joint priority setting and planning (JPSP), collaborative professional activities (CPA), joint On- farm Adaptive Research (OFAR), dissemination of knowledge (DK), joint demonstration trials (JDTR), joint field days (JFD), joint seminar and workshop (JSW), evaluation survey (ES), and evaluation meeting (EM). A structure questionnaire was used to elicit information from a list activities identified among the stakeholders. Data collected were subjected to percentage distribution and one way analysis of variance to determine differences in the involvement of each of the actors. The results show varying degrees of involvement, types of involvement and different levels of intensity. While Japanese institutes are very prominent in funding and training, scientists and farmers are prominent in problem identification and joint demonstration trials. The implications of the results are discussed and pragmatic suggestions made for a proactive revamping of the process of technology development and dissemination for rice production in West Africa.

Abstract: Electrodepsition of nickel from solutions containing nickel sulfate, boric acid, ammonium sulfate and sodium gluconate on copper substrate has been investigated. The study dealt with the influence of bath composition, current density, pH and temperature on cathodic current efficiency as well as the effect of urea, aniline sulfate and chloramine B as additives on the corrosion behavior using Potetiodynamic polarization curve and morphology of the deposited nickel using scanning electron microscopy (SEM). The optimum conditions for producing nickel deposits from the free additives baths were: 0.2 mol/l $NiSO_4.6H_2O$, 0.2 mol/l sodium gluconate, boric acid 0.4 mol/l, ammonium sulfate 0.4 mol/l, pH 8,current density of 2.5 A/dm^2 and at 25 ^{0}C. The same conditions were used in the presence of

Full Text

49

additives, under these conditions the cathodic current efficiency was 96.5% which decreased sharply with increasing temperature. These coatings have high corrosion resistance in comparison with Cu-substrate. However the surface morphology of the deposits varies from spherical grain to columnar in the absence and presence of additives, respectively.

Abstract: The main objective of this study provides a strategy for rural development. Empowerment of rural areas has emerged as an important issue in recent times. The economic empowerment of rural is being regarded these days as a sine-quo-non of progress for a country; hence, the issue of empowerment of rural areas is of paramount importance to community developers, social scientists and social reformers. Empowerment can enable the local people to participate in the economic, political and social sustainable development of the rural communities. The findings of this investigation can assist rural developers in the implementation of rural development strategies based on rural empowerment.

Abstract: "Noise" or "unwanted sound" is one of the major sources of discomfort to the workers which affects human both psychologically and physically. The present investigation was conducted in Iran during the period from September to November 2010. The noise pollution caused by tractor and load were measured in open field with no obstruction and at the driver ear and by stander in accordance with NIOSHA standards. A ITM 399 (without cab) and Valtra T170 (with cab closed and open) and mold board plow and disk plow were used. Unloaded tractor noise was also measured. The data analyzed for different engine speed and gears. Results showed that the Sound Pressure Level (SPL) in the driver ear for the tractor without cab in all cases were more than NIOSH allowable 85 dB(A) criteria for eight hour of operation. The SPL of the tractor with open windows cab was also higher than the standards but lower than the tractor without cab. It was concluded that the driver should either stay on driving for less than 2 hours with tractors without cabin or open window cabin or the only best way, tractors should be equipped with factory made cabins. Even with the latter type of tractors, drivers should avoid opening the window very often for say checking the operation of the machinery behind the tractor or in case the air conditioner malfunctions.

53	**Lateral Tarsal strip technique for correction of lower eyelid Ectropion.** Mohamed A. Marzouk* , Ayman A. Shouman , Ehab S.Elzakzouk and M.Tarek A.Elnaggar Research Institute of Ophthalmology – Giza – Egypt. *marrzouk@hotmail.com **Abstract: Purpose:** Lateral tarsal strip technique is a simple procedure that can be used in the presence of lateral canthal tendon laxity or malposition. The technique was used in this study on cases of involutional , paralytic, and cicatricial ectropion .The surgical outcome from different types of ectropion was compared and evaluated. **Patients and methods:** This retrospective study reviewed records of 30 patients who had undergone lateral tarsal strip from January-2008 to December-2010. All records were examined to determine the indication, management, outcome, postoperative complications and success rate. **Results:** A total of 17 males and 13 females made up the study groups. The mean age of the cohort was 59.15 +\- 6.2 yrs (range 4- 65 years).The average follow up was 24 weeks (6 months).The patients were divided into 3 groups:Group A: 10 patients with bilateral involutional ectropion (20 lids). Group B: 10 patients with unilateral paralytic ectropion (10 lids). Group C: 10 patients with cicatricial ectropion 9 unilateral and 1 bilateral (11 lids). Most common presenting feature was persistent tearing, which was seen in all patients, others included lid laxity, lagophthalmos and unacceptable cosmesis. Thirty-five lids obtained satisfactory correction of eyelid ectropion with a simple LTS surgical procedure, while six lids required additional intra operative ancillary procedures to correct the remaining skin laxity, scleral show and residual ectropion. Common ancillary procedures used were excision of skin and muscle strip, lateral tarsorraphy and scar revision in severe cicatricial ectropion. Good aesthetic and functional results were achieved in all cases.**Conclusions**: Lateral tarsal strip is a simple technique, which can be used in different types of eye lid ectropion. The technique is directed at correcting the anatomical defect, preserving the natural anatomy and maintaining the integrity of tear passage and outflow, rendering excellent cosmetic and functional results. The ancillary procedures used in our study are suggestive of a very specific role for lateral tarsal strip as a sole treatment in correcting various types of eyelid ectropion. [Mohamed A. Preferred Educational Strategies and Critical Thinking Dispositions among Nursing Students

Full Text

54

[1*] Eman El-Sayed Taha , [1]Zinat Ibrahim El Hawashy,[2] Shadia Abou Donia, and [1] Doaa Demerdash

[1]Nursing Education Department, [2] Medical Surgical Nursing Department, Faculty of Nursing, Alexandria University, Egypt
[*]eman_said303@yahoo.com

Abstract: Thinking dispositions are characterological in nature, and like many human character traits, they develop in response to immersion in a particular cultural milieu. The cultural milieu that best teaches thinking dispositions is a culture of thinking environment that reinforces good thinking in a variety of explicit ways. The effective program for teaching thinking dispositions, therefore, should create a culture of thinking in the educational system. Critical thinking is a desirable outcome; so to develop and practice critical thinking; educators need to re-consider course content and curricular strategies used to develop critical thinking. The study aimed to determine nursing students' preferences of educational strategies and their critical thinking dispositions. This study was conducted at the Faculty of Nursing, University of Alexandria. The subjects of this study consisted of (50%) of the total number of students of each academic level comprising 630 students. The students' total score of critical thinking dispositions had significant relation with nine preferred educational strategies out of twenty four. They strongly preferred the following educational strategies: role play, demonstration, portfolio computer assisted instruction/e- learning and panel discussion. While they moderately preferred the following educational strategies: interactive lecture, case study, questioning and nursing round. Finally, they never preferred written assignment. Based on the finding of this study annual assessment of students' CTDs using the CCTDI is carried to select educational strategies that reinforce the positive dispositions and change the negative and ambivalent ones towards the positive inclination.

Abstract: adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones. Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture. Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

56	**Evaluation of Canopy Cover of Street Trees in Urban Forests Using by Satellite Data** Seyed Armin Hashemi Department of Forestry, Lahijan Branch, Islamic Azad University, Iran. hashemi@iau-lahijan.ac.ir **Abstract:** Information on structure of city forest such as species composition and canopy cover density is a prerequisite for planning, design and management of vegetation in cities in local and regional scale. For this purpose in present study, different inventory methods Including 100% inventory by using 20meters transects and aerial images (1:8000 scale) and spot satellite image were compared for evaluating canopy cover surface of street trees with 1 kilometer length is Sep2009 , to develop an optimum and suitable method to evaluate canopy cover of these trees. In 100% inventory considered as the basis for comparing with various methods, canopy surface of these trees was calculated in each 15m transect. Results of paired –T test indicated that results of 100% inventory and aerial photos ($p = 0.52$, $t = 0.809$, $df = 23$) and satellite image ($p = 0.48$, $t = 0.847$, $df = 23$) don't differ significantly. Regression results indicated that using aerial images ($R^2 = 0.92$) and spot images ($R^2 = 0.89$) is relevant to evaluate street trees canopy cover. 57	**Anionic Schiff Base Amphiphiles: Synthesis, Surface, Biocidal and Antitumor Activities** **Nihal O. Shaker; [*]Fatma H. Abd El-Salam; Bahyia M.El-Sadek; Eman M. Kandeel and Sharbat A. Baker** Chemistry Department, Faculty of Science (girl's branch), Al-Azhar University, Nasr City, Cairo, Egypt, B.O. 11754. [*]prof_drfatma@yahoo.com **Abstract:** A series of anionic surfactants containing schiff base group was synthesized and their chemical structures were confirmed using elemental analyses, FTIR, ^{1}H-NMR, and mass spectroscopy. The surface activities of these amphiphiles were determined based on the data of surface and interfacial tensions. Thermodynamics of adsorption and micellization processes of these surfactants in their solutions were also calculated. It was found that these compounds have tendency towards adsorption at the interface and also micelle formation at lower concentrations. Also, these schiff bases amphiphiles have been evaluated for their biocidal activity against bacterial and fungi species and their antitumor activity against three human tumor cells such as $HEPG_2$ (liver), HCF_7 (breast) and HCT116 (colon). [Nihal O. Shaker; Fatma H. Abd El-Salam; Bahyia M.El-Sadek; Eman M. Kandeel and Sharbat A. Baker Anionic Schiff Base Amphiphiles: Synthesis, Surface, Biocidal and Antitumor Activities. 58	**The study of relation between biodiversity indices of woody species and growing stock in natural forest stands** Seyed Armin Hashemi [1] [1.] Department of Forestry, Lahijan Branch, Islamic Azad University, Lahijan, Iran. hashemi@iau-lahijan.ac.ir **Abstract:** In order to determine the relationship between diversity indices of woody species and growing stock per hectare in natural beech (*Fugus orientalis Lipsky*) Forests, Twenty sites specially at middle	Full Text	58

	elevations were studied including three plots per each site . The dimension of each plot was 50 ×100 meters. The method of surveying was selective sampling. Results indicated there are positive linear regression between the biodiversity indices and growing stock per hectare. The best equation were obtained from the relationship between Brillouin index and growing stock per hectare(r =0.95). **Key words:** Biodiversity indices of woody species , Growing stock , Beech , Natural forest stands		
59	Gene Action Studies of Different Traits in Maize (*Zea mays* L.) Under Heat stress and Normal Conditions Zahra Khodarahmpour Assistant Professor of Department of Agronomy and Plant Breeding, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran Zahra_khodarahm@yahoo.com **Abstract:** The present study was carried out to determine the type of gene action, genetic parameters of yield and other quantitative traits by crossing eight diverse maize inbred lines in partial diallel fashion. Seeds of F_1 population along with their parents were evaluated in year 2010 in Shoushtar City (Khuzestan province in Iran) using a randomized complete block design with three replications. Genotypes planted at two dates, 6 July (to coincide heat stress with pollination time and grain filling period) and 27 July (as normal planting). Estimation gene effects and some of genetic parameters and graphic plot drawing to Hayman – Jinks method revealed statistics a and b significant for all traits in two conditions. Considering the average dominance degree and Hayman graphical plot, dominant effects for hektolitr weight trait under heat stress condition and for grain yield under normal condition, over dominance as well as partial dominance for other traits, were revealed. **Key words**: Maize; heat stress; genetic parameters; grafic plot	Full Text	59
60	Genetic Analysis of Yield and Qualitative Traits in Maize (*Zea mays* L.) Under Heat stress and Normal Conditions Zahra Khodarahmpour Assistant Professor of Department of Agronomy and Plant Breeding, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran Zahra_khodarahm@yahoo.com Abstract: The present study was carried out to determine the type of gene action and genetic parameters of yield and qualitative traits by crossing eight diverse maize inbred lines in partial diallel fashion. Seeds of F_1 population along with their parents were evaluated in year 2010 in Shoushtar City (Khuzestan province in Iran) using a RCBD with 3 replications. Inbred lines and hybrids planted in two separate experiment at two dates, 6 July (to coincide heat stress with pollination time and grain filling period) and 27 July (as normal planting). Diallel analysis to Griffing᾿s method 4 and model II were performed. Also estimation gene effects and some of genetic parameters to Hayman – Jinks method revealed. Grain yield in stress condition of the highest ratio GCA/SCA was enjoyed that show additive effect role important. But; other traits of ratio GCA/SCA low were enjoyed. Hybrid K18×K166B of positive and significantly combining in two conditions for grain yield were enjoyed. Analysis of variance of F_1 data showed significant differences for statistics a and b, suggesting the presence of both additive and	Full Text	60

dominance genetic effects in the expression of all traits. The average dominance degree for grain yield trait under normal condition and grain protein percent in heat stress, over dominance as well as partial dominance for other traits, were revealed.

| 61 | **Introduction the medicinal species of *Asteraceae* family in Ilkhji region and Sharafaldin regions of Esat Azarbaijan in Iran** | Full Text | 61 |

Leila joudi*,   Ghassem Habibi Bibalani, Hamide shadkami

Department of Agriculture, Shabestar Branch, Islamic Azad University (**IRI**)
Leila.judy@yahoo.com

Abstract: As medicinal plants are suitable alternatives for synthetic and chemical drugs (Idu and Osemwegie) also because of medical and nutritional importance and valuable protein contents of Asteraceae species, all plants of *Asteraceae* family are collected in Ilkhji and sharafaldin regions during growth seasons of 2007-2009. Plants were collected in 2 regions according to the classical method of regional floristical studies. Collected plants were recognized by valid references (Parsa and Reshinger). Then medical species are chosen by using pharmacopeias. The results of the current study demonstrated that at Ilkhji region 31 species belong to 24 genuses and at Sharafaldin region 25 species belong to 20 genuses that all of them belong to Asteraceae family. Among these species, 19 species at Ilkhji and sharafaldin region had medicinal properties. Medicinal species of these 2 regions consist of: Achillea tenuifolia, Achillea vermicularis, Achillea millefolium, Arctium lappa, Acroptilon repens, Cardus pycnocephalus, Carthamus oxyacantha, Centaurea aggregate, Cichorium intybus, Cirsium ravens, Cnicus benedictus, Cousinia calcitrapa ,Lactuca scarioloides, Lactuca serriola, Onopordon leptolepis, Senecio mollis, Sonchus oleraceus, Tragopogon marginatus, Xanthium spinosum. The results of this study showed that the region has a great potential for producing respective medicinal plants species belong to those families. Medicinal plants recently become more important because of their medicinal uses and in addition they are valuable source of protein.

| 62 | **Manifestation of Existential Issues As a Brilliant Function for Quality of Matrimony** | Full Text | 62 |

Seyed Mohammad Kalantarkousheh[1], Siti Aishah Hassan[2], Rusnani Abdul Kadir[2], Mansor Abu Talib [2]

[2.] Universiti Putra Malaysia. kalantar.counseling@kiau.ac.ir

Abstract: There are some important issues in marital counselling which are discoursed in Existential thought. These issues are freedom, time, human communication, meaning of life, and anxiety, which are shared by the existential counsellors and philosophers. Even though there are full potentials of the existential issues to be applied during counselling sessions, most of them are ignored by couple counsellors. The purpose of this article is to highlight these issues as the key concepts in four different counselling theories of Existential thought. We found that, each theory used only certain issues as the key concepts. Therefore, this study gathers all of the applied existential issues for a future comprehensive marital counselling model. Applying these issues together seems to be a brilliant function for quality of matrimony.   Journal   of   American   Science   2011;7(5):459-465].   (ISSN: 1545-1003).

63	**Verbal Abuse and Coping Behaviors Directed to Operating Room Nursing Staff at University Hospitals** Hala A. Abdou Nursing Administration Dept. Faculty of Nursing, Alexandria University, Egypt h_abdou_eg@yahoo.com **Abstract:** Verbal abuse is a most common form of workplace violence in the operating room settings. It affects operating room nurses personally and professionally. Such effects have a major implication for nursing profession in term of retention, satisfaction, and quality of care. So, the occurrence of verbal abuse depends on a great extent of coping behaviors among nurses working in the operating room environment. Thus this study aimed to determine the relationship between verbal abuse and coping behaviors directed at operating room nursing staff at university hospitals. This study was conducted in all operating room (n = 65) in five major governmental hospitals affiliated to University hospitals, Egypt. The subjects consisted of 206 operating room nursing staff categorized into operating room head nurses (n=16) and operating room nurses (n=190) working in the above mentioned settings. The participants completed a questionnaire includes the verbal abuse scale (VAS) , this questionnaire consisted of a five section related to frequency and stressfulness of incidence of verbal abuse , strength of feeling, similarity of thought, severity of long term negative effects, and coping behaviors. The finding of this study shows that 40% of operating room nursing staff reported that they had been abused by surgeons followed by another nurses 27.7%. The average number of reported incidents during the year was at least once a month or less episodes of verbal abuse. Judging and criticizing, abusive anger as well as blocking and diversity were the most frequent and stressful forms of verbal abuse. The most severe, long term effect of verbal abuse was reported to be its impacts on the physical health, relationship with other nurses as well as patient care outcomes. Threatened was the most intense of emotional reactions, indifferent and frustration. In addition the operating room nursing staff identified with a variety of adaptive and maladaptive coping behaviors and rated the similarity and effectiveness of these coping behaviors in responses to verbally abusive episodes. Conclusion, the need of nursing administrators for empowering operating room nurses to develop the formal protocols for adequately supported dealing with and prevent incidence of verbal abuse from surgeons against them. Also, training of nursing personnel is an essential element of effective verbal abuse prevention program. [Hala A. Abdou. **Verbal Abuse and Coping Behaviors Directed to Operating Room Nursing Staff at University Hospitals.** Journal of American Science 2011;7(5):466-476]. 64	**Socio-demographic Determinants of Rubella Vaccine Uptake by Egyptian University Students Attended a Catch-up Vaccination Campaign** **Ghada F. El-Sharkawy** Public Health & Community Medicine Department, Faculty of Medicine, Zagazig University, Egypt ghada_el_sharkawy@hotmail.com **Abstract:** Rubella immunization of susceptible persons is the best strategy to prevent all cases of congenital rubella syndrome. In November-December 2008, university students were included -for the first time in Egypt - in a mass campaign for measles-rubella vaccination. However, their rate of vaccine uptake and its determinants were not explored enough. So, a cross sectional study was conducted to compare the university students' vaccine uptake by their socio-demographic characteristics and their knowledge and to identify motivating and de-motivating factors. Findings revealed vaccine uptake by 64.8% of the sample;	Full Text	64

significantly higher among younger students, who heard about the campaign and who knew its aim. Among the total sample, a high level of awareness was found in knowledge about rubella name, its hazards, suitable age for vaccination and hearing about the campaign while lower awareness level was found in knowing susceptible groups and campaign's aim. Being from a governorate other than that of the university is the significant factor for low hearing about the campaign while being a female and being an urban resident were the significant factors for low knowledge of the campaign's aim. Reported motivating factors for compliance were; knowing rubella hazards and the national aim and encouragement by family & friends while de-motivating factors were insufficiency of information, lack of trust in government and previous vaccination. In conclusion, rubella vaccine uptake by university students can be increased by more advertisement especially among older, female, urban and from other governorates students in addition to trust building and motivation.

Abstract: Twenty yeast isolates were tested for ethanol productivity, *Saccharomyces cerevisiae* isolated from sugar cane bagasse was the potent producer. Fresh *Saccharomyces cerevisiae* was grown overnight on YEPD medium and was tested to determine the optimum conditions for both biomass and ethanol production. The maximum production of ethanol was obtained at 30°C, pH 6, 35% sugar cane molasses as fermentation medium, 1% corn steep liquor, 1ml of 1 O.D. YEPD broth and shaking at 200 rpm. Different microelements also were tested.

| 66 | **Effect of Calcium chloride and Gibberellic acid on storability of "Succary Abiad" mango fruits under cold storage** | Full Text | 66 |

Wahdan, M. T*., Habib, S. E., Bassal, M. A. And Qaoud, E. M.

Department of horticulture, Faculty of Agriculture, Suez Canal University, Ismailia, Egypt.
*Wahdan2011@gmail.com

ABSTRACT: This study was carried out in two successive seasons (2007 and 2008) on Succary Abiad cv. mango trees grown in Abou Swear region, Ismailia Governorate, Egypt. The trees were 30-year-old, planted at 7×7 meters apart. Fruits storability was improved by CaCl2 or GA3 treatments under cold storage. Fruit weight declined starting from the first week of cold storage up to the end of storage period. GA_3 40 ppm dipping treatment showed the lowest fruit weight loss in the two seasons. The fruit pulp percentage gradually decreased as the storage periods elongated. Fruits from $CaCl_2$ 2% dipping showed the highest fruit pulp percentage compared with the control fruits. Fruit firmness was the highest in fruits treated with $CaCl_2$ 2% sprayed at two months after full bloom or dipping after harvesting. Moreover, SSC increased gradually up to the end of storage periods. While, titratable acidity in the fruits showed gradually decreasing up to the end of storage periods as compared with its values at the beginning of storage. The

	fruit SSC/acid ratios showed gradually increasing in its values higher than at zero time storage. Total sugars in the fruits increased as the storage period elongated to reach its maximum values at the end of storage period. [Wahdan, M. T., Habib, S. E., Bassal, M. A. And Qaoud, E. M. **Effect of Calcium chloride and Gibberellic acid on storability of "Succary Abiad" mango fruits under cold storage**. Journal of American Science 2011;493-501]. 67	**Role of Bacterial Treatments for Upgrading Nutritive Value of Bean Straw and Native Goats Performance** **Abd El-Galil[1], Etab, R. and Ebtehag, I. M. Abou-Elenin[*2]** [1]Department of Animal Production, Faculty of Agric. Ain Shams University, Egypt [2]Department of Animal Nutrition, Animal Production Research Institute (APRI), P .O. Box 443, Nadi El-Said St., Dokki, Giza. [*]eabouelenin@hotmail.com **Abstract:** Twenty baladi kids (16.20 ±0.52 kg; four months age) were divided into four equal groups (five animals each). The animals were randomly assigned using a complete randomize design to receive one of the four rations for 90 days. All animals fed 50% concentrate feed mixture plus one of the roughages as follows: 50% rice straw (R1), 50% untreated bean straw (R2), 50% bean straw treated with *Bacillus sp.* (R3) and 50% bean straw treated with *Ruminococcus albus* (R4). Four digestion trails were carried out using metabolic cages to determine nutrients digestibility and feeding values. In addition, some rumen and blood parameters of experimental rations were determined. Data obtained revealed that treated bean straw with *Ruminococcus albus* (R4) was the highest CP and the lowest value of CF, ADF, ADL and cellulose. No significant differences were observed in total dry matter intake DMI **(kg/ h/d)** among R2, R3 and R4. Total gain, average daily gain (ADG) and feed efficiency (kg gain/kg DMI) were significantly ($P<0.05$) higher for R4 and R3 followed with R2 then R1. Bean straw treated with *Bacillus sp*. Or *Ruminococcus albus* had significantly ($P<0.05$) higher digestibilities of OM, CP, CF, EE, NFE, NDF, ADF and cellulose % than bean straw without treatment (R1) or control ration (R1). Total digestible nutrient (TDN) and digestible crude protein (DCP) had significantly ($P<0.05$) higher values for R4 (67.76% and 10.32%) and R3 (66.88% and 10.05%) than those of R2 (63.55% and 7.28%) then R1 (62.15% and 5.36%), respectively. Total volatile fatty acids (TVFA's) mean value and blood total protein for R4 was significantly higher (12.97 m.equ./100ml and 12.07 mg/100ml, respectively) than that of R3 then R2, and the lowest value was observed with R1. Further more, rumen ammonia NH_3-N (13.95mg/100ml) and blood plasma urea (10.63 mg/100ml) were recorded significant higher values ($P<0.05$) for R4 and R3 than those of R2 and R1, while creatinine had no significant differences among all treatments. It was concluded that treatment of 50% bean straw treated with bacteria (*Ruminococcus or Bacillus)* improved its nutrient digestibility, ADG, and feed efficiency. [Abd El-Galil, Etab, R. and Ebtehag, I. M. Abou-Elenin. Role of Bacterial Treatments for Upgrading Nutritive Value of Bean Straw and Native Goats Performance. C., Dokki, Cairo, Egypt **Corresponding author: ahmedsahab2002@yahoo.co.uk**	Full Text	68

Abstract: The aims of the current study were to determine the seed quality of *J. curcas* of peeled and non peeled nut during storage and the capability of *Aspergillus flavus* and *Aspergillus paraziticus* isolates to produce aflatoxin. Seeds of peeled or non peeled nuts stored for one year and the recent collected seeds of non peeled nut were contaminated with fungi with an average of 37.8% on PDA medium and with an average of 48.9% on Czapek's agar medium. The percentage of fungal infection was higher in seeds stored for one year than in the seeds of the other two sources of non peeled nuts. The obtained results also showed that the number of fungi as cfu per seed was ranged from 0.8 to 6.7cfu/seed with an average of 2.93 and 3.3 cfu/seed on PDA and salt Czapek's agar media respectively. Twelve species which belong to seven genera were detected and they were classified as, *Alternaria tenuis* (11.03%), *A. flavus* (11.77%), *A. niger* (9.77%), *A. paraziticus* (2.05%), *A. terreus* (3.05%), *Fusarium* spp. (22.13%), *Mucor* spp. (6.20%), *Penicillium* spp. (11.03%), *Rhizopus* spp. (8.73%) and *Rhizoctonia solani* (11.87 %). Among the so called storage fungi, *Aspergillus* spp. was the most dominant fungi occurred in highest frequent (30.16%), beside the field fungi (damping –off, root rot and wilt pathogens), i.e., *Fusarium* spp and *Rhizoctonia solani* were also found in high frequencies. The current data showed that the highest percentage of contamination with *A. flavus* was detected in seeds of non peeled nut stored for one year (12.5%) followed by seeds of recent collected non peeled nut (12.1%), while *A. Paraziticus* were detected only in seeds of recently collected of non peeled nut by 6.1%. 62. Percentae of *A. flavus* isolates had a higher ability to produce aflatoxin B_1 with maximal level reached to 20.6μg /100ml, while 60.0% isolates of *A. paraziticus* were able to produce aflatoxin in lower level than *A. flavus,* where the maximum level reached to 17.2μg /100ml.

Microbiological evaluation of Egyptian white soft cheeses style

M.A El Sayed., Hosny I.M., El Kholy W.I., R.K. El Dairouty and Sahar H. S Mohamed

Dairy Department, National Research Center, Dokki, Egypt. **ibrahim_mhosny@yahoo.com**

Abstract: A total of 70 samples of the Egyptian white soft cheese style, different varieties, (30 samples of Domiati , 15 samples of Tallaga , 10 samples of Feta and 15 samples of Kariesh) were collected from Cairo & Giza governorate markets and microbiologically examined as well as the presence of mycotoxins .Aerobic colony bacterial counts (ACC) and molds & yeasts counts (M/YC) revealed that there are clear differences between the cheese varieties. Coliform group and *Escherichia coli* as fecal indicator contamination were implicated in 50 and 24 % of the retailed white soft cheese samples, respectively. The pathogenic *E.coli* O157H7 has been isolated from 19% of the total samples. Also, *Salmonella spp*, has been only isolated from Domiati and Tallaga cheese varieties in 3 and 7 % of the samples, respectively. Meanwhile, the other enteric gram negative foodborne bacteria as *Proteus spp*, *Pseudomonas* spp and *Citrobacter spp* have been isolated from all samples in an average of 24 % .Gram positive bacteria as *staphylococcus aureus, Bacillus cereus* and *Listeria monocytogenes* were isolated from different Egyptian varieties of white soft cheese in rates of 25.7, 11.4 and 14.2% respectively. Therefore, the presences of these pathogens in 26% of the total white soft cheese samples were not accepted according to the Egyptian standard (ES) 1008-2000. *Campylobacter jejuni* was not found in any of the Egyptian white soft cheese style.The other part of study was to apply new methods as Food system (FS) kit, a rapid microbiological test which revealed complete compatibility with the conventional methods (CM) for mold and yeast and most likely for *Salmonella spp*. For the gram positive bacteria, FS test results revealed a relatively lower incidence percentages than the CM. According to the microbiological specifications of the ES 1008-2000, most of Domiati and Kariesh samples were not comply with the ES due to one or more of criterion, 80 and 86.6 % of samples, respectively. Totally , 28.6 % of the Egyptian style white soft cheese were accepted and meet the ES 1008-2000 , using the microbiological conventional methods .While using FS kit test as a rapid method , results revealed 73.3 % of the tested samples (35 sample) did not meet the ES due to mold

69

69

and yeast similar to that found by CM. Contrarily. However, FS test for the other ES specifications as *Listeria monocytogenes*, the presence of pathogenic bacteria as *S. aureus ,B. cereus* and *Salmonella spp* , results were near but lower than obtained by CM. Thus, the deficiency the FS test is due to the lack of counts and coliform not set up, and subsequently the test is not highly recommended for compromising cheese samples with the ES. Aflatoxin M_1, presence was studied in the same 70 samples of the Egyptian style white soft cheese retailed in great Cairo and Giza markets. Results revealed that 4 out of 15 Kariesh , 7 out of 30 Domiati , 3 out of 15 Tallaga and 2 out of 10 Feta cheese samples were positive for the presence of aflatoxin M1 . The highest and lowest aflatoxin concentrations were 0.4 to 0.1 microgram / kilogram of the cheese.

Abstract: One hundred and thirty five different predefined / reference strains of mold, yeast and foodborne pathogens were recovered by FS kits to check up the reliability of the kits to be used as a rapid test for ready to eat different foods. A total of one hundred sixty five samples of ready to eat foods (meat, carbohydrate, savory, salad, dairy) were collected from Cairo area restaurants and take away shops and were tested microbiologically by the conventional (CM) and FS (RM) methods. Microbiological analysis encompassed the pathogenic food borne bacteria and other microbiological criteria determining food safety and according to Communicable Disease and Public Health CDPH, 2000. The results of FS test were reliable for different varieties of ready to eat foods as a rapid method with the conventional methods for detecting foodborne microorganisms. The microbiological analysis revealed that the worst the quality was due to salad foods 70%, then cheese samples 40%, meat different categories 30%, and carbohydrate foods 15% fit out the CDPH, 2000. The main etiologies were due to the presence and high levels of Enterobacteriaceae members and the pathogens of *Salmonella spp*, *E. coli O157H7*, *S. aureus*, *B. cereus* and *L. monocytogenes*.

Abstract: The electrochemical behavior of 3003 aluminum alloys with calcium nitride in sea water was tested using electrochemical techniques. It was found that calcium nitride can be used as an inhibitor to protect the 3003 aluminum alloy from corrosion in sea water, if used with a specific volume. Cyclic polarization testing was conducted to investigate the corrosion behavior of the 3003 aluminum alloys at different calcium nitride volumes. The studies showed that at high volumes (13 ml and up of calcium to 250 ml of sea water) or low volumes (1-7 ml of the calcium nitride 10 250 ml of sea water), the 3003 aluminum alloy has higher susceptibility to corrosion. When 8ml of the inhibitor used a noticeable difference was observed. Passivation was clear from the cyclic polarization curves. In addition to the

	cyclic polarization testing, SEM was used to study the surface of the alloys after being exposed to different volumes of calcium nitride. The results were matched. 72	**Importance of Micro-Credits for Rural Women** [1] Khatereh siyar, [2] Zahra Geraeli Afra [1, 2] Department of Agricultural Economic, Islamic Azad University, Qaemshahr Branch, Iran *Corresponding author: khaterehsiyar@yahoo.com **Abstract:** Women's agriculture activities in villages of Iran in three sections of recent history of rural improvement have been affected by developmental factors. Before land reforms (1962), according to conventional laws in Iran, women were kept apart from having farm lands. According to customs, if farmer was farming in farm system and also if he had large farms so he must used his family workforce (especially woman workforce), but if it was small, he used to work at other's fields for wage. In many cases, women had to work at other parts. Before land reforms and because of being traditional of instruments and production tools, using women's roles was often in conservation and harvesting. While cultivating, most of picking cotton, was done by women, exclusively. In same period (before 1962), women roles was remarkable in cultivating rice. While plowing and preparing fields, they took part in third time trowel, also they had significant role in preparing natural fertilizer. [Khatereh siyar, Zahra Geraeli Afra. **Importance of Micro-Credits for Rural Women.** Journal of American Science 2011;7(5):542-546]. Abstract: A pot experiment was done to investigate the effect of the commercial biofertilizers Biogen (B) and Potassiomage (PG) as well as the rhizobacteria *Streptomyces chibaensis* on the growth of faba bean (*Vicia faba* CV Giza 843). The experiment was done through two successive growing seasons (2008-2009, 2009-2010). In the first season, three different doses of each inoculant were used to select the profitable dose while in the second growing season 2009-2010 the co-inoculation of the three profitable doses were used as inoculant for faba bean seeds. Data was illustrated as growth, yield parameters, seed content of minerals (N, P, K), protein, vitamins (ascorbic acid, riboflavin and thiamin) and carbohydrates were estimated by applying the co-inoculant of the three biofertilizers. The highest values of all these items were obtained from the application of the Biogen + *S. chibaensis* followed by Potassiomage+ *S. chibaensis*

Email: ghhabibi@iaushab.ac.ir

Abstract: Plants can be used for animal grazing, in wind erosion control, to reduce water flow rates, and to increase evaporation and transpiration. In the NW of Iran (East Azerbaijan Province), rangelands previously used to animal grazing were changed to agricultural land use; this vegetation is unsuitable vegetation coverage. We studied SANGUISORBA MINOR to determine its stem biomass characteristics. Data were collected using an accidental sampling methodology (1*1 m). In total, 8 plots were identify and 40 samples were collected for this research. In the minimum, maximum and mean stem biomass for this plant were found to me 4.5, 16.5 and 8.5 g, respectively.

Abstract: In this study the comparative advantage of bottled drinking water production in Sistan and Baluchestan province was investigated using DRC index and policy analysis matrix (PAM) in 2009. Data was collected from the site of External Trade Statistics Yearbook, FAO and annual foreign trade database. The Nominal protection coefficient showed that there was an indirect tax on producers in all sectors. The NSP index was positive in all regions. Result supports this idea that Sistan and Baluchestan has comparative advantage in bottled drinking water production. When yield increase and production cost decrease, bottled drinking water production is usefulness in Sistan and Baluchestan province.

	Bone and lipid profile changes in anandamide injected and high fat fed rats **Mai M .Hasan[*1] and Dalia M. Abd- Elmotteleb[2]** [1]Department of physiology, [2] Department of pharmacology, Faculty of Medicine Zagazig University mmjewefel@zu.edu.eg **Abstract:** Background: Endocannabinoid system has recently attracted the attention not only for the physiological functions, but also for the promising therapeutic potentials as drugs. Bone has been identified as major target for endocannabinoids in which anandamide and 2-arachidonoylglycerol are present at high levels. Also, obesity represents a risk factor for many health disorders including cardiovascular disease, diabetes and cancer. Aim: to explore the effect of high fat diet and anandamide on lipid profile and bone in normal and high fat fed rats. Design: A total number of forty healthy, adult, male albino rats were divided into 4 equal groups each (n=10): Group I: lean control group, Group II: lean injected group, injected with anandamide (0.02 mg/kg i.p., daily for 2 weeks), Group III: high fat-fed group(high fat diet control group) fed with (58% fat) for 12 weeks and Group IV: high fat-fed injected group fed with (58% fat) for12 weeks and then injected with anandamide (0.02 mg/kg i.p., daily for 2 weeks) , in all groups initial body weight, final body weight, cholesterol, triglycerides, high density lipoproteins, serum calcium, serum phosphate, serum alkaline phosphatase, dry femur weight, ash weight, bone calcium content, bone phosphorus content were measured and histopathological studies for bone sections were done. Results: high fat diet fed rats showed significant increase in final body weight, total cholesterol (TC), triglycerides (TG), alkaline phosphatase activity, dry and ash femur weight, as well as significant decrease in serum level of high density lipoproteins (HDL), bone calcium and phosphorus content and corrected dry and ash femur in comparison to lean control group. While, anandamide injected groups (lean and high fat fed) showed significant increase in final body weight, total cholesterol (TC), triglycerides (TG), dry and ash femur weight, bone calcium and phosphorus content with significant decrease in serum level of high density lipoproteins (HDL) in comparison to their corresponding control groups. Alkaline phosphatase activity was significantly increased in lean injected, but significantly decreased in high fat injected rats in comparison to their control groups. The histopathological study showed normal bone architecture in lean control group, foci of new bone formation in lean injected group while high fat fed groups showed thinning in bone trabeculea with mild correction and foci of new bone formation in high fat fed injected group. Conclusion: High fat diet and anandamide caused disturbances in body weight and lipid profile. High fat diet was detrimental to bone health while, anandamide was able to produce beneficial effects on bone. 	Full Text

Abstract: This study was carried out to investigate, the parallism between biochemical, histochemical and immunological parameters in liver injury model induced by CCl_4. We evaluated, (a) The activities of serum aminotransferases (ALT, AST), blood platelets count, hepatic antioxidant enzymes [superoxide dismutase (SOD), catalase (CAT), reduced glutathione (GSH), hepatic hydroxyproline concentration, serum collagenase activity and hepatic DNA content. (b) Serum autoantibodies (ANA, ASMA and AMA or LKM). (c)Liver histology in control and CCl_4-treated rats at different interval times 24, 72 hrs and 1, 4, 8 and 12 weeks. The activities of ALT, AST, collagenase and hydroxyproline concentration, were significantly elevated, while hepatic antioxidant enzymes, blood platelets count and hepatic DNA content were decreased in toxicated rats as compared to non-toxicated rats at 24-72 hrs. On histological examination, steatosis, lymphocyte inflammation and fibrosis were illustrated at 24-72 hrs in CCl_4-treated rats compared to control rats. Absent of autoantibodies from the serum but lymphocytes in tissues were observed began from sample of 72 hrs. Thus we concluded that a parallelism study was demonstrated between biochemical, immunological and histochemical parameters in CCl_4-induced liver injury rats.

82	**Security Performance Analysis and Enhancement of Authentication Protocol in Wireless Mobile Networks** Ja'afer AL-Saraireh Applied Science UniversityUniversity, Amman, Jordan, 11931. sarjaafer@yahoo.com **Abstract:** Due to the rapid growth of wireless technology and wireless services, a detailed look at the issue of security is required. Mobile networks are protected by using authentication security mechanisms. The authentication protocol incurs overheads on the transmission process. These overheads affect the mobile network performance such as delay, bandwidth allocation efficiency and throughput. The main aim of this research is to improve authentication mechanism in mobile networks. In the proposed protocol, AKA has been enhanced by generating temporary key to enable visitor location register (VLR/SGSN) to authenticate mobile station (MS) without intervention of HLR/AuC. Therefore, the bottleneck at the authentication centre is avoided by reducing the number of messages between mobile and authentication centre. A fluid mobility model is used to investigate the performance of signaling traffic and load transaction messages between mobile databases, such as Home Location Register (HLR) and Visitor Location Register (VLR), for both the current protocol and the proposed protocol. The simulation results show that the authentication delay and current load transaction messages between entities and bandwidth are minimized as compared with the current protocol. Therefore, the performance and authentication delay time have been improved significantly. To validate the simulation results in this research work, the results have been compared and analyzed with the analytical results. [Ja'afer AL-Saraireh. **Security Performance Analysis and Enhancement of Authentication Protocol in Wireless Mobile Networks.** Journal of American Science 2011;7(5):599-610]. 83	**Antimicrobial activity of Curcumin upon pathogenic microorganisms during manufacture and storage of a novel style cheese 'Karishcum".** Hosny I.M., W.I El Kholy , H.A. Murad and R.K. El Dairouty. Dairy Science Department, National Research Center, Dokki, Egypt. ibrahim_mhosny@yahoo.com **Abstract:** A survey study was made to evaluate the level of microbial contamination of 35 samples of Karish cheese retailed in Cairo area in compare with the Egyptian standard (ES-1008-2000). Survey results indicated that the brand cheese showed the highest quality, while the street & shop made and vend cheese samples showed the higher the ACC and the worst mycological quality, as reached $>10^3$ cfu/g for each of mold and yeast counts. So, 57% of Karish cheese samples would not be accepted due to the high mycological counts. Coliform group and *Escherichia coli* as fecal indicator contamination were detected in 57 and 25.7 % of the retailed Karish cheese samples, in averages of ~10^3 cfu/g of the Coliform counts, respectively. However, *Staphylococcus aureus, Bacillus cereus and Listeria monocytogenes* were isolated from 17, 8.5 and 2.8 % of the total Kariesh samples, respectively, but any was isolated from the brand cheese. A novel style of Karish cheese was made by adding *Curcuma. Longa* (Curcumin or Turmeric) at a rate of 0.3% (w/v), to obtain a new dairy product "Karishcum". A primary experiment was done to determine the correct percentage of Curcumin addition to cheese milk to get good taste and long shelf-life. A panel test was carried out to determined organoleptic properties of "Karishcum". The behavior of pathogenic bacteria in artificially contaminated during cold storage period at 7°C+1,for 14days, revealed that addition of aqueous Curcumin extract (0.3%) achived a reduction of bacterial counts obout one log of *Salmonella typhimrium*, tow log of *Pseudomonas aurogenosa* and *E.coli0157:H7*, respectively. Meanwhile each *of S.aureus, B.cereus* and *L.monocytogenes* were vanished at the end of the cold storage period (14 days). [Hosny I.M., W.I El Kholy , H.A. Murad and R.K. Adult education in developing countries

[1] Ali Badragheh, [2] Mohammad Abedi

[1, 2] Department of Agricultural Extension and Education, Varamin Branch, Islamic Azad University, Varamin, Iran. *Corresponding author: abedi114@yahoo.com

Abstract: Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings. Concept of adult education in revolutionary countries, is a combination of these two concepts. Changes in these countries due to social, political and cultural revolution, resulting from, literacy and continuing education necessary to find because of the revolution, there is cultural poverty on the other hand the implementation of development plans and the need for skilled personnel are expert. General adult education system based on economic conditions - social and cultural community is different and each specific goals will follow. General objectives of adult education and literacy in two categories is divided into professional education.

Traditional Degrees and online degrees in distance education

[1] Mohammad Abedi, [2] Ali Badragheh

[1, 2] Department of Agricultural Extension and Education, Varamin Branch, Islamic Azad University, Varamin, Iran
*Corresponding author: abedi114@yahoo.com

Abstract: Distances between teachers and students are bridged with an array of familiar technology as well as new information age equipment. What sets today's distance education efforts apart from previous efforts is the possibility of an interactive capacity that provides learner and teacher with needed feedback, including the opportunity to dialogue, clarify, or assess. Advances in digital compression technology may greatly expand the number of channels that can be sent over any transmission medium, doubling or even tripling channel capacity. Technologies for learning at a distance are also enlarging our definition of how students learn, where they learn, and who teaches them. No one technology is best for all situations and applications. The base of available information technology resources is increasing with dramatic speed. Much has been learned about connecting various forms of technology into systems, so that the ability to

[3.] Department of Veterinary medicine, science and research Branch, Islamic Azad University, Tehran, Iran. Rahimbeheshti@gmail.com **Abstract:** To investigate the period prevalence, etiology and some epidemiological features of subclinical mastitis in buffaloes from the Tabriz region, milk samples from 51 lactating buffaloes were aseptically collected for bacterial and California mastitis test and somatic cell counte. An association was observed between the occurrence of subclinical mastitis and lactation number of buffaloes. The periodic prevalence rate of SCM was 27.36%. *Staphylococci* were the most prevalent bacteria, representing 48.55% of the isolates. Coagulase-negative staphylococci (CNS) (36.18%), was the most prevalent species followed by *staphylococcus aurous* (14%). *Lactobacillus, Corynebacterium bovis* and *Bacillus subtilis* was the subsequent bacterial groups in importance according with the distribution among flocks representing 14%, 8% and 7% of the isolates. Coagulase-negative Staphylococci were the most prevailing isolates from samples that showed positve CMT results. 91	**Determination of most important part of yield components by Path Analysis in Corn** Maral Moradi[*], Ebrahim Azarpour Department of Agriculture, Lahijan Branch, Islamic Azad University, Lahijan, P.O. Box 1616, Iran M.A4444@yahoo.com **Abstract:** In order to study of direct and indirect effects of yield components on corn yield for find the most important effective part on yield, an experiment in researching filed of Lahijan Islamic Azad University in 2009 was conducted. This experiment in Split plot format based on Randomized complete block design with two factors, main factor consist of different amounts of nitrogen fertilizer (50, 100, 150 and 200 kg/ha) and sub factor consist of rows spacing (30, 40 and 50 cm) in three replications was performed. In this experiment, Single cross 704 cultivar was used and path analysis for determination of most important part of yield under these treatments was conduced. Determination of most important part of yield can use in agronomical and corrective managements. Results were showed that corn yield had significant correlation with ear length, rows in ear, plant height and ear per plant (r 0.58). Among yield components, ear length was most determinative and most effective trait among other traits on yield, ear length increases had a positive effect on yield increasing and also indirectly affect yield from way of rows per ear and 1000 grain weight. Corresponding author: drtahaatia@yahoo.com

ABSTRACT: Pharmacokinetics of tulathromycin was studied after single dose intravenous, intramuscular and subcutaneous administration. Six apparently healthy Fresian cattle calves were used in a crossover design with 15-day washout period. After intravenous injection of tulathromycin, the half-lives of distribution and elimination ($t_{0.5(\ )}$ and $t_{0.5(\ )}$), volume of distribution at steady state (Vd_{ss}), mean residence time (MRT) and total body clearance (Cl_B) were 0.166 h., 48.348 h., 4.252 L kg^{-1}., 69.645 h. and 0.061 L kg^{-1} h^{-1}., respectively. Following intramuscular and subcutaneous administration of tulathromycin, the maximum concentration (C_{max}) 0.330 and 0.309 ug ml^{-1} were achieved at a maximum times (t_{max}) 1.118 and 1.234 h., respectively. The mean values for absorption and elimination half-lives ($t_{0.5(ab)}$ and $t_{0.5(el)}$) and MRT were 0.135 and 0.155 h., 68.929 and 65.874 h., 99.562 and 95.165 h., respectively. The intramuscular and subcutaneous bioavailabilities were 82.8 and 71.85%, respectively. The result of *in-vitro* protein-binding study indicated that 38.86 % of tulathromycin was bound to calve's serum proteins.

Abstract

In this paper, the stochastic dynamic optimization is used to calculate optimal values of liquidity and government budgetary expenditures for the Iran's forth five year development plan (2005-2009). For this purpose, we minimized quadratic variations of inflation rate and the rate of economic growth from their plan target subject to a nonlinear dynamic system. The results show that, the optimal values of the above control variables are greater than those proposed in forth development plan whereas the optimal values are less than the occurred quantities. Based on obtained results, using the optimal macroeconomic policies will improve the rate of economic growth and inflation rate in comparison with their occurred values. 95	**Management of environmental degradation of Jeddah coastal zone, Saudi Arabia, using remote sensing and geographic information systems** **Amal Bent Yahya Al-Sheikh** King Abdul-Aziz University, Jeddah, Saudi Arabia **Abstract:** This study is focused on the environmental degradation of Jeddah Governorate coast. The importance of study area is related to the effect of human factors and their roles in destruction and production of environmental problems in the coastal zone. The study is focused on the problem of land use planning and sustainable touristic development to maintain the marine ecosystem and its natural resources. Also this work is concerned with developing and suggesting strategy to protect the natural resources of the marine environment in relation to the future expansion of population and developmental projects. The study is elaborated using the recent techniques in remote sensing and geographic information system (GIS). TM and ETM landsat images acquired in 1986 and 2003 of the study area were used. Manuscripts and topographic maps of scale of 1: 4000,000 for Jeddah governorate, in addition to data and information obtain from different institutions were also employed. ERDAS Imagine 8.5 software was used for image processing (i.e. Export function, layers tacking, geometric correction.etc.). Results showed that the negative changes in the coast exhibit 84 km as it record a length of 111 km compared to195 km in 2003. This change leads to the depletion of natural environmental marine resources and erosion of the recreational areas at the coast line. Absence of a proper sustainable planning strategy and management for coastal natural resources, cause improper human pressures and disorders in the natural balance of the marine environment. The study has suggested a strategy for sustainable touristic development, represented in building systems and developing laws with continuous work to revise procedures and update the standard limits. 96	**Effect of Counseling Sessions on Coping Strategies and Anxiety among Parents of Children with Ambiguous Genitalia** **Fawzia Elsayed Abused[1] and Yosr Mohamed Elmasri[2]***	Full Text	96

[1]Pediatric Nursing Dept. [2] Psychiatric & Mental Health Nursing Dept, .Faculty of Nursing, Mansoura University, Mansoura, Egypt. [*]dr_yosrelmasri@yahoo.com

Abstract: Ambiguous genitalia condition is often an emotionally stressful event for parents. Preparation and ongoing support through counseling sessions could be beneficial to both parents and children and would alleviate some of their shame, isolation and ineffective coping associated with intersexes conditions. The present work aimed to investigate the effect of counseling sessions on coping strategies and anxiety among parents of children with Ambiguous Genitalia. A one-group before-after Quasi-experimental design was used. This study was conducted on parent who coming with their children at pediatric surgery department of Mansoura University Pediatrics' Hospital and Private Center for Pediatric Surgery at Mansoura city. The sample included all parents which their children was diagnosed as ambiguous genitalia (n=30). The revised three interview questionnaires, Socio-demographic data sheet, Taylor's Manifest Anxiety Scale and the Parental Coping Strategy Inventory were administered to compare parent anxiety and coping before and after counseling sessions. The total coping score didn't differ significantly at pre and post intervention session (p>0.05) , a highly statistically significant difference was observed between the pre and post test mean score of anxiety (p<0.001) and the coping strategies domain were not correlated significantly with total anxiety of parents at pre, post Inventory session (p>0.05). It is concluded that administration of counseling sessions for parents of children with ambiguous genitalia is an effective method to alleviate their anxiety. It is recommended that, the counseling should ideally be by those trained in sexual/gender/intersexes matters, as early as possible put the family in touch with a counselors and support group, and counseling should be multi-staged (at birth, and at least again at age two, at school entry, prior to and during pubertal changes, and yearly during adolescence) as well as examining parental coping strategies at different stages of development would be an interesting avenue for future research. [Fawzia Elsayed Abused and Yosr Mohamed Elmasri. Effect of Counseling Sessions on Coping Strategies and Anxiety among Parents of Children with Ambiguous Genitalia. Abstract: Serum protein carbonyl group, total thiol group and nitric oxide were studied in 30 patients with rheumatoid arthritis. Obtained results revealed that , Serum protein carbonyl content and nitric oxide (nitrite and nitrate) were significantly higher in rheumatoid arthritis patients than in the controls. However, total thiol group decreased significantly in rheumatoid arthritis patients than in the controls. In addition, protein carbonyl was negatively correlated with total thiol, while , nitric oxide (nitrite and nitrate) didn't correlate with protein carbonyl or total thiol .The impaired serum antioxidant defence mechanisms as evidenced by decreased total thiol group resulted in increased protein oxidation as indicated by increased protein carbonyl .

Hala, M.A. Wahba

Home Economics Department, Faculty of Specific Education, Minufiya University
hala.ali77@yahoo.com

Abstract: The protective effect of nigella sativa, linseed and celery oils against testicular toxicity induced by sodium valproate (SVP) in male rats was studied. The experiment was carried out along 4 weeks on fifty male rats divided into 5 equal groups. Group (1) was kept as normal control (given vehicle), while rats of group (2) were given orally SVP in a dose of 500 mg/kg /day during the last week of experimental period (positive control). The other protected three groups were pretreated by oral administration of nigella sativa, linseed and celery oils each in a dose of 250 mg/kg/day and received SVP in the last week. At the end of experiment, sex organs were obtained for semen analysis, changes in sex organs weight and for lipid peroxidation in testicular tissue and histopathology. Also blood samples were collected for serum testosterone level. Results showed that pretreatment with nigella sativa, linseed and celery oil in SVP-intoxicated rats induced significant increase in the weight of testis, sperm count and motility with a decrease in abnormal sperms. An increase in serum testosterone levels and a decrease in testicular lipid peroxides (MDA) with increase in reduced glutathione were reported in the protected rats. Histopathological examination of the testes of protected rats revealed that these oils caused alleviation of testicular degenerative lesions which seen in valporate-treated rats. In conclusion, nigella sativa, linseed and celery oils produced protective effects against testicular damage induced by SVP. This study recommends that consumption of nigella sativa, linseed or celery oils may be useful as protective agents for patients who suffer from sexual impotency.

	Docetaxel and gemcitabine in patients with advanced urinary bladder cancer: A Phase II study	Full Text	

Hoda H. Essa and Samy M Al-Gezawy

Oncology Department, Faculty of Medicine, Assuit University
aidamahmoud11@yahoo.com

Abstract: The work aimed: To evaluate the efficacy and tolerability of a combination of docetaxel and gemcitabine in patients with locally advanced recurrent, and/or metastatic urinary bladder cancer. **Patients and methods**: An outpatient regimen of gemcitabine and docetaxel combination was tried in thirty-three patients with locally advanced,recurrent,and/or metastatic urinary bladder cancer.Study treatment consisted of gemcitabine1000 mg m^{-2} (days 1+8), and docetaxel 75 mg m^{-2} (day 8) every 21 days for a total of six to nine cycles. **Results:** Among the 33 patients, 17 patients (51.5%) had transitional cell carcinoma, 7patients (21.2%) had squamous cell carcinoma and 9 patients (27.3%) had transitional cell carcinoma with squamous metaplasia. Two patients (6.1%) had complete remission (CR), and 14 patients (42.4%) had partial remission (PR), for an overall response rate of 48.5%. Disease stabilization (SD) occurred in 7 patients (21.2%), while 10 patients (30.3%) had disease progression (PD). Analysis of response rate according to prognostic features known to predict response; Patients with PS 0&1 had an overall response rate of 55.6% (15/27), and patients with PS 2 had an overall response rate of 16.7%(1/6), and this difference was statistically insignificant (P =0.1). As regard to the site of disease, the overall response rate of patients with soft tissue and locally advanced disease was 58.3% (7/12) and 42.9% for patients with visceral metastasis (9/21), and this difference was statistically insignificant (p=0.4). The response rates for patients with risk index of 0, 1, or 2 were100% (2/2), 66.7% (10/15), and25% (4/16), respectively (P = 0.006).With a median follow-up of 10 months (range, 2-20 months), the median survival time was 11 months, the median time to progression was 7 months , 1-year survival rate was 40.3% and1-year progression free survival rate was 28.3%.Both haematologic and non haematologic toxicity were treatable and not severe. **Conclusion:** This schedule of docetaxel and gemcitabine is active and well tolerated as a

99 | 99

first-line treatment for locally advanced, recurrent, and metastatic bladder carcinoma. The favourable toxicity profile of this regimen may offer an interesting alternative, particularly in patients with compromised renal function or cardiovascular disease.

100	**Characterization and Reuse of Kiln Rollers Waste in the Manufacture of Ceramic Floor Tiles** **M.M. Youssef [1] and H. B.G. Ghazal [*2]** [1] Mataria Engineering, Helwan University, [2] The High Institute of Engineering, Chemical Engineering Department, Shorouk, Cairo, Egypt. [*] hbarakat86@yahoo.com **Abstract:** Roller kilns used in the production of ceramic tiles are routinely ground to remove traces of contamination. The ground powder is usually discarded as useless waste. In a previous paper [1] the possibility of reusing this powder in refractory making was investigated. The present paper deals with the possibility of adding this powder without any treatment to standard wall tiles composition. XRD and XRF were used to identify the mineralogical and chemical composition of the powder. Powder compacts were prepared by uniaxial pressing at pressures ranging from 30 to 50 MPa. Firing was performed at temperatures ranging from 1200 to 1350°C for soaking periods ranging from 2 to 6 hours. It was proved that among the investigated parameters, firing temperature plays the leading role in assessing sintering characteristics, followed by soaking time. Forming pressure hardly affected sinterability. SEM micrographs were performed under different firing conditions to follow up the morphology of phases appearing. It was proved that adding up to 10% powder to ceramic floor tiles standard mix did not alter its final properties. [M.M. Youssef and H. B.G. Ghazal. 102	**Specific Geochemical Parameters and Oil: Source Rock Correlations of Some Oilfields in the North Western Desert, Egypt** **M. I. Roushdy, A. I. Hashem, M. M. El Nady, Y. M. Mostafa, N.Sh. El Gendy and *Hager. R. Ali** Egyptian Petroleum Research Institute, Nasr City, Cairo, Egypt *hugochem@yahoo.com\ **Abstract:** Different analytical techniques, including liquid chromatographic separation, gas chromatography and gas chromatography-mass spectrometry were used to characterize the crude oil and extract samples of the source rocks. The samples were collected from different oilfields in North Western Desert Egypt namely: Meleiha, Misaada and Qarun oilfields. In the present work, the mentioned parameters have been used to essentially discuss the relation between the produced oils and their potential source rocks to confirm the indigenous sources for the petroleum generation of the studied oilfields. The results showed that the studied oil samples of Misaada and Qarun oilfields are well correlated with each other, where they are similar in their maturation and source depositional environments and slightly correlated with Meleiha oil. The correlation between source rocks and crude oils show that there is a good correlation between the extract samples of Kharita and Khatatba formations and crude oils from Qarun and Misaada oilfields. While the extract of Bahariya source rocks and Meleiha oil show slight correlation. These evidences indicate that Kharita and Khataba source rocks seem to act as sources and reservoirs for oil generation in the Qarun and Misaada oilfields. **Keywords:** Egypt. Abadir [4*]** [1] Ministry of the military production, [2] Egypt Fibre Company, [3] Central Metallurgical Research Institute (CMRDI), [4]Chemical Engineering Department, Faculty of Engineering, Cairo University, Cairo, Egypt *magdi.abadir@yahoo.com **Abstract:** Serpentine fibers from the El–Fawakhir area in the Eastern Egyptian desert were obtained from the parent rock and characterized using XRD, XRF, IR and thermal analysis. They were then incorporated into unsaturated polyester (UP) matrix to from slabs. These slabs were tested for thermal conductivity and thermal expansion where their insulation behavior was much better than UP samples containing E type glass fibers. Both composite matrices (UP + Serpentine and glass fibers) exhibited similar values of thermal expansion, decreasing with increased fiber level. Both matrices showed comparable tensile and flexural strengths both increasing with increased fiber fraction; while the elongation was much lower in case of serpentine fibers. AC characteristics (AC resistivity, dielectric constant, dielectric loss and dissipation factor) were also determined for both types of UP matrices at different frequencies ranging from 40 Hz to 1 MHz and temperatures up to 120°C. The results showed similar behavior in both types of matrices although those reinforced with mineral fibers showed lower dissipation losses. **Key words:** unsaturated polyester – serpentine fibers – glass fibers – composite	Full Text	103
104	**Ginger Administration has a Protective Effect on the Liver of Albino Rats Treated with 6-Mercaptopurine Drug**	Full Text	104

[1]Department of Anatomy, Faculty of Medicine, Al-Azhar –University (girls) -Department of Physiology, Faculty of Medicine, Zagazig - University
*Olfat_fair@yahoo.com

Abstract: The leukemia is considered to be one of the most frequent tumors in childhood. The first line of its treatment is 6-mercaptopurine (6-MP). There are many recorded cytotoxic effect for 6-mercaptopurine on tissues such as liver, pancreas and bone marrow. Nowadays the needs for administration of cytotoxic drugs is increases as the incidence of malignancies increases. So we have to search for a safe method that can minimize the side effects of these cytotoxic drugs. The ginger has many benefits as anti-inflammatory and anti-oxidant substance. Some indicated as a protective effect for ginger on the radiotherapy treated rats and also it protected from the hepatotoxic and gonado-toxic drugs. This work amid to investigate the protective effects of ginger on liver of rats treated by cytotoxic drug (6-mercaptopurine), a drug of choice in maintenance therapy for leukemia in adult and children. Our hope is to minimize the side effects of the cytotoxic drug with simple and available procedure. Material The current study had been carried on 40 white albino rats that divided into four equal groups. Group I: was served as control group. Group II: was given ginger extract only. Group III: was given 6- MP. Group IV: was given 6-MP + ginger extract. The following parameters were examined in all groups: 1- The serum Alanine aminotransferase (ALT), and aspirate aminotransferase (AST). 2- The cell morphology and histo-pathological changes in the liver The results of the present study showed that treatment with 6-MP alone caused marked signs of cellular degeneration and necrosis of the hepatic tissues, significant increase in the serum levels of ALT (P<0.001) and AST (P<0.001) enzymes when compared with control group. However, the treatment by ginger along with 6-MP showed marked regeneration and improvement in the hepatic tissues and significant decrease in the serum levels of liver enzymes; ALT (P<0.001) and AST (P<0.001) when compared with 6-MP treated group. Conclusion: These findings indicated that ginger has protective effect against 6-MP induced hepatic toxicity.

Abstract: Throughout history, daylight has been a primary source of lighting in buildings, supplemented originally with burned fuels and more recently with electrical energy. Before daylight was supplemented or replaced with electric light in the late 19th-century, consideration of good daylight strategies was essential. As we entered the mid-20th-century, electric light supplanted daylight in buildings in many cases. Fortunately, during the last quarter of the 20th-century and early years of this century, architects and designers have recognized the importance and value of introducing natural light into buildings. Daylight can provide a welcome and dynamic contribution to the human experience in buildings and, as demonstrated in recent studies on schools and retail sales environments, can impact human performance. Most people appreciate daylight and also enjoy the outside view that windows provide. Good daylighting design can result in energy savings and can shift peak electrical demand during afternoon hours when daylight availability levels and utility rates are high. Le Corbusier so clearly identified the importance of light in architecture when he expressed the point that, "Architecture is the masterly, correct and magnificent play of volumes brought together in light ..." emphasizing that "...the history of architecture is the history of the struggle for light. This article summarizes the use of daylight in primary schools with focus on goals, climate and weather, sky, conditions, design criteria, and strategies for day lighting design. Abstract: Background and objective: Fetuin-A is a circulating calcium-regulatory glycoprotein that inhibits vascular calcification. In the present study, serum fetuin-A was studied as a novel risk factor for the development of diabetic nephropathy and the relation between its levels with the state of diabetes control. Patients and Methods: 50 patients with type 2 diabetes mellitus (T2DM) and early diabetic nephropathy, 25 patients of them have well controlled diabetes on treatment (the first group), the other 25 patients have uncontrolled diabetes (the second group), and another 25 healthy volunteers (control group)) were enrolled in this cross sectional study. Serum fetuin-A, Fasting plasma glucose (FP glucose), glycoselated hemoglobin A1c, lipid profile (total cholesterol,HDL and triglycerides), Serum creatinine, Glomerular filtration rate (GFR), Albumin excretion in urine were measured. Results: There was a significant reduction in Serum fetuin-A levels in controlled diabetic patients (314 ± 66.8) and uncontrolled diabetic patients (252.4 ± 55.6) compared to control group (478.6 ± 74.4). A significant decrease was also detected in uncontrolled diabetic patients when compared to controlled diabetic patients ($P<0.001$). A strong inverse correlation was found between serum fetuin-A and each of F P glucose, glycoselated hemoglobin (HbA1c), serum creatinine, and urinary albumin excretion ($r = -0.52, -0.55, -0.61$, and -0.56 respectively; $P < 0.001$ for each). Whereas; GFR was significantly positively associated with serum fetuin-A levels ($r = 0.53, P<0.001$). Conclusion: The results of this study demonstrate that diabetic nephropathy, especially with uncontrolled diabetes, is linked to low serum fetuin-A levels which represents a novel risk factor for the development of vascular complications. This factor could be responsible for the development

108	**IL 18 in diabetic patients with and without coronary atherosclerosis** Hanan Abdel mawgod , Abeer Ibrahim, *Ahmed A. Battah, and **Mustafa I. mokarrab Biochemistry department, Faculty of pharmacy (girls), *Critical Care department, Kasr El Ainy Hospital, **cardiology department, Faculty of medicine, Al-Azhar and Cairo University, Cairo, Egypt. s_eldayem@yahoo.com **Abstract: Objective:** To assess interlukein 18 in diabetic patients with and without coronary atherosclerosis and to detect its relation to lipid profile and blood glucose. Also to investigate the hypothesis that the serum level of IL-18 is a predictor of coronary atherosclerosis in patients with type 2 diabetes. **Patients and Methods:** The study included 45 diabetic patients (15 with no complication and 30 with coronary atherosclerosis) and 15 age and sex matched as a control group. **Results:** Total cholesterol, HbA1c and IL 18 is significantly different in the 3 groups and the highest level is in the diabetic patients with atherosclerosis. On the contrary HDL-c is significantly lower in diabetic patients with atherosclerosis than the other 2 groups. IL8 shows a strong significant positive correlation with blood glucose in diabetic patients with no complication and in diabetics with atherosclerosis. **Conclusion:** that, IL8 is a useful inflammatory marker in diabetic patients and it is higher in those with atherosclerosis. IL-18 might serve as a marker of future cardiovascular risk in diabetic patients. [Hanan Abdel mawgod, Abeer Ibrahim, Ahmed A. Battah, and Mustafa I. mokarrab. **IL 18 in diabetic patients with and without coronary atherosclerosis.** Journal of American Science 2011;7(5):766-770]. Abstract: This work aimed to study the effect of menopause symptoms on Saudi women's quality of life. A descriptive study was carried out on a convenient sample of 120 women during their menopausal period who attended two gynaecologic clinics, in Riyadh, KSMC and Taif, KSA. The subjects were interviewed individually throughout a period of 10 months from February 2010 to November 2010.An interview questionnaire and Greene Climacteric Scale,and menopausal symptoms and the Manchester health questionnaire were used for data collection. The results showed 80% of none educated menopausal women had poor quality of life, 75% of the worker also, had poor quality of life and 63.7% of them who were multipara had poor quality of life. The Pearson correlation test proved a negative significant correlation between the total mean score of quality of life and total mean score of menopausal symptoms. The study concluded that Saudi menopausal women in the study subjects experience high prevalence of menopausal symptoms that adversely affected their quality of life. Women's general characteristics such as: educational level, cohabitation, family size and their gravidity were among factors contributed to their poor quality of life.

*drhantox@yahoo.com

Abstract: The present study investigated the protective effect of phytonutrients and antioxidants in barley and oat added to diet on teratognic effects induced by amitraz® after maternal exposure during pregnancy. 40 pregnant albino rats were divided into 4 groups each of 10. one group was kept as control fed the balanced ration& administered distilled water. Three groups were administered amitraz® (50 mg/ kg b.w.) by gavage during organogenesis from days 6 through day15 of gestation, a group of them fed the balanced ratio and the other 2 groups fed the same diet supplemented with barley or oat (20%), 4 days prior of gestation and continued till the end of the experiment. All dams underwent a caesarean section on day 20 of gestation and their fetuses were examined for external, visceral and skeletal abnormalities. Amitraz induced maternal toxicity manifested as lower body weight gain, developmental toxicity included fetal death, a decrease in fetal body weight and length, as well as increased incidence of fetal external, visceral & skeletal anomalies. These findings were prevented or in lower incidence in groups provided with barley or oat. The obtained data were reviewed and discussed. Conclusively, barley and oat supplement have protective and positive modulation response due to their phytonutrients and antioxidants against congenital anomalies induced by amitraz®. In recommendation, the incorporation of cereal grains such as barley and oat in the food products are chemopreventive agents for adverse effects of xenobiotics.

mahrousatef@hotmail.com

Abstract: Five sexually mature Friesian bulls (3-4 years old and 600-650 kg as an average body weight) were used in the present study. Two experiments were carried out. The first experiment aimed to define the effect of different types of cryoprotective agents (7% glycerol: GL and 7% dimethyl sulfoxide: DMSO) and their combinations (3.5% GL plus 3.5% DMSO) on post-thawing sperm motility, freezability and acrosomal damage of spermatozoa. Enzymatic activity (aspartate-aminotransferase: AST, alanine-aminotransferase: ALT, acid phosphatase: ACP, alkaline phosphatase: ALP and lactic dehydrogenase: LDH) in the frozen-thawed semen was also determined. The second experiment was carried out to establish the effects of 3.5% GL plus 3.5% DMSO (the best cryoprotectant in the first experiment) supplemented with different levels of glutathione (0.0, 0.2, 0.4 and 0.8 mM/ 100 ml) on the frozen-thawed semen quality and enzymatic activity during thawing-incubation at 37°C for 2 hours. The conception rates of the cows artificially inseminated with the frozen-thawed semen containing 7% GL, 7% DMSO, 3.5% GL plus 3.5% DMSO with or without 0.4mM glutathione (GSH) were also assessed. The results revealed that the highest ($P<0.05$) percentage of sperm motility, freezability of spermatozoa and the lowest ($P<0.05$) percentage of acrosomal damage of spermatozoa were obtained in the post-thawed semen extended with 3.5% GL plus 3.5% DMSO as compared to 7% GL or 7% DMSO alone. Moreover, the frozen-thawed bull semen extended with 3.5% GL plus 3.5% DMSO showed significantly ($P<0.05$) lower amounts of AST, ALT, ACP, ALP and LDH enzymes released into the extracellular medium than 7% GL or 7% DMSO alone the (first experiment). The obtained results in the second experiment showed that the frozen-thawed semen extended with 3.5% GL plus 3.5% DMSO added with GSH at levels of 0.2, 0.4 and 0.8mM showed significantly ($P<0.05$) increased the percentage of frozen-thawed sperm motility and freezability of spermatozoa and decreased ($P<0.05$) percentage of acrosomal damage of spermatozoa and amount of AST, ALT, ACP, ALP and LDH enzymes released into the extracellular medium compared to free GSH medium (control). It is of interest to note that, the best level ($P<0.05$) of GSH which maintained frozen-thawed semen quality and enzymatic activities was 0.4mM/100ml GSH. The advancement of thawing- incubation time at 37°C for up to 2 hours of the frozen-thawed bull semen decreased significantly ($P<0.05$) the percentage of post- thawing sperm motility and freezability of spermatozoa, while increased significantly ($P<0.05$) the percentage of the acrosomal damage of spermatozoa and leakage of AST, ALT, ACP, ALP and LDH enzymes into the extracellular medium with the different glutathione levels or free glutathione medium. The highest conception rate ($P<0.05$) was recorded in the cows artificially inseminated with the frozen-thawed bull semen extended with 3.5% glycerol plus 3.5% DMSO added with 0.4mM GSH, and the lowest ($P<0.05$) conception rate was observed with the frozen-thawed bull semen extended with 7% GL or 7% DMSO alone.

Abstract: Care of schizophrenic patients is an enduring stress and leads to considerable amount of burden among caregivers. Little is known about the ways in which families cope while caring for a relative with schizophrenia in developing countries. The aim of the present study was to explore burden and coping strategies in caregivers of schizophrenic patients and identify the relationship between burden

and coping strategies among them. Caregivers were assessed by utilizing caregiver burden self report and ways of coping questionnaires. A descriptive correlational design was used for the study. The sample comprised of 100 caregivers of schizophrenic patients from psychiatric in patient and the outpatient clinic of Neuropsychiatry Department at Assiut University Hospital. The result revealed that level of burden reported by caregivers of schizophrenic patients was high. The most coping strategies used by caregivers of schizophrenic patients were self controlling, positive reappraisal and escape-avoidance. Burden was negatively and non significantly correlated with confrontive coping, distancing, seeking social support and positive reappraisal coping strategies. However, it was positively and non significantly correlated with self controlling, accepting responsibility, escape- avoidance and planful problem solving. Sociodemographic variables were not associated significantly with burden and coping strategies. It is concluded that: Caregivers experienced high level of burden. Burden was none significantly correlated with coping strategies. Recommendation: Psycho educational program is needed to assist caregivers cope successfully with burden resulting from the care of schizophrenic patients.

The Influence of Oral Administration of Simvastatin on Delayed Non-Union Facial Fractures- Clinical Study

Maha M. Sallam

Oral and Maxillofacial Surgery, Dental Unit, Research institute of Ophthalmology, Ministry of Scientific Research. **Sallam_maha@hotmail.com**

Abstract: In this study ten patients with delayed facial fractures presented to our clinic, three of them were in the Research institute of ophthalmology clinic, dental and maxillofacial unit and the other seven were in AL Haram hospital clinic, maxillofacial unit. The patients were in a range of age 25-45 years old, two females and eight males (table.1). All of the patients had non-union fibrous healing and most of them had facial scars at different sites of the face. Others had a chief complaint of pain or numbness of different areas of the face. All of them underwent physical, clinical and radiographic investigations using computed tomograph. Reduction of bone fragments using bone holder was done. The infraorbital nerve was evaluated and decompressed when necessary. Following alignment of the fractures, fixation was maintained by a titanium miniplate and in some cases microplates and screws, after adaptation of the plates to the area. Postoperative care included antibiotics (Clindamycin 300mg.) for a total of 7 days, ice compresses intermittently for 24h., Voltaren 75mg. I.M. every12 h.. Simvastatin (zocor 20 mg. tab.) daily dose was prescribed only to five patients for 3 months (group1) while the other five patients received only the ordinary postoperative prescription (group 2). The aim of this study is to evaluate the effect of oral administration of simvastatin drug on accelerating delayed non –union fractured bone healing. Results: Follow up of the cases revealed slight edema, swelling and hematoma in the first2 weeks; however, it was less in simvastatin group patients, while no infection was noticed in all the patients. Clinical examination of the patients revealed good stability of the bones immediately postoperative. Three months postoperative CT. and/ or three dimensional (3D) facial bone CT scans for all patients revealed that the displaced bone was reduced to its normal anatomy. . It was noticed that patients on the regimen of simvastatin (zocor tablets) (group1) had ameliorated recovery without any complications than in (group2), as the inflammatory reaction was more severe in this group. Bone healing seemed to be accelerated as seen in the CT. radiograph in (group1). At 6-month follow- up, all patients complained of no particular discomfort in everyday life activities and were satisfied with their external appearance. Conclusion:-From this study it could concluded that oral administration of simvastatin 20mg.tablets (zocor) could be prescribed as a regimen postoperatively for all patients with fractures specially in delayed cases for acceleration of bone and soft tissue healing and enhancement of postoperative inflammatory reactions.

ABSTRACT: Screening for the most effective organic extract revealed that acetone fraction significantly decreased the blood glucose level ($p<0.05$) when compared to other fractions and therefore was used for further study in phase 11. The result showed reduction of blood pH with significant value ($p<0.05$) of diabetic untreated when compared to group treated with acetone fraction of *C. gigantea* leaf extract. There was no significant difference ($p>0.05$) in blood pH among the extract-treated groups and glibenclamide-treated group. Protein concentration was observed to increase significantly ($p<0.05$) in diabetic rabbits treated with *C. gigantea leaf* extract when compared to diabetic untreated group. A significant decrease ($p<0.05$) in value of protein concentration of the group treated with acetone fraction of *C. gigantea* leaf extract was observed when compared with group treated to reference drug (glibenclamide).

ABSTRACT: The problem of environmental pollution due to toxic metals has begun to cause concern now in most major metropolitan cities. Nsukka environs have been plagued with perennial problem of water supplies round the year and a better understanding of its water physicochemically status will help to address this daunting problem and issues of human health. The analysis carried out was on the utility water supplies in Nsukka area. Thirteen sampling areas consisting of four boreholes, six dugwells and three springs were chosen for this research work. A total of 26 water samples were taken from the sampling areas during the dry season and another 26 samples during the wet season. Water samples were collected from these sampling areas and refrigerated at 4^0C for processing. Harch Model C50 digital multirange meter was used to measure total dissolved solid. Complexiometric titration was employed in the determination of total hardness of water samples. Bacteriological analysis of the water samples were carried out to ascertain whether there was faecal contamination by the use of multiple tube/most probable number techniques. It was observed that total suspended solid concentration of water samples from dugwell sources was found to have significant increase ($p<0.05$) when compared with the water samples from the samples obtained from borehole and spring sources during both dry and rainy seasons. Total dissolved solid concentration was found to be significantly higher ($p<0.05$) in the water sample from dugwell sources when compared with the total dissolved solid concentration in the water samples from

	both borehole and spring sources during both dry and rainy seasons. Water sample from dugwell sources had showed significant increase ($p<0.05$) in the level of total hardness as compared with water samples from borehole and spring sources during dry and rainy seasons. Also, there was significant increase ($p<0.05$) in the level of total hardness of water sample from borehole sources when compared with the spring sources during dry and rainy seasons. Therefore, from the foregoing, it could be concluded that these boreholes, springs and dugwells water tested in Nsukka town are physicochemically good for human consumption as all the physicochemical parameters tested conformed to WHO, SON and NAFDAC water quality standards except Iyi-adoro spring water which might not be very good for consumption during rainy season because of possible bacteria contamination. 117	**Hadji Mirza Aghasi and Political, Social and religious events in his era** Ali Ahmadalizadeh [1,2] [1.] Research Institute for Education, Ministry of Education, Tehran, Iran [2.] Department of Social History, University of Applied Science,Tehran, Iran dr.alizadeh@yahoo.com **Abstract:** Mirza Abbas Irvaani nicknamed as Hajj Mirza Aghasi, the Sadr-e Aazam (Prime Minister) of Mohammad Shah Qajar must be regarded as one of the star-crossed Iranian Sadr-e Aazams, because he undertook the office when Iran economy and agriculture was devastated due to the Russo-Persian Wars and in the other hands, both Britain and Russia were seeking more influence in Iran and in the court. So, in this harsh condition, Mohammad Shah appointed Hajj Mirza Aghasi as Sadr-e Aazam despite of domestic and foreign efforts to bring the power one that capable to meet their purposes. Although, historians described him as incompetent, semi-insane but history also depicts another picture of him as judicious, gentle, indisposed of punishment and kingcraft and science loving patriot. Following to development of the relations between Iran and the European countries, the economic backwardness and sociological and cultural evolution necessity of Iran was completely revealed and impelled some of the Iranian conscious and provident individuals, under the leadership of Abbas Mirza and then Hajj Mirza Aghasi to ponder and undertake effective measures to obviate this backwardness. In economic and sociologic perspective, as well as student dispatching, order book from abroad, abolishment of torture and execution and take advantage of western civilization are of the beneficial measure of Hajj Mirza Aghasi. In the economic field, he succeeded to launch great leaps towards economical development and advancement and calmed disturbed economical situation after two wars of the Fath Ali Shah period. By relying on agriculture as the pivotal economic factor of that age, Hajj Mirza Aghasi succeeded to relief economical difficulties via aqueduct building and stream construction to irrigate agricultural fields, in a manner that the plenty of cheap agricultural products of that period were available in the markets. Weaponry activity in the field of making artillery and other munitions is another important measure of Hajj Mirza Aghasi which played decisive role in the Iran-Harat war. In foreign affairs, Hajj Mirza Aghasi in struggling to reduce the Britain and Russia influences in Iran was forced to drag third country influence (France) in to the country. Abstract: This paper is concerned with the evaluation of the diffusion coefficient based on the measurement obtained at the boundary by using a numerical approach. We consider the problem of recovering the diffusion coefficient of a rod that is a function of space. The approach is based on finite-difference method and the least-squares scheme. At the beginning of the algorithm, the finite-difference method is used to discretize the problem domain. The present approach is to rearrange the matrix forms of the differential governing equations and estimate unknown diffusion coefficient. The least-squares method is adopted to find the solution. This solution is unstable, hence the problem is ill-posed. This instability is overcome using the Tikhonov regularization method with the gcv criterion for the choice of the regularization parameter. The stability and accuracy of the scheme presented is evaluated by comparison with the Singular Value Decomposition method (SVD). Results show that a good estimation on the diffusion coefficient can be obtained within a couple of minutes CPU time at pentium IV-2.4 GHz PC. [R. Pourgholi. Solving an Inverse Diffusion Problem Using Tikhonov Regularization Method. Journal of American Science 2011;7(5):850-855]. (ISSN: 1545-1003). http://www.americanscience.org.

Abstract: Iran's revolution and its consequences distorted the previous close relationship between Iran and Saudi Arabia. This paper, first as introduction, will discuss the historical competition between ideological and pragmatic approaches in Iran's foreign policy. Then it will study the domination of ideology in the foreign policy of Iran after the Islamic revolution and its role in Iran's foreign relations with littoral states in the Persian Gulf region, in particular, Saudi Arabia. The study further examines the superiority of the pragmatic approach after the end of the Iran- Iraq war (1988) and gradual changes in Iran's foreign policy from 1989. The research also analyzes the role of the new approach in re-establishing and improving the Iran-Saudi Arabia diplomatic relationship, which was severed in 1988, and limited cooperation of the two sides afterwards. The study concludes that despite Iranian-Saudi primary cooperation and agreement after the restoration of mutual ties, they were unable to maintain peaceful relations due to the bilateral and regional problems of the two countries.

	Critical Viewpoint toward Shaykhiyya **Concerning the Coincidence of Hurqalya and the Imaginal World**	Full Text

Yaser Salari[1]

[1] PhD student, Department of Islamic Philosophy and Theology, Science and Research branch, Islamic Azad University, Tehran, Iran
Yaser581@yahoo.com

Abstract: The Shaykhis believed, that between the physical world and the spiritual world, there exists an intermediary world called Hurqalya (from the Greek word Huvarkalya) or the world of archetypal images (Alame' Mithal). From the Shaikhi's point of view, the first corporal form will annihilate completely after

120 (left column) | 120 (right column)

	death and there will have no there return in the Intermediately World and the Resurrection Day, while the corps astral body will remain rotundas, away from any annihilation and destruction. The first body of man will accompany the soul only to the end of the Intermediately World, and while the first Israfil's Blowing of trumpet is heard it will be annihilated too. But the second body as the soul carrier will always accompany the soul and it will never be separated from it, except the time of the Blowing after the second Blowing of the Trumpet in the Resurrection Day, the soul will join the second corps along with the second body, and therefore the spiritual and the corporal resurrection of Sheikhiet will occur. In this paper, the critical viewpoint toward Shaykhiyya is discussed concerning the coincidence of Hurqalya and the Imaginal World. The imaginal world in the spiritual topography of a domain that can only be seen by those who have turned away from the sensus communis and rely on spiritual hermeneutics (ta'wil), a profound issue which he discusses both in the al -Talwihat and Alwah- i imadi. Seeing the archetypes requires transcending all obstacles in order to go beyond what Suhrawardi symbolically refers to as the Qaf Mountain. Finally, the Sheikhis' view of resurrection has been reviewed and analyzed from the point of view of exalted theosophy. [Yaser Salari. The human factors of sustainable design in urban constructions
(With emphasize on Residents' psychological Behaviors)

Saeid Yasinian[1]

[1] Department of Architecture, Hamedan branch, Islamic Azad University, Hamedan, Iran
syasinian@gmail.com

Abstract: The intention of sustainable design is to "eliminate negative environmental impact completely through skillful, sensitive design". Manifestations of sustainable design require no non-renewable resources, impact the environment minimally, and relate people with the natural environment. This manuscript highlights the human factors of sustainable design in urban constructions. While numerous technical progressions have allowed for the reduction of resource consumption, not much study have addressed the reaction of occupants to these appliances, or the degree to which prosperity in achieving sustainability objectives is dependent upon user behavior. This manuscript reviews investigation in related fields and recommends ways in which psychological, behavioral and social issues might be significant to sustainable design, as same as how ways attending to psychological requirements could enhance the success of meeting these and other objectives. Applied behavior and social psychological analytical approaches are surveyed as methods to answer to conservation and recycling objectives. The physiological and psychological profits that green constructions confer on their inhabitants are also notified, as are fields for future investigation, and steps that the building industry could take to develop more sustainable and holistic building practices which incorporate inhabitant behavioral requirements.

Investigating the Aspects of Urban Tourism in Developing countries
(With particular reference to Kohgoliyeh and Boyer Ahmad Province in Iran)

Abdolkarim Azizi

Ph.D. student, Department of geography and urban planning, Faculty of Humanities and Social Sciences, Science and Research branch, Islamic Azad University, Tehran, Iran
Azizi456@gmail.com

Abstract: Tourism industry puts a lot of influence on the development of cities. The experts of European society emphasizes that because of an increase in the speed of information, an increase in culture level of citizens, and an increase in their level of living, the tourism in next years will belong to urban tourism. Based on a principle and a general definition, urban tourism is a kind of tourism which takes place in geographical limit of the city. Urban tourism is one of the most important sections in tourism industry which attracted the attention of tourisms and travelers. In this article, the position of tourism in developing countries is investigated with particular reference to the tourism aspects in Kohgoliyeh and Boyer Ahmad Province in south-west Iran.

125	**Effect of condensed tannin on controlling faecal protein excretion in nematode-infected sheep:** *in vivo* **study** Shahin Hassanpour[1], Mohammad Sadaghian[2], Naser MaheriSis[1], Behrad Eshratkhah[2], Majid ChaichiSemsari[1] [1.] Department of Animal science, Shabestar Branch, Islamic Azad University, Shabestar, Iran. [2.] Department of Veterinary medicine, Shabestar Branch, Islamic Azad University, Shabestar, Iran. hassanpour.shahin@gmail.com **Abstract:** The main propose of this study was to investigating the short term effects of different levels of wattle tannin to protein excretion control during a naturally acquired nematode infection in Moghani sheep. Twenty Moghani ewes (aged 7-12 months and body weight 32 ± 3 kg) were selected randomly and divided into 4 treatment groups. The animals of the experiment had not received any anthelmintic drugs for 4 month. During the study all animals fed *ad libitum* on Moghan plateau and free access to water. Group 1 received placebo. Animals in groups 2, 3 and 4, were drenched 1, 1.5 and 2 gr per kg body weight (BW) wattle tannin (WT) as water solution for one day, respectively. At 0, 24 and 48 hours after drenching WT from each animal faecal sample was taken and stored in individual containers less than $4°C$ carried out to laboratory as soon as possible. Faeces nitrogen (N), dry matter (DM), organic matter (OM), Ash and Wet levels determined following the standard procedures. Data were analyzed as a complete randomized design for repeated measurements using SAS (9.1) software and the least square means compared with Tukey multiple range tests. According to our result there was a significant difference between the groups. Twenty-four hours after drenching highest amount of faecal crude protein execration observed in group 4 ($P< 0.0001$). Additionally, Forty-eight hours after drenched WT there was a significant difference in Group 4 compare to the other groups which has lower FCP execration ($P< 0.0001$). There was no significant difference in faecal OM, DM, Ash and Wet content between groups ($P > 0.05$). In conclusion it is observed that administration of 2 gr WT per kg BW leads to decreasing faecal protein excretion and so resulted in nitrogen retention in animals. [Shahin Hassanpour, Mohammad Sadaghian, Naser MaheriSis, Behrad Eshratkhah, Majid ChaichiSemsari. **Effect of condensed tannin on controlling faecal protein excretion in nematode-infected sheep:** *in vivo* **study.** Journal of American Science 2011;7(5):896-900]. hashemi600@yahoo.com

Abstract: Fair trial in the states of emergency especially after September 11, 2001 attacks is of a high importance. The goal of this article is to recognize the concept of the states of emergency and the determination of their applicability, the study of the mechanism of deviation from the principles and guarantees of fair trial under the said conditions and the recognition of the principles of deviation of the fair trial. For this purpose, the regional and international documents and the policy of control and legal | Full Text | 128 |

institutions have been studied. Among, several international documents, the International Covenant on Civil and Political Rights and the protocols attached to the Geneva conventions and among the regional documents of the European convention of human rights has had the highest protection of the fair trial guarantees. The deliberative views of the International Court of Justice and the legal policy of the European court of human rights have allocated a special place for the reinforcement of fair trial in the states of emergency. The Human Rights Commission of The United Nations and the International Committee of the Red Cross have also played a strong supervisory role in this matter.

The most important result of this article is that the minimum rules of fair trial should not be deviated from any states of emergency. On the contrary, it should be reinforced. Valid derogation of other rules of fair trial requires certain procedural and substantial standards.

Keywords: Fair trial, Valid derogation, the International Covenant on Civil and Political Rights , the European Court of Human Rights, The Red Cross Committee, The Human Rights Commission, The International Criminal Court.

129	**The Contribution of Rural Cooperatives Development in Building Sense of Community in Iran** **Fatemeh Allahdadi** Dept of Organizational and Industrial Psychology, Marvdasht Bramch, Islamic Azad University, Marvdasht, Iran faref2011@yahoo.com **Abstract:** The purpose of this paper is to determine the role of rural cooperatives in building sense of community in Marvdasht, Iran. Capacity building for rural development requires a range of sense of community. Hence, it is expected that the rural cooperatives contribute to building sense of community. The paper is based on the survey questionnaire carried out among 250 rural cooperatives members in rural areas of Marvdasht, Iran. The findings revealed that rural cooperatives have a little contribution in building sense of community for rural development. The importance of lesson plan in adult education

[1] Zeynab Behzadi, [2] Hamid Mohammadi

[1, 2] Marvdasht Branch, Islamic Azad University, Marvdasht, Iran
*Corresponding author: saba11085@yahoo.com

Abstract: Every good course design begins with a needs assessment. For our purposes here, we're going to assume you've completed this assessment and you understand what your students need and what your objectives are for the course you're designing. If you don't know your objectives, you're not ready to design your course. With your objectives in hand, course design can be easy. Like any gathering of people for any reason, it's good to begin at the beginning and address who is there, why they've gathered, what they hope to accomplish, and how they'll accomplish it. Design an activity that gives your students an opportunity to practice what they just learned. Activities that involve breaking into small groups to complete a task or to discuss an issue are good ways to keep adults engaged and moving. It is also a perfect opportunity for them to share the life experience and wisdom they bring to the classroom. Be sure to build in opportunities to take advantage of this wealth of relevant information. Activities can be personal assessments or reflections that are worked on quietly and independently; they can be games or role playing; or they can be small group discussions. Choose your activity based on the best way to provide the adults in

131	**Adult learning: Features and functions** [1] Azam Ghaffari, [2] Abbas Emami [1, 2] Marvdasht Branch, Islamic Azad University, Marvdasht, Iran *Corresponding author: khodamoradi121@yahoo.com **Abstract:** A distinguishing characteristic of adult education programs is that program content and language must be suitable and respectful of adult clients. For example, instead of using the word "student" which may imply a traditional teacher/student relationship where a student is subservient to the teacher, all state program materials use the word "learner" or "customer." Using this type of language acknowledges the adults' existing knowledge and real-world experience and makes them the focus of the program. The Pennsylvania Adult Basic and Literacy Education Indicators of Program Quality emphasize the importance of customer satisfaction and learner progress on individualized goals. One quality area explicitly states that "program staff and learners jointly develop, regularly evaluate, and update an instructional plan that incorporates the individual's learning styles and preferences". This is just one example of how learners and staff are equals and collaborate on the learners' participation in the program. Successful adult education programs recognize that adult learner needs and learning styles may require non-traditional methods of teaching and accommodate them whenever possible. This means holding classes and sessions outside of typical working hours for adults that work, providing one-on-one tutoring, group classes, and other methods of delivering services that are flexible. It is also important to hold the classes where it is convenient for adult learners to attend, such as local houses of worship, residential facilities, libraries, or other community centers. Understanding this key principle is difficult sometimes for organizations that have worked in child education, but not in adult education. 133	**Utilization Information and communication technologies (ICT) in rural people education** [1] Hamid Mohammadi, [2] Azam Ghaffari [1, 2] Marvdasht Branch, Islamic Azad University, Marvdasht, Iran *Corresponding author: mehran11070@yahoo.com **Abstract:** An important factor influencing the adoption of any new technology is an individual's perception of that technology. It is hypothesized by this research that one of the key perception aspects influencing the adoption of IT is the level of trust that the potential adopter has in the IT system and in those who use IT. Trust can be defined as "an individual's optimistic expectation about the outcome of an event" (Hosmer 1995). There are different aspects of trust related to IT. An individual must first trust that information technologies will work and that IT will be beneficial in accomplishing his/her goals and in completing his/her tasks. An individual must also trust that the information they obtain via IT is accurate and the information they send via IT will not be tampered with and privacy levels will be maintained. 135	**Employment of rural women and its effect on empowerment** [1] Abbas Emami, [2] Mohammad Reza Rezaei [1, 2] Marvdasht Branch, Islamic Azad University, Marvdasht, Iran *Corresponding author: sharif11070@yahoo.com **Abstract:** Rural women constitute about half of the world's population and in the world production supply they have energetic communion and constitute a great part of agriculture workforce. They constitute% 50 of the workforce and they participate in the production of half of the foods in the agriculture section. As an example the rural women constitute about 70 to% 80 of agriculture workforce in sub-Saharan Africa, %65 in Asia, %45 in Latin American & Caribbean, %80 in Nigeria & Tunisia and %80 in India, but their role in	Full Text	135

production system is the men's supplements roles and this causes a big responsibility inside their mother & wife duties and it takes a great time and energy of them. Studies in this field show that women spend about two thirds of their time for production, management & organize of their house as the men spend only one third of their time for such things. Although we are familiar with the rural women's role in the village and family's economic, but they direct & indirectly start a new economic relation, with finding modern jobs & financial independency. Catching loan from financial organizations has forced them to have economic schematization for loan reimbursement and to have intellectual economic behaviors. So after that rural women become active in economic activities. In rural traditional economic, women only have productive role and they don't have any role in economic planning, providence and they don't pay any attention to profits and losses. But in this new condition, for managing affairs in best way, the women have to be active in all of the affairs from production to dispense and also in others economic aspects. In other words, women will not be a productive only; they will contribute in managing of economic activities and will find various economic behaviors.

Micro-credit for rural women

[1] Mohammad Reza Rezaei, [2] Hamid Mohammadi

Abstract: Rural women are among those major groups at society who previously were considered less by planners, due to specific reasons in the past. And this problem is more observable at developing countries. While, by looking at women's history of economic and social life, we can find that this great group, continuously have played basic role in forming economic condition of country. This great group consistent with men have had active role at areas of social-economic activities and always have had major part on economic production of society. Nowadays, supporting family supervisor women is adopted by universal society, as politic, economic a social concern and nearly all countries applied related approaches, and however these efforts have resulted in failure, in so many cases . paying part of cost of life by government or charities , establishing forums to analyze family supervisor women's problems , supplying necessary facilities to grow and improve child's life quality and paying facilities to provide sustainable employment , are among most important approaches to support family supervisor women . Paying credit facilities to access sustainable employment with easy terms at limited time, is one of the most important approaches to support family supervisor women. Because alongside supplying their continues needs, their esteem wouldn't be marred. Currently, this approach is used at many countries and positive results have emerged.

Abstract: Drying is one of the most important post harvest processes which convert decaying products to resistant preparations so that it increases the storage duration and keeping product quality (food stuff shelflife). *Hypericum perforatum* L. is an important kind of herbs which its Iranian species characterized by high percentage of Hyperisin as the most important substance of its leaves and flowers. It has an important role in curing some of diseases. In this research, the energy consumption and special required energy for drying of *Hypericum perforatum L.* were investigated by using hot air drying method. The experiments were done at four levels of the temperature (40, 50, 60 and 70°C), air velocity at three levels (0.3, 0.7 and 1 m/s) and bed depth at three levels (1, 2 and 3 cm) on factorial experiment design based on completely randomized design with three replications. Based on results with increasing of temperature, air velocity and bed depth, energy consumption was increased. On the other hand, in constant temperature, with increasing of air velocity special required energy was increased but in constant air velocity, with increasing of temperature, increased.

Abstract: *Objective:* To evaluate myeloid-related protein MRP8/MRP14 (S100 protein) and S100A12 in the serum and synovial fluid of rheumatoid arthritis (RA) and psoriatic arthritis (PsA) patients and its relation to local and systemic parameters of disease activity. *Methodology:* Thirty RA patients (Group I), twenty five PsA patients (Group II) and ten controls (Group III) were included in the study. The patients were subjected to through history taking and clinical examination. Synovial fluid (SF) aspiration was done from twenty RA patients and ten PsA patients. ESR, CRP and synovial fluid analysis for white blood cell count, lymphocytes%, and acute phase serum amyloid (A-SAA) were performed. MRP8/MRP14 and S100A12 were assessed with ELISA technique in serum and synovial fluid samples. *Results:* Serum level of MRP8/MRP14 and S100A12 were elevated in Groups I and II in comparison to group III. The serum and synovial levels of MRP8/MRP14 and S100A12 in Group I and II showed no significant difference. The MRP8/MRP14 and S100A12 in group I showed significant positive correlation with disease activity score (DAS), ESR, CRP, SF MRP8/MRP14, SF S100A12, SF WBCs, lymphocytes% and A-SAA. The SF MRP8/MRP14 and SF S100A12 in group I showed positive significant correlation with ESR, DAS, SF-WBCs, lymphocytes and A-SAA. Group II showed a positive significant correlation of MRP8/MRP14 and S100A12 with ESR, CRP, DAS and PAS index. The SF- MRP8/MRP14 and SF S100A12 in group II showed a positive significant correlation with local inflammatory markers. *Conclusions:* The elevated MRP8/MRP14 and S100A12 in the serum and synovial fluids of patients with RA and PsA showed a significant correlation with local and systemic disease activity parameters. So, it can be used to monitor disease activity and patient's response to treatment.

Abstract: Women, especially in villages of fewer possibilities in terms of investment, credit and enjoy the power. Miran role of rural women more than men, influenced by various factors, conditions and economic,

social, cultural and ecological is. Rural women, either directly (production of crops, livestock, handicrafts and rural) or in terms of helping the agricultural sector (as labor) considerable potential in the community are considered. About 5/6 million women in the production Iran's agricultural sector involved. Activities related to planting, and harvesting, processing and preparation of animal feed, preservation and care of livestock and poultry and some related activities including marketing and sales field role and participation of rural women to sue. One of the problems that governments and governments today should know the world should talk TVs? Especially in rural undeveloped countries. In these countries for lack of proper planning policies and improving quality of life of people in these areas, rural migration to cities has increased significantly is Urbanization and the incidence and growth problems and mental disorders, social, cultural and economic sectors especially in agriculture and animal husbandry provides guidelines and rural development requires a deep study and research in this field is that the governments can Planning and economic policy, social and cultural to help.

Abstract: Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation , and new generation would be adapted with them and add to it . The lack of indigenous knowledge about indigenous practices in many technologies in the developing countries will lead to failure. So attention to indigenous knowledge as a knowledge that is result of many thousand years experience is important in development of villages. Rural benefactors, the people who had communion in development of villages, can take efficient steps in rural development if they pay attention in the process of rural schematization for its development. Indigenous knowledge has different aspects, such as hygiene and treatment, medical plants, linguistics, livestock and agriculture, art and mystery and unprofessional things. Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources.

Abstract: This study was carried out through two successive seasons (2008 and 2009) in a private orange orchard in Qalubia governorate, Egypt in a three years old Navel orange trees budded on sour orange rootstock on clay loam soil (Typic Torriorthents). Planting distance was 2.5×5.0 meters apart and flood irrigation was used by river Nile water. Two nitrogen rates were used 150 and 300 g N/tree/year in three form, 100% mineral nitrogen (M.N.) as ammonium nitrate, 100% organic nitrogen (O.N.) as compost and mixed 50% M.N.+ 50% O.N. each of these treatments with or without K-humate addition (6 kg/feddan). All fertilization treatments were divided into equal five doses added every two months from February to October during the two seasons. The obtained results showed that soil pH values increased significantly with treatments of O.N. and mixed N form. Soil saturation percent increased significantly with organic nitrogen treatments. The highest value of soil organic matter content was obtained with treatment of 300g N/tree/year in organic form and with addition of K-humate (4.7%). There is not clear role of humic acid at 6 kg/feddan on the soil organic matter content. Total soil N content recorded higher significant values with the nitrogen addition as organic form compared with mineral form. Regarding to the N rate treatments of

145

300 g N/tree/year gave higher significant total soil N content than of 150 g N/tree/year. The treatment of organic nitrogen form at 300 g N/tree/year with K-humate addition had highest significant soil available P and K compared with all other treatments in both seasons. In spite of the content of K-humate of K was 7%, there is no stable trend for the K-humate application for the two seasons. There were inconstant trends in soil available Ca, Mg, Fe, Mn and Zn.

The Response of Nonbearing Navel Orange Trees for Mineral and Organic Nitrogen Fertilization Treatments and K-Humate Addition

Abstract: T This study was carried out through two successive seasons (2008 and 2009) in a private orange orchard in Qalubia governorate Egypt in a three years old Navel orange trees budded on sour orange rootstock on clay loam soil (Typic Torriorthents). Planting distance was 2.5×5 meters apart and flood irrigation was used by river Nile water. Two nitrogen rates were used 150 and 300 g N/tree/y in three forms 100% mineral nitrogen (M.N.) as ammonium nitrate, 100% organic nitrogen (O.N.) as compost and mixed (50% M.N. + 50% O.N.) each of these treatments with or without K humate addition (6 kg/feddan). All fertilization treatments were divided into equal five doses added every two months from February to October during the two seasons. The obtained results showed that the highest stem thickness increment percentage was recorded by mixed nitrogen form (50% M.N. + 50% O.N.). Mixed nitrogen form with K-humate recorded the highest significant value of plant height increment percentage in the first season, but in the second season, using nitrogen form at 150g N/tree/y without K-humate recorded the highest significant value. Leaf N content had higher significant values with M.N. treatments. Leaf P content showed insignificant differences among treatments. Mixed N source at 300g N/tree/y without K-humate recorded a higher significant value of leaf K content, in the second season compared with other treatments. Leaf Ca content showed a higher significant value by organic and mixed N form treatments in the first season. Leaf Mg, Fe, Mn and Zn contents increased significantly with M.N. treatments in the first season. While in the second season leaf Fe content had a higher significant value with O.N. treatments. Leaf Mn content illustrated the lowest significant mean level by using N form at 150g N/tree/y treatment. While, leaf Zn content recorded a higher significant value with mixed nitrogen source at 150g N/tree/y with K-humate addition compared with all other treatments. From this results we recommended that the mixed sources of N fertilizer (50% M.N. + 50% O.N.) at 150g N/tree/y is the best N fertilizer, and the application of K-humate or humic acid at commercial rate is not recognized for the young Navel orange trees in clay loam (Typic Torriorthents) soil.

Abstract: There are many tests available to help you and your students discover your best learning style. Generally speaking, however, if you are someone who is more likely to think in pictures, prefer to meet with someone in person, and are more likely to want visual diagrams when completing a project you have tendencies towards visual learning. Similarly, if you are more likely to think in terms of sounds, prefer to speak on the phone with someone, and want verbal instructions then you tend towards auditory learning. Finally, if you are more likely to think in terms of moving images like mini-movies in your mind, prefer to participate in an activity when you meet to speak with someone, and tend to jump right into a project without reading directions you tend towards tactile/kinesthetic learning. In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Robust Control of an Active Suspension System Using H₂ & H∞ Control Methods

Fatemeh Jamshidi [1], Afshin Shaabany [1]

[1] Islamic Azad University, Fars Science and Research Branch, Shiraz, Iran
Fjamshidi59@yahoo. com, afshinshy@yahoo.com

Abstract: In this paper, H2 & H∞ control for an active suspension system are presented. These Controllers are designed for the order reduced model of the plant that makes the design problem so easy, But preserves the performances and stability of the nominal closed loop system. Some constraints on the Input and output sensitivity functions are considered. The results show control specifications are met to large extent with both methods.
[Fatemeh Jamshidi, Afshin Shaabany. Robust Control of an Active Suspension System Using H₂ & H∞ Control Methods. Journal of American Science 2011;7(5):1-5]. (ISSN: 1545-1003). http://www.americanscience.org.

1. Introduction

An active suspension system is used for disturbance attenuation in a large frequency band and in the presence of the load variation. Active suspension systems are currently of great interest in both academia and industry. A literature survey on suspension system shows that several models and controllers have been developed in attempts to enhance and improve the ride and handling qualities in today's vehicle Amirifar (2003), Ray (1991). Linear controllers are the main group of these controllers. In the linear control philosophy, it is assumed that the system's state exhibit only small variations around the equilibrium point, so that a linear approximation model can be used. Existing linear controllers range from PID to robust multivariable controllers Thompson (1989), Landau (1995), Landau (1995), Amirifar (2006), Thompson (1976), Kuo (1999), Aghaie (2007)1]. In Landau (1995) robustness analysis and synthesis methods based on stochastic stability robustness for a quarter-car model was presented that can be applied to higher order active suspension systems. However, such approach requires large feedback gain and reasonable phase must be selected. In Landau (1995) the centralized/ local optimal output feedback controller (CLOFC) was developed for active suspension systems. In Amirifar (2006) and Thompson (1976) optimal control theory was applied to the design of an active suspension system. The used performance index is based on ride quality, suspension deflection, and tire deflection. In Thompson (1989) a combination of the H∞ and LQR methods was used to improve the system performance when it is subject to external disturbances, e.g., road irregularities, and parameter uncertainties, e.g., vehicle weight as payload varies. Even though this method provided better performance, its application to a vehicle suspension

System is difficult, since the H∞ method

often results in complex high- order controllers even the design model is of reasonable size Karnopp (1983). In order to reduce the order of high-order controllers, controller order reduction techniques can be used. In Sunwoo (1991) a new controller order reduction technique with stability and performance preservation via LMI optimization was presented and implemented on an active suspension system. The controller order reduction problem was reduced to an LMI problem, so it can be solved efficiently. The fixed parts of the high-order controller which should be preserved in the reduced-order controller, and many other specifications on the reduced-order controller that can be expressed as LMIs constraints, can easily be treated.

The novelty of this paper is the presentation of the classical H₂ & H∞ control schemes for the active suspension system. The control specifications are enforced in the H₂ & H∞ problems as the constraints on the input and output sensitivities. The desired performances are obtained by precise selection of the weighting functions that may affect the stability of the closed loop system in turn. In this paper, the reduced order model of the system is used to design the controllers, but performance indexes and stability are examined for the main system. The simulation results for both of H₂ & H∞ controllers are given and compared.

The reminder of this paper is organized as follows. In section 2, an active suspension system is introduced. Section 3 is devoted to the H₂ & H∞ controller design for robustifying, achieving the wanted performances and the stability margins. Finally, section 4 presents the concluding remarks.

2. Active suspension system

The schematic diagram of the active suspension system is shown in Figure 1.
Figure 1. Schematic diagram of the active suspension system

Figure 2. Magnitude of the frequency response of the primary path

Two models for the system will be identified, corresponding to the primary and secondary path. The input of the primary path (excitation of the shaker), u is the input of the secondary path (proportional to the piston position) and y is the system output (residual force).

The active hydro-suspension system reduces the machine vibration at the resonance frequency. The principal parts of the suspension system are given below:

1.   an elastomere cone that encloses the main chamber filled with silicon oil (1);
2.   an inertia chamber enclosed with a flexible membrane (2);
3.   A piston (3) that is fixed on a DC motor. When the position of the piston is fixed, the suspension system is passive;
4.   An orifice (4) that allows oil flow between two chambers.

The principal idea of the active suspension is to change the elasticity of the system in order to absorb the vibrations generated by the machine that we want to isolate. For the experimental purposes the machine is replaced by a shaker which is driven by a computer generated control signal.

The output of the system is the measured voltage corresponding to the residual force. The control input drives the position of the piston via an actuator. The transfer function, F(s) between the excitation of the shaker and the residual force is called the primary path. The secondary path is defined as the transfer function between the control input and the residual force.

The magnitude analysis of the frequency response of the primary path obtained by spectral analysis is shown in Figure 2, this analysis shows that there are several vibrational modes, with the first mode at 31.47 Hz and the second mode around 160Hz are the most important ones.

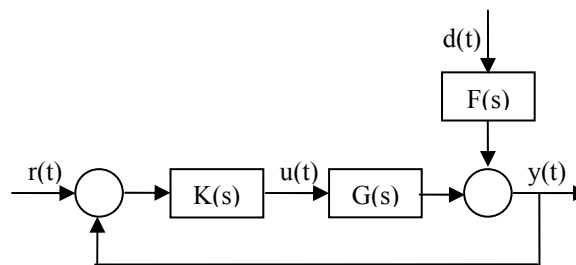
The structure of the controlled active suspension system is given in the Figure 3.


Figure. 3. Block diagram of the controlled active suspension system

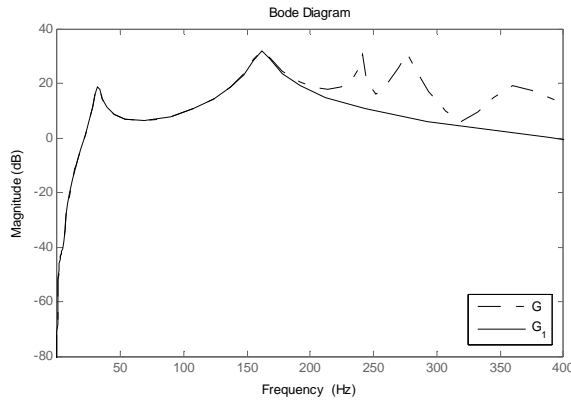
In this section, the design of a controller for the active suspension system is considered. A 15-th order continuous-time model of the secondary path G(s) is used for scheme. G(s) consists of several vibration modes, whereas the first mode around 30 Hz, and the second mode around 160 Hz are the most important ones. In order to consider the effects of the most important modes during the controller design procedure, a low-order model, namely, $G_1(s)$ is obtained by truncating the high frequency modes. Figure 4 shows the magnitude Bode plot of G(s) and $G_1(s)$.


Figure 4. The magnitude Bode plot of G(s) and $G_1(s)$.

3. Controller design and simulation results

The control goal of this system is to compute a linear controller which minimizes the residual force around the main vibration modes of the primary path model and to try to distribute the amplification of the disturbances over the higher frequencies.

The control objective can be presented in terms of the constraints for the closed-loop sensitivity functions. The output sensitivity function of the nominal closed loop system, $S_{yp}(s)$ is defined as

$$S_{yp}(s) = \frac{1}{1 + G(s)K(s)} \qquad (1)$$

The input sensitivity function of the nominal closed loop system, Sup(s) is defined as

$$S_{up}(s) = -\frac{K(s)}{1 + G(s)K(s)} \qquad (2)$$

The modulus of the output and input sensitivity functions must be bounded above in the frequency domain by the special constraints. Figure 5 and Figure 6 show the magnitude Bode plot of the constraints on the input and output sensitivity functions used in the controller designs.

The resulting 12-th order H∞ Controller achieves the control specifications approximately. The nominator and denominator of K(s) are given below. Figure 7 and 8 show the magnitude bode plot of the sensitivity functions obtained by controller implementation.

$$d_{K_\infty}(s) = s^{12} + 1996.8s^{11} + 4.2813 \times 10^6 s^{10} + 4.8207 \times 10^9 s^9$$

$$+ 5.5322 \times 10^{12} s^8 + 3.4406 \times 10^{15} s^7 + 2.4111 \times 10^{18} s^6$$

$$+ 6.4411 \times 10^{20} s^5 + 1.8 \times 10^{23} s^4 + 2.5085 \times 10^{25} s^3$$

Figure 7. Output sensitivity function constraint (solid) and output sensitivity function (dotted), with H_∞ controller

The resulting 10-th order H2 Controller achieves the control specifications approximately. The nominator and denominator of K(s) are given below. Fig. 9 and 10 show the magnitude bode plot of the sensitivity functions obtained by controller implementation.
Figure 8. Input sensitivity function constraint (solid) and input sensitivity function (dotted), with H∞ controller

$$n_{K_2}(s) = 2.1505s^9 + 9519.1s^8 + 1.832 \times 10^7 s^7 + 2.7996 \times 10^{10} s^6$$
$$+ 2.8233 \times 10^{13} s^5 + 2.4727 \times 10^{16} s^4 + 1.2337 \times 10^{19} s^3$$
$$+ 6.4232 \times 10^{21} s^2 + 5.0442 \times 10^{23} s + 1.0294 \times 10^{25}$$
$$d_{K_2}(s) = s^{10} + 1942.3s^9 + 4.14 \times 10^6 s^8 + 4.5216 \times 10^9 s^7 + 5.126 \times 10^{12} s^6$$
$$+ 2.9771 \times 10^{15} s^5 + 2.0559 \times 10^{18} s^4 + 4.081 \times 10^{20} s^3 + 8.1062 \times 10^{22} s^2$$
$$+ 5.1225 \times 10^{24} s + 8.7689 \times 10^{25}$$

Figure 9. Output sensitivity function constraint (solid) and output sensitivity function (dotted), with H_2 controller
Figure 10. Input sensitivity function constraint (solid) and input sensitivity function (dotted), with H_2 controller

The gain margin and phase margin of the controlled system are presented in table. 1. Results show that the controlled system is stable and is sufficiently far from stability margins.

Table. 1 stability margins

	H_2 Controller	H_∞ Controller
Gain Margin	5.0897	6.5464
Phase Margin	109.9230	130.5152

3.   Conclusion

An application of the H_2 & H_∞ controls to an active suspension system has been presented. By translating the control goals on the input and output sensitivity functions, a mixed sensitivity problem has been obtained. The reduced order model of the system is used to design the controllers, but performance indexes and stability are examined for the main

system. The final solutions are the 10th-order H_2 controller and the 12th-order H_∞ controller that achieve all design specifications and have good stability margins. It is clear that the H_∞ controller has higher order than the H_2 controller but give better performances.

Abstract: Peroxidases are essential enzymes in biodegradation of lignin which have been investigated intensively in fungi. Six fungal isolates were isolated from rice husk and screened for their activities to produce an extracellular lignin peroxidase enzyme (LiP). One isolate (identified as *Cunninghamella elegans*) was found to be the most potent one. The maximum LiP productivity was under static condition (LiP activity= 15800 U L^{-1}), at pH 6 (LiP activity= 14200 U L^{-1}), 30°C (LiP activity= 15300 U L^{-1}) and after 14 days incubation period (LiP activity= 14300 U L^{-1}). LiP Purification protocols involved several steps including firstly, the precipitation of LiP with 80% ammonium sulphate with a fold of 2.43 and enzyme activity of 89500 U L^{-1}. Secondly, LiP was further purified using Sephadex G-100 fractionation with a purification fold of 2.76 and enzyme activity of 112200 U L^{-1}. Finally, the molecular mass of purified LiP was estimated at 50 kDa. using SDS-PAGE technique.

1. Introduction

The increasing expansion of agro-industrial activity over the last 40 years has led to the accumulation of a large quantity of lignocellulosic residues all over the world (Villas-Boas *et al*., 2002). Agriculture has played and will continue to play an important economic role in Egypt. Egyptian agriculture is traditionally based on crop productions, particularly cotton, wheat, vegetables, rice and bean. By-products derived from these sub-sectors have and will continue to provide large quantities of valuable nutrients to sustain livestock, particularly ruminant production in Egypt. However, they are known mostly containing lignocellulosic materials which are a complex structure of lignin. Zanirun (2008) reported that removal of lignin is important in order for enzymatic hydrolysis to occur as it acts as a barrier to most of agricultural wastes. Lignin is a complex aromatic amorphous polymer, most commonly derived from wood and is an integral part of plant cell walls and is the second most abundant biopolymer after cellulose, employing 30 % of non-fossil organic carbon and constituting from a quarter to a third of the dry mass of wood (Boerjan *et al.*, 2003). It is relatively hydrophobic and aromatic in nature and is known for its heterogeneity in lacking a defined primary structure (D'Souza Ticlo, 2008). It is an essential part of the plant cell wall, imparting rigidity and protecting the easily degradable cellulose from attack by pathogens (Lankinen, 2004). Eriksson *et al*. (1990) also stated that lignin is a three-dimensional heterogeneous polymer stored in the plant cell wall of all vascular plants. It is the most abundant renewable aromatic biopolymer in the biosphere. Owing to its recalcitrant nature, lignin is remarkably resistant to degradation by most microorganisms, an important factor limiting the rate of degradation of lignocellulosic materials. Studies on lignin biodegradation are important for possible biotechnology application, since lignin polymers are major obstacles to the efficient of utilization of lignocellulosic materials in a wide range of industrial processes. The lignocellulosic biomass from plants is a renewable source of food, energy and chemicals. It accounts for more than 60% of the total biomass production (Kuhad *et al.*, 1997). Lignocellulosic waste material is produced in huge amounts in agriculture, forestry and in the pulp and paper industry. The use of this waste is an important way to recycle carbon to energy and food. The lignocellulosic material of plants consists of three main components, namely cellulose, hemicelluloses and lignin.

Ligninase or lignin peroxidase (LiP) is gaining importance for its biotechnological application due to its integral role in the biodegradation of lignin, lignin related aromatic compounds and the potential use in industrial processes such as biopulping, biobleaching and bioremediation. (LiP) has been extensively studied and has been reported that its production was by several fungal isolates (Zanirun, 2008).

Due to its complicated structure and non-hydrolysable bonds, lignin is more difficult to break

down than cellulose or hemicelluloses. The molecular mass of lignin is about 100 kDa which prevents its uptake inside the microbial cell. Thus, the biological degradation of macromolecular lignin must occur through the activity of extracellular enzymes (Argyropoulos and Menachem, 1997). In 2004, Kareem and Akpan reported that the use of agricultural by-products as substrate for enzyme production was cheap and could facilitate large scale production of industrial enzymes in the tropics. Obligate and facultative fungi from lignocelluloses substrates are an important source of lignin-degrading enzymes (Bucher *et al.*, 2004; Pointing and Hyde, 2000). Fungi play a mostly saprophytic role to release nutrients which can again be used by plants and animals as organic sources for metabolism (Raghukumar, 2004). This role involves the degradation and mineralization of lignocellulosic substrates and fungi that do so are termed as lignicolous or lignin-degrading fungi (D'Souza Ticlo, 2008). The lignin degrading fungi initiate the process of lignin degradation using a specialized set of enzymes, i.e., the lignin-degrading enzymes, which include the heme-containing peroxidases.

A lignocellulosic substrate (wheat straw and hemp woody core) promotes the production of LiP of *P. chrysosporium* under culture conditions, in which, N and C are non-limiting (Kapich *et al.*, 2004). Peroxidases catalyze the oxidation of substrates using H_2O_2 as a final electron acceptor. All peroxidases share the same catalytic mechanism consisting of three steps. First, the ground state ferric peroxidase reacts with H_2O_2 to yield two electron oxidized intermediate known as the compound I. Then, compound I is reduced by an exogenous substrate in one electron reaction to another enzyme intermediate called compound II, which is subsequently reduced back to the ground state by another substrate molecule, also, in one electron reaction (Verdin *et al.*, 2006).

Under natural conditions fungi are able to grow on many substrates difficult to exploit by more rapidly growing organisms such as bacteria. Growth on complex substrates is based on the secretion of extracellular enzymes (Lankinen, 2004).

Guo (2001) and Shen *et al.* (2005) isolated the LiP enzyme by precipitation with ammonium sulphate and the enzyme was further purified by fractionation on three steps of chromatography, cation exchange, hydrophobic interaction and anion exchange to obtain an electrophoretically homogenous pectinase. The molecular weight of the purified enzyme was estimated by SDS-PAGE.

2. Material and Methods
2.1. Rice husk preparation and cultivation

The rice husk was obtained from Mansoura governorate of Egypt. It was homogenized using sterile mortar and pestle and passed through sterile stainless steel sieves of 200 μm and 100 μm in succession, followed by washing with sterile distilled water. The particles were then plated on potato dextrose agar (PDA) supplemented with 10% antibiotic solution (contained 1 gm of penicillin in a combination with 1 gm of streptomycin sulphate in 100 ml of sterile distilled water) to prevent bacterial growth (D'Souza Ticlo, 2008). The plates were then incubated at 25°C for 4-7 days. After the end of incubation period, six fungal isolates were isolated and purified.

2.2. Media preparation for enzyme production

The culivation medium (production medium) of the fungal isolates contained 4.5% (w/v) rice husk, 1.5% yeast extract, 1% glucose, 0.25% NH_4Cl, 0.05% thiamine chloride, 0.2% KH_2PO_4, 0.2% $MgSO_4.7H_2O$, 0.01% $CaCl_2$, and 0.05% KCl. Tap water was used for preparation of the medium and the pH was adjusted to 6. Erlenmeyer flasks (250 ml) containing 100 ml of medium were inoculated with 1 cm square agar piece ($8x10^6$ spores/ml) from an actively growing fungal isolates on PDA and incubated at 25°C for 7 days (Dayaram and Desgupta, 2008).

2.3. Enzyme extraction

The enzyme extraction was carried out according to the method described by Dayaram and Desgupta (2008). Briefly, cultures were harvested after 7 days, filtered and clarified by cooling centrifugation at ~12000 x*g* for 20 min at 4°C to remove the mycelia and enzyme activity was assayed.

2.4. Lignin peroxidase activity assay

Lignin peroxidase (LiP) was determined by monitoring the increase in absorbance (A_{310}) due to the oxidation of Veratryl alcohol to veratraldehyde at 37°C (Tien and Kirk 1988). The reaction mixture (2.5 ml) contained 500 μl enzyme extract (previously prepared as mentioned above), 500 μl H_2O_2, 500 μl Veratryl alcohol solution and 1.0 ml sodium tartarate buffer, pH 3.0 and LiP activity was calculated from the molar extinction coefficient ( ) of 9300 mM cm^{-1} (D'Souza Ticlo, 2008). LiP was expressed as enzyme units per liter (U L^{-1}), where one unit of enzyme activity is defined as the amount of enzyme oxidizing 1 μmol of substrate per minute. One fungal isolate was selected as the most potent isolate and sub-cultured to be identified.

2.5. Identification of the fungal isolate

The most potent fungal isolate was characterized and identified at Regional Center of Mycology and Biotechnology (Al-Azhar university, Cairo, Egypt) for further identification. The identification method was based on the fungal identification as described by Domsch *et al.* (1993) and Samson *et al.* (2000).

2.6. Factors affecting LiP productivity

The effects of pH, agitation, incubation time and temperature on the production of the crude enzyme were studied. In each experiment the optimum conditions deduced from the previous experiments were considered.

2.7. Protein estimation

Protein concentration was determined according to Bradford (1976) method. To 30 µl of sample, 900 µl of Bradford's reagent (Bio-Rad, CA, USA) were added and incubated at room temperature for 30 min. The absorbance was recorded spectrophotometrically at 595 nm. Bovine serum albumin (Sigma) was used for standard curve plotting.

2.8. Ammonium sulphate fractionation

Ammonium sulphate was added slowly to the culture filtrate with stirring at 4°C to 80% saturation. The mixture was stored overnight at 4°C, to allow the protein to precipitate. The solution was then centrifuged at 17000 x*g* at 4°C for 30 min. The precipitate was dissolved in distilled water to a final volume 10 ml (D'Souza Ticlo, 2008).

2.9. Dialysis and concentration of the crude LiP enzyme

The culture filtrate was placed in dialysis bags, cut off 12 kDa (Sigma), and dialyzed against 0.2M citrate-phosphate buffer, pH 6 for three successive times until no longer of ammonium sulphate in the buffer, then concentrated by osmosis using sucrose (D'Souza Ticlo, 2008).

2.10. LiP enzyme purification

The dialyzed protein preparation was applied onto a column (Pharmacia column, 2.5 x 50 cm) packed with Sephadex G-100. This was equilibrated in 0.2M citrate-phosphate buffer pH 6, then eluted with the same buffer. The fractions O.D. was monitored at A_{310} and LiP activity was measured. LiP purity was confirmed by SDS-PAGE. Preparation of the column and the fractionation procedure was carried out as mentioned by Scopes (1994).

2.11. Determination of LiP molecular mass

LiP molecular mass was estimated using sodium dodecyl sulphate-polyacrylamide gel electrophoresis (SDS-PAGE) as described by Weber and Osborn (1969).

3. Results
3.1. Microorganisms

Six fungal isolates were used in teh preliminary experiment to screen their efficiency for the production of the lignin-degrading enzymes. Only one isolate was selected for further identification due to its highest enzyme productivity. The isolate was identified as *Cunninghamella elegans* as shown in Fig (1).

3.2. Production and activity of LiP enzyme

The production of ligninolytic enzyme by *Cunninghamella elegans* was investigated in rice husk containing medium i.e. Production medium. Optimization of medium was regularly studied for further characterization purposes.

3.2.1. Optimization of cultivation medium for LiP production

Results shown in Fig.2 revealed that LiP activity reached the maximum productivity on day 14 of growth (10.800 U L^{-1}) at 25°C. Below and above this particular incubation period, a remarkable drop in the enzyme yield was noticed. LiP productivity at different pH values was determined. LiP showed the highest activity peak at pH 6 (14.200 U L^{-1}). However, the activity decreased gradually in the alkaline side. The maximum LiP activity found at 30°C (15.300 U L^{-1}). The noticeable difference between static and shaking conditions (12.3 x*g*) on production of LiP was found (Fig.2). Since, static state was more effective (15.800 U L^{-1}) than shaking one (8.400 U L^{-1}).

3.2.2. Concentration of LiP by ammonium sulphate fractionation

The highest activity of LiP protein preparation was obtained by precipitation at 80% ammonium sulphate (Table, 1).

3.2.3. Purification of LiP enzyme by column chromatography

Results revealed that only one peak was found. This step resulted in increasing purification folds of LiP enzyme up to 2.76. A summary of purification steps is represented in Table 2.

3.2.4. Molecular mass determination of LiP

As shown in Fig. (3), the purified LiP was analyzed by SDS-PAGE. A single protein band was

observed and the molecular mass of LiP was estimated at 50 kDa.

4. Discussions

To reduce environmental damage from weathering and coal burning, biotechnological processes are needed to convert hard coal or lignin to clean, cost-effective energy sources or other useful materials. A microbial, enzymatic or enzyme-mimetic technology that can take place at moderate temperatures and pressures (Fakoussa, 1992) would have great advantages compared to the current physical and chemical coal conversion technologies. Biocatalytic particles are also smaller than conventional catalytic particles and thus more efficient. In this study, the potential of producing LiP has been investigated. *Cunninghamella elegans* was found to be the most potent isolate between six fungal isolates for producing LiP. The maximum LiP productivity was under static condition at pH 6, 30°C and after 14 days of incubation period. LiP

Purification was isolated firstly by the precipitation with ammonium sulphate. Its enzyme activity was 89500 U L^{-1}. Then, LiP was purified by gel permission chromatography and its activity increased to 112200 U L^{-1}. The molecular mass of LiP was estimated, by SDS-PAGE, at 50 kDa. During the past decade, fungi were studied in relation to their ability to degrade recalcitrant organo-wastes (Field *et al*., 1993; Vyas *et al*., 1994; Demir, 2004). These studies were done in parallel with those on a complex enzymic system that allows fungi to degrade lignin (Barr and Aust, 1994; Costa *et al*., 1994). Peroxidases are essential enzymes in biodegradation of lignin and lignite which have been investigated intensively in fungi (Yang *et al*., 2005). In our study, it was observed that LiP activity appeared to reach the maximum in the culture fluid, when *Cunninghamella elegans* was grown in specially designed rice husk broth. Growth and enzyme production in static flasks were superior when compared to that found in shaked cultures, therefore, static conditions were chosen for routine cultivation. LiP activity in the culture fluid was detectable after 14 days. Kareem and Akpan (2004) reported that the use of agricultural by-products as a substrate for the enzyme production was cheap and could facilitate large scale production of industrial enzymes. LiP activity was determined by monitoring the oxidation of veratryl alcohol to veratraldehyde at 37°C as indicated by an increase in A$_{310}$. Chia (2008) stated that the discovery of LiP, veratryl alcohol has played a pivotal role in the study of the lignin biodegradation process. Veratryl alcohol is used as an assay for enzyme activity due to the easily detectable absorbance of the produced veratraldehyde. LiP is capable of oxidizing non-phenolic compounds with a relatively high redox potential of the oxidized enzyme intermediates (Schoemaker and Piontek, 1996). The mechanism of action of LiP was discovered from studies of methoxylated benzenes, which were oxidized by LiP to unstable molecules called cation radicals. The cation radical 1,4-dimethoxibenzene, decomposes in the reaction with H$_2$O, producing methanol and benzenequinone (Chia 2008). Fakoussa and Hofrichter (1999) reported that the pH range for LiP was between 2.0 and 5.0 with an optimum somewhere between 2.5 and 3.0. In our study, the *Cunninghamella elegans* LiP is different from other fungal LiP, since the optimum pH of *Cunninghamella elegans* LiP was 6.0. However, the *Cunninghamella elegans* LiP had a wider range of pH. At pH 8.0, the LiP activity was still retained. The optimum temperature was between 25 and 30°C. It was highest at 30°C, and rapid inactivation occurred above 35°C. These results on extracellular LiP agree fairly well with those reported by other researchers (Zanirun *et al*., 2009 and Yadav *et al*., 2010). The subunit molecular mass range of white-rot fungal LiP was 38– 47 kDa and that of peroxidases was 38–50 kDa (Fakoussa & Hofrichter 1999). *Cunninghamella elegans* LiP had a subunit molecular mass of 50 kDa, that was within this range. Peroxidase activity was detected in PAGE by selective staining. The optical absorption spectra of enzyme showed that *Cunninghamella elegans* peroxidase had a distinct band. Yadav *et al*., (2010) isolated LiP from a fungal culture filtrate with a molecular mass of 48 kDa estimated by SDS-PAGE. Further studies are in progress for the practical application of *Cunninghamella elegans* LiP. Meanwhile, future study using this isolate would concentrate upon finding the breadth of pollutants that can be further exploited to develop a cost effective bioremediation process.

Changes in physico-mechanical properties of banana fruit during ripening treatment

Mahmoud Soltani*, Reza Alimardani, Mahmoud Omid

Department of Agricultural Machinery, Faculty of Agricultural Engineering and Technology, University of Tehran, Karaj, Iran. *mahmoodsoltani39@yahoo.com

Abstract. In this paper, some physical and mechanical properties of banana fruits at different level of ripeness were investigated. Relation between various stages of ripeness and these properties were determined and correlation coefficients were calculated. The color of the fruit skin was measured as L^*, a^* and b^* in *CIELAB* system. The mechanical properties were extracted from plotted force-deformation curve. A significant difference at 5% level was found between the level of ripeness and these properties. Duncan's multiple range test was conducted and results were reported. Results showed that changes in L^*, b^* and C was similar, also variation of color index (*CI*) was similar to a^*. The firmness, rupture energy and hardness decreased as banana fruit ripened. All measured physico-mechanical properties of banana fruit except deformation had High correlation with stage of ripeness. Result of deformation analysis showed no significant difference at various stages of ripeness. The correlation between deformation and stage of ripeness was obtained as 0.2.

Key words: Banana fruit, Physical, Mechanical, Ripening

1. Introduction

Banana is one of the popular fruits in the world. Banana fruit is grown in many countries in sub-tropical areas and the big exporters are located in South East Asia, South America and the Caribbean. The Cavendish variety is widely produced by these countries. Banana is subsumed third place in the world fruits volume production after citrus fruit and grapes. Green-mature banana fruits are transported to consumer countries and ripened in controlled conditions. Imported banana fruits are transported to airtight warehouses with ethylene gas control system and are ripened. During ripening process, many changes are occurred in physical and mechanical properties of banana fruits. Knowing the physical and mechanical properties of banana fruit and changes in these parameters in ripening treatment is the most important attributes to design handling, sorting, processing and packaging system. Knowing these properties of agricultural products would help designer engineers to apply forces and dimensions of machine's units properly to protect fruits from bruises, injuries, decay lesions and numerous other defects that emanate as results of post-harvest processing treatments. In many fruits such as banana and mango, the level of ripeness associates with physical and mechanical properties such as firmness, color and dimensions of fruits. These parameters can be applied to predict the quality of fruits. Also in design of processing systems for these fruits, changes occurred in phisyco-mechanical properties must be remarked. Many studies have been reported on the physical and mechanical properties of fruits, such as bergamot (Rafiee et al., 2007), coconut (Terdwongworakul et al., 2009), date fruit (Keramat Jahromi et al., 2008), kiwi fruit (Lorestani and Tabatabaeefar, 2006), melon (Emadi et al., 2009), orange (Khojastehnazhand et al., 2009; Sharifi et al., 2007) and citrus fruits (Omid et al., 2010).

For banana fruit, some researches were accomplished about its physico-mechanical properties. For example, Kachru et al., (1995) investigated physical and mechanical characteristics of two varieties of green-mature banana fruit. Saeed Ahmad et al., (2002) conciliated the temperature effect of ripening treatment on properties of banana fruit. Also investigation on reciprocal effect of storage humidity, temperature and fruit length on characteristics of banana fruit were done (Saeed Ahmad et al., 2006). Salvador et al., (2007) studied the changes in color and texture of banana during storage at 10 ºC and 20 ºC. They found that during storage, the change in peel color from green to yellow was gradual in the *M. Cavendish* samples, whereas the *M. Paradisiacal* variety presented a different pattern, remaining green for the first 8 days and then changing rapidly to a yellow tone from day 12 onwards. While the flesh texture of the *M. Cavendish* type bananas softened quite rapidly during storage, it evolved more slowly in the *M. Paradisiacal* variety and there was little variation in the flesh hardness values over the storage time. As it is found from previous studies, it is necessary to

investigate changes in physico-mechanical properties of banana fruit during ripening treatment.

The objectives of this research were to study some physical and mechanical properties of banana fruit and changes in these parameters during ripening treatment. The parameters investigated include L*, a*, b*, CI, C, H, firmness (*F*), rupture energy (R_E), hardness (*Ha*), deformation (*D*).

2. Materials and Methods

Specimens were provided from an airtight warehouse having ripening operation on banana fruit. During ripening, peel color varied from green to yellow. Ripeness is currently assessed visually by comparing the color of the peel with standardized color charts that describe various stages of ripeness. In trade market, seven ripening stages of bananas are usually discerned: stage1: all green; stage 2: green with a trace of yellow; stage 3: more green than yellow; stage 4: more yellow than green; stage 5: yellow with a trace of green; stage 6: all yellow; stage 7: all yellow with brown speckles. Color stage was judged visually using a chart scale to categorize bananas based on their level of ripeness. Banana fruits (*Cavendish* variety) were selected from imported bananas that were ripened in an airtight warehouse with ethylene gas control system. Undamaged bananas of each stage were selected and cut into fingers. The specimens were transferred to the material property laboratory, department of Agricultural Machinery Engineering, Faculty of Engineering and Technology, University of Tehran.

Color of fruit can be described by several color coordinate systems. Some of the most popular systems are CIELAB and RGB. The CIELAB color space is based on the concept that colors can be considered as combinations of red and yellow, red and blue, green and yellow, and green and blue (Figure 1). To determine the exact combination of colors of a product, coordinates of a three dimensional color space are assigned.

The L* coordinate of an object is the lightness intensity as measured on a scale from 0 to 100, where 0 represents black and 100 represents white. The a* coordinate of an object represents the position of the object's color on a pure green and pure red scale, where -127 represents pure green and +127 represents pure red. The *b** coordinate represents the position of the object's color on a pure blue and pure yellow scale, where -127 represents pure blue and +127 represents pure yellow.
Figure 1. *CILAB* color space.

The color of the fruit skin was measured as L*, a* and b* by a spectrocolorimeter (Model Konica Minolta CR-400, Japan), in *CIELAB* system. The color index (*CI*) was calculated using the following formula (Jimenez-Cuesta et al., 1981):

$$CI = 1000 \frac{a*}{L*.b*} \tag{1}$$

The saturation or chroma (*C*) indicates intensity or strength of hue. This parameter was computed by following formula (Ozturk et al., 2009):

$$C = \sqrt{a*^2 + b*^2} \tag{2}$$

The hue angle (*H*) between the color vector and the negative a* axis was used to characterize the color changes during developmental changes. This hue angle was calculated from the a* and b* values as follows:

$$H = \begin{cases} 180° - \tan^{-1}\left(\dfrac{b*}{a*}\right) & if \quad a* > 0 \\ \tan^{-1}\left(\dfrac{b*}{a*}\right) & otherwise \end{cases} \tag{3}$$

Mechanical properties of specimens were measured by an Instron Universal Testing Machine (Model SANTAM ST 5) controlled by a *PC*- based data acquisition card in a personal computer. A cylindrical probe with 8 mm diameter was used to penetrate in banana fruit (Saeed Ahmad et al., 2006).The penetration speed was set at 50 mm/min. The samples were placed on a fixed plate on its lateral surface and the puncture test was carried out at 2 cm away from the middle of the fruit. The compression test was initiated until rupture occurred as is denoted by a rupture point in the force–deformation curve. As the penetration initiated and progressed, a force-deformation curve was plotted (Figure 2). The rupture point was detected by the

break point in the force-deformation curve as shown in Figure 2. When the rupture occurred, the test was stopped. The compression test results and graphs were generated automatically (by software installed on the computer, *ver* 5, *SMT* Machine Linker, SANTAM Co).The mechanical properties of banana fruit were extracted in terms of firmness, rupture energy, rupture deformation and hardness.
Figure 2. Compressive force versus deformation of banana fruit.

A randomized complete block experiment design was carried out on experiments. For each treatment, three samples were randomly selected and the average values of three experiments were reported. Experimental data were analyzed using analysis of variance (*ANOVA*). Duncan's multiple range test was employed for mean separation. The level of significance was at 5%. The analysis was performed using the Excel Analysis Toolpack Option (*MS* Corporation, Redmond, *WA*, *USA*).

3. Results and Discussion

Mean values and standard deviations of chromatic properties of banana fruit were calculated. There was a significant difference (P ≤ 0.05) between the levels of banana ripeness for L^*, a^*, b^*, *CI*, *H* and *C*. Results of Duncan's multiple range test for these characteristics are presented in Table 1.

The value of L^* increased between stages one and three and reached to 70.35 and stopped until stage six then decreased rapidly to 48.82 at stage seven. Similarly, b^* varied in this fashion (Figure 3). The saturation or chroma is a function of a^* and b^*. The values of a^* were smaller than b^* values, so the effect of a^* on chroma was poor. Therefore, the values of chroma were approximately equal to b^* (Figure 3). Decrease in these parameters at stage seven was as a result of developing brown spots on banana fruit skins.

Table 1. Mean values of L^*, a^* and b^* at different stages of ripeness.

level	L^*	a^*	b^*	CI	C	H(°)
1	57.4[c]	-14[c]	32.6[c]	-7.6[a]	35.6[c]	-66.7[b]
2	62[bc]	-9.1[b]	38.4[b]	-4.6[d]	39.9[bc]	-74.4[c]
3	70.4[a]	-4.6[b]	45.7[a]	-1.5[bc]	46[a]	-84.2[d]
4	66[ab]	-7.7[b]	40.9[ab]	-3[cd]	41.7[ab]	-79.2[cd]
5	65.4[ab]	1.2[a]	40.4[ab]	0.5[a]	40.4[bc]	91.7[a]
6	67.1[ab]	0.9[a]	40.3[ab]	0.4[ab]	40.3[bc]	91.6[a]
7	48[d]	2.6[a]	27.4[d]	2[a]	27.5[bc]	95.6[a]

In each column, means followed by the same letter are not significantly different (P ≤ 0.05) according to Duncan's multiple range test.
Figure 3. Variation of L^*, b^* and C *vs* stage of ripeness. Vertical lines represent the standard deviation.

The a^* increased when banana fruits reached to a full-ripe stage. A positive correlation was observed between a^* and various stages of ripeness. As it was noted, an increase in a^* means a decrease in the degree of greenness. The maximum value of a^* was 2.6. This point is near of the b^* axis, so the redness of skin color can be neglected. These changes during ripening period (loss of greenness) occurred as a result of the breakdown of the chlorophyll pigments in the peel tissue. The color index (*CI*) is a function of a^*, b^* and L^*, but as perceived from Figure 4, the procedure variation of *CI* and a^* were similar.
Figure 4. Variation of a^* and CI *vs* stage of ripeness. Vertical lines represent the standard deviation.

The correlation (R) between CI and a^* was obtained as 0.985. Change in hue angle is presented in Figure 5. After the banana fruit reached to stage four, the color vector transferred from green to yellow region. The time near the inflexion point was the most illustrative of the dynamics of the developmental changes.
Figure 5. Variation of hue angle *vs* stage of ripeness. Vertical lines represent the standard deviation.

The time when the inflexion point occurs might be suitable for characterising the development process, comparing cultivars, influences of ripening treatment at various conditions and determining the time of appearance of the ripe fruit (Muskovics et al., 2006). The slope of that part of the graph showed the rate of the color changing provides useful information about the number of days during which the color turns from green to yellow (Muskovics et al., 2006). The equations representing the relationship among chromatic properties and ripeness stage of banana fruit and their coefficient of determination (R^2) are given in Table 2. Results of polynomial regression show a quadratic relation between these parameters and stage of ripeness.

Table 2. Equations representing relationship between chromatic properties and stage of banana fruit.

Parameter	Equation	R^2
L^*	$L^* = -1.6651 S_r^2 + 12.588 S_r^{\wedge} + 45.397$	0.78
a^*	$a^* = -0.1539 S_r^2 + 2.6837\ S_r - 9.6171$	0.91
b^*	$b^* = -1.4531 S_r^2 + 11\ S_r + 23.027$	0.85
CI	$CI = -0.1912 S_r^2 + 4.3479\ S_r - 18.123$	0.90
C	$C = -1.3189 S_r^2 + 9.5146\ S_r + 27.092$	0.86

$^{\wedge}$ S_r is the ripeness level of banana fruit.

There were significant difference ($P < 0.05$) in firmness, rupture energy and hardness of banana fruit at different stages of ripeness. Results of Duncan's multiple range test for these parameters are presented in Table 3. There was no significant difference ($P > 0.05$) in the deformation.

Table 3. Mean values of firmness, Rupture energy, and hardness.

Ripeness level	Firmness (N)	Rupture energy (J)	Hardness (N/mm)	Deformation (mm)
1	75 [a]	225 [a]	12.6 [a]	6
2	60.1[b]	252 [a]	7.2 [b]	8.3
3	46.2 [c]	192[ab]	5.6 [c]	8.3
4	40.9 [c]	214[a]	3.9 [d]	10.5
5	26.7 [d]	99.4 [b]	3.6 [d]	7.4
6	28.9[d]	158 [ab]	2.9 [d]	10
7	27 [d]	91.3[b]	3.9 [d]	6.8

In each column, means followed by the same letter are not significantly different ($P \leq 0.05$) according to Duncan's multiple range test.

A decrease was observed in firmness, rupture energy and hardness as fruit ripened. The firmness degraded from 75.1 N at stage one to 27 N at stage seven. A second degree polynomial relationship was found between firmness and stage of ripeness (Table 4). The similar trends were also reported by Singh *et al.*, (2006) for orange. After stage four, the slope of firmness degradation was slower than before stage four (Figure 6). As noted in previous expression, this stage is inflexion point. In this point the banana converted to ripe status from unripe mood. The variation of rupture energy was irregular, but the green mature banana (stage one) have greater rupture energy than full-ripe (stage seven) one. The rupture energy decreased from 225.8

J to 91.3 J (Figure 7).   The hardness of fruit, decreased in quadratic form as banana fruit ripened from 12.6 J.mm^{-1} to 3.9 J.mm^{-1} (Table 4). No relationship was found among deformation of fruit and ripeness level (Figure 9). The correlation between deformation and stage of ripeness was 0.2.
Figure 6. Variation of firmness *vs* stage of ripeness. Vertical lines represent the standard deviation.
Figure 7. Variation of rupture energy *vs* stage of ripeness. Vertical lines represent the standard deviation.
Figure 8. Variation of hardness *vs* stage of ripeness. Vertical lines represent the standard deviation.
Figure 9. Variation of deformation versus stage of ripeness. Vertical lines represent the standard deviation.

Decreases in mechanical properties were as a result of alteration in the composition of cell wall solubilisation of pectins and hydration of cell walls during ripening. Banana fruit softening is due to alteration in cell wall structure by degrading enzymes (e.g. polyglacteronase) and also to degradation of starch (Seymour, 1993).

The equations representing relationship among mechanical properties and ripeness stage of banana fruit and their coefficient of determination (R^2) are given in Table 4. Results of polynomial regression showed a quadratic relation between these parameters and stage of ripeness.

Table 4. Equations representing relationship between chromatic properties and stage of banana fruit.

Parameter	Equation	R^2
Firmness (F)	$F = 1.5274\ S_r^2 - 20.296\ S_r^\wedge +94.204$	0.98
Rupture energy(R_E)	$R_E = -1.7614\ S_r^2 - 10.29\ S_r +252.69$	0.73
Hardness (Ha)	$Ha = 0.470\ S_r^2 - 5.0591\ S_r +16.509$	0.97

$^\wedge$ S_r is the ripeness level of banana fruit.

4. Conclusion

The changes in physical and mechanical properties of banana fruit as a function of ripeness stage were investigated in this study. A significant difference was found in studied properties except deformation. At different levels of ripeness, the relationship of these properties with stages of ripeness and coefficient of determination were found. The *a** and *CI* had a good correlation with the ripeness level of banana, also firmness and hardness had good correlation with ripeness level, so these properties can predict the ripeness level of banana fruit during ripening treatment, but extraction of

mechanical properties would result in the destruction of samples. It could only be a good practice in laboratory and not for quality inspection in warehouses. The best method for predicting the level of ripeness is to measure chromatic properties ($a*$ and CI) since this method dose not destroy the fruits. It is also a rapid method of ripeness prediction of banana fruit.

Neural Network and Wavelet Transform For Classification and Object Detection

Afshin Shaabany [1], Fatemeh Jamshidi [1]

[1] Islamic Azad University, Fars Science and Research Branch, Shiraz, Iran
afshinshy@yahoo.com, Fjamshidi59@yahoo. com

Abstract: The practical utilization of object detection and classification, in high-performance structural mine detection or proximity fuses is somewhat impeded due to some complicated phenomena such as: existence of multiple wave modes, jamming, high susceptibility to diverse interferences, bulky sampled data, clutters and difficulty in signal interpretation. An intelligent signal processing approach using the wavelet transform and artificial neural network algorithms was developed; this was actualized in a signal processing package. The intelligent signal processing technique comprehensively functions as signal filtration, data compression and pattern recognition, capable of extracting essential features from acquired raw wave signals and further assisting in structural mine detection or proximity fuses evaluation. For validation, the algorithm was applied to the detection and classification of 10 different objects.
[Afshin Shaabany, Fatemeh Jamshidi. Neural Network and Wavelet Transform For Classification and Object Detection. Journal of American Science 2011;7(5):20-25]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: Wavelet; Classification; Mine detection; intelligent signal processing.

1. Introduction

Signal processing and interpretation plays a pivotal role in a mine detection or proximity fuse system, dominating in deciding the precision that the system can offer and its feasibility. An effective signal processing and interpretation approach is expected to extract essential yet concise characteristics from acquired raw signals, and assist the decision-making unit in conducting a diagnosis or prognosis. In the past few decades, more challenging requirements from various industrial practices, such as real-time failure surveillance on aircraft, have increasingly motivated the research into developing viable Signal processing and interpretation techniques.

With the aid of the state-of-the-art advances in information processing and high-capacity computing devices, a diversity of novel and pragmatic signal processing and interpretation techniques have become available. Amongst these, methods using time-series analysis (Keilers, 1995), the fast Fourier spectrum (FFS) (Kim, 2001), the time–frequency distribution (the short-time Fourier transform (STFT) (Legendre, 2000), the wavelet transform (WT) (Legendre, 2000, Zheng, 2001) and blind de-convolution have been adopted. It's noticeable that Time-series analysis, FFS and STFT aren't suitable for time limited signals i.e. proposed magnetic sensor in this paper.

On the other hand, signal processing and interpretation have gained substantial acceptance from major engineering communities due to their good balance between desirable precision and versatile accessibility. However, several troublesome issues associated with the utilization of signal processing, are commonly noticed:

(1) In practice, the sensors may be operated in noisy or fluctuating environments, where the captured wave signals usually suffer from diverse disturbances or jamming signals.

(2) In experimental, the interferences from clutters, such as type of the soil in mine detection or clods in radar systems, may obscure the object-induced wave components in the signals.

(3) The use of high-resolution sampling can guarantee a precise identification, but it unavoidably leads to bulky data flow for serializing the scanning, burdening the signal processing to a certain extent.

All of these factors undoubtedly weaken the sensitivity of sensors to detecting and classifying objects and considerably lower the identification precision of a mine detection or proximity fuses system. With this motivation, an intelligent signal processing and pattern recognition technique for mine detection systems was developed, taking advantage of the wavelet transform and artificial neural algorithms, implemented by a signal processing package. The signal processing package is comprehensively includes units of signal filtration, data compression and pattern recognition. Validation of the algorithm was conducted by classifying the waves that acquired by the magnetic sensor proposed in (Birgé, 1997) for 10 different objects.

2. The Philosophy of Using Wavelet

In studies of vibrational signals in the early 1990s, found a clear advantage in singularity detection in signals. Nowadays, wavelet transform-based signal processing, covering signal purification,

spectrographic analysis, clutters removing and signal/image compression. The output of magnetic sensor is time limited, thus the remarkable potential of the wavelet transform leads to powerful signal processing Technique for Clutter Reduction in detection problem.

During practical implementation, two forms of wavelet transform are available, the continuous wavelet transforms (CWT) and the discrete wavelet transforms (DWT).

Fundamentally, applied with a basic orthogonal wavelet transform function, $\Psi(t)$ a time-dependent wave signal, $f(t)$ acquired from a sensor is converted into a quadratic expression using the dual parameters scale, a, and time, b:

$$W(a,b) = \frac{1}{\sqrt{a}} \int_{-\infty}^{+\infty} f(t)\overline{\Psi}(\frac{t-b}{a})dt \qquad (1)$$

The operation performed by equation (1) is defined as the CWT and W (a, b) is the CWT coefficient. $\overline{\Psi}(t)$ denotes the complex conjugate of $\Psi(t)$.

For simplicity, equation (1) is executed by calculating the wavelet coefficients only at discretized scale and time using dyadic variables m and n, contrastingly defined as the (DWT):

$$DWT(m,n) = a_0^{-m/2} \int f(t)\Psi(-a_0^{-m}t - nb_0)dt \quad (2)$$

$$a = a_0^m \qquad b = na_0^m b_0 \qquad m,n \in Z$$

where a_0 and b_0 are constants deciding the sampling intervals along the time and scale axes, respectively. Equation (2) decomposes signals into associated ranges of relatively higher and lower frequencies. The signal is represented hierarchically by a series of approximations (low-frequency components, denoted by A) (Figure 1) and details (high-frequency components, denoted by D). Inversely, reconstruction of the wave signal is discretely implemented via:

$$f(t) = c\sum_m \sum_m C_{m,n}(t)DWT(m,n) \qquad (3)$$

$$C_{m,n}(t) = a_0^{-m/2}\Psi(a_0^{-m}t - nb_0)$$

This is the multi-resolution concept that is the base of signal de-noising or compression. The multi-resolution formulation is obviously designed to decompose signals into finer and finer details.

For the first step in object detection and classification, two approaches were used for signal purification: de-noising and scale selecting.

2.1. De-Noising

In this algorithm, at the first step, noise was removed from acquired signal; then the samples that are close to zero were removed (delay removing) and

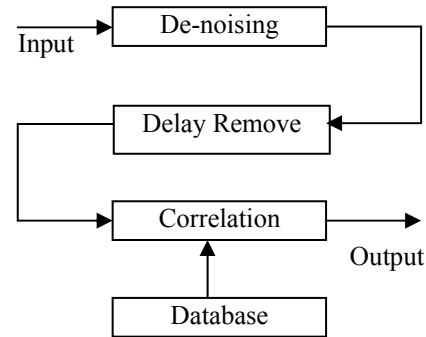
pure signal was remained. In the last step, correlations of pure signal with reference signals that are in database were computed in order to classify the proposed objects. In this way, input signal assigned to the class that lead to maximum correlation (Figure 2).
Figure 1. The hierarchical architecture for a three-level DWT decomposition.


Figure 2. Classification by wavelet; De-noising method.

The underlying model for the noisy signal is basically of the following form:

$$s(n) = f(n) + \sigma e(n) \qquad (4)$$

where time n is equally spaced. In the simplest model we suppose that $e(n)$ is a Gaussian white noise $N(0, 1)$ and the noise level is supposed to be equal to 1. The main objective of de-noising is to suppress the noise part of the signal $s(t)$ and to recover $f(t)$. Use of wavelet for de-noising is efficient for families of functions $f(t)$ that have only a few nonzero wavelet coefficients or have a sparse wavelet representation (SU,2004). For example, a time limited function, has such a property

and since the output of magnetic sensor is a time limited signal thus de-noising with wavelet was selected. From a statistical viewpoint, the model is a regression model over time and the method can be viewed as a nonparametric estimation of the function $f(t)$ using orthogonal basis.

The general de-noising procedure involves three steps:

(1) Decompose: Choose a wavelet and level N then compute the wavelet decomposition of the signal $s(t)$ at level N.

(2) Threshold detail coefficients: For each level from 1 to N, select a threshold and apply thresholding to the detail coefficients.

(3) Reconstruct: Compute wavelet re-construction using the original approximation coefficients of level N and the modified detail coefficients of levels from 1 to N.

According to the basic noise model, two threshold selection rules are implemented in the signal processing packet: *scarce* and *penalized*. These strategies are based on an approximation and de-noising result from Barge and Massart (Fausett, 1994).

2.1.1. Scarce Method

The scarce strategy is such that at level J the approximation is kept and for level j from 1 to J, the n_j largest coefficients are kept with:

$$n_j = \frac{M}{(J + 2 - j)^a} \qquad (5)$$

where J is the level of the decomposition, M a positive constant and a a sparsely parameter ($a > 1$).

So, the strategy leads to select the highest coefficients in absolute value at each level. The numbers of kept coefficients grow scarcely with J-j. Typically, $a = 1.5$ for compression and $a = 3$ for de-noising. A natural default value for M is $L \le M \le 2L$ where L denotes the length of the coarsest approximation coefficients.

The rate of false alarm depends on a. Minimum of error (28%) obtain in $a = 2.2$. See Figure 3.

2.1.2. Penalized Method

This strategy can be viewed as a variant of the fixed form strategy of the wavelet shrinkage. The threshold T applied to the detail coefficients for the wavelet case or the wavelet packet coefficients for a given fixed *WP* tree is defined by:

$$T = \left| c(t^*) \right| \qquad (6)$$

With:

$$t^* = \arg\min\left[-\sum_{k=1}^{t} c^2(k) + 2\upsilon t \left(a + \log(\frac{n}{t}) \right); t = 1, \ldots, n \right]$$

where $a > 1$, $c(k)$ are sorted in decreasing order of their absolute value υ is the noise variance.

Also, in this method, the rate of false alarm, depend on a (Figure 4).
Figure 3. Scarce method
Figure 4. Penalized method

2.2. Scale Selecting

In this algorithm, at the first step, wavelet transform coefficients of acquired signal were computed; then the signal was reconstructed but some of coefficients for fine scales were removed. For example see Figure 5. This result would be clarified in the last section.

In the next step, samples that are close to zero were removed (delay removing) and pure signal was remained. In the last step, correlations of pure signal with reference signals that are in database were computed. Input signal assign to the class that lead to maximum correlation (Figure 6). In this method the amount of 7% error can be achieved.

3. The Philosophy of Using Neural Networks

Artificial neural networks are major tools for classification, especially in nonlinear systems (Kohonen, 1990). Because of nonlinearity nature of system such as magnetic field, communication channel and goal object, neural networks have been

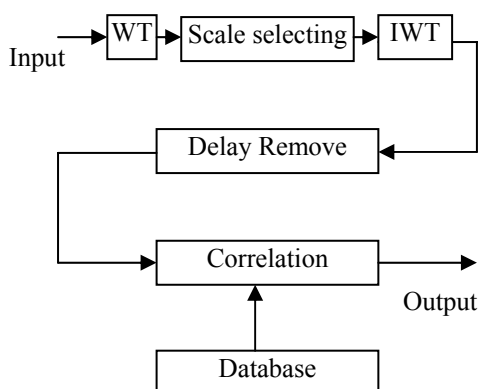
used to classify different objects. LVQ and MLP are supervised neural networks that have been used for object detection and classification.
Figure 5. Amplitude vs. time of samples


Figure 6. Classification by wavelet; Scale selecting method.

3.1. LVQ

Linear vector quantization (LVQ) (Mandelbrot, 1982) is a pattern classification method in which each output unit represents a particular class or category. The weight vector for an output unit is often referred to as a reference vector for the class that the unit represents. During training, the output units are positioned to approximate the decision surfaces of the theoretical base classifier. After training, an LVQ net classifies an input vector assigning it to the same class as the output unit that has its weights vector closed to the input vector. An LVQ network has a first competitive layer and a second linear layer. The competitive layer learns to classify input vectors in much the same way as the competitive layers of Self-Organizing. The linear layer transforms the competitive layer's classes into target classifications defined by the user. LVQ network training diagram have been shown in Figure 7. The network was trained in 7 epochs and 5.828 second by Intel 2.4MHz processor. Some of input vectors of each class have been used for initial values of weight vectors.

3.2. MLP

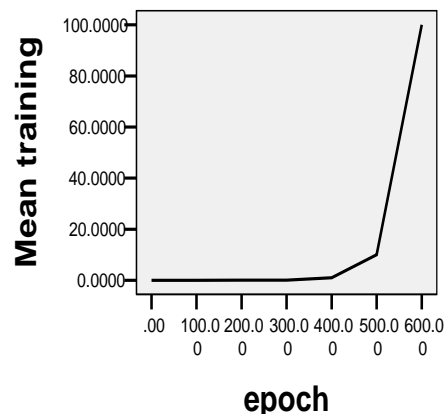
General purpose Multilayer Perceptron neural net, have been used for recognizing objects. A multi-layer feed-forward neural network, consisting of one input layer with α input elements, hidden layer with λ computing neurons and one output layer containing β output variables, was used. Where the variables α, β and λ are dependent on the actual application. Training diagram for MLP network with α, β and λ equal to 200, 16 and 8 respectively and 80 training vector have been showed in Figure 8. The network was trained in 603 epochs and 13.5 second by Intel 2.4MHz processor.
Figure 7. LVQ training diagram


Figure 8. MLP training diagram.

4. The Philosophy of Combination of Neural Network and Wavelet

If the captured signals suffer with noise and clutter, the neural network can be unsuccessful to classify them correctly. Also, wavelet transform can be unsuccessful to classify captured signals from nonlinear systems (minimum 9% error in simulation results). Thus combination of wavelet transform and neural network has been used. Wavelet analysis and

neural networks have been combined in numerous manners. We distinguish two categories of methods. In the first one, the wavelet part is essentially decoupled from learning. A signal is decomposed on some wavelet and the wavelet coefficients are furnished to a neural network. In the second category, wavelet theory and neural networks are combined into a single method. We limit the scope of this article to the first category.

The combination of neural network and wavelet algorithm procedure involves four steps (Figure 9):

(1) In the first step, wavelet transform coefficient of input signal was computed.

(2) In the second step some of scales were selected and coefficient of this scales furnished to a MLP neural network.

(3) Next, delay for stability emulated to signal.

(4) Finally, neural network classify inputs.
Figure 9. Classification by combination of Neural network and wavelet.

4.1. Selecting Scales

Details coefficients are independent random Gaussian realizations and coarse scales are object information. The multi-resolution analysis can be viewed as a bank of digital filters (low pass and high pass filters). Frequency bands correspond to wavelet analysis tree in Figure 1 was shown in Figure 10.

The maximum relative velocity of sensor and object is approximately 2 meters per second that should travel 10 centimeters. This travel consuming 0.05 seconds and lead to maximum 5 period of signal. The FFT of one of input signals was shown in
Figure 10. Classification by combination of neural network and wavelet.

Figure 11. The fastest component of acquired signals also confirms this bandwidth. Thus the bandwidth of input signals is approximately 100Hz. The sampling frequency of input signals is 5 KHz. Thus the filter bank idea leads to the selection of scales 6, 7 and 8.

This view also can be reasonable with Fractional Brownian motion (fBm). An fBm is a continuous-time Gaussian process depending on the Hurst parameter $0 < H < 1$. Versus fBm theory the fluctuation of signals depend on derivation of magnitude of wavelet transform coefficient (SU, 2004). Whatever fluctuation increases, the derivation of magnitude of wavelet transform coefficient would be close to zero and for completely random noise is equal to zero. For separating noise and object information from acquired signal, the 1-norm of wavelet transform coefficient of signal in each scale was computed. The logarithm of 1-norm versus scale was shown in Figure 12. It shows that derivation of 1-norm is close to zero for scales 1, 2, 3, 4 and 5, thus the detail of signal in these scales corresponds to noises and scales 6, 7 and 8 denote information. Coefficient of wavelet transform in scales 6, 7 and 8 furnished to neural network and would be classified. Wavelet transform remove noise and clutter and neural network classify objects. Also in this algorithm because some scale was selected, number of inputs to neural network would be decrease and training would be faster. Each acquired signal has 2500 samples. With this technique the input to neural network decreases to 87 samples.

5. Conclusion

With the motivation of some troublesome issues in the development mine detection, an intelligent signal processing and pattern recognition approach has been developed using the wavelet transform and artificial neural algorithms; this was actualized in a signal processing package. Its functionally consists of units of signal filtration, data compression and pattern recognition.

For validation, the signal processing package was applied to acquired wave signals from a magnetic sensor for 10 different objects. The results show that, taking advantage of the intelligent signal processing and pattern recognition technique, the procedure for mine detection effectiveness can be dramatically enhanced. The methodology presented in the current work can also be extended to other structural pattern recognition techniques with appropriate modifications.

Pharmacokinetic of florfenicol (Water soluble formulation) in healthy and Pasteurella infected broiler chickens

H. A. El-Banna and H.Y. El-Zorba

Department of Pharmacology, Faculty of Veterinary Medicine, Cairo University
Corresponding author :elzorba1@hotmail.com

Abstract: Florfenicol has been approved in the European Union for use in cattle and pigs as an injectable solution for treatment of respiratory diseases in cattle through injection .But now, it was introduced in some countries as an oral solution for the treatment of several poultry diseases. **The aim** of the present study is to describe the Pharmacokinetics of florfenicol (water soluble formulation)in broiler chickens after either a single intravenous and oral administration (by a dose of 30 mg/kg^{-1} body weight). Meanwhile, comparing its disposition in control healthy and *Pasteurella*-infected broilers. Following the IV administration of the drug in healthy and diseased birds, the drug plasma concentration declined in a biphasic pattern. The maximum plasma concentration of florfenicol in control healthy and diseased was reached one hour after its oral administration. But the peak level detected in control broilers was higher than that detected in infected birds. **Conclusion:** Data of the present study showed that volume of distribution, total body clearance in infected birds were higher than that determined in healthy ones. On the other hands, systemic bioavailability were significantly lower (F %,55.6 %) in diseased broiler compared to values determined in healthy ones (F % ,71.5).

1. Introduction:

Florfenicol, (FF) is a structural analogue of thiamphenicol, possessing a wide spectrum of activity against both Gram-negative and Gram-positive bacteria (Syriopoulou *et al.,* 1981). Florfenicol was reported to have a greater activity than chloramphenicol and especially against *Pasteurella*, *Salmonella, E. coli* and *Staphylococcus aureus.* Florfenicol inhibits peptidyltransferase activity and affect microbial protein synthesis (Cannon et al., 1990).

The p-nitro group of chloramphenicol is responsible for serious bone marrow toxicity and dose-independent irreversible aplastic anemia, partially described in human, but not in animals. For this reasons, the use of chloramphenicol in food-producing animals has been banned in the USA, the European Union and several other countries.

Florfenicol has been approved in the European Union for use in cattle and pigs as injectable solution for treatment of respiratory diseases in cattle but now it introduced in some countries as oral solution for the treatment of several poultry diseases. The efficacy and residual pattern of water soluble formulation of florfenicol in broilers were described by El-Banna et al., (2007). The disposition kinetic of florfenicol injectable

formulation has been described in healthy and experimentally infected broiler chickens (Afifi and Abo El-Sooud, 1997; Shen et al., 2003) and ducks (El-Banna, 1998). No references to data concerning the disposition kinetics of water soluble formulation in poultry could be obtained.The aim of the present study is to describe the Pharmacokinetic of florfenicol (water soluble formulation) in broiler chickens after a single intravenous and/or oral administration at a dose of 30 mg/kg body weight. Meanwhile, comparing its disposition in *healthy* and *Pasteurella*-infected broilers.

2.Materials and Methods:
2.1. Materials:
2.1.1.Birds

Sixteen symptom-free control healthy broiler chickens and 34 naturally *Pasteurella*-infected (diseased) were used.

-Their body weight ranged from 1.5 to 1.8 kg and their was age 35 days.

-Birds were housed in cages, fed on antibacterial-free balanced rations *ad-libitum* with free access for water.

-Diseased broilers, suffering from slightdiarrhoea, mucoid discharge from the mouth, ruffled feathers, conjuctivits and lack of appetite, were selected from a naturally infected flock.

-Microbiological examination of heart blood samples collected from all used birds revealed that birds were infected with *Pasteurella. .*

-On the other hand, symptom-free broilers were found *Pasteurella*-free.

-Biochemical identification of the isolated strain indicated that the pathogen was *Pasteurella multocida*.

-Analysis of bird plasma revealed no peaks of flofrenicol were seen using the HPLC method of analysis.

2.1.2. Drugs
Florfenicol (Florecol ,100 mg/ml) water soluble formulation for oral use was supplied by Avico (JORDAN). The sterile solutions were prepared by I.V. and oral administration.

2.2.Methods:

2.2.1.Single dose study
A single dose (30 mg /kg^{-1} body weight) of florfenicol was injected intravenously (wing vein) in control healthy and infected broilers (8 birds / group).

Another two groups of 8 control healthy and infected broilers were received florfenicol orally at the same dose (30 mg/ kg^{-1}, b.wt.).

Blood samples (1 ml each) were collected in heparinized tube via wing vein puncture before , after 10, 20, 30 min and 1, 2, 4, 8, 12 and 24 hours post administration.

Blood samples were centrifuged and the clear plasma samples were separated and stored at -20 C until assayed.

*2.2.2.*Multiple doses studies:
This was performed on the diseased group (18 birds/ group), and given florfenicol (30 mg kg^{-1}, b. wt) daily for 5 consecutive days in drinking water.

Blood samples (1ml each) were collected at 24, 48, 72, 96 and 120 hours from the starting time of giving the dose to estimate florfenicol blood concentrations.

Three birds were slaughtered at 1 hour then at 1, 2, 4, 6 and 7days after the last dose. Blood and tissue samples (lung, liver, kidney, and muscles) were collected for estimation of the drug concentration.

*2.2.3.*Analytical method
The plasma concentrations of the examined florfenicol were measured by means of a modified reverse-phase high-performance liquid chromatography (HPLC) method reported previously by Varma et al. (1986).

A Shimadzu HPLC system (JAPAN) equipped with auto sampler and detector uv. SPD – 10 AVP detector (Shimadzu) and a Chromolith

Performance RP-180 4.6–100 mm column (Merck KGoA Darmstadt, Germany) were used for the separation and quantification of the drugs. The mobile phase was established on mixture of acetonitrile and water (18:82) at a flow rate of 1 mL/min. The drugs were detected by UV absorption at 224.1 nm.

Plasma or tissue samples were extracted in ethylene acetate (0.5 ml: 1.5 mL or 1g :5ml). The tubes were rotated for 10 min and then centrifuged at 2000 g for 10 min as well. Then, 1 mL of the organic layer was aspirated and evaporated under nitrogen. Each of the residues was dissolved in 0.375 mL of the solvent mixture of acetonitrile–water (1:2, v/v), vortexed, and then centrifuged at 19 000 g for 20 min at 4 ºC. The supernatant was collected, filtered through a 0.45-mm nylon filter, and finally transferred to auto-sampler vials.

Assay validation for Florfenicol indicated a limit of detection (LOD) of 0.01 ug/mL, limit of quantification (LOQ) of 0.05 ug/mL whereas the recovery rates were higher than 92.3% for all florfenicol.

The serum protein-binding of the drug was determined in vitro using the method of Craig and Suh (1980) with florfenicol concentration of 0.625, and 10μg/ml^{-1}

*2.2.4.*Pharmacokinetic analyses of the data
A computerized curve-stripping program (R Strip; Micromath Scientific Software, Salt Lake City, UT, USA) was used to analyze the concentration-vs-time curves for each individual bird after the administration of florfenicol by both routed. The following intravenous injection, the disposition curve of florfenicol that expresses the decline in drug concentration as a function of time was best described by a bi-exponential expression. The following equation was used to describe the bi-exponential concentration-time curve for florfenicol in serum after intravenous administration:

$$Cp° = Ae^{-t} + Be^{-t}$$

Cp° is the concentration of drug in the serum at time t.

A is the intercept of the distribution phase with the concentration axis expressed as μg ml^{-1}.

B is the intercept of the elimination phase with the concentration axis expressed as μg ml^{-1}.

is the distribution rate constant expressed in units of reciprocal time (h^{-1}).

is the elimination rate constant expressed in units of reciprocal time (h^{-1}), and **e** is the natural logarithm base. Following administration, each individual curve of florfenicol-vs- time was analyzed to determine the peak of drug concentration (C_{max}) and time to peak concentration (T_{max}). This program also calculated non-compartmental parameters by statistical moment theory. Elimination of half-life ($t_{½el}$) was calculated as Ln 2/ .

The area under the concentration-time curves (AUC) were calculated by the trapezoidal rule, (Gibaldi and Perrier, 1982) and further extrapolated to infinity. AUC is the area under the curve. Systemic bioavailability (F%) is the fraction of the oral dose absorbed and calculated from AUC oral / AUC X100. body clearance area calculated according to Baggot (1978).

2.2.5.Statistical analysis:

The obtained results were presented as mean ± standard error (SE). These results were statistically analyzed using student "t" test, according to (Snedecor and Cochran, 1980)

The mean plasma concentration of florfenicol in control healthy and infected (diseased) broiler chickens following the I.V.and oral administration of 30 mg kg-1 body weight are recorded in Fig (1 and 2) . Data showed that plasma concentrations of the drug were significantly (p<0.01) lower in diseased than in healthy birds at the same time intervals.
Following the I.V. administration of the drug in healthy and diseased birds, the drug plasma concentration declined in a biphasic pattern (Fig1) .

3.2.Multiple dose studies
Following the oral administration of florfenicol (30 mg kg^{-1} b.wt) in infected birds daily for 5 successive days, the collected blood samples at 24, 48, 72, 96 and 120 hours showed that Florfenicol was still detected in plasma,   and all tested tissues on the 4th day after stopping of drug medication in   diseased birds. All tissues of   infected birds could be considered drug free except liver and kindeys of infected birds   at 6th day after stopping of drug administration (Table 3).

3.3.Protein binding
 The capacity of florfenicol binding to plasma proteins was 18.5 and 23.7 % (at 10 µg ml^{-1}) ;   and 16.5 and 18.4 % (at 0.625 µg ml^{-1}) with mean values of 17.5 ± 0.82 and 21.05 ± 1.57 % in healthy and diseased plasma; respectively.

4. Disscussion

The concentrations of the florfenicol in the plasma were analyzed by means of the same HPLC method.

The results obtained   showed lower plasma concentrations of florfenicol in diseased broilers as compared with healthy ones following the drug administration at different time intervals. This observation could be attributed to a more rapid extravascular distribution of florfenicol in diseased than in healthy broilers . The phenomenon of rapid and wide distribution of antimicrobial drugs in diseased tissues have been previously reported in chickens (Soliman, 1989; Atef et al., 1991), and in mammals (Ladefoged, 1979; Baggot 1980).

Our findings showed that plasma concentration of florfenicol injected IV to healthy and diseased broilers follows a two compartment open model. This finding is in agreement with the result previously recorded in broiler chickens (Afifi and Abo El-Sooud, 1997); ducks (Elbanna,1998) and turkeys (Switala,et al.,2007). The reported short distribution and elimination half-lives (t $_{0.5}$ α and β); higher body clearance and the increase in volume of distribution in diseased birds is consistent with the observed lower plasma concentrations of florfenicol in Pasteurella infected broilers. Similar findings have been previously recorded for chloramphenicol in chickens suffering from E. coli infection (Atef et al., 1991). Following IV injection in broilers , florfenicol was rapidly distributed and eliminated. The elimination half-life in healthy broilers (t $_{0.5}$ β) of 3.65   is higher than values recorded in broiler chickens using injectable formulation (2.88 h), Afifi and Abo El-Sooud 1997), turkeys (2.37),

Switala,et al.,2007) but shorter than values recorded in ducks (El-Banna, 1998).

In addition, the volume of distribution at steady state (Vdss) and total body clearance (ClB) were also different in different formulation ; being 5.11 L/kg and 26.86 ml/kg/min in broilers (Afifi and Abo El-Sooud 1997) and 1.06 L/kg and 0.32 L/kg/h in turkeys (Switala, et al.,2007) for injectable formulation   as compared with 1.3 L/kg and 0.38 L/kg/h respectively for healthy broilers in the present investigation for water soluble formulation.

Following the oral administration, the mean plasma concentration of florfenicol was significantly lower in diseased broilers . This is consistent with the rapid elimination of the drug indicated by the shorter elimination half-life in diseased birds (3.1 h) as compared with the value for healthy ones (t$_{0.5el}$, 3.8 h). Maximum plasma concentrations of florfenicol in healthy and diseased broilers (7.3 and 5.8 µg ml-1) were observed 1 hour post oral administration   of the drug. The calculated C$_{max}$ and t$_{max}$ for healthy broilers (6.8 µg ml-1 and 1.4 h respectively) recorded in this study were higher   than values recorded previously in broiler chickens (C$_{max}$, 3.2   µg ml-1 and t$_{max}$ 63.11 + 3.9 min) by Afifi and Abo El-Sooud (1997) but lower than values recorded in turkey (C$_{max}$, 12.25   µg ml-1 and t$_{max}$ 2 h) by Switala, et al., (2007) . Following the oral administration of florfenicol in a dose of 30 mg kg-1 b.wt. Florfenicol could be detected in plasma of healthy broilers for 19.25 hours following a single IV injection or oral adminsteration in a concentration above   the minimum inhibitory concentration (MIC) for pasteurella determined in the present study (0.312 ug/ml) (Syriopoulou *et al.,* 1981).

On the other hand, these levels were obtained for shorter period (15 h) in Pasteurella infected broilers following oral administration.

Until now, studies on the efficacy of florfenicol using pharmacokinetic/pharmacodynamic (PK/PD) approaches have not been carried out. This means that surrogate markers for predicting the clinical effects for florfenicol used in veterinary therapy have not yet been established. On the basis of results obtained in the present studies, we could show graphically that the duration of time that florfenicol concentrations exceed MIC values (T > MIC) characteristic for the susceptible organism were similar. For example, the plasma concentration of florfenicol were maintained above 0.312 ug/mL for 19 and 15 h, respectivelcty in healthy and pateurella infected birds. If one assumes that T > MIC correlates with the efficacy of florfenicol, the differences in the rational dosage regimen based on the PK/PD approach for these drugs would be relative mainly to their pharmacodynamic properties.

For the treatment of infected chickens, a florfenicol oral dose of 30 mg/kg at 12-h interval has been recommended (Afifi & Abo El-Sooud, 1997; Shen et al., 2003). In this study, we have shown that after a single oral dose of 30 mg/kg, the time of florfenicol plasma concentration above 0.31 ug/mL was approximately 15 h in diseased broilers which is in good agreement with Shen et al., (2003). Examination of the pharmacokinetics of florfenicol and its possible adverse effects during continuous administration are necessary for confirming similar dosage in briolers.

Bioavailability value is associated mainly with the degree of bioactivecompound absorption from the gastrointestinal tract and the first-pass effect when the drug particles undergo biodegradation before reaching the central compartment area. Relatively improved florfenicol absorption can be confirmed by its kinetic profile; in particular, florfenicol concentration reaches its maximum value (C_{max},) in the shortest time. This is consistent with shorter absorption live time recorded in the present study. The data obtained showed a relatively lower value of systemic bioavailability F % in diseased broilers (55.6%) as compared with that recorded in healthy ones (F %, 71.5). Similar values was recorded previously in ducks (El-Banna, 1998) but higher values of systemic bioavailability were ,however, previously recorded in broiler chickens (F %, 96.58 %, Afifi and Abo El-Sooud, 1997) following the IM injection and in turkeys following the oral administration (F%, 83 % , Switala, et al., 2007). The capacity of florfenicol binding to plasma proteins was 17.5±0.82 and 21.05±1.57 % respectively in the plasma of healthy and diseased birds. The values in healthy plasma were similar to those reported in broiler chickens (Afifi and Abo El-Soud, 1997) and in ducks (El-Banna, 1998). The relatively low extent of protein binding of florfenicol was consistent with its high steady-state volume of distribution and extensive distribution in tissues

Our finding revealed that florfenicol concentration in the kidney, and liver was higher than the concurrent plasma concentration. This finding agreed with that reported for florfenicol in poultry (Afifi and Abo El-Soud, 1997 ;El-Banna, et. al. 2007) and in ducks (El-Banna, et. al., 1998). High drug concentrations in the lung and kidney indicated that florfenicol may be an excellent drug for treating respiratory and urinary tract infections caused by susceptible organisms. The drug was detected in the kidney, and liver of diseased birds until the 6th day after treatment ceased (30 mg kg-1 daily for 5 days).

CONCLUSION

It must be emphasized that it would be unwise to over generalize the findings of this study in relation to all broiler diseases; because clearance rates in birds infected with other different organisms might follow different time courses.

Plasma florfenicol concentrations for 30 mg kg[-1] daily dosage were suitable to maintain its therapeutic concentration for controlling fowl cholera (Pasteurellosis). In addition, florfenicol should be withdrawn at least 7 days before marketing to ensure that the drug is completely eliminated from tissues.

Rural women participation in extension activities

*Corresponding author: abedi114@yahoo.com

Abstract: In all communities, rural women are considered as an important factor in achieving rural development goals and in fact are half of the manpower needed for rural development. However, in the rural community of Iran, there are gaps between the ruling class (capital owners) and villagers, between literate and illiterate, and between men and women. Especially in villages women have fewer possibilities in terms of investment and less power and credit. Role of rural women, over of men, is more influenced with different economic, social, cultural and ecologic factors. Rural women are considered as a noticeable potential in the community either directly (crops production, livestock, handicrafts, cottage industries) or indirectly by helping the agricultural sector (as labor)

Introduction:

About 5.6 million women are involved in agricultural production, and activities related to planting... harvesting, preparation of animal food, and taking care of livestock and poultry and some certain activities related to trading and marketing are all different fields of rural women's role and participation. Based on current statistics, women in rural area participate about 50% in conversion industries, 22% in producing crops and livestock, 75% in handicrafts and in areas related to planting…harvesting , respectively, 25, 24 and 4.26. And also in activities related to livestock, they handle 23% of livestock grazing, 42% of animal care and 100 percent of total poultry in the village. Therefore their role in achieving food security is undeniable. But, like most developing countries, this crucial role in society and in process of rural development, is not obvious. In Iranian rural community, about 80% of women work, but they are mostly considered as housewives, unpaid employment, domestic workers, family workers, or independent employers. The statistics often do not take into account seasonal, part-time, unpaid employment, and housekeeping activities. In economics and social sciences, those of women's activities that have emerged out of house and affected national economy, are the ones to be noticed. In most research and statistics men are known as the heads of household and they are also the owners of lands and fields. That only 1% of the rural lands are belonging to women does confirm such matter (Samadi Afshar, 2004).

Development is a multidimensional process and has various economic, social, political and cultural dimensions. Rural women's participation has not been active and effective; because this participation's most important aspect, namely economics, is for rural women. However the value of their work in

agricultural products is rarely considered as income and they are not independent either (Amiri, 2000).

For an active participation of women in development, first we need to give a definition for their role in development and then barriers related to their role will be discussed. Although apparently there is no difference of gender in development programs but reality is that women are less considered in participatory programs and most of these plans are planned for men. Finally, planner's optimistic look toward women's participation will be greatly helpful improve rural family budget and will increase the difference between urban and rural families. If, by credit, loans and other financial facilities, rural families are able to build up their own business and make a living through the income and become financially self-reliance or independent, no doubt we will witness some social, economic and cultural changes in villages (Varzgar and Azizi, 2001).

Rural women's participation:

Women, being half the population, play an effective role in the economic welfare of family and society. In Iran's economy, women are one of productive factors, but, so far, researchers and writers have ignored the issue of women's participation in economic activities. While in present situation considering the role of women's participation seems to be obligatory (Balali, 2005).

Participation in its broader sense means to motivate people and thus increase the sensitivity to understand and become responsive of development programs and it also carries the concept of local initiatives.

In fact, participation is to guide people caught by disability, to help them realize their potentials and to empower them to make the best use of life.

According to preceding definition of participation, and the ability of participation to turn potential into imminence power, women should participate more actively in economic affairs. Statistics regarding women and girls' activities,

especially in rural areas, are always presented much lower than the real numbers (Ghaffari, 2000).

Village with the word "woman" removed will lose its literally in production and economic activities, their everyday activities in different fields all are evidence of woman being required in rural production. Rural girls and women are responsible for a variety of roles and duties including wife, mother, producing crops, livestock and agricultural activities, making and marketing handicrafts which are common in each area, and food preparation.

Daily activities of girls and women in different fields all are evidence of woman being required in rural production sector. Women are the major potential for developing the rural economy which leads to further growth of rural production. Increasing awareness towards the role of this class in production and towards necessity of their broader participation in economical and social development, have forced the countries to consider and support their activities while making new rural, Local and national policies (Rahmani Andalibi, 2001).

Being aware of women and girls' important role in rural activities, many countries have established institutes and organizations to advance women's progress. These organizations try to remove legal barriers that prevent women to participate in development activities as much as men. And finally improve their social, political and economic status in society. With continues evaluation and analysis of current development plans, we can provide especial conditions to ease women's access to production recourses and social services, and considering women's social situation in every society, we can provide the opportunity for them to increase their participation, share income like men, and take part in decision-making(FAO, 1998).

Importance of women's participation:

It's not possible to reach rural development goals without understanding the present situation of society and its groups. Meanwhile identifying the groups with critical roles in the rural area development program will be of importance. Women, as a rural group, due to numerous reasons have always received the least attention while their activities in non-monetary sector play a certain role in rural household economy. As most men leave the village to work in town, women provide much of the agriculture force in the area. In recent years the situation has been more considerable as rural migration to town is getting more. In most Iranian villages women's population is more than men. According to FAO's reports, in some African regions, for 60% of families, women are responsible for supervising family. Even for cases that men are the direct responsible of production affairs, women's role

in family economy can't be denied just because they don't get paid. Although these efforts appear to register in none of official statistics, they easily replace some other activities with significant financial value.

Studies by FAO show that more than half of the world's crops are collected by women. According to estimates, 1.3 billion of world's poor are women, thus the slogan "poverty has a feminine face" is spread worldwide.

Given that in many parts of the world, the production potential of women is not used properly, a cost-benefit study by the World Bank shows that investing on women in developing countries will be more profitable than any other investment. In addition to financial benefits of this huge force, its ancillary results will also be useful. The ancillary benefits of women's employment include: lower population growth and children mortality rates (Navab Akbar, 1997).

Rural women are a big part of productive force and in developing countries third to half of them are supervising households; as a result they face numerous problems, such as:

-Lack of access to social and health facilities

-Various daily chores inside and outside the home

-Men's skill and increase of women's responsibility

-Lack of professional to educate women

Around the world and in Iran, the issue related to female employment, especially in rural areas (which is a manifestation of participation), is not unemployment but unpaid employment; because all the unpaid work done by women at home, such as cleaning, washing, nursing, social affairs, agriculture and livestock,… are encountered as non-economical activities; While visible economic sector cannot continue to exist without this invisible sector's goods and services. On the other hand, rise of industrial system and expansion of factory job all over the world, attracted men to these economic systems and this has given men an objective vision; Whereas, the majority of women, due to working alone at home have got a subjective vision. Now, as women enter labor market and start to participate, they'll become objectified; because the work system will encourage them to think like men. Being more around the house and their local area will help both men and women in terms of subjectivity and objectivity (Arab-Mazar and Jamshidi, 2005).

Thus the issue of women's participation has important effects, including:

-Acceleration of plans implementation

-Realization of people's every day needs with cooperation and consultation

-Increasing efficiency and reducing functional expanses of projects

-Creating opportunities for talent realization and scientific activities

-Creating sense of solidarity and cooperation

-Increase social and personal awareness

-Women, sharing ideas in decision-making and determining their own destiny

-Participation of women as an important factor and a major power to achieve development

Therefore, according to preceding discussions and importance of women's participation in future plans, it's of great importance to study and recognize the factors affecting their participation in social activities of rural area (Fakhraee, 2002).

Discussion and results:

In the new system of advanced agricultural economy, the value of women's work that previously was unpaid labor now must be paid in cash. Expect for agriculture which is rural women's main work field they have rarely participated in tow other fields of economy. The most important issue of women's social and political participation is to take part in planning, decision making, implementation of decisions, and evaluation of results. Generally they have had a little share in such processes. Although in recent years rural women have participated more in villages' management, social and cultural organizations, and cooperative institutions' management; but having a lower level of literacy, education, income and social status than urban women they still have the smaller share of administrative and official jobs. Some barriers to women's participation which can be categorized in 3 groups of personal, familial, and social include: law literacy level, large volume of work both inside and outside of home for many reasons including seasonal migration of men and the great diversity of rural women's activities(nursing, housekeeping, agriculture, handicrafts, livestock,…), malnutrition, law health indicator, Patriarchal structure of society, father or husbands disagreement with a woman's participation in social and economic activities for various reasons like cultural reasons or unwilling to lose the labor force at home, negative attitudes towards women's abilities, gender discrimination, family's poverty, superstitious beliefs, misleading customs like fatalism, law access of women to credit and facilities, inaccessibility of extension services, men-orientated social activities and participation plans, deficiency of professionals needed to educate rural women, problems of access to health services and social facilities, low income of rural women compared with men, lack of non-governmental organizations dealing with rural women's problems, few women managers in rural area. (Rahimi, 2001)

Nowadays, micro-credit and micro-financing have changed people's lives; it has brought back life to poorest and richest communities of the world. So we can easily observe a great increase in people's access to general financial services. Facilitating the access of families to financial services, they begin to invest on educational expenses, healthcare, healthy nourishment, trading, and housing based on their priorities. Overall in many countries financial plans mostly focus on women. Women, provided with financial facilities, will receive a loan, guarantee to pay it back, keep their saving account and also they'll have insurance coverage. Micro-financial plans have an important message for families and communities. Many studies have proven that women's access to mentioned facilities may improve their conditions in family and society; it also helps them feel more self-confident and makes them aware of their own abilities. Thus providing micro-credit services for the poor in society is a powerful tool to reduce poverty and so that they are able to create assets, earn more money and become less vulnerable against the economic pressure. Of about 1.3 billion poor in the world there are 900 million poor women, this obviously shows that poverty has a feminine face. According to UN's development fund, 10% of world's income and less than 10% of world's assets belongs to women. While a majority of them never posses the capital needed for their activities, women still play an important role in the economic development of country. Therefore women draw the micro-credit policy maker's attention more than others. Choosing women as the main target of micro-credit plans is an effective strategy to eradicate poverty; because their income will upgrade the family welfare; furthermore earning money improves their social status. In some countries this choice is influenced by society's attitude and culture (Araghzadeh, 2002).

For instance founder of Grumman Bank of Bangladesh, Mohammad Yunes, has stated that: "women have plans for themselves, their children, and their family life; they always have an overlook while men just look for fun" to explain why 94% of their clients are women.

Women's access to micro-credits have shown that their income benefit to improve their family and provide livelihood. In addition to all these another reason of women being the target of micro-credit plans is that women have higher loan recovery rates. Totally, expanding women's access to micro-credits may lead to many useful results which in economy is mentioned as "virtuous spiral"; because their access to micro-credits results in family welfare and in a broader point it'll improve community's welfare and shall be increased welfare this process is repeated.

In researches that conducted by Nanda (2004) became clear that women participation in credits programs had positive effects on their demand about health care. Fiona Steele and et al (2008) in researches that conducted as called " influences of credits programs on empowering women at Bangladesh , found that women who joined to credits programs , have participated in more educational programs

and have married with more educated men and also they have saved more and they had more cash .

Shahnaj and Chaudhury(2009) in research as "credits and its role on empowering women " concluded that there is meaningful relation between attending in credits programs and empowering women , at economical dimensions .

Maybe the main challenges that threaten credits associations , is lack of necessary emphasizes on social dimensions and on reinforcing their basics , that practically cause that this social foundations lose its efficiency soon and practically changed to unsuccessful institution .

Fiona Steele and et al (2008) in researches that conducted as called " influences of credits programs on empowering women at Bangladesh , found that women who joined to credits programs , have participated in more educational programs and have married with more educated men and also they have saved more and they had more cash .

Ellen and her Colleagues (2009) used approach called it "credits and education at Bolivia, Ghana, Honduras, Mali and Thailand". This approach looks for empowering women through financial services with education. In this approach, women get familiar with importance of credits through education and extension and also familiar with ways to access it through establishing different groups.

Ruhal Amin and others (2010) found that those who joined credit funds had more ability rather than those who didn't.

Jameela (2010) presented that credit programs has shown lot of affects on empowering women so that has increased their social, politic and economic ability. Thus it is obvious that credits programs and its educational and empowering programs can be affective on social, humane and economic development or rural society, if it be associated with proper and gradual practices and base on reciprocal communications principles and apply opinion of local society.

A study conducted by Chabokru et al (1384) shows the crucial importance of micro-credits for farmers who do not possess physical financial assets (land, building, livestock, well…) and work in agricultural sector because of environmental conditions (such as living in a village) or because it's their ancestral occupation.

So today, women's participation in sustainable economic, social, and cultural development in rural areas is not optional but an essential matter. Those communities that have not seriously considered the necessity of participation faced failures and delayed community's development, welfare and security process. In any community, village, or social group, broad participation of every women in decision-making and any other matter related to national or local development programs, is a key variable in social sciences and in the last few decades, it has

interested many scholars of socio-economic and especially cultural issues, and is considered as one of the most fundamental democratic rights of women in a society. As we know in a popular participation, all people are given the opportunity to participate in planning and decision making for their society and for their own future. When in practice women feel that they can be involved in planning, policy making and deciding or solving problems in the society certainly they'll feel more solidary and become more interested in social, economic, and cultural development programs.

Abstract: Objective: To compare the healing effect of Oleozon and calcium hydroxide on experimentally exposed pulp tissue. **Method:** Direct pulp exposures were conducted in nine dogs, i.e., three dogs were prepared for each experimental period of 7, 30 and 90 days. In each dog the upper and lower canines of the right side were capped with calcium hydroxide (Dycal), while those of the left side were capped with ozonated olive oil (Oleozon). After the observation periods, the teeth were prepared for histomorphological examination. **Results:** The tissues capped with Oleozon revealed inflammation with dilated blood vessels and hemorrhages at 7 days, a slight inflammatory response at 30 days, and the increase of collagen fibers and fibroblast with dilated blood vessels at 90 days. While, the tissues capped with calcium hydroxide exhibited medium degree of inflammation and necrosis adjacent to the exposure site at 7 days, remarkable absorption of necrotic tissues with few collagen fibers and fibroblast at 30 days, and a localized connective tissue capsule with depositions of reparative dentin at 90 days. **Conclusion:** Based upon the results and the limitations of the study, it was concluded that direct pulp capping with Oleozon induced less degrees of irritation to the dental pulp compared to that with Dycal. **Clinical significant:** The application of Oleozon paste for direct capping to exposed pulp could have a possibility to serve as a therapeutic method to enhance pulp tissue healing.
[Rania Sayed Mosallam; Amany Nemat; Ahmed El-Hoshy and Shiro Suzuki. **Effect of Oleozon on Healing of Exposed Pulp Tissues.** Journal of American Science 2011;7(5):38-44]. (ISSN: 1545-1003). http://www.americanscience.org.

Key words: Experimental pulp exposure, pulp capping, Calcium Hydroxide, Oleozon,histopathological examinations

1. Introduction

Preservation and maintenance of pulpal vitality has been a prime concern in operative dentistry. Historically, the placement of medicaments or materials against pulp exposures during caries excavation has been considered controversial, and instead conventional endodontic therapy has been recommended, (Langeland (1981); Tronstad and Mjör (1972)). The reluctance for direct pulp capping to pulp exposures in a carious field is based on unpredictable outcomes using traditional materials and treatment protocols. Moreover, compromised immune responses and impede cellular differentiation and recruitment, normal pulpal repair mechanisms may not function properly when bacterial by-products induce pulp inflammation. To date, researchers have never been identified a reliable non-absorbing bioactive pulp capping material that consistently stimulates cellular repair mechanisms, seals the dentin and promotes formation of a biologically stable reparative dentin bridge, Ward (2002).

Enhanced understandings in pulp physiology, caries progression, inflammatory mediators, and pulpal defence mechanisms have changed the clinical approach to caries removal and protocols for direct pulp capping, Hahn and Liewehr (2007). Several studies have demonstrated that the exposed pulp has the ability to heal when micro-leakage and bacterial contamination are prevented, Cox et al., (1987). A wide verity of materials and techniques for direct pulp capping have been used, including calcium hydroxide, hydrophilic resins, resin-modified glass ionomer cements, tri-calcium phosphates and, more recently, mineral trioxide aggregate(MTA), Heys et al.,(1981); Hørsted et al.,(1985); Matsuo et al.,(1996)and Auschill et al.,(2003) Success rates with direct pulp capping in a carious field have varied depending on the techniques and materials. In humans, success rates range from 30 to 85 percent in two- to 10-year retrospective studies, Barthel et al.,(2000); Baume and Holz (1981).

In fact, Calcium hydroxide, once considered the gold standard for pulp capping materials in which new materials should be tested, Farhad, A. and Mohammadi, (2005); Heys et al., (1980), but long-term studies have shown that the results were variable and somewhat unpredictable, Baume and Holz (1981); Hørsted et al., (1985); Barthel et al., (2000) and Auschill et al., (2003) .The material does not provide close adaptation to dentin, does not promote consistent odontoblast differentiation and has been shown to be cytotoxic in cell cultures; the resultant reparative dentin formation can be

38

characterized by tunnel defects, Schröder (1985); Andelin et al., (2003). Tunnel defects within dentin bridges may provide a pathway for the penetration of microorganisms to activate circulating immune cells, induce pulp irritation and produce subsequent dystrophic calcification Cox et al.,(1996).

Other innovative technical advances to halt the carious process and initiate the repair of potentially damaged tissue include the use of lasers, ozone technology and bioactive agents that induce and stimulate pulpal defenses, Moritz et al., (1998); Goldberg et al., (2003); Dähnhardt et al., (2006) . Ozone therapy is a modern noninvasive method of treatment. The word ozone was discovered by Schonbein in 1840 and comprises an allotropic variation of oxygen, Rilling (1983); Stopka (2003) . Ozone is an activated, trivalent form of oxygen. Ozone possesses strong antimicrobial activity, debriding effect, powerful oxidizing properties and can simulate angiogenesis, Sunnen (1988); Stopka (1999). Ozone is not only very powerful oxidizing agent that can kill a wide variety of viruses and bacteria, but also a very powerful non-chemical disinfectant, Seidler et al., (2008). Nowadays, ozone is employed as ozonated olive oil (Oleozon), which is widely used as a clinical therapeutic agent for wound healing Martinez-Sanchez et al., (2005). Ozonated materials, in which the ozone molecule stabilized as an ozonide between the double bonds of mono-saturated fatty acid, have the capacity to deliver nascent oxygen deep into the treated area without causing irritation. Under the influence of ozone, improved rheological properties, Verrazo et al., (1995), raised intracellular ATP, Oosting, et al., (1991) activated cellular metabolism , Shiratori et al., (1993) and expression of cytokines relevant to healing, especially Transforming Growth Factor (TGF- 1) were observed, Bocci et al., (1994).Ozone is currently used in dentistry as a possible antiseptic agent, and the effectiveness of ozone in the treatment of oral diseases is currently a subject of intensive investigations. Ozone has been used either in gaseous or in aqueous form for treatment of caries, in the root canal disinfection, and for enhancing epithelial wound healing, Filippi (2001); Nagayoshi et al., (2004); Baysan A, Lynch (2004). Flippi (2001)observed the accelerating effect of ozonized water on epithelial wound healing in the oral cavity. However, there is a lack of sound data on histological effect of ozone on oral tissues to minimize any possible side effects by controlling its applications , Bocci (2005).

Therefore, the purpose of this in vivo study was to compare the histomorphological characteristics of ozonated olive oil and calcium hydroxide cement when used as pulp capping agents in experimentally exposed dental pulp at different time intervals.

2. Materials and method:
2.1. Materials:
Calcium hydroxide containing product (Dycal, Dentsply/Caulk, U.S.A) and ozonated olive oil (Oleozon) were used as capping materials in this study. Ozonated olive oil paste was prepared through incorporation of ozone gas (O_3), generated by the Ozo-1m VTT unit (Ozomax, Qubba/Canada) with concentration of 70ug/ml (5%), into olive oil and was kept in a sterile sealed jar at $-20C^o$. Glass ionomer restorative material, Ketac Fil plus Aplicap (3M/ESPE, St Paul, MN, USA) was used as a restorative material.

2.2. Method:
Mixed breeds healthy dogs (n=9) between one and two years old were selected for the present study i.e., three dogs were used for each experimental period of 7, 30 and 90 days. After the quarantine period dogs were housed in individual cages with an area of $1.5m^2$ and 1.5m high, provided with dry balanced diet, drinking bowels and cleansed daily. In each dog the right canines were capped with Dycal, while the left canines were capped with ozonated olive oil. Each dog was tranquilized by an IM injection of 10 mg/Kg of neurazine. General anesthesia will be performed by IV injection of Thiopental sodium in dose of 30mg/Kg body weight. The anesthetic effect occurred after 10-15 minutes and lasted for 30-60minutes. The selected teeth were cleaned and disinfected with Betadine. A dry field of operation was maintained by cheek retraction and placement of cotton rolls in the muco-buccal fold during operative procedure. Oval shaped class V cavities were prepared at 2 mm away from the gingival margin. The average dimensions of the cavities were 4mm in the longitudinal direction and 2mm mesiodistally. The cavities were prepared with a sterile #3 rounded bur using a low-speed engine with 25,000 – 30,000 r.p.m. under sterile physiological saline spray. The cavities were rinsed with sterile saline and dried with small cotton pellets. Pulp exposure was performed in the center of the pulp floor by means of #1 round bur under water coolant. Homeostasis was performed by irrigation with sterile saline and cotton pellet before placing the capping materials.

The application of Dycal was carried out according to the manufacturer's instruction. Equal amounts of the base and catalyst were mixed homogenously and placed gently over the exposure site using a #1 insertion spatula. They were served as a positive control group. For the corresponding pulp exposures on the left jaws, a thin layer of Oleozon was applied to the cavity using a small plastic instrument. It was spread evenly throughout the length of the exposed pulp in an incisogingival direction. Then, the cavities were restored with glass

39

ionomer restorative material. The animals were observed until recovery, and then every dog was transmitted to the cage after it regained its complete consciousness.

After observation period of 7, 30 and 90 days, the dogs were sacrificed by bilateral perfusion of formalin through cannula in common carotid arteries. The jaws were immediately dissected free, and the teeth were separated from the jaws by the use of handsaw. The apical root third of each tooth was amputated and immediately placed in individual bottles of 10 percent neutral-buffered formalin for 48 to 72 hours to allow proper fixation of pulp tissue. After fixation, they were placed in gauze bag tied with a string, which had been dipped in melted Paraffin .The bag was suspended in large quantity of decalcifying solution consisting of 5 percent aqueous solution of nitric acid for 1 to 4 days. The decalcifying agent was changed daily to maintain its effectiveness. The teeth were stored in decalcifying solution until obtaining certain degree of softening, which was checked by needle penetration. When they reached to required softening stage, every trace of decalcifying solution was removed by rinsing in running water for 24 hours, and then neutralized in 10 percent formalin. The additional irrigation was completed in running water for 24 to 48 hours. Dehydration was carried out in ascending grades of ethyl alcohol, and the specimens were then cleared in Xylene and embedded in Paraffin wax. Bucco-lingual cross sections of 7 microns were serially prepared in each cavity and stained using hematoxylin and eosin staining. The samples were evaluated under light microscopy to detect morphological alterations for each material and time period. The changes in pulp tissues were assessed using the Negm scale as weak, medium and considerable degree of inflammation.

The status of the odontoblastic layer was determined according to Qvist & Qvist (1977) with the following indexes: 0 as no reduction, 1 as insignificant reduction, and, 2 as medium to significant reduction.

The quantity of reparative dentin was evaluated by the method of Stanley on a 3–degree scale: 0 as no reparative dentin, ½ as initial formation of reparative dentin, and 1 as presence of a significant amount of reparative dentin.

3.Results:
3.1.Histomorphological analysis of the samples capped with Oleozon

The microscopic examination of the serial sections of the teeth showed vital pulp in all teeth. After 7 days, direct pulp capping with Oleozon revealed a considerable degree of inflammation with dilated blood vessels and hemorrhages. Significant reduction of the odontoblasts was detected Figure 1.

However after 30 days, the histomorphological image changed drastically. A weak inflammatory reaction according to Negm, a well-organized layer of odontoblastoid cells, absence of hemorrhage, and persistence cellular infiltration were observed in Figure 2. After 90 days, increased collagen fibers and fibroblast with dilated blood vessels were detected in Figure 3.
Figure 1 Morphological changes in canine dental pulp 7 days following direct capping with Oleozon
Figure 2 Morphological changes in canine dental pulp 30 days following direct capping with Oleozon
Figure 3 Morphological changes in canine dental pulp 90 days following direct capping with Oleozon

3.2.Histomorphological analysis of the samples capped with Dycal

The histomorphological changes of exposed pulp contact with Dycal revealed medium degree of inflammation, mononuclear cellular infiltration and necrosis at site of exposure at 7 days. The odontoblastic layer shows index 2 by Qvist adjacent to the damaged area. No reparative dentin was detected. The predentin was very thin and almost

40

absent near the exposed cavity. The rest of the pulp appeared full of congested and dilated blood vessels with extravasations particularly at the central portion of pulp cavity shown in Figure 4. 30 days specimens demonstrated Qvist index 1 and Stanley index 0. A weak inflammatory reaction, remarkable absorption of necrotic tissues at the exposure site with few collagen fibers and fibroblast were detected. The rest of the pulp appears nearly normal. There was an evidence of thin layer of dentin bridge formation shown in Figure 5, which was not always complete. After 90 days, a localized connective tissue capsule was detected between area with inflammatory reaction and healthy pulp tissues. Fibroblasts, small blood vessels and peripherally cited collagen fibers were detected inside this restrictive capsule. There was a prolific deposition of reparative dentin, as thin collar of osteodentin, with irregular and immature morphology as shown in Figure 6.

Figure 4 Morphological changes in canine dental pulp 7 days following direct capping with Calcium Hydroxide.

Discussion

Pulp capping comprises adequate protection of exposed dental pulp by the applications of medicaments and restorative material. This technique aims to preserve the vitality of pulp tissue, thus avoiding more invasive endodontic treatment. Although pulp exposure frequently occurs by caries process in which there is inflammatory reaction, the selection of healthy vital teeth for this study has the benefit of standardization and can be regarded as

acceptable method in determining the effects of tested materials. In judging the efficacy of pulp capping materials, it is important to evaluate the presence of inflammatory reaction, necrosis and calcified bridge formation.
Figure 6 Morphological changes in canine dental pulp 90 days following direct capping with Calcium Hydroxide.

Based on the properties of ozone, the present study was designed to test ozonated olive oil paste as a direct pulp capping material in dogs' teeth. Ozone is very unstable gas. In air, ozone has longevity of only a few minutes; while in water, ozone lasts for a few days. However when ozone dissolved in an oil base such as 100% pure olive oil, ozone has a life span measured in months to years. The amount of oxygen and ozone saturation level is exponentially greater in solid paste than in liquid oil product. Also, the liquid does not have the long time release which ozonated olive oil paste does, Sechi et al., (2001). Different ozonized solutions such as vegetable oils have been used successfully against different infections. Vegetable oils are natural products derived from plant origin consisting of ester mixtures of glycerol with chains of fatty acid contain 14 to 20 carbon atoms with different degree of unsaturation, Ferrari et al.,(2004). The unsaturated triglycerides in vegetable oils were responsible for its favorable properties. There are different vegetable oils derived from various sources. Knowledge of their composition provides insight into their physical and chemical properties. Ozonized olive oil (Oleozon) was widely used for its therapeutic and antimicrobial effect against bacteria, fungi and virus, Hammer et al., (1999). The olive oil is obtained from olive tree and presents a high proportion of oleic acid (65-85%). It is characterized by high ratio of polyunsaturated fatty acids, such as the monounsaturated oleic acid and the polyunsaturated linoleic acid, Gertz et al.,(2000). Ozone chemically reacts with carbon-carbon double bonds present in unsaturated fatty acids producing long complex molecules called 'ozonoids'. These ozonoids are effective antimicrobial agents, and

41

stimulate the reparative and regenerative pathways at cellular level. Hydrolysis of ozonized oil will generate different products such as hydroperoxides, acetones, peroxides, and aldehydes and these compounds could be also responsible for the wide biological activity of ozonized olive oil, Siqueira et al.,(2000); Valacchi et al.,(2005). Furthermore, ozonated olive oil remains stable for 2years when stored at 4°C Valacchi et al.,(2005). The safety of Oleozon was discussed by Gundarova et al. (1996) and Alvarez et al. (1997) The present study is the first study that uses ozonated olive oil as direct pulp capping material. The histomorphological results of Oleozon application to the pulp showed a diffused involvement of the inflammation. It was reported that ozone exposure is associated with activation of growth factors, which are important to regulate inflammatory reactions and consequently the process of wound healing, Hørsted et al.,(1985);Pierce et al.,(1988); Werner and Grose (2003);Lim et al.,(2006). The increase of collagen fibers and fibroblasts indicated that ozone might act on healing directly or indirectly through collagen synthesis and fibroblast proliferation. Fibroblasts have been known to play an important role in reepithelization, synthesis of collagen fiber, extracellular matrix regeneration, and for the release of growth factors, Bocci(1994). The deposition of collagen by fibroblasts during the inflammatory process is a key event for human pulp repair, Barkhordar et al.,(2002); Chan et al.,(2005). Kim et al (2009) stated that the increased expression of platelet derived growth factor (PDGF) and transforming growth factor- (TGF-) were correlated with increased collagen fibers and fibroblast proliferation. TGF- 1 has a direct influence on cell proliferation, angiogenesis, chemotaxis (fibroblasts and monocytes), synthesis of extracellular matrix and collagen synthesis, Pierce et al.,(1988);Jazwa et al.,(2006).Also there was increase in vascularity in the ozone group. This was explained by Kim et al (2009) in which the increased vascularity might be due to the increased expression of vascular endothelial growth factors (VEGF) by ozonation, which is the main cytokine of vascularization in the late phase of healing. Bocci et al (1994) stated that the improved delivery of O$_2$ and release of growth factors appear beneficial in accelerating healing of wounds. Therefore, the treatment of the pulp with ozonated olive oil probably works by promoting collagen synthesis, fibroblast proliferation, and improvement of circulation. Taken together, we can infer that ozone application may be regarded as a therapeutic method to enhance pulp tissue healing.

On the other hand, the results obtained with calcium hydroxide are similar to the findings of others in direct pulp capping, Stanly and Lundy (1972);Eskandarizadeh et al.,(2006); Modena et

al.,(2009). The superficial necrotic layer (cauterization zone) could be due to the chemical injury caused by hydroxyl ions, which present highly alkaline pH, yielding to an initial destructive effect , Glass and Zander (1949); Holland(1971). It has been reported that the high alkaline pH can solubilize and release some proteins and growth factors from dentin , Modena et al.,(2009). It was evident that, calcium hydroxide was able to enhance the pulp to perform its normal functions including deposition of secondary dentin. This was evident especially after 90 days test period. Dentin bridge formation occurred mainly from the periphery of exposure site, as its thickness at the periphery was greater than the thickness toward the prepared cavity. This may indicate its formation from the residual dentin chip at the wound surface, Kitasako et al., (2000); Parirokh et al.,(2005). These events may be responsible for pulp healing and hard tissue barrier formation.

So far, ozonated olive oil has the capacity to serve as a therapeutic agent. This highlights the importance of conducting further researches on ozone, which has encouraging expectation for further clinical applications.

Conclusions

Based upon the results and the limitations of the study, it was concluded that direct pulp capping with Oleozon induced less degrees of irritation to the dental pulp compared to that with Dycal. The application of Oleozon paste for direct capping of exposed pulp could have a possibility to serve as a therapeutic method to enhance pulp tissue healing.

Conflict of Interest:

The authors declare that they have no conflict of interest.

Abstract: most distance education courses offered by traditional colleges and universities that are semester and classroom oriented, with courses offered by most of the DETC-accredited institutions you can study any time and anywhere. Distance education is especially suited for busy people who wish to increase their knowledge and skills without giving up their jobs, leaving home, or losing income. You learn while you earn. Many courses provide complete vocational training; others prepare you for upgrading in your present job, without losing wages, experience or seniority. You receive individual attention, and you work at your own pace. In recent years, technology has played a significant role in transforming the traditional distance education school into a dynamic, interactive distance learning method using toll-free telephone lines, as well as a diverse array of personal computers, video devices, CD and DVD ROMs, online courses over the Internet, interactive devices, and other modern technological innovations. The future for distance study promises to be exciting.

Keywords: Distance Learning, education

Introduction:

When the standardization and the requirements for training by the third millennium will be talking, unconscious form, design and construction to provide context and use tools and indicators to teaching the principles of community-based knowledge to the mind is centered. . No doubt these requirements and identify the correct tools and proper utilization of their functions according to accelerate the development expected in the knowledge-based information society will be effective. Such concerns and problems that any country in its development plans in motion to the information becoming a knowledge based society means a society would be faced with the centrality of knowledge, Dealing with existing tools and how these tools are used.

Led the way when dealing with those massive training programs available to speak to the technological tools that we expect to occur that planners and decision makers that planners and decision makers of large structures, especially university education according to the image Access to the development of community information are available on these tools are selected and used.

Massive wave of data produced in today's world it nicknamed the "information age" has all day and through various means of communication in the world will move on its size are added. Other hand, as we're not the world witnessed the development of the role of information communication devices transporting feedback fast and absorb the information around the world, we forget

Therefore, information and communication as the main lever or two important move in developing

wings, we learn. Meanwhile, proper utilization of the capacities of these two valuable and effective indexes in the general development concept for any society and the principles of a critical need is considered. With a view to clarifying this issue can be paid in the best way to create a platform for developing data standards and access to a knowledge based society, what really can be. To achieve a clear and practical answer in this area before all the existing definitions and indicators mentioned placed.

Definition of distance learning:

in distance education teachers often are separate and comprehensive. Preparation of educational materials, supporting learners under the supervision of a training center takes place almost never do as a group are not**.** For services to education and electronic learning aids such as printed materials, computers and the Internet rely on.

Another look at the educational system of a new e-business and artistic and is a comprehensive solution to the institutions that want to move in the direction that technology and change their teaching methods and environments are possible to achieve the new educational approach provides**.**

Distance education is any type of schooling that takes place away from a physical campus. Distance education is also known as:

- distance learning
- virtual learning
- online learning
- e-learning
- online education
- web-based training

Types of Distance Education Programs:

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence.

Distance education began for the delivery of courses to students who live in remote areas. Over the years, though, this form of education has become the preferred method for learning outside of the classroom.

Distance Education is now undertaken by people with busy schedules, hectic lifestyles, special needs, and also those living in isolated areas. What's more, with such flexible learning options you can choose to study at any time and from any location you like.

There are a number of different **forms of distance education** and it's important to know which method you prefer:

- **Correspondence learning:** your course materials are printed and sent out to you by mail/courier. The advantages are that you have a printed set of reference materials, you can study anywhere and you are not reliant on a computer, you can learn for long periods of time.
- **eLearning:** your course materials are provided to you in multimedia format; that is, on CD/DVD. In this way you can choose to take your study materials within you and learn anywhere in the world with just a laptop.
- **Online learning:** no materials are sent to you and you do all your learning online. The limitation is that you need to be logged onto a computer (though you may be able to download and print some of your materials yourself, though this can cost you more in ink), there is a limit to how much you can absorb and do online, and most people's attention span on-screen is limited to 20 minutes (your eyes get tired after that).

- **Broadcast learning:** where you tune into a series of television, radio or Internet broadcasts (e.g. podcast, YouTube, etc.).
- **Teleconferencing:** where your lessons are conducted in real time through an Internet connection. Limitations are that streaming can be slow, connections can cause problems (students and teachers generally need to be computer literate) and there can be delays in talk-time, depending on software, hardware and connection capabilities.

Benefits of Distance Learning:
Benefits and opportunities that distance education provides, include:
 - training a wide range of audiences.
 - meet the needs of students and students who can not attend in place.
 - Possible connection between students and students with cultures, beliefs and experiences are different.
- Benefiting from coaches and speakers who do not live in the country.

Educational methods in distance learning:
Today, under the new system replaced the traditional systems of learning and learning week (ie tutoring methods, lectures) are:
-    **Multimedia courses:**
These courses and widely used elements of image, communication, graphics and simulated components, animation and communication elements for guidance and tips, and talk back on course and curriculum issues are held.
-    **Enhanced communication mechanisms:**
The mechanism of any texts simultaneously, and asynchronous audio-visual communications to protect you. This case allows students to practice on topics learned will give.
-    **Written test:**
 thus, question and test via a distributed communication network, are corrected and returned. These exams through video conferencing support and runs.
-Virtual Seminar:
thereby different groups of students in different geographical environments linked together makes.
-    **Collaborative virtual laboratories:**
 the laboratory of the Group's activities are supported. Workshops such as software engineering.
-Smart academic factors:
academic factors that inform intelligent, support and guidance students pay.

Remote educational tool:
distance learning tools and supplies various uses. These tools in four main courses are:

A - Audio Tools:
Audio tools include training such as two-way interactive telephone, video conference, shortwave radio and a strain of tools such as audio tape and radio.

B - Image tools:
including slides, films, video tapes and video conferences.

C - Data:
computers as electronic data are sent and received. Because the data word description for a wide range of educational tools is used.
Computer applications for distance education are varied and include the following:
1- Training to Computer Management.
2 - Computer Assisted Instruction.
3 - through PCs.
4 - e-mail, telegraph, computer conference and the World Wide Web simultaneously.

D - Print:
The main element of distance education programs, particularly in the exchange and delivery system information tools are considered.

Key factors in the process of distance education:
the process of remote training, the following factors contribute:
-       Students:
Regardless of educational content, role and main element in the learning process students are responsible.
-       Coaches and Teachers:
Success depends on a lot of educational activities the ability, skills and knowledge are the coaches and professors.
-       Facilitators of communication:
Facilitator bases, as the bridge between students and mentors are. Must base expectations of teachers and educational needs of students and service coordination and communication to create.
-       Support staff:
One of the important pillars of any development of distance education programs, by development group finds. Operational support staff such as student registration, copy and distribute their resources, order textbooks, security and copyright, and are responsible for the report.
-       Management:
The group decision makers, builders and judges are considered to be educational and should be

considered among the factors above, establish the correct relationship formation.

Advantages of Distance Learning: Benefits of Distance Learning

Since distance learning has emerged as a new learning option, many students consider it. However, because it is new, they hesitate before opting for this education path.

This article lists and discusses about the Distance Learning key advantages.

Like everything in life, what works for on doesn't work for other people.New technology sounds confusing for many as it one of these new "techy things". After reading these 5 benefits of distance learning, you may get the idea of its advantages. Read further..

Benefits of Distance Learning: Advantages to Consider

Here are the good things with it -

1– The Flexibility: You utilize it in a convenient manner – Distance learning gives you the autonomous decision on the learning program and its schedule.
You are the one who decide on the time of taking the online   courses.
You also set your own pace and control how fast you want   to   go   over   material.
Because these are online courses, you set your learning times. You take the decision on where to complete your learning duties and when to have more readings. In some degree programs, you can plan the syllabus and design the set of courses – You can even set the pace of your learning.

2 – The Availability: Almost every degree today is available online. Distance learning becomes an option for many students who cannot take the on-campus rout for any reason. Even a well known universities and college combine distance learning for some of their traditional campus education programs. Many of these online degrees are accredited   regionally.
Distance education is a great option for those who aren't able to leave their jobs/careers and/or family for a traditional education.

3 – The Accessibility: Another benefit of distance learning is that wherever you have a computer access you may learn. Since you're not required to follow certain classroom/class work schedule, you are able to plan a flexible timetable of any given online class you   take.
Choosing distance learning gives you the ability (and flexibility) to study anywhere, anytime. You can also make quick decision down the learning process – How long you would want to learn in any given time.

4 – The Cost effectiveness: A key distance learning advantage for many people is the cost. In most cases the prices of online degree programs are lower than traditional campus college or university.
In addition, other education's costs factors are – travel time, housing, meals and time spent in classroom for every course. When selecting distance learning, you save money on each of these factors.

5 – The Efficiency: You effectively use your time. Distance learning actually saves your precious time. You don't waste your time on travel to class, walking, talking etc. No time is spent on traveling to classrooms and there is no dead time before/after courses.

As it is in any decision taken, distance learning may fit the needs and work best for one while not work for the other.

Disadvantages of Distance Learning: Drawbacks of Distance Learning

Though distance learning sounds appealing for many people, it doesn't necessarily work for all of us – It has its disadvantages. This article provides the key disadvantages of distance learning.

If you consider this method of learning, you may want to know more about certain issues/aspects of this new technology.

Distance Learning Disadvantages & Drawbacks

While distance learning has many good advantages, it also has some drawbacks that require your attention as follows :

1 – Educational Support: Since it is an on-line method, distance learning doesn't provide face to face interaction with teachers or other students. It might be that no teacher is available for answering questions.
In distance learning you have little to no support – you have to work hard for finding own resources for completing learning assignments. If your learning style is to use assistant from instructors (and other students) for discussing/understanding things in the material studied, then distance learning might not work for you.

2 – Accreditation: Many online degree programs still do not have the higher accreditation (regional accreditation) as the mainstream colleges and universities would give you.

3 – New technologies: Distance learning is a new technology and like with new techy things, it doesn't fit many people who have technology fears and cannot adopt new technical skills easily. It requires having technical skills such as – Computer knowledge, working with new software and experience Internet tools.

4 – Responsibilities: Believe it or not, many of us need to follow discipline for things we do and it is also true with taking education, otherwise we would not   learn.
Many people need an extra push to complete tasks and studies. When you opt for distance learning, you are the master of your domain for the bad and good things of it – You responsible for your plan and time.

5 – No Socializing: A downside of distance education is that it takes away an important aspect of the learning experience – Socializing and Interacting with others. If you enjoy meeting new people while learning don't go for distance learning.
Be it teachers, students or the campus itself, some people essentially need the campus atmosphere and the interaction with others to get the right spirit of studding.
With distance learning, you would need to get along by   yourself.
Education is a lot more of just learning experience. It is also a great opportunity to meet other students. Having distance learning, you lack opportunities to interact face-to-face with others

Pros and Cons of Distance Learning:

It is important to weigh the pros and cons of online learning, though the pros already seem to outweigh the cons.

In the future, there is little doubt that online education will become a standard part of our lives, whether traditional institutions disappear completely or not. Here is a list of both advantages and disadvantages for you to consider and compare:

The Pros of Distance Learning

Some of the advantages it provides include:

1. Saves time and money: Distance learning saves time and money by eliminating the need to commute to and from the campus. This is tons of free hours, allowing you to sleep more, study more, or accommodate your studies better to your full-time professional life.

2. Convenience: Asynchronous classes and extremely flexible schedules are perfect for many people. They allow time to absorb and respond. And they make it possible to study when it is most convenient to you, like during work, or on the train home, or even while on a cruise in Hawaii.

3. Geographic availability: Online education abolishes geographic limitations. Anyone can study anywhere. There is not need to travel abroad anymore. You can simply log on to your chosen institution from the comfort of your room.

Education Quality: For now, traditional institutions of great quality are more numerous than equivalent online ones. But there are already a number of online programs which combine revolutionary online methods with uncompromising quality. Soon there will be many more.

The Cons of Distance Learning

Some of the most often cited disadvantages include:

1. New Technology – Confusion

High-tech environments are not for everyone.

Some people are disoriented by absence of face to face contact. Online multi-media may confuse, unless you are a hardcore cyber-space resident.

2. Being self-disciplined

The degree of freedom allowed by online courses may as easily turn to your disadvantage if you have no self-discipline.

3. Lack of Feedback

Most of distance learning classes are asynchronous. This may allow time to think before responding, but it also means that you probably get less feedback than you would have in a traditional classroom.

4. Accreditation concern:

Not all online-course credits are transferable. Not all the employers are willing to hire candidates that have online degrees. Some online institutions accreditation still subjected to questions.

Conclusion:

In general, new methods of educational systems to countries around the world as a necessity and need for learning and training opportunities to study in areas with different climatic features and conditions of learning and education according to their gender and cultures, has been. Each method is mentioned with regard to changes in features and creates an education system, and evaluation is used. Judgement of distance education in an educational way, first as a necessity to eliminate barriers to educational climate and geographical areas, age and gender restrictions learners began their work And more in a death education system, especially in the philosophy and goals based on theories of learning theories have evolved to find and promote professional growth. Approach to distance education with regard to the necessity of education in countries formed.

Emergence and development of information societies is the consequences of industrialization. Despite the diversity of information in various forms of media in local, national and international, access, exchange and use of various information easier than last time is. Information society, a member of your buddies know that open information system in terms of geographical location and the last 25 years, organizational development, are limited. Distance learning faster than other forms of training has been. Growth factor in the economic interests of this type of educational approach, flexibility and remove the

distance can be named. The methods of distance education, required for building physical education is not providing services. Teachers and trainers in this method - compared with traditional methods - and have more opportunities to more people than are being trained. In this type of teaching style of each person in each academic field, and each job can be arbitrary in time and space, trained without having to leave the house for work or business is education. This method requires that students are dispersed over long distances provides. Distance learning advantages of distance education in comparison with traditional education, the need for physical locations and training programs limited to no specific time period. In this type of teaching style, learning for life without possibility of spatial and temporal constraints for each individual there. In distance education, problems related to lack of qualified teachers and appropriate educational environment - as it posed in the traditional method of M is - is resolved. In this way the use of advanced features in digital libraries and search the various sites during the study, time and cost savings are.

Abstract: This paper attempts to identify the relationship between civic engagements of local people and level of their participation in local government of Torbat-Heydarieh, Iran. The paper is based on the study carried out among 400 citizens of Torbat-Heydarieh. The analysis of data uses Pearson correlation to determine the relationship between variables involved. The findings reveal that two levels of participation (tokenism and citizen-power) have positive and significant relationship with civic engagement, while there is no significant relationship between non-participation level and civic engagement. The findings of the study imply that those respondents who engage more in civic activities would participate in high level of participation in local government.

Keywords: civic engagement; people's participation; local government

1.Introduction
A number of studies in recent years have examined the relationship between civic engagement and participation in local government. Many researchers concluded if local people more engage in social activities or community matters, it is more likely that they participate in local government affairs more actively (Putnam. 2000, Zlatareva. 2008). Parnell et.al (2002) argues that civic engagement contributes to enable the people to participate in local government activities and that presents a potential development resource for local government. A lot of studies on relationship between civic engagement and participation in local government have been conducted. All these studies are performed by western researchers. Thus, the relevance of the findings in the Iranian context may not be fitting. To date, very little research has examined about the relationship between civic engagement and participation in local engagement in Iran. In point of case, local communities in Torbat, Iran have been never been studied of such. Thus there is limited understanding of the relationship between engagement in civic activities and participation in local government and also has never done any study here about level of people's participation in local government affairs.

2. Literature Review
Participation of citizens in decision-making can produce more efficient and effective. Citizen participation is an important factor for successful and prosperity of local government, as well as their participation promote the quality of good governance. Without community participation, there are obviously no accountability, no development, and no program (Aref et al, 2009). Ashley & Roe, (1998) describe community participation as a spectrum from passive to active involvement to full local participation, where there is active community participation and venture ownership. Meanwhile, some scholar such as; Pretty (1995), Oakley (1991), Johnson (1982), and Wandersman (1987), provided a typology of participation, but the most suitable typology that is adopted to urban issues is Anstein's ladder (Mohammadi et, al. 2010) Arnstein's ladder of citizen participation (1969), is the most well-know continuum of citizen participation which frames participation in terms of citizen power. According to her; participation is "the redistribution of power that enables the have-not citizens, presently excluded from the politics and economic processes, to be deliberately included in the future. It is the strategy by which the have-nots join in determining how information is shared, goals and policies are set, tax resources are allocated, programs are operated,…" according to her study, citizens are considered as an integral part of governnace process and their participation is essential for community.This ladder has eight rung and each rung corresponding to the extent of citizens' power in determining the plan and/or program. The eight rungs are categorized into three categorize. The bottom rungs of the ladder are manipulation and therapy. These two rungs describe

level of non-participation, which the real objective is not to enable people to participate in planning, but to enable powerholders to educate the participants. The next grouping encompasses three degrees of tokenism; informing, consultation, and placation. In this level citizens may indeed hear or be heard, but under these conditions they lack power to influence

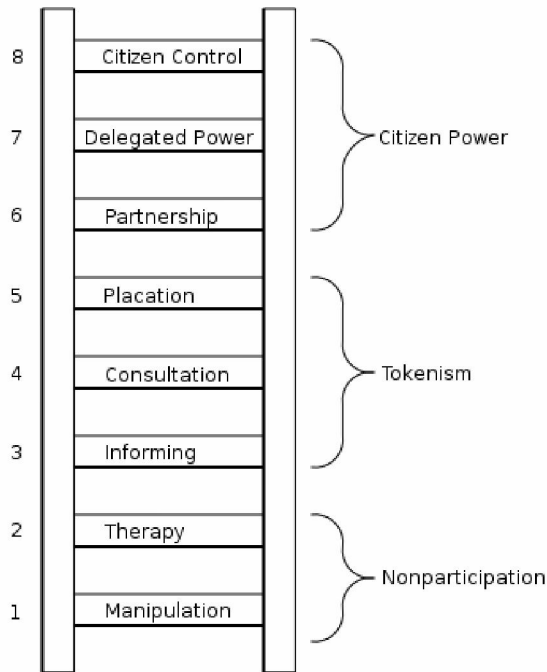
decisions (Arstein 1969). It is the illusion of a voice without the voice itself. The highest level of ladder is citizen-power, which include; partnership, delegated power and citizen control. In this level citizen control all issue and they obtain the majority of decision-making seats.


Figure 1: Arnsteins' Ladder of Citizen Participation

manipulation stage (stage 1). It is bottom range of participation, that people are placed on rubber stamp advisory committees or advisory boards for the express purpose of 'educating' them or engineering their support (Arstein 1969).

Second stage is *Therapy* (stage 2). Therapy, as Amstein (1969) noted, a type of participation that is presented in the form of a small group, masked as citizen participation. It is on the lowest rung of participation because it is both dishonest and arrogant (Arstein 1969).

In stage 3 (*informing*), authorities inform citizens of their rights, responsibilities, and options can be the most important first step toward legitimate citizen participation. However, too frequently the emphasis is placed on a one-way flow of information (Arstein 1969).

In 4 stage (*consultation*) people be invited to give their suggestions, this rung of the ladder is still a sham since it offers no assurance that citizen concerns and ideas will be taken into account. The

most frequent methods used for consulting people are attitude surveys, neighbourhood meetings, and public hearings (Arstein 1969).

Placation is stage 5 that citizens begin to have some degree of influence though tokenism is still apparent (Arstein 1969).

At the rung of *partnership* (range 6), power is in fact redistributed through negotiation between citizens and power-holders. They agree to share planning and decision-making responsibilities through such structures as joint policy boards, planning committees and mechanisms for resolving impasses (Arstein 1969).

In range 7 (*delegated power*), Citizen participation under this rung consists of negotiations between citizens and authorities that result in citizens having partial decision making authority over a particular plan, program or project. The citizens gain various delegated power arrangements sometimes as a result of demands (Arstein 1969).

The highest level of ladder citizen participation is *citizen power* (range 8). in this range people have the degree of power (or control) which guarantees that participants or residents can govern a programme (Arstein 1969).

Lowndes et al. (2001) point out, local government networks, public demands, and corporation strategy are as factors that affect public participation in local government (Lowndes et al.,2001). As well as Putnam (2000) have indicated to social capital – especial civic engagement - as a main factor that affect on citizens participation in local government. This study focus on the relationship between civic engagement as a key component of social capital and participation in local government.

Civic engagement refers to the ways in which citizens participate in the life of a community in order to improve conditions for others or to help shape the community's future. Civic engagement is seen as means of building social capital. The concept of social capital has been popularized by so many authors, but very often of them has focused on individual or some groups as the unit of analysis. Although, these views about social capital is useful for social capital theorists, but Putnam offered more useful and practical views of social capital. Putnam thought of social capital as a resource, which is resulted from peoples' social connections. Putnam (1993a), made an important role to the social capital discuss by exploring the nature of social capital at the community level. Community level social capital can not be measured merely as an aggregation of individual networks. Community level social capital resides in groups and the networks among them (Woolcock, 1998). Strong community level social capital creates the civic infrastructure, which supports formal and informal processes of decision making and public involvement (Potapchuck et al., 1997).

Putnam (1993) defines social capital as those features of social life that enable participants to act together more effectively to pursue shared objectives. Unlike physical or human capital, it is not the property of individuals or institutions. Rather it is produced 'in the spaces between people' and affects their ability to associate with one another, particularly outside immediate and intimate relationships. Like other forms of capital, it is productive but differs 'in that it is self reinforcing and cumulative' (Putnam 1993:38). Its depletion is more likely to occur through under-rather than over-use.

The concept of social capital has three main components which have achnowledged by social capital theorists. These key components are; networks of civic engagement', 'norms of generalized reciprocity' and 'relations of social trust'. (Knack and Keefer, 1997, Fukuyama, 1995, and Putnam, 1993). According to Putnam (1993) the establishment of these components is as a precondition for effective government. Social capital in this study is used as manifestication of participation between citizens with each other and also with local government. And, although social capital is elaborated by three component, but, Putnam (2000, p.19) states, the core notion of social capital is networks of civic engagement, which influence productivity of individuals and groups. He argues, without network of civic engagement, individuals become more isolated and lose the expectation that working for their communities.

The mention of civic engagement is very board and there is no consensus about its definition (Gibson, 2000). Different authors define civic engagement in different ways, based on their views and interests. Some authors like; Diller (2001) and Hollister (2002) defined civic engagement in limited way, which only include engagement in formal activities, ig; participation in political activities, or participation to make change in civil society. Whereas, a number of authors defind it in a board way, which encompass both formal and informal activities, these authors are such as; Putnam (2000), and Micheal Della (2004).

Putnam's definition includes informal social activities (visits with friends, card games) as well as formal activities (committee service), community and political participation. Michael Della (2004) also defined civic engagement in broad way. He asserts the term of civic engagement encompass a with range of activities of different types. According to him "Civic engagement is individual and collective actions designed to identify and address issues of public concern. Civic engagement can take many forms, from individual voluntarism to organizational involvement to electoral participation. It can include efforts to directly address an issue, work with others in a community to solve a problem, or interact with the institutions of representative democracy. Civic engagement encompasses a range of specific activities such as working in a soup kitchen, serving on a neighborhood association, writing a letter to an elected official or voting".

According to Zlatareva (2008), civic engagement is about participation, empowerment and partnership. It is about how citizens organize for collective action and interact with national and local level state institutions but also non-state actors such as NGOs and the private sector, and how they articulate their interests and exercise control over decisions that affect their lives. UNDP (2002) defines civic engagement as "a process, not an event that closely involves people in the economic social, cultural and political processes that affect their

lives."It entails ensuring people's involvement in decision-making, and enhancing their enjoyment of the shared benefits from the development process.

Zlatareva (2008), argue Civic engagement requires active citizenship - meaning citizens who are willing to participate in decision-making and to share the responsibility with government and other actors. When citizens perceive themselves as actors and active participants, rather than passive beneficiaries of services, they are more able to assert their citizenship through participation in shaping the policies that have an impact on their lives and by demanding accountability.

Main contribution to civic engagement has been to create: safe space for participation by playing the role of mediator between citizens and local authorities, by motivating and creating suitable environment for people to participat at the local level, and by identifying the necessary changes required for the local governments (Zlatareva, 2008). As well as the major outcome of civic engagement has been to help people overcome some of the key barriers to participation - mistrust, apathy and skepticism - and to demonstrate the value of participation. By developing people's abilities to engage, by opening up space for their involvement, by providing access to information, by mobilizing them for collective action (Zlatareva, 2008). Putnam (2000) states, whatever people more engage in social activities, it is more likely that they more participate in local government activities. This is because, civic engagement as a main component of social capital, enable participants to act together more effectively to pursue shared objectivities at the local level. According to him the stock of social capital in a region for example as measured by the density of citizens' participation in community organizations (choral societies, soccer leagues, pottery clubs, and the like) turned out to the best predictor of local performance.

People are the real capital of societies. Civic engagement implies that living together is not a passive exercise; in societies people must actively contribute to the common welfare of each other. Citizens, especially poorest social sectors must be empowered to participate effectively in decision-making processes. UNICEF (2008) point out civic engagement programs often empower people to make positive contributions to their societies and to change their own lives in the process.

Although the above statements assert, people participation is affected by civic engagement, but it must be mentioned people participation also plays a crucial role in promoting civic engagement as main element of social capital as well as in development of local government. Zlatareva (2008)

believes civic engagement is being foster by enhancing citizen's involvement in public dialogues and decision-making and by strengthening the participation of the poorest groups in policy processes. UNDP (2006) identify the effective role of participation of poorest social sectors, women, youth, and indigenous people. Mobilizing civic engagement among these groups is a basic foundation for strengthening their voice in the policymaking process. participation of people in local community activities, put them in the position that being connected to other sectors and engage in new social networks.

3. Methodology

This study is based on quantitative method. Quantitative methods use standardized measures that fit divers' opinion and experiences into predetermined response categories (Hopkins, 2000). The advantage of the quantitative technique is that it measures the reaction of a great many people against a limited set of questions, thus facilitating comparison and statistical aggregation of the data. This allows the researcher to give a broad, generalized set of findings (Patton, 1987). Quantitative measures are brief, and easily aggregated for analysis. They are systematic, standardized, and easily presented in short space and period of time. The study used survey design in which questionnaire was used to collect the data. Questionnaires are well-established methods of collecting data within social science research (Dillman, 2000). Questionnaire survey is a useful tool of research that are related to community participation (Shin, 2004). A questionnaire is a data instrument that each respondent fills out as part of participating in research study (Johnson & Christensen, 2004).

The findings of this paper are drawn from 400 questionnaires carried out with citizens of Torbat-Heydarieh. Torbat Heydarieh is located in the east north of Iran in Khorasan Razavi province; it is 1005km far from Tehran (capital of Iran). In this study Cluster Sampling was used. This is type of random sample that use multi stages and is often used to cover wide geographic areas. Cluster sampling was chosen because it can select a proxy for community that they represent the voice of people. The population of this research will be all of the residents include men and women and 17 above years who live in Torbat Hedarieh. Ten questions were developed based on the literature review of the measurement of civic engagement. The respondents were asked to insure these questions which were constructed to gauge their engagement in civic activities. The questionnaire was piloted tested to have its content validated by several reviewers of Persian background.

Statements of civic engagement were tested for their validity using Cronbach's alpha. The respondents in pilot study had diverse demographic characteristics, especially with regards to community.

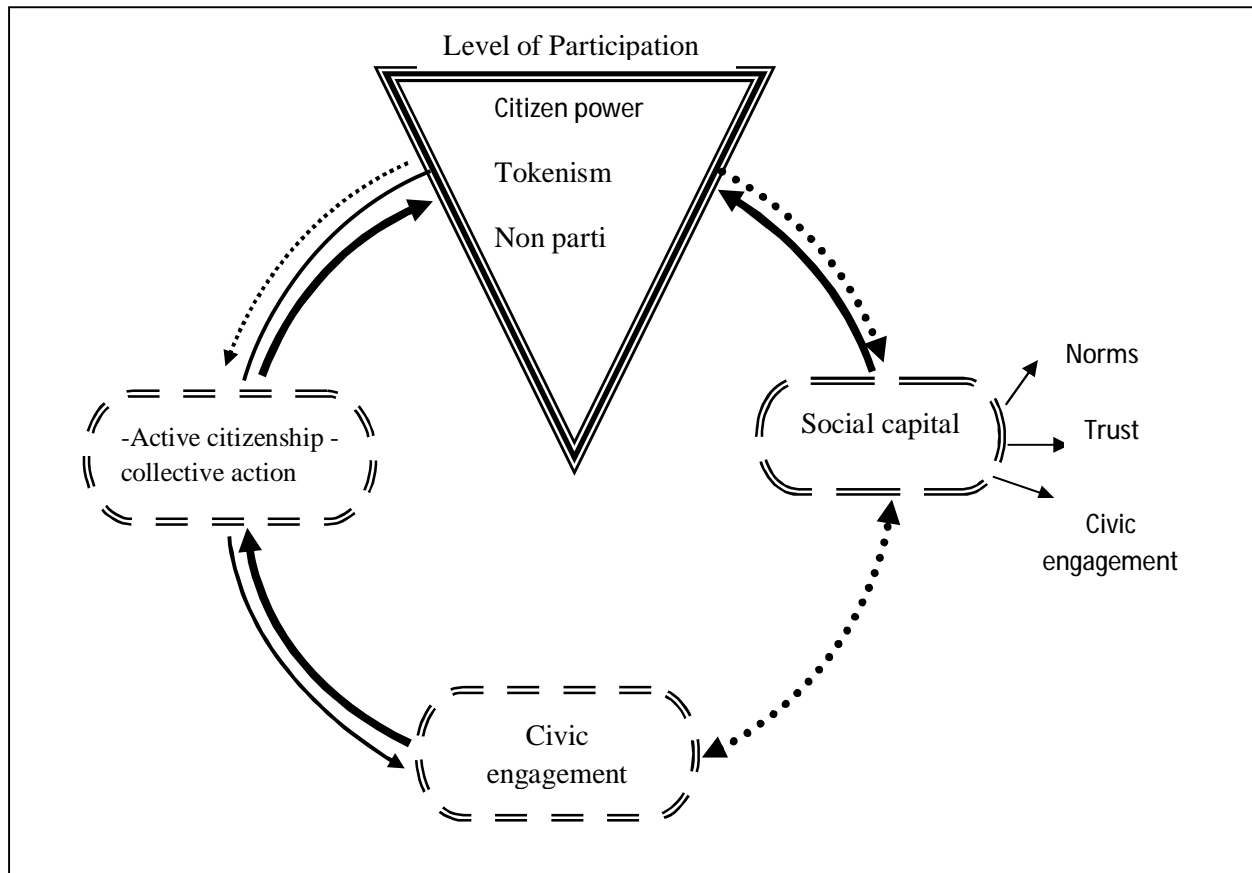
To test the proposed objective, this research was used statistical statics such as Pearson correlation and descriptive statistic. Pearson correlation was employed to measure the degree of relationship between variables involved (the civic engagement and levels of participation). Pearson correlation statistic is a statistical technique to measure the strength of the association that exist between two quantitative variables (Ary et al.,1996). In statistics, correlation (often measured as a correlation coefficient) points to the strength and direction of a linear relationship between two variables that has been determined randomly (Aref and Redzuan, 2009). And, Descriptive analysis was employed to determine level of people participation. In this study participation is a composite variable, consisting of three level, namely, nonparticipation (5 items), tokenism (7 items), and citizen power (9 items). The study used Likert-scale to measure every item. In the analysis, the civic engagement was correlated with the three levels of participation in order to determine the strength of their relationships. Meanwhile, means and standard deviations are the descriptive statistics that were used to describe the basic features of these variables. To assess the normality of the distribution of the data, the skewness and kurtosis of each variable were also examined. According to George & Mallery (2002) if the coefficient of the skewness and kurtosis falls between -0.5 and +0.5 inclusive, then the distribution appears to be relatively symmetric which in this study skewness of non-participation was -.312 and Kurtosis -.447, skewness of tokenism was .303 and Kurtosis -.118, and skewness of citizen-power was -.577 and Kurtosis -.325.


Figure 2; Cycle of engagement in civic activities, social capital and level of participation

4. Result and Discussion

As mentioned above, the main objective of the study is to determine the relationship between civic engagement and level of participation. Pearson correlation was used to identify these relationships. Table 1 shows the findings of the study in relations to means and standard deviations of studied variables. For the three variables related to level of participation (nonparticipation, tokenism and citizen power), the data reveal that generally, the mean scores of nonparticipation level is higher than tokenism and citizen-power. This is reflected by the means of every level – nonparticipation level (M = 20.26, SD = 3.12), tokenism level (M = 17.27, SD = 3.93), citizen-power level (M = 15.91, SD = 4.8). These findings imply that participation in nonparticipation level is more frequent than tokenism and citizen-power. Moreover, the standard deviations show that there are relatively small deviations (differences) between respondents (citizens) in terms of their participation in each level. Meanwhile, the mean of civic engagement is relatively moderate (M = 24.35, SD = 4.91). It implies the majority of citizen engage in civic activities relatively moderate.

The second analysis for this paper focuses on the relationships between civic engagement and the level of participation based on Arnstein ladder. The results of the analysis are shown in table 2. The relationship between them were investigated using the Pearson product moment correlation coefficient. Based on the person product moment correlation results (table 4.17) and the magnitude of association guidelines (0.70 to 0.99 = very strong association, 0.50 to 0.69 = substantial association, 0.30 to 0.49 = moderate association, 0.10 to 0.29 = low association and 0.01 to 0.10 = negligible association) suggested by Davis (1971), there was not significant relationship between civic engagement and non-participation level of participation (r = .026, N = 400, P = .601). While, the relationship between civic engagement and tokenism level of participation shows a positive and low linear relationship (r = 203, N = 400, P = 0.000). Also the correlation between civic engagement with citizen-power level of

participation was found to be statistically significant (r = 120, N = 400, P = .016).

When comparing the nonparticipation, tokenism and citizen-power levels of participation with civic engagement, table 2 shows no significant relationship between civic engagements with non-participation level of participation. However civic engagement has weak positive and significant relationship with tokenism and citizen-power levels of participation. According to Parnell et.al (2002) engagement to civic activities enables people to participate in local government activities and that presents a potential development resource for local government. The findings of this study are supported with Knack (2002), which believe civic engagement can lead to better local government performance, through enabling local people to participate in election and especially other modes of citizen voice, that cause local government be accountable to local people (Kneck, 2002).

Based on results of this study, table 2 revealed, although there was a relationship between civic engagement and levels of participation, their relationship is at the "low association". It depends on the socio-cultura context of Iran, because people in Iran are more interested in participating in uncivil activities rather than civil activities. In other words, people are more interested participating in religious, charity, and sports activities than participating in local government, NGOs, and politica parties. As well as they have not had enough experience interact collectively with local government. Sharma (2009) argue civic engagement is not related to the interaction of an individual citizen with governing but rather the interaction of a collection of individuals.

This results is supported by study that has been conducted by Wilson (1999), he conclude people would prefer to take part in social activities such as sporting events, religion ceremonies, or trade union gathering than attend public meeting about community-based issues. He argued/elaborated people will mobilize over issues that they can visualize, that affect them in an immediate way.

Table 1: Means and Standard Deviation of the studied variables

Variables	Means	Standard Deviation
Level of nonparticipation	20.26	3.12
Level of tokenism	17.22	3.93
Level of citizen-power	15.91	4.8
Engagement in civic activities	24.35	4.91

Table 2 : Correlation Matrix Analysis of Engagement in civic activities and Levels of people Participation (n = 400)

Variable	X	Y_1	Y_2	Y_3
X- Engagement in civic activities	1.00			
Y_1- Non-Participation level	.026	1.00		
Y_2- Tokenism level	.203**	.418**	1.00	
Y_3- Citizen-Power level	.120*	-.491**	.493**	1.00

** Correlation is significant at 0.01 level

5. Conclusion

This study endeavored to investigate the relationship between civic engagement and level of people participation in local government, based on the findings of the questionnaire carried out in Torbat-Hehdarieh city. Participation of citizens is a focal point for promoting the efficiency of local government programs. The efficiency of of local government programs is ensured when citizens are involved in policy formulations. From the findings of this study, it is found that, - based on Arnstein's ladder of participation - there is no correlation between civic engagement and non-participation level. Whereas, there is positive correlation between civic engagement and levels of tokenism and citizen-power. Thus it could be concluded that, more engagement in civic activities, may make possible that citizens more participate in local government matters. In other words, if citizens engage in formal or in-formal activities, such as; sports and religious programmes and attending public meeting, it is more likely that they be able to involve in decision-making process, exercise their priorities, and discuss with local government about their problems. Therefore the result of this study indicates main recommendation, that is; focus on measures which involve citizens more in civic activities. The findings of this study have an implication on understanding the role of engagement in civic activities in participation in local government.

Use of Medicinal Plants in the Treatment of Premenstrual Syndrome: A Review

Nahid Golmakani [1], Samira Ebrahimzadeh Zagami [2]

[1,2.] Instructor of Midwifery, School of Nursing and midwifery, Mashhad University Of Medical Science, Mashhad Iran. ebrahimzadehzs@mums.ac.ir

Abstract: Premenstrual syndrome is a common condition in women and includes a range of emotional, psychological, and physical symptoms triggered by the menstrual cycle. Complementary and alternative medicine use is more prevalent in the treatment of diseases, and many women use medicinal plants without a physician's prescription. Modified diet and use of herbal medicine may be one effective method in the treatment of premenstrual syndrome. The purpose of this study was to collect information about medicinal plants used in the treatment of premenstrual syndrome. This review studied articles obtained from data bases, *Pubmed, Science Direct, MD Consult, Inter Science,* and *Iran Medex* from 2000-2010. Several studies and trials have shown a reduction of premenstrual syndrome symptoms after consumption of *Hypericum perforatum*, *Vitex agnus castus*, saffron, ginkgo, and soy rather than the placebo group. Medicinal plants can be used in the treatment of premenstrual syndrome if certain precautions are followed. More studies are needed about these and other plants.

Keywords: Medicinal Plant, Premenstrual Syndrome, Treatment

1. Introduction

Premenstrual syndrome (PMS) is a common condition (Jurgens, 2009; Canning, 2010) and a collection of symptoms, ranging from physical to behavioral, which begin one to two weeks prior to menstruation and diminish with the onset of menstruation (Jurgens, 2009). Symptoms can be severe enough to overshadow family activities, and interfere with social or professional obligations of the affected individual (Kimural, 2007; Adriane, 2000). PMS has been reported to occur in at least 75 percent of women at some point during their reproductive years (Jurgens, 2009). About 30-80 percent of women have mild to moderate symptoms of PMS in each cycle, but only 2.5 percent of women exhibit symptoms so severe that they interfere in everyday activities (Bryant, 2005; Clare, 2001). Although there is a wide range of symptoms, the primary cause is unknown probably the result of several factors (Jurgens, 2009). There are several potential hormonal scenarios involved in the etiology of PMS: estrogen dominance, progesterone dominance, too much prolactin, vitamin/mineral deficiencies, reduce indorophin, disorder prostaglandin metabolism, low levels of serotonin, and psychological factors (Canning, 2010; Ryan, 2008, Marsden, 2003; Berek, 2003). Also, there are factors like hormonal imbalance, reduced progesterone-to-estrogen ratio, sodium retention, lack of nutrients such as Vit. B6, Mg, Ca, inappropriate response to neurotransmitters, abnormal function axis hypothalamus - pituitary - adrenal defect that leads to adrenal hormone secretion

and environmental factors such as stress (Braverman, 2007; Clare, 2001).

The most common age is for symptoms to appear is between 25 to 45 years. PMS symptoms are quite variable. The most common symptoms are: abdominal pain, mood instability, irritability, nervous tension, headache, increased appetite, palpitations, weakness, dizziness and fainting, weight gain, swollen hands and feet, swelling and sensitivity of breast, penchant to sweets, feel of swelling and abdominal bloating, depression, poor memory, and insomnia (Clare and Subhash, 2001). Many treatment approaches have used a range of western drugs and non-drug therapies with varying outcomes (Morse, 2007). Drug treatments include antidepressants, diuretics, progesterone, estrogen replacement, pyridoxine and GNRH agonists and supplement treatment. Chemical drugs used to treat PMS have many side effects, including gastrointestinal disorders, kidney failure, etc. (Kimural, 2007; Schellenberg 2001). Most women do not require long-term drug treatment and medication is not needed for moderate symptoms. Nutritional therapies are popular, but lack a clear evidence base. Although there is little research to determine the effects of alternative medicines, many women are using them (Canning, 2006). As many as 80 percent of women suffering from symptoms of PMS report self-medicating with over-the-counter (OTC) products, including natural health products (NHPs) such as herbs, vitamins, and minerals (Jurgens and Whelan, 2009). As women search for ways to treat the troublesome symptoms of premenstrual syndrome

(PMS), many hope to find a natural option (Marsden, 2003). Since PMS is a chronic condition, we must note side effects of medications. Herbal medicine has recently been recognized as acceptable treatment because it has fewer side effects (Ozgoli, 2009). One study found that the most common treatment in Asian women was hormones (32 percent) while in European group, phytotherapy/vitamins prevailed (48 percent) (Facchinetti, 2007). The purpose of this study to collect information about medicinal plants used in the treatment of premenstrual syndrome.

This review studied data obtained from *Pubmed, Science Direct, MD Consult, Inter Science,* and *Iran Medex* databases between 2000-2010. Key search terms were: complementary medicine, alternative therapy, premenstrual syndrome, PMS. The results of studies have been resulted such as clinical trial, case-control studies.

2. Discussions
2.1 Chasteberry (*Vitex agnus castus*)

Chasteberry (*Vitex agnus-castus*), or monk's pepper, is found in western Asia, southwestern Europe, and much of the southeastern United States (Roemheld-Hamm, 2005). Chasteberry has been used for several centuries in the treatment of hormone-dependent gynecologic diseases. Recent studies support its use for periodic breast discomfort related to premenstrual syndrome (Roemheld-Hamm, 2005; Gorkow, 2002). The main mechanism is not known but it impacts dopamine receptors and reduces the secretion of prolactin. It is assumed that vitex stimulates the release of luteinizing hormone (LH) that leads to release of progesterone. Increased progesterone reduces the secretion of estrogen. Its indirect and direct effect on progesterone and prolactin result in an improved balance in the luteal phase of the menstrual cycle (Stevinson, 2000). Chasteberry is well-tolerated. Its few reported side effects may include gastrointestinal discomfort, dizziness, and dry mouth. Drug interactions have not been reported, but caution is recommended for its use with dopamine agonists or antagonists (Roemheld-Hamm, 2005). Randomized controlled trials showed that chasteberry is helpful in reducing symptoms of PMS/PMDD such as irritability, mood, anger, breast fullness and tenderness, headache, cramps, water retention, swelling, and food cravings (Jurgens, 2009).

A 2001 BMJ study evaluated 170 women with PMS symptoms. Women were randomized and blinded for receiving either vitex or placebo. Participants were evaluated for irritability, mood alteration, anger, headache, and breast tenderness and bloating. After three consecutive menstrual cycles, 52 percent of the vitex group had a 50 percent or greater decrease in symptoms versus only 24 percent of

placebo patients. Vitex relieved irritability, mood swings, anger, and headache and breast tenderness but not bloating (Marsden, 2003).

A study by Aqajani and colleagues was performed in Babol University of Medical Sciences to evaluate *vitex agnus castus* in PMS treatment. This study was performed on 20 patients with PMS. Diagnosis of PMS was conducted through interviews according to COPE (Calendar of Premenstrual Experiences). The severity of symptoms was given a score zero (absence of symptoms) to three (severe symptoms prohibiting activity). Patients in both groups (10 people per group) received *vitex agnus castus* and placebo drops. Both groups used 30 drops of the drug twice a day for at least five days before menstruation for three consecutive cycles. After three months of treatment, researchers recorded physical and psychological symptoms through questionnaires and interviews. At the end of research, they showed 70 percent improvement in the treated group with *vitex agnus castus* and 30 percent improvement in the placebo group. Therefore they recommended that women with PMS receive medical *vitex agnus castus* (Aqajani, 2002).

A double-blind clinical trial was conducted to assess *agnus castus* in the treatment of premenstrual syndrome in Germany. In this study, 170 women in the control group (84 cases) and intervention group (86 cases) were sampled. The mean age was 36 years and the average menstrual cycles was 28 days. Both of groups received a drug (*agnus castus* or placebo) - one tablet daily for three months. At the end of the study, there was a 52 percent improvement in the *agnus castus* group and 24 percent in the placebo group, a significant difference between two groups (Schellenberg, 2001). A prospective randomized double-blind placebo-controlled study was conducted to assess the efficacy of the extract of *vitex agnus castus* (VAC) in the treatment of 67 Chinese women with moderate to severe premenstrual syndrome (PMS). Women received one tablet of VAC or placebo. Researchers documented symptoms with a daily rating scale with negative effect, water retention, food cravings, and pain. The result was that all four symptom factor scores were significantly reduced by the third treatment cycle. They concluded that *vitex agnus castus* extract was effective in treating moderate to severe PMS in Chinese women, especially in symptoms of negative affect and water retention (Ma, 2010). Atmaca et al. compared the efficacy of fluoxetine with *vitex agnus castus* extract and concluded that fluoxetine was more effective for psychological symptoms although the extract decreased the physical symptoms (Atmaca, 2003).

Adverse effects of *vitex agnus castus* include GI upset, nausea, vomiting, headache, rash, acne, and irregular menstrual cycle. Researchers used a different preparation of chasteberry, ranging from a crude extract of *vitex agnus castus* (20–40 mg/day) to 20 mg/day of an extract (fruit extract ZE 440:60 percent ethanol 6-12:1) standardized to casticin. Drug interactions were theoretical, but documentation was lacking (Jurgens, 2009).

Several different studies have shown that products containing *vitex agnus castus* fruit extract are useful for decreasing prolactin serum levels and increasing pathophysiologicaly and can be a good treatment for women who suffer from premenstrual syndrome (Doll, 2009). A study showed that *vitex agnus castus* is a safe, well-tolerated, and useful drug for the treatment of moderate to severe PMS (He, 2009).

2.2 Hypericum perforatum (St. John's wort)

Hypericum perforatum (St. John's wort) is a medicinal plant that prompts amino-oxidase activity and prevents serotonin reuptake. It reduces premenstrual syndrome symptoms with treatment properties similar to fluoxetine Several studies have shown that it is effective in the treatment of mild types of depression. For the treatment of premenstrual symptoms its use is for at least two months in the luteal phase (Pakghohar, 2005). If this plant is used in high doses, it can cause sensitivity to light (Van, 2009). Adverse effects include GI upset, nausea, diarrhea, insomnia, irritability, agitation, forgetfulness, dizziness, headache, dry mouth, worsening of PMS symptoms, bloating, breast tenderness, and rashes (Jurgens, 2009). Its drug interactions are anesthetics, anticoagulants/antiplatelets, antidepressants, antidiabetic agents, barbiturates, benzodiazepines, beta-adrenergic blockers, calcium channel blockers, cyclosporine, HIV protease inhibitors, etc. (Jurgens, 2009; Van, 2009).

Canning et al. (2010) investigated the effectiveness of *hypericum perforatum* on symptoms of PMS in UK. They conducted a randomized, double-blind, placebo-controlled, crossover study between November 2005 and June 2007. In this study, 36 women, who remained eligible after three screening cycles, underwent a two-cycle placebo run-in phase. They randomly received *hypericum perforatum* tablets 900 mg/day (standardized to 0.18 percent hypericin; 3.38 percent hyperforin) or placebo tablets for two menstrual cycles. After a placebo-treated period, the women crossed over to receiving placebo or *hypericum perforatum* for two additional periods. Symptoms were recorded daily using the Daily Symptom Report. The results

indicated that the effect of *hypericum perforatum* was statistically better than the placebo in improving physical and behavioral symptoms of PMS. A significant difference in the treatment of pain-related PMS symptoms was not found. They concluded that treatment with *hypericum perforatum* was more effective than placebo for the most common physical and behavioral symptoms associated with PMS (Canning, 2010).

Pakgohar and colleagues did a double-blind clinical trial on 70 students with PMS at Tehran University in 2005. After confirmation of PMS symptoms by the completion of daily symptoms for two consecutive cycles, participants were randomly divided into two groups. Samples were treated with 30 drops of *hypericum perforatum* (haypyran) and placebo twice a day at least seven days before menstruation for a duration two consecutive cycles. PMS symptoms decreased after consumption of *hypericum perforatum* 46.45 percent and in the placebo group 18.1 percent. They concluded that treatment of PMS with haypyran is effective (Pakghohar, 2005).

A pilot study was performed at Exeter University. In their study, 19 women with PMS were treated with 300 mg standard hapyrysyn 3 percent. The results showed a 51 percent reduction in PMS score and at least a 50 percent reduction in symptoms for more than two thirds of women (Stevinson, 2000). A study showed the herbal combination of *hypericum perforatum* and *vitex agnus castus* to be superior to the placebo for total PMS-like scores, PMS-D, and PMS-C clusters. Also it was shown to reduce anxiety and hydration clusters in the treated group (Van, 2009).

2.3 Saffron (crocus sativus)

Saffron was effective in relieving overall symptoms of PMS in one good-quality randomized control trials. Adverse effects of saffron were increased or decreased in appetite, headache, hypomania, sedation, and nausea. Saffron poisoning was reported at high doses (5 g). Drug interactions were not reported (Jurgens, 2009). Agha-Hosseini et al. (2008) conducted a double-blind and placebo-controlled trial to investigate whether saffron (stigma of *crocus sativus L.*) could relieve symptoms of premenstrual syndrome (PMS) in Tehran and Zanjan. Women who were 20 to 45 years old and had regular menstrual cycles and PMS symptoms for at least six months were selected for the study. Women were randomly divided into two groups and received capsule saffron 30 mg/day (15 mg twice a day - morning and evening) (group A) or capsule placebo (twice a day) for two menstrual cycles (cycles three and four).

Researchers found that saffron was effective in relieving symptoms of PMS. It was shown that saffron was significantly effective in cycles three and four in the total Premenstrual Daily Symptoms and Hamilton Depression Rating Scale. They concluded that *crocus sativus L.* can used in the treatment of PMS. However, further investigation is needed (Agha-Hosseini, 2008).

2.4 Ginkgo biloba L.

Ginkgo biloba is used in traditional Chinese medicine. Clinical studies have shown that ginkgo extracts have a therapeutic effect in Alzheimer's disease, failing memory, age-related dementias, poor cerebral and ocular blood flow, congestive symptoms of premenstrual syndrome, and the prevention of altitude sickness (McKenna, 2001). It was used 160–320 mg/day (EGb 761) from day 16 of menstrual cycle to day five of the next menstrual cycle. Its adverse effects were mild: GI, confusion, dizziness, headache, constipation, and palpitations (Jurgens, 2009).

A study was conducted to determine the effect of ginkgo biloba L on the symptoms of PMS. Their single-blind, randomized, placebo-controlled trial was conducted from November 2007 to April 2008. Students who lived in dormitories of a medical university (Tehran) and suffered from PMS symptoms were selected. They recorded daily symptoms for two consecutive menstrual cycles. After 90 students with PMS were identified, they were randomized in two treatment and placebo groups and took gingko biloba L. tablets (containing 40 mg leaf extracts) or placebo three times a day from the 16th day of the menstrual cycle to the fifth day of the next cycle. The results showed that there were reduced physical and psychological symptoms and their severity in both groups. They concluded that gingko biloba L. can reduce the severity of PMS symptoms (Ozgoli, 2009).

2.5 Soy

A cross-sectional study was conducted to evaluate the effect of dietary soy isoflavones on PMS. In that study, 84 women between the ages of 28 and 40 years participated. They found that soy isoflavone intake was significantly related to MDQ scores in the menstrual phase. They suggested that soy isoflavones could be one of the dietary factors related to the complexity of premenstrual syndrome (PMS) and further study conducted on the effect of soy isoflavones on PMS is required (Kim, 2006).
A study was conducted to determine the effect of soy isoflavones on premenstrual symptom severity. Results indicated that premenstrual symptoms like headache and breast tenderness were reduced in the soy IF group. After active treatment, the soy IF group showed significantly greater reduction of cramps and swelling over the placebo group (Bryant, 2005).
A cross-sectional study was conducted to evaluate the effects of intake of soy, fat, and other dietary components on premenstrual symptoms in 189 Japanese women aged 19-34. Food consumption information, including soy products and isoflavones, was obtained by a semiquantitative food frequency questionnaire. The Moos Menstrual Distress Questionnaire (MDQ) was used to evaluate the changes in the menstrual cycle. They found that soy products or isoflavone intake do not change the MDQ score in the premenstrual phase (Negata, 2004).

2. Discussions

Medicinal plants can be used in the treatment of premenstrual syndrome with respect of specific principles and precaution. Chasteberry is possibly effective and effectiveness of saffron, ginkgo, St. John's wort, and soy are limited according to the evidence. Therefore more studies are needed about them and other plants.

Effect of Green Tea Extract on the Rat Liver; Histoarchitectural, Histochemical and Ultrastructural Studies

Amal A.A. El Daly

Department of Zoology, Faculty of science, Benha University, Benha, Egypt
ml_eldaly@yahoo.com

Abstract: Green tea consumed worldwide since earliest time considered beneficial to human health due to its specific metabolic activity along with antioxidant effect. This study was headed for investigate the effect of green tea on histoarchitecture and histochemistry as well as the fine structure of rat liver. For this purpose, male albino rats (*Rattus norvegicus*); 3 months age weighing between 100 –120 g were used. The animals group-housed six for each in wire mesh cages fed ad libitum divided into two groups: control and experimental group. The latter was divided into three subgroups; 1%, 1.5% and 3% green tea extract feeding animals. Green tea was received instead of drinking water for 25 days using feeding bottles. After the experimental period, the animals were sacrificed and liver pieces were prepared for both light and electron microscopic examination. The results depicted hypertrophied hepatocytes associated with cloudy swelling. There were some pyknotic and karyorrhectic hepatic nuclei in comparison to the control. Blood vessels appear congested and Blood sinusoids contracted. There was an indication of few collagen fibrils in the hepatic stroma. Hepatocytes had PAS positive deposits in their cytoplasm. Furthermore, hyalinization of the hepatocytes was distinct in the animal's liver feeding on higher doses. The ultrastructural results revealed destructed hepatocytic organelles as well as hypertrophied and irregular contoured hepatocytic nuclei. Moreover, many lipid droplets, few profiles of granular endoplasmic reticulum and destructed mitochondria in the hepatocytes cytoplasm were apparent especially after higher doses of treatment. Though, it was fulfilled that green tea consumption induced an alteration in the liver tissues and its fine structure as well as carbohydrate metabolism. Consequently, another aspect was providing into the cellular response of rat liver toward green tea extract property. It must be carefully using for it's harmfully outcome on long term.

1. Introduction

Tea is one of the most widely consumed beverages in the world made from the leaves of *Camellia sinensis* L. species. Green tea is the non-oxidized/non fermented product contains high quantities of several polyphenolic flavonoid compounds such as epicatechin, epicatechin gallate, epigallocatechin, and epigallocatechin gallate (EGCG) which reported to have antioxidant properties (Graham, 1992; Rice-Evens et al., 1996) well thought-out to maintain and improve health. It contains high quantities of an active compounds (catechin and caffeine) so as to might act to exert thermogenic and so an antiobesity action (Chantre and Lairon, 2002). It has anticarcinogenic activity (Stoner and Mukhtar, 1995; Zhen, 2002). Moreover, polyphenols because an active ingredients exhibit antioxidant and free radical scavenging properties showed cardioprotective, neuroprotective, antidiabetic, and antimicrobial properties (Liao et al., 2001; Alschuler et al., 1998; Augustyniak et al., 2005). Besides, EGCG prevents the ethanol induced

hepatotoxicity and inhibits the development of the fatty liver and renal failure (Yokozawa et al., 1996 & 2005; Yun et al., 2007). At the level of green tea extract, many researches reported that it have a benefit for human and protective against the diseases resembling treatment of arthritis, infection, and impaired immune function (Van et al., 1999). Moreover, it reduce cholesterol synthesis in liver (Bursill et al., 2007) and traditional decrease the severity of liver injury in association with lower concentrations of lipid peroxidation (Chen et al., 2004; Duh et al., 2004). In addition, Kan et al. (2009) demonstrated that green tea extract have a protective against nephrotoxicity and oxidative damage in rat kidney induced by gentamicin.

In the period in-between, few researchers (McCormick et al., 1999; Stratton et al., 2000; Chang et al., 2003) have investigate the potential toxicity of green tea and polyphenols when administered at high doses, as a concentrated product. Although the potential biological effects and powerful antioxidant properties of green tea extracts (Vial et al., 2003 and

Bonkovsky, 2006) data regarding the hepatotoxicity effect are limited in the literature. There are no longer doubt that ingestion of concentrated extracts of Chinese green tea (*C. sinensis*) poses a real and growing risk to liver health (Jimenez-Saenz and Martinez-Sanchez, 2006) of which we require to be attentive. Additionally, the mechanisms of hepatotoxicity of that *C. sinensis* ought to have further investigation and its wide-spread consumption requires an increase attention by doctors and pharmacovigilance authorities (Javaid and Bonkovsky, 2006).

However, the data available are still not definitive for cellular and *in vivo* hepatotoxicity caused by green tea phenolic acids and catechins (Galati et al., 2006). It was reported that green tea, like any active principle, needs to be used at the exact composition and the accurate posology to exert a pharmacologically significant effect (Chantre and Lairon, 2002).

Therefore, the aim of the current study was to investigate the effect of green tea on the liver of rats, is it has a side effects at any hazard doses, especially it used in a further attenuated studies as a protective antioxidant with no harmful material.

2. Materials and Methods
Green tea extract:

Green tea (Kangra, Himanchal Pradesh, India and Lipton-Unilever, Englewood Cliffs, NJ, USA) was purchased locally packaged by the Egypt National Native Product sources. Green tea extract (GTE) was prepared according to Khan et al, (2009) by adding green tea (30 g) to 500ml of boiling water, steeped for 15–20 min. Infusion was cooled to room temperature and then filtered. The tea leaves were extracted a second time with 500ml of boiling water and filtered, and the two filtrates were combined to obtain 3% green tea extract (3 g tea leaves/100 ml water).This dietary treatment reflected a daily consumption of 3 cups of green tea by an adult weighing 70 kg. The resulting clear solution is similar to tea brews consumed by humans.

The used extract poured into the animals feeding bottles. The rats supplied with freshly prepared tea every morning.

Animals and experimental design:

Male albino rats (*Rattus norvegicus*) obtained from the National Research Center in Dukki, Cairo (N.R.C.), 3-4 months age weighing between 100 –120 g were used. The animals were housed in wire mesh cages fed ad libitum and allowed to adjust to the new environment for one week before starting the experiment. The rats were housed at $25 \pm 2^{o}C$ dark/light cycle. Animals were

randomly divided into two experimental groups each of six animals as follows:
1) Group I (control): Animals given standard diet and tap water.
2) Group II (green tea extract): Animals given standard diet and green tea extract (GTE). This group divided into three subgroups so as to received GTE in three concentrations 1% , 1.5% and 3%) instead of drinking water within a repeated dose for 25 days to determine the dose dependent effect.

After the experimental period, 24 hrs after the previous administration the animals were anesthesized under light ether, livers were removed and subjected to different studies.

Preparation of Specimens:

Small pieces of liver were fixed separately in 10% buffered neutral formalin for 24hrs. Tissues were processed and embedded in paraffin blocks. Paraffin sections were cut with at 5μ thickness, stained by routine hematoxylin and eosin stain and Crossman's Trichrome stain for evaluation of collagen fibers. Other sections prepared for periodic acid Schiff reaction intended for carbohydrates (Bancroft and Stevens, 1990). The ready sections examined under a Zeiss light microscope.

For electron microscopy small pieces of liver were fixed in 2% glutaraldehyde fixative in 0.1M Na- cacodylate buffer, pH 7.2, followed by three washes in the buffer, then post fixed during 1 h in 1% $OsO4$ in the same buffer, dehydrated, cleared and infiltrated within Resin. Ultra thin sections were stained with 2% uranyl acetate, followed by Reynold's lead citrate and examined with a Siemens ELMISKOP I or Zeizz M-109 Turbo electron microscope.

3. Results:

In control liver of rats, the hepatic tissue is formed of hepatic cords of normal healthy polyhedral hepatocytes having one or two vesicular nuclei, every with distinct one or more nucleoli. The blood sinusoids in between the hepatic cords are lined with flat endothelial cells and von Kupffer cells (Fig. 1). The distribution of collagenic fibers and fibrils could be distinguished with Crossmon's trichrome stain, while the hepatocytes took a reddish colour and the blood erythrocytes were orangiophilic (Fig. 2). The distribution of glycogen in the hepatocytes took the magenta colour after Periodic acid Schiff technique (PAS) (Fig. 3).

The hepatic tissue by the electron microscope (EM) revealed the ideal hepatocytes with normal mostly euchromatic nuclei and fewer nuclear heterochromatic contents with apparent more

electron dense nucleoli with their associated heterochromatin, filamentous and elongated mitochondria with their intact cristae (shelves), bile canaliculi between the adjacent hepatocytes, few lipid droplets, intact Golgi apparatus, free ribosomes, primary lysosomes mostly related to the bile canaliculi, secondary lysosomes, also few peroxisomes as also fine electron dense glycogen deposits(Fig. 4).

In the rat liver, given 1% GTE for continuous 25 days instead of drinking water, the hepatic tissue revealed hepatocytes with, their cytoplasm exhibited cloudy swelling degeneration, and narrow blood sinusoids between the hepatic cords, congested blood vessels other than the sinusoids, there were some pyknotic and karyorrhectic hepatic nuclei (Fig.5). In comparison to the control, there were here depositions of few collagenic fibrils in the stroma (Fig.6). Most of hepatocytes revealed depleted glycogen from their cytoplasm, so few number of hepatocytes had PAS positive deposits in their cytoplasm, the hepatocytes exhibited hypertrophied pictures (Fig.7).

The ultrastructural picture of the hepatic tissue demonstrated many lipid droplets in the cytoplasm of the hepatocytes replacing the destructed hepatocytic organelles, hypertrophied hepatocytic nuclei (Fig. 8). Irregular contoured hepatocytic nuclei, few profiles of granular endoplasmic reticulum (gER); (Fig. 9), many lipid droplets and destructed mitochondria (Fig. 10). As well, were present large intact von Kupffer cells in the blood sinusoids (Fig. 11).

In the rat liver, given 1.5% GTE for continuous 25 days instead of drinking water, the hepatic tissue revealed very distinct hepatocytic vacuolar degeneration, some completely destructed

hepatocytes and congested branches of portal vein were seen (Fig.12). Regarding the Crossmon's trichrome stain, it was clear that there were no collagen fibrils more than in control (Fig. 13). The hepatocytes had PAS +ve, some of the hepatocytes revealed vacuolar degeneration; those latter cells were deprived of glycogen deposition in their vacuolar cytoplasm (Fig. 14).

By EM, Some shrunken hepatocytes were in their way of degeneration and necrosis, had electron dense cytoplasm as a whole, numerous lipid droplets in their cytoplasm, decreased number of profiles of granular endoplasmic reticulum, few glycogen electron dense granules, many secondary lysosomes, destructed mitochondria, and widely spaced hepatocytes (Fig. 15).

In the rat liver, given 3% GTE for continuous 25 days replacing by drinking water, the hepatic tissue showed frequent number of destructed and dead hepatocytes, numerous number of leucocytic infiltration in the portal areas, congested blood sinusoids (Fig. 16), less glycogen deposition but more hyalinization of PAS+ve in the hepatocytes, atrophied hepatocytes with smaller hypotrophied or smaller nuclei (Fig. 17).

By EM, the hepatic tissue showed severe destruction of the hepatocyte cytoplasmic organelles in many of the cells, many lipid droplets, the hepatocytes lost their microvilli in relation to the space of Disse, active large very distinct von Kupffer cells in the hepatic sinusoids (Fig. 18). In addition, there were exaggerated loss of the plasma membranes of some hepatocytes, extravasated neutrophils from sinusoids to the area of hepatocyte degeneration and destruction (Fig. 19).
Fig. l: Photomicrograph for a section in the control liver of rat, showing central vein (C), Hepatic cords (H), normal hepatocytes with vesicular nucleus (h), blood sinusoids (s) lined with endothelium and von Kupffer cells (k). (H & E stain, X 400)
Fig.2: Photomicrograph for a section in the control liver of rat, showing distribution of collagen fibres and fibrils (in green), normal hepatocytes (h) and blood sinusoids (s), portal area (p). (Crossmon's trichrome stain, X 400)
Fig.3: Photomicrograph for a section in the control liver of rat, showing normal distribution of glycogen in the hepatocytes (in magenta colour), blood arteriole (ar), blood sinusoids (s). (PAS-technique, X 400)
Fig.4: Electron micrograph for a section in the liver of control rat showing normal hepatocyte nucleus (N) and 2 nucleoli (nu), mitochondria (m), bile canaliculi (c) and related lysosomes (s), granular endoplasmic reticulum (ER) in many profiles (ER), Golgi apparatus (G), few lipid droplets (P), free ribosomes (r), secoundary lysosomes (sc) and peroxisomes (ox).(X 6000)
Fig.5: Photomicrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water,   showing cloudy swelling of hepatocytes and their nuclei, the cells   are suffered from slight hydropic degeneration, narrow blood sinusoids (s) congested arteriole (ar), note pyknotic nucleus (p) and karyorrhectic nuclei (k) .(H & E stain, X 400).
Fig.6 : Photomicrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water showing, more deposition of collagen fibrils than control (in green), leucocytic infiltration in the portal area (in), bile ducts (b), branches of hepatic arterioles (ar). (Crossmon's trichrome stain, X 400).
Fig.7:   Histochemical detection of liver section of rat given 1% GTE for continuous 25 days instead in drinking water, showing distribution of glycogen in the hypertrophied hepatocytes in few amounts (in magenta colour), and the PAS positive reacted basal lamina of the branch of the hepatic arteriole (arrow). (PAS technique, X 400).
Fig.8: Electron micrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water, showing many lipid droplets of variable sizes (P) in the hepatocytes, replacing the destructed some organelles, hypertrophied hepatocytic nucleus (n) that is deviated to one side, few number of lysosomes (l) some in groups (d) were poured to the adjacent blood sinusoid, endothelial cell of blood sinusoid (e), (X 6000).
Fig.9 : Electron micrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water, showing secondary lysosomes (l) many lipid droplets,   irregular contour of hepatocytic nucleus (n), few granular ER profiles (ER),   cross sectioned   profiles of the endoplasmic reticulum cisternae (c), (X 8000).
Fig.10: Electron micrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water, showing destructed mitochondria with many lipid droplets (p) at the region of the destructed mitochondria, distorted other mitochondria (m), (X 8000).
Fig.11: Electron micrograph for a section in the liver of rat given 1% GTE for continuous 25 days instead of drinking water, showing active intact von kupffer cell (k)in the hepatic sinusoid (s), distorted mitochondria (m) and many lipid droplets (p), (X 6000).
Fig.12: Photomicrograph of hepatic histopathology in rat liver given 1.5% Green tea extract for continuous 25 days instead of drinking water, displaying very distinct vacuolar degeneration of many hepatocytes (arrows), congested branches of portal vein (co) in the portal area, some degenerated hepatocytes and completely destructed or obscured (d), (H & E stain, X400).
Fig.13: Photomicrograph of hepatic histopathology in rat liver given 1.5% Green tea extract for continuous 25 days instead of drinking water ,screening congested blood sinusoids and branch of hepatic arteriole (ar), degenerated hepatocytes (d), (Crossmon's trichrome stain, X 400).
Fig.14: Histochemical examination of rat liver section given 1.5% Green tea extract for continuous 25 days instead of drinking water, viewing accumulation of hypertrophied hepatocytic glycogen in their cytoplasm(in magenta colour), some hepatocytes were suffering from vacuolar degeneration and had no glycogen deposits, (PAS-technique, X 400)
Fig.15: Electron micrograph for a section in the liver of rat given 1.5% GTE for continuous 25 days instead of drinking water ,performance some affected shrunken hepatocytes (1 & 2) having electron dense cytoplasm with many lipid droplets (P), the latter were also present in the still active hepatocytes, mitochondria with destructed cristae (m), primary lysosomes (l), bile canaliculi (c), decreased profiles of granular endoplasmic reticulum (ER), secondary lysosomes (sc), widely spaced hepatocytes, many delicate electron dense glycogen deposits (g), (X 8000).
Fig.16: Photomicrograph for a section in the liver of rat given 3% GTE for continuous 25 days instead of drinking water, showing numerous number of leucocytic infiltration in the portal area of the hepatic tissue, hypotrophied nuclei, dead hepatocytes (d), congested blood sinusoids(s), (Crossmon's trichrome stain, X 400).
Fig.17: Histochemical analysis of hepatocellular distribution of carbohydrates using periodic acid Schiff reaction in liver of rat given 3% GTE for continuous 25 days instead of drinking water; showing less storage of glycogen(in magenta colour) in the hepatocytes than in those of 1.5% GTE given, atrophied hepatocytes with smaller hypotrophied nuclei, many dead hepatocytes(d), (PAS-technique, X 400).
Fig.18: Electron micrograph for a section in the liver of rat given 3% GTE for continuous 25 days instead of drinking water, showing severe destruction for the cytoplasmic organelles of many hepatocytes 1,2,3 & 4 that evinced also many lipid dropletrs (p), the hepatocytes lost ther microvilli in the space of Disse (d), the blood sinusoids evinced intact active von kupffer cells(k),endothelium of the sinusoids (e), a lymphocyte (ly) in the sinusoid , (X 6000)
Fig.19: Electron photomicrograph corresponds to hepatocytes of rat given 3% GTE for continuous 25 days in drinking water ,showing exaggerated destructed hepatocytes (h) that lost its cell membrane, the neighboring 3 hepatocytes 1,2 & 3 had electron dense cytoplasm , many lipid droplets(p), extravasated neutrophil (n) to the area of hepatocyte degeneration,   blood vessel (bl), (X 8000)

4. Discussion

Green tea is a natural antioxidant that have been used in the most enduring of food cultures-Chinese and Japanese tea and to the safety concerns about nutrient supplements such as vitamin C., Vit. E and B-carotenes. Although these concerns still exist, consumption of naturally derived antioxidants such as green tea beverages and extract may a safer alternative and effective means of increasing the intake of antioxidants, since each cup of green tea (100 ml) is reported to contain 50- 100 mg of polyphenols (Luo et al.,1997). However, an ancient knowledge in traditional remedies does not always guarantee safety. There have been a number of available adverse events, including hepatic failure associated with human use of green tea extracts intended for its antioxidant (Gloro et al., 2005; Javaid and Bonkovsky, 2006; Jimenez-Saenz and Martinez-Sanchez, 2006; Bjornsson and Olsson, 2007). Moreover, consumption of natural remedies which considered as food supplements need increase attention to prevent liver hepatotoxicity (Javaid and Bonkovsky, 2006). It was reported that *in vitro* treatment of rat hepatocytes with high concentration of epigallocatechin gallate (EGCG) reduced cell viability (Schmidt et al., 2005; Galati et al., 2006) and hence caused liver, kidney and gastrointestinal toxicity (Isbrucker et al. ,2006).

So, concerning the findings of the latter authors, the current work is coincident with their results, where the hepatocytes of rats showed hydropic degeneration and the cells appear larger than the hepatocytes of control due to cloudy swelling after 1% GTE, also congested hepatic arterioles, and deprived hepatocytes from deposition of glycogen in their cytoplasm, leucocytic infiltration in the portal areas of the hepatic tissue. Moreover, the ultrastructural study revealed numerous secondary lysossomes, numerous lipid droplets; fewer profiles of granular endoplasmic reticulum, large intact and active von Kupffer cells and some distorted mitochondria, some of the hepatocytes nuclei were deviated to one side, few numbers of primary lysosomes. In vivo studies, Isbrucker et al., (2006) and Galati (2006) suggested that administration of high doses of the tea catechin, EGCG resulted in hepatotoxicity, so disagreeing with the finding of Bonkovsky (2006), Federico et al., (2007) and Sarma et al., (2008) who considered green tea is safe in a wide range of doses, but hepatotxicity was related to consumption of high does of tea-based dietary supplements. Consequently, the results of this work, after giving GTE by a concentration of 1.5%, the hepatic tissue evinced hepatocyte vacuolar degeneration followed by destructed some hepatocytes, congestion of hepatic arterioles and blood sinusoids apparent intact well-developed active Kupffer cells and few fibrin deposits in the hepatic stroma, more glycogen deposition in the hepatocytes cytoplasm in comparison to control. Other effects of similarly doses that tested in this study have been found by Elasrag (2010). The research focused his demonstration on mutation, chromosomal damage and necrosis in the liver and kidney. Furthermore, Lambert et al. (2007) added that gastrointestinal irritation associated with consumption of high doses of tea preparations.

From the view of the portal areas of the hepatic tissue which was also considered in this study, more leucocytic infiltrations and congested blood sinusoids were present. It might be due to inflammatory reaction and thrombosed capillaries a accompanied the necrosis of the hepatocytes (Cotran et al., 1999). In the other hand, the atrophied hepatocytes with smaller hypertrophied nuclei apparent in this study probably due to vascular damaged after ingestion of higher doses as reported by the same author. Moreover, at the level of tea ingredients, liver necrosis was associated with treatment of high concentrations of high doses of epigallocatechin

gallate (Schmidt et al., 2005; Goodin and Rosengren,2003) and catechin preparation up to 2000 mg/kg induced chromosomal aberration (Ogura et al., 2008). In converse, Manna et al. (2009) reported that tea polyphenol diminish the inflammatory response, proliferation and apoptosis in lung lesions on the 9th week of benzo[a] pyrene exposure.

According to this work, ingestion of the higher dose (3% GTE) revealed depletion of glycogen in hepatocytes cytoplasm but lesser than lower dose i.e. dose dependant. It may possibly induced instability of metabolic enzymes related to glycogen storage. Hence, it previously reported that the polyphenols of GTE such as flavonoids and pyrogallol are potent inhebetors of the detoxifation enzyme COMT (Kdowakiet al., 2005) and catechin gallate, the major constituent in GTE were found to inhebits human COMT-mediate O-methyl translation of catechol estrogen with high potency (Nagai,2004). The mechanism by which green tea extract induces trouble in carbohydrate metabolism may by attributed to mitochondrial toxicity and reactive oxygen species (ROS) formation by tea catechins which induced cytotoxic effects (Galati et al., 2006). The present data agreed with other work by Broadhurst et al. (2000) and Kao et al. (2000) who found that glucose production inhibited by green tea leading to lower blood glucose level that is related to glycogen (PAS-positive) of the hepatocytes. Some authors reported that GTE polyphenols, epigalleatechi-3-gallate was mimetic in that lowered blood glucose, while others approved that glucose-carrier transport through cell membrane (Waltner-Law et al., 2002).

Electron microscopic examination of rats liver cells after supplemented green tea in this study, revealed destruction of the mitochondrial cristae and somewhat decreased profiles of the granular ER besides wider blood sinusoids that carried neutrophils to the areas of destructed hepatocytes and their organelles. These changes were recognized especially after higher dose treatment. Hence, might be due to the bioavailability and oxidative stress induced by administration of high doses of the tea catechin EGCG (Maeta et al. (2007; Schmidt et al., 2005). Moreover, Arakawa et al. (2004) and Nakagawa et al. (2004) added that EGCG promotes apoptosis and has bactericidal activity which is qualified to its ability to reduce O_2 to yield H_2O_2

The present data revealed trouble in several hepatocytes which denoted within electron dense cytoplasm and rich lipid droplets in accordance with Kan et al (2009) who reported significant increase of phospholipids after GT consumption. Furthermore, abundant of secondary lysosomes were apparent because of the attack of primary lysosomes to the degenerated cytoplasmic organelles of the hepatocytes. Kumar et al. (2005) reported that the increases in the number of autophagic vacuoles within the cell that contain fragments of cell components like mitochondria and endoplasmic reticulum at which the lysosomes discharge their hydrolytic contents This thought to connected to potential toxicity when green tea administered at high dose that previously confirmed by Change et al. (2003) and Stratton et al. (2000).

Since each model has its reverse, this work can be finish with the intention of GTE must supplement by one or two cups daily to be beneficially for human. In the main time, it was determined that polyphenols of GTE are exhibit antioxidant and free radical scavenging properties (Scott et al., 1993) but other searchers found to have potent inhibitors of the detoxification enzyme (Kadowaki et al., 2005). Others sure those catechins are known to be unstable at neutral and basic pH and undergo oxidation leading to production of reactive oxygen species. Besides, EGCG has been reported to have both antioxidant and pro-oxidative activities (Sang et al., 2005a) under certain conditions and may induce oxidative stress *in vivo* (Lambert et al., 2007 and Sang et al., 2005b). Conversely, Bonkovsky (2006), Federico et al. (2007) and Sarma et al. (2008) found that green tea is safe in a wide range of doses. In this regard, Isbrucker et al. (2006) found that oral administration of green tea extract (Teavigo) to Bangle dogs for 13 weeks resulted in dose dependent toxicity and death, conditions that are supported by the findings of this work.

5. Conclusion:

The repeated ingestion of highly concentrated up to 3% green tea extracts has its harmful effect on the liver tissues that are subjected to variable hazards due to hepatotoxicity from tea extract polyphenols, so it can be allowed to ingest GTE beverage in a low concentration and for one or two times a day, every one a cup of 100ml containing 50-100mg of poly phenols, so to keep well the hepatic tissue.

Abstract: Distance education delivers classes (live or pre-taped) to students in their home, office, or classroom. It is used by K-12, higher education, continuing education and business. As the cost of delivering quality education increases, institutions find that limited resources prevent them from building facilities, hiring faculty, or expanding curricula. They are using distance education to maximize resources and are combining their assets with others to produce programming. Distance education is offered internationally, nationally, regionally, and locally over all forms of conferencing technology. Distance learning is expanding and examples of it are increasing dramatically. Fewer than 10 states were using distance learning in 1987; today, virtually all states have an interest or effort in distance education. Distance learning systems connect the teacher with the students when physical face-to-face interaction is not possible. Telecommunications systems carry instruction, moving information instead of people. The technology at distant locations are important and affect how interaction takes place, what information resources are used, and how effective the system is likely to be.

Introduction:

Distance education delivers classes (live or pre-taped) to students in their home, office, or classroom. It is used by K-12, higher education, continuing education and business. As the cost of delivering quality education increases, institutions find that limited resources prevent them from building facilities, hiring faculty, or expanding curricula. They are using distance education to maximize resources and are combining their assets with others to produce programming. Distance education is offered internationally, nationally, regionally, and locally over all forms of conferencing technology.

Distance learning is expanding and examples of it are increasing dramatically. Fewer than 10 states were using distance learning in 1987; today, virtually all states have an interest or effort in distance education. Distance learning systems connect the teacher with the students when physical face-to-face interaction is not possible. Telecommunications systems carry instruction, moving information instead of people. The technology at distant locations are important and affect how interaction takes place, what information resources are used, and how effective the system is likely to be.Technology transports information, not people. Distances between teachers and students are bridged with an array of familiar technology as well as new information age equipment. What sets today's distance education efforts apart from previous efforts is the possibility of an interactive capacity that provides learner and teacher with needed feedback, including the opportunity to dialogue, clarify, or assess. Advances in digital compression technology may greatly expand the number of channels that can be sent over any transmission medium, doubling or even tripling channel capacity. Technologies for learning at a distance are also enlarging our definition of how students learn, where they learn, and who teaches them. No one technology is best for all situations and applications. Different technologies have different capabilities and limitations, and effective implementation will depend on matching technological capabilities to education needs.

Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home.

The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been

learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections.

Interactivity is accomplished via telephone (one-way video and two-way audio), two-way video or graphics interactivity, two-way computer hookups, two-way audio. Interactivity may be delayed but interaction provided by teacher telephone office hours when students can call or through time with on-site facilitators. Classes with large numbers of students have a limited amount of interactivity. Much of the activity on computer networks is on a delayed basis as well. Possibilities for audio and visual interaction are increasingly wide.

In the earlier days of distance learning, it was most common to see distance learning used for rural students who were at a distance from an educational institution. The student might watch a telecourse on a television stations, read texts, mail in assignments and then travel to the local college to take an exam. This model is still in use, but as the technology has become more sophisticated and the cost of distance learning dropped as equipment prices dropped, the use of distance education has increased.

High front-end costs prevented an early widespread adoption of electronically mediated learning. Distance learning has been aggressively adopted in many areas because it can meet specific educational needs. As the concept of accountability became accepted and laws required certain courses in high school in order for students to be admitted to state colleges, telecommunications was examined as a way to provide student access to the required courses. Many rural school districts could not afford the special teachers to conduct required courses. Distance education met this need by providing courses in schools where teachers were not available or were too costly to provide for a few students. It also fulfilled a need for teacher training and staff development in locations where experts and resources were difficult to obtain. These systems link learner communities with each other and bring a wide array of experts and information to the classroom.

Challenges which faced the early users of distance education are still with us today. If distance education is to play a greater role in improving the quality of education, it will require expanded technology; more linkages between schools, higher education, and the private sector; and more teachers who use technology well. Teachers must be involved in planning the systems, trained to use the tools they provide, and given the flexibility to revise their teaching. Federal and state regulations will need

revision to ensure a more flexible and effective use of technology. Connections have been established across geographic, instructional, and institutional boundaries which provide opportunities for collaboration and resource sharing among many groups In the pooling of students and teachers, distance learning reconfigures the classroom which no longer is bounded by the physical space of the school, district, state or nation.

The key to success in distance learning is the teacher. If the teacher is good, the technology can become almost transparent. No technology can overcome poor teaching which is actually exacerbated in distance education applications. When skilled teachers are involved, enthusiasm, expertise, and creative use of the media can enrich students beyond the four walls of their classroom.

Teachers need training in the system's technical aspects and in the educational applications of the technology. Areas for assistance include the amount of time needed to prepare and teach courses, how to establish and maintain effective communication with students, strategies for adding visual components to audio courses, ways to increase interaction between students and faculty, planning and management of organizational details, and strategies for group cohesion and student motivation.

The interchange of ideas requires different communication methods than in conventional classrooms: information technologies are predominantly visual media, rather than the textual and auditory environment of the conventional classroom, the affective content of mediated messages is muted compared to face-to-face interaction, and complex cognitive content can be conveyed more readily in electronic form because multiple representations of material (e.g., animations, text, verbal descriptions, and visual images) can be presented to give learners many ways of understanding the fundamental concept.

WHAT IS DISTANCE EDUCATION?

Distance education is a method of education in which the learner is physically separated from the teacher and the institution sponsoring the instruction. It may be used on its own, or in conjunction with other forms of education, including face-to-face instruction. In any distance education process there must be a teacher, one or more students, and a course or curriculum that the teacher is capable of teaching and the student is trying to learn. The contract between teacher and learner, whether in a traditional classroom or distance education, requires that the student be taught, assessed, given guidance and, where appropriate, prepared for examinations that may or may not be conducted by the institution. This

must be accomplished by two-way communication. Learning may be undertaken either individually or in groups; in either case, it is accomplished in the physical absence of the teacher in distance education. Where distance teaching materials are provided to learners, they are structured in ways that facilitate learning at a distance.

EFFECTIVE TEACHING AND LEARNING WITH DISTANCE EDUCATION

Distance education dictates changes in behavior for both the teacher and the learner. The successful student develops persistence and skills in self-directing work. The successful distance education teacher becomes conversant with new technology and develops new instructional styles, moving from creating instruction to managing resources and students and disseminating views (Strain, 1987). Administrative and faculty support for distance education are critical to the success of this instructional method. Administrators should take note that the implementation of a distance education program may allow access to a greater number of students. However, the time and work associated with teaching at a distance exceeds the normal requirements of campus-based instruction.

Students in distance education settings perform as well or better on assignments, class activities, and exams when compared to campus-based students (St. Pierre, 1998). Nevertheless, students must maintain persistence and a clear focus to succeed in a distance learning situation. Self-direction, a passion for learning, and strong individual responsibility are important influences on achievement. There are indications that distance education works best for more mature, motivated, well-organized, and already accomplished learners (Rintala, 1998).

Garrels (1997) describes five critical elements for successful teaching at a distance:

1. Instructor enthusiasm. This requires animation and comfort in front of the camera, or with the technology utilized. Faculty support and interest are critical to the success of distance learning endeavors.

2. Organization. Teaching materials must be prepared in advance; timing, variation, and smooth transitions must be planned. Instructors should allocate from 3 to 5 hours of preparation for each hour of distance instruction. Great attention to detail is required long before the actual classroom activity occurs (Summers, 1997).

3. Strong commitment to student interaction. Whatever the modality used to teach at a distance, the instructor must encourage and facilitate ongoing communication between the students and the instructor.

4. Familiarity with the technology used in the class format. Faculty development is important before beginning any distance activities, and instructors should be trained in video use, computer use, or other forms of instructional technology used.

5. Critical support personnel. Production staff, graphic designers, and technical staff members will help the instructional setting produce successful teaching at a distance.

Distance education is any type of schooling that takes place away from a physical campus. Distance education is also known as:

- distance learning
- virtual learning
- online learning
- e-learning
- online education
- web-based training

Types of Distance Education Programs:

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence.

Distance education began for the delivery of courses to students who live in remote areas. Over the years, though, this form of education has become the preferred method for learning outside of the classroom.

Distance Education is now undertaken by people with busy schedules, hectic lifestyles, special needs, and also those living in isolated areas. What's more, with such flexible learning options you can choose to study at any time and from any location you like.

There are a number of different **forms of distance education** and it's important to know which method you prefer:

- **Correspondence learning:** your course materials are printed and sent out to you by mail/courier. The advantages are that you have a printed set of reference materials, you can study anywhere and you are not reliant on a computer, you can learn for long periods of time.
- **eLearning:** your course materials are provided to you in multimedia format; that

is, on CD/DVD. In this way you can choose to take your study materials within you and learn anywhere in the world with just a laptop.

- **Online learning:** no materials are sent to you and you do all your learning online. The limitation is that you need to be logged onto a computer (though you may be able to download and print some of your materials yourself, though this can cost you more in ink), there is a limit to how much you can absorb and do online, and most people's attention span on-screen is limited to 20 minutes (your eyes get tired after that).
- **Broadcast learning:** where you tune into a series of television, radio or Internet broadcasts (e.g. podcast, YouTube, etc.).
- **Teleconferencing:** where your lessons are conducted in real time through an Internet connection. Limitations are that streaming can be slow, connections can cause problems (students and teachers generally need to be computer literate) and there can be delays in talk-time, depending on software, hardware and connection capabilities.

Online Education Pros

Of the many advantages and new possibilities of online education, here are some of the Strengths:

1. Greater flexibility

Online students have more freedom in choosing their programs and schedules. This allows many busy adults to adapt online courses to their already established everyday life of work and family. For many, this is simply the only way they can study for that degree which will take them farther in their career and life.

2. Saves Time and Money

Online education saves an enormous amount of time and money which in traditional education is wasted on commuting. Commuting is also very tiring, while online education means you can study from home, in a comfortable environment with everything you need close   at   hand. Tuition also costs less for most online institutions.

3. Logistics

Traditional education is restricted due to logistical issues; there is only this amount of students who can be in a place at a given time, whereas in online classes, there is no question of paucity of space. As long as the online classes have the necessary bandwidth, an unlimited number of students can study, all over the globe. Then again, traditional classes would turn up expensive to maintain, because the educational institution needs to maintain a place

and its facilities. When it comes to online education, all they need to do is to set up E-learning tools, an Internet connection and a website where people can learn. While this is not cheap too, but it is definitely cost less as compared to the costs of a place to carry on.

Online Education Cons

To balance our view of online education, let's consider some of the disadvantages/Weaknesses:

1. Requires Self Discipline

The greater freedom of online classes requires greater self disciplines, but not everybody has it. The comfort of studying from home may also reflect negatively on your motivation to do your best.

Depending on your personality, home can provide as many distractions as traditional campus facilities (designed especially for studying).

2. How well have you learned

With online education, the students have a greater hold on the education process, and that is not always a good sign. For example, in online education, though the teachers set up the audio and video clips with the same dedication, it remains to be seen whether the students study it with the same dedication that they would in a classroom.

3. No Campus Life

Many people remember the college/university as the best time of their lives. Part of it is the campus life – During and after classes. One of the disadvantages of taking online education rather than traditional one, is that in online education you will not have the atmosphere of campus lawns, corridors and classrooms, huge libraries with real books you can hold. There will be no campus buddies and no campus culture.

4. Internet Connection

Another negative point of online education is that it entirely depends on the internet connection. Though many countries have a robust Internet connection and others are getting it soon, there are still countries, and areas in countries that do not have access to Internet and other enhanced technologies. It would be difficult to get online education in countries that have a limited online presence.

Online Education VS Traditional Education

This article reviews the differences and the pros and cons of online VS traditional education. Gone is the world where only traditional, campus-based education existed and you only had to choose the university or college you wanted to study in.

Someday, probably in the near future, Online Education will replace traditional institutions. At least, many degree programs will combine the on

campus courses as well as online classes as a standard educational approach.

But for now, the future student has to decide first whether he/she wants to study online or on a campus degree.

Here are some points to consider the pros and cons of online and traditional institutions:

Differences between Online and Traditional Education; Comparison

1. Convenience

One of the most striking, innovative, and unprecedented features of online education is their convenience for almost anyone. Persons busy with careers or families will be able to compose their schedules so that they fit their individual time constraints. This is possible because courses are delivered in the form of electronic-based modules online.

It is also convenient because it requires no commuting, saving a great deal of time and money. It allows to study from home, with the only requirement being the possession of an adequate computer and internet connection. Basic computer skills only are required to acquire higher education online.

2. Expenses

Tuition costs less for most online institutions. Online education also eliminates the additional expenses usually entailed by traditional "campus life", commuting, and the purchase of study materials.

3. Feedback

Feedback is somewhat better in traditional education. Students can interact directly face to face with both classmates and teachers, which makes feedback easier to understand and faster to get. Some online institutions do offer chat rooms and video/audio meetings.

4. Accreditation

The credit of online education depends on its purpose and context. If you only have online degree(s) and are just trying to find work, employers may prefer traditionally educated candidates. If you are already an employed and valuable professional, online learning will be seen favorable as a way to improve your skills, expand your professional knowledge, and thus contribute more at work.

5. Ecology

Online education has obvious positive effect on the environment.

It may not be measurable now, but if online education largely replaces traditional institutions in the near future it will mean that less paper will be used for books and writing material and fewer campuses will be built while the number of students and employed teachers will only increase radically.

Conclusion:

In general, new methods of educational systems to countries around the world as a necessity and need for learning and training opportunities to study in areas with different climatic features and conditions of learning and education according to their gender and cultures, has been. Each method is mentioned with regard to changes in features and creates an education system, and evaluation is used. Judgement of distance education in an educational way, first as a necessity to eliminate barriers to educational climate and geographical areas, age and gender restrictions learners began their work And more in a death education system, especially in the philosophy and goals based on theories of learning theories have evolved to find and promote professional growth. Approach to distance education with regard to the necessity of education in countries formed.

Emergence and development of information societies is the consequences of industrialization. Despite the diversity of information in various forms of media in local, national and international, access, exchange and use of various information easier than last time is. Information society, a member of your buddies know that open information system in terms of geographical location and the last 25 years, organizational development, are limited. Distance learning faster than other forms of training has been.

Growth factor in the economic interests of this type of educational approach, flexibility and remove the distance can be named. The methods of distance education, required for building physical education is not providing services. Teachers and trainers in this method - compared with traditional methods - and have more opportunities to more people than are being trained. In this type of teaching style of each person in each academic field, and each job can be arbitrary in time and space, trained without having to leave the house for work or business is education. This method requires that students are dispersed over long distances provides. Distance learning advantages of distance education in comparison with traditional education, the need for physical locations and training programs limited to no specific time period. In this type of teaching style, learning for life without possibility of spatial and temporal constraints for each individual there. In distance education, problems related to lack of qualified teachers and appropriate educational environment - as it posed in the traditional method of M is - is resolved. In this way the use of advanced features in digital libraries and search the various sites during the study, time and cost savings are.

Pros and Cons of Online Classes: Advantages and Disadvantages of Online Courses

Ali Badragheh

Department of Agricultural Extension Education, Islamic Azad University, Garmsar Branch, Garmsar, Iran
*Corresponding author: badraghehali@yahoo.com

Abstract: Distance education can be used for some aspects of most disciplines. For example, several institutions of higher education already have developed certificate programs, undergraduate programs, and graduate programs in health and physical education that are delivered using distance education methods. Eastern Oregon University, Emporia State University, Kutztown University, LaSalle University, the Medical College of Wisconsin, University of Wisconsin at Stevens Point, and Virginia Tech are among institutions integrating distance technology into their physical education programs. Traditional programs that are heavily based in skill development and demonstration or require laboratory work can be offered in a distance education framework using interactive video interfaced with computers to facilitate a hands-on learning approach at a distance. Classes that use lecture and laboratory experiences are easily adapted to a distance education situation. Course materials, including animals for dissection, are sent to class participants with video and written instructions and assignments.
[Ali Badragheh. **Pros and Cons of Online Classes: Advantages and Disadvantages of Online Courses**. Journal of American Science 2011;7(5):81-87]. (ISSN: 1545-1003). http://www.americanscience.org.

Introduction:

Distance education delivers classes (live or pre-taped) to students in their home, office, or classroom. It is used by K-12, higher education, continuing education and business. As the cost of delivering quality education increases, institutions find that limited resources prevent them from building facilities, hiring faculty, or expanding curricula. They are using distance education to maximize resources and are combining their assets with others to produce programming. Distance education is offered internationally, nationally, regionally, and locally over all forms of conferencing technology.

Distance learning is expanding and examples of it are increasing dramatically. Fewer than 10 states were using distance learning in 1987; today, virtually all states have an interest or effort in distance education. Distance learning systems connect the teacher with the students when physical face-to-face interaction is not possible. Telecommunications systems carry instruction, moving information instead of people. The technology at distant locations are important and affect how interaction takes place, what information resources are used, and how effective the system is likely to be.

Technology transports information, not people. Distances between teachers and students are bridged with an array of familiar technology as well as new information age equipment. What sets today's distance education efforts apart from previous efforts is the possibility of an interactive capacity that provides learner and teacher with needed feedback, including the opportunity to dialogue, clarify, or assess. Advances in digital compression technology may greatly expand the number of channels that can be sent over any transmission medium, doubling or even tripling channel capacity. Technologies for learning at a distance are also enlarging our definition of how students learn, where they learn, and who teaches them. No one technology is best for all situations and applications. Different technologies have different capabilities and limitations, and effective implementation will depend on matching technological capabilities to education needs.

Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home.

The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been

learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections.

Interactivity is accomplished via telephone (one-way video and two-way audio), two-way video or graphics interactivity, two-way computer hookups, two-way audio. Interactivity may be delayed but interaction provided by teacher telephone office hours when students can call or through time with on-site facilitators. Classes with large numbers of students have a limited amount of interactivity. Much of the activity on computer networks is on a delayed basis as well. Possibilities for audio and visual interaction are increasingly wide.

In the earlier days of distance learning, it was most common to see distance learning used for rural students who were at a distance from an educational institution. The student might watch a telecourse on a television stations, read texts, mail in assignments and then travel to the local college to take an exam. This model is still in use, but as the technology has become more sophisticated and the cost of distance learning dropped as equipment prices dropped, the use of distance education has increased.

High front-end costs prevented an early widespread adoption of electronically mediated learning. Distance learning has been aggressively adopted in many areas because it can meet specific educational needs. As the concept of accountability became accepted and laws required certain courses in high school in order for students to be admitted to state colleges, telecommunications was examined as a way to provide student access to the required courses. Many rural school districts could not afford the special teachers to conduct required courses. Distance education met this need by providing courses in schools where teachers were not available or were too costly to provide for a few students. It also fulfilled a need for teacher training and staff development in locations where experts and resources were difficult to obtain. These systems link learner communities with each other and bring a wide array of experts and information to the classroom.

Challenges which faced the early users of distance education are still with us today. If distance education is to play a greater role in improving the quality of education, it will require expanded technology; more linkages between schools, higher education, and the private sector; and more teachers who use technology well. Teachers must be involved in planning the systems, trained to use the tools they provide, and given the flexibility to revise their teaching. Federal and state regulations will need

revision to ensure a more flexible and effective use of technology. Connections have been established across geographic, instructional, and institutional boundaries which provide opportunities for collaboration and resource sharing among many groups In the pooling of students and teachers, distance learning reconfigures the classroom which no longer is bounded by the physical space of the school, district, state or nation.

The key to success in distance learning is the teacher. If the teacher is good, the technology can become almost transparent. No technology can overcome poor teaching which is actually exacerbated in distance education applications. When skilled teachers are involved, enthusiasm, expertise, and creative use of the media can enrich students beyond the four walls of their classroom.

Teachers need training in the system's technical aspects and in the educational applications of the technology. Areas for assistance include the amount of time needed to prepare and teach courses, how to establish and maintain effective communication with students, strategies for adding visual components to audio courses, ways to increase interaction between students and faculty, planning and management of organizational details, and strategies for group cohesion and student motivation.

The interchange of ideas requires different communication methods than in conventional classrooms: information technologies are predominantly visual media, rather than the textual and auditory environment of the conventional classroom, the affective content of mediated messages is muted compared to face-to-face interaction, and complex cognitive content can be conveyed more readily in electronic form because multiple representations of material (e.g., animations, text, verbal descriptions, and visual images) can be presented to give learners many ways of understanding the fundamental concept.

Pros and Cons of Online Classes: Advantages and Disadvantages of Online Courses

Distance learning is a hot subject today, but is it really for you? It is best not to hurry when choosing a college or university, lest you find yourself a victim of hype. Online courses are a new revolutionary way of providing education. Even traditional institutions are increasingly incorporating the Internet e-learning online interaction means and software tools into their programs.

What do the education institutions offer?

Archived video footage and virtual real-time lectures, online assignments and presentations, electronic academic material, multimedia as part of

classrooms – all these have been part of higher education for a while now.

However, Online Education means taking entire degree program online, via your laptop. This means an entirely new experience, yet not everybody is ready for it.

Taking Online Classes via Online education program requires specific learning skills, which some people lack.

The Pros of Online Classes:
The key advantages of using an online class are –

1. Time flexibility
For some people there is nothing worse than getting up before 9 in the morning. Traditional higher education often requires just that. But with online education students have the possibility to adjust schedules to their life, rather than adjust their life to predetermined   schedules. Other people benefit greatly from it too: parents, full-time employees, and anyone else who for this or that reason is too busy to attend traditional classes.

2. Geographic flexibility
Online institutions make possible something unprecedented: it no longer matters where you live. You can live in one of the world and study daily at an institution based in another without ever leaving your native country, or even your room, for that matter. Even in terms of local travel online education is a revolution: there are no more bus, train, or car trips, no traffic jams, no being late for the bus/train, no time and money spent on travel.

3. Class Notes
Not everybody knows how to write great class notes. Online courses provide electronic transcripts of every lecture. This is great for anyone who has short attention spans or does not like to write during lectures.

4. More educational means
Much more so that in traditional classrooms, online education incorporates online multimedia possibilities into instruction.

Possible cons of online classes include:
What are the Disadvantages of Online Courses? Here are some

1. Credits
Not all online course credits are transferable to traditional degree programs!

2. Require self-discipline

Excellent self-discipline and time management without the aid of strict schedules, attendance requirements, and personal communication

3. Lack of interpersonal interaction
No interpersonal relationships with ether teachers or students; only via email, message boards, and other online means of communication.

Disadvantages of Online Classes: Disadvantages to Consider
This article will focus on the disadvantage of taking Online Classes. Online education is not exactly a trend yet, but it is becoming increasingly popular.

The reason for this is that it offers new opportunities where none existed before – Many people wouldn't have been able to acquire the necessary higher education without it. However, like all things in life, taking Online Classes has some drawbacks and disadvantages as compared to the traditional classrooms.

That said, online classes are not perfect for everyone. To avoid getting caught in the hype and making the wrong decision, consider the pros and cons of online education.

Taking Online Classes – Disadvantages
Let us review the weaknesses :

1. Lack of Socializing
Taking courses through the net completely erases the concept of socializing. Although there are online class discussions in online education, it is still not always an easy way to interact. This method completely eliminates the possibility to meet classmates face to face in and outside the classroom.

2. Lack of Close Personal Contact with Teachers
Besides being unable to socialize with other students, there is no way to arrange personal face-to-face meetings with the teachers. This, too, can be a significant disadvantage for those students who are motivated by close personal connection, discussion, and advice. Online tutorials definitely do not provide this vital touch and online discussions may not be intimate enough to provide the same powerful stimulus.

3. Classroom Attendance – None
This may sound like a good thing to some, but for many this is a major flaw of the online system. Some simply cannot focus on their own, while sharing an actual room with other motivated students right in front of them is a great incentive to concentrate and understand. Others simply love the

atmosphere of campus classrooms and would never give them up.

4. Self-Discipline

Studying via the net from home means you have more freedom and more responsibility for managing your time and effort. It is important to know that you are able to invest enough effort into studies without the stricter discipline imposed by traditional institutions and without their added incentives of classroom attendance and personal meetings.

5. Accessibility

Most people would have no problem accessing online education and that is one of its major plusses. Still, some simply do not have the required Internet connectivity (the required bandwidth for taking online class) or no personal computer they could comfortably use for prolonged private study sessions.

For these people campus-based courses are actually much better, since they provide an environment for group and individualized study: classrooms, offices, libraries, etc.

6. Accreditation and Employment

This is one of the most serious aspects of the online   education. It is still an emerging system and many authorities and employers officially do not recognize many online diplomas. Moreover, even if a degree is from an officially accredited online institution, many employees still prefer candidates with traditional degrees.

Advantages of Online Classes: Benefits of Online Classes

Imagine a future without campuses and classrooms. Instead there will be academic cyber-space and scholarly chat rooms. Accredited academic programs world-wide will be given via the Internet, producing an unprecedented global number of world experts in every field.

This is not yet the case today, but online schools are already offering great opportunities where none existed only a few years ago.

Higher education is becoming easily available to people who would otherwise never even dream of it – Adults who work full time, family people, people from remote countries all over the world converging in world-class learning centers.

Because online education is still a new field, it is important to know exactly what it can and cannot offer you.

What are the benefits of online classes? Advantages of taking Online Classes

Some of the Pros of enrolling to Online Education and taking online courses:

1. General Convenience

Generally speaking, online classes are more convenient since you do not need to leave home to take   them. Time table is flexible and there is generally more freedom. It is also simply convenient to be able to study anywhere while being able to do many of the required things almost any time of the day, like on the train when going home from work.

2. Time Considerations

Online courses save a lot of valuable time, especially if you are an adult with a career and a family to take care of. Basically, you log on to the class/course site and you are "at the university" – no need to take long rides back and forth or trudge from one end of the campus to another (and some campuses can stretch across an entire city and require bicycles or buses).

3. Online Teaching Possibilities – New cutting edge technologies

Online classes offer many innovative possibilities of communication. Where in a traditional classroom everything would have to be done in face to face interactions, which has its advantages but is also often inconvenient or simply impossible (for some).

An online class environment eliminates certain boundaries and constraints, allowing easy near-instant access to information, resources, libraries, extensive photo and video archives, and personal meetings compressed, through the power of the Internet, from hours to minutes.

4. Whom Online Class Suits Best

- Disciplined students with excellent time management skills who do not need teachers and strict predetermined programs to do their best.
- Students who wish to study in a specific country or institution which is otherwise not accessible to them (geographic convenience).
- Students who cannot afford traditional education – Online schools are generally less expensive.
- Students who dislike campus requirements. Although for many, the campus life is the best time of their life, some people prefer

the privacy of their homes. Online education is ideal for them.

- Students who cannot afford traditional education due to busy professional or personal schedules.

Online Classes VS Traditional Classes: Comparison between the Two Methods

Nowadays it is not enough to choose the university you want to learn at. Today, you have to first decide whether you want an online degree or an offline/traditional education.

Online education is a growing force in the field of additional and higher education. It is probable that in the near future, within a decade or two, online education will be the global standard.

Considering the differences between these two methodologies of education can provide you the basic knowledge and even surprising opportunities.

Online Classes VS Traditional Classes
Attendance

Traditional institutions require physical presence and participation in classrooms. This entails extensive travel and expenses. For many only this already makes higher education impossible. Online education requires no traveling at all, saving time, money, and energy. Busy people will therefore be able to combine extensive studies with work and family. Education is available to sailors on submarines and to astronauts in space!

Virtual classrooms vs. real classrooms

There are two camps around this issue – Those who love attending campus-based lecture and those would rather stay at home. Virtual education means there are no campuses and no classrooms. For those who prefer to be at home and are comfortable with cyber-space this is a virtual paradise. For those who are technophobic, get confused by online multi-media, and who prefer direct human contact this may be a veritable digitalized hell. But the amount of people who are uncomfortable with technology and the internet is decreasing exponentially. Most people are addicted to the internet. And video communication is becoming standard nowadays, allowing top-quality group video communication online.

Traditional and Online Schedules

Online institutions deliver many or all courses via modules. These modules can be scheduled by the student him or herself to be taken virtually at any time of day or night. This is obviously impossible with traditional classes, however requires a high

degree of self-motivation and the ability to meet requirements while enjoying greater freedom.

The Value of online classes/degree earned as compared to the traditional ones

When it comes to quality, going to Online Classes becomes universal as going to a traditional college class. One has to remember that the world is changed rapidly and the online education is now a great alternative to the traditional one. Just like a person got used to choose between campus-based colleges and universities, today the online education grows to be an option. Of course, with its different varying quality of degrees, just like any on-campus degrees.

These are just some of the differences between these two educational methods.

The benefits of Taking Online Courses: Why should you take it Online?

Let us consider the advantages of taking online classes:

1. Recognition:

First things first, online courses are widely accepted and sought after by employers. It is not something that people shun away from. In fact, a research conducted by DETC has revealed that more than 70% of employers look forward to recruiting people who possess online degrees rather than their traditional counterparts.

2. Being your own boss:

Traditional education requires teachers to impart education to students and monitor and evaluate their performances as well. If you are one of those who hate being nagged by someone, then online courses are meant for you. You can study on your own and keep yourself motivated without the interference of any one.

3. Accessibility and comfort:

Online courses are a respite for all those who hate functioning in a preplanned and methodical way.

Online classes enable students to study whenever they want to and from where ever they can. They can study from within the comforts of their homes. Further, online courses suit working professionals the most.

4. Reading and not listening:

Online courses require students to study referring to online textual content sent by universities. Thus, they can escape the monotonous lectures and long classrooms hours yet be well acquainted with the study materials.

5. Individualistic minds at work:

Online courses are the best for those who hate social interactions and love to be on their own. The courses alienate all sorts of distractive elements that may be present in a traditional classroom. Thus, a student can enjoy his/her peace of mind.

6. Resource center:

Online courses enable students to refer to notes or relevant study material by visiting the archived section. This is not so in traditional classrooms. If a student misses a class lecture, he/she misses the study content as well.

You would now surely agree that **accredited online courses** have the same worth as the traditional ones.

Conclusion:

In general, new methods of educational systems to countries around the world as a necessity and need for learning and training opportunities to study in areas with different climatic features and conditions of learning and education according to their gender and cultures, has been. Each method is mentioned with regard to changes in features and creates an education system, and evaluation is used. Judgement of distance education in an educational way, first as a necessity to eliminate barriers to educational climate and geographical areas, age and gender restrictions learners began their work And more in a death education system, especially in the philosophy and goals based on theories of learning theories have evolved to find and promote professional growth. Approach to distance education with regard to the necessity of education in countries formed.

Emergence and development of information societies is the consequences of industrialization. Despite the diversity of information in various forms of media in local, national and international, access, exchange and use of various information easier than last time is. Information society, a member of your buddies know that open information system in terms of geographical location and the last 25 years, organizational development, are limited. Distance learning faster than other forms of training has been.

Growth factor in the economic interests of this type of educational approach, flexibility and remove the distance can be named. The methods of distance education, required for building physical education is not providing services. Private extension: functions and duties

[1] Molouk Gharibpanah, [2] Azita Zamani

Abstract: Diverse agricultural extension funding and delivery arrangements have been undertaken since the mid-1980s by governments worldwide in the name of "privatization." When agricultural extension is discussed, privatization is used in the broadest sense – of introducing or increasing private sector participation, which does not necessarily imply a transfer of designated state-owned assets to the private sector. In fact, various cost-recovery, commercialization, and other so-called privatization alternatives have been adopted to improve agricultural extension. The form and content of decentralization has dominated development discourse and public sector reform agenda in Kenya in the last two decades. The evolution of public agricultural extension arrived at a worldwide turning point in the 1980s, one that represented the end of a major phase in the growth of publicly funded extension in both the developed and developing world. Agricultural extension increasingly has become defined as one or other of (apparently) differentiated activities of technology transfer or rural development. In many situations, the transfer of technology, heretofore considered the purview of public sector systems, has been reconceived. Such changes suggest a refocussing of paradigms for the delivery of public sector extension.

Keywords: private extension

Introduction

Extension services may be loosely defined as including all activities involved in the exchange of information relevant to agricultural and livestock production, processing and marketing. The word "extension" has been criticized as inherently emphasizing the "top-down" dissemination of information while ignoring other types of information flow between farmers, extension and research – particularly activities that involve farmers as equal partners in the process. This paper uses the term "extension" while recognizing that extension functions are multi-faceted and go beyond "top-down" dissemination of new technologies. For example, the information flow through extension channels may include anything from advice from a consultant on refrigerated flower shipping to the feedback to researchers of results from farmer-managed varietal trials.

Private firms provide services in accordance with their specialized incentives and farmers respond in terms of what they see as most beneficial to them. As each type of extension (public and private) has limitations, the objective for farmers, and agricultural development organisations of all types (local and international) is to attain the best mixture of public, private and NGO services. As Roth (1987) asserts, the public sector in general is over-burdened by

numerous activities and moving some of them to the private sector might allow more effective implementation of essential services. While extension services cannot, and should not, be totally privatized, there is room for both some privatization of public extension activities and active promotion of private and NGO extension activities which complement rather than replace existing public extension services. The analysis in this paper draws on cases in which information exchange, feedback to research, and all other major extension functions form only one part of a larger agribusiness operation or agricultural project. This paper focuses on Implication of private extension in developing countries .

The debate on the role of the public sector is not limited to the context of agricultural extension, but encompasses the larger concerns of public policy and institutional and organizational development. Indeed, the degree of government versus private involvement in an economy is an enduring philosophically and politically vexing question. The move toward privatization and efforts to decentralize government functions relate to this theme.

There are two themes in the broader privatization debate: first, a "political economy" consideration of the role and size of government in an economy, which focusses on whether or not there is a failure of private markets; and, secondly, an expressed need to reduce government outlays. While many reassessments of publicly funded extension have reflected the second theme, it is worth considering the rationale for public versus private activity in an economy. In mixed economies, the prevailing

economic justification for government involvement in an activity such as agricultural extension is market failure, whereby the market mechanism alone cannot perform all economic functions for appropriate resource allocation. Market failure may arise because some goods or services are public goods (such as publicly funded agricultural research knowledge) which can be consumed in a nonrival fashion by all members of society without any individual's consumption reducing the amount available for other individuals. Because the benefit of providing such goods cannot be appropriated by individuals, individuals generally will not provide such goods in a society even though there may be significant gains for producers and consumers. Some extension activities are clearly concerned with public goods subject to market failure. Other activities (such as individually tailored advice) confer appropriable private benefits which could be adequately supplied by private markets. Private goods sometimes are subject to market failure, whereby the operation of private markets does not provide certain services at a socially optimal level or where external costs or benefits are accrued by others rather than the provider of the goods. Market failure also may arise when current generations place insufficient value on preservation of resources for future generations. These latter circumstances are particularly characteristic of land and water degradation (Cary, 1983). Publicly funded conservation extension is often directed to overcoming such market failures (Barr & Cary, 1992). Government support for the provision of extension services may reflect that such services would be inadequately provided without intervention or, for reasons of equity, because services would not be available to the extent thought socially desirable. Some situations for agricultural extension clearly reflect private goods; other situations clearly are characterized as public goods. There is a lot of fuzzy ground in the middle where it is not particularly clear that an extension activity is conferring a public or private good. In such situations, the extent of publicly funded extension is likely to be determined by the political influence brought to bear by relevant interest groups (Cary, 1993).

The philosophical thrust of the general privatization debate has centred, on the one hand, on whether certain government activities could be performed more efficiently by private agencies. operating in private markets and, on the other hand, on whether inequities may arise because not all individuals have access to resources to purchase privately supplied services.

services that cater primarily to large-scale farming.

The Netherlands' experience in moving to a partially privatized system highlights some of the implications for agricultural extension, particularly in developed countries. The Netherlands' approach reduced government outlays as well as the government agency role conflict between concern for farmers' interests and the implementation of increasingly stringent environmental policies. With farmers paying for an increasing share of the extension services, their representatives have more influence on the direction of the extension service. New organizational structures and linkages have had to be established to link the "privatized" and private extension services with the research institutes, experiment stations, and regional experiment farms. Consequent upon, or in parallel with, the changed Dutch arrangements, other changes have taken place in the Netherlands' extension system. There is some evidence, at least for the vegetable greenhouse sector, that the high level of cooperation among extension information organizations in both the public and private sectors no longer exists (Huang, 1992). The more commercial orientation of the system appears to be creating tensions between extension workers and their clients in a less "open" knowledge and information system, with farmers who used to share information during study-group meetings now being more reluctant to do so.

The New Zealand Ministry of Agriculture and Fisheries advisory service, now fully commercialized and receiving no direct government funding, if sold will be the first extension service fully privatized from government ownership. In 1994 the number of consultants employed in this agency was about half of the peak number of advisers employed in 1987. Some of these advisers will have retired or departed voluntarily; others have established private consulting businesses. The consequence of the changes in New Zealand has been an increase in fee-for-service consulting (the number of farm and horticultural consultants has approximately doubled), with the traditional "advisory" extension no longer existing on a large scale. While, in most cases, the changes seem to have been readily accepted, there remains concern over the effective transfer of scientific findings to agriculture (Walker, 1993). Wider structural changes have sharpened the focus and efficiency of research agencies and advisory consulting work. Traditional technology transfer extension is now largely confined to agricultural commodity boards. Agriculture New Zealand engages in some specific "public good" technology transfer projects on a contract basis to commodity research agencies and the national Foundation for Research, Science and Technology.

There has been no formal assessment of the impact of the New Zealand changes. However, there does appear to be less interaction among organizations, reduced feedback from farmers to science providers, and more limited information distribution, particularly to less well-off and poorer performing farmers (Walker, 1993).

The new developments highlight greater institutional pluralism. Extension, interpreted broadly, now is often a mixed system or a "complex" where services are provided by private and public sector entities. The larger context in which a mix of public and private services operates presents a new challenge with new potential roles and responsibilities for the public sector. A major premise of this chapter is that policy makers must consider the entire agricultural extension complex when planning to allocate funds or seeking alternative funding arrangements for the public sector.

2-Strategies for change

Public sector extension, facing criticism for its cost and its lack of efficiency and for not pursuing programmes that foster equity, is confronted with a number of possibilities for change. There has been a trend, perceptible throughout various extension systems undergoing adjustment, of greater flexibility and multiple partners in funding agricultural advisory services (OECD, 1989). Le Gouis observed three major policies adopted by government and farm organizations regarding privatization of extension:

1. Public financing by the taxpayer only for the kinds of services that are of direct concern to the general public

2. Direct charging for some individual services with direct return (in the form of improved income)

3. Mixed funding shared between public and private professional association contributions for some services where the benefits are shared. A pervading development in new forms of financial support for extension is the trend to mixed sources of funding, reflecting strategies to gain access to additional sources of funding. In several developing countries, public-private extension coordination is already established. Alternative patterns indicate a fostering of private corporate initiative, encouraging cooperative ventures by farmers, coordinating public-private extension services, and privatizing the public system (Wilson, 1991).

The need for improved and expanded extension activities, together with a strengthening philosophical view of less government involvement in national economies, has led to a number of strategies for changing the way extension services are delivered.

2-1 Revitalization

The United States Cooperative Extension Service, when criticized for lack of relevance and vision (Dillman, 1986), regrouped and reviewed the criticisms. Its Extension Committee on Organization and Policy (ECOP) organized a Futures Task Force to review issues and put forward recommendations with a view to revitalizing the system (ECOP, 1987), which has led to various alterations structurally and programmatically.1 Meanwhile, the advancement of electronic information systems is resulting in increased privatization, with important implications for the future structure of U.S. agriculture (Goe & Kenney, 1988).

2-2- Commercialization

New Zealand's Ministry of Agriculture and Fisheries' (MAF) agricultural advisory service now operates under user-pay, commercial criteria (Hercus, 1991). The MAF advisory service, renamed MAF Consulting and, subsequently. Agriculture New Zealand, has remained (temporarily) a public agency, although its employees have given up a number of public employment benefits and now receive commissions for consulting work undertaken. The agency depends for its annual budget on consulting fees received from farmers and contractual arrangements with government for the supply of policy information and rural intelligence to government.

2-3- Cost Recovery

Other public extension systems have moved toward cost-recovery approaches. Mexico has developed a fee-based system among large-scale farmers in the northwest region and plans the development of a similar arrangement among small-scale farmers in the south central region (Wilson, 1991). The Agricultural Development and Advisory Service (ADAS) in England and Wales, notionally "commercialized," operates on a partial cost-recovery basis. Clients of ADAS pay a fee for advice which formerly was free of charge. This process of cost recovery, introduced in 1987, was directed towards the agency receiving 50 per cent of its income from commercial fees by 1993-94 (Bunney & Bawcutt, 1991; Harter, 1992).

2-4- Voucher Systems

Some countries have replaced public extension delivery systems with vouchers, distributed by government services, for farmers to use in hiring private extension consultants (as in Chile). Coupons attached to agricultural bank loans, committing a certain percentage of the loan for extension services, have been used in Colombia.

4- Gradual "Privatization"

In 1990 The Netherlands "privatized" approximately one-half of its public extension service by transferring field extension personnel, with initial government financial support, to the farmer associations. The elements of the extension service responsible for linking research and the privatized extension services, policy preparation, implementation, and promotion and regulatory tasks remained under the aegis of the Ministry of Agriculture (Le Gouis, 1991). The "privatized" extension service is governed by a board on which farmers' organizations and the government are equally represented (Proost & Röling, 1991). Dutch farmers make a partial contribution to the cost of the new organization through membership subscriptions to farmer associations, as well as through direct payment for individual analyses. Farmers will eventually contribute 50 per cent of the cost of the service: special services such as individual analyses will be fully paid for by the farmer clients. The Dutch government has established new government-funded structures for integrating subjectmatter specialists into extension teams to facilitate the transfer of information and knowledge and for the provision of information on government policy (Bos, Proost, & Kuiper, 1991; Proost & Röling, 1991).

A gentler form of "privatization" has been proposed for the delivery of government extension services in the Australian state of Victoria. A review of extension services determined that, for government-provided services conferring essentially private benefits to individuals, rather than cost recovery by government fee charging, it is more desirable and more efficient that private advisers deliver such services. However, because of the complexities of extension service delivery and the varying nature and levels of development of different agricultural sectors, a number of constraints were identified which precluded universal application of such a principle (Cary, 1993).

In order for rural industry organizations to take a greater responsibility for technology transfer, the Victorian government has proposed "outsourcing" for delivery of future extension programs. Outsourcing means that the government extension agency will retain a core pool of extension project staff and "buy in" private sector professional services with skills that the agency considers unnecessary to maintain. Agricultural consultants and contract staff will be employed to help deliver services in specific projects funded by rural industry and the federal government. Such projects are likely to be broad and industry wide and not tailored to individual farm circumstances.

In most cases, governments have not actually "privatized" their agricultural extension services. In its pure sense, privatization implies a full transfer of ownership (usually by way of sale) from government to a private entity, with that entity meeting all costs and receiving any profits. In the case of extension, governments have followed a number of distinct pathways such as commercializing the service while retaining it as a public agency, shifting public sector delivery services to private sector delivery of the service while maintaining oversight and basic funding of delivery, or pursuing cost-recovery measures to pay for the service. Thus the phrase "privatization of agricultural extension" generally is misleading.

Other Arrangements

Some countries have never developed public sector agricultural extension services, leaving the function of agricultural extension to private sector commodity enterprises or industry agencies, albeit often with some government financial subsidy. In France, while chambers of agriculture and private sector companies provide extension services, the former are substantially supported financially by public funds. In New Zealand, extension services to the dairy industry for many years have been delivered by the Dairy Board consulting service, financed by the dairy industry. In other cases, nongovernmental organizations have been used to supplement public sector extension services, especially in the area of rural development (Amanor & Farrington, 1991).

This arrangement has certain advantages for increasing extension coverage and encouraging farmer participation in technology systems, but it also has certain inherent limitations. In most countries, private sector companies are already important contributors to technology transfer and the advancement of agricultural development through, mainly, contract arrangements with farmers. Rightfully, the private sector has come to be acknowledged as a major information provider to both large and small farmers involved in monocropping (Cary & Vilkinson, 1992). The characteristic of "privatized" extension systems is a focus on commercial farms. It is salutary to state the obvious in relation to decisions regarding private and public provision of extension: when extension is delivered privately, it represents a commercial decision; when extension is delivered publicly, it is a political or bureaucratic decision. In determining whether to privatize, it is important, in the first instance, to establish whether an extension programme is designed to help commercial enterprises or small-scale farming and rural development.

Conclusion:
Privatization may have some attendant disadvantages because of unequal access to resources and because of a diversity of "agencies" and the associated difficulty of coordinating external groups and other government departments. Private delivery agents will be less responsive to government policy direction, and there may be linkage problems with public applied research organizations. While the process of information transfer amongst farmers traditionally has been characterized by a cooperative, free exchange of information, industrial information traditionally has been a private good characterized by patent rights, process licensing, the use of paid consultants, and differentiated production and marketing processes. In developed economies with commercialized agriculture sectors, many of these features of industrial information transfer are becoming more common in agriculture. The trend to privatization will be stronger the more such circumstances exist. The range of different circumstances prevailing in agricultural extension worldwide suggests that a wide variety of approaches should prevail.

The rationale for private sector provision of agricultural extension services is generally based on an expectation of increased efficiency with the operation of private markets and with the resulting efficiencies contributing to the growth of a country's GNP. In contrast, the rationale for public provision of agricultural extension services is based on the following points: (1) much agricultural information is a public good; (2) only government extension services are likely to promote concern for natural resources management; (3) public sector extension may enhance the education of farmers who often lack adequate access to educational institutions; (4) the public service often provides information that reduces risk to farmers; (5) the service may provide information that reduces transaction costs; and (6) an extension service may be concerned with community health issues related to possible human hazards such as accidents and poisonings linked to agricultural chemicals. The argument for privatization is based upon:

- More efficient delivery of services
- Lowered government expenditures
- Higher quality of services

The diverse financial arrangements adopted in the last two decades by governments worldwide to fund agricultural extension services provide a valuable menu of options for consideration by other countries confronting the "privatizing" of public sector services. Still, several countries have resisted the trend toward privatization of agricultural extension, concerned perhaps by the implications reviewed in this chapter. In both developed and developing countries, renewed debate and experimentation around extension is certainly needed, but not only around allocation decisions and how best to develop cooperative arrangements with the private sector.

In most countries, government-funded extension is likely to focus its activities more selectively on public-good activities which exist and on areas where the marketplace is unlikely to provide services at a socially optimal level. Such areas will include "broad" rather than "specific" technology transfer, dissemination of environmental and resource technology, and human resource development. The move in the public sector toward privatization and efforts to decentralize government functions can serve to highlight the continuing and key role of the public sector and focus the operative question on its responsibility as a coordinating agent. Its roles of regulation and providing service for priority audiences unserved by the private sector will be undiminished.

Using Information and communication technologies (ICT) in extension education

Azita Zamani [1] and Nahideh Erfanirad[2]

[1, 2] Mahabad Branch, Islamic Azad University, Mahabad, Iran

*Corresponding author: mehran11070@yahoo.com

Abstract: The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that. This paper uncovers a whole plethora of ICT emergence as a technology of the new millennium. Against the backdrop of the ongoing ICT boom, this paper makes an attempt towards studying its applications and usage planning process and policy making for the rural communities focusing on how it helps in aligning the key factors and reduce the problems of alienation, fragmentation and dislocation of knowledge. Policy makers and service providers have increasingly come to view information and communication technologies (ICT), and particularly the Internet, as an important tool in providing disadvantaged groups and areas with access to information, services and markets that would otherwise be inaccessible. The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that.

Keywords: information and communication technologies (ICT), agricultural extension

Introduction:

The global economy requires the kind of necessity and purpose of educational institutions. Since the current trend towards reducing incomplete information and access to accurate information is growing, other schools can not control time to transfer a set of prescribed information from teacher to student during a fixed time point are, but schools must to promote Culture of "Teaching for Learning For example, acquisition of knowledge and continuous learning skills which make possible during the individual's life. According to Alvin Toffler, illiterate in 21st century, who was not read and write but those who do not know which fail to learn or remember are illiterate. (Jauhari, 2004).

In the rural context, development involves use of physical, financial and human resources for economic growth and social development of the rural economies (Burkey, 2000). The term rural development also represents improvement in quality of life of rural people in villages. As per Chambers (1983) "Rural Development is a strategy to enable a specific group of people, poor rural women and men, to gain for themselves and their children more of what they want and need." Singh (1999) defines Rural Development as "A process leading to sustainable improvement in the quality of life of rural people, especially the poor". The fact of the matter is that three quarters of the world's poor, about 900 million people are in rural areas, and the Millennium poverty target set by Millennium Development Goals (MDG), cannot be met unless the world addresses rural poverty. "Sustainable Rural Development can make a powerful contribution to four critical goals of: Poverty Reduction, Wider shared growth, Household, national, and global food security and Sustainable natural resource management" (World Bank, 1997).

Hence worldwide there is a growing emphasis on development of rural economy of the countries. Any improvement, in the social or economic status of rural areas would not just directly benefit rural poor but would also bring down the migration-pressures on cities and contribute by positive ripple effect in global stride towards development.

Institutions and experts accept Governance as a reflexive process, wherein policies, institutions, outcomes and analysis interact, to maximize the process of participatory development (UNDP, 1997; Ludden, 2005; Mehta, 2006).

Information and communication technologies (ICT), including radio and television and the newer digital technologies like computers and the Internet as potentially are introduced powerful tools and activators of educational reform and changes. different ICT, when properly applied can be developed to help access to education and the relationship between training and workshops to strengthen the increasingly digital, the quality of education also helped to create teaching and learning in an active process connected to real life high take. However, the experience of being raised by ICT in the classroom and other educational sites around the world during the last few decades proves that is not automatic fully realize the potential benefits of ICT training. (Guptaand et al, 2004)

With the help of state and local funding, information technology has been purchased for schools ever since the 1980s. The state has also found many ways to support teacher training in the use of IT, and it has also allocated funds for the production of IT programs. Instruction in the use of IT has also played an important role in teacher training organized by local school authorities (Becker, 2000).

It is against this background that the need arose to find out how far we have progressed in the application of ICT in education and what impacts these significant economic investments have had. It is also time to start a value-oriented discussion of how strongly the future of the Iran society—and with it, of education and training— will be linked to the vision of an information society brimming over with technology (Mohseni, 2003).

The importance of communication in the development process has been acknowledged for many years by the development community. FAO has spent at least thirty years pioneering and promoting - both in thinking and practice - the centrality of communication in development. The most essential ingredient of good communication – putting people at the centre of the communication process - has similarly been understood and documented for many years.

agriculture extension and farmer-outreach programs face three major challenges – cost-effective outreach, solutions tailored to needs of individual farmers and an image that is farmer-friendly. The internet and mobile networks have the potential to provide agro-information services that are (i) affordable, (ii) relevant (timely and customized), (iii) searchable and (iv) up to date. Large sections of the farming community, particularly the rural folk, do not have access to the huge knowledge base acquired by agricultural universities, extension-centers and businesses. While telecenters are beginning to dot the rural landscape [1], one of the big barriers remains the lack of agro-content that (i) is in the language of the farmers (ii) is relevant to their needs and (iii) is delivered in a form that is of immediate use to them.

Information Technology, more precisely the Information and Communication Technology (ICT), has emerged world over as a technology of the new millennium. By augmenting the process of information exchange and reducing the transaction costs, this ubiquitous technology is instrumental in increasing productivity, efficiency, competitiveness and growth in all spheres of human activity. The potential benefits of, however, can be harnessed only if the technology diffuses across the different sectors of the society. Unfortunately, we are living in a world of 'digital divide' wherein half of the world population have never made a telephone call . The digital divide is not only an international problem, but for most developing nations including is also a national phenomenon. Nonetheless, it has been argued that in an era of globalization, the ability to harness this technology for the 'rural' improves the capability of the developing country.

Information technology (IT) has connected the world globally and is now changing our lifestyle and social consciousness dynamically. Of late, it has emerged as a best tool for information sharing and mutual communication. None of the walks of life have been left untouched by the IT sector be it grain threshing or global business. Agriculture has also been greatly influenced by IT in the present era though the share of IT in agriculture is only 1.3%.

Information Technology and its Components

Induction of IT as a strategic tool for agricultural development and welfare of rural requires that the necessary IT infrastructure is in place. The rapid changes and downward trend in prices in various components of IT makes it feasible to target at a large scale IT penetration into rural. Some of the broad factors to be noted with respect to various components of IT are listed below :

1. Input devices :
Radical improvements are witnessed with respect to the means of communication by human beings with computers such as key boards, mouse devices, scanners. The advent of touch screen monitors that allow users to give input to computers by touching on the appropriate location of the monitor has made it possible to develop user-friendly interface for farmers which is easy, intuitive, circumvents language barrier and at the same time provides a relaxed environment to the users. The present day digital cameras make it possible to capture and store good quality graphics and large video clips. The small size and low weight of these digital cameras, which are increasingly becoming affordable, open up the possibilities of providing computer based demonstration clips to educate the farmers.

2. Output devices :
Monitor screens, printers & plotters, data projectors support high resolution and good quality output. The quality of these output devices have the potential of generating renewed interest in the farmers in using IT based services. The light weight portable data projectors can be easily carried by the agricultural extension personnel for serving larger audience. Similarly, speakers can also be attached to the computers to incorporate voice based trainings for farmers.

3. Processors:
The processing speeds of computers have gone up. At present, Intel P-IV based processors @ 1.5 Ghz are available in the PC range which makes it possible to undertake substantial processing of data at the client side.

4. Storage Devices :
40GB and even higher hard disk drives have become common in PC range of computers. This makes it possible to store substantial information at the local level which facilitates faster access. Similarly, high

capacity floppy disk drives, CDs make it possible to transfer large volumes of data to locations which can not be connected to networks immediately. These storage devices are also used for backup of crucial data. As a precaution, many corporates store their backups at locations away from the place of work.

5. Software :

Various operating systems are available which act as interface between the user and the machine. The graphic user interface (GUI) has become an accepted prerequisite for end users. Microsoft's 'Windows' continues to be a favourite. Application softwares which can support complex user requirements are available. Of the shelf solutions for office automation packages, groupware applications, complex database solutions, communication products, solutions based on remote sensing & geographical information systems are available. In addition, solutions based on some or all of these are also readily available. The present downward trend in the IT industry provides an opportunity get customised application for any specific task developed at an affordable price. Rapid Application Development and Deployment (RADD) is a popular model for quick development and deployment of applications. Development environment itself is simplified with tools that quicken the pace of software specialists. Project management and monitoring software are available that facilitate efficient execution of large and complex applications that are required for rural

6. Networking devices :

The capacity of modems, used to convert the data from digital to analog and vice versa, which are popularly employed to use telephone lines have increased. Internal modems are available integrated into the computer so that they are not exposed to outside environment. The capacities of other networking devices such as routers have also gone up which makes it possible to create large networks with smooth data transmission.

7. Transmission Media

: The media through which the data transfer takes place has also undergone revolutionary change. Telephone lines are still the popular source although the reliability and low bandwidth are still major issues. High capacity cables, optical fibre, radio, wireless local loops, satellite transmission and various solutions based on a combination of these are already being used in many parts of the country.

8. Other accessesories :

Uninterrupted Power Supply (UPS) devices are crucial to ensure the

longetivity of the IT equipment as well as provide backup mechanisms. The potential of solar

power packs to provide a feasible solution to shortage of power in the rural areas needs to be

exploited.

CONCLUSION

A common strategy in higher education ministries in developing countries is public and private sector partnership in strategy or pursue rapid ICT projects is based. This partnership has different forms such as grant aid private sector interaction with public assistance, donated educational equipment and components by companies to public schools, providing technical assistance for planning, management and consolidation tools and human resources at the local level. But after financial aid, testing programs based on ICT is critical.

Many of the ICT training programs based on the charitable agencies aid have been unable to have high durability. Because the government has failed in its financial assistance in this situation none of the local communities to provide resources do not needed to continue these programs. Two strategies in here "to support government and local communities to move" are important. Since the 21st century, is century of education support about youth in Asia, to find sustainable ways to bridge the digital age in Asian countries is a real priority. And work through partnership that local leaders and guides are experts it can be lasting forever.

Several recommendations that emerged from the discussions emphasized on the need to think of ICT in education beyond computer aided learning and investigate the potential other technologies like community radio and other medium. These mediums could not only be cost effective but also has a greater outreach potential. It was also pointed out that low cost software solutions for e-learning that have scopes for innovation, should be incorporated in large scale projects. With an indication to open source solutions, the sessions recommended that such solutions should become a part of the overall policy for implementating technology supported education interventions.

Sustainability and scalability of project are also issues that needed serious considerations. While moving beyond the pilot and experimental phase, projects especially those that needs a considerable financial contribution should have a viable sustainability model for up scaling. It was also recommended that implementers needs to be cautious when selecting areas for implementing ICT in education projects.

Projects should also not lose priority of the education objectives. In some cases ensuring school accountability system and teachers attendance may be more important that investing time and resources in ICT integration in schools. One fact that emerged in the sessions was that ICTs effectively computers,

initiated in government department and schools were being used as decision support in education. Essentially, clear criteria, norms and standards needs to be developed for the information that was being used for decision-making.

Water Scarcity and Need for Sustainable Water Use

Ahmad Reza Ommani[1] and Azadeh N. Noorivandi[2]

[1]Assistant Professor Department of Agricultural Management, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran, Ommani75451@yahoo.com
[2] Department of Agricultural Management, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran, noorivandi_a@yahoo.com

Abstract: Availability of water is the most limiting factor for agricultural sector. More than 90% of the renewable water in the country is used for agriculture, but the sector still cannot provide enough production to meet the demand of the population. On the other hand, with the current conditions the total agricultural products from irrigated farming are 56 million ton and total water used for irrigated agriculture is 83 bm^3, therefore water productivity is 0.7 kg/ m^3. For the supply of food for the year 2020 the agricultural production should increase to 160 million ton. Therefore the water productivity should increase to 1.6 kg/ m^3. Therefore, focus on efficient use of water through irrigation efficiency and improvements in management of water use will be the major challenges in the coming years. [Ahmad Reza Ommani. **Water Scarcity and Need for Sustainable Water Use**. Journal of American Science 2011;7(5):98-105]. (ISSN: 1545-1003). http://www.americanscience.org.

Water and Agricultural Economy

The importance of agriculture in the economy is indicated by its significant contribution to the gross domestic product (one-forth of GDP) and the provision of job opportunities to 25% of the labour force (Keshavarz, Heydari & Ashrafi, 2003). Irrigation increases cropping intensity and contributes to expansion of areas suitable for farming. It increases yields, stabilizes output, enables crop diversification, reduces risk and increases farm incomes and employment. Through irrigation is influence on agricultural incomes, irrigation has a multiplier effect on non-farm incomes. Irrigation contributes to food security and poverty alleviation. By improving agricultural productivity, irrigation contributes significantly to overall growth and development.

The issue of water scarcity is further intensified by a high dependence on water. Growing population and its needs for food and drinking water, coupled with a short vision on regional water planning and management, have resulted in an unbalance between water supply and demand. Pollution, climate change and frequent severe droughts have been making the problem even more serious and make the future pretty uncertain. Water resource scarcity and unbalance between supply and demand are leading to high competition for water and consequently greater risks of food insecurity in the region (Ommani and Noorivandi, 2003).

In most countries such as Iran, the agriculture sector is the predominant consumer of water. Historically, large-scale water development projects have played a major role in poverty alleviation by providing food security, protection from flooding and drought, and expanded opportunities for employment. In many cases, irrigated agriculture has been a major engine for economic growth and poverty reduction. However, at the same time, poor communities have tended to suffer the greatest health burden from inadequate water supplies and, as result of poor health, have been unable to escape from the cycle of poverty and disease. Thus, growing scarcity and competition for water stand as a major threat to future advances in poverty alleviation, especially in rural areas. In semi-arid regions, increasing numbers of the rural poor are coming to see entitlement and access to water for food production, livestock and domestic purposes as more critical than access to primary health care and education. Ommani and Noorivandi (2003) pointed out, that scarcity of water resource is unintelligible process. This process is dependent to social, natural and economical factors (Figure 1).

Water and Food Security

Utilization of new irrigation methods and optimum use of water is a vital element to access food security. Based on the research done by Ommani and Noorivandi (2003), both socio-economic characteristics and environmental conditions of the farm have increased the food insecurity for the Iranian farmers. They suggested that smallholder farmers with under-developed socio-economic and environmental conditions are relatively poor. They concluded that lack of sufficient farm management competencies make higher water and soil erosion, over-fertilization, inadequate application of manure, lack of fallow, overgrazing, burning of crop residue, and over-use of pesticides. Based on this research water is the resource

for food security. Water and food security interact together.

Many of the over 800 million people in the world who still go hungry live in water scarce regions. When FAO launched its Special Program for Food Security in 2003, it was well revealed that limited access to water was often a major constraint to increasing food production. A key question for the future is whether water shortage will act as a serious brake on food production during the coming decades (FAO, 2002).

FAO (2001) pointed out; that global population will continue to expand at a rate of 1.1 percent until 2015 and more slowly thereafter. Today's population of 6000 million will reach 8100 million by 2030, an increase of about 33 percent. As a result, demand for food will increase over this period but at a slowing rate. The nature of the demand will also change as incomes rise and urbanization continues. The urban population is expected to increase from 43 percent of the world population in 1990 to 61 percent by 2030.

The growing population and changes in food priorities will result in a strong demand for additional food production, though the types of grains demanded for food and feed, and the mix of grains and animal products in the diet, will change. Although net food imports into the developing countries are expected to increase, most of the increasing demand in developing countries will be met by increased local production. According to FAO (2002), increases in demand can be met in three ways:

- increasing agricultural yield;
- increasing the area of arable land; and
- increasing cropping intensity (number of crops per year).

Over the past 30 years, most of the increase came from yield, mainly as a result of the Green Revolution. This is expected to be case in developing countries over the next 30 years, with 69 percent of the increase in was resulted from yield, 12 percent increases in cropping intensity and the rest from increase in the area of cultivated land. Much of increase in crop production will come from irrigated land, three-quarters of which is in the developing countries. Currently, some 20 percent of agricultural land in the developing countries is irrigated and it provides about 40 percent of crop production in these countries (FAO, 2001).

FAO (2002) pointed out, that over the past 30 years, the irrigated area expanded at about 2 percent a year, giving a total increase of some 100 million hectares during 1962–98. Irrigated area in developing countries in 2000 was nearly doubled than, what it was in 1962. FAO (2002) expects that irrigated areas in 93 developing countries could grow by 0.6 percent yearly between 1998 and 2030. Such a rate of growth would lead to only a 23 percent increase in irrigated area over the period. However, when coupled with increase in cropping intensity, the effective harvested irrigated area is expected to increase by much more: from 241 to 323 million hectares, a 34 percent increase. Will there be enough freshwater to satisfy the growing needs of agriculture and other water uses. Agriculture already accounts for about 70 percent of the freshwater consumption in the world and is seen as the main factor behind increasing global freshwater scarcity.

Analysis of 93 developing countries by FAO shows comparatively encouraging conclusions on this question. During the period 1998–2030, irrigation water consumption in these countries is expected to grow by a total of only about 14 percent, from the current 2 128 km3/year to 2 420 km3/year in 2030. This increase is low compared to the increase projected in the harvested irrigated area. Much of this difference is explained by an expected improvement in irrigation efficiency, leading to a reduction in the withdrawals needed for irrigation water per irrigated hectare. Another reason for this reduction is due to a change in cropping pattern for some countries, such as China, where a substantial shift from rice to wheat production is expected: irrigation water requirements for rice are usually twice those of wheat.

Water Quantity
1. Renewable Fresh Water Resource
The main source of water in Iran is precipitation both rainfall and snow, estimated the mean range of 1995 to 2000 to be 415 billion cubic meters (bm^3). About 72% of the total rainfall directly evaporates and by taking in to account 13 bm^3 of water entering from the borders, the total potential renewable water resource are estimated to be 130 bm^3. Currently, the total water consumption is approximately 88.5 bm^3, out of which more than 93% is used in agriculture, while less than 7% is allocated to urban and industrial consumption. Under the present situation 82.5 bm^3 of water is utilized for irrigation on 7.5 million hectares of land under irrigated agriculture (Ommani and Noorivandi, 2003).

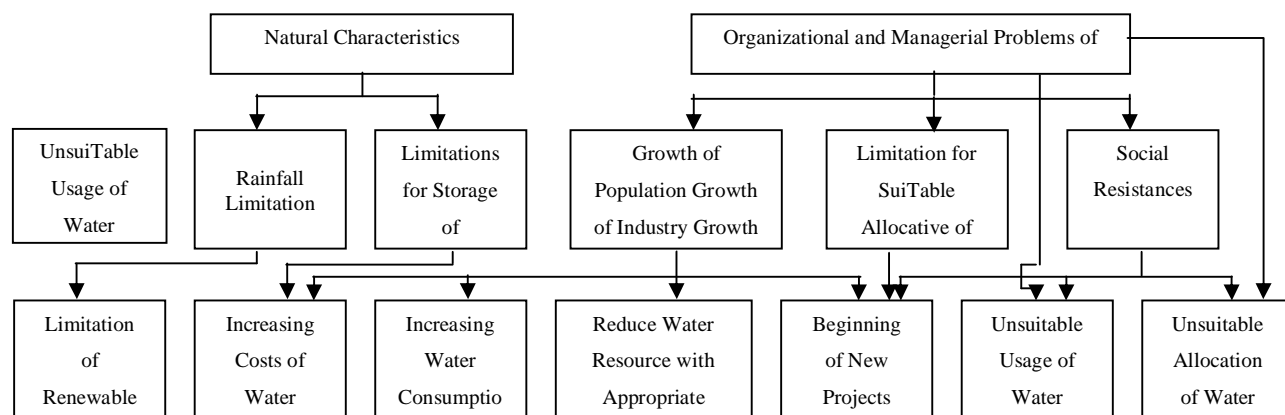
2. Non Renewable Groundwater Resource
Groundwater continues to be one of the dominant sources of bulk water in Iran. Its use has been essential for meeting water demands and household food security. In addition to being a regular source of water under normal climatic conditions, it plays a critical role in food supply and livelihood security during dry periods, in view of its ability to act as a buffer against drought and precipitation variability. Increased access to groundwater reduces risk substantially enabling many formers make out of poverty. From the environment perspective, groundwater plays another role of no less importance (Keshavarz, Heydari & Ashrafi, 2003).


Figure 1. Factors Affected On Water Scarcity   Source: (Ommani and Noorivandi, 2003)

Shortages of groundwater in areas of excessive abstraction and groundwater pollution by various sources are now common in the region and emphasize the importance of correct estimates and proper development, regulation and protection of supplies, in order to ensure the continued availability of this key natural resource (Ommani and Noorivandi, 2003). However, the management of groundwater has not always met the required standards and there are clear indications of major problems with over-abstraction and its consequences in many parts of the region. The available information clearly indicates that groundwater over-abstraction and quality degradation are among the major emerging problems in the Iran. In several parts of the region, over-abstraction is severe and water levels are declining at rates that range from 1-3 meters per year. Water level changes and fluctuations are the most important factors influencing access to groundwater for the environment and human uses. Even small drops in groundwater level can have substantial impacts on surface water availability because of the close link between surface and groundwater (Keshavarz, Heydari & Ashrafi, 2003).

3. Water Scarcity

The demand for water in Iran continues to grow due to population growth and the push for economic development. Population growth at high rates has steadily reduced the per capita share of water resource over the past half century, offsetting socio-economic plans and putting high pressure on the limited water resource (Najafi, 2006). The international costs of strategic food security crops are

highly sensitive to variations in water supply, which directly or indirectly depend on rainfall. Under the prevailing arid and semi-arid climatic conditions in the Iran, reliable food production depends heavily on water resource (Saxena, 2006).

In today's world, water continues to be central to food security, environmental health, recreation, energy production, transportation, etc., and thus to the overall well being of the people (Keshavarz, Heydari & Ashrafi, 2003). Although most of the surface of planet earth is covered with water, only about 2.5 % of it is fresh water and less than 1% is available for human use. Saxena (2006) pointed out, that many countries of the West Asia and North Africa region are already facing severe water poverty and the situation here is likely to worsen in the years to come because of the demographic pressures and climatic change.

4. Water Quality

In Iran intensification of agricultural and industrial activities has led to the contamination of surface and ground water by fertilizers and other chemicals, a rapid rise in the level of groundwater, which leads to water logging and soil salinity, and high loads of the most common water pollutant (organic matter from domestic sewage, municipal waste and agro-industrial effluents). Similar situations exist in many other countries of the region (FAO, 2003a).

Sewage water is a source of pollution of both surface and ground water resource. It is produced mostly from large cities in urban areas. Sewage water is treated and released for agricultural use in many

countries. Industrial liquid waste is hazardous and contaminates large quantities of freshwater with small volumes produced from industrial plants. The industrial plants should be built far from watercourses and groundwater basins and should not e allowed to dump their wastes in hazardous areas without prior treatment. Pesticides, insecticides and fertilizers, which are used intensively in agriculture, might cause serious contamination to freshwater resource, and pose a threat to both human health and the environment (FAO, 2003a,b).

5. Agricultural Water and Poverty

Based on Asian Development Bank (1999) poverty is multi-dimensionally complicated, and is the result of myriad interactions between resource, technologies, institutions, strategies, and actions. The multidimensional character of poverty has been reflected in a wide array of papers, poverty reduction strategies, and policies (Asian Development Bank. 1999). World Commission on Dams (2000) pointed out, that although water provides only a single element in the poverty equation, it plays a disproportionately powerful role through its wide impact on such factors as food production, hygiene, sanitation and food security, and the environment. Indeed, development agencies, groups, and experts worldwide are increasingly recognizing the important role that water can have on poverty (World Commission on Dams, 2000). Within the water and poverty debate, agricultural water holds a unique place. While solutions to other dimensions of the water and poverty problem such as sanitation, hygiene, and potable supplies, generally call for increased expansion of services, the agricultural water problem requires drastic improvements in existing services. Furthermore, agriculture is now the world's largest user of water, consuming 80–90% of annual utilized supplies and providing livelihood for most of the world's poor.

Biltonen et al (2002) pointed out, that within agriculture, water is a vital resource for many productive and livelihood activities and many developing countries have promoted water resource development over the last 5 decades to improve social outcomes. Huge investments have been made in water resource to achieve such broad objectives as economic growth, rural and agricultural development, national food security, famine protection, and land use intensification. Hussain et al (2004) also claims that irrigation development has been regarded as a powerful factor for providing food security, protection against adverse drought conditions, increased prospects for employment and stable income, and greater opportunity for multiple cropping and crop diversification. Access to reliable irrigation can enable farmers to adopt new technologies and intensify cultivation, leading to increased productivity, overall higher production, and greater returns from farming (Hussain et al, 2004)

Hussain et al (2004) pointed out, that there are five key interrelated dimensions of the relationship between access to good agricultural water, socioeconomic uplifting in rural communities, and poverty reduction. The dimensions are production, income/consumption, employment, vulnerability/food security, and overall welfare (Figure 2). In addition, Rezaei-Moghadam and Karami (2006) described relationship between poverty and sustainability of agricultural systems. The linkage between sustainable agriculture, poverty and agricultural extension efforts and their impacts on rural centers has been discussed in this study. The findings of path analysis in three different causal models provide the complexity of relationships between variables and environmental degradation so that there is a causal relationship between poverty and sustainability. Lack of direct causal effect of use of technology and extension efforts on sustainability in three models indicated the structural and institutional limitations of extension in diffusion of appropriate technologies. Finally, recommendations regarding regional planning with respect to socio-economic characteristics and changing from transfer of technology approach to other alternatives and revising the education programs of extension agents are provided.

Based of Figure 3 negative direct causal effect of poverty on sustainability indicated the relationships between poverty and environmental degradation lack of direct causal effect of use of technology and extension efforts on sustainability indicated the structural and institutional limitations of extension in diffusion of appropriate technologies.

6. Water Scarcity and Need for Sustainable Water Use

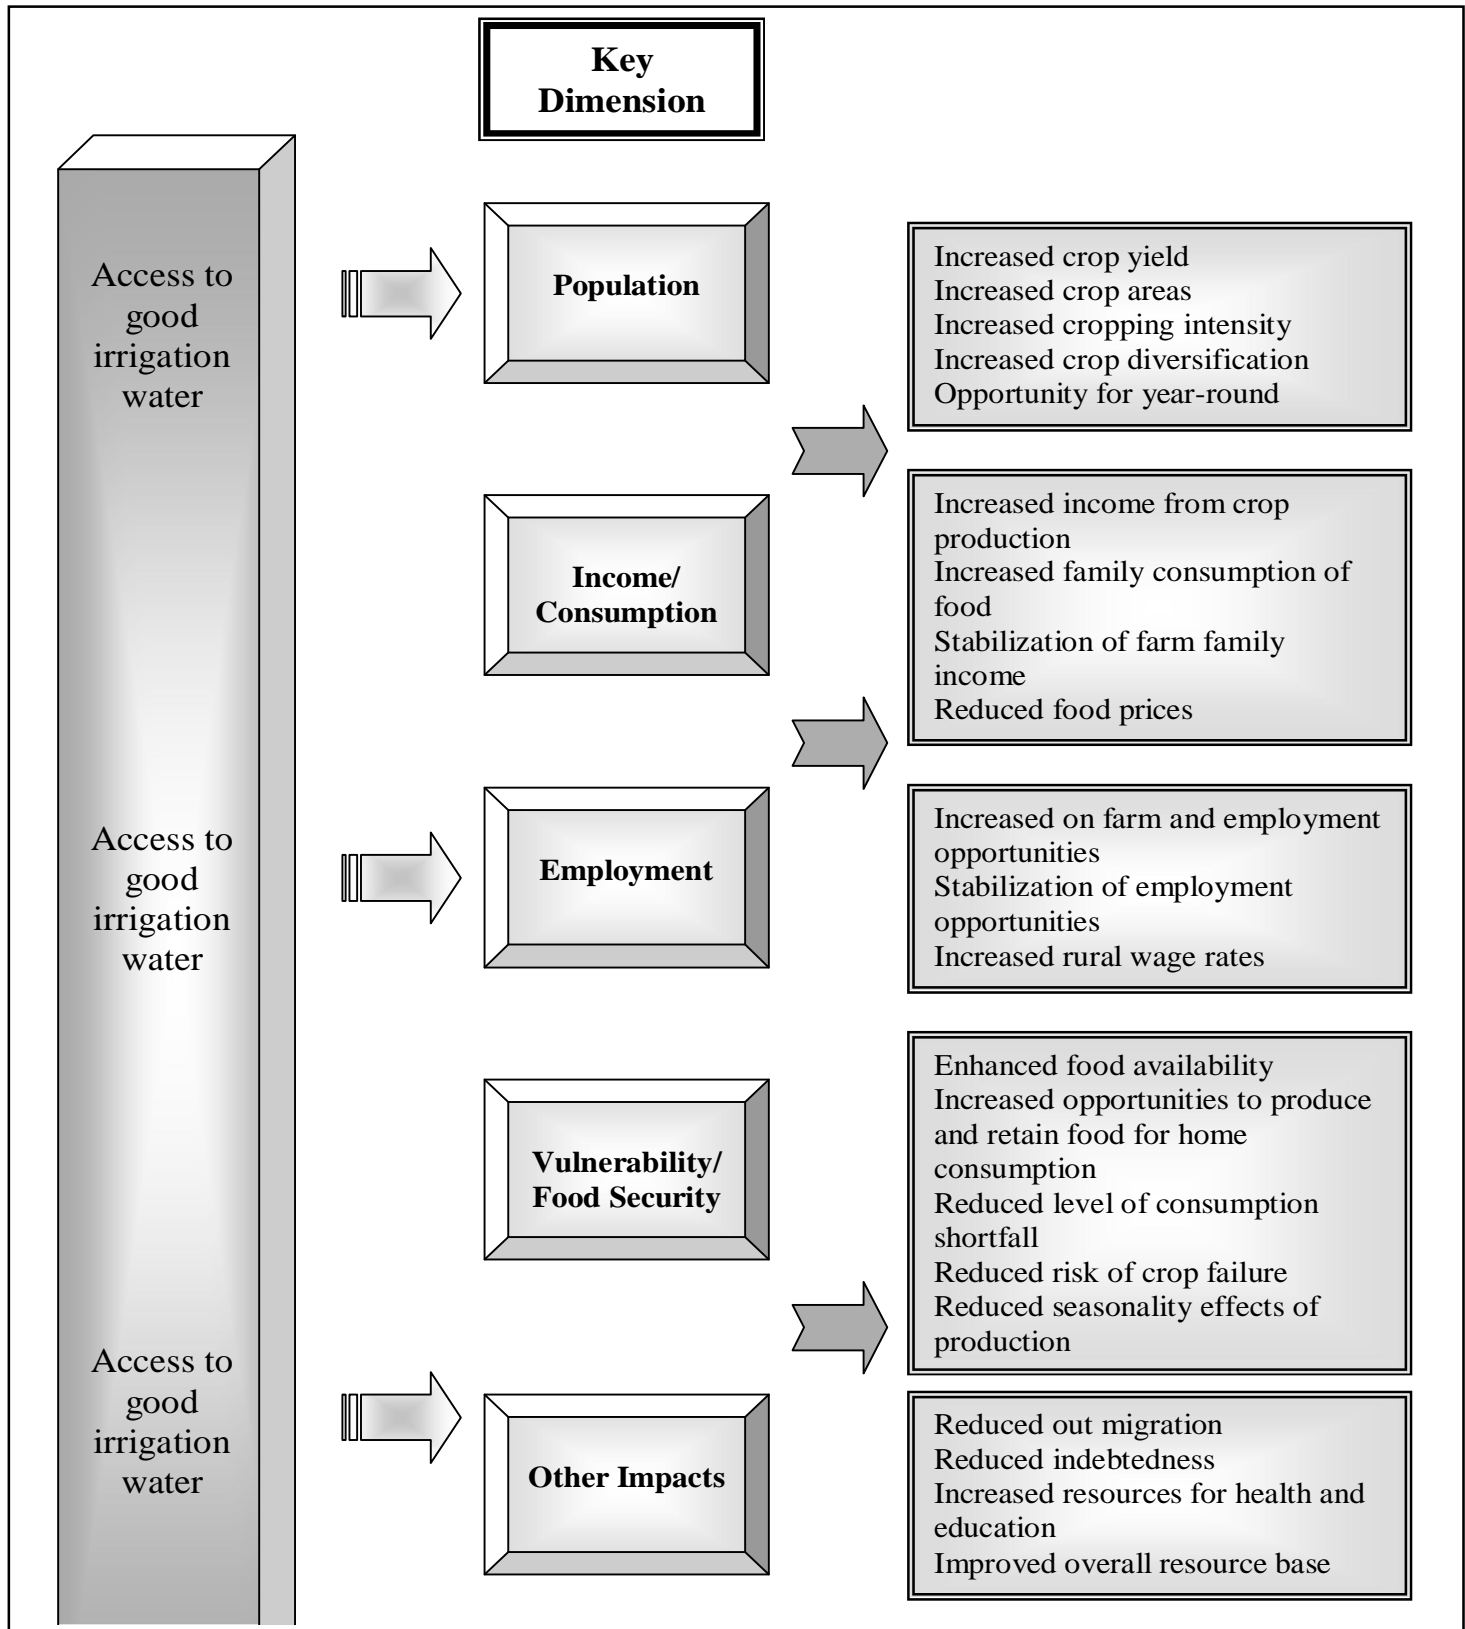
Water scarcity, defined in terms of access to water, is a critical constraint to agriculture in many areas of the world. A fifth of the world's people, more than 1.2 billion, live in areas of physical water scarcity, lacking enough water for everyone's demands. About 1.6 billion people live in water-scarce basins, where human capacity or financial resource are likely to be insufficient to develop adequate water resource. Behind today's water scarcity lie factors likely to multiply and gain in complexity over the coming years (Molden, 2007).


Figure 2. Agricultural Water and Poverty Reduction: Key Dimensions Source: (Hussain et al, 2004)
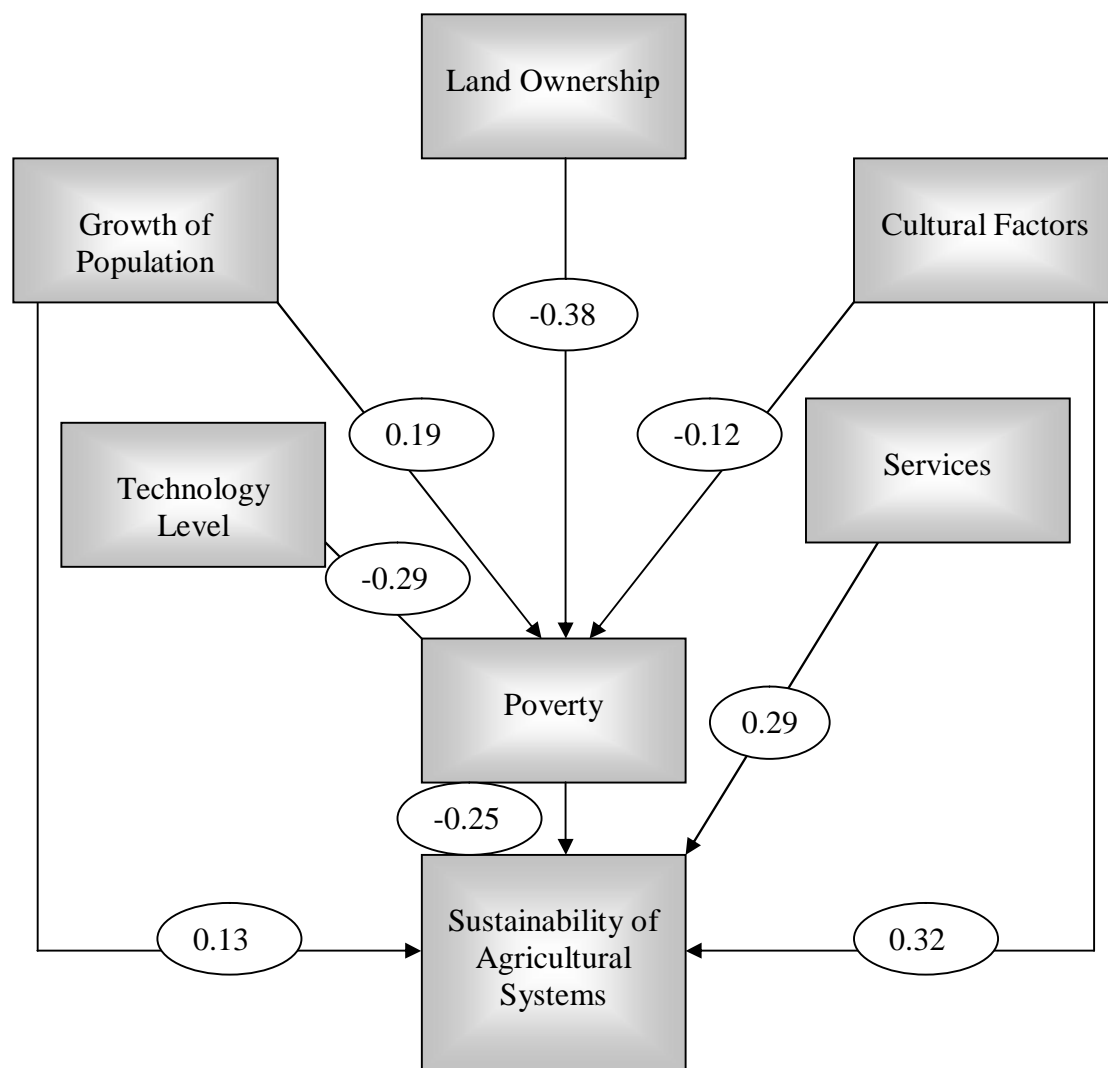

Figure 3. Relationship between poverty and sustainability of agricultural systems.
Reference : (Rezaei-Moghadam and Karami, 2006)

A growing population is a major factor, but the main reasons for water problems lie elsewhere—lack of commitment to water and poverty, inadequate and inadequately targeted investment, insufficient human capacity, ineffective institutions, and poor governance. Water and food security are strongly connected. Many of the nearly 800 million chronically undernourished people live in water-scare regions. In these areas, limited access to water often plays a major constraint to improving food production. Global population will continue to expand. The increase in population and changes in food preferences will result in a strong demand for additional food production (FAO, 2001). It is expected that much of the increase in crop production will come from irrigated lands, as irrigated agriculture is much more productive than rain-fed agriculture - irrigated agriculture contributes nearly 40 percent of world's food production on 17 percent of cultivated land. However, agriculture already counts for 70 percent of the freshwater withdrawals in the world - for developing countries this figure is even as high as 85 percent - and is seen as the main factor behind increasing global water crisis (FAO, 2003a).

The key to increase world's food production without deepening the global water scarcity is improving the efficiency in the use of irrigation water. At irrigation scheme and farm level, irrigation efficiency can be sometimes as low as 30 percent. The gains from introducing effective water management and improved irrigation and water-control techniques and technology can be tremendous both in terms of water saving as well as in increase in productivity and stabilization of erratic food production (FAO, 2003a).

7. Recommendation:

Therefore, focus on efficient use of water through irrigation efficiency and improvements in management of water use will be the major challenges in the coming years. Recent events of drought in the country have resulted in the reduction of water productivity in farming. In recent years Khuzestan Province encountered with shortage of water resource (Organization of Agricultural-Jihad of Khuzestan, 2004). Sustainable water resources management in agriculture and increasing the water use efficiency in Khuzestan Province has a vital role for conservation of water resources.

Allahyari and Chizari (2008) Indicated that Iran's extension system dos not pay enough attention to necessity characteristics of extension organization to accomplish environmentally sound agriculture and these attributes are not favorable situation. These conditions necessitate reorganizing of extension institutions to accomplish sustainability.

Considering unsustainable agricultural conditions of Iran (Ommani and Chizari, 2008), organizational recession and inability of current extension organizations (Allahyari and Chizari, 2008) to accomplish of sustainability, it seems that extension systems require a new structure and contents to achieve sustainability objectives.

Abstract: Agricultural extension is a public service for human resource development (HRD) in the agricultural sector. Multiple studies in Iran showed that, although extension services has played a positive role in agricultural development of Iran, but there are difficulties, barriers, misunderstandings, and weaknesses in the transfer of new technology and information to farmers. Lacking the suitable linkage between extension and research organizations has been a barrier for transfer of appropriate new technology to farmers. This problem exists in water sector of agriculture. The major consumer of water in Iran is the agriculture sector. Identifying suitable extension mechanisms have important role to developing extension system. Therefore, identifying extension mechanisms for supporting sustainable water resources management in agriculture of Iran is the one of the major approaches needs to be carefully thought and accurately implemented for the extension system development. [Ahmad Reza Ommani. **Agricultural Extension and Sustainable Water Resources Management in Agriculture**. Journal of American Science 2011;7(5):106-112]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: Water, Extension mechanisms, Agriculture sector

1. Challenges for Sustainable Agriculture

During the past fifty years, agricultural development policies have been remarkably successful at emphasizing external inputs as the means to increase food production. This has led to growth in global consumption of pesticides, inorganic fertilizer, animal feedstuffs, and tractors and other machinery (Ommani and Chizari, 2002). These external inputs have, however, substituted for natural processes and resource, rendering them less powerful. Pesticides have replaced biological, cultural, and mechanical methods for controlling pests, weeds, and diseases; inorganic fertilizers have substituted for livestock manures, composts, and nitrogen-fixing crops; information for management decision comes from input suppliers, researchers and extensionists rather than from local sources and fossil fuels have substituted for locally generated energy sources (Roling and Pretty, 1997).

The basic challenge for sustainable agriculture is to make better use of these internal resources. This can be done by minimizing the external inputs used, by regenerating internal resource more effectively, or by combinations of both (Ommani and Chizari, 2007).

According to various studies, the agri-food sector in Iran has not yet shown any significant development during the last decades. Despite the advancement of infrastructural services made available to rural people over the past 20 years, they still, however unfortunately, live in unequal social and cultural environments. In the third decade of rural development in, Iran, this problem will reveal

itself as societal demands which naturally bring about social challenges in future (Safaei, 1999). The most important challenges may fall in the following categories: Inadequate resource management for production and insisting degradation of soil or water resources and the associated ecological consequences and inadequate job opportunities (Safaei, 1999). Nevertheless, there is various evidence that agriculture is still far behind the real potential of the country considering its available resource. On the other hand, sustainable land and water use has not yet been reached in Iran (Darvishi, 2003).

Karshenas (1994) contended that the difficulties within Iranian agriculture have resulted from inefficient resources management by actors within the sector, rather than by a squeeze of natural resources in agriculture. Hence, more consideration to human resources in the agricultural sector is essential. Since farmers and land and water users are the primary active human resources in the agricultural sector, increasing their competence is of necessity to improve the efficiency and productivity of farming. Today more consideration to human resources in the agricultural sector becoming increasingly important because of the competitiveness within the sector. Based on the research of Karami and Rezaei-Moghaddam (1998), both socio-economic characteristics and environmental conditions of the farm have increased the poverty of Iranian farmers. They suggest that smallholder farmers with under-developed socio-economic and environmental conditions are relatively

poorer. They concluded that poverty is a major reason for unsustainable agriculture. Lack of sufficient farm management competencies effectuate higher soil erosion, over-fertilization, inadequate application of manure, lack of fallow, overgrazing, burning of crop residue, and over-use of pesticides.

In addition, Chizari, Lindner and Lashkarara (2001, p.65) reported that:

"Major barriers hampering adoption of sustainable agriculture practices included: limited financial returns for farmers, limited farmer knowledge of sustainable agriculture principles and methods, low levels of farmer education, government rules and regulations, problems with soil erosion and lack of water, and a low level of extension agent knowledge with respect to sustainable agriculture."

2. Challenges for Water and Soil Resources

Water pollution and destruction of natural resources is one of the serious problems faced by the people in Iran. Rapid population growth, industrialization and urbanization in the country are adversely affecting the environment. Though the relationship is complex, population size and growth tend to expand and accelerate these human impacts on the environment (Razavi, 2001)

Direct impacts of agricultural development on the environment arise from farming activities, which contribute to water pollution (Ommani and Noorivandi, 2003). Usage of chemical material in agricultural practices has main impacted on water resource pollution. Seepage of pollution waters that produce by agricultural practices. Karshenas (1994) claimed that the difficulties within Iranian agriculture were caused by the mismanagement of human resources and by actors within the agricultural sector, and not because of shortages of natural resources in agriculture. Main method that use for plow of lands in farms of Iran is traditional plowing. Traditional plowing cuts down and overturns up to 8" of soil. The coulter disks on traditional plows are straight disks. This way has vital affected on erosion of soil and water.

Direct impacts of agricultural development on the environment arise from farming activities, which contribute to soil erosion, land salinization and loss of nutrients (Abtahi, 2006). In Iran, like other developing countries, soil erosion is one of the most important factor that affect on agricultural productivity. The content of annual soil erosion in Iran is estimated 2.5 billion ton. This amount is equivalent with 8 percent of soil erosion at world scale (Najafi, 2005).

Nevertheless, there is a variety of evidence that agriculture in Iran still lags far behind what it could potentially achieve considering the available resource

in the country. For instance, research reveals that more than 50% of the total available land, water, and natural resource have not yet been used in agriculture and only 37% of all cultivable land and 58% of all acquirable water, have been utilized (Tahmasebi, 1998). On the other hand, sustainable land use has not yet been achieved in Iran.

Another direct impact of agricultural development on the environment arises from farming activities, which contribute to water pollution (Ommani and Noorivandi, 2003). Usage of chemical material in agricultural practices has main impacted on water resource pollution. Seepage of pollution waters that produce by agricultural practices is main factor to pollution of suberranean water resource.

Agriculture, as the single largest user of freshwater on a global basis and as a major cause of degradation of surface and groundwater resource through erosion and chemical runoff, has cause to be concerned about the global implications of water quality. The associated agrofood-processing industry is also a significant source of organic pollution in most countries. Aquaculture is now recognized as a major problem in freshwater, estuarine and coastal environments, leading to eutrophication and ecosystem damage. The principal environmental and public health dimensions of the global freshwater quality problem are highlighted below (Ongley, 1996):

- Five million people die annually from water-borne diseases.
- Ecosystem dysfunction and loss of biodiversity.
- Contamination of marine ecosystems from land-based activities.
- Contamination of groundwater resource.
- Global contamination by persistent organic pollutants.

In addition to problems of waterlogging, desertification, salinization, erosion, etc., that affect irrigated areas; the problem of downstream degradation of water quality by salts, agrochemicals and toxic leachates is a serious environmental problem. "It is of relatively recent recognition that salinization of water resource is a major and widespread phenomenon of possibly even greater concern to the sustainability of irrigation than is that of the salinization of soils. Indeed, only in the past few years has it become apparent that trace toxic constituents, such as Se, Mo and As in agricultural drainage waters may cause pollution problems that threaten the continuation of irrigation in some projects" (Rhoades, 1993).

3. Enhancing Water Conservation

FAO (2003, p. 21) claimed that the regional water demand management strategy would be based on the following domains:

- Generalization of modern and improved irrigation methods in replacement of the currently prevailing conventional, low-efficiency methods;
- Promotion of water recycling and use of non conventional water resource such as treated wastewater and other low-quality waters;
- Mobilization of the water resource still available, through infrastructure and water harvesting techniques, with due consideration to the environment;
- Adoption of irrigation water pricing to recover at least operation and maintenance costs of irrigation schemes and to enhance water conservation and higher productivity;
- Review of water-related policies with a major focus on water scarcity and drought preparedness and mitigation;
- Establishment and adoption of water regulatory frameworks and review of existing ones to introduce measures and incentives for water savings and to grantee transferable water rights;
- Irrigated crop diversification, promoting high value and water-stress tolerant crops;
- Regional cooperation on the above aspects to create synergy from investments and promote exchange of experience between countries of the region.

The problems of water scarcity, groundwater depletion, pollution, water logging and salinity are symptoms of a much deeper problem embedded in policy, institutional and market failures for the development and management of water resource in the Iran. Policy failure is attributed to low cost recovery used in producing a commodity (FAO, 2003). The institutional failure is due to lack of well-defined property rights, improper regulatory frameworks and open access that encourage depletion of natural resource such as groundwater for which the user does not pay the cost. Finally, market failure refers to the existence of natural monopoly and other external cost placed on agriculture and water sector.

4. Role of Extension Education in Sustainable Water resources management (SWRM) in Agriculture:

Environmental Education

More than half of the world's population, and more than 70 percent of the world's poor are to be found in rural areas where hunger, literacy and low school achievement are common. Education for a large number of people in rural areas is crucial for achieving sustainable development. Poverty education strategies are now placing emphasis on rural development that encompasses all those who live in rural areas. Such strategies need to address the provision of education for the many target groups: children, youth, and adults, giving priority to gender imbalances. This complex and urgent challenge should be addressed systematically, through an intricate set of policy measures, at all levels of education systems (UNESCO, 2002).

There are five key interrelated dimensions of the relationship between access to good agricultural water, socioeconomic uplifting in rural communities, and poverty reduction. The dimensions are production, income/consumption, employment, vulnerability/food security, and overall welfare (Hussain et al, 2004). In general, access to good irrigation allows poor people to increase their production and income, and enhances opportunities to diversify their income base, reducing vulnerability caused by the seasonality of agricultural production as well as external shocks. Thus, access to good irrigation has the potential to contribute to poverty reduction and the movement of people from ill-being to well-being. While there is an enormous literature on the impact of irrigation on poverty reducing intermediate variables, particularly from South Asia, no review is made here. Rather, recent case studies are presented to identify the conditions under which access to agricultural water can have significant poverty-reducing impacts. Before reviewing the case studies, it is useful to have a conceptual framework for considering the potential impacts agricultural water can have on various segments of the rural population (Hussain et al, 2004).

The world as we know it has a number of immense, human related problems and all the predictions are that these problems will get worse unless we act globally (Inman and Rogers, 2007). Education is one powerful way in which we can affect change for a different kind of world (Benn, 1999).

Extension Education and Sustainable Water Resources Management (SWRM)

The great challenge for the coming decades will be to increase food production with less water, particularly in countries with limited water and land resource. The effective and sustainable use of water for agriculture has become a global priority of vital importance, requiring urgent and immediate solutions in view of intensifying competition (Ommani and Chizari, 2006). Based of multiple researches training and education are a key input, and requirement, of sustainable development (Loucks, 2000; UNESCO, 2002; FAO, 2003).

The problem is not new and much research and investments have been made to develop more refined techniques and practices to apply water accurately to the crop according their requirements. There still exists a large gap between the availability of technologies for effective water use and the adoption of these technologies. One of the reasons is that relatively little attention is paid to establish an effective support system to assist farmers in the adoption and properly operation of new techniques and technologies.

Extension services can play an importantly role in assisting users to adopt new techniques and technologies for more efficient water use and increased production. Such services can be provided by private, public or co-operative agencies. Increasingly commercial agencies can take over the traditional role of the public agencies, although often restricted to the more lucrative parts of irrigation sector. Critical in the promotion of irrigation advisory services is the financial sustainability of such institutes, as in particular in many developing countries inadequate funding is available to finance public services (Smith and Munoz, 2002).

Sivayoganathan and Mowjood (2003) at their research with title "role of extension in irrigation water management in Sri Lanka" highlights the dynamic role of extension in effective irrigation water management by farmers engaged in both surface as well as groundwater irrigation. Irrigation water management to be effective should meet the perceived needs of the three major stakeholders namely the farmers, the system operators and the policy makers. The recent trend is the transfer of irrigation system management from the government agencies to the farmer organizations. The farmer organizations should, therefore, be strengthened by training and by the provision of necessary legal, economic and social supports so that they could play an effective role in motivating farmers to become partners rather than mere participants in irrigation water management. On-farm water management technologies for effective water use should be demonstrated to farmers and they should be encouraged to adopt the same. The village level officers from both government and non-government agencies engaged in advising farmers in irrigated agriculture should be trained periodically so that they could perform their role effectively leading to greater agricultural productivity.

Powell (1977) claimed that the contributions, which an agricultural extension service can make to improve water management at the farm level, are very essential. To be able to influence farmers in developing countries it is essential to devise systems in which relatively unskilled extension staff can communicate to the large numbers of small-scale farmers. Patterns of crop-rotation must be simple and will frequently be constrained by subsistence requirements. To establish the type of technical advice needed and communications systems to support this advice it is necessary to identify the stage of development, the aptitude and innovativeness of the farmers involved in the project.

Extension activities based on the survey information were effective in creating awareness, but did not result in widespread change (Armstrong, 2000). Also, development options that have the potential to increase whole farm profit will invariably consider the potential to increase water use efficiency (WUE). At this regard, extension approaches are very important (Armstrong, 2000).

Smith (2005) pointed out, that through a participatory approach in extension, technical staff and other stakeholders put farmers in charge of water management at field and scheme level, promote the adoption of appropriate technologies and establish the necessary local capacity to put farmers in charge of water development and management. Participatory Training and Extension (PT&E) has proved to be an effective tool for this and to establish the appropriate support structure to assist and advise farmers in irrigation development and management. PT&E is in particular useful for small holder irrigation and in the case of irrigation management transfer programs.

Bruening and Martin (1992) at their research with title "farmer perceptions of soil and water conservation issues: implications to agricultural and extension education" claimed that the following conclusions were drawn from the findings of the study;

- Groundwater and water quality issues seem to be of greater concern to farmers than soil conservation issues.
- Field demonstrations and county meetings are useful techniques to use when presenting information about soil and water conservation issues.
- Farmers explain governmental agencies such as Soil Conservation Service, County Extension Service and state university specialists as the most useful sources of information regarding soil and water conservation issues.
- Farmers believe improved communications and education are needed to ensure proper management of chemicals used in agriculture (p. 53).

Andrzej (2006) presented direct relation between water management and farmer's education. Also, Molden (2007) stated, that investments are required to build knowledge and to reform and develop institutions. Education, research, capacity building,

and awareness raising are stepping stones toward better sustainable water management in agriculture. A new cadre of policymakers, managers, and extension providers is needed, with staff trained to understand and support producers in water management investments in farms and communities. But investments are not enough.

Molden (2007) claimed that, improving sustainable water management in agriculture requires learning by doing and a flexible, adaptive approach. Adaptive management is appropriate for variable resource in a context of continually fluctuating parameters. Adaptive management incorporates an understanding of the variability within systems, as well as long-term and slow-onset changes. It allows for management practices to be responsive to these variations, some of which can be rapid (Molden, 2007).

Loucks (2000) pointed out , that a "key to sustainable water resources management is the existence of sufficiently well trained personnel in all of the disciplines needed in the planning, development, and management processes"(p. 7). In regions where such a capacity is needed but does not exist, it should be developed. Training and education are a very important input of sustainable development. Capacity building is one of the most essential and important long-term conditions required for sustainable development. Sustainable systems development and evolution cannot be achieved without local expertise, an expertise that needs to be developed and to be transferred to each succeeding generation of professionals (Loucks, 2000).

Another important factor in sustainable water resources management is that the local people must not only be capable, but must also be willing to assume the responsibility for their water resource systems (Loucks, 2000). One of the drawbacks of a centralized dominating government that takes the responsibility for local system design and operation is that the local people become accustomed to looking to government for help, rather than to looking to themselves. The ideal local water resource managers are well-trained persons who know the behavior of that system, have experience with its floods and its droughts, and know the concerns and customs of the people of the region, a group to which they belong (Loucks, 2000).

In the late 1980s, it was realized that most technologies developed by researches alone were inappropriate for smallholder farmers (FAO, 2001). Farmer participatory research became the approach to adapt technologies to farmers' conditions and by the 1990s, to develop technologies together with farmers. Farmers were now seen as partners in research and extension, and the key players in the innovation process (Anyaegbunam, Mefalopulos and Moetsabi, 2004). The understanding that the main key to agricultural development is to enhance the farmers' management and problem solving capacity and the farmers' capacities to develop, modify and diffuse new technologies and techniques themselves from farmer to farmer led to the development of Participatory Extension (FAO, 2001).

FAO (2001) also claimed that for successful and sustainable introduction, use and improvement of water control techniques and technologies farmers should be encouraged to analyze their problems, search for solutions, monitor and evaluate the selected and implemented techniques and technologies, and adjust them according to their constraints and opportunities. Participatory Training and Extension in Farmers' Water Management (PT&E-FWM) aims to ensure a sustained support to farmers in this process (Kay, 2002).

The Speed of light
A Fundamental Retrospection to Prospection

Narendra Katkar
Author – Investigator – Analyst, Founder-Chair

Abstract: Speed of light can not be achieved independently by any Body even a Photon, unless it has a source, a thrust of that speed. Further, no amount of radiation or light form can be produced *freely*, unless some amount of (mass) rest energy is converted to dynamic liberated energy. With the investigation of above query and retrospection in mass- energy relation, a paradigm shift in understanding fundamental nature of Energy and Universe is presented. [Narendra Katkar. **The Speed of light - A Fundamental Retrospection to Prospection.** Journal of American Science 2011;7(5):113-127]. (ISSN: 1545-1003). http://www.americanscience.org.

Key words: Light Speed, photon, electron positron interaction, Energy, Universe

Introduction

Physics is a natural science and attempts to present general analysis of nature; carried out with the purpose to understand how the universe works. (Feynman, Leighton, Sands (1963), Maxwell (1878), Young, Freedman (2004), Holzner (2006).

Philosophy of physics is the examination of the fundamental aspects of physical world and philosophical questions are primary in modern physics, with it the understanding of matter and energy and their interactions. (Bohr, (1958), Penrose (2004), Butterfield, and Earman, (2007), Craig, and Nick, (2001), Deutsch, (1997), d'Espagnat, (1989, 1995, 2006), Bohm, (1980), , Lawrence, (1992), Stenger, (2000), Weizsäcker, (1980), Rosenberg, (2006), Godfrey-Smith (2003), Godfrey-Smith (2003).

Many physicists, Laplace, Erwin Schrödinger, Roger Penrose, Stephen Hawking, have expressed ideas concerning the philosophical inferences of their work, Hawking calls himself as an "unashamed reductionist" and discusses the subject with Penrose's views. (Laplace, (1951), Schrödinger, (1983, 1995), Hawking and Penrose (1996), Penrose, (2004), Penrose, Shimony, Cartwright, Hawking (1997).

After foundation of Quantum Mechanics, mathematical formulations has been of ever increasing applications in theoretical work and now accepted as Mathematical physics. (Geroch, (1985), Szekeres, (2004), Yndurain, (2006), Aslam, Hussain, (2007). Although, it was much earlier articulated, that mathematics does not thoroughly describe the nature of Reality.

Albert Einstein, *"as far as the laws of mathematics refer to reality, they are not certain; and as far as they are certain, they do not refer to reality."* See note.

The scientific community has responsibility to communicate to citizens of the world and the governments, the exact nature of fundamental features of their work and must enlighten all, of any uncertainty about cognizance of the phenomenon.

The following article of fundamental physics is an attempt to communicate to specialists, students, experts of other fields, governments and the citizens, the basic aspects of Energy and Universe, in an unambiguous language.

The Speed of light

"... *The most accurate standard for the meter is conveniently defined so that there are exactly 299,792,458 of them to the distance travelled by light in a standard second...***"** (Penrose, R. 2004, pp 410–1).

This is approximately 186,282 miles or 299792.458 km per second in vacuum.

Speed of light had historical investigations, which are the basis of scientific endeavors of individuals, concerning one of the most influential branches of physics, the light. (Galilei, G (1954) [1638], Rømer, O (1676), Newton, I (1704), Halley, E (1694), Fizeau, HL (1849), Foucault, JL (1862), Michelson, AA (1878), Newcomb, S (1886), Perrotin, J (1900), Michelson, AA; Pease, FG; Pearson, F (1935), Froome, KD (1958), Brillouin, L (1960), Evenson, KM; *et al.* (1972), Jackson, JD (1975).

Finally, the velocity of light in meters was determined by International Bureau of Weights and Measures (2006).

The question, never asked, is, *"How the light achieves such a speed? What is the source of that speed?"*

Einstein illustrated the equivalence of mass and energy. (Einstein, 1923, [1919] 1982). According to Einstein's equation $E = mc^2$, the energy E of a body is quantitatively equal to the product of its mass m and the speed of light c squared, or all mass has energy equal to its energy content. We might simply say all Mass is Energy. Or again, in relativity, rest mass is proportional to a body's rest energy, E=m, meaning the rest mass is the energy in the rest frame**.** (Flores, F. 2005).

The general illustration of Einstein's equation is in the interaction of sub-atomic particles. When an electron interacts with a positron, both particles are entirely annihilated; in reality, their mass is converted into a pair of gamma ray photons (Dirac, 1928, 1930, 1931).

This conversion of mass of electron e^- and positron e^+ into two photons is emblematically written as:

$$e^- + e^+ \rightarrow \gamma + \gamma$$
The overall energy of the two photons is equal to the amount of the (theoretical) kinetic energies of the electron and positron in addition the sum of the rest-masses of the two particles, multiplied by c^2. This raises many questions.

c^2 is a quantity, can be calculated in joules. c^2 = (299,792,458 m/s)2 = 89,875,517,873,681,764 J/kg ($\approx$9.0 × 1016 joules per kilogram).

"C" is also a symbol for light speed, which is 299792.458 km per second in vacuum. When this quantity is applied to "mass", it becomes messy.

Historically, many thinkers were involved in conceptualizing the mass – energy relation; S.Tolver Preston in 1875 gave Eα Δ mc2, (Preston, 1875), Poincarè in 1900 said mv = (E/c2)c, Poincaré, H. (1900), **Olinto** De Pretto who speculated E=mc2 in 1903-1904 (Pretto, 1904; Bartocci, 1999), Fritz Hasenöhrl in 1904 m= 4E/3c2 (Hasenöhrl, F. (1904), Einstein in 1905, 1923, Δm=L/c2 (Einstein in 1905, 1923), Planck, M, 1907. m-M = E/c2 in which the mass increased by absorbing heat (Planck, 1907, 1908), finally, the equation E = Mc**2** remained in Einstein's name.

Above interaction $e^- + e^+ \rightarrow \gamma$ $+ \gamma$ is instantaneous. The interacting particles have no net linear momentum before the interaction. This interaction achieves velocity "c" by self inter-acceleration, equal to c in a Planck time, symbolized as *tp,* which is $10^{-44.}$ Sec. (Plank Time: 2005) and the emitted photons have the speed of light.

Paul Dirac, theorizing electron-positron annihilation said, *"Such process is spontaneous, i.e. it occurs necessarily for any pair of electron and positron independently of their energy. The process does not need any previously existing radiation."* (Dirac, 1930, Heitler, 1954).

If there is no previously existing radiation and no net linear momentum with the pair electron-positron, then what is the real rest energy of electron and positron without association of kinetic energy?

"S*pontaneous*" because of particle's intrinsic attributes which are of opposite nature. Once the particles come in contact, there is nothing to hold back, neither any acceleration required.

In fact, this is an inverse interaction of negation of quantum attributes. Particles negate their charge, magnetic moment and angular momentum devoid of kinetic energy. The canceling of quantum attributes leads to the conversion of rest energy into active liberated Energy.

The Planck time, *tp* is$10^{-44.}$ Sec, where light travels in a vacuum at a distance of 1 Planck Length *lp*, which equal to 1.616252(81) ×10^{-35} meters. Classical electron radius is r_e = .817 940 2894 x 10^{-15} m. The negation interaction of above particles has same radius each, the cancellation of the same occurs in a Plank time, *tp,* in Dirac's expression, "*spontaneous*"**.**

Application of the Plank time was also conceptualized by Stephen Hawking (1974-1975)**,** who hypothesized the Evaporating Black Holes by particle pair annihilation.

c^2 is an imaginary quantity and has nothing to do with velocity in practical term, neither the quantity is exact, when applied with assumptions of mass increase. The real energy liberated from a mass is always equal to its natural energy content at rest.

$E = mc^2$ suppose to give estimation of energy out put. Example one gram of mass will generate energy out put equal to 21kt of TNT. This is based on calculation: **c^2 = (299,792,458 m/s)^2 = 89,875,517,873,681,764 J/kg ($\approx$9.0 × 10^{16} joules per kilogram).**

Is c^2 a conversion factor? This has gone terribly wrong.

The physicist at the Manhattan Project participant Serber, Robert, (1992) said: *"Somehow the popular notion took hold long ago that Einstein's theory of relativity, in particular his famous equation $E = mc^2$ plays some essential role in the theory of fission… but his theory of relativity is not required in discussing fission. The theory of fission is what physicists call a non-relativistic theory, meaning that relativistic effects are too small to affect the dynamics of the fission process significantly."*(See also Note: Conversions used)

SLAC: *"Look at an example of how this energy unit works. The rest mass of an electron is 9.11 x 10⁻³¹ kg. Using E = mc2 and a calculator we get:*

E = 9.11 x 10⁻³¹kg x (3 x 108 m/s)2 = 8.199 x 10⁻¹4 joules, convert the joules to electron volts. This gives the mass of an electron as 0.511 MeV (about half a million eV). So if you ask a high energy physicist what the mass of an electron is, you'll be told the answer in units of energy. You can blame Einstein for that!" (Special Relativity: SLAC).

This is not science.

Laboratory produced Positron was having only 85 eV kinetic energy and detected electron–positron pairs from a surface on which the low energy positron beam was impacted, confirmed energies of pair particle Ee+ + Ee−, in the range of 30 to 90 eV only. (Van Riessen et al. 2008)

Above induced positron and produced pair are not at rest.

A Laboratory produced Positron can have an energy of just 85 eV and by multiplying with the uncertain factor "c2", the rest energy of same particle, without linear momentum, suppose to be 511 keV. Indeed, this is a clear case of incongruity. Fundamentally, what are we calculating?

We neither have real rest energy of an Electron or Positron, nor do we have the particle at the speed of light to measure its total energy.

Extraordinary conclusion was drawn on the basis of the energy of motion W of an electron by Einstein, with equation:

$$\mathbf{W} = \int \epsilon \mathbf{X}\,dx = m\int_0^v \beta^3 v\,dv$$
$$= mc^2\left\{\frac{1}{\sqrt{1-v^2/c^2}} - 1\right\}.$$

Einstein said: *"Thus, when v = c, W becomes infinite. Velocities greater than that of light have--as in our previous results--no possibility of existence. This expression for the kinetic energy must also, by virtue of the argument stated above, apply to ponderable masses as well."* (Einstein, 1905).

The fallacy is mass approaches infinity as the velocity v approaches the speed of light c. In other words, it will require infinite energy to move a body at the speed of light c. (Okun, 2009).

We use special relativity with the misconstrued idea of mass increase, which gives numerical value drawn from c2 quantity to measure a particle mass, because it is impossible to evaluate mass of an immobile electron, so the measurements are carried out on electrons in motion or for that matter, all measurements on all particles are carried out with the same method of erroneously conceived relativistic mass.

The values of Planck constant, the fine structure constant and the Rydberg constant are applied to calculate the electron rest mass in kilograms (Mohr, et al. 2008).

As early as in 1938, the experiments conducted on electron deflection by magnetic and electric application, confirmed no significant distinction in mass. (Zahn and Spees, 1938)

Mass of Electron does not increase with velocity.

This implies that if mass does not increase as the velocity v approaches the speed of light c, then very fundamental basis of *'kinetic energy'* is also questionable.

Foundations of the concept of kinetic energy established by Gottfried Leibniz and Johann Bernoulli, who described kinetic energy as the living force, vis viva. Willem's Gravesande of the Netherlands provided experimental evidence of this relationship (Zinsser 2007). Gaspard-Gustave Coriolis, in 1829published the paper titled Du Calcul de l'Effet des Machines, resented the mathematics of kinetic energy. William Thomson, later Lord Kelvin, is given the credit for coining the term "kinetic energy" c. 1849 - 1851. (Smith and Wise. 1989, Merz 1912).

According to Newtonian kinetic energy in classical mechanics, the kinetic energy of an object is related to its momentum by the equation:

$$E_k = \frac{p^2}{2m}$$

Relativistic kinetic energy, according to Einstein's theory, when a body's speed is a significant fraction of the speed of light, the calculation of its kinetic energy is given by:

$$p = \frac{mv}{\sqrt{1-(v/c)^2}}.$$

And the effort exhausted accelerating an object from rest to a relativistic speed is:

$$E_k = \frac{mc^2}{\sqrt{1-(v/c)^2}} - mc^2.$$

This equation shows that the energy of a body come close to infinity as the velocity *v* approaches the speed of light *c*.

A particle of mass **m** traveling at speed *v* has kinetic energy is: $E_k = \frac{1}{2}mv^2$.

The objects comprising many particles, the kinetic energy is the sum of the kinetic energies of the particles of the compound system.

The pertinent question is, "Is there, in real terms, a quantity called Kinetic energy?" Or is it only a *transfer of velocity* by exhaustion or dispersal of energy in surrounding by the system in momentum?

The measure of a unit of momentum, in high-energy physics, in electron-volt is regularly used. A potential difference of one Volt causes an electron to put on a separate quantity of energy, kinetic, which is one eV.

In other words, the electron volt is a unit of energy equal to roughly $1.602 \times 10^{-}19$ Joule, which is equal to the amount of kinetic energy suppose to gain by a single released electron accelerated through an electric potential difference of one volt.

This misconstrued rise of energy is applied in terms as eV, keV, MeV, GeV, TeV, and some day in future in PeVs, as units of momentum calculated as increase of energy resulting from acceleration of the particle.

It is extremely misleading with misrepresented theory of mass increase by calculating the (mass) unknown rest energy of a particle in momentum, multiplied by imaginary increase of energy (or mass) with the term "kinetic energy" and again multiplied by imaginary quantity c2.

In fact, the body with momentum is releasing energy called "kinetic energy".
An accelerated quantum is radiating, there by dissipating its rest energy.

A body of about 102 grams, moving one meter releases 1 joule of energy.

Even human body at rest releases 1 joule of energy in a hundredth of a second in the form of heat.

A 50 kg mass moving at 720 meters per hour emits 1 joule of energy.

A tennis ball moving at 23 km/h also releases 1 joule of energy. (Ristinen & Kraushaar 2006).

Hence the term: **m = E/c2**

This also means:
Heavier elements become lighter by conversion of partial rest energy to radiation.

Retrospection:

Poincaré observed that the action/reaction theory applies for matter and the electromagnetic field, which has its own momentum. He called this, electromagnetic field energy a fictitious fluid ("fluide fictif") with a mass density of **E / c² (m = E/c²)**. Einstein's showed that a body losing energy as radiation or heat was losing a mass of the amount **m = E / c².** (Poincaré, 1906, Darrigol, 2005).

In his famous 1905 paper '*DOES THE INERTIA OF A BODY DEPEND UPON ITS ENERGY-CONTENT?*'

Einstein said: **"If a body gives off the energy L in the form of radiation, its mass diminishes by L/c². The fact that the energy withdrawn from the body becomes energy of radiation evidently makes no difference, so that we are led to the more general conclusion that. The mass of a body is a measure of its energy-content…"**

Now known as **m = E/c²**

Hindsight, in above equation, emitted energy E is mass m. Whatever the amount of energy E is, it is, indeed converted form of mass.

The speed of light

Above equation, **m = E/c²,** the emitted energy E is in fact the converted E, can be a photon and photon is having the velocity **c** and has the source, the **mass**. Hence, the energy of photon is equal to energy of converted mass; so also, the velocity of photon is achieved at the source, i.e. **at the moment of conversion of mass into energy.**

Therefore, E = mc, with it m = E/Eo, means without total rest energy Eo at velocity c and velocity c = E/m is the converted state, in first and last expression c is a **conversion factor, not a numerical multiplication factor.**

The quantity of E depends on energy content of transformed rest energy.

The "c2" factor is redundant and must be eradicated from all applications.

E = Mc
M at the speed of light **c** is Energy **E.**
The "c" is not a numerical factor. It is felicitator of conversion.
Consequently, each (mass) energy packet can be converted to electromagnetic energy at the speed of light.

Application of algebraic symbols and numerical values are completely misleading. There are umpteen numbers of possibilities of energy emission of multiple frequencies, correspondingly large number of opposite fractional charge emissions.

This is elucidated in later sections.

If correctly understood, in above described negation interaction, the total mass of e^- and e^+ is converted into energy when the interaction reaches velocity of light. Otherwise the total (mass) energy content should never be converted into gamma ray photons and the photons should never have the velocity **c.**

Hence the equation, for the above convergence must be:

$$(e^- \leftrightarrow e^+)\, c = 2\gamma$$

The symbol "$\leftrightarrow$" here used for interaction and charge attraction.

In electron-positron interaction, their mutual attractive force, created by opposite charges, is so strong that the spin-spin fission of the intrinsic angular momentum of both particles is accelerated to maximum, a ***self-acceleration*** in the point of contact. This is one of the most violent interactions in Universe, where the collective interactive momentum attains, extraordinary as it may sound, instantly, the speed of light.

Photon is a product, hence, like all products; the carried attributes are acquired from the source. In case of energy of gamma ray photon, it is acquired from e- and e+ interaction, the energy acquired is equal to energy of a single particle, which is 0.511 MeV (given by questionable c2 factor), (Mohr, 2008) and total energy of both particles is 1.022 MeV. The spin angular momentum is also converted from spin **½** of electron positron to spin 1of photons. In other words the net angular momentum is conserved.

Accordingly, the Speed of light is also acquired at the point of conversion, which is from sum total of angular and attractive force momentum acceleration of inverse negation.

$$(e^- \leftrightarrow e^+)\, c = 2\gamma$$

Above conversion declares:
At the velocity c, the mass does not increase to infinity. It transforms into radiation.

In retrospection, the photon is not carrying the equal charge and magnetic moment of the (mass) rest energy, which is transformed into radiation Energy. It does have electromagnetic field.

Differing to such event, by total deceleration of canceling intrinsic attribute, the phenomenon collapses in non quantum state, called *"Vacuum State"*.

Ultimate Point of integral deactivation is by total dissolution of intrinsic angular momentum. This is Absolute Conversion of quantum to non quantum state, in other words, finite to infinite state of Energy.

The idea above is extrapolated in last section.

Retrospection continued:

Einstein often had recollections of the implications of special relativity and made statement, "inert mass is simply latent energy." and did not mention relativistic mass. (Einstein, 1956). Einstein derived E=mc2 with some ambiguity that "E is the energy contained in a stationary body." (Einstein, 1976).

The idea of relativistic mass got stuck in text books, with experts, students and public as E=mc2, though the meaning of that equation was messed-up.

Einstein in his May 1921 lectures at Princeton, said that "Eo = mc2 and with c set equal to one, the energy, Eo, of a body at rest equals its mass." (The Collected Papers of Albert Einstein, 2002; Einstein, 1922).

"…many textbooks and articles credit him with the relation E=mc2, where E is the total energy, m is the relativistic mass, and c is the vacuum speed of light. Einstein never derived this relation, at least not with that understanding of the meaning of its terms." (Hecht, 2009).

Many thinkers have tried to clarify the fallacy of E = Mc2. Yet, the misconception is still clinging with experts and public. (Okun, 1989; Rindler, 1990; .Vandyck, 1990; Kolb, 1966; Adler, 1987; Aubrecht II, 2004; Easton, 1988; Hobson, 2005; Carson, 1998; Warren, 1976; Atkin, 2000).

"…modern representations of relativity, it is urged, once again, that the use of the concept at all levels be abandoned." (Oas, 2005).

In physics, the Lorentz force is the force on a point charge due to electromagnetic fields. Maxwell provided the equation for the Lorentz force in relation to electric currents. (Huray 2009)

The modern Maxwell's equations explain how electrically charged particles and objects give rise to electric and magnetic fields and the Lorentz force law summarizes above explanation by describing the force acting on a moving point charge in the presence of electromagnetic fields.

Maxwell's equations, *"together with the Lorentz force law...summarize the entire theoretical content of classical electrodynamics".* (Jackson, 1999 and Griffiths, 1999).

In electrodynamics, the Larmor formula (Larmor 1897, Jackson 1998) calculates the total of radiation by a nonrelativistic point charge as it accelerates. Any charged particle (an electron), accelerating or decelerating radiates away energy in the form of electromagnetic waves.

Bremsstrahlung also refers to radiation due to the acceleration of a charged particle. (Griffiths 1999, Haug & Nakel 2004).

Yet another aspect of motion of electron, conceived by Erwin Schrödinger in 1930, called *"Zitterbewegung"* as a result of interference between positive-negative energy wave constituents. This interference between positive and negative energy states generate a fluctuation, surprisingly at the speed of light, at the location of an electron around the nucleus, giving a circular frequency of 2mc2 / hbar, which is around 1.6×10^{21} Hz.

All above concepts illustrate that all forms of (mass) rest energy radiate, either by acceleration or interaction, even at ground state.

Accelerated charge must radiate, there by losing its rest energy through radiation.

An alpha α hits an atom or other high-speed radiating charged particles knock off electrons out of atoms and release large number of accelerated electrons called δ delta rays. The term was used earlier by J.J. Thomson. With these of positive charge δ delta rays are also emitted. Electron and positive charge interact and convert to radiation, that scatters in water and the blue light is seen. The case of Cerenkov radiation, velocity higher than the speed of light is misconstrued and not compelling.

During Radioactive decay process, as in case of internal conversion is defined as $\alpha = e / \gamma$ where e is the rate of conversion electrons and γ is the rate of gamma-ray emission. Example, the nucleus of 125I, 7% of the decays emits energy as a gamma ray, while 93% release energy as conversion electrons. Therefore, this excited state of 125I has an internal conversion coefficient of $\alpha = 13.6$.

It is assumed that a core electron is detached; creating a vacancy, an electron from a higher energy level falling into the vacancy, releases energy. This energy is released in the form of a photon, at the same time many photons knock-off other electrons, from the atoms. All radio active process is stochastic. This second evicted electron is called an Auger electron (IUPAC, 2006). Auger electrons also emitted when an electric field is produced within an atom's electron cloud on account of loss of another electron, which further creates acceleration and eject yet other electrons of the atoms orbital electrons.

In fact, there large electrons or negative charges emitted by radio activity and positive charges are also accompanied, released in opposite directions.

In particle accelerators electrons or other accelerated particles will lose their energy rapidly than other particles through Bremsstrahlung or simply, by radiating, which takes place not only during particles in flight but also in measuring devices like bubble chamber and other detection device materials like lead plates or walls, Freon gas or argon gas.

Has "Quantum electrodynamics" really solved the problem raised by Maxwell equation, i.e. accelerated charge must radiate? (Nahin, and Heaviside, [1861] 2002).

An experiment stimulated by using microwave techniques of radio-frequency transitions between 2S1 / 2 and 2P1 / 2 levels of hydrogen, in 1947 by Willis Lamb and Robert Retherford was performed to measure the interaction between the electron and the vacuum. The result showed the small shift in energy level is known as Lamb shift. This gave foundation for the contemporary QED theorized by Julian Schwinger, Richard Feynman, and Freeman Dyson. (Lamb et al. 1947)

The "Zitterbewegung" caused by interference between positive- and negative-energy waves components, also seen in stochastic electrodynamics that the Zitterbewegung is an interaction of a classical particle with the zero-point field. (Henning Genz 2002).

Zitterbewegung by another viewpoint also describes the Lamb shift, where the "Zitterbewegung" term disappears and the anticipated values for wave-packets which are of totally positive or negative energy waves, by applying a Foldy Wouthuysen transformation. (Foldy-Wouthuysen: website)

The fundamental aspect of QED is the description of light and matter interactions. QED is a mathematical theory which tries to describe all experience concerning electrically charged particle interactions by exchange of photons. (Feynman, 1985).

Richard P. Feynman, in his series of lectures on QED for public (Feynman, 1985) presented a classic non-mathematical exposition of QED.

The three basic actions relating central mechanisms of Feynman's presentation of QED are:

1: "A photon goes from one place and time to another place and time".
Yes, it does.

2: "An electron goes from one place and time to another place and time".
It may but under some conditions. .

3: "An electron emits or absorbs a photon at a certain place and time."
No, absolutely not.

The extraordinary effort to mathematically formalize the theory does not satisfy the required understanding of physical nature of phenomenon.

The mathematicians Henri Poincaré argued that the laws of science did not relate to the real world at all, but signify random conventions intended to support a supplementary suitable and "functional" depiction of the analogous phenomenon.

The unrelenting critic of QED was Dirac. Recently in 1975, he said,

"I must say that I am very dissatisfied with the situation, because this so-called 'good theory' does involve neglecting infinities which appear in its equations, neglecting them in an arbitrary way. This is just not sensible mathematics. Sensible mathematics involves neglecting a quantity when it is small – not neglecting it just because it is infinitely great and you do not want it!" (Kragh, 1990 p 184).

Feynman, even though had played significant role in the development of quantum electrodynamics, said in 1985:

"The shell game that we play ... is technically called 'renormalization'. But no matter how clever the word, it is still what I would call a dippy process! Having to resort to such hocus-pocus has prevented us from proving that the theory of quantum electrodynamics is mathematically self-consistent. It's surprising that the theory still hasn't been proved self-consistent one way or the other by now; I suspect that renormalization is not mathematically legitimate". (Feynman, 1990).

Close observation shows that:
There is no Electron around the Nucleus; therefore there is no possibility of some 'thing' called electron absorbing and emitting photon.

How does an atom emit radiation?

Vacuum-Zero Point Energy

Using Max Planck's formula (Planck, M. 1900), Albert Einstein and Otto Stern published a paper in 1913 (Einstein (1913), suggesting that an atomic system, an oscillator subsists a residual energy or vibrational energy at absolute zero equal to energy of $\frac{1}{2}h\nu$. They named this lingering energy as ***"Nullpunktenergie"*** in German, meaning zero-point energy. (Laidler, 2001).

This absolute zero is not a temperature less state; rather it was considered for ground state or the lowest energy state, also called *zero-point field*, (Gribbin,1998).

Since then, many attempts and interpretation of Zero point Energy (ZEP) have been reported. (Nernst, (1916).Marshall, (1963), Sakharov, (1968), Boyer, (1975), Boyer, (1980). Boyer, (1985), Haisch, et al. (1994), de la Pena, and Cetto, (1996). Rueda and Haisch (1998), Sciama, 1991), Haisch et al. (2001), Rueda and Haisch, (2005). de la Pena, and Cetto, (2005)**.**

The lowest possible energy, the energy at ground state of a quantum mechanical system is called Zero-point energy. All quantum mechanical systems go through fluctuations in ground state, which have associated zero-point energy, based on the Heisenberg uncertainty principle.

The uncertainty principle of all physical systems expects, even at absolute zero temperature, a zero-point energy that is greater than zero. Liquid helium-4 (4He) remains unstable liquid and does not freeze, at lowest laboratory temperature, because of its zero-point energy.

A molecule in atmosphere has energy of around 0.03 eV which corresponds to room temperature.

Therefore, fundamentally, there is no absolute inertia in physical world. All physical phenomenons are active and radiating.

To exist (physically) is to be active and thereby radiate.
Again, this means:
Heavier elements become lighter

At what moment, the becoming of lighter side is not known, yet it does.

We describe Energy with attributes and properties, hence finite aspects of Energy. We do not know, *what Energy is?*

A paradigm shift?

In reality, c is a finite speed; hence a mass requires same finite speed to travel at that velocity. Only difference is, at the speed of light, the mass, which is in fact a packaged energy, is transformed into dynamic liberated energy. "Packaged Energy" term is not to be confused with older term used by Plank for radiation quantum. In 1900, Max Planck working on radiation suggested that the energy in electromagnetic waves could be released in "packets" of energy; he called these packets "energy elements" (Planck, M. (1901).

More proper term would be "Quantized Energy" for each particle.

We can totally cancel the misnomer "***mass***" and also the imaginary quantity "***c^2***". All particles are ***Quantized Energy*** and atoms are composite packets. All dynamic energy, i.e. radiation, light, photons are released energy from these packets. Hence:

"*Everything essentially is Energy*"

Hence, the equation is:

$$E = E_0 c$$
Or
$$E_{rel} = E_0 c$$

Where, E_{rel} is, released converted energy, equal to the amount of rest energy, E_0 is quantized rest energy and c is speed of light. Again "c" here is a conversion factor, not quantitative multiplication factor. For the partial release of energy **E** would be:

$$E = E_{rel} / E_0$$
The actual rest energy E_0 is never known.

In fact, this is applicable as the second law of thermodynamics which describes the Entropy. That is a measure of the energy not accessible for practical work in a thermodynamic progression (Haddad, Chellaboina, VijaySekhar; Nersesov, 2005). In other words, as stated above, the released energy is lost and never returns to its original state, which was the quantized state.

The Planck constant was first described as the proportionality constant between the energy (E) of a photon and the frequency of its associated electromagnetic wave (ν)

The Planck constant $E = h\nu$ has the value $4.13566733(10) \times 10^{-15}$ eV.s.

In case of light quantum, Photon, supposed to be of zero mass, a calculation was made by testing Coulomb's law to very high precision. (Plimpton, Lawton, 1936), then unacceptable result of an experiment has given a maximum value of photon mass, $m \lesssim 10^{-14}$ eV/c2, (Williams et al.1971), now accepted value, based on galactic vector potential to measure the torque wielded on a magnetized ring (Lakes, 1998), gave an upper limit, reported by the Particle Data Group, is 1×10^{-18} eV/c2, (Amsler, 2008).

Considering this mass of photon as 10^{-18} eV to be real, then with the conversion factor c, this energy is the *released energy* of an electron and positron, each having rest energy equal to 10^{-18} eV or of $4.13566733(10) \times 10^{-15}$ eV These have to be the fractional charge particles, called quasielectron and quasipositron.

The quasiparticles based on a theory formulated by Robert Laughlin (Laughlin (1983) to explain the fractional quantum Hall Effect. Their charge can be of lesser amount than the electron charge e. Observed results are, as fractions of electron charges of e/3, e/4, e/5, and e/7 or one-third, one-fifth, one-seventh - or indeed, two-thirds, two-fifths or three-fifths etc. (Fractional charge, 1997), Stormer, 1999).

Consequently, these fractional charge quasiparticles must also have associated fractional mass of electron, a "*Nanomass*", nothing to do with the units of measure 10^{-9}. We should expect numerous odd denominators of these fractional masses (Lou, 2003), which in turn have fractional rest energy associated.

According to quantum mechanics, the wave equation, as developed by Schrödinger in 1926, allows us to determine a probability that an electron will be located at certain point when a measurement is made. The electron exists in a probability distribution or probability density, which appears to be rather fuzzy. This fuzziness is termed as "electron cloud." (Web: science.)

Atomic orbital is a mathematical function that describes the wave-like behavior of either one electron or a pair of electrons in an atom, (Milton et al. 2005) some times called "atmosphere" around nucleus of an

atom. If an extra electron is added to a single atom, the additional electron has a propensity to uniformly fill up a volume of space around the nucleus so that the resulting collection, termed as the atom's "*electron cloud* " (Feynman, 2006) likely to be in a general spherical region of probability relating where the atom's electrons will be found.

In fact, each point in the *"electron cloud"* contains the possibility, not only of an electron, but also of varied *"Quasielectrons"* each with fractional charge. It depends on what and how much induced impact is created, either atomic interaction or external injection, on the *"cloud",* whereby the separation of an electron or a quasielectron takes place.

The implication of quantum mechanics, as seen above is that the structure of atom is a nucleus with a "cloud" around. There is no way to determine the electron as a particle, its rest position and mass.

In fact there is "no electron" around the nucleus and an atom being a neutral phenomenon, consequently there "no charge" with the cloud and the nucleus.
The observed charge is a change of state, a transformation, including a positron.
A photon of any energy does not create on its own a positron; it is the atomic neutral phenomenon ejects the electron and positron or polarized emission.
Positron is not a freely created particle, even out of vacuum state.

Matter has property of Polarizabilities, which establishes the dynamical reaction of a bound arrangement to exterior fields, which gives insight of the interior organization. (Zhou; et. al. 2002)
In physics, polarity is a description of a binary attribute or a direction,
An electrical charge has a polarity, a voltage has a polarity, a magnet has a polarity, the spin in quantum mechanics has a polarity and quantum mechanics describes photon polarization as the sinusoidal *(having a magnitude that diverges as a sine curve)* plane of electromagnetic wave.

The other way to approximate the real rest mass quantity is by the observed electromagnetic quantity. As already understood above, all radiation has to be transformed form of some mass quantity or quantized energy.

Therefore, when we observe electromagnetic frequency of an amount of 1.24 eV, which is the visible light or about 1.6 eV to 3.27 eV(Molinaro, 2006), it is certain that an energy packet (mass) of 1.24 eV is converted to radiation. This is the partial quantity of "Electron Cloud" or of two opposite charge "cloud" parts in waves, quasielectron and quasipositron waves, which had energy content equal to 1.24 eV.

A photon with a wavelength of 532 nm (green light) would be the converted form of about 2.33 eV rest energy. Likewise, 1 eV rest energy would be equal to an infrared photon of wavelength 1240 nm.

This is given in:

$$E(\text{eV}) \approx \frac{1240\,\text{eV nm}}{\lambda\,(\text{nm})}$$

Consequently, all observed electromagnetic quantities, from Gamma rays of 1.24 MeV or above energy to extremely low frequency as low as 12.4 feV **(Femto or Quadrillionth of 1 eV)** are effectively converted energy contents of varied "electron - positron cloud" waves, partially or entirely.

Instead of creating panic of atomic structure may collapse, by conversion of electron, quasielectron or negative-positive charge transformation to energy, it would be extremely crucial to understand the nature of Vacuum Infinite Energy, also called Zero Point Energy and its relation with observed phenomenon.

Out of Vacuum

In quantum field, the vacuum condition is the quantum state with the lowest possible energy which has no material particles. The vacuum state of a quantized field is also called Zero-point field.

The vacuum state or the quantum vacuum is considered as "by no means a simple empty space" (Lambrecht 2002). The vacuum state holds ephemeral electromagnetic waves and particles burst into and out of existence. (Dittrich & Gies 2000).

A hypothetical massive scalar elementary particle, called Higgs boson, predicted by three groups of physicists: François Englert and Robert Brout; by Peter Higgs, and by Gerald Guralnik, C. R. Hagen, and Tom Kibble, which is the part of the Standard Model and is a result of the professed Higgs mechanism, proposed in 1964. This supposes to elucidate how most of the known elementary particles acquire mass.

There are no identified elementary scalar bosons of spin-0 in nature. Although statistically, there are many composite spin-0 particles.

Theory of Higgs field also implies that quantum vacuum generates mass, in the form of virtual Higgs bosons, with which particles acquire their mass through interactions with a ubiquitous field carried by the Higgs.

In fact the standard model, the "Higgs mechanism" calculates the creation of masses for the W±, and Z weak gauge bosons in the course of electroweak symmetry breaking. (**Bernardi et al 2007**)

"Physicists have now confirmed that the apparently substantial stuff is actually no more than fluctuations in the quantum vacuum". **(Battersby 2008)**

The Large Hadron Collider (LHC) experiments at CERN are for confirmation of this Higgs field, which in turn will mean that the observed Universe is a virtual reality.

Prospection

To estimate probabilities of effects between elementary particles,

Feynman diagrams are employed, which involves perturbation theory, where the amount corresponds to an infinite series, i. e. an estimation of ever decreasing terms. In this series, a Feynman diagram is suppose to be an instinctive graphical depiction of a term.

A quantum mechanical or statistical field theory is represented in graphics by Feynman diagram, corresponds a perturbative input to the shift amplitude or association function.

In fact, Feynman diagram has no physical implication. It thrives to provide merely the infinite sum over all probable Feynman diagrams which present physical results. This infinite sum is usually only asymptotically convergent, which is a formula, appropriating progressively, more exactly, as a changeable approaches limit, often infinity. (Gribbin, 1997)

"In many cases, the particle number operator does not commute with the Hamiltonian for the system. This implies the number of particles in an area of space is not a well-defined quantity but like other quantum observables is represented by a probability distribution. Since these particles do not have a permanent existence, they are called virtual particles or vacuum fluctuations of vacuum energy." (Kaivarainen and Lehnert 2005)

It is too simplistic to conceive ideas like pair particle annihilation and creation through Vacuum or a virtual particle, as Feynman diagram thrives to establish (Kragh, 1999). There has to be list minimum

information of one intrinsic attribute in Vacuum state or with the Energy in vacuum state.

The most intrinsic to every quantum mechanical occurrence is the Spin value of the angular momentum and this has to be the fundamental comparative characteristic of observed phenomenon and Vacuum-Zero point energy. As the Zero Point Energy or Vacuum Energy is non-measurable and non-observable, consequently it is non-quantum mechanical. Ultimately, it is "*Spinless"* state of Energy or Absolute Inertia.

Though it is Absolute Inertia, it is an ephemeral state of Energy.

As earlier stated, in a certain condition, there is an ultimate Point of integral deactivation, which is by total dissolution of intrinsic angular momentum, the Absolute Conversion of quantum to non quantum state, in other words, finite to infinite state of Energy.

Is the information of physical system lost by the "**Spinless**" condition of Vacuum Energy, which is a consequence of dissolution, *"loss of spin"* of a quantum phenomenon in Vacuum State?

No. it does not.

An abstract model of quantum mechanics which is not current in classical physics postulated as total information about a system is prearranged in its wave function. A unitary operator determines the progression of the wave function. Unitarity means, the information is preserved in the quantum sense.

Since the beginning of all endeavors to understand universe, more than a century back or later, a simple common sense question should have been put by the scientific thinkers:

If we wish to know the origin of Universe, the question is:

What is the origin of first particle?

The answer is: *The origin of first particle is a no-particle state, where there was no quantum.*

That is, a non quantum state, which also means, "*attributeless*" condition.

The cosmic microwave background Radiation (Penzias and Wilson1965).of 2.725K is the evidence that lot of radiation has been already gone down to 0K, hence, we find the Emptiness behind the background radiation. 0K is a least laboratory measure of heat, around − 273ºC. It is not Absolute Zero, in the sense, there is no possibility of any degree of temperature measurement at all. There are also some anisotropies

observed in the cosmic background radiation. (White 1999, Wright 2004).

If infinite lifetime attributed to finite phenomenon, example, to a photon, then it should carry same energy frequency from its source till infinity. The skies and space all over Universe must be luminous, filled with clear observable radiation.

The observed microwave background radiation and observed red shift, a correlation between distance and recession velocity which is known as Hubble's law, (Hubble, 1929, Christianson, 1995) tells us that light is indeed reducing its intensity.

In other words, as it is known, *"attenuation"*, a decrease in property or gradual loss in intensity as energy wave flux or a beam of particles, as the distance from the source increases, due to interaction with medium, scattering, spreading in three dimensions, even without interaction.

The true meaning of Entropy is gradual loss of usability of energy.

Hence, the radiation reaching its intensity to Zero, the Energy reaches the Vacuum state. This is observed in the Intergalactic space between galaxy clusters, also called voids. (Freedman & Kaufmann 2008, Lindner, et al.1995).

The causal connection of Vacuum non-observable with observable and measurable quantum mechanical phenomenon is: Spin angular momentum.

Ehv (T=0) = So.
Loss of Spin of Radiation Quantum at Absolute Zero

Here *So* is Loss of Spin of radiation quantum at Absolute Zero (not laboratory measure), in fact, in nature, this transition is gradual. Energy in radiant form is fainting or weakening. Without Loss of Spin of Radiation Quantum, there should not be "night" and there will not be Voids or Emptiness between galaxies. This is the ultimate conversion of Energy, from observable to non observable state; and it is only a *"Change of State"*.

In fact, Energy in Emptiness condition is all permeating.

A photon is not an independent phenomenon also finite, it has a source. Hence, it carries the information of that Quantum source, which is transformed into radiation quantum.

By the *Loss of Spin* of radiation quantum at absolute zero, the final stage of dissolution of radiating

Energy in Vacuum carries the Quantum Information of the source of photon in Vacuum Spinless State.

In other words, Energy in Vacuum state has Quantum Information, which is a Cosmic Quantum Code (CQC).

This is in fact the origin, the Cosmic Primal Energy (CPE) with CQC.

Consequently, it is an ephemeral condition, in the sense that it is variable and regains spin angular momentum as a consequence of CQC.

Experimental laboratory and observed model of quantum information is extrinsic property. The Intrinsic property, "the Quantum Code" of Nature is Cosmic.

Energy devoid of CQC is Infinite Absolute inertia and that is purest form of Energy, non-finite, non-quantized and non-radiant.

The fundamental basis of Universe is a Law of Absolute Transformation.

We should not be surprised, if we find whole universe is spinning inside the non spinning Vacuum Energy. Energy content of observable phenomenon is sustained by all permeating infinite and non-dimensional Energy of Vacuum state, the Cosmic Primal Energy. We can not measure the lifetime of an atom or of a quantum either by measuring the (mass) rest energy content or by calculation of radiation emission by that quantum. The lifetime is related to its origin from Cosmic Primal Energy in Vacuum state, at the same time quantized state does not have infinite lifetime because it goes back to Vacuum Cosmic Primal Energy State by radiating.

The law of conservation of energy states that energy can neither be created nor destroyed: it can only be transformed from one state to another. This conversion still retains mass in non-matter energy form. (Taylor & Wheeler, 1992).

The extension of law of mass-energy conservation is the ***Law of Absolute Transformation*** with the examination presented here. Vacuum Energy, *VE*, is Spinless Non-quantum State of Cosmic Primal Energy with Cosmic Quantum Code, CQC, which means this condition is evanescent. The observed particles are quantized Energy, *QE*, as a result of CQC with angular momentum, and all electromagnetic radiation of all frequencies is released energy, RE, of quantized energy, which is, in fact, as already mentioned, transformed condition of energy content of *QE*.

The Universe is a process of Absolute transformation, from Cosmic Primal Energy, **CPE** *to Quantum to Radiation and back to CPE Vacuum State.*

$$CPE \rightarrow QE \rightarrow RE \rightarrow CPE$$

Energy is never created neither lost.

"Everything essentially is Energy"

What is Energy? ...!!!

Conclusion

Speed of light can not be achieved independently by any Body even a photon, unless it has a source, a thrust of that speed. Further, no amount of radiation or light form can be produced freely, unless some amount of (mass) quantized energy is converted to dynamic liberated energy.

It is also most fundamental to investigate and experiment on the basis of "Loss of Spin" theory given here, the nature of Vacuum Infinite Energy, also called Zero Point Energy, which will establish its relation with observed Universe, with the understanding that observed Universe *is* Vacuum Energy with *spin.*

Waste management in rural areas of Iran

Mortaza tavakoli [1], sadegh afrasiyab rad[2]

1. PhD, Faculty Member; Department of Geography, University of Zabol, zabol, Iran
tavakoli@uoz.ac.ir or tavakoly52@gmail.com
[2.] M. Sc student, Department of Geography, University of Zabol, zabol, Iran

Abstract: The most important role of health is providing physical and mental well-being for people of society. Today, the waste problem is focused less than any other environmental hazards such water and air pollution. Purpose of this study is recognition review and analysis state of waste production resources in rural areas of central rural sub city areas of Shiraz and Zabol counties. Research method in this study based on field observation, interviews, obtains data, from the questionnaire, and analyze data by SPSS software. Findings show that most produced rubbish in rural of Shiraz is paper and textile with 63%, maximum street rubbish is animal stool with 42%, and most market waste is vegetable with 69%. In comparing with rural of Zabol, maximum domestic waste is paper 38% and major rubbish production research is dust with 64%, maximum market rubbish is vegetables 58% and major amount of street rubbish is paper with 54%. There is a significant relationship between waste production amount and rural distance to city and between waste component and method of dispose it and distance to city. the studies done in the waste management in studied rural level, shows great part of human and finance resources spend collecting and transport and no action don in the fields of production, storage, recycling and disposal.
[Tavakoli mortaza, afrasiyabiy rad sadegh. Waste management in rural areas of Iran. Journal of American Science 2011;7(5):128-135]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: Environmental health; Waste production; Rural; How disposal; Iran

1. Introduction

There is close and interacting relationship between health and development. The public health importance of the resulting nuisance has not been sufficiently characterized (Aatamila and et al., 2010). Public health and cleaning the place is necessary for individual and social health and well-being as one of the main indicators of development (Darbanastaneh., 2008). In the developed (post-) industrialized word urbanity is often found to be related to health status of the population (Kroneman and et al., 2010). Nowadays, there is many health measures related to waste (production and how its disposal) (Ahler and still., 2002). Produce and how its disposal is considerable since man begin social live of a continuous one place and its hazards and its effects. Population growth is relevant to health as it is both an indicator of, and contributor to, changes to broader social and economic conditions of an area (Fraster and et al., 2005). Rapid population growth, increased consumption, changes in life style and consumption pattern of people, which is perfect features, enhance history caused increasing waste production in different regions. Principles of health and sanitation environment in any place requires that throw away waste produced in the minimum time and away from the homes and environment and human life to the principles and sanitary disposal the action as short as possible.

On of concerns of our society is the problem the amount of daily produced waste for urban households is about 700 grams and have been reported 500 rural household (Abdoli., 1995). In rural areas a mixture of waste and recycled material are buried in that have side effects on environment, pollution of soil and ground, water and air and to the lock of recycling of valuable material and burial also have the economic mistakes (Neal., 1995). physical and chemical composition and amount of waste produced resource change with factor such as different seasons, day of the week, nation and religious accessions, food habits, income level and other factors (Omrani., 1994).

Solid waste consists of any solid material that is considered mystics in public as trash, rubbish, ashes animal bodies, urban and rural waste, human and animal waste and .... (Behnodi., 2001) Wastes from a variety of source such as domestic resources, trade, urban, industrial, agricultural, open areas and refining are produce and enter the home environment (Fataei., 2006). According to this definition that we can say produced waste resources in rural are different, varied and numerous and effective factor in production, amount properties in the rural garbage can note to year time, geography site, producer people habits, study area and location, demographic characteristics, and public attitudes and behavior, income level and many of other problems. So produced waste (food, glass, plastic, paper and ...), street waste (leaves, straws dung ...) and rubbish (paper, cloth, sand ...) and ash (Basvantapa., 2003). The waste resources in the rural waste production ;

waste-rebated health plan can not occur in satisfactory way the disposal stage and type done how causes no discomfort and disease in the village level. Not sometime all factors of situation and waste production are quite clear each community may be has special social-economic factors that affect quality, composition and amount of waste produced. Therefore, for the recognitions of a community waste production situation, the comity must be studied. Also long-term waste production situation indicates community population changes, characteristic of community and changes in energy source (Shari at panahi., 1997).

1.1. Importance research

Even if high efforts of governments and international organizations, basic health needs of many world-disadvantaged people has still not been full filled. In many countries, less than percentage15 of rural have access to health services (Djukanovic and Mach., 1985). Including important health services, the problem is total waste collection and transportation and disposal it. Being non-healthy environment in rural poverty existence in those areas, lock of awareness of the causes of disease through rural waste, lack of health services related to waste produced materials in the rural. Lack or absence of perfect system for collect transport or waste disposal and all these cases of make an unsuitable and unhealthy environment in country rural. In other hand, existing pollution problem on earth and many of the harsh environments is part of problem that has caused for our attention less that is imposed to our live and it is reflected to us. Introducing to how waste is produced in the country deprived areas (rural) and control this waste solid material is a kind of combat to this choose existence of million tones of waste in rural areas an ten thousands types of toxic and hazardous materials in it that is resulted of human daily activities, is caused of wild speared pollution in this environment and this waste materials are cause of 60 to 90 percent of cancers, directly or indirectly (Ahmadi., 2005).

Lack of management and explicit rules for collection, disposal and recycling for more than 38000 tones waste per day that almost 76 percent conversion of fertilizer and thousand tones of plastic, paper and carton, now is burial in unsuitable form or are scattered around cities near rural areas and regardless to the health risks and produce types of disease, also has economic lusts. According to a total account, or people spend about 10 thousand us dollar for waste collection and disposal (Eskafi., 1995).

With regard to text and knowledge of this fact that, there is no attention to country's rural areas in terms of health, importance of this research will be

doubled. In general, the importance of the collecting, healthy sanitation and waste recycling in rural areas won't be cleared for us, until risk of is will be known well. Waste is not only cause of diseases, degrading and undesirability of environment, also can contaminate soil, water and air and make lot of damage in natural and social life cycle.

1.2. Problem research

Population growth an scientific awareness of producers of reduce land resources, forced officials and expert to puttee waste production issue and disposal them by recycling the solid waste materials on top of their programs, more serious in part two decades, specially since 1975. Therefore, with knowledge of resources of production the waste can do considerable helps to waste recycling. Therefore, principles of economic criteria requires that paper, carton, glass and plastic and other production resources be interdicted and separated before burial in a regional operation and be re-used (Dtjoelk., 2003). populate consumption, severs integration, increasing the amount of waste produce, wrong locate for burring waste, various disease caused by non sanitary waste disposal, multiple sources of waste produced in the rural, under ground water pollution, environment destruction and .... Areas. With regard to expressed issues related to environment hazards caused by waste produce and it's dispose method and importance of it in rural areas, there is little attention to this issue and with consider to economic and spends related to it we divided that present a research named an analysis of waste production resource and method of dispose it in Iran rural regions.

2. Background

Activity and movement, that are life requirement, has remained symptoms for makes his life continued. So cleaning environment especially in rural areas is necessity of life continue (Saeednia., 1999). Consider to waste dispose and clean the environment has old history. In 1750 requires new system of solid waste collection and disposal makes common using of waste caring lorry and waste management was considered as one of society health bases, with increasing health activities (Omrani., 1994). Furthermore, beginning of waste management regard to ancient years and reusing of human stool. In agriculture. Material management in modern methods has started in united state since 1940 decade and in England since 1930 decade (Gloss and et al., 2002). Many optimization techniques have been developed for supporting decisions of municipal solid waste (MSW) management and evaluating relevant

operation and investment policies since the 1960s (Li and et al., 2010).

In Iran, waste and cleanness management is delegated to municipalities in cities and to Dehyaries (nongovernmental organization) in villages. Undoubtedly, waste management and specially collection and exiting it from environment in cities older history compared to villages. This history in Iran is regarded to Baladiye law (municipality) in 1946 and according to this law city cleaning is duty of Baladiye (municipality) and then in 1955, this duty delegated to municipality, accordant to municipality law. In relation to villages, according to, article 69, paragraph 6 of organization duties and election Islamic councils law that is adopted in first of June 1996, Dehyar duties contains, care in doing health enforcement, maintain cleanness and create a suitable context for provide environment health. In statue of organization and parliament of Dehyaries, adopted in junary 2001, improvement of village environment state and maintain of health and cleanness is described as Dehyar duties.

3. Material and methods
3.1. Study area

Shiraz County is in latitude 36 degrees and 29 minutes north and in 33 degrees and 52 minutes east, is in 1500 meters height from the sea, and has 1688.8 square kilometres equivalent is province of Fars (www.fars.ir). County population is over 1711186 that 877849 of them are men and 833337 one woman. 1324055 of this population (336447 households) are in urban areas and 386582 people (91115 households) are in rural areas. 203727 person of this population are men, 182855 women and 549 non-residents that is equal to 112 households (Census General Population and housing., 2005). Shiraz County has 6 districts, 5cities, 21 municipalities and 512 resident rural and 249 residents rural (www.aftab.ir). All of rural of Shiraz are in distance longitude between 52° 30 to 54° and latitude between 29° and 30° (Gazetteer of country rural., 1983).

Zabol city with a width equal to 15,197 square kilometers (2, 1 percent of the province is located between 30° and 7 to 31° and 29 in north latitude and 59° and 58 to 61° and 50 in east. This city is in leading of north of sistan and baloochestan province in terms of geographic location and is located in neighboring of south Khorasan province in north, Kerman province in west, and Afghanistan country in east.

Population of Zabol city is 329,317, 137,947 of them are in urban areas and 237,097 of them are resident in rural areas (Census General Population and housing, 2006). This city has 6 district center, 5 country, 17 villages and 885 rural areas. Zabol is in

210 kilometers distension to Zahedan city and is located in end of connection road of Zabol-Zahedan. This road is the most important of populated regions of Zabol country and capital of province and other regions and province of country.

3.2. Statistical analysis

This study is a descriptive-analyzing research that was performed in 2010 in ten rural, which are located in Shiraz and zabol cites. Scientific contend of study is based on library studding from available resources, books, internet sites and relative agencies. rural which are in this study are selected randomly and in different distance to shiraz and zabol cities in field observation in this research questionnaire is information collection tool that interview method was for making the completed.

Information gathering method based on field observation, interview with rural resident and for informs to waste production resource and how to dispose it, we need to make some questionnaires and this important topic has done and so some questionnaires were disturbed in each five selected villages. Questionnaires disturbing was based on sample volume rate 10 percent of the number of rural households and then for analyze the inform data, SPSS software has been used. In addition, households waste compounds of each rural determined in field status. For measuring rural health are, a table is used to make us inform to health condition of collected rural.

Also, for inform to studied rural conditions and situations, some information give related to research topic in rural. In according to give informed, people residence audition is permanent and drinking water source in this areas (all of the rural) is provided from high areas and by absorption wells. In addition, main connecting road type is asphalted and in rural roads are sand road and waste burial place in rural of shiraz is waste burial place for Shiraz city (the place is called Barmashoor) is in 25 kilometers distance to Shiraz city and in south east of Shiraz city. (Studied rural waste burial place is common with waste burial place of Shiraz city) (Table 1).

It is north worthy that state of Zabol resident villagers are permanent, villages often have not purified water and all of inter villages connection reads are soundly and created for animals and garbage in this villages are not collected and disposed (Table 2).

4. Results
4.1. An analyze on source waste production in studied rural

Table 1: features of the study rural (Shiraz).

Rural name features	Bidzard	Tofihan	Dehno	Zafarabad	Aliabad
Population*	1206	4671	1617	4112	895
Number of house holds	295	1142	412	1079	224
Total literacy	880	3402	1208	3200	643
Natural village location	a valley	a valley	a valley – a mountain	a valley – a mountain	a valley
Village distance to shiraz	20 kilometers	15 kilometers	10 kilometers	17 kilometers	6 kilometers
Altitude	1500 meters	1486 meters	1480 meters	1490 meters	1469 meters
Distance to waste burial	10 kilometers	5 kilometers	23 kilometers	5-6 kilometers	Less than 2 kilometers

Table 2: features of the study rural (Zabol).

Rural name features	Jaleei	Hasanabad piri	Toti	Rostam mahmod	Gorg
Population*	1323	900	232	308	84
Number of house holds	357	150	34	54	12
Total literacy	298	678	155	128	20
Natural village location	Desert	Desert	a valley	a valley	a valley
Village distance to shiraz	5 kilometers	25 kilometers	30 kilometers	29 kilometers	33 kilometers
Altitude	473 meters	474 meters	472 meters	472 meters	472 meters
Distance to waste burial	1 kilometers	300 kilometers	*	*	*

Produced waste in rural is consist of all of waste materials which made of done Activities in rural this material is several of production resource and physical features, too. In a rural, various parts are active and each part has a role in waste production. House holds, trade, rural, animal husbandry, open areas and heath centers parts, each one, have waste production with special features. Waste production resource has a direct effect in recycling act, collecting, separating and possibility of isolated materials (Nozarpor., 2000). In a general classification, waste materials are in 3 groups: 1) materials that are fuel or can make them fertilizer such as vegetable waste, paper and straw. 2) Materials that are fuel excursively such as synthetic material, horn and bone. Rubber and leather. 3) Materials that are not fuel and are not able to make them fertilizer such as crystal and glass stone and iron (Ahmadi zad., 2006). Great part of waste production in rural of Shiraz is produced in house hold sector that mainly consist of residual and remaining food waste (58 percent), plastic (22 percent), others (10 percent), paper (6 percent), glass (6 percent), according to correct process we can provide needed non-mineral manure in agriculture sector from this massive volume of waste produced in house hold sector (Kreith., 1997). Must produced waste by rural house holds of Shiraz are paper-texture (63 percent), sand (26 percent), and animal waste (7 percent), glass an pieces of wood (each on 2 percent) of amount of rubbish production. Other rubbish production recourse in studied areas in Shiraz are market or trade waste that the greatest part of that

is vegetable (69 percent) and finally street waste other kind of waste production in rural that animal stool with 42 percent is the greatest production resource in this sector. In table 4, the most important resource of waste production in studied rural is observed and also tables number 4-8, waste production in each rural separately. As in seen, in must rural, waste production resource is same, the must important house hold wastes food, rubbish: paper, texture, trade: vegetables and waste production resources of street is of all cases in street (leaf, straw, animal stool, paper). Other informed data is observed in table 3.

In table 4, waste production in villages of Zabol city is contained separately. According to contained information in table 5, it can be expressed that the most important source of waste production resource of the villages Zabol is domestic waste like villages of Shiraz with this different that the most amount of domestic waste in villages of Zabol is paper with 38 percent. But in villages of Shiraz it allocated to food.

Waste. Most of produced rubbish in Zabol is dust with 64percent, and against villages of Shiraz expressed that this area is desert and there exist local winds. According to the finding data, most of trade rubbish in villages of Zabol is vegetable (58 percent) and finally major source of street waste production (open areas) is paper with 54 percent in villages of Zabol. Other found information is available in contained tables. As is viewed in villages of both regions, is similar with a little difference caused of environmental and geographical conditions.

Table3: waste production resources in studied rural in percentage (Shiraz).

Waste production resources	Produced waste			
House hold	Food (58)	Glass (4)	Plastic (22)	Paper (6)	All of cases (10)
Rubbish	Paper-texture (63)	Pikes of wood and metal (2)	Glass (2)	Sand (26)	Animal waste (7)
Trade (market)	Vegetable (69)	Animal waste (16)	Broken glass (2)	Iron parts(-)	All of cases (13)
Open areas (street)	Leaf (6)	Straw (14)	Animal stool (42)	Paper (8)	All of cases (30)

Table4: waste production resources in rural in percentage (Zabol).

Waste production resources	Produced waste			
House hold	Food (29)	Glass (1)	Plastic (17)	Paper (38)	All of cases (15)
Rubbish	Paper-texture (26)	Pikes of wood and metal (4)	Glass (-)	Sand (64)	Animal waste (6)
Trade (market)	Vegetable (58)	Animal waste (12)	Broken glass (6)	Iron parts(4)	All of cases (20)
Open areas (street)	Leaf (6)	Straw (2)	Animal stool (2)	Paper (54)	All of cases (36)

4.2. Analyses of physical compounds

Results of fraction waste material have direct effects on collecting and recycling operation (Fataei., 2005). For establish management system of solid waste material in a place in original and technical form and design and process the program related to keep, collect, transport and find disposal and also regenerate the resource projects such as compost fertilizer production, getting resurge from waste, biogas production, recycling need to determine the feature exactly and physical properties recognize the waste production resource in that area. Determining the rural waste features is too difficult because of verity of production resources of and component verity.

These activities in development countries need to 2000 to 4000 dollars, in terms of diversity and complexivity (Diaz and et al., 1993). In last chapter, we painted to waste production resource in rural and in this chapter we will analyze the physical compounds in waste material. It is noted that waste produced type is different in different places and have special form. Possibility of reduction, people economic condition, season of year and many of other factors is effective on physical compounds of rural waste and pay attention to this topic in management supplies and tools and equipment is important. It is important that determine the type and intergradient is just by use it again (Eslami., 2001).

In tables 5and 6 percentage of physical composition of rural produced waste is presented. As in viewing, the maximum composition part of produced physical waste context is related to vegetable in both regions that is (average 52 percent in Shiraz) and (average 5, 44 percent in Zabol) and the minimum amount of produced waste in Shiraz is ash produced by fire (average 2 percent) and the minimum amount of produced waste in Zabol villages is glass (average 1, 5 percent). Reasons for this difference are Shiraz is nearer to capital, seasons of year and economic situation.

By reviewing physical component of waste in rural we can express there is significant relationship between distance to Shiraz and Zabol cities and waste components and it is, by increasing distance between Shiraz and Zabol and studied rural, physical component consist the rubbish, animal stool and by decreasing distance to city, amount of glass and texture and paper increase (tables 7 and 8). Waste remaining time in rural environment decrease, too. One of advantage of waste quick collecting is, prevent the fly growth because growth time for this inset is less than one week. So, garbage collection must be done before pupa generating and transport to a suitable place. For getting the best result for environment health and beauty, waste must

be collected in rural areas at least two times in winter and three times in summer (Mobaraki., 1996).

To pay attention to the researches done in rural, collecting is just one a week. This note is more important that we know 80 percent of rural waste in summer is equal with 80 percent of waste produced in a year. Another point is that amount of rural house hold must in most villages is 2-3 kilograms per day and it is considerable.

If rural distance to city increases, amount of waste produced increase, too. For example, maximum rural waste produced is in two Bidzard and Zafarabad rural with respectively 20 and 17 kilometers distance to city and minimum waste produced is for Aliabad rural with 6 kilometers distance to city. According to expressed text, there is a significant relationship between amount of waste produced and distance to Shiraz city.

Table 5: physical compounds and component materials of produced waste in studied rural (Shiraz).

Row	Material	Weight percent Minimum - maximum	Average
1	Glass	2-4	3
2	Food	29-58	43.5
3	Paper	6-8	7
4	Plastic	6-72	14
5	Texture and paper produced	14-63	37
6	Wood	1-5	3
7	Ash	0-4	2
8	Dust and sand	3-2	14.5
9	\Metal	2-8	5
10	Leaf	1-6	3.5
11	Stew	7-14	10.5
12	Animal stool	18-42	30
13	Vegetables	35-69	52
14	Animal waste	9-16	12.5
15	Animal waste	5-7	6

Table 6: physical compounds and component materials of produced waste in studied rural (Zabol).

Row	Material	Weight percent Minimum - maximum	Average
1	Glass	1-2	1/5
2	Food	3-6	4/5
3	Paper	36-70	53
4	Plastic	6-14	10
5	Texture and paper produced	11-26	18/5
6	Wood	1-4	2/5
7	Ash	0-6	3
8	Dust and sand	19-64	41/5
9	Metal	2-8	5
10	Leaf	1-6	3.5
11	Stew	5-12	8/5
12	Animal stool	9-12	11
13	Vegetables	31-58	44/5
14	Animal waste	7-12	9/5
15	Animal waste	5-7	6

Table 7: physical compounds and component materials of produced waste percentage (Shiraz).

rural	Distance to shiraz city	glass	plastic	paper	texture	wood-metal	dust and sand	leather	animal	stool	total
Tofihan	15	2	25	5	20	-	18	3	2	18	100
Bidzard	20	-	27	-	6	-	30	-	4	30	100
Zafaraba	17	-	20	15	25	5	12	-	2	13	100
Aliabad	6	10	23	2	27	27	5	5	-	9	100
Dehno	10	6	40	2	30	-	8	8	4	8	100

Table 8: physical compounds and component materials of produced waste percentage (Zabol).

rural	Distance to shiraz city	glass	plastic	paper	texture	wood-metal	dust and sand	leather	animal	stool
Zhaleei	5	3	27	6	21	-	18	-	2	18
Hasanabad piri	25	2	31	3	11	-	29	-	5	19
Toti	30	0/5	19	6	8	5/5	31	-	2	21
Rostam mahmod	29	0/5	33	8	13/5	1	25	-	-	16
Gorg	33	0/5	34	-	11	-	31/5	3	5	11

Tables 9: amount of produced waste per day for each household percentage (Shiraz).

rural	Distance to city	Less than one kilogram	One kilogram	2-3 kilogram	3-5 kilogram	5 kilogram and more
Tofihan	15	-	10	80	10	-
Bidzard	20	-	20	70	10	-
Zafarabad	17	-	30	50	20	-
Aliabad	6	10	30	60	-	-
Dehno	10	10	20	60	10	-

Tables 10: amount of produced waste per day for each household percentage (Zabol).

rural	Distance to city	Less than one kilogram	One kilogram	2-3 kilogram	3-5 kilogram	5 kilogram and more
Zhaleei	5	24	30	34	8	4
Hasanabad piri	25	23	27	35	9	6
Toti	30	31	15	45	4	5
Rostam mahmod	29	27	19	44	6	4
Gorg	33	20	19	13	39	9

This amount in Zabol villages is that produced waste in Zabol villages is for more than Shiraz villages and Gorg village is in 33 kilometers distance to Zabol and it's 39 percent of its residents produce 3-5 kilogram waste per day, in Zhaleei village, the nearest village to Zabol, and 39 percent of people produce 2-3 kg waste per day. According to expressed text it is cleared there is a significant relation ship between amount of waste produce and destination to city. This species total waste collection (once a week) and with notification to the high amount of waste production in rural, rural residents abandonee waste in rural areas or made them store in a place and stored waste been disturbed by animal and therefore resulted diseases and unhealthy

environment: waste collect by rural Dehyaries (nongovernmental organization) and under Dehyari (nongovernmental organization) controlling in studied rural areas. Waste collecting time in rural areas, in according to people saying, is in early morning horses (96 percent of waste is collected in 8 to 12 horses). In studied villages, 8 percent of is carried by engine wants and 2 percent of them by is table 9 and 10, amount of produced waste is observed for each household per day. In most of Zabol villages, 80 percent of them produced waste is not collected or if it is done, it is done manually and with using the garbage cart. If it is done, it is done manually and with using the garbage cart.

Waste transportation as one of necessary and essential element means caring material with motors and other equipment. This selection is difference that is caused of geographical conditions and existed facilities. In villages in order to waste transfer equipment such as garbage cart, cars and tractors are used.

But in villages of Zabol, there isn't any consider to geographical condition of location, either waste isn't collected in some villages. Waste collection in Zabol villages hasn't any specific time and according to talk of most of people, is some cases, waste is not collected and this topic is due to leave and accumulate by villagers and due to appear health problems and issues in village. Some of these consequences of accumulation of waste and not collect it is studied villages are:
Waste septic with going the time and realize bad and unpleased breath that pollute the natural and healthy air and annoy the village residents.

Accumulate the waste in studied villages and not burry it healthy, can contribute starry animals such as dogs, wild animals and vermin insects. This animal can be caused of transferring of disease such as typhoid, cholera, plague a Location of waste accumulate is most suitable area for growth, regeneration and development of mice's. That in addition to transferring the disease can load lot of damages to human economically.

Accumulation the waste in villages and bea using by livestock is due to transfer disease factors to villager by milk and meat and appears the disease. In other hand, livestock diseases can transfer with waste and release to other animal and also humans and cause infectious diseases among human and livestock.

Be cause of no exiting of water ways and suitable Hungarians in studied villages in other to transfer rain water in rainfall seasons, rain fall can worsen the health condition by flowing on waste and cause sepsis and publish the pollution.

Accumulation the waste in villages can cause that children and kids play in alleys because of lack of recreation center, have contact to garbage and transfer illness and pollution to their families.

Because of quantity and existence of variables such as waste production in rural, lack of attention to rural health, financial issues in services related to waste, technology effects and some restriction in the consumption of raw material and energy, problems related to management of solid waste materials in rural environment have more complexities than city environment.

In studied villages, there is many problems in management of solid material that are known (such as: waste collecting once a week, leaving the waste in village, lack of waste recycling, non-technical transport, being disposal waste place near to rural and …). There are always various function complexities. Therefore, in most areas (rural and urban) for waste management, four primal productions, temporary store, collect and dispose in used. Rural area that are in more interaction to city and it need to being near to city such as waste recycling that done just in Aliabad rural but in waste dispose step, Aliabad rural has health problems such as insemination under ground water, soil insemination, attract, regenerate and growth the vector insects and rodents and animal and this problem monitor the non-technical locating of waste disposal place and without considering. In villages of Zabol have long destination to Zabol such as Tooti, RostamMahmud and Gorg, waste collect, transfer and bury isn't done and villagers leave produced waste in live environment.

With attention to that is expressed and done studies, now in waste management in studied rural, most part of financial and human sources spend for collect and transport and there is no action in field such as produce, keep, recycling and dispose That these cases are more excessive in villages of Zabol.

This lack of balance is the best reason for dies-management in waste material work in studied villages. Due to high volume of waste production in villages and lack of interact between joyful elements in management system that there is not from waste production sources to waste dispose, it can be resulted that there is not management for solid waste material in rural areas.

Collection carring and disposar operation of waste is required to careful programming. This program should direct the operation healthy and appropriately, because programming is one of managment divices to achieve to reasonable way for dicishion . evidences shows, everywhere waste management has property function, society health get eficience.

5. Conclusion

produced waste resources in rural are different, varied and numerous and effective factor in production, amount properties in the rural garbage can note to year time, geography site, producer people habits, study area and location, demographic characteristics, and public attitudes and behavior, income level and many of other problems. Major part of waste prouduction in villages of shiraz are related to domestic waste that cartain remained food with 58 percent. Most of rubbish produced by rural households allocated to texture - paper with 63 percent. Other source of waste production in Shiraz rural areas is commercial or market waste that major part of it contain vegetable with 69 percent and animal stool is major production resource of this part with 42 percent .

The most important waste production resource as similar as Shiraz is domestic waste allocated to paper with 38 percent, but this subject in villagers of Shiraz is allocated to food. Major part of rubbish produced by Zabol villagers is related to dust with 64 percent that is against Shiraz, locating in desert and sandy being. Accordint to finding datas, major amount of commercial waste in villages of Zabol is vegetable (58 percent) , as similar as Shiraz And intaily, major source of street rubbish production (open areas) in villages of Zabol, is paper with 54 percent. In studied villages in both region, waste producton resource are similar to each other with little diffrence couse of geographical and environmental conditions. Major part of physical context composition is related to vegetables in both regions that is (averege 52 percent in Shiraz) and (averegae 44,5 percent in Zabol) and lowest amount of waste produced in villages of Zabol (averege 1,5 percent).

Resons for this diffrence is in this two region is shiraz less distanation to capital than Zabol and economic condition of people. In studied villages of Shiraz, waste collection done just once a week (this subject isn,t done at all according to villagers talk). This note when is more excessive that we recognize 80 percent of villagers waste in summer is equal to 80 percent of waste produced in a year. Another note is amount of waste produced by rural housholds in most villages is 2-3 kg per day, that is considerable in this kind. What ever distance to city is more, amount of produced waste is more too. For example most waste producion is in Bidzard and Zaffarabad villages with Respectively 20 and 17 km distance to Shiraz and lowest amount of produced is allocated to aliabad village with 6km distance to Shiraz. This casses are right in Zabol, Tooti villages is in 30 km distination to Zabol, 39 percent of its residents produce 3-5 kg waste per day. And in

Zhaleei village is the nearest village to Zabol, 34 percent of villagers produce 2-3kg waste per day.

It is clear that there is a significant relationship between amount waste production and destination to city. This kind of waste collection (once a week in villages of Shiraz and no collection in villages of Zabol) and with action to high level of waste production in villages is due to villagers leave waste in village environment or accumulate waste in residence location and accumulated rubbish become published in environment by animals and so this factors are due to creating diseases and making village environment non-healthy In most studied villages, especially villages of Zabol, there isn't a specific method to waste management and sanitation in villages and always, waste is leave around residential centers. In these villages, this material is back to live environment with factors such as children, water, wind and animals. There are many problems in solid material management in studied villages that can consider combining function. variously to solve this known problems, such as (waste collecting once a week, living waste in rural environment , non-recycling of waste, non-normative waste transferring and nearing burial location to villages and …..)

Therefore in most location (rural and urban), 4 foundation of production, temporary storage, collection and disposal are using for waste management. Existed terms in waste management are done properly, in which villages that are in a more interaction with city.

This lack of balance is the best reason for dies-management in waste material work in studied villages. Due to high volume of waste production in villages and lack of interact between joyful elements in management system that there is not from waste production sources to waste dispose, it can be resulted that there is not management for solid waste material in rural areas.

Abstract: A distinguishing characteristic of adult education programs is that program content and language must be suitable and respectful of adult clients. For example, instead of using the word "student" which may imply a traditional teacher/student relationship where a student is subservient to the teacher, all state program materials use the word "learner" or "customer." Using this type of language acknowledges the adults' existing knowledge and real-world experience and makes them the focus of the program. The Pennsylvania Adult Basic and Literacy Education Indicators of Program. Quality emphasize the importance of customer satisfaction and learner progress on individualized goals One quality area explicitly states that "program staff and learners jointly develop, regularly evaluate, and update an instructional plan that incorporates the individual's learning styles and preferences" . This is just one example of how learners and staff are equals and collaborate on the learners' participation in the program. [Ali Badragheh and Mohammad Abedi. **Key Characteristics of Adult Education and Literacy Programs.** Journal of American Science 2011;7(5):136-141]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: adult education, Literacy

Introduction:

Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Therefore, it is helpful to distinguish between at least these dimensions of the issue:

- "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act)1 defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills necessary to exercise one's rights and responsibilities for citizenship. Different dimensions of literacy are often categorized by terms that cluster several dimensions of literacy important for different clients. Examples include workplace literacy (combining both basic academic skills and workplace skills), and family literacy (combining basic academic skills and other skills essential for successful parenting).

- "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

The objectives related to this goal touch on several of the common elements of definitions listed above, for example:

- Different dimensions of literacy (e.g., academic and workplace skills),
- The level of education attainment (e.g., increasing the number of persons who complete postsecondary degrees),
- The needs of target groups (e.g., parents, minorities, or part-time learners),

- The need to increase the availability of particular educational services, strategies or means (e.g., accessibility of libraries to part-time learners or opportunities for parental involvement), and
- The importance of lifelong learning, both in the learning behavior of individuals and in the educational system's responsiveness to the needs of adult learners.

Adult:

Adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge.

Adult education:

Several definitions of adult education has been done Community

- Adult Education is a⎤in the following examples are given of them. conscious effort by public institutions or voluntary organizations to promote community awareness comes action.
- adult education teaching is typically specific age group above the legal age⎤ limits as formal and informal, voluntary and at different levels of time, place
- Adult Education is a process in which people who⎤and education is presented. somehow been cut course they consciously to change or advance their skills in information and do organized activities.
- Adult education includes all formal and informal training and volunteer after⎤ school, which by experienced educators and aware of the system.

Educational materials on adult education with daily life, needs, goals, aspirations and past experiences of adults and their relationship helps to results learned in life and career are used.

Adult characteristics:
To understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.
Operating speed:
Slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due

to weakness and increased awareness of natural forces and their skills.
Consciousness:
no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability (which varies with the speed of learning) is not relevant.
Health:
what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.
Background of knowledge - skills and beliefs of adults:
adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

Ways to Improve Adult Literacy

Adult literacy is a global problem. One in five adults cannot read. Here are 5 ways you can help improve adult literacy.
1. Literacy Websites

Start by researching some of the online resources available to you. Some are comprehensive directories that can help you identify help in your own community.

2. Your Local Literacy Council
Even some of the smallest communities are served by a county literacy council. Get out the phone book or check at your local library. Your local literacy council is there to help adults learn to read and children keep up with reading in school. Staff members are trained and reliable.
3. Adult Education Classes

Your literacy council will have information about adult education classes in your area. If they don't, or you don't have a literacy council, get out the phone book again. If your own county doesn't offer adult education classes, which would be surprising, check the next closest county, or contact your state education department. Every state has one.

4. The Library

Never underestimate the power of your local county library to help you accomplish just about anything. They love books. They adore reading. They will do their best to spread the joy of picking up a book. They also know that people cannot be productive employees if they don't know how to read. They've got resources available, and can recommend special books, to help you help a friend learn to read.

5. A Private Tutor

It can be very embarrassing for an adult to admit that he or she cannot read. If the thought of attending adult education classes freaks someone out, private tutors are always available. Your literacy council or library are probably your best places to find a trained tutor who will respect the student's privacy and anonymity.

Key Characteristics of Adult Education and Literacy Programs:

1- Staffing:

Successful adult education programs have staff members who are committed to adult learners and know how to make the most of available resources with limited budgets. Staff must be flexible and work hours that are more convenient to adult learners. Additionally, staff must be trained in principles of adult education and should attend professional development courses.

2- Volunteers:

Volunteers are critical to the success of adult education programs, as they often provide valuable one-on-one tutoring sessions with adult learners outside of a formal classroom. Volunteers must be trained in principles of adult education and literacy programs, as well as methods to monitor their learners' progress. Having a volunteer coordinator is important, as this person trains the volunteers and serves as their point of contact during the tutoring sessions. If volunteers need advice on how to work with their partners or need new materials to cover during their sessions, a volunteer coordinator is an invaluable resource. Without a coordinator, volunteer retention would be very low. It is important that learners be paired with volunteers for a certain period of time, as it is difficult for adult learners to make progress if their tutor partner changes constantly. Clear expectations should be established for how often and how long tutors will meet with their learners. Congregations often can serve adult learners through tutoring programs, as congregations have easy access to a steady stream of volunteers. It may be easier for congregations to operate an informal tutoring program versus a comprehensive adult education program, since those programs need a higher level of staffing.

3- Respect for adult learners:

A distinguishing characteristic of adult education programs is that program content and language must be suitable and respectful of adult clients. For example, instead of using the word "student" which may imply a traditional teacher/student relationship where a student is subservient to the teacher, all state program materials use the word "learner" or "customer." Using this type of language acknowledges the adults' existing knowledge and real-world experience and makes them the focus of the program. The Pennsylvania Adult Basic and Literacy Education Indicators of Program Quality emphasize the importance of customer satisfaction and learner progress on individualized goals (see Appendix A). One quality area explicitly states that "program staff and learners jointly develop, regularly evaluate, and update an instructional plan that incorporates the individual's learning styles and preferences" (p.7). This is just one example of how learners and staff are equals and collaborate on the learners' participation in the program.

Successful adult education programs recognize that adult learner needs and learning styles may require non-traditional methods of teaching and accommodate them whenever possible. This means holding classes and sessions outside of typical working hours for adults that work, providing one-on-one tutoring, group classes, and other methods of delivering services that are flexible. It is also important to hold the classes where it is convenient for adult learners to attend, such as local houses of worship, residential facilities, libraries, or other community centers. Understanding this key principle is difficult sometimes for organizations that have worked in child education, but not in adult education. Congregations that have held learning programs for children may feel that they are suited to take on adult education without realizing the differences in program structure and content. It is important that congregations research training opportunities before embarking on an adult education program.

4- Practical program content:

Related to the program quality area of "respecting adult learners," curriculum should be practical and relevant to the individual learner's goals. Many adult learners are interested in advancing their careers, starting a new career, transitioning into post-

secondary school, or attending other educational or training programs. Program content should help learners work on their personal educational or vocational goals. Materials from their current or future job can be utilized as part of the curriculum to make it hands-on and practical for the older learner. Some programs that have provided educational programs for children may have learning materials and textbooks that they think they can use with older learners. However, this is not an effective way to teach adults and participants may be turned off from a program that uses children's books for their teaching materials.

5- Assessment and evaluation:

To have an effective adult learning program and demonstrate program success, learners' progress must be monitored during their participation. There are many official assessments that state funded programs use for standard programs, such as the adult diploma program or GED classes. However, informal measures should also be used to monitor learners' progress and help learners' view their improvement. Seeing concrete improvement over time is important to keeping learners motivated and committed to the program.

6- Space:

The learning environment where an adult education program takes place should be well-lit, clean, and suitable for adults. Additionally, having computers available is useful for learners and staff to access online resources. Many learners want to improve their computer literacy as well as language or numerical literacy, so having a computer lab is valuable.

7- Community relationships:

It is important for adult learning programs to have working relationships with libraries, local businesses, work-ready programs, and other community resources. Since many learners attend adult education programs to advance their career goals, it is important that programs be able to refer them to job readiness or placement organizations. Libraries are also a valuable resource for organizations that are looking for materials that are appropriate for adult literacy programs. The Philadelphia Free Library has a program called the "Reader Development Program" which gives away two free library books a year to adult learners who have a library card.4 Books cover topics such as reading, writing, math, job skills, parenting, biography, fiction, GED and ESL. Program staff can also access these books for their own classes.

Conclusion:

Additional material for the next stage of learning often means to be expected when developing your

learning skills Learners to increase awareness and enjoyment of reading and studying to operate. To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Incentives aimed at providing content that audiences are produced primarily to attract different groups of adults interested in design, so that their participation in learning programs are encouraged. Motivational training materials for learners and have great importance even in support of successful applications over learners, planners and executors for educational programs is important.

Material often set different types of materials and educational content in books and pamphlets, books, training guides, trainers, equipment auxiliary audio, visual and material are included such that during actual teaching sessions, are used in the transmission and content but also to achieve the goals of making education programs are important.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc.

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them. Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

The task force's policy recommendations are guided by these principles:

- Recognize that adult illiteracy is not an isolated problem but a fundamental barrier to every major challenge facing Kentucky. Without significant improvements in adult literacy the Commonwealth will be unable to make progress on issues such as early childhood education, education reform (elementary/secondary and postsecondary), economic development, and improving the

health and well-being of Kentucky's families and communities.

- Shift from top-down implementation of a federal or state program to leading a statewide public campaign that depends fundamentally on a bottom-up commitment of communities, employers, and educational institutions. The campaign must engage all aspects of Kentucky life—all dimensions of state and local government, all education levels, the state's business and civic leaders, voluntary organizations, and all others whose work affects—or is affected by—the problem of adult illiteracy.
- The future of Kentucky depends on narrowing the disparities among counties by improving the adult literacy of the population in all regions of the state.
- Shift from an emphasis on providers to the needs of clients. Measure performance and progress in terms of impact on the quality of life and economic well being of:

Learning styles in adult education

[1] Mohammad Abedi, [2] Ali Badragheh

[1, 2] Department of Agricultural Economic, Islamic Azad University, Marvdasht Branch, Marvdasht, Iran
*Corresponding author: abedi114@yahoo.com

Abstract: In the best of all possible worlds, you would incorporate all three learning styles into each of your lessons. However, this is just not possible in the real world of teaching. In truth, it is often not hard to include both auditory and visual learning styles in your lessons. For example, you can have instructions written on the board and say them out loud. However, it is not always as easy to include the tactile/kinesthetic learning style into your lessons. The sad truth is that many students have this as their strongest learning style. It is best to not force the issue but instead find natural places to include kinesthetic learning. If your class warrants it, you could include simulations, role-playing, debates, or the use of manipulative.

Introduction:

Adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge.
Several definitions of adult education has been done Community

- Adult Education is in the following examples are given of them. conscious effort by public institutions or voluntary organizations to promote community awareness comes action.
- adult education teaching is typically specific age group above the legal age] limits as formal and informal, voluntary and at different levels of time, place
- Adult Education is a process in which people who]and education is presented. somehow been cut course they consciously to change or advance their skills in information and do organized activities.
- Adult education includes all formal and informal training and volunteer after school, which by experienced educators and aware of the system.

Educational materials on adult education with daily life, needs, goals, aspirations and past experiences of adults and their relationship helps to results learned in life and career are used.

in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings.

In developing countries and backward because the problems in primary education, lack of resources and facilities, poverty, social existence, economic and cultural concept of adult education is different. In such countries the concept of adult education, literacy education is.

Concept of adult education in revolutionary countries, is a combination of these two concepts. Changes in these countries due to social, political and cultural revolution, resulting from, literacy and continuing education necessary to find because of the revolution, there is cultural poverty on the other hand the implementation of development plans and the need for skilled personnel are expert. General adult education system based on economic conditions - social and cultural community is different and each specific goals will follow. General objectives of adult education and literacy in two categories is divided into professional education.
Literacy goals include:

- Providing primary education in childhood that adults were deprived
- raising awareness for adults;
- knowledge bases and adults about their cultural heritage;
- increase confidence in adults.
  Professional education goals include:
- Equipped with the necessary skills to adults living;

- providing the necessary manpower for the country's goals;
- achieving social equality and equity and eliminate the existing differences between different classes.

Understanding and Using Learning Styles

Students, in fact all individuals, are most effective when they are taught in their personal learning style. In fact, there are three major types of learners: visual, auditory, and tactile/kinesthetic. While most individuals without disabilities can learn using any one of these styles, most people have one for which they show a stronger affinity.

Learning Styles:

1- Visual Learners - Visual learners are those who generally think in terms of pictures. They often prefer to see things written down in a handout, text or on the overhead. They find maps, graphs, charts, and other visual learning tools to be extremely effective. They remember things best by seeing something written.

2- Auditory Learners - Auditory learners are those who generally learn best by listening. They typically like to learn through lectures, discussions, and reading aloud. They remember best through hearing or saying items aloud.

3- Kinesthetic Learners- Kinesthetic, also called tactile, learners are those who learn best through touching, feeling, and experiencing that which they are trying to learn. They remember best by writing or physically manipulating the information.

Learning Style Assessments:

There are many tests available to help you and your students discover your best learning style. Generally speaking, however, if you are someone who is more likely to think in pictures, prefer to meet with someone in person, and are more likely to want visual diagrams when completing a project you have tendencies towards visual learning. Similarly, if you are more likely to think in terms of sounds, prefer to speak on the phone with someone, and want verbal instructions then you tend towards auditory learning. Finally, if you are more likely to think in terms of moving images like mini-movies in your mind, prefer

to participate in an activity when you meet to speak with someone, and tend to jump right into a project without reading directions you tend towards tactile/kinesthetic learning.

How to Effectively Use Learning Styles in Class:

In the best of all possible worlds, you would incorporate all three learning styles into each of your lessons. However, this is just not possible in the real world of teaching. In truth, it is often not hard to include both auditory and visual learning styles in your lessons. For example, you can have instructions written on the board and say them out loud. However, it is not always as easy to include the tactile/kinesthetic learning style into your lessons. The sad truth is that many students have this as their strongest learning style. It is best to not force the issue but instead find natural places to include kinesthetic learning. If your class warrants it, you could include simulations, role-playing, debates, or the use of manipulatives.

Concerns When Incorporating Learning Styles

Though rarer today then in the past, some teachers discount the importance of learning styles. They continue to teach in their one major method without trying to vary instructional methods. This is a mistake that will lead to less learning in the classroom.

On the other hand, many students and to a lesser degree some teachers make the mistake of thinking that they cannot learn using methods that are not focused on their learning style. This is also a huge mistake that in the end will result in less learning. If teachers do not help their students find ways to be successful learning information presented in any style, they are not helping them succeed in the future. The fact is that students will be faced with many different styles of teaching during the educational career. Only by finding ways to adapt and learn using other styles, will students end up succeeding.

Examples of ways that students can adapt:

- Kinesthetic learners would include writing down information that they are to learn.
- Visual learners could create word webs, venn diagrams, or other visual presentations of information.

- Auditory learners could read a passage out loud from their textbook or from handouts

1- Kinesthetic Learners:

A Look at Kinesthetic Learners:

Kinesthetic learners typically learn best by doing. They are naturally good at physical activities like sports and dance. They enjoy learning through hands-on methods. They typically like how-to guides and action-adventure stories. They might pace while on the phone or take breaks from studying to get up and move around. Some kinesthetic learners seem fidgety, having a hard time sitting still in class.

Key Learning Methods for Kinesthetic Learners:

Kinesthetic learners learn best through doing including manipulating items, simulations and role plays, and other methods that physically involve them in the learning process. They enjoy and learn well from experimenting and first hand experience. Further, they learn best when activities are varied during a class period.

Ways to Adapt Lessons for Kinesthetic Learners:

Vary instruction not only from day-to-day but also within a single class period. Provide students with as many opportunities as your curriculum warrants to complete hands-on work. Allow students to role-play to gain further understanding of key concepts. Provide students with the opportunity to work in small discussion groups as they study materials. If possible, plan a field trip that can help reinforce key concepts. Allow students to stretch partially through the class if they seem to become restless.

2- Auditory Learners

A Look at Auditory Learners:

Auditory learners learn best by listening and talking aloud. They typically notice and remember sounds. They are good at remembering things that they hear. They are also good with words and language. They often read to themselves as they study. They are also often distracted by noise and sounds.

Key Learning Methods for Auditory Learners:

Auditory learners learn best through hearing the information. They often need to read the written word aloud to help them remember key points. Verbal repetition is an effective means of study for auditory learners.

Ways to Adapt Lessons for Auditory Learners:

Provide students with oral along with written instructions for assignments. Include whole group discussion in your class. Provide students with videos to complement the written text. Allow time for students to read out loud or talk through problems they might be having. Provide breaks from silent reading periods. Also, realize that those who are strong in auditory learning typically take longer to read a passage.

3- Visual Learners

A Look at Visual Learners:

A typical visual learner uses visualization techniques to remember things. They often have a good sense of direction because they visualize maps and directions in their mind. Many prefer to read information in a textbook or on the whiteboard rather than listen to the teacher lecture. They also enjoy doodling and drawing. Visual learners typically use sight words in their everyday terminology. For example, they might say "Let's take a look at this." or "Let's look at this from a different perspective." They remember details including colors and spatial arrangements.

Key Learning Methods for Visual Learners:

Visual learners learn best by seeing what they are being taught. Visual learners typically prefer images, maps, graphs, and other visual representations over other forms of instruction. They will find that if they include images, mind maps, lists, and other visual techniques in their notes then they will have a better chance of remembering key information.

Ways to Adapt Lessons for Visual Learners:

Including diagrams, mind maps, word webs, visuals, and other forms of graphic organizers will help visual

learners get the most from your instruction. Teach students to use highlighters when going through their notes and to create flashcards when studying for tests and learning information. Try not to give only oral instructions before requiring students to complete an assignment. Further, stay away from lecture without accompanying notes and/or visuals.

Conclusion:

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- - Preparation for adults to learn how much he depends on previous learning. Knowledge that has accumulated because of an ability to absorb new information more person is. Past educational experience features a diverse group of adult learners, the starting point of any activity on the diversity training is emphasized.

2- intrinsic motivation, learning a deeper and make them sustainable. When the need is met directly by the learning itself, what is learned, but is complementary learning. Creating a training activity in adult learning needs, learning ensures stable

3- Positive reinforcement (reward) learning to reinforce the negative (punishment) is more effective. Many adults because of negative experiences at the beginning of schooling, are weak and afraid. Feeling of success in adult learning for continuous learning and adult participation is essential.

4- To maximize learning, information must be provided an organized manner. Entries can be simple or complex can be arranged around related concepts are organized. Starting point for organizing content knowledge for adults and adults is linked to past experiences

5- Learning, especially regarding skills development, will be added frequently.

6 - Duties and meaningful content than meaningless subjects are learned more easily and are later forgotten. This issue, especially for older adult learners is true. Challenges of adult learning facilitators by the way that content was significantly associated with the experiences and needs of learners is.

7- Passive than active participation in learning activities, learning increases. Adult educators are allowed to participate actively in India, a stable and meaningful learning to help

8- Environmental factors affect the learning. Tangible things such as noise, crowded places, temperature, light and ... Learning process can be prevented. Other factors such as stress, ridicule, pressure, fatigue and low health can also reduce learning.

Advances of biological taxonomy and species identification in Medicinal Plant Species by DNA barcodes

Chong Liu [1]　Zhengyi Gu[1]　Weijun Yang [1]*　Li Yang [2]　Dilnuer[1]

[1.]Xinjiang Institute of Materia Medica/Key Laboratory of Xinjiang Uygur Medicine　Urumqi 830004
China　liu_chong02@163.com
[2.] Pharmacy school of Xinjiang Medical University　Urumqi 830004　China

Abstract: Medicinal Plant Species taxonomy is authenticated according to morphological features. It is a long-standing problem of mixing authentic species with their adulterants in medicinal preparations. However, DNA barcoding is a new technique that uses a short DNA sequence as a molecular diagnostic for species-level identification, Our purpose is to briefly expose DNA Barcode of Life principles, relevance and universality. Barcode of life framework has greatly evolved, giving rise to a flexible description of DNA barcoding and a larger range of applications. Similarly, a variety of single locus or combined loci have been propose as DNA barcodes for the plant identification, which are the coding regions or non-coding regions in plastids or the nuclear genome, such as *rbcL*, *matK*, *rpoB*, *rpoc1*, *psbA-trnh*, *ITS* and *rbcL+psbA-trnH*.

Key words: DNA barcoding; ITS2; matK; psbA-trnH

1 Introduction

Traditionally, the Medicinal Plant Species taxonomy is authenticated according to their morphological features. Even until now, morphological keys still are main basis of taxonomy (Wang, 2006). However, there is a long-standing problem of mixing authentic species with their adulterants in medicinal preparations. This problem has consequences for medical safety as well as for the conservation of the authentic species (Ma, 2007; Zhou, 1995; Mao, 2004;). The classical morphological authentication approach was confronted with difficulties due to overly similar traits used for taxonomic characterization (Gao, 2009 and Ching, 1978) and an ever decreasing number of specialists.

However, the term "DNA barcode" for global species identification was first coined by Hebert in 2003 and has gained worldwide attention in the scientific community (Shilin chen, 2010). Recognition of animals, plants and fungi has been performed using this technique. DNA barcode is a short fragment of the genome and species identification using DNA barcoding has been completed in several studies (Gregory, 2005 and Lahaye, 2008) taxonomists (Schindel, 2005) and is likely to usher the taxonomic research into a new era.

Most researchers agree that the mitochondrial gene encoding cytochrome coxidase subunit 1 is a favorable region for use as a DNA barcode in most animal species and even in some fungal species, including those of the groups Ascomycota, Basidiomycota and Chytridiomycota. However, the CO1 gene and other mitoc excluded hondrial genes from plants have limited usefulness for identifying plant species across a wide range of taxa due to the low amounts of variation in the genes, as well as the variable structure of the mitochondrial genome (Pennisi, 2007; Chase, 2005, Fazekas, 2008; Chase, 2007; Daniel; 2006). Thus, screening for single or multiple regions appropriate for DNA barcoding studies in nuclear and plastid genomes in plants has been an important research focus.

2 DNA barcoding as a driving force in the Plant

First, most single-copy genes in the nuclear genome, as well as their introns, have been as barcode candidates because of the lack of universal primers for their amplification[9]. However, with the exception of 5.8S, the internal transcribed spacer (ITS) of nuclear ribosomal DNA and regions of the ITS could be potential barcodes (Lahaye, 2008 and Chase, 2007). Second, extensive studies have focused ongenes and introns of the chloroplast genome. Comparing with animals, CO1 gene evolves slower in plants. Therefore, CO1gene is not appropriate to be the standard of barcode for plant. Recently, the research and application of DNA barcoding in plant is in the exploration stage. So the most important task is to select candidate genes or DNA regions and identify a suitable DNA barcode. There are many researchers did exploration on filtrating the plant barcode, and they try to find the perfect DNA barcode from chloroplast gene.

2.1 Single fragment DNA barcode in plant

ITS2 ribosome transcribed spacer gene states in RNA gene 5.85 and 28S compartment. Its evolutive speed is faster, so that the more evolution information can be acquired. In 2010, Shiling Chen et al (2010) show the study on filtrating DNA barcode sequence in 8557 medical plant samples. The samples were about Angiosperms, gymnosperms, ferns, mosses, lichens, algae and fungi. Date show compared seven candidate DNA barcodes (psbA-trnH, matK, rbcL, rpoC1, ycf5,ITS2, and ITS) from medicinal plant species. According to the result, ITS2 sequence has the best performance, the discrimination ability of ITS2 in more than 6600 plant samples belonging to 4800 species from 753 distinct genera and found that the rate of successful identification with the ITS2 was 92.7% at the species level. At the same year, Xiaohui Pang et al (2010) show adopted ITS2 sequence identify 888 1410 1183 samples form Angiosperms, gymnosperms and Euphorbiaceae, and the identification rates are 73% 100% 90%. Therefore, The ITS2 region can be potentially used as a standard DNA barcode to identify medicinal plants and their closely related species.

Comparing with other chloroplast cording gene, *matk* evolutionary speed is faster, and it is more appropriate to PCR amplification matk gene segments. In 2008, Labaye at al (2008) show had 100% success by matk gene to PCR amplification in 1667 plant materials. However, Kress et al (2007) argued that if other Family plants have this high success rate on amplification, because the Labaye's 96% using materials are Orchidaceae. The different branch groups of *matk* gene are difficult to be extended and sequencing , because the *matk* primer is not universal. According to the result in table1, Fazekas et al (2008) had 87.6% success rate by using 10 pairs primers to amplification 251 samples form 32 genera plants. *Matk* single segment has only 56.0% success on identifying the different plants, and there are 25.5% the original forward and reverse sequencing are less than 80%. In 2007, Sass and Kress et al (Kress, 2007 and Sass, 2007) did not acquire the expected identification result in Cycadales, and its correct identification rate are 24% and 14.6% separately. Therefore, the design and effective identification in *matk* gene universal primer will be important for next stage.

Another plastid DNA region proposed is the non-coding *psbA-trnH* spacer (Kress, 2005 and Shaw, 2007). This region is one of the most variable non-coding regions of the plastid genome in angiosperms in terms of having the highest percentages of variable sites (Shaw, 2007).This variation means that this inter-genic spacer can offer high levels of species discrimination. Kress et al (Kress, 2005) compared 10 loci for authenticating closely related species in 7 plant families and 99 species belonging to 88 genera in 53 families, they found that the extended length of *trnH-psbA* is 247-1221 bp, and the space region is 119-1094 bp, they reported that the *psbA-trnH* spacer and the internal transcribed spacer could be used as a pair of potential barcodes for identifying widely divergent angiosperm taxa. Moreover, Kress et al (Kress, 2005) and Fazekas et al shown the results that *trnH-psbA* has the highest success ratio of extension and the highest exactness ratio of identification in the alternative segments. *trnH-psbA* also has the best performance on distinguishing the relate plant. Specifically, the identification ratio of *trnH-psbA* is above 90% in Orchidaceae, and 70% in Compsoneura (Kress, 2005). However, Sass et al extended two bands in Cycadales plant by using the primers from Kress. Therefore, *trnH-psbA* space region cannot be the appropriate barcode in Cycadales, and the variance of segments in *trnH-psbA* is not enough for the identification in Heracleum.L and Glyceria.

The protein encoding plastid gene *rbcL* has been proposed as a potential plant barcode by several sets of researchers (Chase, 2005 and Newmaster, 2006), usually in conjunction with one or more other markers. One benefit of this region is the large amount of existing information—there are more than 10,000 *rbcL* sequences already in GenBank (Chase, 2005 and Newmaster, 2006). However, many of these are unvouchered or erroneously identified, and none has electropherogram trace files available, so all of these would have to be repeated to meet the standards for an official "DNA barcode" designation in GenBank. Furthermore, studies by Chase & al. (2005) and Newmaster & al. (2006), which demonstrated a fair degree of success in discriminating species, used nearly entire *rbcL* sequences (at least 1300 bp long). An ideal DNA barcoding region should be short enough to amplify from degraded DNA and analysed via single-pass sequencing. One possibility is to develop primer sets for short portions of this gene to produce a barcode of appropriate length, but our attempts to develop universal primers to achieve this have been unsuccessful to date.

2.2 Combined fragment DNA barcode in plant

In higher plants, the mitochondrial genome evolves much more slowly than in animals. The COI-region is thus inappropriate for plant species distinction (Shilin Chen, 2010). The CBOL plant working group (PWG) agrees that plant barcoding will be multilocus, with one "anchor" (i.e. universal across the plant kingdom) and "identifiers" to distinguish closely related species.

Table 1 Plant DNA Barcodes Identification Rate

Gene	Species	Numbers	Identification Rate	Reference	Time
ITS2	Medicinal plant	8557	92.70%	Silin chen et al	2010
	tragacanth	41	100%	T gao et al	2010
	Gymnosperms	888	73%	pang XH et al	2010
	Rosaceae	1410	100%	pang XH et al	2010
	Euphorbiaceae	1183	90%	pang XH et al	2010
matK	Cycadales		24%	Sass et al	2007
	Relative plant	96	14.60%	Kress and Erickson	2007
	Compsoneura	8	failure	Newmaster	2008
	Relative plant	251	56.00%	Fazekas et al	2008
		1667	100%	Lahaye et al	2008b
trnH-psbA	Relative plant	99	92%	Kress et al	2005
	Pteridophytes Gymnosperms Angiosperm	251	100%	Fazeka et al	2008
	Orbanchaceae	4	100%	Han JP et al	2010
	Compsoneura		70%	Newmaster et al	2008
	Orchidaceae	1667	90%	Lahay et al	2008b
	Heracleum.L Glyceria	87	failure	Whipple et al Logacheva et al	2007 2008
rbcL+trnH-psbA	Relative plant	96	88%	Kress, Erickson et al	2007
	Gymnosperms Angiosperm	251	64%	Fazekas et al	2008
matK + atpF-atpH + psbK-psbl	Monocotyledoneae	101	93.10%	Lahaye et al	2008a
matK +atpF-atpH +trnH-psb	Monocotyledoneae	101	89.30%	Lahaye et al	2008a

There are many researches indicate that the identification ratio of single segment DNA barcode is low. Therefore, barcode selection should not only consider single segment DNA barcode, but also the multiple segments component. Kress and Erichson said (Fazekas, 2008) that *rbcL+trnH-psbA* can be the segment to create the barcode for all land plant. Chase et al emphasized *Matk* is a key factor to identify advanced plant, *rpoC1+rpoB+matk* and *rpoC1+rpoB+rbcL+trnH-psbA*. In 2008, Newmaster et al (2008) did the sampling study on Compsoneura, and did the selection test on 7 chloroplast DNA segments *UPA rpoB rpoC1 accD rbcL matk* and *trnH-psbA*. The result shows that *matk+trnH-psbA*

perform better in identification. In May 2009, CBOL analyzed 907 samples of 550 plants: 445 samples were come from Angiosperm, 38 samples were come from Gymnosperms, and 67 were come from cryptogamous plants. The selection of 7 DNA barcodes of plant were compared the candidate sequence *atpF-atpH matK rbcL rpoB rpoC1 psbK-psb1 psbA-rbcL*, then they suggested subdue *matK+ rbcL* combination to be the currency barcode for land plant. However, CBOL thought this combination is not perfect, because its success ratio of identification on species was 72%. Ren BQ et al (Ren BQ et al,2009) examination team focused on Betulales as their research objective in 2009. They did sampling analysis on 131 of all species

in the world (26 species), and evaluated 4 DNA segments *ITS rbcL matK psbA-trnH* . The result shown that *ITS +psbA-trnH* combination achieved 88% for species-level identification and this was the highest ratio in all subjects. November 2009, Global DNA barcode, the third international meeting in Mexico, not only rbcL and matk, but also *psbA-trnH* sequence gained the regard and agreement form experts. CBOL advised that the currency and ability of identification *ITS* and *psbA-trnH* is very impartant.

The full results of this study will be published elsewhere, and analyses of the efficacy of intensively trialled regions in part 2 are still ongoing. However, as a "research update", we summarise the current state of play. Two plastid gene regions, partial *rpoC1* and *rpoB*, performed well as barcoding regions in terms of being amplifiable with a limited range of PCR conditions and primer sets and, although not particularly rapidly evolving, were able to discriminate among species in many groups of organisms. A third gene region, *matK*, showed much higher levels of sequence variation and provided better species discrimination, but work is still underway to improve PCR primer sets to enhance its 'universality'. The greatest level of species discrimination was achieved when all three regions are combined (*rpoC1*, *rpoB* and *matK*), and this represents one option as a standard DNA barcode for plants.

A second option we present is *rpoC1*, *matK,* and *psbAtrnH.* This option substitutes for the relatively conserved coding region, *rpoB,* the previously mentioned, highly length-variable, non-coding intergenic spacer, *psbA-trnH*. The benefits to doing this are that additional species level resolution may be obtained, while at least part of the plant barcode (the sequences from *rpoC1* and *matK*) will be comparable and alignable across broad evolutionary distances. The downside of this approach relates to the introduction of bioinformatics challenges and problems with degraded tissue due to the variation and often larger size of the *psbA-trnH* spacer.

3 Barcode Candidates in Medicinal Plant

DNA barcoding can be regarded as a tremendous tool to accelerate species discovery and initiate new species descriptions. Moreover, it re-opens the debate on species concepts (Fitzhugh, 2006; Rubinoff 2006b; Balakrishnan, 2007; Miller, 2007 and Vogler, 2007). In addition, DNA barcodes will be a useful and powerful tool for nonprofessional users such as customs officers, traditional drug producers and managers and forensic specialists. Therefore, a rapid and simple DNA barcoding identification system, even an imperfect one, is likely to be welcomed. The search for and development of herbal medicines is rapidly increasing worldwide, so practical and accurate authentication resources are urgently needed (Sucher, 2008; Yao,

2009; Song, 2009 and Shaw, 1997). Chen et al shows the potential for a DNA barcoding technique to become a standard for the authentication of medicinal plants and their adulterants.

Analysis situation of Activity Status in Urban and Rural Area Population of Iran

Mortaza tavakoli

PhD, Faculty Member; Department of Geography, University of Zabol, zabol, Iran
tavakoli@uoz.ac.ir or tavakoly52@gmail.com

Abstract: The study has looked into the population of Iran aged 10 and above by activity status and sex including the urban and the rural areas. An analysis of the country's population and activity status could explain the economic and social situations of the state and its people. The increasing unemployment and reduction of goods and productive services may cause some detrimental effects in the society and country's economy. Through the study's assessment on the country's population and activity status, the collaboration of the government and its various sectors can set forth to strengthen human development by investing in human resources and employment. A significant increase in the population rate of male and female students in the rural areas and with the decrease in the rate of homemakers for both sexes is a good sign. This implies that these individuals have seen the potentials of education in empowering them to develop their skills and abilities and obtain necessary knowledge of making a living and becoming a productive individual. Population growth forms formidable barriers to a country's progress and development and this phenomenon is usually attributed to socio-cultural, religious and environmental factors but with a better understanding of its occurrence will help regulate and control its growth.
[Tavakoli mortaza. Analysis situation of Activity Status in Urban and Rural Area Population of Iran. Journal of American Science 2011;7(5):152-157]. (ISSN: 1545-1003). http://www.americanscience.org.

1. Introduction

Iran's population both in the urban and rural areas continues to increase over the next decades from its first national census in 1956.(Mohseni 1977) The number of employed and unemployed persons has also markedly increased from 1956 to 2006. With the rate of growth in population, it also follows that the rate of unemployment is rising fast and poses a problem to the country. In 1967, in acknowledgement to family planning as a form of human rights and foreseeing its benefits on the socio-economic situation of families, the government of Iran launched the active family planning program, which lowered fertility rates. However, after the Islamic revolution in 1979, the family planning program was eradicated and then restored in the 1990s due to population growth, which led to the country's economic crisis.(united nations 2001)

The rise in Iran's population explains the increasing social and financial discontent of unemployment in the country since they comprise a major part of the national population. Their number is gradually increasing and due to economic crisis whose detrimental effects can hit most those already suffering financially. Rapid population growth as seen by economists hinders a country's effort to meet the needs of its people. Its resources are utilized to provide for the requirements of its growing population and sectors of the country instead of venturing on more investments that are productive. In this case, the government fails to produce more job opportunities compared to the increase of work force (Popenoe 1969).

The objective of this paper is to assess the overall population rate and rate of economically and non-economically active population in the country including the urban and rural areas of Iran by sex. Specifically, it aims to find out the rate of employed and unemployed population by sex in rural and urban areas and if the trend has, either decreased or increased in a span of 50 years from 1956 to 2006.

The Associated Press (2010) has stated that in 2005, the new government promoted population growth ensuring incentives and support to families who advocated the program. But the source from which this financing will be obtained is still unsure. Advocacy to population growth can be attributed to the people's socio-cultural values and beliefs where the family is considered the center of life among the people. But with the gradual education of women and men on family planning and with the increase of health centers in Iran, it has helped in lowering the rapid population growth that has deterred economic growth in Iran over the past years. The paper will definitely be significant to government sectors of Iran. A systematic identification of the various issues, concerns, problems and, impediments to economic development would guide the proper government sectors how to extend the most appropriate and effective assistance to Iran's population control and

opening wider opportunities for employment and better incomes for the people (Copus2006).

In addition, Iran's present rapid growth of population can be attributed to certain factors such as more birth than death rates and immigration and emigration rates. Although on a national level, migration from one region to another does not change the number of population in a country, there could be adverse effects, which can be felt in urban areas where population influx is constantly on the rise thus regions tend to develop at different rates depending on the productive activity of different human endeavors. These urban areas become appealing to many who seek employment, business ventures and those educationally oriented thus, increasing the population in these areas (Hoodfar1994). Eventually these areas become more congested causing problems in housing situations, inefficiency of government services and rise in unemployment rate. A country suffering from heavy population increase becomes a ground for social and economic problems (Coleman 1980). The economy of Iran depends much on its oil industry, but on the other hand, it also has many natural resources such as agricultural lands and minerals waiting to be explored and developed for economic possibilities with the efforts of the people and the government. This paper illustrates how population growth leads to a country's numerous problems and one of these is the rise of unemployment rate in both urban and rural areas. Unemployment is a waste in the country's human resource. If these resources are fully recognized and utilized, the economy of the nation will be better.

2. Material and Methods

The study is descriptive in nature. Both qualitative and quantitative approaches were employed in the data acquisition and analysis. The study uses the data obtained from the Ministry of Interior, Statistical Centre of Iran on the country's total population, employed and unemployed persons in both urban and rural areas. The data focused only on a 50-year period from 1956 to 2006. The population obtained does not come successively but that there is a gap of 10 years from one year to the next. It was analyzed to identify Iran's population at a specific year including the number of employed and unemployed persons in urban and rural areas. This information falls under the economically active population. The unemployed as part of the data pertains to those who are looking for work.

Other data pertained to the not economically active population in both the urban and rural areas of the country include the student population, homemakers, income recipients and others. The

income recipients are persons who are receiving pension and retirement benefits.

For the purpose of quantitative analysis, the number of male and female population as well as the number of employed and unemployed population was converted into percentages. The unemployed population is specifically those who are seeking work. These percentages were then compared to identify the category and community area that would need more attention and improvements.

3. Results

Table 1 illustrates Iran's total country population and the population of the country distributed according to community type – urban and rural areas from one decade to the next beginning from 1956 to 2006. It is evident that there is a sharp increase in the total population of the country. The number of males comprises 50 to 52 per cent of the population while the number of females comprises 48 to 49 per cent of the total population which indicates that majority of Iran's population consists of males.

From 1956, Iran's total population has increased to more than 46 million in 2006. The rise in population for both male and female occurred most in the urban areas as seen in Table 1. The year 2006 has brought about the highest increase in the male population in the urban area hitting 69 per cent while the female population was at 79 per cent. It is also observed that from 1956, the total population in the urban areas was just 32 per cent and has gradually increased to 69 per cent in 2006. This is also true for both male and female population rate, which slowly rose in the decades that came after.

On the other hand, the male population in the rural areas had its highest rate of 66 per cent in 1956 but the population slowly dropped to 30 per cent in 2006. The female population has also decreased from 67 per cent in 1956 to 30 percent in 2006.

In general, as illustrated in Table 1, the total country population and the population rate in the urban areas have increased throughout the decades from the first national census in 1956 until 2006. On the contrary, the population in rural areas has decreased from 1956 to 2006 and so do both its male and female population. In 2006, almost 70 per cent of the people live in the urban areas while 30 per cent reside in the countryside.

Looking at Table 2a, there is an increase number of the total country's employed and unemployed population from 1956 to 2006. The urban areas of the country also show an increase and between 1976 and 1986 there is 7.4 per cent of increase in the employed population. Initially in 1956 from an unemployment percentage of 54, the number

decreased to 21 in 1966 and continued to maintain a low unemployment rate in 1976 with 22 per cent. Then unemployment in the urban areas rapidly grew in a span of 10 years from 1976 to1986 with 36 per cent in difference.

 As illustrated in Table 2a, between 1956 and 2006 the total number of employed persons dropped from 69 per cent to 31 percent that is About half of the initial percentage in 1956. Unemployment in the rural areas started at 45 per cent in 1956 and rapidly rose to 78 per cent by 1966.   From 1976 to 2006, unemployment continued to decrease reaching 36 per cent.   While there is an apparent increase of employed and unemployed persons in the urban areas, the rural areas of the country illustrates otherwise.

The percent of employed male population in the urban areas was doubled in 2006 from a initial mark of 30 per cent in 1956. Yet throughout the years between 1966 and 1976, there is a sudden 10 per cent rise in employment for the male population in the urban areas. In the countryside, male employment has decreased to 31.5% in 2006, which is almost half of the employed 69 per cent of males in 1956. Meanwhile in 1956 with 53 per cent of unemployed male in the city there was a rapid decrease of 30 percent, which obtained 22 per cent of unemployed males in 1966.

In addition, 10 years thereafter there was just little increase to 25 per cent in 1976. But between 1976 and 1986, a marked increase of unemployment occurred arriving at 57 per cent and continued to rise to 61 per cent by 2006.

The rural areas started out with 45 per cent of unemployed males in 1956, which rose to 76 per cent in 1966. Male unemployment slowly dropped

by 2 per cent in 1976 at 74 per cent. Then in 1986, unemployment was brought down to 42 per cent reaching 38 per cent in 2006. Based on Table 2b, the rate of male unemployment in the urban and rural areas of Iran has presented some irregularities in the increase and decrease of unemployment between 1956 and 1986.

Female employment in the city has also shown a steady increase beginning 1956 to 2006. But as observed from the table, there was a decrease of employment among women from 61 per cent to 56 per cent in 1996 and rose again to 70 per cent by 2006. On the other hand, female employment in the rural areas declined from 67 per cent in 1956 to 29 percent in 2006. An irregularity was also observed from 1991 to 2006 where female employment rose to 43 per cent in 1996 from 38 per cent of employed women in 1991. This was brought down again to 29 per cent in 2006.

Table 2b also illustrates an irregularity of women unemployment for those who live in the city and the countryside. Apparently, there was instability of female unemployment from 1956 to 2006. With unemployment at 50 per cent in the urban areas, this has declined to a low 13 per cent in 1966 then arriving at 12 per cent in 1976. But by 1986, the rate of unemployment dramatically changed and rose to 64 per cent. Though this has decreased to 52 per cent in 1991 and remained steady at 52 per cent until 1996, once again, this has increased by 14 per cent in 2006 becoming 66 per cent.

In the rural areas, the highest female unemployment rate occurred between 1956 with 50 per cent of unemployment to 1976 with 87 per cent increase.

However, between 1976 and 1986, the number of unemployed women declined to 34 per cent. There was a steady increase from 1986 to 1996 then dropped to 33 per cent in 2006.

Table 3a shows the total country population as well as the total percentage rate of not economically active persons in the urban and rural areas. This consists of the student population, home makers, income recipients and others. A large number of the country's population comprise of students whose population rate from 1956 to 2006 remained high from 62 per cent to 75 per cent. Home makers in Iran apparently show gradual increase from 31 per cent in 1956 reaching 67 per cent in 2006. The population rate of income recipients also increased over the past 50 years marking its highest rate in 1991 with 81 per cent which declined to 67 per cent in 1996 but managed to increase to 75 per cent in 2006. For others who are not economically active, the population rate also rose to three times more of its

initial population rate of 21 per cent in 1956 to 63 per cent in 2006.

Table 3a: Not Economically Active Population in Total including Urban and Rural Areas 1956 – 2006

Total County	Total (thousand)	Student (thousand)	Home Maker (thousand)	Income Recipient (thousand)	Other (thousand)
1956					
1966	6717	685	4964	-	1068

1976	43	70	36	-	35
1986	53	69	45	54	49
1991	56	63	53	71	39
1996	58	62	56	81	45
2006	64	69	60	67	52
	69	73	67	75	63
Rural					
1956	65	24	68	-	79
1966	56	29	63	-	64
1976	46	30	54	45	51
1986	43	36	45	28	59
1991	41	37	43	18	54
1996	35	30	39	32	46
2006	30	26	32	24	36

The rural areas manifest some irregularities in the increase and decline in the population rate of students, income recipients and others who are not economically active. But the population rate of home makers in the rural areas has decreased from 68 per cent in 1956 to 32 per cent in 2006.

Looking at Table 3b, the number of students for the male and female population in the urban areas has shown a decrease from 1956 to 1991. The number of female students in the city was at the highest with 90 per cent while the number of male students was at 70 per cent. From 1956, it has continued to decline until 1991. It began to rise once more from 1996 to 2006. In the rural areas, the percent rate of students grew from 29 per cent to 68 per cent among males and 9 per cent to 33 per cent in 1991 among females. Sadly then this number has decreased between 1991 and 2006.

Male homemakers living in the urban and the rural areas were not stated in the census from 1956 to 1976. However, it is clearly seen that the male homemakers in the city have increased from 1986 to 2006 by 9 per cent. This is also true for female homemakers, which continued to grow in number reaching 67 per cent in 2006 from a low percent rate of 31 in 1956. If there is an increase of

male and female homemakers in the city, the countryside shows a decrease in their number. Male homemakers have decreased by 10 per cent in 2006 while female homemakers have also declined by 36 per cent.

6. 1996	36	27	39	49	53
7. 2006	31	24	32	29	39

An unsteady growth and decline of population rate among income recipients from the city was experienced throughout the years between 1976 and 2006. Yet during the years 1956 to 1966, there were no census noted on this particular category. The highest noted number of income recipients in the city occurred in 2006 for both male and female recipients. It differs in the countryside where the highest number occurred in 1956 for both male and female income recipients and continued to go down until 2006.

For the others who are not economically active, the population rate started low in 1956 with 21 per cent for males and 20 per cent for females. This number increased at a high rate by 2006 with 66 per cent and 59 per cent respectively for males and females living in the city. However, the opposite is experienced in the rural areas. The population rate for income recipients for both males and females

decreased from 1956 to 2006. From 78 per cent for males and 79 for females, these numbers went down to 33 per cent and 39 per cent for males and females respectively.

In general, while there is an increase in population rate for homemakers, income recipients and others in the city, a decrease in the number of these indicators of not economically population is seen in the rural areas. The student population however shows unsteady rise and fall of number between 1956 and 2006.

4. Discussion

It is evident that the rate of male and female population in the city has risen from 1956 to 2006 and so with the rate of employed and unemployed persons. With the rise of population and employment and unemployment in the urban areas, there is a decrease of population and employed and unemployed person s found in the countryside. This is due to possible migration from the rural areas to the city over the past years from 1956 to 2006. Naturally, the city becomes the center for productive activities and with many different human endeavors in business and commerce, education opportunities, industrial, cultural and political activities. These opportunities found in the urban areas become attractive particularly to those who are inclined in the field of business and educationally oriented individuals from the other rural regions of the country. Consequently, this leads to an increase in population in the cities thus causing the rural or less developed areas to lessen their work force and deprive them of other more productive ventures. For developing countries, the continued growth in the cities is an observed trend.(Appadu 2005).

While population growth for male and females in the urban areas has increased, the rate of employed and unemployed males and females has also increased. This may be considered due to factors such as the increase in birth rates and positive migration. But if not properly checked and regulated, excessive population and unemployment growth may lead to other problems such as economic, social, educational, health problems and moral degeneration.

In the rural areas however, there is an apparent decrease in population growth as well as the rate of employed and unemployed persons both male and female alike. The decline in population may be attributed to migration to the cities and improvements in family planning programs that have been introduced in the country through government information and education programs. (Dickson 2009).

A significant increase   in the population rate of male and female students in the rural areas and with the decrease in the rate of homemakers for

both sexes is a good sign. This implies that these individuals have seen the potentials of education in empowering them to develop their skills and abilities and obtain necessary knowledge of making a living and becoming a productive individual. Sadly, in the urban areas while the number of students has occasionally seen some fluctuations, the number of homemakers has gradually increased for both male and female (chihiro 2010). This may be explained by the rapid population growth in the cities resulting to a reduction in the demand for goods and services. Such decrease in production and increase in population also results to inefficient usage of human resources and lost output in the society. Repercussions may mean that due to the government's inability to generate employment for the increasing number of work force in the country, possibilities of exploitation of workers by local and foreign capitalists can happen through low wages, poor working conditions and absence of other economic benefits (osinubi 2003).

Population growth forms formidable barriers to a country's progress and development and this phenomenon is usually attributed to socio-cultural, religious and environmental factors but with a better understanding of its occurrence will help regulate and control its growth.

Physical and Mechanical Properties of beans

Alireza Shirneshan

Mechanical Engineering Group, Faculty of Engineering, Islamic Azad University, Najafabad Branch, Iran
arshirneshan@yahoo.com

Abstract: Food properties are needed and play a significant role to predict and define the quality and behavior of seeds. In this study physical (dimension, weight, volume, sphericity, static coefficient of friction) and mechanical (maximal impact deformation, dynamic coefficient of friction) properties of four common beans are reported. As static coefficient of friction is equal to tangent of slip angle, a suitable apparatus was constructed and static coefficient of friction for four genotypes Daneshkadeh and Dehghan (white color) Naz and Sayyad (Red color) on three surfaces (rubber, tarpaulin and steel galvanized) were measured. Also dynamic coefficient of friction was determined at surface moving velocities of 4, 8 and 12 m/min. Mechanical behavior under impact load were determined in terms of average rupture force in pendulum impact, that is design and constructed. Randomize complete block design showed that, static and dynamic coefficient of friction had major difference between beans genotypes, surfaces and velocity. Mean values showed that the lowest static coefficient (0.32) occurred with steel galvanized surface and highest (0.44) on tarpaulin surface. The lowest dynamic coefficient of friction (0.24) occurred with steel galvanized surface and highest (0.385) on tarpaulin surface. It was observed that the magnitudes of physical damage in Sayad beans were higher than Naz, Daneshkadeh and Dehghan respectively. The average loss of germination to beans decreased with increasing impact energy. Naz and Dehghan had minimum mean volume and weight and Daneshkadeh had maximum sphericity and geometric mean.

INTRODUCTION and LITERATURE REVIEW

In order to design equipment for the handling, conveying, separation, drying, aeration, storing and processing of bean seeds, it is necessary to determine their physical properties. Recently scientists have made great efforts in evaluating basic physical properties of agricultural materials and have pointed out their practical utility in machine and structural design and in control engineering. Dimensions are important to design the cleaning, sizing and grading machines. Coefficient of friction is important in designing equipment for solid flow and storage structures. The coefficient of friction between seed and wall is an important parameter in the prediction of seed pressure on walls (Amin et al., 2004).

Several investigators determined the physical properties of seeds such as Shepherd and Bhardwaj (1986) for pigeon pea; Amin et al. (2004) and Carman (1996) for lentil seed; Ogunjimi et al. (2002) for locust bean seed; Yalcin et al. (in press) for pea seed; Konak et al. (2002) for chickpea seeds, Dutta et al. (1988a) and Aviara et al. (1999) for gram and guna seeds respectively.

The coefficient of friction is important parameter in the design of material handling equipment and storage structures. Methods that have been used to study the coefficient of friction of agricultural products include moving a given surface against the material (Lawton, 1980), tilting an inclined plane, (Aviara et al. (1999), Deshpande et al. (1993), Dutta et al. (1988a) and the use of shear box equipment (Osunade and Lasisi, 1994). The structural surfaces usually employed are galvanized steel sheet, wood and plywood. Studies on the angle of repose of grains and seeds have been conducted by various researchers using a specially constructed box with removable front panel (Dutta et al., 1988a; Fraser et al., 1978). The objective of this part of project was to measure the peak static and dynamic coefficient of friction for various bean cultivars against common construction materials with typical surface conditions.

The study of the mechanical characteristics in agricultural products is important in order to design equipments operating with maximum efficiency but not compromising the final product quality. The seed coat layer is thin, making them susceptible to mechanical damage during handling and drying. Generally, mechanical injury occurs during harvesting when the pods are threshed, but injury can also occur any time when the seeds are processed or handled including during planting (Copeland and Saettler, 1982). When grains are submitted to forces that exceed the resistance of the

material, grain breakage or cracks are found (Liu et al., 1990). During harvesting, handling and storage operations, the grains go through several static and dynamic pressures such as high speed impacts which cause bruises, crushes and cracks that increase the susceptibility to deterioration during storage (Bargale et al., 1995).

Bergen et al. (1993) in a study on 'Trapper' peas and 'Laird' lentils observed that seeds dropped from a greater height caused more seed damage on all three selected surfaces, namely: steel, plywood, and concrete. Seeds with lower moisture content reportedly incurred more damage. However, they did not observe any significant change in the germination percentage. Perry and Hall (1965) studied the mechanical properties of pea beans using an experimental impact machine and high-speed motion picture camera. They were able to estimate the kinetic energy, maximum total force during impact, average time of impact, and the deformation. Their results showed that pea beans were elastic since temporary deformation averaged 12.7% during impact, while permanent deformation averaged 2.7% only. In a study of damage on soybean seed quality, Paulsen et al. (1981) observed that an increase in impact velocity resulted in increased split beans. Evans et al. (1990) impacted soybean seeds in a seed impacting device at four moistures (7.2, 10.1, 12.9, and 16.2%), four impact velocities (10, 20, 30, and 40 m/s), and five seed orientations. A steel impact surface caused the most damage, while the polyurethane surface caused the least. Seed damage increased with impact velocity and decreased with moisture content. Bartsch et al. (1979) observed that impact damage for soybeans at 5 m/s and 10 m/s were statistically similar. Nevertheless, damage increased as the approach velocities increased from 10 m/s to 15 m/s.

This study was undertaken to a) determined some physical properties of bean seeds, Dimensions, volume, sphericity; b) measuring the static and dynamic coefficient of friction against three different materials; c) quantify the physical damage caused to dry beans due to impact caused by pendulum; d) determine the loss in germination to dry beans due to impact and e) compare strain energy and rebound energy for four bean genotypes, Daneshkadeh and Dehghan (white color) Naz and Sayyad (Red color).

MATERIAL and METHOD
Physical attributes

The seeds were cleaned manually to remove all foreign matter such as dust, dirt, stones and chaff as well as immature, broken seeds. The initial moisture content of the seeds was determined by oven drying at 105±1° C for 24 h (Suthar and Das, 1996; Yalcin and Ozarslan, 2004). The initial moisture content of the seeds was 8 to 10% d.b. The moisture in the seeds was allowed to equilibrate at room temperature of 27C for at least 72 h. To determine the average size of the seed, 100 seeds were randomly picked and their three linear dimensions namely, length, width and thickness were measured using a micrometer with accuracy of 0.01 mm (Altuntas et al., 2005). The sphericity and volume of seeds was calculated by using Mohsenin (1986) relationships.

Coefficient of friction

The friction device, utilized in this experiment (Figure1) was essentially a refined version of the device used by Mohsenin (1986). The static and dynamic coefficient of friction of bean seeds against three different structural materials, namely rubber, tarpaulin and galvanized iron was determined. A polyvinylchloride cylindrical pipe of 50 mm in diameter and 50 mm in height was placed on an adjustable tilting plate, faced with the test surface and filled with the 30g bean sample. The cylinder was raised slightly so as not to touch the surface. The structural surface with the cylinder resting on it was raised gradually with a screw device until the cylinder just started to slide down and the angle of tilt   was read from a graduated scale (Singh and Goswami, 1996; Suthar and Das, 1996). The coefficient of friction was calculated from the tan( ). The maximum value of friction force was obtained when box started moving, and this was used to calculate the static coefficients of friction. While the box continued to slide over the friction surfaces at 4, 8 and 12 m/min velocity, the dynamic friction force was measured. The test table height was adjusted so that the cable between the box and force gage was always in a horizontal position. The horizontal pull (friction force) was measured by the A&D Co. digital force gage with 0.1g accuracy and continually recorded on a computer. The maximum amplitude of the consequent undulating dynamic force line was the peak force. The dynamic friction force calculated by dividing the total area (integrated time base) under the force travel curve by the total travel distance (extension). The sliding friction force divided to sample weight was used to calculate the dynamic coefficients of friction. An analysis of variance evaluation was made for the peak static and dynamic friction data respectively. A Duncan rank test was used to test for significant differences between each treatment.
Figure1. Apparatus for measuring (a) static CoF (b) dynamic CoF

Impact damage to beans

Seeds are also subjected to forced pendulum impact that happens in threshers. The tested and untested (control) seeds were graded manually according to the guideline of the Canadian Grain Commission (1993). The seeds were sorted as cracked, split, and undamaged. Splits included broken pieces that were less than three-quarters of the whole seed and halves that were loosely held together. Cracked seeds included seeds with visibly cracked seed coats and seeds with less than one-fourth seed broken off. The percentage of cracked split, and undamaged seeds was adjusted for damage in the untested seeds. Undamaged seeds from each treatment combination were subjected to germination tests to check for internal damage. Germination tests were done by Alberta Wheat Pool at Camrose, Alberta. In each sample tested, seeds were placed evenly on two sheets of a germination paper towel, then covered with a single sheet, rolled and held in upright position. The rolled towel was moistened until its mass was about three times its dry mass (Canadian Food Inspection Agency, 1995).

From eq. (1) the impact energy (w_i) is equal to summation of rebound energy (w_R), strain energy (w_P) and energy losses (w_L). In pendulum apparatus, total impact energy and rebound energy with an estimation of friction (losses) is distinct, so strain energy will be determined (Sitkei, 1986). Coefficient of restitution could be determined by eq. (2) (Bueche and Hecht, 1997). In this equation, a and b are primary and secondary angle of pendulum rebound.

$$Wi = w_R + w_P + w_L \qquad (1)$$

$$e = \sin(b/2) / \sin(a/2) \qquad (2)$$

The experiment was set up as a factorial complete design. There were four replicates for the measurements of strain energy and Coefficient of restitution. The Mstat-c software was used to derive the least squares and standard errors for the dependent variables. The Duncan test was used to compare the means.
Figure 2. Impact apparatues

RESULTS and DISCUSSION
Seed physical attributes

A summary of the results of the determining physical parameters of 400 seeds is shown in Table (1). The geometric mean diameter ranged from 3.2 to 8.4 mm. The geometric mean of the axial dimensions is useful in the estimation of the projected area of a particle moving in the turbulent or near turbulent region of an air steam. The sphericity was 27.8 to 73.8 Percent which indicated that the shape of the beans makes them difficult to roll on surfaces.

Static and dynamic coefficient of friction

The ANOVA indicated that the variation of peak static coefficients of friction with cultivar and surface was significant ($P<0.05$ and $P<0.01$ respectively). Also cultivar*surface interaction was significant ($P<0.01$). These two factor interactions were further evaluated by plotting and studying interaction patterns. No consistent trends, except for surface effects, were evident. Mean value showed that the lowest static coefficient (0.32) occurred with steel galvanized surface and highest (0.44) on tarpaulin surface. For the dynamic coefficients of friction, the same effects and interactions were

found to be significant in the Anova as were found for the peak static coefficients of friction. Mean value showed that the lowest dynamic coefficient (0.24) occurred with steel galvanized surface and highest (0.385) on tarpaulin surface (Table 2).

Table 1. Some physical properties of four beans

Property	Genotype	Mean value	Minimum value	Maximum value

Galva. steel	Dehghan	0.277		0.255	0.23	0.19
Tarpaulin	Sayyad	0.45		0.41	0.39	0.35
Rubber	Naz	0.42		0.425	0.39	0.25

For beans, the dynamic coefficient of friction was less in value than static coefficient of friction, however for high moisture content, chopped forage or plant tissue, the dynamic coefficient of friction does exceed the peak static coefficient of friction (ASAE, 1990; Mekvanich and bagnall, 1978). The static and dynamic coefficient of friction of bean seeds on three surfaces are presented in Table (1) and it was observed that the static coefficient of friction is higher than dynamic coefficients of friction. Both the static and dynamic coefficients of friction were highest in rubber, followed tarpaulin and galvanized steel. This may be due to smoother and more polished surface of galvanized metal than other test surfaces. These results was agree with the behavior of dry engineering materials as noted by Mohsenin (1986), who observed that the friction force decreases as the sliding velocity increases.

The analysis of variance showed a significant effect of moving velocity on dynamic coefficient of friction. Generally, the dynamic coefficients of friction for bean cultivars decreased as the velocity increased. The lowest dynamic coefficient occurred at 12 m/s for galvanized steel and highest occurred at 4 m/s for tarpaulin (Table 2).

Impact force

The means of split and cracked damage in beans and the percentage of seed germination at various impact energy levels are shown in Table 3. It was observed that the magnitudes of physical damage in Sayad beans (Table 2) were higher than Naz, Daneshkadeh and Dehghan respectively. The average loss of germination to beans decreased with increasing impact energy. All two independent variables namely, impact energy and variety had significant effect ($P<0.01$) on the measured values. Figure 3, 4 shows the value of strain energy and Coefficient of restitution of four beans. Bean damage increased as the impact energy increased which was also the case for soybeans (Evans, et al. 1990; Paulsen et al. 1981). A decrease in percent germination was observed as the impact energy increased.

Germination in Naz and Sayyad (Red color) was low in high level impact energy (1.035 j).

CONCLUSIONS

Based on the results of this study, the following conclusions can be drawn:
. The value of dynamic CoF was less than static CoF and both of them were highest in rubber, tarpaulin and galvanized steel respectively.

Table 3. The means of damage in beans at various impact energy levels

Bean Genotypes		1.035	0.990	0.955	Control
Daneshkadeh	Split	30%	0	0	0
	Cracked	0	10%	0	0
	Germination	40%	60%	70%	90%
Naz	Split	40%	10%	0	0
	Cracked	0	10%	0	0
	Germination	30%	60%	80%	86%
Sayad	Split	50%	0	0	0
	Cracked	0	20%	0	0
	Germination	30%	60%	90%	90%
Dehghan	Split	20%	0	0	0
	Cracked	0	0	0	0
	Germination	50%	70%	90%	100%

(Impact energy levels, J)

. The relationship between loss of germination resulting from the impact tests using different variables were well defined. A decrease in percent germination was observed as the impact energy increased.
. To avoid bean seed damage and thereby to avoid decreased germination capacity during preparation of seeds for sowing, the impact energy level of seed should not exceed 1 J.

Stimulation effect of some bioregulators on flowering, chemical constituents, essential oil and phytohormones of tuberose   (*Polianthes tuberos L.*).

[1] Lobna, S. Taha and [2] Rawia, A.Eid

Department of Ornamental Plant and Woody Trees.National Research Centre,Dokki, Cairo, Egypt
* Corresponding author, emil, lobnasalah82@yahoo.com

Abstract: Bulbs of tuberose plants were soaked (24h) or sprayed with solutions of spermidine and ATP at 50, 75 or 100ppm for each. Both bioregulators (especially at 100 ppm) augmented plants bulblets and flowering characteristics (No. of bulblets, fresh and dry weights of bulblets, no of days to flowering, No of florets/spike, spike length, length of rachis and fresh and dry weights of spike) Spermidine was more effective than ATP for bulblets parameters but ATP was preferred for flowering parameters, photosynthetic pigments (Chl a, b and carotenoides), chemical constituents of plants (Indoles, phenols and total carotenoides). Essential oil content of flowers was significantly improved by soaking or spraying of ATP at 50, 75 or 100ppm. The highest amount of endogenous GA3 produced with ATP at 100ppm. However, spermdine (100ppm) caused the highest amount of cytokinins. Using ATP as soaking or spraying treatment at 75 or 100ppm resulted in the highest amount of ABA.

1-INTRODUCTION

Polianthes tuberose linn (Family, Amaryllidareae) is a night blooming plant that distributed in hotter parts, mainly south America or Mexico. Besides its popularity as an ornamental garden plants with beautiful blossoms, flowers are used in perfume industry and also diuretic and emetic activity. Bulbs are used for curing raches in infant (Rammamurthy *et al.,* 2010)[1].

Spermidine is one of the major polyamine forms in plants. Polyamines are low-molecular weight polycations constitute a part of the overall nitrogen metabolism and the nitrogen source in the nutrient solution determines the polyamine synthesis and accumulation in plant (Altman and Levin, 1993)[2] . It was suggested that polyamines are able to bind with several negatively charged molecules, such as DNA (Pohjanpelta and Holtta, 1996)[3], protein (Apelbaum *et al.,* 1988)[4], membrane phospholipids and proteins (Tassoni *et al.,* 1996)[5] and pectic polysaccharides (D'oraci and Bangi, 1987)[6]. Polyamines were localized in the vacuoles, mitochondria and chloroplasts (Abd El-Wahed and Krima, 2004)[7]. They modulate several growth and developmental processes viz., cell division, differentiation, flowering fruit ripening, embryogenesis, senescence and rhizogenesis (Kakkar *et al.,* 2000)[8].

Phosphorus plays an important role in many enzyme reactions depending on phosphorylation and energy conservation and transfer for a wide range of biochemical processes (Walker, 1980[9]; Stevenson, 1986[10]; and Marshner and Cakmak, 1986[11]).

Phosphorus nutrition is doubly critical because the total supply of phosphorus in most soils is low and is not readily available for the plant use. Most of the basically adenosine- tri- phosphate (ATP) generating pathway, i.e. photophophorylation, glycolysis, TCC-Cycle, and oxidative phosphorylation are restricted [Lyons and Breidenbach (1990)[12] and Ortiz (1991)[13]]. In addition, synthesis of bioconstituents, minerals uptake, translocation and retention processes are dependent on the adenosine tri-phosphate (ATP) supply (Mengel and Kirkly, 1982). Besides the involvement of ATP in the system of gene expression and function, it is also directly involved in gene (DNA) structure (Dashek, 1997)[15]. The AMP (the hydrolytic derivative of ATP) is the main precursor of cytokinins (Jameson, 1994)[16].

Phytohormones regulate the protective responses of plants against both biotic and abiotic stresses by means of synergistic or antagonistic actions (Schemlz *et al.* 2003)[17].

The major objective of this investigation was to determine the effects of spermidine as polyamine and adenosine-tri-phosphote (ATP) on the promotion of plant growth flowering, chemical constituents, essential oil content and endogenous phytohormons of *Polianthes tuberosa* L.

2-Materials and Methods

The field experiments were carried out in Oseim district, 6 of October governorate during the two successive seasons 2008 and 2009. The aim of study was to investigate the effect of spermidine and ATP soaking and foliar application on the flowers, essential oil content and some chemical constituents of *Polianthes tuberosa L.* plants.

Experimental procedures: Bulbs of tuberose were obtained from ornamental plant research Dept., Ministry of Agric, Egypt for cultivation. The soil is clay loam in texture (sand 37, silt 28 and clay 35%), tented to alkalinity in reaction (pH 7.91). It had low content of calcium carbonate (2.04%); organic matter (1.40%) and E.C. (0.45ds/m). High in available phosphorus, potassium (3.2 and 78mg/100g soil), and low in available Fe, Mn, Zn, Cu (9.3, 3.24, 0.84, 0.89 mg/100g soil), respectively.

On April, 2008 and 2009 bulbs of tuberose plants were soaked in prepared solution of spermidine and ATP reach at 50, 75 and 100ppm for 24h. after that planted in rows, at spacing of 30 cm between bulbs within each row, and 60cm between rows. The plants were fertilized with 80: 40: 60 g/m^2 from NPK, calcium superphosphate (15.5% P_2O_5) was added before planting while the plant were fertilized with ammonium nitrate (33.5%) and potassium sulphate (48% K_2O) after 30 days from planting at two side dressings. Plants were sprayed three times with spermdine and ATP each at (50, 75 and 100ppm). The control plants were sprayed with water. The experiments were set up in a completely randomized block design with three replications. After the flowering period of each season, the following data were recorded, number of days to flowering, spike length (cm), spike diameter (cm), length of the rachis (cm), number of flowers/spike, fresh and dry weight of spike (g), No.of bullblets /plants, fresh and dry weight of bulblets (g). Treatments were arranged in a complete block design with three replicates. The data were statistically analyzed using analysis of variance according to Snedecor and Cochran (1980)[18].

Chemical Analysis : Soil surface samples (0-30 cm depth) were taken before planting from the experimental site. Soil was air-dried and sieved through 2mm sieve. Physical and chemical characteristics, were evaluated according to Ankerman and Large (1974)[18]. Total carbohydrates were determined in the ground line dry powder of tuberose plants using the colorimetric method described by Herbert et al. (1971)[20], photosynthetic pigments including chlorophyll (a and b) as well as carotenoids content were determined in fresh branchlets as mg/gm fresh weight, according to the producer achieved by Saric *et al.* (1967)[21].

Total phenols : 1gm of the fresh leaves were macerated in 5-10 ml 80% ethanol for at least 24 hr at 0°C, the alcohol was clarified the remained residue was re-extracted with 5-10ml 80% ethanol 3times. At the end, the clarified extract was completed to 50 ml using 80% ethanol. The colorimetric method of folin-Denis as described by Daniel and George (1972)[22].

Endogenous phytohormones :

The shoot of the plants of this group were frozen in liquid nitrogen and stored in deep freezer at -20°C until used for estimation of endogenous hormones.

Endogenous phytohormones were determined by using HPLC method

The frozen plant material were homogenized with absolute ice clod methanol in wavering blander and stored at 3°C for 24h. The alcohol was filtered and two subsequent extraction were carried out using 80% ice cold methanol and the alcoholic extracts were evaporated to aqueous phase as described by (Badr *et al.,* 1971)[22]. The aqueous phase was adjusted to pH 8.2 and partitioned three times against equal volumes of petroleum ether according to (Van Bragt, Laba, 1969)[24].

Separation of gibberellins, auxins and cytokinins were carried out according to Hiraja *et al.,* (1972)[25]. Endogenous hormones IAA, GA3 and were determined by their absorption at 269 nm. The peak area of the samples were compared to the corresponding peak areas of a standard solution containing known concentration analyzed using a waters 54100 high performance liquid chromatography (HPLC).

3-Results and Discussion

Bulblets and flowering characteristics

Data given in Table 1 show that soaking treatment of spermidine at 100ppm was a companied by an increase in the number of bulbets, fresh and dry weights of bulbets as well as number of florets/ spike length and length of rachis. The increment were 55.5%, 86.1% and 56.6%, 29.61, 20.3% and 4.2%, respectively as compared with control plants in the two seasons. While, the application of spermidine at 100ppm as spraying treatment caused the highest fresh and dry weights of spike (100.31 and 27.71, respectively).

Relations between polyamine and flowering processes have been observed by many investigators. In cherry flower buds, polyamines that increase rapidly with the onset of active metabolism were dected in all stages of bud development (Wang et al., 1985)[28]. Conjugated polyamines are known to be associated with the physiology of flowering metabolite synthesis

(Slocum and Galston, 1985)[27]. Spraying *Calendula officinalis* plants with brassinosteroid significantly promoted their flowering characteristics (Shalaby and Talaat, 1998)[28]. Nahed *et al.* (2009)[28] found that application of putrescine at 200 ppm had a promative effect on cormlets and florets caracters of gladiolus plants.

　　Regarding the effect of ATP, it was found that (Table 1) the best results in bulblets and florets parameters (No of day to flowering, No of florets/spike,

spike length, length of rachis, fresh and dry weight of spikes were obtained by using soaking treatment of ATP at 100 ppm.

　　Rawia *et al.,* (2009)[30] on *Matthiola incana* L. indicated that ATP application was considered the most effective treatment for increasing growth characters i.e No of flowers and dry weight of flowers. This may be attributed to the major role of ATP in plant metabolism according mengel and Kirkly (1982)[14].

Table (1): Effect of spermidine and ATP on tuberose bulblets and flowering characteristics (mean of the two seasons).

Concentration (ppm) Treatment		No. of bulblets	F.w of bulblets (g)	D.W of bulblets (g)	No of days to flowering	No of florets /spike	Spike length (cm)	Length of rachis (cm)	F.W of spikes (g)	D.W of spike (g)

Photosynthetic pigments:

　　The data recorded in table 2 show that soaking treatment of ATP at 100 ppm significantly increased chlorophyll a, b and a+b to highest amounts (0.57, 0.25

and 0.82 mg /g. F.W, respectively) followed by soaking treatment of spermidine at 100ppm. Whereas, application of spermidine or ATP as spraying treatment (100 ppm) increased carotenoides content to highest

values (0.69 and 0.67 mg/g F.W, respectively) in tuberose plants as compared with control (Table 2). These results indicated that tuberose plant content of pigments responds to spermidine and ATP applicaton positively. This could be due to the spermidine capability (as polyamine) to stabiles protoplast and prevent both loss of chlorophyll during senescence in protoplast and leaves (Kaur-Sawhney, 1980)[31]. Ma *et al.,* (1996)[32] suggested that he effect of polyamines in inhibiting chlorophyll degradation may be related to the inhibition of peroxidase activity. Increasing

carotenoids content may due to convert these substances to pyruvic acid that led to enhance bioynthesis of leaf carotenoids (Martin – Tanguy, 2001)[33].

Regarding the effect of ATP, the above mentioned results are in harmony with those obtained by Rawia *et al.,* (2009)[30] who observed that the highest values of chlorophyll a and b in *Matthoila incana* plant was obtained from ATP application.

Table (2).   Effect of spermidine and ATP on photosynthetic pigments (mg/g F.w)of *Polianthes tuberose* L (mean of two seasons).

Chemical constituents:
Total indoles :

Data presented in table 3 show that spermindine and ATP significantly affected total indoles content of *Polianthes tuberose* plants. This was shown by the increased indoles content in plants with soaking or spraying spermidine or ATP at 100 ppm which were significantly variable compared to the effect of the control. This showed that spermidine treatments enhanced phytohormons which can play an important role as regulator of growth and development of plant endogenous polyamine (Shunquan *et al.,* 2001)[34]. In the same time, role of ATP in activating most processes in plant metabolism was mentioned by Mengel and Kirkly (1982)[14].

Total soluble phenols :

Data presented in Table 3 show significant differences in total soluble phenols content of *Polianthes tuberose* plants as a result of spermidine or ATP application. Spraying spermidine treatment at

100ppm increased the phenolic content to the highest value (19.2mg/g F.w) followed by ATP at 100 ppm as soaking or spraying treatment (15.2 and 15.6, respectively). Spermidine treatment at 100ppm (soaking or spraying) was more effective than the ATP one. It could be due to the convertion of spermidine into another substance in the plant. It could derive from sugars, free amino acids, phenolic compounds and essential oil (Abd El-Wahed *et al.,* 2004)[7]. Spermidine converts to diaminopropane that can be converted into β-alanine, which in turn deaminates the production of cinnamic and para coumaric acids, respectively, from which the more complex phenolics are converted (Herrman, 1976)[35].

Total carbohydrate content :

Data in table 3 show the total carbohydrate % in tuberose plants. It can be emphasized that application of ATP at 100 ppm (soaking or spraying) resulted in the highest values of total carbohydrates (25.3% and 23.21%, respectively) followed by soaking treatment of ATP at 75ppm and spermidine at 100ppm

(22.5 and 22.2, resespectively) as compared with control. These results were confirmed by those of Dessouky (2002)[35] on *Borago officinalis* and Rawia (2004)[30] on *Mattiolia incana.*

Essential oil content (%) :

Data presented in Table 3 indicate that application of spermidine or ATP as soaking or spraying treatment significantly affect tuberose essential oil percent. It could be deduced from the present results that essential oil percent increased to highest percentage by application of ATP as soaking or

spraying treatment at 50, 75 or 100 ppm followed by similar treatments of spermidine as compared with control. These results are in close agreement with those reported by Baljieet *et al.,* (1996)[36] on *Guizatia abyssinica,* Shalan (2001)[38] on *Lagenaria siceraria,* Dessouky (2002)[36] on *Borago officinalis* and Abd El-Wahed *et al.* (2004)[7] on *Chamomilla recutita.*

Phytohormos

The data recorded in table 4 show that the detected amounts of endogenous gibberellin (GA₃), total cytokinins and Absecic acid (ABA) content in tuberose plants significantly affected by spermidine and ATP treatments. The highest amounts of endogenous GA₃ (26.21 and 26.43ng/g) were recoded with ATP at 100 ppm as soaking or spraying treatment followed by spermidine at 100 ppm (spraying treatment) as compared with control treatment. On the other hand, application of spermidine at 100 ppm as soaking treatment resulted in the highest amount of total cytokinins (391.21ng/g fw) followed by soaking or spraying treatment of ATP which gave 382.13 and 385.00ng/g FW respectively. Also the application of ATP at 75 or 100ppm as soaking or spraying treatment resulted in the highest amounts of ABA (35.11, 37.21, 31.11 and 33.41 ng/g FW respectively) as compared with control plants.

In this respect Mahgoub *et al.* (2006)[39] reported that treated carnation plants with puterscine at the rate of 200 and 400 ppm increased the contents of

.

endogenous promoters (IAA, GA₃ and cytokinins) in comparison with those obtained from the untreated plants. On the other hand, application of the same treatment caused dramatic reduction in the level of endogenous natural inhibitor (ABA).

It has been shown that polyamines interact in some way with all plant hormones. Polyamines like cytokinins have antisenescence activity (Altman, 1989)[40]. Polyamines have been ascribed various roles such as that of a new class of plant growth regulators, hormonal second messengers and as one of the reserves of carbon and nitrogen at least in cultured tissues (Slocum and Flores, 1991)[41].

In addition, the consequence of spermidine degradation can be the products of a precursor for other growth substances in plant (Abd El-Wahed, 2006)[42].

The results may be attributed to the major role ATP in activating most processes in plant metabolism (Mengel and Kirkly, 1982)[14]. The AMP (the hydrolytic derivative of ATP) is the main precursor of cytokinins (Jameson, 1994)[16]

Lens Protein Changes Associated With Cigarette Smoking

Eman M.Aly * and Eman S. Elabrak

Biophysics and Laser Science Unit, Research Institute of Ophthalmology, Giza, Egypt.
*e.Aly@hotmail.com

Abstract: Purpose: Smoking is an independent risk factor that has dose-response effect. The goal of the present work is to study the biophysical and biological effects of smoking on the crystalline lens of the rabbits. **Materials and methods**: Twenty New Zealand albino rabbits used in this study were classified into five groups in which group I (n=4) served as control. The other groups were exposed to different durations of cigarette smoke (five cigarettes per day). Animals were decapitated after 2, 4, 6 and 8 weeks and soluble lens proteins were separated and the following measurements were carried out: estimation of total soluble protein, refractive index measurement, sodium dodocyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) and determination of sodium, calcium and potassium concentrations. **Results**: The results showed that, exposure of the animals to cigarette smoke resulted in decrease of the protein concentration and potassium content that was accompanied by an increase in the refractive index of the soluble lens proteins and an increase in sodium and calcium content. In addition, there were changes in the molecular structure of soluble lens proteins demonstrated by SDS-PAGE. **Conclusion**: smoking causes morphological and functional changes to the lens that may lead to cataract.
[Eman M.Aly and Eman S. Elabrak. **Lens Protein Changes Associated With Cigarette Smoking.** Journal of American Science 2011;7(5):172-177]. (ISSN: 1545-1003). http://www.americanscience.org.

1. Introduction

Cigarette or tobacco smoking is a well-recognized major risk factor for a wide range of diseases, such as cardiovascular, respiratory, and malignant diseases[1]. Human[2,3,4] and animal studies[5,6,7] have demonstrated that maternal smoking has several detrimental and teratogenic impacts on pregnancy and its outcomes such as placental insufficiency, foetal growth retardation, low birth weight, foetal brain damage, and sudden infant death syndrome. Smoking also has adverse ocular effects. It has been shown to be a risk factor for many common and severe eye diseases, such as Graves' ophthalmopathy[8], age related macular degeneration [9], glaucoma [10], and cataract [11,12,13]. Many of these diseases lead to irreversible blindness. The epidemiological relationship between smoking and cataracts has been well studied by case-controlled [14,15], cross-sectional [16,18], and prospective studies [19-20]. There is a dose-response relationship between the cumulative amount of smoking and the risk of nuclear cataract developing [21]. A major teratogenic component of tobacco smoke responsible for adverse effects is nicotine. A typical smoker using 20 cigarettes a day will absorb about 0.3 mg/kg nicotine daily, resulting in peak plasma nicotine concentrations in the range of 10 to 50 ng/ml[22,23,24]. The present work deals with the biophysical and biological effects of smoking on the crystalline lens of the rabbits after different periods of exposure namely 2, 4, 6 and 8 weeks to provide support for the hypothesis that cigarette smoking increases the risk of cataract formations.

2. Materials and methods

Twenty New Zealand albino rabbits with an average body weight of 2.5±0.5 Kg were selected from the animal house facility at the Research Institute of Ophthalmology, Giza, Egypt. The research protocol was approved by the local ethical committee that applies the ARVO (THE ASSOCIATION FOR RESEARCH IN VISION AND OPHTHALMOLOGY) statements for using animals in ophthalmic and vision research. The animals were classified into five groups in which group I (n=4) served as control. The other groups were exposed to cigarette smoke (five cigarettes per day) [25] by using eye speculum to insure that their eyes were exposed to smoke. Groups II, III, IV and V were exposed to smoke for 2, 4, 6 and 8 weeks, respectively. Animals were decapitated after different periods of exposure and eyes were enucleated. Then, the lenses were freed from the eye. The lenses without their capsules were weighed, homogenized separately in de-ionized water and centrifuged at 16,000 rpm to extract soluble lens proteins then stored at -20°C for the following measurements.

Estimation of total soluble lens proteins:

Total proteins in the soluble part of the crystalline lens were determined by the method of Lowry et al.[26].

Refractive index:

The refractive index of native soluble lens protein was measured using Abb's-refractometer attached with temperature control unit type W Lauda (Germany).

SDS polyacrylamide gel electrophoresis:

Soluble lens proteins were separated according to their molecular weights by sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) according to Laemmli[27] using 5% stacking gel and 12% separating gel. The data represented graphically with an automatic scanner (model R-112, manufactured by Beckman).

Sodium (Na^+), Potassium (K^+) and calcium (Ca^{++}) content:

Sodium, potassium and calcium content in lens homogenate were recorded using atomic absorption spectroscopy in order to study the membrane permeability of the lens.

Statistical analysis:

Data were expressed as the mean ± SD. Comparison between groups was performed using analysis of variance (ANOVA), commercially available statistical software package (SPSS-11, for windows) was used where the significance level was set at $p < 0.05$.

3. Results:

Fig (1) shows the total soluble lens proteins of control and exposed rabbits to cigarette smoking after 2, 4, 6 and 8 weeks. The protein concentration in control (group I) was 290.7±3.5 mg/g lens tissue wet weight. After 2 week of exposure to smoke the protein content was 288.1±3.9 that indicate no change in group II. But the rest of exposed animals' groups show a significant decrease in the soluble lens protein content to 280±4 (group III), 260.4±5.2 (group IV) and 255±4.3 (group V) after 4, 6 and 8 weeks, respectively.

Fig (2) shows the refractive index of soluble lens protein for control and after exposure to smoke for all periods. It is clear from the figure that the groups exposed to smoke were characterized by an increase in the refractive index relative to control, except group II.

Fig 1. Protein concentration of rabbit lens for control and after exposure to smoking for different periods.
Fig 2. Refractive Index of rabbit lens protein for control and all groups exposed to smoking for different periods.

Panel (a) of Fig (3) shows the electrophoretic patterns of lens proteins for control rabbits, it was characterized by the presence of 10 peaks, which reflect the different soluble protein fractions with specific intensities and broadening that covered the molecular weight range 39 – 178 KDa. In panel (b) of fig (3), the patterns of lens proteins for group II which were exposed to cigarette smoke for 2 weeks revealed no change in the electrophoretic mobility and the intensity of all peaks proteins fractions. After 4 weeks of exposure to cigarette smoke (panel c of fig 3), the pattern revealed some shift to high molecular weight for all fractions and covered the molecular weight range 42-183 KDa. Also a decrease in the intensity of the 75 KDa peak is observed to be 0.1 compared to the control which is 0.17. Panels (d) and(e) of fig (3) shows the electrophoretic pattern of soluble lens proteins for animals exposed to cigarette smoke for 6 and 8 weeks, respectively. The two

patterns revealed propagation of the same phenomenon; shift in all fractions to high molecular weight and covered the molecular weight range 40-185 KDa and 65-195 KDa after exposure to smoke for 6 and 8 weeks, respectively. Panel (d) characterized by decrease in the intensity of low fractions mobile groups. Also panel (e) (8 weeks exposure to smoke) is characterized by reduction of fractions to 9 peaks.

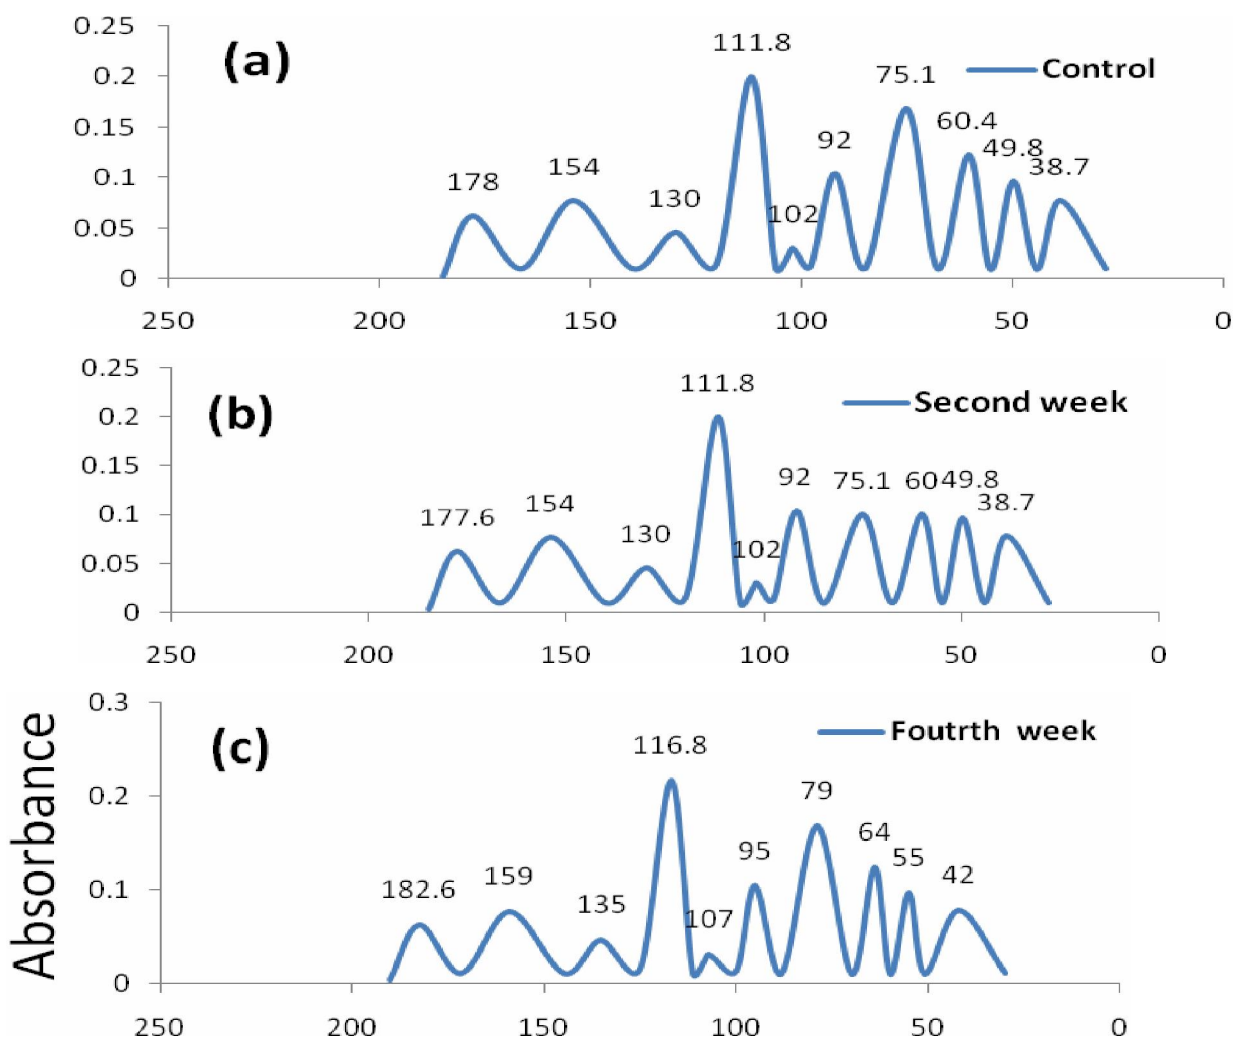
The cigarette smoke influence on the concentration of cations in the lens protein homogenates was illustrated in Figs 4-6. Sodium, Ca^{++} and K^+ concentrations did not change after 2 weeks of exposure to cigarette smoke. Four, 6 and 8 weeks of exposure produced a remarkable increase of both Na^+ and Ca^{++} concentrations in exposed rabbits (Fig 4, 5). On the contrary exposure to cigarette smoke caused a pronounced decrease of K^+ concentration with respect to control samples (Fig 6).


Fig 3. Electrophoretic pattern for (a) control animals, (b), (c),(d) and (e) animals exposed to cigarette smoking for 2,4,6 and 8 weeks, respectively
Fig 4. Sodiem concentration in lens homogenate of control and exposed to smoking for different periods.
Fig 6. Potassium concentration in lens homogenate of control and groups exposed to smoking for differemt periods.

4. Discussion

Cigarette smoke contains numerous organic and metallic compounds emitted as gases and condensed tar particles, many of them being oxidants and prooxidants, capable of producing reactive oxygen species (ROS). These chemically ROS are known to be present or formed in cigarette smoke which may lead to modification of biological macromolecules [28]. Smoking causes morphological and functional changes to the lens due to its atherosclerotic and thrombotic effects on the ocular capillaries. Smoking also enhances the generation of free radicals and decreases the levels of antioxidants in the blood circulation, aqueous humour, and ocular tissue. Thus, the eyes are more at risk of having free-radical and oxidation attacks in smokers.

Total soluble lens proteins of the rabbits lens and refractive index were quantitatively changed after exposure to cigarette smoke more than 2 weeks. These changes may give an interpretation about the appearance of high molecular weight aggregates which could be attributed to the formation of new protein molecules that differ from the native protein of the control lens. Also these changes are supported by the electrophoretic studies in which shift of all fractions to high molecular weight due to either loss of surface charge or increase in the molecular weight. The present study supports the hypothesis that damage to lens cell membrane affects ion exchange mechanisms with associated formation of cataract [29,30]. It has been demonstrated that in cataract formation there is a significant increase in lens cytosolic calcium and sodium concentrations, together with a decrease in cytosolic potassium levels [31]. The results obtained in our study suggest that increased levels of calcium and sodium and decreased levels of potassium are related to the oxidative damage of cigarette smoking relative to the period of smoking time. Duncan et al.[32] studied the physiological status of human eye lens membranes of different ages in the population. One likely mechanism of cataract formation is oxidation and precipitation of lens proteins. Smoking may increase the oxidative stress in the lens that increases lipid peroxidation and decreases plasma antioxidant levels. The relationship between smoking and cataracts has been well studied [14,16,19]. There is a dose-response relationship between the cumulative amount of smoking and the risk of nuclear cataract developing [21]. Heavy smokers are more at risk than other groups. The cigarette smoking contributes to the formation of cataracts in two ways. First, free radicals present in smoke assault the eye directly, potentially damaging lens proteins and fiber cell membrane in the lens. Second, smoking reduces the body's levels of antioxidants and certain enzymes which may help remove damaged protein from the lens.

In conclusion, Smoking -if continued- may lead to cataract, perpetuate further ocular damage and lead to permanent blindness. Cessation of smoking and avoidance of passive smoking is advised to minimize the harmful effects of smoking on the eyes.

ABSTRACT: Prophylactic antibiotics have been shown to be effective in reducing the incidence of febrile morbidity associated with cesarean section after labor. However, the relative effectiveness of different single antibiotics has been studied infrequently. Several new broad spectrum antibiotics are now available, and any further benefit from more traditional antibiotics for surgical prophylaxis remains untested. A randomized clinical trial for testing the efficacy of cephalosporin versus Amoxicillin in preventing post cesarean section infection, and to identify the role of health education about wound care in reducing post cesarean section wound infection. This study conducted at emergency unit of the Obstetrics &Gynecological department, Woman's Health Center, Assuit University Hospital, between 2008 to 2009. Women's undergoing emergency and elective cesarean section were recruited into the study and given either drug as prophylaxis. The sample comprised 200 pregnant women. 100 pregnant women received Amoxicillin and the other 100 pregnant women received Cephalosporin as a prophylactic antibiotic. For each group, 50 women received routine hospital wound care and the other 50 women received health education about wound care. Random assignment was done by computer generated tables. Concealed envelopes containing the random number made to be opened after deciding to include the case in the study. the -present study reported that the percent of surgical site infection (SSI) of elective cesarean section was 2.5% (0.5% in Amoxicillin group and 2% in cephalosporin group) with no significant difference between both groups. We can concluded that use of Amoxicillin as a prophylactic antibiotic as effective as Cephalosporin in preventing post cesarean section wound infection. And women that received health education about wound care are less likely to expose to wound infection than those who receive only routine hospital care, in spite that the comparative results are not significant.
[Walaa H. Ibrahim, A. M. Makhlouf, Mervat A. Khamis, and Entisar M.Youness. **Effect of prophylactic antibiotics (Cephalosporin versus Amoxicillin) on preventing post caesarean section infection.** Journal of American Science 2011;7(5):178-187]. (ISSN: 1545-1003). http://www.americanscience.org.

Key Words: Prophylactic antibiotics, Wound infection, Cesarean section.

Introduction

Infection is one of the most common complications of cesarean delivery. Factors that have been associated with an increased risk of infection among women who have a cesarean delivery include emergency cesarean section, labor and its duration, ruptured membranes and the duration of rupture, the use of prophylactic antibiotics or not, the socioeconomic status of the woman, number of prenatal visits, vaginal examinations during labor, anemia, blood loss, obesity, diabetes, general anesthesia, the skill of the operator and the operative technique.(John & Sons, 2007).

In the absence of prophylactic antibiotics, the rates of postpartum endometritis can be as high as 35% to 40%.This rate varies dramatically according to the clinical situation; the use of routine prophylactic antibiotics substantially reduces the rate of infection. (Peter, 2007).

Amoxicillin as a prophylaxis antibiotic do not kill bacteria, but they stop bacteria from multiplying by preventing bacteria from forming the walls that surround them. The walls are necessary to protect bacteria from their environment and to keep the contents of the bacterial cell together. Bacteria cannot survive without a cell wall. But, Cephalosporins are the most frequently prescribed class of antibiotics.(Yury,2009).

Cephalosporins are bactericidal agents, which mean that they kill bacteria. They have the same mode of action as penicillin. All bacterial cells have a cell wall that protects them. Cephalosporins disrupt the synthesis of the peptidoglycan layer of bacterial cell walls, which causes the walls to break down and eventually the bacteria die. (Jay, 2007).

General principles for the prevention of any surgical infection include skin antisepsis and antimicrobial prophylaxis. Although antibiotic prophylaxis during cesarean section has been extensively studied and generally found to be effective in preventing infection, surveys suggest inconsistent and variable application of recommendations for its use. Questions remain about the indications for prophylaxis, the choice of drug (whether a broad

spectrum or longer acting agent is better), its route, timing and frequency, the cost-effectiveness of different strategies, adverse effects of antibiotics for the woman and her infant. Particularly controversial is whether antibiotic treatment should be given to all mothers or only to those at greatest risk of infection.(John& Sons, 2007).

In women undergoing either elective or non-elective cesarean section with no signs of infection before the operation, the use of prophylactic antibiotics has been shown to reduce the risk of endometritis by two thirds to three quarters (Smaill,2007).The reduction of wound infection by three-quarters justifies giving prophylactic antibiotics for non selective C.S.(Blado,2008) .

A guideline for preventing surgical site infection developed by the American Centers for Disease Control and Prevention(CDC, 2005) recommended that sterile dressings should be used to protect the incision for 24 to 48 hours postoperatively. The guideline also recommends educating patients and their families on wound care, including symptoms of infection and the need to report such symptoms. There was no recommendation that incisions primarily closed (when the edges of the wound incision are brought together and closed with sutures, clips, glue or staples) should be covered for longer than 48 hours. (Fernadez *et al*.,2008)

Significance of the study

The use of prophylactic antibiotics to decrease the incidence of maternal infectious morbidity following Cesarean section has been systematically investigated. The rate of cesarean section is increasing and so infection due to this procedure is expected to increase. Without prophylaxis, the incidence of endometritis is reported to range from 20 to 85%; rates of wound infection and serious infectious complications as high as 25% have been reported.(John & Sons, 2007).Several types of antibiotics are used, so the investigator is interested in studying the role of use of prophylactic antibiotic with different types of antibiotics on prevention of post cesarean section infection and the effect of health education about wound care in reducing the rate of wound infection.

Objectives

To Compare the effect of Amoxicillin versus Cephalosporin in preventing post cesarean section infection ,and Identify the role of health education about wound care in reducing post cesarean section wound infection.

Research design
This study was a Randomized Controlled Trial.

Setting

This study conducted at emergency unit of the Obstetrics &Gynecological Department, Woman's Health Center, Assuit University Hospital. Between 1/10/2008 to 30/9/2009. Follow up of the cases ended in 30/10/2009.

Participants

Women undergoing emergency and elective cesarean section were recruited into the study and given either drug as prophylaxis. Excluded patients who had established infection prior to the operation, had had any antibiotic in the preceding week, those allergic to any of the drugs, premature rupture of membranes for more than 24 hrs , diabetic and anemic pregnant women.

The sample comprised 200 pregnant women. 100 pregnant women received Amoxicillin and the other 100 pregnant women received Cephalosporin as a prophylactic antibiotic. For each group, 50 women received routine hospital wound care and the other 50 women received health education about wound care through the investigator.

Tools of data collection

Data were collected using an interview questionnaire that was designed by the researchers to collect the necessary data. It based on review of related literature and reviewed by experts from nursing, Obstetrics and Gynecological nursing and medical related specialists, it contains six sections that includes the following:-
   1) Socio demographic data.
   2) Obstetrical data.
   3) Past Obstetric history.
   4) Current pregnancy data included.
   5) Data related to the current C.S delivery.
   6) Data related to the wound infection if present.
   Data collection took place within 12 months from 1/10/2008 to 30/9/2009. Follow up of the cases end in 30/10/2009. Permission was obtained from the director of Woman's Health Center at Assuit University Hospital.

The present study carried out through three phases as follow:
Interviewing phase: In which the investigator interviewed the mother, after that explained the nature of study, full history and consent obtained from the women**.**

Intervention phase:
Women were randomized to either Amoxicillin or Cephalosporin prophylactics antibiotics groups with or without health education about wound infection. Random assignment was done by computer

generated tables. Concealed envelopes containing the random number made to be opened after deciding to include the case in the study.

Then a full medical and obstetrical history were taken from the mother, Woman's vital signs, especially temperature and pulse were taken before C.S. The pregnant woman was brought into the theater for elective C.S and type of the chosen antibiotic with her. The investigator informed the anesthetist about the dose (2gm) given intravenously and time (after cord clamping) of the given antibiotic. When the pregnant woman received anesthesia spinal or general and the Obstetrician began to make an incision the time of the beginning observed by the investigator and accounted till the end of the operation.

Through this time the investigator observed the C.S operation for:

1. Any intra-operative complications occurred
2. The dose and time of the giving antibiotic.

After C.S. operation, the investigator reminded the Obstetrician not to write any type of antibiotics in the patient's sheet as a post operative treatment.

The heath education was given in the form of:

- The wound may be painful especially when you move or cough. This is due to internal pressure on the wound. Placing a hand firmly on the wound when you cough or move will counteract this pressure and reduce the pain.
- Keep the wound dry until any stitches are removed (normally about 7 days) so, no bathing allowed.
- Do not lift heavy items for at least 6-8 weeks after the delivery
- Keep the wound clean and dry.
  - Avoid wetting the dressing if it was being wet change it quickly.
  - When you change the dressing, clean the wound with sterile anti septic solution.
  - Do not soak the wound until it is healing well, such as swimming, bathing (shower is fine)
  - Change the wound dressing day after day.
  - Use sterile dressing.
  - Avoid exposure to sun rays.
  - Avoid exposure to heat. .
  - Increase intake of vitamin C like (Lemon juice – Orange) as it improves the immunity.
  - Increase intake of iron supplementation.
  - Increase intake of protein in diet. **(**Fernadez *et al.*,2008).

Follow up phase:

In the second day after operation the investigator observed the patient and the patient sheet for hyperthermia (temperature more than 38 degree)

and if recurrent as a sign of fever. The investigator gave heath education about wound care to the woman that the envelope showed that she would receive heath education about wound care .

In the third day of the operation (day of discharge of the woman), the investigator ensured that the woman had the discharge card , the treatment was free of antibiotics and informed the woman to come back in the tenth day post operative at the out patient clinic with her follow up card. Follow up of the wound was done by the investigator and the Obstetrician to observe wound status for healing process and signs of wound infection if present.

The following postpartum complications were recorded if present:

-Febrile morbidity: Temperature of $> 38^{o}$c obtained on 2 or more occasions at least 4 hours apart and wound infections.

Signs of wound infection according to Killian *et al.* 2001 are:

- Redness or excessive swelling in the wound are
- Throbbing pain or tenderness in the wound area
- Generalized chills or fever
- Pus or watery discharge collected beneath the skin or draining from the wound
- Foul odor from the wound
- Red streaks in the skin around the wound or progressing away from the wound
- Erythema, indurations ,cellulites or purulent drainage.
- Uterine tenderness after 48 hrs.
- Offensive or purulent lochia.

Then, the Obstetrician and the investigator determined if the wound was completely healed or not. If not, the mother needed to receive therapeutic antibiotic or readmitted to the hospital to be treated from wound infection. The decision of treatment was taken by the Obstetricians according to the women's health center policy.

Results:

A total of 200 women were recruited into the study, 100 each to amoxicillin and cephalosporin antibiotic groups.

Their demographic data were presented in **Table 1.** The two groups were similar in age, education , residence and parity with no significant difference.

Concerning the admission data, **Table 2.** illustrates that both groups had similar gestational age / weeks, (majority of cases were between 36-40 wks) and similar vaginal examinations with no significant

difference. It also shows that more than one third of the woman had previous C.S as an antenatal risk factor.

      Table 3. shows data related to operation characteristics of both groups. Repeated cesarean section constituted the commonest indication of C.S followed by previous C.S & postdate, and precious baby with no significant differences. The study sample shows no significant difference in the duration of C.S and majority of cases were done under spinal anesthesia.

      The study outcome measures related to wound infection are presented in **Table 4.** the incidence of post- operative wound infection was significantly higher in Amoxicillin group (12%) versus (3%) in Cephalosporin group ,(P=0.016). It also shows that there were no significant difference among both groups regarding the side effects during intrapartum period, number of dressings, place of dressing, and the duration of wound healing.

      It was also illustrated from the present study that, women who had infected wounds(3%) did not receive health education about wound care and were not significantly higher than those received health education about wound care (2%), (P=0.361).

      As regards the relation between age groups and wound healing, it was noticed that no significant difference among women of both groups regarding age groups(P=0.392).

      Patterns of wound healing were not significantly different between both groups with regards the duration of the C.S .

      Number of PV examinations in cephalosporin and amoxicillin groups presented in this study as follow, infected wounds that take more than 20 days to heal (3%) were undergone PV examinations more than 5 times in the whole duration of labor process among both groups with no statistical significance difference (P = is 0.669).

Discussion

Women's Health Center Assuit University Hospital is a teaching hospital. It conducts on the average 14,000 delivery a year and had a caesarean delivery rate of 40 %(unpublished from official records). Patients who undergo caesarean delivery spend an average of 3 days on the ward in the absence of post operative morbidity. Those with complications may spend up to twice as many days on the ward. As has been found in other studies, abdominal wound infection is the major post operative complication. Any

intervention which reduces this complication will therefore speed up recovery and cut down on the length of stay on the ward.

The traditional measure of effectiveness of an antibiotic used prophylactically is the subsequent presence or absence of postpartum febrile morbidity. Broad spectrum antibiotics are available, and in this randomized controlled study, cephalosporin was compared with amoxicillin.

The present study shows no statistically significant difference as regards demographic characteristics, maternal characteristics in obstetrical history, and current obstetrical history.

The present study revealed that the great majority of women were housewives (94% in Amoxicillin group and 96% in Cephalosporin group), more than one half of them were had basic& secondary education (53% in Amoxicillin group and 56% in Cephalosporin group), and the majority of women were lived in rural areas (61% in Amoxicillin group and 65% in Cephalosporin group). These sociodemographic characteristics were typical of the clients attended, the Woman's Heath Center, Assuit University Hospital, Assuit Governerate, upper Egypt. In the same line, these findings are inconsistent with Mahmoud (2007) who showed that the majority of women, who had cesarean section, were from rural areas and housewives (82.9% and 93.6% respectively). But she presented that more than half of women were illiterate. These socio demographic characteristics were also typical of the clients attended, the Woman's Heath Center, Assuit University Hospital, Assuit Governorate. But, these findings are not totally incongruence with EDHS, (2005) in Egypt, Hildingsson, *et al.*(2002) in Sweden, and Greene, *et al* .(2005) in U.S.A. who reported cesarean section increased with the women's educational level and common in urban areas.

In this study the incidence of post- operative fever was significantly higher in Amoxicillin group (12%) versus (3%) in Cephalosporin group (P= 0.016). This was inconcurrent with the study of Ghana medical Association (GMA),(2007) who reported that post-operative fever occurred in 5.6% and 7.5% in the Co-amoxiclav and triple therapy groups who compare the efficacy of co- amoxiclave (amoxicillin + clvulanic acid) and the triple therapy of ampicillin + gentamycin + metronidazole as prophylactic antibiotic during cesarean section.

Concerning the indications of cesarean section, the present study findings revealed that, the previous two or more cesarean sections included nearly one fourth of the women (24%) as a primary indication of cesarean section, 17% for previous cesarean section and post date, and 7.5% for previous cesarean section and decrease oligohydraminous. This finding is in agreement with Mahmoud (2007), in Assuit University, who found that the main indication for cesarean sections was repeated cesarean section n (20.1%). This is agreed nearly with Gulfareen *et al* (2009) who showed that the percent of repeated cesarean section as primary indication was (19.2%).

Regarding number of P.V examinations, the present study showed no significant difference between the two groups (P= 0.467). It presented that the majority of women were examined between 1-5 times (81% in Amoxicillin group and 83% in Cephalosporin group). Similar finding concerning with the study of Tippawan (2005), this study showed that more than one half (56.8%) of women were examined per vagina from 1-5 times. And all cesarean sections were included elective and emergency cesarean section. Olson *et al*, (2008) found no statistically significant difference between two groups (case and control group) (P= 0.408) and the majority of women (60.5% in case group and 61.9% in control group) were examined vaginally between 1-6 times before cesarean section.

Regarding duration of cesarean section the present study showed that majority of women (60% in Amoxicillin group and 58% in Cephalosporin group) their operation were ended within (31-60) minute. These findings were in agreement with Johnson *et al* (2006), who reported that majority of women their operation were finished within 31-60 minutes. On the other hand Tippawan *et al* (2005) showed that majority of women (62%) their operation finished in a time less than 90 minutes.

All cesarean section operations performed to the women under spinal anesthesia except 5 women that their operations performed under general anesthesia, three in Amoxicillin group and two in cephalosporin group with no statistically significant difference between two groups. On the other hand GMA (2007), found that the great majority of women (96.3% in Co-amoxiclav group and 92.5% in triple therapy group) their operation were performed under general anesthesia. And the rest of women's performed their operations under spinal anesthesia .

Although prophylactic antibiotics have been shown to reduce the incidence of postoperative infections morbidity after cesarean delivery, the most effective regimens and timing of administration have not been established, some has suggested antibiotic prophylaxis only for emergency cesarean section and others demonstrated that prophylactic antibiotics were effective and cost saving for all cesareans, elective and emergency (Johnson *et al.,*2006).

Some investigators recommended cefazolin, while cephalotin, cefazolin plus metronidazole, ampicillin, and metronidazole plus gentamicin had also been proposed by others. Controversies are also exist regarding the timing of antibiotic administration since some suggested prior incision, but others proposed after cord clamping. Neither single dose administration nor triple dose is another issue of discrepancy (Thigpen *et al.,* 2005).

As to the timing of administration, delayed administration of prophylactic antibiotics, after clamping the umbilical cord, did not result in more post operative infections. The major reason not to start prior to surgery is to prevent placental passage and fetal exposure to the drug. Moreover, there will be neither alteration of the neonatal flora nor interference with the pediatrician's assessment of possible sepsis in the newborn (Sullivian *et al.,*2007)[22].

In the present study prophylactic antibiotics were given to the women in a single dose of 2 gms Amoxicillin or Cephalosporin that was given intra operatively after cord clamping. Thigpen *et al* (2005) studied Cefazolin administration either before skin incision or right after cord clamping and demonstrated similar infectious morbidity in both groups.

Regarding side effects of the antibiotic, the present study reported that there was no significant difference between Amoxicillin and Cephalosporin. And the side effects were resolved without need to treatment, these clinical signs were very simple because the drug was prescribed for such a short interval in healthy, reproductive aged women. But, Mirghani *et al.,* (2004) noted that three patients suffered vomiting and one patient (1%) in the Ceftriaxone group developed a maculopapular skin rash; this occurred immediately after drug administration and resolved spontaneously without treatment. No patient suffered adverse drug effects in the Ampicillin / Cloxacillin group; there was no statistically significant difference between groups. With taking into consideration that the prophylactic antibiotic was given to the patients in the form of Ceftriaxone as a single dose of 1 gm or 1 gm Ampicillin / Cloxacillin intravenously at the time of induction of anesthesia.

The present study reported that the percent of surgical site infection (SSI) of elective cesarean section was 1% in Amoxicillin group and 4% in Cephalosporin group with no significant difference between them. The study which was done in 2007by GMApresented that abdominal wound infection was found in rates; 3.7% in Co-amoxiclav group and 13.1% in the triple therapy group. Co-amoxiclav was statistically found superior to the triple therapy in preventing abdominal wound

infection and uterine tenderness. With taking in consideration that group 1(triple therapy) included Ampicillin 1gm + Metronidazole 500mg + Gentamycin 80 mg all given intravenously after cord clamping and repeated 12 hours after first dose.

Concerning duration of cesarean section and its relation to wound infection, the present study reported that there is no relation between duration of cesarean section and wound infection. This is not in agreement with Oliver *et al* (2009) who demonstrated that the risk of postoperative wound infection was considerably reduced when the operation time was short. In the course of prolonged operation, there was significant tissue devitalisation resulting from tissue handling and reduced tissue perfusion

Findings of the present study regarding number of P.V examination and its relation to wound healing, reported that the women who examined per vagina more than 5 times exposed to infection by 8%, but the women that not examined per vagina exposed to infection by 4%. This means that there was a relation between the number of P.V examination and wound healing. These finding were in agreement with Oliver *et al.* (2009), who demonstrated an association between multiple vaginal examinations and post cesarean wound infection.

Regarding the heath education about wound care given to the mother and its relation to wound healing versus receiving routine hospital care, the present study showed that the women that their wounds were infected and received the routine hospital care were not significantly higher than those received post partum wound care . This ensured the association between health education about wound care and wound healing.

Conclusion

Based on the findings of the present study it concluded that: use of Amoxicillin as a prophylactic antibiotic is as effective as Cephalosporin in preventing post cesarean section wound infection, and women that received health education about wound care are less likely to expose to wound infection than those who received only routine hospital care, in spite that the comparative results are not differ significantly.

Recommendations

Based on the findings of the present study it was recommended that:
-Use of Amoxicillin as a prophylactic antibiotic be less costly compared by Cephalosporin in preventing post cesarean section wound infection. So, it should be taken in consideration the cheaper than other to be used as a prophylactic antibiotic.

-The nurse carry a vital role in reducing wound infection by introducing health education about wound care to the mothers, so there should be an encouragement from head nurses and doctors to follow this action to aid in reducing post C.S wound infection.

Role of Fine Needle Aspiration Cytology in Diagnosis of Soft Tissue Tumors

Hassan A.Maher Wael[1], Khamis N.Nehal[1] and Hammam M. Makram[1]

1. Pathology Department, Faculty of Medicine, Suez Canal University, Ismailia, Egypt
wael_hassan2@med.suez.edu.eg,

Abstract: Fine needle aspiration cytology has many advantages that make it a first-choice diagnostic approach in many tumors. However, its role in diagnosing soft tissue tumors has been debated and at times discouraged. The aim of the study is to review the role of fine needle aspiration cytology in diagnosing soft tissue tumors and to establish cytological criteria for the most encountered soft tissue tumors. The databases were searched up to 2010 and a comprehensive review of the relevant literature was performed, focusing on the followings: utility and limitations of fine needle aspiration cytology in the diagnosis of soft tissue tumors, diagnostic efficacy of fine needle aspiration cytology in the diagnosis of soft tissue tumors, the cytological features of the most commonly encountered soft tissue tumors, the role of fine needle aspiration cytology in differentiating benign soft tissue tumors from soft tissue sarcomas and its role in grading and exact subtyping of soft tissue sarcomas. The findings of this review showed that fine needle aspiration cytology in conjunction with ancillary studies, especially immunohistochemistry, along with the clinical and/or radiographic data can approach a diagnostic accuracy of 95% for the diagnosis of soft tissue tumors. Also, placing the sarcoma into one of the five cytomorphological group (pleomorphic, spindle, myxoid, small round/ovoid and epithelioid) is useful to reach a confident diagnosis of benignity or malignancy and to suggest a type-specific diagnosis. However, subtyping or grading spindle cell sarcomas as well as lipomatous tumors are often challenging and the use of immunohistochemistry is mandatory for proper diagnosis of these tumors.
[Hassan A.Maher Wael, Khamis N.Nehal and Hammam M. Makram. Role of Fine Needle Aspiration Cytology in Diagnosis of Soft Tissue Tumors. Journal of American Science 2011;7(5):188-199]. (ISSN: 1545-1003). http://www.americanscience.org.

Key words: Fine needle aspiration cytology, soft tissue tumors, cytological criteria, immunohistochemistry

1. Introduction

Soft tissue tumors (STTs) have been considered to pose some of the greatest diagnostic challenges in surgical pathology. According to the latest World Health Organization (WHO) classification, more than 100 benign subtypes, over 50 variants of sarcoma and a number of 'border-line' entities have been described for STTs (Fletcher, 2006). According to Egyptian mortality statistics 2004, death due to soft tissue sarcoma (STS) represents 2.74% of all cancer deaths (Elattar, 2006). Fine needle aspiration cytology (FNAC) has many advantages that make it a first-choice diagnostic approach in many tumors as it is an outpatient procedure, it doesn't need anesthesia and it permits sampling of different parts of a large tumor to evaluate its heterogeneity (Domanski et al., 2005).

However, the cytological diagnosis of STTs, based on FNAC, has been debated and at times discouraged (Weiss and Goldblum, 2008). Obtaining sufficient specimens from deeply seated small and necrotic/cystic lesions is technically a potential pitfall. Sometimes only necrotic tissue is obtained. Some benign lesions can contain atypical cells such as nodular fasciitis and some malignant tumors such as synovial sarcoma (SS) or well-differentiated liposarcoma (LPS) have rather bland cytology (Maitra et al., 2000). On the other hand, Bharat et al. (2007) evaluated 127 cases of FNAC smears from STTs, diagnosed over a period of 5 years and

stated that FNAC is fairly specific and sensitive in STTs diagnosis for primary, recurrent and metastatic lesions and that some cytological types, especially round cell and pleomorphic sarcomas, can be quickly identified. In another study carried out by Kitagawa et al. (2003) to evaluate the usefulness of FNAC for the preoperative diagnosis of STTs of the hand, they concluded that FNAC is a useful diagnostic tool, especially in its ability to distinguish between malignant and benign lesions of the hand, but its main limitation in diagnosing hand tumors, is the difficulty in diagnosing schwannoma and fibrous tumors, which are common. In addition, Khalbuss et al. (2010) proved that there can be a high sensitivity and specificity in diagnosing bone and soft tissue lesions by FNAC.

So, it is apparent that there has been and stills a debate on the usefulness of FNAC in diagnosing STTs. Also the accurate cytological features for classifying and diagnosing STTs haven't yet been settled. Therefore, this study was carried out to give an overview about STTs classification, their grading and staging. Also, the role of FNAC in diagnosing STTs will be reviewed and the cytological features for classifying and diagnosing STTs as a guide for early accurate diagnosis will be studied.

2. Materials and Methods

The Databases were searched up to 2010. A comprehensive review of the relevant literature was performed, focusing on the followings: utility and limitations of FNAC in the diagnosis of STTs, diagnostic efficacy of FNAC in the diagnosis of STTs, the cytological features of the most commonly encountered STTs, role of FNAC in differentiating benign STTs from STS and role of FNAC in grading and exact subtyping of STS.

The following methodological items were taken into account: (1) type of study, (2) sample size, (3) sample selection, (4) laboratory techniques and (5) statistical analysis.

3. Review of Literature
3.1 Definition and Classification

STTs are defined as mesenchymal proliferations that occur in the extraskeletal, nonepithelial tissues of the body, excluding the viscera, coverings of the brain and lymphoreticular system (Kumar et al., 2007). The most recent classifications of STTs have been based principally on the line of differentiation of the tumor, that is, the type of tissue formed by the tumor rather than the type of tissue from which the tumor arose (Wiess and Goldbulm, 2008). The most significant conceptual changes in the last WHO classification of STTs, is that it revised categorization of biological behavior, allowing for two distinct types of intermediate malignancy, identified respectively as 'locally aggressive' and 'rarely metastasizing' in addition to 'benign' and 'malignant' types (Fletcher et al., 2002). Also it acknowledged the poorly defined nature of the categories known as malignant fibrous histiocytoma (MFH) (which in reality represents undifferentiated pleomorphic sarcoma) and haemangiopericytoma (HP) (most examples of which are closely related to solitary fibrous tumor (SFT). It also categorized the so-called angiomatoid MFH and extraskeletal myxoid chondrosarcoma (EMC) into tumors of uncertain differentiation (Fletcher, 2006).

Most benign STTs do not recur locally while locally aggressive STTs often recur locally and are associated with a local infiltrative growth pattern. On the other hand, rarely metastasizing STTs are often locally aggressive but show the well-documented ability to give rise to distant metastases in occasional cases. Malignant STTs (known as STS) are characterized by local destructive growth and a significant risk of distant metastasis, ranging in most instances from 20% to 100%, depending upon histological type and grade (Weiss and Goldblum, 2008).

3.2 Frequency of STTs in Egypt

In Egypt, according to the National Cancer Institute (NCI) records registry, the number of the newly diagnosed STTs cases from the year 2002, 2003 and 2005 constitute 2.74% of total malignancies recorded with a male predominance of 60.07% and with a high percentage of pediatrics, 28%. They were thus ranked the third amongst pediatric tumors, after lympho-hematopoietic and bone tumors (Elattar, 2006). Table (1) shows the relative frequency of the different types of STS.

Table (1): Relative frequency of the histopathological types of STS in Egypt (Elattar, 2006).

Type	%
LPS	16.04
Rhabdomyosarcoma (RMS)	13.80
Primitive Neuroectodermal Tumor (PNET)	13.06
MFH	10.07
Synovial sarcoma (SS)	9.70
MPNST	7.09
Fibrosarcoma	4.48
Leiomyosarcoma (LMS)	3.36
Alveolar soft part sarcoma (ASPS)	1.87
Vascular sarcomas	1.87

3.3 Histological grading of STS

Grading, based on histological parameters only, evaluates the degree of malignancy and mainly the probability of distant metastasis (Conidre et al., 2001). The two most widely used grading systems for STS are those of the Federation Nationale des Centres de Lutte Contre le Cancer (FNCLCC), also known as the French Federation of Cancer Centers sarcoma group and the United States National Cancer Institute (NCI) (Fletcher, 2006).

3.4 Staging of STS

The tumor size, Regional lymph node involvement, Distant metastasis staging system (TNM) used for STS was developed by the International Union against Cancer (UICC) and the American Joint Committee on Cancer (AJCC). This system incorporates histological grade as well as tumor size and depth, regional lymph node involvement and distant metastasis (Greene et al., 2002).

3.5 Diagnosis of STTs by FNAC

Diagnosis, as well as prognosis of STTs has been based on the assumption that pathologists would have significant amounts of tissue on which to render a diagnosis and grade. Although incisional biopsy is the golden standard for the diagnosis of deep soft tissue masses, reliance on minimally invasive techniques as FNAC to procure diagnostic tissue has become more common (Weiss and Deyrub, 2006). Other diagnostic methods include IHC, Electron Microsopce (EM), DNA analysis and molecular diagnostics.

FNAC has many advantages that make it a first-choice diagnostic approach in many tumors. It is an

outpatient procedure, it doesn't need anesthesia and it permits sampling of different parts of a large tumor to evaluate its heterogeneity (Domanski et al., 2005). Also, properly performed, FNAC is the least tissue-invasive diagnostic procedure and the risk for sarcoma-cell spread is negligible (Akerman, 1998). In the hands of experienced cytopathologists, FNAC in conjunction with ancillary techniques has a diagnostic accuracy approaching 95% for the diagnosis of soft tissue malignancy (Kocjan, 2004). Additionally, as therapy and prognosis are heavily dependent on the grade and stage of the tumor, Singh et al. (2007) stated that most of STS can be successfully subtyped and even graded by FNAC.

On performing FNAC to STTs, five passes at most should be made with the needle being moved back and forth through the specimen without exiting the skin surface. It's recommended to sample tissue from at least three different parts from the tumor to assess its heterogeneity (Wakely and Kneisl, 2000). The microscopic evaluation of STTs obtained by FNAC should be based on both wet fixed Hematoxylin and Eosin stain (H&E) or Papanicolaou stain (Pap) and air-dried May Griinwald- Giemsa (MGG) or Diff-Quik smears. The wet-fixed material is superior for evaluation of nuclear detail such a chromatin structure and nucleoli while the MGG staining gives excellent information on cytoplasmic detail and the background matrix (Weiss and Deyrup, 2006).

There are, however, certain limitations for the use of FNAC in the diagnosis of STTs. The main pitfall is that the needle may miss the tumor and a false diagnosis is made on the basis of cells aspirated from the tissue surrounding the tumor (Singh et al., 2007). Insufficient material obtained by FNAC may result in a false diagnosis or preclude any diagnosis at all (Fletcher et al., 2002). In addition, there are some rare STTs, in which the cytological criteria that allow their correct diagnosis as benign or malignant, as well as to type them, have not been established. Comparative histological-cytological studies of reasonably large series of these tumors are often lacking (Fuju, 2006). Examples of these tumors are lipoblastoma, chondroid lipoma, perineurioma, aggressive angiomyxoma, SFT of soft tissue, mixed tumor of soft tissue, parachordoma and spindle cell LPS (Singh et al., 2004). Another important pitfall in depending on FNAC in the diagnosis of STTs is misinterpretation of the cellular material. This mostly occurs in the diagnosis of benign lipoma variants as pleomorphic lipoma, hibernoma or lipoblastoma and in the interpretation of soft tissue metastases from pleomorphic carcinoma or melanoma as pleomorphic sarcoma. Also, metastases from renal clear cell carcinoma might be misinterpreted as pure round cell LPS (Brooks, 1996).

The benefits and limitations of FNAC in the definitive diagnosis of a STS must be weighed in relation to the proposed treatment (Akerman, 1998). The main purpose of FNAC in soft tissue lesions is to inform the surgeon whether the tumor in question is a true soft tissue lesion/tumor or a STS or a soft tissue metastasis (Kilpatrick et al., 2001). In case of sarcoma, the standard treatment in the majority of cases is primary radical surgery (a minimum of 1 cm to 2 cm margins of normal tissue), sometimes followed by radiotherapy. The type of surgical intervention depends more on the site (subcutaneous or deep), size and the relation of the sarcoma to vessel, nerve bundle and periosteum than on the histotype. Thus a reliable diagnosis of sarcoma is sufficient for the surgeon in those cases where primary radical surgery is the proposed treatment (Liu et al., 1999). When the treatment includes neoadjuvant therapy (radiotherapy or chemotherapy) followed by surgery, the FNAC diagnosis must equal that of a histopathological evaluation as regard histotype and malignancy grade (Kilpatrick et al., 2001). At present, neoadjuvant therapy is used for some cases of STS as RMS, neuroblastoma and extraskeletal Ewing's sarcoma/primitive neuroectodermal tumor (ES/PNET) family of tumors (Weiss and Goldblum, 2008).

For FNAC specimens, several studies recommend a classification approach that divides STTs into **five** major cytomorphologic subgroups based on the predominant cytological appearance of the specimen on aspiration smears: pleomorphic, spindle cell, myxoid rich, small round/ovoid cell and epithelioid. In most cases, once a cytomorphological subtype has been determined, the corresponding histological grade in many cases is definitional (Singh et al., 2004). Such classification has been used in many comparative cytological-histological studies to evaluate the role of FNAC in the diagnosis of STTs (Costa et al., 1996; Kilpatric et al., 2001; Mathur et al., 2003; Dey et al., 2004 and Bahrat et al., 2007). The most reported pitfall in this classification is that it is not possible to classify all STTs into these five groups. In addition, overlapping cytological features can occur. For example, RMS can display a variety of cytomorphological features, ranging from a small round cell to spindle cell morphology as well as the presence of a myxoid background in the botryoid forms. Likewise, SS may demonstrate a predominant epithelioid cell pattern rather than the classic spindle cell pattern (Singh et al., 2004). However, such a categorization may be useful to reach a confident diagnosis of benignity or malignancy, to suggest a type-specific diagnosis as well as in the recognition of important differential diagnoses (Akerman and Domaniski, 2003).

In the following sections, the diagnostic features of each of the above mentioned patterns will be discussed as well as the most common types of STTs belonging to

each of them and the limitations of the diagnosis of each.

3.5.1 Pleomorphic cell pattern

The typical features are a marked variation in cellular and nuclear size and shape and in case of sarcoma marked nuclear pleomorphism including atypical multinucleated tumor cells and prominent nucleoli (Akerman et al., 1980). Benign STTs in this category are nodular fasciitis and pleomorphic lipoma. Typical examples of sarcomas are undifferentiated pleomorphic sarcoma (pleomorphic sarcoma of the MFH type), pleomorphic LMS, pleomorphic LPS and the less common pleomorphic RMS (Singh et al., 2004). In most cases of pleomorphic STS, the cytological features are not diagnostic for subtyping beyond a diagnosis of "pleomorphic sarcomas, not otherwise specified" (Singh et al., 2004). Wrong (2008) have reported that, adult patients with pleomorphic sarcomas, regardless of the histological subtype, are treated similarly with complete surgical excision and radiation therapy and/or chemotherapy. This is due to the fact that prognosis and treatment responses are approximately the same across the group. The most common differential diagnostic problems arise in the separation of pleomorphic sarcomas from sarcomatoid carcinomas from various sites (lung, kidney, pancreas, and thyroid), malignant melanoma, and anaplastic lymphoma. All of these entities can present with highly cellular smears with a predominance of dyscohesive cells that are markedly pleomorphic and sometimes multinucleated. Careful review of the clinical history along with ancillary studies (panel of IHC stains) is crucial for accurate classification (Singh et al., 2007).

The following table shows the most common STTs with pleomorphic pattern and their diagnostic morphological features:

3.5.2 Spindle cell pattern

The spindle cell pattern is characterized by predominance of more or less atypical spindle cells with fusiform or ovoid nuclei and elongated uni- or bipolar cytoplasm. The cells are mostly arranged in sheets or fascicles, but dissociated cells are often present. A small population of larger rounded, polygonal or triangular cells with relatively abundant cytoplasm and nuclei of variable size and shape may be present in some sarcomas (Akerman and Domaniski 2003).

Common examples of benign tumors are neurilemoma, spindle cell lipoma, desmoid fibromatosis, SFT, HP and deep leiomyoma. Typical spindle cell sarcomas include the LMS, MPNST, monophasic SS, dermatofibrosarcoma protuberans (DFSP), spindle cell gastrointestinal stromal tumor (GIST), fibrosarcoma and angiosarcoma (Singh et al., 2004).

Table (2): The most common soft tissue tumors with pleomorphic pattern and their diagnostic morphological features (Dahl et al., 1981; Akerman and Rydholm 1983; Walaas et al., 1986; Akhtar et al., 1992; Almeida et al., 1994; Liu et al., 1999; Thirumala et al., 2000; Clayton et al., 2001; Kong and Cha 2004; and Khalbuss et al., 2010).

Tumor	Diagnostic Morphological features
Nodular fasciitis	- Abundant myxoid background. - Pleomorphic population of myofibroblasts: spindly, rounded or triangular, with cytoplasmic processes and admixture of inflammatory cells.
Pleomorphic Lipoma	- Fragments of mature fat. - A variable number of large cells with hyperchromatic nuclei and eosinophilic cytoplasm - 'Floret cells' are seen.
Undifferentiated pleomorphic sarcoma (MFH-type sarcoma)	- Cellular smears with necrosis. - Variable proportions of atypical and pleomorphic spindle cells, polygonal cells and multinucleated large cells.
Pleomorphic LMS	- Cellular smears with necrosis. - Tumor cells have marked cellular and nuclear pleomorphism with abundant eosinophilic cytoplasm. - Multinucleated tumor cells.
Pleomorphic LPS	- Presence of highly atypical multinucleated lipoblasts
Pleomorphic RMS	- Atypical rhabdomyoblasts with abundant eosinophilic cytoplasm

The group of spindle cell sarcomas is the most diagnostic challenging because of difficulties in accurately separating benign lesions from low-grade sarcomas and accurately subclassifying the sarcoma (Singh et al., 2007). Also, Domaniski et al. (2006) have shown that the two major criteria used to designate a FNAC specimen as a sarcoma, namely, moderate to high smear cellularity and hyperchromatic nuclei in almost all sampled cells; do not always allow accurate separation and/or grading among the spindle cell sarcoma group. Benign mesenchymal lesions often demonstrate marked dyscohesiveness and hypercellularity that, in some cases, result in destructive changes clinically and radiographically mimic a sarcoma (Li et al., 2001). Because metastases outnumber primary STS, nonsarcomatous malignancies must be included in the differential diagnosis of spindle cell sarcomas. Sarcomatoid carcinomas, mesotheliomas, malignant melanomas, and non-Hodgkin lymphomas associated with sclerosis present the most difficulty in accurate separation from primary spindle cell sarcomas. Correlation with the past medical history and IHC stains is crucial in rendering an accurate diagnosis (Singh et al., 2004).

The following table shows the most common STTs with spindle cell pattern and their diagnostic morphological features:

Table (3): The most common soft tissue tumors with spindle cell pattern and their diagnostic morphological features by H&E stain (Dahl et al., 1981; Akerman and Rydholm 1983; Ryd et al., 1986; Lopez et al., 1990; Kilpatrick et al., 1996; Boucher et al., 2000; Clayton et al., 2001; Sawh et al., 2001; Li et al., 2001; Domanski and Gustafson 2002; Akerman and Domaniski 2003; Singh et al., 2004; Wrong, 2008; Domaniski et al., 2006; Akerman and Domanski 2007; Owens et al., 2007 and Kaur et al. 2010).

Tumor	Diagnostic Morphological features
Neurilemoma (Schwannoma)	- Fragments with fibrillary background and spindle-shaped cells forming Antoni A, while others have loose appearance with cells having slender cytoplasmic processes (Antoni B)
Spindle cell lipoma	- A mixture of mature adipose tissue and dispersed or clustered, bland-looking spindle cells, in a myxoid background
Desmoid Fibromatosis	- Fragments of paucicellular collagenous stroma. - Fibroblasts with spindle-shaped nuclei are seen.
SFT	- Dispersed bland cells mixed with cell-tight three-dimensional fascicle-like clusters. - Nuclei with bland chromatin and
Deep leiomyoma	- Clusters of dispersed cells and small aggregates of cells with elongated, blunt-ended, or cigar-shaped nuclei.
LMS	- Cells have moderately pleomorphic elongated blunt-ended nuclei, with prominent nucleoli and intranuclear inclusions.
MPNST	- A fibrillary background. - Spindle-shaped cells with elongated, wavy nuclei. - Presence of pleomorphic and/or multinucleated tumor cells
Monophasic SS	- Dispersed spindle shaped cells and branching fragments of tightly packed cells - Cells have ovoid bland nuclei and inconspicuous nucleoli
DFSP	-Tumor cells are uniform spindle cells, either dispersed or clustered in three-dimensional cell-rich fascicles (fascicular arrangement). - Stripped nuclei are often seen.
Spindle cell GIST	- Cohesive clusters of cells with spindly, ovoid, comma-shaped nuclei and scanty cytoplasm with cytoplasmic processes.
Fibrosarcoma	- Uniform population of dispersed and clustered atypical spindle shaped cells, with fusiform nuclei
HP	-Hypercellular aspirate formed of minimally atypical spindle shaped cells arranged in fragments traversed by vascular channels.
Angiosarcoma	- Hypocellular aspirate with predominantly single spindled to rounded cells with abundant vacuolated cytoplasm and pleomorphic nuclei. - Vasoformative features: intracellular RBCs, well-formed vessels and microacinar formation.

3.5.3 - Myxoid pattern

Although myxoid changes can be seen in a variety of STTs, it's not usually consistently seen as a dominant feature of the tumor (Singh et al., 2004). Aspirates of myxoid tumors often look like droplets of glue. Under low power magnification there is an evident myxoid background matrix, faintly pink in H&E stain and faintly green in Pap stain. The cellular pattern is variable: pleomorphic, spindly or round cells (Akerman and Domanski 2003).

A myxoid pattern is common to several STTs. Examples of benign tumors are intramuscular myxoma, liboplastoma, ossifying fibromyxoid tumor (OFMT), perineurioma, parachordoma and mixed tumor of soft tissue (myoepithelioma). The most common sarcomas are myxofibrosarcoma and myxoid LPS, low-grade fibromyxoid sarcoma and extraskeletal myxoid chondrosarcoma (EMC) (Singh et al., 2004).

The following table shows the most common STTs with myxoid pattern and their diagnostic morphological features:

Table (4): The most common soft tissue tumors with myxoid pattern and their diagnostic morphological features (Akerman and Rydholm, 1983; Housini and Dabbs 1990; Szadowska and Lasota 1993; Verma et al., 1993; Lindberg et al., 1999; Minami et al., 2001; Akerman and Domanski 2003; Hornick and Fletcher, 2003; López-Ferrer et al., 2005; Jakowski and Wakely 2007; Hong et al., 2008; Ran et al., 2008; Colin et al. 2010 and Zardawi 2010).

Tumor	Diagnostic Morphological features
Intramuscular myxoma	- Scattered vessel fragments - Cells have elongated uniform nuclei and cytoplasmic processes
Lipoblastoma	- Fatty tissue fragments. - Branching strands of capillaries - Vacuolated lipoblast-like cells.
OFMT	- Mildly atypical cells which may be dissociated, or arranged in rosette-like structures,
Perineurioma	- Elongated cells with fusiform nuclei and cytoplasmic processes arranged in clusters
Parachordoma	- Cells are polygonal with abundant cytoplasm and bland nuclei. -Some cells have vacuolated cytoplasm and eccentric nuclei.
Mixed tumor of soft tissue	- Cells are spindle-shaped or rounded epithelioid-like grow in rows, clusters or groups
Myxofibrosarcoma	- Fragments of curved vessels - Atypical spindle cells with scattered large polygonal cells - Some cells have a vacuolated cytoplasm or contain droplets of mucoid material (violet in MGG stain)
Low-grade fibromyxoid sarcoma	- Homogenous population of spindle-shaped cells with mildly atypical nuclei - No vessel fragments.
Myxoid LPS	- Tumor tissue fragments with "chicken wire" capillary vessels, and vacuolated lipoblasts
EMC	- Variable arrangement of cells: clusters and branching strands. - Cells are rounded, elongated and fusiform with bland nuclei and vacuolated cytoplasm

3.5.4- Small round/ovoid cell pattern

Round cell sarcomas predominate in the pediatric population, and, in contrast to adult patients, definitive

cell typing is necessary (Singh et al., 2004). Smears are typically cellular and composed of small to medium-sized cells with rounded or ovoid nuclei and a variable amount of cytoplasm. The shape of the cells is variable: rounded, ovoid or triangular. Nuclei are often bland and nucleoli are small (Bahrat et al., 2007). This pattern is shown mainly by glomus tumor, neuroblastoma, extraskeletal ES /PNET, RMS (especially alveolar), desmoplastic small round cell tumor (DSRCT) and small cell variant of SS (Franco et al., 2007).

In rare cases, it may be difficult to correctly classify this group of sarcomas by histological examination. However, correct cell typing is often possible and achievable in 92% of all round cell sarcomas by FNAC with the judicious use of ancillary studies (IHC, EM and cytogenetics) (Liu et al., 1999).

The following table shows the most common STTs with small round/ovoid cell pattern and their diagnostic morphological features:

Table (5): The most common soft tissue tumors with small round/ovoid cell pattern and their diagnostic morphological features (Seidal et al., 1982; Silverman et al., 1988; Bennert K and Abdul-Karim, 1994; Renshaw et al., 1996; Akerman et al., 1996; Kilpatrick et al., 1999; Layfield et al., 1999; Liu et al., 1999; Silverman et al., 2000; Handa et al., 2001; Granja et al., 2005 and Fuju 2006).

Tumor	Diagnostic Morphology features
Glomus tumor	- Myxoid fibrillary background - Cells are of medium size with poorly defined cytoplasmic borders and rounded bland nuclei
Neuroblastoma	- Cells with hyperchromatic nuclei and cytoplasmic processes arranged in rosette-like structures with a central fibrillary core
ES/PNET family; classic ES	- Highly cellular aspirate. - Double cell population: *Large cells with abundant vacuolated cytoplasm and rounded nuclei (Large light cells) *Small cells with irregular dark nuclei and scanty cytoplasm (Small, dark cells).
ES/PNET family; PNET	- Pleomorphic cells with cytoplasmic processes. - Rosette-like structures.
Alveolar RMS	- Cells are small with scanty vacuolated cytoplasm and prominent nucleoli. - Rhabdomyoblasts: tadpole cells with eccentric nuclei and eosinophilic cytoplasm.
DSRCT	- Cells are small with scant vacuolated cytoplasm and rounded nuclei with small nucleoli, showing rosette-like arrangement.
Small cell variant of SS	- Small cells with scanty cytoplasm and bland nuclei admixed with large cells with abundant cytoplasm and prominent nucleoli.

3.5.5- Epithelioid Cell Pattern

The epithelioid cell pattern is created by cells with epithelioid features: rounded or polygonal cells with distinct cytoplasmic borders, abundant cytoplasm, and rounded, ovoid or irregular nuclei. Nucleoli are often prominent. The tumor cells are arranged in groups, tight clusters or are dissociated. Stripped nuclei are a common finding (Akerman and Domaniski 2003).

This pattern is the least frequently encountered group on FNAC specimens. Typical examples of benign tumors are granular cell tumor (GCT), adult rhabdomyoma and paragangliomas. The most common sarcomas are epithelioid sarcoma, clear cell sarcoma, ASPS, malignant extrarenal rhabdoid tumor, epithelioid cell gastrointestinal stromal tumor (GIST) and epithelioid variant of angiosarcoma (Bahrat et al., 2007). The cytomorphological features among this group of sarcomas show considerable overlap necessitating the use of ancillary studies with IHC to make a specific diagnosis and for separation from non-sarcomatous malignancies (Singh et al., 2007).

The following table shows the most common STTs with small epithelioid cell pattern and their diagnostic morphological features:

Table (6): The most common soft tissue tumors with epithelioid cell pattern and their diagnostic morphological features (Mondal 1995; Akhtar et al., 1994; Gupta et al., 1998; Maruyama et al., 1998; Zeppa et al., 1998; Logrono et al., 1999; Domaniski and Dawiskiba 2000, Zaharopoulos 2001; Cardillo et al., 2001; Li et al., 2001; Mallik et al., 2001; Wieczorek et al., 2001; Creager et al., 2002; Kwon et al., 2002; McGregor et al., 2003; Singh et al., 2004; Laforga 2005; Jin and Saleh 2009 and Min et al., 2010).

Tumor	Diagnostic Morphological features
Granular cell tumor	- Individual cells and cells in cohesive clusters are seen.
Adult rhabdomyoma	- Large epithelioid cells with cross striation in the cytoplasm.
Paraganglioma	- Loose clusters of cells separated by bands of connective tissue strands - Cells have pleomorphic spindled or oval nuclei. - Reddish cytoplasmic granules on MGG stain.
Epithelioid sarcoma	- Cells are medium-sized to large with large nucleoli. - Admixture of lymphocytes, plasma cells and histiocytes.
Clear cell sarcoma	- Cells in small clusters showing intranuclear pseudoinclusions and intracytoplasmic melanin
Alveolar soft part sarcoma	- Hemorrhagic aspirate - Alveolar arrangement of tumor cells can be seen.
Malignant extrarenal rhabdoid tumor	- Grey blue paranuclear cytoplasmic globular inclusions are seen in the tumor cells.
Epithelioid cell GIST	- Tumor cells are rounded with abundant cytoplasm and rounded nuclei.
Epithelioid angiosarcoma	- Both dispersed cells and branching tumor tissue fragments of tightly packed epithelial-like cells showing mild to moderate nuclear atypia.

3.6 Diagnostic efficacy of FNAC in the case of STTs

In terms of diagnostic efficacy, Khalbuss et al.

(2010) reported a high overall sensitivity of 96% and specificity of 98% for the FNAC diagnosis of soft tissue and bone lesions, and a very low rate (3%) of inadequacy. Bahrat et al. (2007) concluded that FNAC had 100% sensitivity and 87% specificity in the diagnosis of STTs. These were comparable to the results of Nagira et al. (2002) wherein the respective values were 92% and 97%. In another series, Wakely and Kenisl (2000) reported 100% sensitivity and 97% specificity in STTs diagnosis with FNAC. Layfield et al. (1986) achieved 95% sensitivity and specificity while dealing with these lesions. In Khalbuss et al. (2010) study on 1114 soft tissue and bone FNAC specimens, there were 15 false negative (FN) (malignant tumor diagnosed as benign cytologically) diagnoses that were most commonly due to sampling error and 3 false positive (FP) (benign tumor diagnosed as malignant cytologically) diagnoses, which were attributable to errors in interpretation due to the misinterpretation of reactive stromal cells with therapy-related changes as malignant cells. In Bahrat et al. (2007) study, 2 cases (1.57%) were FP and none was FN. While a study on 517 STTs aspirates by Akerman et al. (1985) revealed a 2.9% FP rate, the subsequent studies by Wakely and Kenisl (2000) and by Kilpatrick et al. (2001) yielded a single case of FN and nil FP. This was in contrast to a study by Nagira et al. (2002) who identified higher figures for false positivity and false negativity. In Khalbuss et al. (2010) and Bahrat et al. (2007) studies, the results were comparable to the documented range of <1%-5% (FP) and 2-15% (FN) (Layfield et al., 1986; Bommer et al., 1997; Kilpatrick et al., 2001 and Nagira et al., 2002). An overall concordance of 98% in Khalbuss et al. (2010) is comparable to results of Bahrat et al. (2007) and Shah et al. (2003). Also, Singh et al. (2004) reported that in the hands of experienced cytopathologists, FNAC in conjunction with ancillary techniques has a diagnostic accuracy approaching 95% for the diagnosis of malignancy. Besides, the presence of a cytopathologist for onsite evaluation and the presence of concurrent core biopsy in selected cases, which allow for optimization of the FNAC in obtaining sufficient material and provide immediate cytological-histological correlation, respectively are additionally important factors in the success of FNAC in diagnosing STTs (Khalbuss et al., 2010).

However, Khalbuss et al. (2010) reported that the more problematic group was the group of inadequate FNAC specimens. Although only one study defined adequacy in soft tissue FNAC biopsies as the presence of at least 5 clusters of 10 unobscured cells on the majority of slides (Palmer et al., 2000), yet there are no established adequacy criteria for bone and soft tissue cytology which results in variation in the number of inadequate cases by pathologist, by institution, and by

study. Also, the authors concluded that benign STTs are more difficult to subclassify than malignant lesions. In addition, there are only a few studies documenting how well FNAC can subtype previously undiagnosed STS, and the results vary widely, with an average 50–70% success rate (Akerman and Rydholm, 1983; Trovick et al., 1998; Liu et al., 1999; Kilpatrick et al., 2001; Domaniski et al., 2006 and Domaniski 2007). In a series carried out by Kilpatrick et al. (2001) on 140 patients to evaluate the role of FNAC in the primary diagnosis of STS, they found the accuracy of FNAC for histological subtyping to be greater for pediatric sarcomas (92%) (with the use of ancillary studies) than for adult sarcomas (52%). The authors further showed that if one is able to subtype or at the least, place the sarcoma into the proper cytomorphological group (pleomorphic, spindle, etc.) then a specific grade was not needed for the initiation of treatment because in most cases, the histological grade is readily apparent. In their series, the FNAC diagnosis was sufficient to begin definitive therapy in 83% of patients with STS. Jones et al. (2002) have shown similar results supporting the opinion that FNAC can accurately subtype and grade STS in most cases. In their series of 107 FNAC (77 with corresponding surgical material available), only low-grade sarcomas were undergraded in a significant minority of cases, reducing the utility of FNAC when this group of neoplasms is encountered.

As previously mentioned, many studies recommend dividing STTs into one of five major cytomorphological subtypes based on the predominant morphology: myxoid, spindle cell, round cell, pleomorphic, and polygonal/epithelioid cell. However, it should be recognized that overlapping cytological features can occur; therefore, some tumors might be considered in the differential diagnosis of more than one category. For example, features of SS could be placed in the epithelioid/polygonal, small cell and spindle cell groups (Bennert and Abdul-Karim, 1994 and Kilpatrick et al., 1999). Several studies show also that grading or subtyping of spindle cell sarcomas by FNAC alone is often challenging (Kitagawa et al., 2003; Singh et al., 2004; Bahrat et al., 2007 and Singh et al., 2007). Other studies (Palmer et al., 2000 and Kilpatric et al., 2001) have found similar difficulties when diagnosing lipomatous tumors by FNAC and recommend that deeply seated soft tissue lesions that appear predominantly fatty by current imaging techniques should be evaluated by incisional or excisional biopsy techniques. Also Singh et al. (2004) have concluded in their review of the utility and diagnostic challenges of FNAC in the diagnosis of STS that the epithelioid cell and spindle cell groups are the most challenging to accurately subclassify and grade based solely on cytomorphologic features.

Most authors agree that a definitive cytological

diagnosis must be based on a combination of the cytological findings (ie, adequate specimen, cytomorphology) correlated with results of ancillary studies (IHC, flow cytometry, cytogenetic analysis and EM), along with the clinical and/or radiographic data (Singh et al., 2004). Also, Khalbuss et al. (2010) supported the idea that the majority of malignancies involving soft tissue and bone can be diagnosed and subclassified by FNAC when adequate history, ancillary studies, and onsite evaluation are used. Ancillary diagnostic procedures especially IHC plays an important role in the workup of small round cell, spindle cell, and epithelioid sarcomas (Shah et al., 2003). Table (7) outlines the IHC screening panels for the three categories of tumors for which it is clinically most useful in the rendering of an accurate diagnosis. Also, table (8) shows the most common genetic changes used in the molecular diagnosis of STTs (Miettinen 2006 and Wardelmann et al., 2010).

Table (7): Immunohistochemical screening panels for the round cell, spindle cell and epithelioid cell sarcomas (Singh et al., 2004).

Round cell sarcomas	Spindle cell sarcomas	Epithelioid sarcomas
*RMS MyoD1 and Desmin+, CK+/-	*Synovial sarcoma CK+, EMA+, CD99+, S-100+,Desmin-	*Epithelioid sarcoma CK+, CD34+, Vimentin+, S-100-, CD30-, CD45-

4. Summary and Conclusion

Although FNAC is a widely accepted and established diagnostic technique in diagnosing the presence of primary malignancies, metastatic disease, and benign nonneoplastic lesions, but its role in the evaluation of STTs has remained controversial, especially as the primary modality for establishing an initial diagnosis. Therefore, this study was carried out to review the utility and pitfalls of FNAC in the primary diagnosis of STTs, to highlight diagnostically challenging lesions and comment on the limitations of

FNAC in providing a definitive diagnosis.

Table (8): The genetic changes used in the molecular diagnosis of some soft tissue tumors (Miettinen 2006 and and Wardelmann et al., 2010).

Tumor	Affected genes
GIST	C-KIT mutations PDGFRA mutations
ES	EWS-FLI1 EWS-ETV1 EWS-ERG
Alveolar RMS	PAX3-FKHD PAX7-FKHD
ASPS	ASPSCR1–TFE3
Myxoid LPS	FUS-CHOP
EMC	EWS1R–CHN TAF2N–CHN TFG–NR4A3
DSRCT	EWS-WT1
SS	SYT-SSX
Clear cell sarcoma	EWS-ATF1
Angiomatoid MFH	TLS–ATF1 EWS1R–CREB1 EWS1R–ATF 1
DFSP	COL1A1–PDGFB
Myxoinflammatory fibroblastic sarcoma	Amplification of VGLL3
Well differentiated LPS	Amplification of MDM2, CDK4, HMGA2
Low-grade fibromyxoid sarcoma	FUS–CREB3L2 FUS–CREB3L1

The findings of this review show that for the primary workup of STTs, FNAC has several major advantages that certainly outweigh its limitations. However, the inexperience of cytopathologists with the wide spectrum of soft tissue neoplasms, coupled with overlapping morphologic appearances of reactive and neoplastic lesions, limit the widespread usage of FNAC as the diagnostic procedure of choice in STTs. In addition, there are still some rare STTs that can't be accurately diagnosed by FNAC because the cytological criteria that allow their correct diagnosis as benign or malignant, as well as to type them, have not been well established. However, FNAC in conjunction with ancillary studies (IHC, cytogenetics, flow cytometry, EM and cytogenetic analysis), along with the clinical and/or radiographic data can approach a diagnostic accuracy of 95% for the diagnosis of STTs. Although accurate assessment of the grade of STS is difficult by FNAC, yet if one is able to place the sarcoma into one of the five cytomorphological group (pleomorphic, spindle, myxoid, small round/ovoid, epithelioid) then a specific grade is not needed for the initiation of treatment because in most cases, the histological grade is readily apparent. However, subtyping spindle cell sarcomas as well as lipomatous tumors is often

challenging. The use of IHC is mandatory for proper diagnosis of these tumors.

So, this review assures the role of FNAC in the primary diagnosis of STTs as well, in recurrent and metastatic lesions. Exhaustive trials for subtyping and grading of some confusing STTs and the probability of error have to be weighed with the option of placing such tumors in one of the cytological groups which is a trend widely accepted by many authors.

5. Recommendations

Based on the results obtained from the present study, recommendations those worth mentioning are:

- Any patient with a STT presenting with any of the followings should be referred to a multidisciplinary musculo-skeletal centre: subcutaneous tumors larger than 5 cm in diameter, any deep-seated (inter- or intramuscular) tumors and any STT clinically suspected for malignancy.

- On performing FNAC from a STT, sampling tissue from at least three different parts from the tumor is advisable to assess its heterogeneity.

- The microscopic evaluation of STTs obtained by FNAC should be based on both wet fixed H&E or Pap stain and air-dried MGG stain.

- Small, deep seated STTs are to be needled with ultra sound guidance to avoid misdiagnosing reactive cellular changes as STS.

- On evaluating the cytological smears from STTs, it's recommended to place the STT into one of the five major cytomorphological subgroups based on the predominant cytological appearance: pleomorphic, spindle cell, myxoid rich, small round/ovoid cell and epithelioid cell. This aids in reaching a confident diagnosis of benignity or malignancy and suggesting a type-specific   diagnosis.

- Optimal interpretation of cytology findings of STTs requires a combination of the results of ancillary studies (IHC, flow cytometry, cytogenetic analysis and EM), along with the clinical and/or radiographic data. Close interaction between the clinician and cytopathologist is therefore an essential component to the success of FNAC in the workup of STTs. The patient referral request should include full personal data, clinical data including site and size of the tumor, results of radiographic studies, previous biopsies if done, its result and detailed information concerning biopsy sites.

- Further correlative cytological-histological studies on large number of cases should be carried out to try to identify distinguishing cytological features for each type of STTs.

- Further scope of STT evaluation on cytology can be expanded with more studies dealing with application of ancillary techniques on aspirate samples.

Behavioral Responses of Castrated Buck Kids at Different Ages By Using Different Methods of Castration

Souad A. Ahmed and Essam A. Ahmed

Department of Animal Hygiene, Behavior and Management, Faculty of Veterinary Medicine, Benha University.
Egypt. *souadahmed45@yahoo.com

Abstract: To evaluate the behavioral responses of kids to castration by burdizzo (Bur), rubber ring (RR) or control handled, 90 buck kids were used. Behavioral responses of kids throughout the 180 minutes after castration or control handled were assessed by using a video camera. Castration of younger kids (7 and 21 days) took significantly shorter time than 42 days old. RR produced the highest values of active pain behavior, frequency of elimination, less frequently suck, teat seeking or nibble at feed. The scrotal sloughing was delayed in older kids. Results of questionnaire indicated that most castrations were done at the farm; castration failure was only in some of Burdizzo especially those older than 8 weeks. It was concluded that kids castration must be done as early as possible to reduce the total pain response and for achievement of animal welfare, and Burdizzo method is the preferable technique for castration of kids at all ages.

1. Introduction:

Under general husbandry procedures in animal rearing, Castration is carried out as routine animal husbandry procedures in lambs although it has been recommended that they should only be undertaken after careful consideration of their necessity by the farmer (Anon 2007). Castration of males those not wanted as replacement bucks should be done during the first days or weeks after birth for many reasons; to prevent disruption in the flock through sexual activity of young males, castrated males can remain with their dams and female flock mates for a much longer period of time than intact males, prevent unwanted pregnancies, indiscriminate breeding and reduce fighting and injury to animals as a result of sexually related behavior and dominance amongst males and there is a belief that castration improves conformation of the body thus producing a better quality product (Archer, 2004; and Farm Animal Welfare Council, 2008).

Castration also prevents physically or genetically inferior males from reproducing and prevents pregnancy in commingled pubescent groups (Stafford and Mellor 2005). Castrated males are easier to manage, especially as they mature thus maintain general control of stock. Beside this, castration of bucks is recommended to avoid the goaty odor which taints the doe's milk. Male lambs are preferably castrated in the first few days or weeks of life because animal handling is easier and postoperative complications are fewer (Baird and Wolfe, 1998).

However, management actions can also be a source of poor welfare in the neonatal lamb, particularly carrying out painful procedures without

the use of analgesics, and disruption of the ewe–lamb bond by permanent or temporary separation (Dwyer 2008). Studies investigating differences between pain responses of lambs at different ages have been undertaken using different methods of castration and tail docking (Johnson et al. 2009).

The most widely methods of castration being used are rubber ring, burdizzo and surgical or open methods. Rubber ring castration method via application of a tight rubber ring around the neck of the scrotum using an elastrator causes ischemia, leading to tissue death and sloughing. Other methods include the application of an emasculator (e.g. Burdizzo clamp) over the spermatic cord to crush and destroys a narrow segment of each spermatic cord, causing irreversible damage to the vessels supplying the scrotum, leading to ischemia and testicular atrophy, while the third is the open or surgical castration involves excising the scrotum and underlying tissues to reveal the testes which are then removed by tearing, cutting or twisting, with or without cautery, legation or clamping. (Dinnis et al., 1997a). All three castration methods produced changes in the integrated scrotal pain scores which were significantly higher compared to control lambs (Thornton and Waterman-Pearson, 1999). Pain in animals is a complex experience, dependent not only on the severity of the insult to pain pathways and the degree of tissue or nerve damage, but also on previous pain experiences and on social position within a flock/herd. Pain associated with inflammatory diseases is probably the major source of pain in ruminant species (Fitzpatrick et al. 2006).

Melches et al. (2007) reported that long-term pain after rubber ring castration of calves can last for

at least 42 days. In addition, the prolonged wound healing and long term local pain compared to Burdizzo castration and the occurrences of local infections do not favor the rubber ring method. The Burdizzo method appears to be both effective and safe but can be difficult to apply and considerable variability in its effectiveness can occur (Hosie *et al.,* 1992). Zimmerman (1986) suggested that in animals a painful experience should result in learned avoidance and affect the animal's behavior including social behavior. Therefore we can use behavioral and physiological criteria to determine whether an experience is painful to an animal.

Castration-related responses indicating pain and distress in lambs include changes in behavior and serum cortisol concentration, and the occurrence of abnormal postures. This has been well established by several authors investigating post castration-distress over the first few hours after castration (Molony et al., 2002). After castration individual lambs expressed pain in different ways; some rolled; some wagged their tails while others head turned, stamped their feet or vocalized (Molony et al., 2002). This experiment aimed to study the behavior of castrated buck kids at three different ages after castration by RR or Bur, and to assess the suitable method for each age class depending on the response of buck kids to castration method that was less painful to the animal. Also to assess the preference of owners to any method through the results of questionnaire.

2. Materials and Methods:
Animals:
Three different ages and three methods of castration (including control handled) were used in this study to see the effect of age and method of castration on the behavior and welfare of kids.   This study was conducted on ninety buck kids aged 7, 21, and 42 days were used, in this study. For each age group, ten kids were castrated by rubber ring, ten by Burdizzo, and ten kids were control handled and used as control for both. Animals were allowed to acclimatize for a minimum of 24 hours in the pens where the castration was done prior to commencement of the study. Does were housed with their kids in straw bedded pens for the duration of the experiment (Molony et al., 2002). Green fodder and water were provided ad libitum and concentrates fed as required.
Experimental design:
Before castration, all kids received a tetanus prophylaxis of 1500 IU of Tetanus-Serum, the castrations or control handlings were performed between 0700 and 0800 A.M. Three methods were studied (control handling, rubber ring, and Burdizzo), each kid experienced only one castration method.

1- Control handling: The operator manipulated the testes for 1–2 min in order to simulate the handling associated with castration.
2- Rubber ring castration (RR): A constricting latex rubber ring was applied to the neck of the scrotum, using an elastrator after ensuring that both testes were situated distal and the teats proximal to the ring. One person held the kid while a second person applied the treatment.
3- Burdizzo castration (Bur): Each spermatic cord and associated scrotal tissue was crushed each with a Burdizzo clamp. The second application of the clamp lay distal to the first. Care was taken to ensure that the clamp crush lines did not overlap. castration and control handled were done according to (Melches et al., 2007).
Recording of behavioral responses:
Behavioral observations of kids during control handled and castration and the immediate behavioral responses of each buck kid throughout the 180 minutes following castration or control handling were assessed by using of a video camera (Hitachi) situated at a slightly elevated angle to record all activities within the pen; video taping enabled the experimental area to remain free from human presence and activity, thus lessening the risk of altering the kid's normal behavior. The video tapes were reviewed at a later date and the behavioral responses were recorded. The 180 min experimental period (post castration) was divided into 10 min observation periods and the occurrence or count of each behavior or pasture was recorded for each 1 min period (Grant 2004).
Description of behaviors was based on what reported by (Molony et al. 2002 and Grant 2004), as follows:
Foot stamp and kicking: one action was recorded when either a front or hind limbs was lifted and forcefully placed on the ground while standing or lying.
Statue standing: standing immobile for more than 10 s usually with the hind limbs slightly apart and positioned further back than normal, the back was arched, the tail tucked between the hind legs and the kid was trembling, with an obvious withdrawal from interaction with other pen members and outside stimuli.
Lateral lying with head up, or down: lateral recumbency with one shoulder on the ground, with extension of the hind limb and with the head up or down.
Abnormal ventral lying: ventral recumbency with the hind limbs partially or fully extended, or with the kid keeping the scrotal region off the ground.
 Abnormal standing/walking: Standing or walking unsteadily sometimes with tail wagging; walking on knees; moving forward with bunny hoops; circling; leaning on a support or falling, swaying.

Normal standing/ walking: standing, walking and playing, eating or investigating with no apparent abnormality.

Active pain behaviors:-

Head turning: (movement of the head beyond the shoulder), include both looking and touching at the source of pain and grooming.

Tail wagging : a single side to side tail wagging was recorded as one action. Tail wags while teat seeking was not counted.

Rolling: kid rolled from lying on one side to the other without getting up, half rolls on the back were included.

Easing quarters: one action was recorded each time a front or hind limb, including the shoulder and hind quarters was moved in a less forceful manner than stamping or kicking or the whole body was shifted or eased without moving from the place of rest, tensing of leg muscles was also included.

Licking scratum and inside of the hind leg: during standing or lying down, the kid turns its head toward the inside of hind leg and scratum with elevation one of hind legs with vigorous licking.

Restlessness, the number of times the kid stood up and lay down; each unit scored included both the act of rising and lying down, instances of the kid rising as far as its knees were included in the count.

Vocalizations; occurrence of each vocal sound was recorded.

Backward movements: the kid move few steps backward while leaning on object.

Elimination: number of defecations and urinations.

Teat seeking: kid seeks the teats with or without sucking was recorded.

Feeding: when the kid nibbles or eats feed.

Also the effect of age on time needed for castration and scrotal sloughing were recorded. The time for castration or manipulation was measured, including the time for fixation and disinfection (Melches et al., 2007).

Beside this there was a survey on kids' castration through a questionnaire to owners and veterinarians (according to Hosie et al., 1996) as follows:-

1-Why do you castrate your kid?

2- At what age do you castrate your kid?

3-Which technique have you used? And who do it ?

4- At what age do you use (Surgical removal, Burdizzo castrator, Rubber ring).

5- In case of surgical removal do you use tetanus prophylaxis? Yes or No

6-Where do you normally carry out this task?

7- Are you aware of any injuries or deaths associated with these techniques? Yes or No.

8- Do you use anesthetics when castrating?   Yes or No.

9- Are you aware of any failure with any of these techniques? Yes or No. if yes how many?

Statistical analysis: Analysis of variance (ANOVA) was performed on the behavioral data, gathered during the 180 minutes to compare differences in behavioral activities and time spent in various postures, between treatments. Data were analyzed using SPSS (SPSS 2003, SPSS Inc.), and (P<0.05) was consider as statistically significant. Data are presented as means ± SE.

3. Results:

As shown in table (1); the time needed for castration of buck kids was significantly affected both by age of kids and method of castration. Castration of older kids (21 and 42 days) took significantly longer time (P<0.05) in both methods of castration. Bur method took significantly (P<0.05) longer time than RR at all ages.

As shown in table (2); age of castrated kids significantly (P<0.05) affected the behaviors (vocalization, tail wagging and kicking) during castration process. The incidence of these behaviors during castration was greater in older kids (42 days).

Table (1) Effect of method of castration and age of buck kids on the time needed for castration each kid (min.), and scrotal sloughing in RR method

Age / Method of castration	7 days	21 days	42 days
Rubber ring	0.57 ± 0.01 [b]	2.09 ± 0.04 [a]	2.15 ± 0.25 [a]
Burdizzo	1.08 ± 0.03 [b]	3.32 ± 0.22 [* a]	4.56 ± 0.53 [a*]
scrotal sloughing (days)	14.60 ± 0.11 [c]	22.16 ± 2.18 [b]	41.56 ± 6.18 [a]

Values are shown as means ± S.E. M

[a,b,c] means with different letters in the same raw are significantly different at P<0.05

means with stars [*] in the same column are significantly different at P<0.05

Table (2) Incidence of kicking, vocalization, and tail wagging of kids during castration and handled control at different ages:

Age	Behavior	Control	Rubber ring	Burdizzo
7 days	Kicking	0.33 ± 0.11^c	1.33 ± 0.88^b	3.67 ± 0.43^a
	Vocalization	0.50 ± 0.08^c	1.40 ± 0.05^b	4.98 ± 0.24^a
	Tail wagging	0.50 ± 0.01^c	3.12 ± 0.02^b	5.20 ± 0.54^a
21 days	Kicking	0.67 ± 0.33^c	2.57 ± 0.67^b	5.47 ± 1.02^a
	Vocalization	0.33 ± 0.04^c	$2.64 \pm o.11^b$	6.67 ± 0.43^a
	Tail wagging	0.60 ± 0.25^c	$3.20 \pm 0.21^{b*}$	6.61 ± 0.51^a
42 days	Kicking	1.33 ± 0.21^c	2.89 ± 0.07^b	5.82 ± 0.53^a
	Vocalization	0.54 ± 0.21^c	4.14 ± 1.00^b	9.67 ± 0.88^a
	Tail wagging	1.20 ± 0.04^c	$5.35 \pm 0.58^{b*}$	$8.80 \pm 0.53^{a*}$

Values are shown as means ± S.E. M
[a,b,c] means with different letters in the same raw are significantly different at P<0.05
means with stars[*] in the same column are significantly different at P<0.05

The abnormal postures were virtually absent in control kids and present in those castrated at all ages used in this study for up to 180 minutes following castration (Tables 3-5). RR kids had significant (P<0.05) increase in statue standing and immobile periods, abnormal lying with full extension of hind limb, while lateral lying with head up or down, and normal standing/ walking were more in case of Bur castration technique. By age advancement of castrated kids there was significant (P<0.05) increase in the time spent doing abnormal pastures in both RR and Bur kids.

Table (3) Effect of method of castration on time (min) spent in abnormal postures by kids in 180 minutes after RR and Bur castration (7 days of age):

Behavior	Control	RR	Bur
Statue standing	0 ± 0^c	37.18 ± 0.19^a	9.53 ± 1.21^b
Lateral lying , head up	0 ± 0^c	5.37 ± 0.14^b	10.52 ± 0.12^a
Lateral lying , head down	0 ± 0^c	6.2 ± 0.15^b	14.33 ± 0.23^a
Abnormal ventral lying, full leg extension	0 ± 0^c	36.40 ± 3.05^a	27.36 ± 0.16^b
Abnormal ventral lying, partial leg extension	0 ± 0^c	20.53 ± 1.17^b	30.2 ± 0.15^a
Abnormal standing\ walking	0.21 ± 0.05^c	53.32 ± 0.11^a	36.22 ± 0.23^b
Normal standing\walking	95.11 ± 2.7^a	7.30 ± 0.23^c	18.18 ± 0.49^b

Values are shown as means ± S.E. M
[a,b,c] means with different letters in the same raw are significantly different at P<0.05

Table (4) Effect of method of castration on time (min) spent in abnormal postures by kids in 180 minutes after RR and Bur castration (21 days of age):

Behavior	Control	RR	Bur
Statue standing	0 ± 0^c	39.51 ± 3.05^a	20.42 ± 0.13^b
Lateral lying , head up	0 ± 0^c	18.53 ± 1.17^b	33.40 ± 3.05^a
Lateral lying , head down	0 ± 0^c	2.48 ± 0.15^b	10.41 ± 3.17^a
Abnormal ventral lying, full leg extension	0 ± 0^c	39.36 ± 0.32^a	29.21 ± 1.14^b
Abnormal ventral lying, partial leg extension	0 ± 0^b	8.33 ± 0.09^a	9.13 ± 0.27^a
Abnormal standing\ walking	0.18 ± 0.03^c	55.49 ± 0.18^a	$36.53 \pm o.35^b$
Normal standing\walking	107.11 ± 1.19^a	3.18 ± 0.12^c	11.52 ± 3.17^b

Values are shown as means ± S.E. M
[a,b,c] means with different superscripts in the same raw significantly differ (p 0.05)

Table (5) Effect of method of castration on time (min) spent in abnormal postures by kids in 180 minutes after RR and Bur castration (42 days of age):

Behavior	Control	RR	Bur
Statue standing	0 ± 0^c	42.29 ± 0.28^a	30.8 ± 3.17^b

The incidence of active pain behaviors (tail wagging, rolling, easing quarters, licking scratum and inside of the hind leg, restlessness, vocalizations, and backward movements) were significantly higher in case of RR kids than Bur kids and handled control at the same ages, while the incidence of head turning increased in case of Bur kids (Tables 6 & 7).

Table (6) Effect of method of castration on incidence of active pain behavior by kids in 180 minutes after Burdizzo (Bur) castration:

Age / Behavior	7 days	21 days	42 days
Head turning	3.40 ± 0.74^b	8.12 ± 1.84^a	8.46 ± 1.33^a

[a,b,c] *means with different letters in the same raw are significantly different at P<0.05*

As shown in table (8); there was significant (P<0.05) increased in the frequency of urination and defecation behaviors and significantly (P<0.05) reduction in ingestive behavior in case of RR and in older age.

Table (9); revealed that most of buck kids were castrated between one and 10 weeks of age, Burdizzo was used between 2 and over 8 weeks with % of 2 and 16 respectively, while rubber ring was between one day and 8 weeks of age with % of 17 and 2

respectively. Most farmers still do surgical castration between ages of 7 days to over 8 weeks by themselves in the farm (seventy seven percent), and small percentage (twenty three percent) of castrations were done at the clinic. Castration failure was not recorded either for surgical or rubber ring castration methods, but were noted only in 7 out of 30 kids where the Burdizzo was used especially older than 8 weeks.

Table (8) effect of method of castration on the incidence of elimination, suckling and teat seeking, and feeding behavior by kids in 180 minutes after castration and handled control:

	Age / Behavior	7 days	21 days	42 days
Handled control	Urination	2.12 ± 0.01^b	2.36 ± 0.33^b	3.31 ± 0.16^a

Table (9) Results of questionnaire on buck kids' castration survey:

Method of castration		Burdizzo	Rubber ring	surgical
Age (weeks)	1-2	-	17	83
	2-4	2	12	86
	4-8	2	2	96
	Over 8	16	-	84
Place of Castration	At clinic	23		
	At the farm	77		
Using of anesthesia		For older kids more than 8 weeks in case of surgical castration only		
Using of tetanus prophylaxis		in case of surgical castration only (40 %) especially over 4 weeks)		
Failure or recurrence		7	-	-
Injuries or deaths		2	2	3
Reason of castration	Prevent unwanted pregnancy	20		
	Avoid behavioral problems	27		
	Fattening	48		
	Avoid goaty odor	5		

4. Discussion:

The purpose of this study was to examine the behavioral responses of kids castrated by RR or Bur at different ages (7, 21 and 42 days of age), and to compare these responses to those seen in handled control of the same ages to those castrated. As pain is associated with suffering and distress, thus it is important to be estimated as it interferes with most behavioral patterns of animals. During castration kids did struggling behavior which increased with age of kids, as castration of younger kids (7 days of age) took significantly shorter time than older kids. The time of castration was significantly affected by age of castrated kids and age of castration. Older kids (21 and 42 days) took significantly longer time in both methods of castration. Bur method took significantly longer time than RR at all ages because the instrument had to be applied for each testicle. These results confirmed the findings of (Hosie *et al.,* 1993 and Melches et al., 2007) as they stated that castration of lambs of the Burdizzo group, took significantly longer time than the castration of lambs of the rubber ring groups.

In case of RR castration, there was significant effect of age of kids at castration on the average time taken for the scratum to drop off; it sloughed earlier in case of younger kids than in older kids because in the later there was more tissue and innervations by blood vessels and nerves, so it took longer time to slough. Kent et al (2000) recorded that 80% of castrated lambs still had scartum present after 28 days of castration by RR. In castrated lambs, Mellema et al. (2006) found that after rubber ring castration, the scrotal tissue and its contents began to dry up and fell off after an average of 24.7 ± 4.4 days. Also Melches et al. (2007) reported that in case of rubber ring castration, the testes dropped off after a (35 ± 6.9) days in lambs.

The incidence of vocalization, tail wagging and kicking, behaviors during castration were greater in older kids, (42 days) indicating the severity of pain due to more tissue damage in those kids. This result agree with (Molony et al., 1993) who found that in lambs all methods of castration at all ages produced changes in behavior that were interpreted as indicative of considerable pain. The expression of pain during castration was significantly influenced by the castration method (Molony et al., 2007). The incidence of kicking, tail wagging, and vocalization during application of Bur was greater than RR at all ages used in this study as application of Bur need sometime to apply (grasping the scratum and manipulate the testes down into the scratum by hand, manipulation of spermatic cord and squeezing the Bur totally closed, clamping it on the kid's scrotum to crush the cord for each testicle and to the difficulties

of its application. Foot stamping and kicking or restlessness made up the main part of the total active behavior after rubber ring castration (Mellema et al. 2006). In piglets, (Weary et al., 1998) recorded vocalization when castrated and demonstrated that piglets call at a higher frequency during the procedure especially during the severing of the spermatic cord.

Studies investigating differences between pain responses of lambs at different ages have been undertaken using different methods of castration and tail docking (Johnson et al. 2009). In our study it was clear that all castration methods produced changes in behavior which were significantly higher compared to handle control kids and in older kids more than younger. Johnson et al. (2009) demonstrated that very young lambs have a reduced cerebrocortical response to castration than their older counterparts and it has been assumed that they perceive less pain.

Pain is typically estimated to be mild or moderate based on abnormal postures and behaviors indicating discomfort (Molony et al., 2002).

There was significant difference in abnormal postures (statue standing, lateral lying with head up, lateral lying with head down, , abnormal ventral lying with partial leg extension, and abnormal standing\ walking) between RR and Bur kids in all kids at all ages used in this study ranged from (7-42 days). RR kids had significant increase in statue standing and immobile periods, and abnormal lying with full extension of hind limbs, by reducing total movements; this may be an attempt by the kid to decrease painful sensation, as pain might increase as a result of moving. Pain can lead to a period of hyperalgesia, which is a change in the relationship between pain perception and stimulus intensity, resulting in a decreased stimulus threshold and increased pain in response to a suprathreshold stimulus (Raja et al. 2000 and McCracken et al. 2010).

(Grant 2004) found that statue standing was highly indicative of Mulesing treatments. Lying postures and abnormal walking/standing based upon the degree of limb extension, as the increase full extension depends on testicular tissue pain. This agrees with what reported in lambs by (Molony et al., 2002), that lying with full extension of the hind limbs is associated with lambs ranked higher in the pain scale. These abnormal postures values were higher in RR kids than Bur kids at all ages, the high level of these behaviors following RR castration reflects direct pressure on the spermatic cord and scrotal skin exerted by the tight rubber ring followed by ischemic scrotal and testicular pain and due to the inflammatory response of RR produced increase sensitivity at this site. Also may be as a result of RR kids displayed agitated behavior such as incessant pacing along the pen perimeter and ischemic pain

from RR prevented kids from adopting a similar strategy as observed in castrated lambs by (Grant, 2004). In castrated lambs, Mellema et al. (2006) stated that the proportion of recorded postures that were abnormal was significantly greater after RR castration, than Bur during the first 2 h. they added that from days 1 to 6 after treatment, lambs castrated without local anaesthesia (Bur and RR) exhibited a significantly higher rate of total active behavior than control lambs.

Lateral lying with head up or down, and normal standing/ walking were more in case of Bur castration technique which produced a short burst of intense pressure but not ischemic pain from the scratum and its contents. Molony et al., (1993) postulated that this is because some afferent nociptive signals are abolished by the crushing action of the clamp on the neuron serving these structures.

Pain is related to the amount of tissue damage (Lester et al., 1996 and Molony et al., 2002 ; and Fitzpatrick et al. 2006). Castration of older kids (42 days) displayed more active pain behavior than younger ages (7& 21 days), this is because of by increasing age of kid, there was an increase in pain sensation due to more innervations by nerves and blood vessels and more tissue damage, so those kids try to alleviate pain by doing these behaviors.

Many authors (Mololny et al., 1993; Kent et al., 1995 and Goodwin et al., 2007) have favored using active pain behaviors as a mean of assessing pain following castration. In both methods of castration, it was found that the abnormal lying with full leg extension and abnormal standing\ walking were significantly increased with age as with increasing age there was more tissue damage and more pain sensation, while lateral lying with head down, and abnormal lying with partial leg extension, were significantly decreased by age. Due to the tension of the rubber ring, RR kids spent significantly more time doing abnormal postures than Bur kids which spent greater time in lying postures at the same ages. These results agree with Melches et al. (2007), who observed that rubber ring lambs exhibited more often abnormal postures than the Burdizzo lambs: a tendency towards this difference was found during the time period 20 min to 2 h after castration, and significant differences were found during the time period 2.5–9 h after castration. Age significantly affected both the abnormal postures and the time spent in lying postures (all lying postures). Normal standing behavior was very short during the observational period in castrated animals, and this have been interpreted as indicators of post-castration pain and/or distress as reported by (Mellor et al., 1991; Wood et al., 1991; Kent et al., 1995, and Lester et al., 1996).

In the same ages, it was found that RR kids had significantly more incidence of active pain behaviors (tail wagging, rolling, easing quarters, licking scratum and inside of the hind leg, restlessness, and backward movements) than Bur kids and handled control this may be due to noxious mechanical stimulation of the skin and subcutaneous tissue by the ring (as recorded in lambs by (Molony et al., 2002; Mellema et al. 2006; and Goodwin et al., 2007). The same was reported in lambs by (Kent et al., 2001), who observed fewer incidences of tail wagging, easing quarter, rolling and limb movements where castrator was applied proximal to the RR. Watts and Stookey, (2000), reported that vocalization is obviously an important part of many animals normal communication and a form of commentary on their own sense of well-being. As tissue damage increased by age, These behaviors significantly increased by age, indicating that the severity of pain increased in older kids (21 and 42 days), they also did more vocalizations than those castrated at 7 days, also vocalization was affected by methods of castration, RR castrated kids did more vocalizations than Bur at all ages. These results disagree with what reported by Grant, (2004), who stated that vocalization of the lamb did not appear to correlate well with the severity of the treatment and its expression was highly variable amongst lambs.

The incidence of restlessness and walking backward increased by age and were significantly more in case of RR indicating the severity of pain due to more tissue damage. Those animals suffered more and couldn't still in a fixed position for long time, thus they move more frequently to alleviate the pain sensation.

The frequency of urination and defecation in castrated kids was significantly affected by age and method of castration; it increased significantly in case of RR and in older ages, this indicated that those kids suffered more stress which made the kids stripping urine and increase times of defecation especially during the first hour after castration. McCracken et al. (2010) found that after tail docking in lambs, some behaviors such as urination were infrequently displayed and there was not a significant difference between the pre and post docking measurements.

There was significantly reduction in ingestive behavior (suckling and teat seeking and nibbling at feed) at different ages in this study. This may be related to reduction in appetite due to pain sensation and distress. In lambs, Mellema et al. (2006) reported that castration pain and distress should affect animal behavior, they may also affect food intake with consequent differences in daily weight gain. Our results agree with (McGlone et al., 1993, and Weary et al. 1998), they recorded reduction in suckling,

standing and increased lying time in the behavior of young pigs compared with that of intact pigs at all ages tested. Also reduction in suckling in castrated kids may be related to loss of appetite as reported in castrated cattle by (Stilwell et al., 2008).

Results of questionnaire indicated that the age of castrated buck kids were between one and 10 weeks of age, Burdizzo was used between 2 and over 8 weeks, while rubber ring was used in younger kids between one day and 8 weeks of age. Surgical castration also done between ages of 7 days to over 8 weeks, and mostly done by farmers themselves in the farm, while small percentage of castrations were done at the clinic. Castration failure noted only in case of Burdizzo especially those older than 8 weeks. This might be failure to apply sufficient crushing pressure to the spermatic cord due to short time of application as reported in lambs by Hosie *et al.,* (1996) who stated that the highest failure rate was attributed to a faulty bloodless castrator which the flockmaster believed did not achieve an adequate crushing pressure. The results also showed that in case of surgical castration, only 40 % of castrations used anesthesia and tetanus prophylaxis, and it was limited to those kids over 8 weeks. There was no significant difference in the percentage of deaths between castration methods, from 100 castrated kids of different ages, only two deaths were attributed to both Burdizzo and rubber ring whereas there were three for surgical castration. Deaths did not occur immediately after castration, but due to injury from the technique and infection to the scrotal skin, or to swelling of one or both testicles due to hemorrhage as reported by Hosie et al., (1992). The main reasons given for castration of kids mostly for fattening, to avoid behavioral problems and to prevent unwanted pregnancy, while the least percentage, was recorded for avoidance the goaty odor of milk.

Conclusion:

As some of buck kids have to be castrated for the previous reasons, thus from welfare point of view, it is important to choose the safest and less painful method to apply because the careful selection of procedures could reduce the total pain response. Despite rubber ring castration was the easier and faster, it led to long-term pain after castration and had adversely effect on behaviors as compared with Burdizzo castration.

The % of time spent doing behaviors that indicate painful sensation was increased with age which indicate that pain sensation in younger ages diminished earlier than older. The results of questionnaire revealed that using of Burdizzo and rubber ring castration still have some ignorance. The general recommendation is to castrate kids as early as possible as pain sensation diminished earlier in young

kids (7-21 days) than old (42 days) which results more tissue damage which probably increases the likelihood of post operative complications.

Synthesis of Some New Annulated Thieno Pyridine,Pyrazolopyridine and Pyrido Pyridine Derivatives

F.F. Mahmoud, Nadia T.A. Dawood, Nahed F. Abdel-Ghaffar

Department of Chemistry, Faculty of Science, Al-Azhar University, Cairo, Egypt.
dawounadia @yahoo.com

Abstract: The reaction of arylidenemalonitrile with cyanothioacetamide afforded pyridine derivatives. Thus compound 1 reacted further with different nucleophilic and electrophilic reagents yielding different products which were confirmed via spectroscopic analysis.

1. Introduction

No doubt that thienopyridines are an interesting class of heterocycles and their chemistry has recently received considerable attention especially because of their potential utility as antibacterial[1-4] antihypertensive[5], diabetes mellitus [6-8], as well as analgesics and antiinflammat ,sedatives, anticougulants [9-11], antiortherosclerotics [12] and as gondatropin releasing hormone antogeonsits[13]. The derivatives of thiopyridines are also useful intermediates for the synthesis of some medicines and related compounds. It was discovered that the pyridyl thiolate moiety enhances antifungal and antiinflammatory activities of several important drugs [14, 15]. Herein we report some new pyridinethione derivatives and their related product.

2. Results and Discussion

Thus pyridinethione derivative 1, which is prepared according to the literature [16, 17] was reacted with active methylene compounds namely, chloromalononitrile, and /or ethylbromoacetate in refluxing pyridine to afford the theinopyridine derivatives (3a,b) respectively. The structure of compounds 3a,b was established based on the elemental analysis and spectral data. The mass spectrum of compound 3a is compatible with the molecular ion peak at m/z=229 (M$^+$). Compound 3a is assumed to proceed via reaction of compound 1 with -halo compound to afford the S-alkylated derivative 2a followed by cyclization to 3a.

The mass spectrum of compound 3b is compatible with the molecular ion peak at m/z = 276 (M$^+$) (Scheme 1).
Scheme (1)

Alkylation of pyridinethione 1 with methyl iodide gave the S-methyl derivative 4 which was reacted with hydrazine hydrate to give the product 5 in a good yield [18,19]. The IR spectrum of 5 showed the presence of absorption peak at 3412-3323cm^{-1} for two NH$_2$ and 3280-3200 cm^{-1} for NH group

respectively. The ^{1}H-NMR spectrum of compound 5 exhibited a singlet at　11.64 ppm for NH group in addition to the signals of NH$_2$ and CH$_3$ in their proper positions. Accordingly this reaction product could be formulated as [3,6-d] amino pyrazolo[2,3-c]pyridine derivative (Scheme 2).
Scheme 2

On the other hand, compound 1 was reacted with hydrazine hydrate in ethanolic solution to afford the pyridotriazine derivative 6. The structure of compound 6 was established based on its elemental analysis and spectral data. The mass spectrum of compound 6 showed the molecular ion peak at m/z = 216 (M$^+$).The IR spectrum agreed well with the proposed structure. Also acetylation of the pyridine thione 1 with acetic anhydride afforded the acetyl derivative 7. The structure of compound 7 was

confirmed by its correct elemental analysis and spectral data. The IR spectrum of compound 7 exhibited the disappearance of the absorption band due to the NH$_2$ functional group at 3450-3300cm^{-1} and appearance of NH group at 3346-3181cm^{-1} and CO acetyl at 1717cm^{-1}. The ^{1}H-NMR of 7 revealed 2.50ppm (s, 3H,CH3),　3.73ppm (s, 3H,COCH3), 12.78ppm (br, 1H). Also, the mass spectrum of compound 7 was compatible with the molecular formula C$_{10}$H$_8$N$_4$OS at m/z = 232 (M$^+$) (Scheme 3).
Scheme 3

Also, the reaction of compound 1 with acrylonitile afforded the N-ethylcyano derivative 8. The ^{1}H-NMR spectrum of compound 8 revealed the structure of this compound. The mass spectrum of compound 8 is compatible with the molecular ion peak at m/z = 274 (M$^+$) corresponding to the molecular formula $C_{11}H_9N_5S$.

Furthermore, compound 8 was reacted with aryl cinnamonitrile derivatives 9a-d to afford product of condensation which was formulated as structure 10a,d with the elimination of hydrogen cyanide .Structure 10a-d was established based on ^{1}H-NMR that revealed the presence of ethyl function in the reaction product (Scheme 4).

9,10 Ar , a = Ph
          Ar , b = 4-OMPh
          Ar , c = 4-ClPh
          Ar , d = 3-pyridine
Scheme (4)

Similarly the pyridinethione (1) reacted with arylidine malononitrile 9a-d in boiling pyridine to afford the pyridopyridine derivatives 11a-d. The structures of compounds (11a-d) were confirmed by elemental analysis and spectroscopic data. The IR spectrum of compound 11a showed the presence of absorption peaks at 3319cm^{-1} for νNH$_2$, 1630cm^{-1} for νC=N and 1210cm^{-1} for νC=S functional groups. The ^{1}H-NMR spectrum of 11a exhibited signals at 3.44 ppm for NH$_2$ group in addition to the aromatic

protons. Also the mass spectrum of compound 11b showed a molecular ion peak at m/z = 347 (M$^+$) corresponding to the molecular formula $C_{18}H_{13}N_5OS$.In a similar manner, the reaction of 1 with malononitrile and formaldehyde, and/or acetaldehyde yielded the corresponding 2-thioxopyridopyridine derivatives 12a,b respectively. The structure of compounds 11and 12 were confirmed by elemental analysis and spectroscopic data (Scheme 5).

12, a, R = H
         b, R = Me

11, a, Ar = Ph
         b, Ar = 4-OMPh
         c, Ar = 4-ClPh
         d, Ar = 3-pyridine
Scheme 5

The thienopyridine derivative 13 was readily obtained via the reaction of compound 1 with elemental sulphur. Subsequent treatment of compound 13 with acrylonitrile resulted only in cyanotheylation product 14. Compounds 13 and 14 were confirmed by elemental analysis and spectroscopic data. (Scheme 6).
Scheme 6

3. Experimental

Melting points were taken with the help of stuart apparatus and were uncorrected.The IR spectra were produced with a Jasco FT/IR 5300 spectrophotometer using the KBr technique.^{1}H–NMR spectra were measured using a Jeol FX-100 spectrometer 60 MHz and a Varian Gemini 200 instrument 200 MHz and 250 & 300 MHz with TMS as an internal reference. Mass spectra were obtained by using of a Schimadzu-GC MS-QP 1000 EX instrument using the direct inlet system Microanalyses were performed by the microanalytical unit at Cairo University. All compounds gave satisfactory elemental analyses.

Synthesis of 6-Amino-4-methyl-6-thioxo - 1,2 - dihyropyridine -3,5-dicarbonitrile (1).
It was prepared according to the literature. The mass spectrum of (1) exhibited a molecular ion peak at m/z (160, 100%). ^{1}HNMR spectrum of (1) exhibited signals at 1.21 (3H, s,3H,CH3) 3.34 (2H,s,2H,NH2), 12.76 (br,1H,cyclic NH).

Synthesis of 3,6-Diamino-4-methylthieno [2,3-b] pyridine-2,5-dicarbonitrile (3a).
A mixture of (1) (0.01 mol) and chloroacetonitrile (0.01 mol) in 15ml of pyridine was refluxed for 5h, after cooling the obtained product it was recrystallized from DMF to give (3a). MS of (3a). $C_{10}H_7N_5S$, exhibited a molecular ion peak at m/z 229 (M^+, 100%). ^{1}H-NMR spectrum of (3a) exhibited signals at 2.50 (3H, s,3H,CH3), 3.33 (2H, s2H,NH2), 4.29 (2H, s,2H,NH2).

Synthesis of 3,6-Diamino-5-cyano-2-ethoxy carbonyl-4-methyl thieno[2,3-b] pyridine(3b).
A mixture of (1) (0.01 mol), ethylbromoacetate (0.01 mol) in 15 ml of pyridine was refluxed for 5h. The reaction mixture was then cooled and the obtained product was recrystallized from ethanol to give (3b). ^{1}HNMR spectrum of (3b) exhibited signals at 1.21 (t,CH,CH2CH3), 4.15 (q,2H,CH2,CH3), 3.32 (s,3H,CH3).

Synthesis of 2-Amino-4-methyl-6-thioxomethyl pyridine-3, 5-dicarbonitrile (4).
A mixture of 1 (0.01 mol) andmethyl iodide (0.01 mol) in 20 ml of dry acetone in the presence of anhydrous potassium carbonate (0.5g) was refluxed for 4h. The reaction mixture was then cooled poured into a beaker containing crushed ice (50 gm). The obtained product was recrystallized from ethanol to give (4). MS of (4) $C_9H_8N_4S$ exhibited a molecular ion peak at m/z (204, 100%). ^{1}HNMR spectrum of (4) exhibited signals at 2.56 (s,3H,CH3), 3.61 (s,3H, S-CH3), 3.74 (s2H, NH2).

Synthesis of 3,6-Diamino-4-methyl-1H-pyrazol [3,4-b] pyridine-5-carbonitrile (5).
A mixture of (4) (0.01 mol) with and hydrazine hydrate (0.01mol) was refluxed for 4h. The obtained product was recrystallized from ethanol to give (5). MS of (5) $C_8H_8N_6$ exhibited a molecular ion peak at m/z (188, 100%). ^{1}H-NMR spectrum of (5) exhibited signals at 2.73 (s, 3H,CH3), 5.19 (s,2H,NH2), 6.54 (s, 2H,NH2) ,11. 64 (s,1H,NH

cyclic).

Synthesis of 4-Amino-5-methyl-7-thioxo-7,8-dihydropyrido [2,3-d] [1,2,4] triazine-6-carbonitrile (6).

A mixture of (1) (0.01 mol) and hydrazine hydrate (0.01 mol), in ethanol (20 ml) was refluxed for 4h.The reaction mixture was then cooled and the obtained product was recrystallized from ethanol to give (6). MS of (6) $C_8H_6N_6S$ exhibited a molecular ion peak at m/z 218 (M^{-2}], 25, 9%). ^{1}H-NMR spectrum of (6) exhibited signals at 2.74 (s, 3H, CH3), 3.33 (s, 2H, NH2), 12.80 (s, 1H, NH cyclic).

Synthesis of N-(3, 5-Dicyano-4-methyl-6-thioxo-1, 6-dihydro- Pyridine -2-yl) acetamide (7).

A mixture of **1** (0.01 mol) and acetic anhydride (0.01 mol) was heated on a steam bath for 4hr. the reaction mixture was then cooled and the obtained product was recrystallized from DMF to give(**7**).MS of (**7**)$C_{10}H_8N_4OS$ exhibited a molecular ion peak at m/z 232 (M^+, 26%). ^{1}H-NMR spectrum of(**7**)exhibited signals at 2.50 (s,3H,CH3), 3.73 (s,3H,COCH3), 12.78 (br,1 H,cyclic NH).

Synthesis of 6-Amino-1-(2-cyanoethyl)-4-methyl-2-thioxo-1,2-dihydropyridine-3,5-dicarbonitrile (8).

A mixture of (1) (0.01 mol), and acrylonitrile (0.01 mol) in pyridine (15 ml) was refluxed for 4h. The reaction mixture was then cooled,poured into ice-HCl mixture and the obtained product was recrystallized from ethanol to give (8). MS of (8) $C_{11}H_9N_5S$ exhibited a molecular ion peak at m/z (243, 24.7%). ^{1}H-NMR spectrum exhibited signals at δ2.52 (s,3H,CH3) 2.99 (q,2H-NCH2), 3.48 (q,2H,CH2CN), 3.41 (s,2H,NH2).

Synthesis of 5-Amino-7-aryl-1-(2-cyanoethyl)-4-methyl-2-thioxo-1,2-dihydro[1,8] nphthydrine-3,6-dicrabonitrile (10a-d).

A mixture of (8), (0.01 mol) and derivatives of malonitrile namely benzylidene malono nitrile,4-methoxy benzylidene and 4-chloro benzylidene (9a-d) (0.01 mol) in pyridine (20 ml) was refluxed for 8h. The reaction mixture was then cooled poured into container of crushed ice (50 gm), neutralized with dil. HCl (5 ml) and the obtained products were recrystallized from ethanol to give (10a-d). MS of (10a) $C_{20}H_{14}N_6S$ exhibited a molecular ion peak at m/z 370 (M^+, 19.5%).^{1}H-NMR spectrum of (10b) exhibited signals at 2.43 (s,3H,CH3), 2.99 (t,2H,CH2-N), 3.44 (t,2H,CH2CN), 3.34 (s,2H,NH2).^{1}H-NMR spectrum of (10d) exhibited signals at 2.51 (s,3H,CH3), 3.01 (t,2H,N-CH2), 3.47 (t,2H,CH2CN), 3.28 (s,2H,NH2).

Synthesis of 5-Amino-7-aryl - 4 -methyl-2- thioxo-1, 2-dihydro - [1,8] naphthylridine -3 , 6-dicarbonitriles (11a-d).

A mixture of 1 (0.01 mol), substituted arylidene derivatives of malononitrile (0.01 mol) in pyridine (20 ml) was refluxed 10h. The reaction mixture was then cooled poured into ccontainer of crushed ice, neutralized with dil. HCl (5 ml) and the obtained product was recrystallized from ethanol to give 11a-d. MS of 11a $C_{17}H_{11}N_5S$ exhibited as molecular ion peak at m/z (317, 100%). ^{1}HNMR spectrum of 11b exhibited signals at 1.07 (3H, s), 2.11 (3H, s), 3.44(2H, s,) 7,19-8.03 (4H, m) 12.41 (1H, s), ^{1}H-NMR spectrum of 11c exhibited signals at 1.21 (3H, t), 2.90 (2H, q), 3.36 (2H, s), 7.37- 7.67 (4H, m), 11.05 (1H, s).

Synthesis of 5-Amino -4- methyl -2- thioxo-1,2-dihydro - 1,8 , naphthopyridine 3,6 - dicarbonitriles (12a,b) .

A mixture of 1 (0.01 mol), aliphatic aldehydes namely acetaldehyde and formaldehyde (0.01 mol) in 20 ml of alcohol in the presence of TEA was refluxed for 10h. The reaction mixture was then cooled and the obtained product was recrystallized from ethanol to give 12a,b. MS of 12b $C_{12}H_9N_5S$ exhibited a molecular ion peak at m/z = 253 (M^+, 7%), ^{1}H-NMR spectrum of 12a exhibited signals at 2.74 (3H,s), 4.69 (2H, s), 7.96 (1H, s), 8.68 (5H, s), 12.31 (1H, s). ^{1}H-NMR spectrum of 12b exhibited 2.74 (3H, s), 2.90 (3H,s), 3.34(2H,s), 7.94(SH, s), 12.05 (1H, br).

Synthesis of 3,6 –Diamino -4- thioxo -4,5-dihydrothieno [3,4-c] pyridine-7-carbonitrile (13)

A mixture of 1 (0.01 mol), and sulphur (0.01 mol) in 20 ml of alcohol/TEA was refluxed for 4h. The reaction mixture was then cooled and the obtained product was recrystallized from ethanol to give 13. MS of 13 $C_8H_6N_4S_2$ exhibited a molecular ion peak at m/z 220 (M^+, 2.9%).

Synthesis of 3,6 –Diamino -5- (2-cyanoethyl) -4-thioxo -4,5- dihyro – thieno [3,4-c] pyridine-7 carbonitrile (14)

A mixture of 13 (0.01 mol) and acrylonitrile (0.01mol), in 15 ml of pyridine was refluxed for 5h. The reaction mixture was then cooled and the obtained product was recrystallized from DMF to give 14. MS of 14 $C_{11}H_9N_5S_2$ exhibited a molecular ion peak at m/z 275 (M^+, 11%). ^{1}H-NMR spectrum exhibited signals at δ 2.98 (2H, q), 3.48 (2H, q), 3.01 (4H, br), 7.86 (1H, s), 7.97 (5H, br).

Table (1) IR spectra of synthesized compounds

Compd. No.	υ_{max} (cm^{-1})
1	3485(NH$_2$), 3283(NH), 2989 (CH–arom.), 2924(CH aliph.), 2214(C≡N), 1639 (C=C), 1269 (C=S).

Antimicrobial Activity

The newly synthesized compounds were screened for their antibacterial activity against two species of Gram positive bacteria, namely Bacillus subtilis and *Staphylococcus aureus* and two species of Gram-negative bacteria *Escherichia coli* and *Pseudomonas aeruginos* (Table 3). (In nutrient agar broth) and antifungal activity (in Dox's medium and saboured's agar) by the agar diffusion method [20,21] at a concentration 20 mg/ml using DMSO as solvent and blank. The compounds were tested also for their activities against antifungal such as *Candida alicans* and *Candida parapsilosis* (Table 4).

The antimicrobial screening results were measured by the average diameter of the inhibition zones, expressed in mm.

As shown in the results, all tested compounds displayed significant activities against bacteria, while compounds 1 and 13 were very active against all the tested organisms among all the tested compounds.

Table (3): Antibacterial activity of synthesized compounds

The present investigation deals with the preparation of thienopyridine derivatives, these compounds are at least as effective as asprine in preventing vascular events in patients at high risk, and possibly somewhat more[22,23].

One of the major classes of adenosine diphosphate (ADP) receptor antagonists are thienopyridines. Thienopyridines composes a subcategory of antiplatelet medication, known as receptor inhibitors, used commonly for the treatment of atherosclerotic cardiovascular disease[24].

The thienopyridines derivatives play an important role in antibacterial and anticancer chemotherapy. As shown in the results (Table 5) most of compounds displayed activity as antitumors[25].

Diagnosis of Nutrient Status in Balady Mandarin Orchards of a Newly Reclaimed Area in Egypt

Khalifa, R. Kh. M.; El-Fouly, M.M.; S.H.A. Shaaban[*] and H.A. Hamouda

Department of Fertilization Technology, National Research Centre
[*]shashaaban@yahoo.com

Abstract: The present work aimed to determine the nutritional status of Balady mandarin orchards, through soil testing and leaf analysis, in order to work out a proper fertilization programs. A field study was conducted at El-Tall El-Kepeer, Ismailia governorate, covering 19 Balady mandarin orchards grown on sandy soils under drip irrigation. These soils are of poor fertility. However, fertilization of these orchards still depends upon the grower's inherited knowledge and in very small scale on the extension information. The trees were fifteen years old. The orchard soils had very high pH values, low to high level of EC and Na, and were low in total $CaCO_3$ and very low in O.M. The values for available nutrients in soil were found to be as very low of P, Fe, Mn, Zn and Cu. Values of K, Mg ranged between very low to medium levels, However values of Ca ranged between medium to high levels. The leaf macronutrient values were low in N, ranged between optimum to high in P and Mg, ranged between low to high in K, However values of Ca was ranged between low and optimum. The leaf micronutrient contents were as follow, Fe ranged from optimum to high; Mn, Zn and Cu were ranged from low to the beginning of optimum levels. The nutrient correlations of the leaves revealed some antagonisms between K and Ca, Mg and both of Mn and Zn. Also, the nutrient correlations of the leaves and fruits revealed some antagonisms between N in leaves and Zn in fruits, P and K in leaves and Mn in fruits, K in leaves and N, Cu in fruits, Ca in leaves and K in fruits.

Introduction:

In the past, research has been mainly focused on relatively small orchards in clay soil in Nile Delta which was highest in nutrient supply. During the recent years, the programs of agricultural development in Egypt aim to increase the cultivated areas in sandy soil. Soils in El-Tall El-Kepeer area, Ismailia Governorate are highly sand, which contains about 90% to more than 95% sand. Citrus production comprises the largest fruit sector in Egypt. Egypt has a great potential for citrus production when its ecological and other characteristics were considered. According to, Static's of Agricultural Production Requirements (2007). Production of Egypt citrus is 3.181.000 t coming from 2,109,000 t of orange, 732,000 t mandarins, 297, 000 t lemon and 43,000 t grapefruit, Besides that, there are about 42.000 ha are in the beginning of production. However, about 30% of citrus orchards in Egypt became located on poor soils and newly reclaimed areas. Poor soil fertility and poor fertilization strategies are largely a result of insufficient information on the soil fertility and plant nutritional status of crops in these areas.

One of the major deficiencies in most of the sandy citrus soils of Egypt is an acute shortage of organic matter and is commonly low in both macro and micronutrients, which can limit tree function. In addition micronutrients deficiency occurs in trees growing in such alkaline soils (Amberger, 1982, El-Fouly and Fawzi, 1982 and El-Fouly et al. 1986).

Balady mandarin is extensively grown in these sandy soils which their inherited fertility is low and pH values in the range of 8.0 to 9.0, and proper nutrients management is required to grow mandarin successfully on such soils. In the past, research has been mainly focused on macronutrients such as N and P.

Mandarin trees do much better to their nutritional status through good nutrition and controlled nutrient supply during different seasons can produce higher yield. Average recommendation will result in high yielding or large trees in the grove receiving relatively less fertilizer than they require, and low yielding or small size tree areas receiving relatively more fertilizer than necessary (Schumann et al., 2003; Zaman et al., 2005). Local over fertilization may decrease ground water quality, reduce profit margins, induce deficiency of other elements and interfere with metabolic processes. Under unsuitable fertilization, may restrict citrus yield and quality and variable rate of application avoids these problems but requires knowledge of the scale of variability of soil and tree characteristics within each field (Mulla and Bhatti, 1997).

Soil and leaf analysis can be used to evaluate the nutritional status of the trees and nutrient availability

in the soil to supply the trees with nutrients requirement (El-Fouly, 1985, Embleton *et al*., 1996). It is necessary to have information on nutrients removal for each variety grown in the region to determine proper fertilization management strategies, and make adjustments on their fertilization programs accordingly. The objective of this study was; therefore, to diagnosis nutrient status in Balady mandarin trees grown in sandy soils, to be used as a tool to optimize fertilizers use and helps in formulating the fertilization programs.

2. Materials and Methods
Field practices

The study was conducted in Baladi mandarin of fifteen years old, grafted on folk mariana rootstock and established on sand soil, located in El-Tall El-Keeper, Ismailia governorate, Egypt as a newly reclaimed area, during two successive years (2008-2009). Extensive survey was conducted covering as many as 19 orchards represent area of 20000 ha. The trees were under drip irrigation system and were uniform in growth. The trees were subjected to the same management treatments. The trees were cultivated at 4 x 4 m distance (620 tree/ha[-1]). The common fertilizer applications were used as following: 48 m^3/ ha of farmyard manure during January. NPK rates were 310 kg N ha[-1], as ammonium nitrate (33.5% N), 66 kg P_2O_5 ha[-1], as superphosphate (15.5% P_2O_5) and phosphoric acid (60% P_2O_5) and 215 kg K_2O ha[-1]. as potassium sulfate (48-52% K_2O) kg ha[-1] year) were applied as fertigation and distributed along the growing season. Foliar sprays of Mg nitrate were applied to the spring flush leaves.

The study were done on orchards considered to be low yielding (<22,000 kg/ha).

Soil sampling

Soil samples were randomly collected from the zone of the root tips of the trees under the end of canopy in November. Depth of the soil sampling was 0-60cm. The samples were air dried, ground to pass through a 2 mm sieve using a wooden grinding and stored in plastic bottles prior to the physical and chemical analysis.

Leaf sampling

The leaf samples were collected randomly around the tree from the fully mature leaves of spring flush. 4 to 7– month–old young shoots. Samples were washed with tap water, 0.001 N HCL and distilled water, respectively, then dried at 70°C and ground in a stainless steel mill, then passed through a 40 mesh nylon sieve and stored in plastic bottles.

Fruit sampling

The mineral analysis was done in the total fruit including the peel, pulp, and the juice to estimate the total mineral nutrient contents in the harvested fruits.

Chemical analysis

Soil samples were analyzed for texture, pH and electrical conductivity (EC) using water extract (1:2.5) method, for total calcium carbonate ($CaCO_3$%): calcimeter method and for organic matter (O.M%) using potassium dichromate (Chapman and Pratt, 1978). Phosphorus was extracted using sodium bicarbonate (Olsen *et al*., 1954). Potassium (K), calcium (Ca) and Magnesium (Mg) and sodium (Na) were extracted using ammonium acetate (Jackson, 1973). Iron (Fe), Manganese (Mn), Zinc (Zn) and Copper (Cu) were extracted using DPTA (Lindsay and Norvell, 1978).

Plant material was digested using an acid mixture consisting of nitric, perchloric and sulfuric acids in the ratio of 8:1:1 (v/v), respectively (Chapman and Pratt, 1978). Nitrogen (N) was determined in the dry plant material using the boric acid modification described by Ma and Zuazage (1942), and distillation was done using a Buechi 320-N$_2$-distillation unit. Phosphorus was photometrically determined using the molybdate vanadate method according to Jackson (1973).

Potassium, calcium and sodium were determined using flame photometer (Genway). Mg, Fe, Mn, Zn and Cu were determined using the Atomic absorption spectrophotometer (Perkin Elemer 1100 B). The soil data were evaluated using the criteria published by Ankerman and Large (1974), Lindsay and Norvell (1978) and Peryea (2000), whereas the leaf analysis data were evaluated according to the criteria reported by (Jones *et al.*, 1991) in Plant Analysis Handbook. Data were subjected to statistical analyzed using Costate Statistical package, in order to calculate means, standard deviations (SD) and the possible correlations (r) (Anonymous, 1989).

3. Results and Discussion:
Soil properties and its nutrients status:

From Table 1. it can be noticed that soil texture is sandy, It's known that coarse-textured soils lack both nutrient and water holding capacities. Also, soil pH had high value, the range was between 8.30-9.10 and the average was 8.80$\pm$0.18. Under such high alkaline conditions, availability of some nutrients is expected to be low. The average of electric conductivity (EC) was in the medium level (0.30$\pm$0.18); however the range was between low and very high levels (0.14-0.76). The soil found to be low in $CaCO_3$; contained lower than 2% $CaCO_3$ which is expected to haven't effect on the nutrient availability

(Ankerman and Large, 1974). The soil of the orchards was very poor in organic matter content, the range was between 0.13-0.27 and the average was 0.20±0.03%. Soil organic matter is used as an indicator of soil fertility. It is well known that soil organic matter had a strong positive relationship with total N content in soil, thus it is also, expected to be low.

Table (1): Range, Mean±SD of physical-chemical characteristics of the soil

Character	Range	Mean±SD	Available nutrient content	Range	Mean±SD	Evaluation
Sand %	88 - 91	90±1	Macronutrients, (mg/100g)			
Silt %	02 - 04	03±1	P	00.22 - 00.55	00.40± 00.10	Very low
Clay %	05 - 09	07±2	K	11.50 - 38.00	25.00±12.59	Medium
Texture	Sandy		Mg	22.00 - 62.00	41.20±12.49	Medium
pH(1:2.5)	8.30 - 9.10	8.80±0.18	Ca	105.00 - 320.00	233± 52.05	High
E.C dS/m	0.14 - 0.76	0.30±0.18	Na	08.00 - 38.00	15.45 ± 06.75	Very low
$CaCO_3$ %	0.80 - 2.00	1.44±0.30	Micronutrients, (mg/Kg)			
O.M %	0.13 - 0.27	0.20±0.03	Fe	01.60 - 04.10	2.65± 0.73	Very low
			Mn	00.30 - 01.50	0.84± 0.34	Very low
			Zn	00.20 - 00.70	0.44± 0.19	Very low
			Cu	00.10 - 00.60	0.29± 0.12	Very low

Table 1. contains also, the range and the average values of the major nutrient availability in the soil samples, available P-content was ranged between 0.22-0.55 and the mean was 0.40±0.10 mg/100g soil. According to data mentioned by Ankerman and Large, 1974 in Table 2, P is considered very low where under the conditions of such soil (high pH), the availability of P is expected to be reduced, and plants might suffer from P- deficiency. The average of available potassium levels seem to be medium, (25.00±12.59), however the range was between very low and high levels (11.50-38.00) mg/100g soil. Therefore, potassium fertilizers must be added to compensate the K shortage in the deficient soil. The mean extractable Ca was high (233±52.05) mg/100g soil, however the range was between medium to high (105-320) mg/100 g soil. The mean extractable Mg was medium (41.20±12.49) however the range was between low to medium (22-62) mg/100g soil.

Table (2): Tentative rating values of soil fertility status

Element	Rating				
	Very low	Low	Medium	High	Very high
$CaCO_3$%	<0.5	0.5 -2	2.1-8	8.1-30	31-45
Organic matter (O.M),%	<1.0	1-2	2.1-3	3.1-5	>5.0
Electric conductivity (E.C.) dS/m	<0.1	0.1-0.2	0.3-0.4	0.5-0.7	>0.7
pH	<5.8	5.9-6.6	6.7-7.2	7.3-8.5	>8.5
Macronutrients (mg/100g)					
Phosphorus (P)	<00.5	0.5-1.1	1.2-2.7	2.8-4	>4
Potassium (K)	<11.7	11.8-20	21-30	31-47	>47
Calcium (Ca)	-	<100	100-200	>200	-
Magnesium (Mg)	<11	11-29	30-180	>180	-
Sodium (Na)	<20	20-25	26-30	>30	-
Micronutrients (ppm)					
Iron (Fe)	<5	5-10	11-16	17-25	>25

Zinc (Zn)	<0.5	0.5-1.5	1.6-3	3.1-6	> 6
Copper (Cu)	<0.3	0.3-0.8	0.9-1.2	1.3-2.5	>2.5

Source: Ankerman and Large (1974), Lindsay and Norvell (1978), Peryea (2000)

As it's known in most sandy soils, which contain inadequate levels of available micronutrients and according to data in Table 2, mentioned by Ankerman and Large, 1974, the extractable Fe, Mn, Zn and Cu

levels of the present soil samples are in the very low levels.

Nutrient concentrations in leaves:

It is well known that mandarin trees are very sensitive of nutrient deficiencies in the soil. Data of ranges and mean of nutrient leaves content in Table 3 and according to critical values mentioned by Jones *et al*. (1991), Reuter and Robinson (1986, 1997) in Table 4. Nitrogen concentration in the leaves ranged between 1.51-2.99 and the mean was 2.16+0.366%, on dry matter basis, which tends to be low. This may be due to high leaching of ammonium nitrate in such soil with 90% sand. It is recommended to add nitrogen as ammonium sulphate, which is less leaching and more efficient at sandy and high pH conditions. In this respect, Johnston (2004) reported that when ammonium sulphate is applied one pH unit can be decreased and this pH change is important for P availability supply and may be also for micronutrient availability supply. P-concentrations in the mature leaves ranged between 0.16-0.32%, and the mean is 0.23+0.044, which is ranged between sufficient and high levels and with sufficient mean. Potassium concentrations in the leaves ranged between low and high levels (0.65-1.39%), and the mean is sufficient (1.06+0.189). Magnesium concentrations in the mandarin leaves ranged between sufficient to high (0.56-0.73%), and the mean is 0.65+0.048 which, is in high level, while, Mengel and Kirkby, 1987, mentioned that Mg uptake by plants can be restricted by the high levels of Ca in the root medium, which might led to Mg deficiency in plants, in spite of its high levels in the soil. The high level of Mg in leaves may be resulted from the magnesium foliar application.

In spite of high levels of Ca in the root medium, calcium concentrations in the leaves ranged between low to sufficient (1.20-3.30%), and the mean is (2.42+0.49) which, is in low level, that is may be because the movement of calcium in the soil is slowly.

Fe concentrations can be higher than, equal to, those in normal trees. Fe-concentrations were ranged from sufficient to high (99.0-375.0 ppm) and the mean is sufficient (185.0+79). Concentrations of Mn were ranged between low and sufficient (21.5-56.0 ppm) and the mean is (28+8.6) which is at the beginning of the sufficient levels. In this respect Bergman (1972) mentioned that the nutrient element contents should lie as far as possible in the middle or even better in the upper half of the satisfactory or optimal range. As a result of factors described above most Zn concentrations in this study were low in most cases, where Zn concentration was ranged between low and beginning of the sufficient level, (13.0-39.0 ppm) and the mean is low level (18.0+6).

Zinc deficiency is widespread in citrus trees in Egypt (El-Fouly, 1985). Marshner, 1993, mentioned that in soils with very high pH and very low in organic matter, availability of Zn to plant roots is extremely low. In addition, Boaretto *et al*., 2002; Sanchez and Righetti, 2002, found that when severe Zn deficiency symptoms appear, early spring foliar sprays could increase the micronutrient concentration in the targeted organs. Also, it could stimulate vegetative growth (Swietlik, 2002). Similar results were also, found by Shaaban and El-Fouly, 2005. In this study, Cu-concentration was found to be less than the adequate range in most samples, which ranged from low to sufficient level (2.0-15.0 ppm), with mean at the beginning of sufficient level (5.5+3.2 ppm). It is well known in sandy soil that Cu-availability and consequently its concentration in leaves of grown plant are expected to be low. Deficiencies of Cu can reduce Zn uptake through root injury. It could be concluded that nutrient concentration in Balady mandarin leaves is greatly affected by soil characteristics as well as farm management, thus soil and plant analysis, crop requirement should be considered when preparing a fertilizer recommendations.

Table (3): Range, mean+SD of leaf nutrient contents.

Element content	Range	Mean+SD	Evaluation	Element content	Range	Mean+SD	Evaluation
Macronutrients, (%)				Micronutrients, (ppm)			
N	1.51 - 2.99	2.16+0.366	Low	Fe	99.0 - 375.0	185.0+79	Sufficient
P	0.16 - 0.32	0.23+0.044	Sufficient	Mn	21.5 - 56.0	28+8.6	Sufficient
K	0.65 - 1.39	1.06+0.189	Sufficient	Zn	13.0 - 39.0	18.0+6	Low
Mg	0.56 - 0.73	0.65+0.048	High	Cu	2.0 - 15.0	5.5+3.2	Sufficient
Ca	1.20 - 3.30	2.42+0.491	Low				
Na	0.09 - 0.15	0.12+0.018	Sufficient				

Table (4): Values level of leaf nutrients content of Balady mandarin trees

Nutrient	Low	Sufficient	High
		%	
N	<3.00	3.00 – 3.40	>3.40
P	0.11 – 0.14	0.15 – 0.25	>0.25
K	0.47 – 0.89	0.90 – 1.10	>1.10
Mg	<0.30	0.30-0.60	>0.60
Ca	<3	3 - 6	>6
		ppm	
Fe	<60	60-150	>150
Mn	<25	25-200	>200
Zn	<25	25-100	>100
Cu	<5	5-15	>15

Source: Jones *et al.* (1991), Reuter and Robinson (1986, 1997)

Frequency distribution (%):

Table 5 showed frequency distribution (%) of soil nutrients, as well as the leaf concentrations of these nutrients. The data showed that 100% of the soil samples contained low N, P, Fe, Mn, Zn and Cu whereas 53% contained low K and Mg, 5% contained low Ca, while, 95%, 47%, 47% of Ca, K, Mg respectively, had optimum level. Leaf samples analysis showed that 89% of N and Ca, 84% of Zn, 53% of Cu, 37% of Mn and 10% of K from leave samples had low levels, while 89% of P, 84% of Mg, 74% of K and Fe, 63% of Mn, 47% of Cu from leave samples had optimum levels. In addition, 11%, 16%, 16%, 26% of leave samples showed high level of P, K, Mg and Fe, respectively. Therefore, we can, conclude that Balady mandarin trees have the ability to accumulate nutrients in higher concentrations in their leaves relative to their soils

Table (5): Frequency distribution (%) of available nutrient through analysis of soil fertility and leaf nutrient composition

Nutrient	Soil fertility constraints			Leaf nutrient constraints		
	Low	Optimum	High	Low	Optimum	High
N	100	-	-	89	11	-
P	100	-	-	-	89	11
K	53	47	-	10	74	16
Ca	5	95	-	89	11	-
Mg	53	47	-	-	84	16
Fe	100	-	-	-	74	26
Mn	100	-	-	37	63	-
Zn	100	-	-	84	16	--
Cu	100	-	-	53	47	-

.

As for correlation between leaf nutrient contents of the mandarin trees, data of Table 6., showed that there is a significant positive correlation between content of P and both of Fe, Mn, Zn and between Fe and Cu and between Mn and Cu. As well as highly significant positive correlation were found between Fe and both Mn and Zn and between Mn and Zn. On the other hand, significant negative correlation was found between Mg and Mn and highly significant negative correlation was recorded between K and Ca and between Mg and Zn. Table 6, pointed out to the importance of the balance fertilization.

Table 6. Correlation coefficient between leaf nutrient contents of the mandarin

Nutrient	P%	K%	Ca%	Mg%	Na%	Fe ppm	Mn ppm	Zn ppm	Cu ppm
N%	0.397	-0.062	0.207	0.102	0.008	0.358	0.163	0.103	0.283
P%		0.187	-0.154	-0.216	0.317	0.558*	0.490*	0.549*	0.265
K%			-0.616**	0.158	0.095	0.092	0.073	0.066	-0.055

Nutrient concentrations and removal by fruits:

Tables 7 and 8 showed that Balady mandarin fruit removed the largest amount of potassium (K), followed by Calcium (Ca), nitrogen (N) phosphorus (P) and magnesium (Mg), respectively. Where a ton of fruit removed 2.06, 1.43, 1.33, 0.41 and 0.35 kg of K_2O, CaO, N, P_2O_5 and MgO, respectively. Also, Balady mandarin fruit removed the largest amount of iron (Fe), followed by manganese (Mn), zinc (Zn) and copper (Cu), respectively. Results suggest it reasonable to expect that potassium was the highest nutrient removed by Balady mandarin fruit.

Beside the nutrient removal, the behavior of each nutrient and soil properties must be take in consideration at preparing fertilization program. Fertilizing based solely on nutrient removal could lead to deficiencies or overuse of some nutrients. Leaching and denitrification of fertilizer nitrates may result in as much as 50% fertilizer nitrogen lost. Some nitrogen may be supplied from organic matter in the soil, but this amount is usually small in sandy soils. Yield nutrients removal is not a good indicator of phosphorus needs. Suitable- soil fertilized has an abundant reserve of soil phosphorus which is available to trees. Since phosphorus does not leach, it can build up to high levels in suitable-fertilized trees. Fertilization based on yield nutrients removal is better for potassium fertilization than the other nutrient. In sandy soils, potassium is not enough for high-yielding fruits. If fruits removal of potassium is greater than fertilizer applied, deficiencies can be occurring. It is worthy to mention that applying potassium as foliar spray on citrus trees gives better growth, high fruit-set and yield, (Ibrahiem *et al*., 1993). On the other hand, the uptake of some nutrients is dependent on their ratio in soil solution, for example much K reduces Mg availability in soil solution (Laegreid e*t al*.,1999). Calcium and magnesium must be considered because of the special needs for high fruit quality. The availability of iron, manganese, zinc and copper is little to do with yield removal.

Table 7. Range, mean+SD of fruit nutrient contents.

Nutrient content	Range	Mean+SD	Nutrient content	Range	Mean+SD
Macronutrients, (%)			Micronutrients, (ppm)		
N	0.47 - 1.27	0.75+0.16	Fe	11 - 87	39+25
P	0.02 - 0.26	0.08+0.06	Mn	4 - 9.5	7.2+1.4
K	0.48 - 1.34	0.98+0.21	Zn	4 - 9.0	6.1+1.4
Mg	0.10 - 0.15	0.12+0.02	Cu	0.5 - 2.5	1.2+ 0.5
Ca	0.35 - 0.85	0.58+0.13			
Na	0.02 - 0.04	0.03+0.01			

Table 8. Nutrients removed by fruits

Macronutrients removed (Kg/ton fruit)				
N	P_2O_5	K_2O	CaO	MgO
1.33	0.41	2.06	1.43	0.35
Micronutrients removed (g/ton fruit)				
Fe	Mn	Zn	Cu	
70	13	11	2	

As shown in Table 9, a positive significant correlation was found between the content of K, Cu in both of leaves and fruits. However, highly significant negative correlation was found between the following nutrients, N in leaves and Zn in fruits and K in leaves and Mn in fruits. In addition, significant negative correlation was found between P in leaves and Mn in fruit, K in leaves and both N and Cu in fruit, Ca in leaves and K in fruits, as well as between Mg in leaves and Cu in fruits and between Cu in leaves and N in fruits. We can, therefore, conclude that when we want to improve the quality of fruits we must considering leave nutrients content.

Conclusion:
In our study we showed that there is nutrient deficiency and imbalance nutrition in Balady mandarin orchards. Nutrients concentration in mandarin leaves is greatly affected by soil characteristics. Balady mandarin trees have the ability to accumulate nutrients in higher concentrations in their leaves relative to their soils. Crop nutrient requirement should be considered when preparing a fertilizer recommendation. Leave nutrient contents and their effect on the fruit nutrients should be consider, to improving fruit quality.

Abstract: One of the most aspects of managing of agricultural machinery is control and estimating of repair and maintenance costs. So, this is necessary to introduce mathematical methods to define repair time and machine condition. It reduces repair costs and increases the chance of machine service. In this research, condition monitoring was established to introduce this mathematical model for tractors in Iran. The study was done on MF285 and MF399 as the most conventional tractors in Iran. 120 tractors were selected randomly and their repairing and maintenance costs as well as working time were recorded. The costs for usual methods and control monitoring methods were compared by F test in SPSS software. Results show that the effects of CM can reduce costs in comparison with usual method significantly (Sig=0.002). Finally by assuming cumulative working time (X) as independence and cumulative costs based on definite percent of initial price (Y) as dependence variable a mathematical model was introduced. Powered regression introduced this model as $Y=0.0028\ X^{0.981}$ which can used to estimate repairing and maintenance costs for selected tractors.

1.   INTRODUCTION

With regard to the importance of technical and economical management in agriculture sector and control costs in the production fields, our knowledge about the present situation in different parts of these sections plays a major role. Using of agricultural machinery is of the most important parts in this section and investment in this field causes the highest cost of production processes (Ward, Nulty & Cunney, 1985). Therefore machinery management including control of the amount of expenditures related to maintenance and repair machinery is one of the most important parameter that a manager must make do with it.

Today, tractor is one of the most important power sources in agriculture. Effect of tractor power on agriculture is considerable (Rotz, 1987). Good machinery management yields 25% less machinery repair cost .poor machinery management yields 25% greater repair costs. (Singh, 2006). Machinery costs fit into two broad categories:

Fixed costs - Those costs associated with how long a machine is owned, rather than how much it is used.

Fixed costs represent more than one-half of the total cost of owning a piece of machinery.

Operating costs - Those costs associated with the amount of machine use (Rotz & Bowers, 1991). Precise information and close to the reality about the time and the type of ravages for agricultural machines plays an important role in programming to do preventive repairs and increases the reliability of machines and implements. There are three types of maintenance tasks: breakdown, corrective and preventive. The principal difference in these occurs at the point when the repair or maintenance task is implemented. In BM[1], repairs do not occur until the machine fails to function. Preventive and corrective maintenance tasks are implemented before a problem is evident (Mobley, 2008). The difference between them is that in corrective maintenance a problem must be existing then repair it. The main activities which help programming of corrective and preventive maintenance is the CM[2] of

---

[1] breakdown maintenance
[2] condition monitoring

machine systems. It means that checking machine parameters can help to inform machine condition. It may lead to activities which reduce needed repair. Oil analysis is the main CM technique for reciprocating machinery maintenance and fault diagnosis (Lindley, Higgins, Darrin & Mobley, 2008).

In 1974, Hunt gathered the information about repair and maintenance cost for 745 agriculture machinery working in corn fields of Illinois for 8 years. He suggested a practical model based on power formula to calculate accumulated repair and maintenance cost by working hours (Hunt, 2001). In 1986, Morris studied about repair and maintenance cost for some agriculture tractors in England. The cost was calculated by type of the machines and annual working hours in his method. This manner expressed the cost using percentage of primary purchase cost (Morris, 1986). In 1999, a same studding was done by fuel in 8 area of South Africa. Repair and maintenance costs for 282 tractors were gathered and analyzed by him. At the end, a power formula as same as the previous equations was suggested. This recently advancing formula includes management and operation factors (Fuls, 1999).

Improved reliability results in lower maintenance costs. If the assets are not breaking down, a greater percentage of maintenance work can be performed in a planned and scheduled manner, which enables the workforce to be at least twice as efficient. Reducing these losses will also result in requirement of
• Fewer spare parts
• Less overtime
• Fewer contractors (Massoudi, 1994).

Oil analysis is the main CM technique for reciprocating machinery maintenance and fault diagnosis. The object of this research was to choose and to investigate the best oil for Dump Truck HD325-5, used for transportation of minerals, by OCM method (Oil condition monitoring). The results from this article have enhanced understanding on the dependent and independent roles of oil analyses in predicting which oil is more suitable for a machine in working condition (Mollazade & Ahmadi, 2008).

2.   MATERIAL AND METHOD

Reduction of repair and maintenance cost using CM method was the main goal of this research. The cost for two types of conventional tractors in Iran called MF285 and MF399 were investigated by analyzing their engines and gearboxes oil for 3 years. Lubricating oil analysis, as the name implies, is an analysis technique that determines the condition of lubricating oils used in machine. In this case viscosity, contamination, fuel dilution, solid content, fuel soot, oxidation, nitration, total acid and bases number and particle content were checked during tests. The costs were compared with costs calculated by breakdown maintenance (BM) method to determine the effect of CM method on reduction of costs. For this comparison the costs were determined by CM and BM methods using annual working hours. The tractors were classified according to their age in unit year into 15 groups from 1 to 15. Also, for per class, the mean annual repair &maintenance costs and Accumulated working hours were calculated. The information about random annual working hours and costs were gathered by using face to face questionnaire. The costs for CM and BM were compared together by F-test. With regard to this goal, SPSS15 computer software was used. By the way, the software provided a regression analysis to determine relationship existed between the costs (based on percentage of primary purchase price) and the annual working hours for each method.

The amount of fixed costs that affected by the life and the purchase price with regard to the fact that elective systems for two years with equal method has been chosen for every two methods of the amount of the weekend.

3.   RESULTS

The costs of spare parts, repairman vague, oil, filters and timeliness were investigated for BM and CM methods separately for MF285 and MF 399, respectively as shown in table 1.

Table 1. The mean annual repair and maintenance costs for MF285 and MF399 tractors

	Type of maintenance	Repayment cost ($/hr)	Oil and fuel ($/hr)	Filters ($/hr)	Total ($/hr)
MF285	BM	0.33	0.35	0.07	0.75
	CM	0.13	0.3	0.02	0.45
MF399	BM	0.35	0.39	0.15	0.89
	CM	0.13	0.36	0.10	0.59

Table 2 includes variable costs, fixed costs, incomes, benefits and benefits per costs. According to the results shown in table 3, there is a significant difference between costs in CM and BM method similar to the significant difference existed between their incomes.

Table 2. The mean annual fix and variable costs and Income for MF285and MF399

	Type of maintenance	Variable costs ($/hr)	Fix cost ($/hr)	Income of trait ($/hr)	Profit of trait ($/hr)	Profit per cost ratio
MF285	BM	3	1.5	15	10.5	2.33
	CM	2.72	1.5	17.22	13	3.08
MF399	BM	3.5	2.7	19	12.8	2.00
	CM	3	2.7	20.18	14.48	2.54

Table 3 present the obtained data from 60 sample tractors MF285 and MF399, including annual use and cost were used to calculate the accumulated working Hours and repair and maintenance cost. The presented data in these tables were used to comparison repair and maintenance costs, predicted between BM and CM and determine the repair and maintenance cost model. According to the tables 3 and 4 by using F-test deference between the amounts accumulated R&M in methods BM and CM at the level of 5 %(table 4).

ANOVA table a show that the cost of repair and maintenance cost in two methods has been mentioned in the 5% signification difference exists (Table4). With regard to the average cost in two method can be said that the amount of in method BM more than the method of CM.

To determine the relationship between accumulated costs and accumulated working hours, some mathematical formula including liner, power, exponential and logarithmic equations were used. The power formula shown in table 6 for kind of tractors in type of maintenance. Formula is available for estimating repair costs realizing that repair/maintenance cost have a variable structure as the machine ages.
$Y=aX^b$
Where X is the accumulated working hours for the tractors and Y is accumulated repair and maintenance costs.

Figure1. Rapier and maintenance cost of tractors BM and CM method in Iran

Figure2. Comparison of results with other researchers

The figure 1 shown increased of R&M cost in BM and cm method. With regard to the chart, the trend of increase cost of CM method much less than BM method. According to figure 2, repair and maintenance cost is increased with a lower gradient in the CM method than the BM methods suggested by other researchers. So, CM can reduce the repair and maintenance costs to an acceptable level. By the way, it increases the reliability of machines and decreases the timeliness costs using reduction of the breakdown times for machines.

The relations with relations which have already been achieved by the researchers compared the formula get the method of condition monitoring of the amount of increasing the costs of buildings with sloping shows less. The rate is increasing the costs of buildings in this method is very much lower than breakdown maintenance method.

Therefore it can be concluded by the use of that supervision and using the situation can take care of the cost of repairs in an acceptable level and reduced the other side regarding the number of casualties happened during research, which is very much lower than usual method is can be said that this method can be the amount of reliability machine to take higher and the expense of stopping the decrease.

4.   DISCUSSION

Using CM, reduced maintenance costs amount to very much.these results are in harmony with data have been published by Massoudi (1994).

The obtained results showed that amount of costs in two ways CM and BM were observed, the average cost in BM method, much larger than average cost in CM method is. the obtained results seem to be in accordance with the published data by Mollazade & Ahmadi (2008).

ANOVA table a show that the cost of repair and maintenance cost in two methods has been mentioned in the 5% signification difference exists (Table 5).

Trend of increasing costs in the way CM, much slower method is BM method. the obtained results deference   to be in accordance with the published data by ward (1985); bowers (2005); ASAE (2000).

5.   Conclusion

Therefore it can be concluded by the use of that supervision and using the situation can take care of the cost of repairs in an acceptable level and reduced the other side regarding the number of casualties happened during research, which is very much lower than usual method is can be said that this method can be the amount of reliability machine to take higher and the expense of stopping the decrease.

Abstract: Complex role of adult learning and training process is significant, his role gradually changed from the donor information and active for many years will assume that the principles and techniques that are used in teaching children to contribute equally in the adult learning process On the other hand is effective in children for adult education teachers were employed. Later that person was well trained (ie the experts), who could well slow or a group leader to manage the program, was selected as an adult educator. Thus learners directly in adult education programs that are based on experience were used, and adult As a mature child which has its own characteristics and is unique is that the principles and techniques of the different techniques used for the education of children is needed. As a result the role of adult educator gradually from non-skilled person without the expertise of individual specialists and trained to be changed and Instructors for training and educational opportunities were provided at all levels are therefore unable to work for educators from institutions with short-term training courses for users of the guidance program (project leaders) through summer workshops for professional leaders through programs Training of Master and PhD levels in schools of higher education courses were provided.

Introduction:

The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act)1 defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills

Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education.

Characteristics of adult education:
flexibility in time:

In the past, usually one of the obstacles in the way of learning and development of adult education was being inflexible and time courses were programs. But now most countries have to consider that the speed limit of time and learning ability and facilities must be adults. Flexibility in time means that not only should the time classes and programs for adults is appropriate, but necessary facilities should be provided for independent study.

Flexibility in the location:

One of the aspects of flexible space is that individuals can, regardless of their residence to the study and advancing their knowledge and skills pay. For example, adults in remote villages should like people who live in the city use of educational programs. After flexibility in other places is that the issue of specificity of location is not considered primarily educational.

Flexibility in age:

Educational opportunities for certain age should not use it for all regardless of their age, is possible. In fact, educational programs must use people of different ages to prepare.

Flexibility in admission:

No adult should not only be deprived of education because of the necessary conditions for admission in the class does. Of course this is not such a person without academic records to participate in university classes is accepted, Adoption order is that the adults in educational programs at different levels, according to the possibility of using the opportunity that is provided must be based on the experience and knowledge and their knowledge is.

To combine education and job responsibilities:

Adults should be able to work during that time engaged in training classes take them. In other words, their presence in the class should be considered part of their work. This means that low-literate or illiterate working people who are allowed to work an hour of your daily spending surpassed participation in educational programs.

The role of adult educator:

Complex role of adult learning and training process is significant, his role gradually changed from the donor information and active for many years will assume that the principles and techniques that are used in teaching children to contribute equally in the adult learning process On the other hand is effective in children for adult education teachers were employed. Later that person was well trained (ie the experts), who could well slow or a group leader to manage the program, was selected as an adult educator. Thus learners directly in adult education programs that are based on experience were used, and adult As a mature child which has its own characteristics and is unique is that the principles and techniques of the different techniques used for the education of children is needed. As a result the role of adult educator gradually from non-skilled person without the expertise of individual specialists and trained to be changed and Instructors for training and educational opportunities were provided at all levels are therefore unable to work for educators from institutions with short-term training courses for users of the guidance program (project leaders) through summer workshops for professional leaders through programs Training of Master and PhD levels in schools of higher education courses were provided.

Other procedures, where the role of teacher has changed the theoretical concepts first, an understanding of adult learning was unfounded on the principle that the concept of adult education is based on transferring knowledge to them and saying what they should know or duty to interpret absorption educator their training. In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of

adult personal and community among people. In addition, a person well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities, In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people. In addition, a person well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities. His role in the educational process as a facilitative (helpful), leader (leading), incentives, consultant and source of information (not move), regular (planned), judge poster and ..... Is. The ultimate goal of people helping him to his ability to help raise up to be adult. Fact that the adult educator role of a marginal position in society has changed to a central location for this position change the natural outcome of many social problems such as wars, crime, illiteracy and disease .... Can easily be resolved through processes of adult education.

Although two decades of adult education a fundamental instrument of national policy and local governments, state and national cost millions of dollars for adult education began (1950), and cost requests in the years 1960 million by the sectors of trade, industry, universities, religious institutions and government agencies will pay increased. Where adult education resources in 1950 are allocated only for the welfare of individuals found with increasing social problems such as urban crisis, Nvady inequality, unemployment and illiteracy .... In these areas was also widely added. So the mission developed its adult education and its usefulness for human growth and development became clearer.

As indicated earlier, a strength of adult education in Kentucky is the dedication of the many teachers often serving under difficult conditions, without adequate support, and often with compensation and benefits less than teachers in the public schools. Testimony before the task force characterized the work of adult educators as "missionary" work. Recognizing the seriousness of the adult literacy issue in Kentucky, it should be a major concern that the Commonwealth does not have a comprehensive approach to the professional preparation, development, and support of adult educators.

The challenge for Kentucky will be to move from a system that still depends on teachers with limited training in working with adults, to one in which professional competence in working with adults is a basic requirement. Any strategy to make this transition must involve both professional development and support for the teachers now in the

field as well as a new system for a new generation of adult educators.

Beyond the issues relating directly to DAEL(Department of Adult Education and Literacy), the task force heard a number of concerns about the Commonwealth's overall approach to adult literacy.

- Lack of coherent statewide leadership and coordination among multiple complementary initiatives aimed at the same problem.
- Lack of continuity in state leadership. Cited in particular was the difficulty sustaining a high level commitment to the issue long enough to make a difference because of changes in priorities of the state's political leaders. A high level of turnover in the leadership of the Department of Adult Education and Literacy has also contributed to the instability.
- Tendency to think of adult education as a separate categorical program rather than a strategy that cuts across the mission and responsibility of multiple Commonwealth programs and initiatives (e.g., early childhood education, welfare reform, economic development, and corrections).
- Multiple uncoordinated categorical federal initiatives that tend to drive (and fragment) policy for an overall state effort that is largely funded by Kentucky.
- A tendency to commingle and confuse different functions. The most important distinction is between functions focused on the needs of clients (adult learners, employers, communities, regions, and the Commonwealth as a whole) and functions associated with the operations and performance of providers. It is important that each of these functions receive attention, yet the tendency is for one (e.g., overseeing a network of providers) to drive out attention to overall system strategy.
- Inadequate coordination of services to meet the needs of individual adults, communities, employers, and regions is hindered by:

- Vertical financing and regulatory relationships between separate federal and state programs and local providers and administrative units. These vertical relationships can hinder the horizontal coordination of services for individual adult learners, communities, and employers.
- Turf wars among providers, local politics, and long-standing conflicts among neighboring counties.

- Inadequate links with and leverage of other public and private initiatives and investments to reach the target population. Major sources of help include employers, postsecondary education, and workforce development.
- Lack of a state financing policy and strategy for provider performance incentives and collaboration, and tax and other employer incentives for leverage of non-state resources.
- Lack of programmatic and administrative flexibility to meet the rapidly changing needs of adult learners, employers, regional economies, and communities.

Conclusion:

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the assays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning.

Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- - Preparation for adults to learn how much he depends on previous learning. Knowledge that has accumulated because of an ability to absorb new information more person is. Past educational experience features a diverse group of adult learners, the starting point of any activity on the diversity training is emphasized.

2- intrinsic motivation, learning a deeper and make them sustainable. When the need is met directly by the learning itself, what is learned, but is complementary learning. Creating a training activity in adult learning needs, learning ensures stable

3- Positive reinforcement (reward) learning to reinforce the negative (punishment) is more effective. Many adults because of negative experiences at the beginning of schooling, are weak and afraid. Feeling of success in adult learning for continuous learning and adult participation is essential.

4- To maximize learning, information must be provided an organized manner. Entries can be simple or complex can be arranged around related concepts are organized. Starting point for organizing content knowledge for adults and adults is linked to past experiences

5- Learning, especially regarding skills development, will be added frequently.

6- Duties and meaningful content than meaningless subjects are learned more easily and are later forgotten. This issue, especially for older adult learners is true. Challenges of adult learning facilitators by the way that content was significantly associated with experiences and needs of learners is.

7- Passive than active participation in learning activities, learning increases. Adult educators are allowed to participate actively in India, a stable and meaningful learning to help

8- Environmental factors affect the learning. Tangible things such as noise, crowded places, temperature, light and ... Learning process can be prevented. Other factors such as stress, ridicule, pressure, fatigue and low health can also reduce learning.

The role of indigenous knowledge for sustainable development

Khatereh siyar

Department of Agricultural Economic, Islamic Azad University, Qaemshahr Branch, Iran
*Corresponding author: khaterehsiyar@yahoo.com

Abstract: Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources . Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation , and new generation would be adapted with them and add to it . Many experts believe that for making a sustainable development, Indigenous and modern knowledge should be combined. Nowadays, so much efforts have done to make use of Indigenous knowledge but main part of these efforts were done for derivation and making it scientific. [Khatereh siyar. **The role of indigenous knowledge for sustainable development.** Journal of American Science 2011;7(5):237-241]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: sustainable development, indigenous knowledge

Introduction:

The importance of Indigenous knowledge and effort in compilation of that with modern knowledge were considered and it was tried to make general and stable view in relation with environment and the way of living through this way (Popzan, 2002). Our today's world is the contradictions and collision's world. Contradiction between cultures, religions, different societies and countries. In recently years, from Renaissance till now, as much as human had developed, they also had contradictions and collisions in their world (Azkia and imani, 2008). One of these contradictions is the contrast between tradition and modernism. Maybe we can find these contrast roots in colonial era, the time when colonists promote their innovation in their colonies. Mostly these techniques and innovations show their Indigenous knowledge and the way of their living is foolish and inefficient and tried to enter industrial ways in to their life to increase production efficiency through this way. Thus the way of their living which was been formed during thousands of years has gone to be forgotten little by little (Bouzarjmehri, 2004). We can say, agriculture part is bearing the most damage in this rapid industrialization process. Absolving old and compatible ways in agriculture part and replacing and using of implant, harvest patterns without any proportions with environment has caused decrease of production efficiency, soil erosion and hard destruction of environment during a long time. Finally, at the end of the 20th century decades, some solutions were suggested to solve these inconsistencies and problems. So

By first of 21 century, world see some sings of great concerns about social, economic and environmental system sets. It is expected that world population reach to 8 billion people at 2025. Increased

Consumption and poverty have led to high pressure on environment. At so many areas, environment condition is more fragile than before. We have faced decay at environmental issues, especially at vast parts of developing areas of world, in spite of considerable improvement of rivers conditions and air quality at some area such as Europe and north of America. Increased consumption, rare sources and factors such as population growth and imbalanced growth, would endanger, development of different countries (Popzan, 2002). Obviously, economic development can follow unexpected social and environmental affections involving weather changes, using freshwater sources inordinately, decrease living diversity and increase inequality (Gigler, 2003). Sustainable development is outcome of development that follow multi dimensional economic activities with protect environment and its related social issues. So in current decade, presenting indigenous knowledge issue was reinforced in order to present modern approach of development, in which the issue of human-oriented of development would be insisted. In this modern attitude toward development process, environmental, social and cultural concerns were emphasized over economic interests. Indigenous knowledge is part of national capital of each nation which encompasses their beliefs, values, practices, tools and local acknowledges. This is the same knowledge that , different nations had found their

foods from nature , prepared their clothing , settled in home , educated their children , organized their society and kept health of themselves and poultries , during the centuries thereby(Eshraghi, 2004) .

Compilation of Indigenous and modern knowledge:

Many experts believe that for making a sustainable development, Indigenous and modern knowledge should be combined. Nowadays, so much efforts have done to make use of Indigenous knowledge but main part of these efforts were done for derivation and making it scientific (Burger, 1997).

Amiri Ardakani and Shah vali (2003) believe that the undesirable outcomes of development on people and rural environment is the result of using new science by scientist, so by blending and making relation between modern and Indigenous knowledge we can solve this problem.

Millar believe that by combining Indigenous and modern knowledge we can make trust between researchers and rural people, because by using this way researchers and rural people know themselves as a partner that are responsible for a common process and product. Millar believe that the trust is the reason for future development (Penny, 2001).

Experts believe that there is no way to reach sustainable development except to combine Indigenous and modern knowledge.

Indigenous and modern knowledge will complicate when:

1- We solve structural barriers such as political, economical, cultural and social difficulties.
2- We correct the thoughts on educational systems by emphasizing on learning and thought process and also correct the thoughts on research systems by emphasizing on audience and beneficiaries needs.
3- We solve communication barriers that cause inactivity on relation process and steady and dynamic flow of knowledge between peasants, experts and scholars. (Emadi and Amiri Ardakani. 2004).

Concept and nature of indigenous knowledge:

Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources (Warren, 1993).

Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation , and new generation would be adapted with them and add to it (Merrewij , 1999) .

Since, each knowledge is consequent of individual interaction with environment, so indigenous knowledge is consequent of indigenous people interaction with their environment. Chambers with emphasis on people's role at development process believes that "rural people's knowledge" term is more eloquent than other terms for indigenous knowledge. Our purpose of rural people are producer farmers , input buyers , agriculture production sellers and etc. "people" in above phrase emphasis that this knowledge is more verbal and less has been written . This word also referred to whole knowledge system which contains concepts, beliefs, and attitudes and also contains gain, store and transmitting knowledge process (Rajasekaran, and Babu, 1996).

Sustainability and sustainable development:

Sustainability is meaning to make economic, social and environment's views in harmony with our constant needs. Sustainability includes widespread and comprehensive points and is depended on interference in social issues. It is concentrated on future and today's issues and is a world movement and in harmony with our authorities (Kolawople, 2001).

The correct concept of Sustainability has fallowed a certainly and warranty of life satisfaction quality for everybody. Of course for reaching to this constancy, it is not enough to decrease pollutant activities or prevent of increasing levels of consumption, but also we should make a suitable schematization for decreasing poverty and making activity for reaching to equanimity and improvement of chances in and out of countries. Sustainability had implication on steady and sustainable conditions. Steady condition encompasses distant horizons (Dewes, 1998).

The concept of sustainable development is a complicated concept that is explained by different people in different ways. From international viewpoint, the more famous definition of sustainable development is obtained through 1978 reports by Brandt land commission with this title" our common future" that is defined as fallow: sustainable development is a development that contain our modern needs without making any problems in providing future generation's needs.

Sustainable development recognize that social, economic and environmental results are related to each other and they should be equally in harmony for making decisions process. Decisions which are based on Sustainability will help future generation in reaching to a well environment and success economic (Box, 1999).

Infrastructural information in sustainable development:

Ideal and infrastructural information in sustainable development consist of:

1- Environment and economic integration: economic decisions should be made according to their effect on environment.
2- Making guarantee between generations: decisions should be made according to their effect on future generation's environment
3- Social justice: all the people have this right to have an environment to grow on it and be successful
4- Environmental protection: it is needed to protect of natural sources and support plants and animals.
5- Quality of life: a widespread definition of human welfare should be given which is more important than economic welfare.

Reaching to sustainable development through Indigenous knowledge:

Dictated pattern's failure through western development countries to third world countries show that Indigenous knowledge is necessary to reach development.

Untrop believe that usage of local knowledge is efficient and useful in development and Indigenous knowledge's researchers believe that they achieved to an important source for innovation in agriculture methods and a good farming production to improve the rural people's life. On his idea, some of researchers call Indigenous knowledge as a good supplement and replacement for modern knowledge and they have tried to spread the usage of this knowledge all around the world. These plans as a "communion research with farmers" or "first is the first" are introduced. In this research method, private organs and local groups have the main role and unlink the current research plans, the tests are done with the farmers attendance in their farms and not in research centers and far from environment condition. The ways that farmers and rural people use for management of their living environment are the most scientific ways, although we couldn't understand it at the first sight (Chambers, 2000).

Eshraghi (2000) explained that by introducing sustainable development model or development environmental model and according to world food organization (FAO), sustainable development will create when applied technologies in rural development are in proportion with rural people's knowledge and also are acceptable by them. Also he says that one the main ways to reach sustainable development in society is that to have enough and

necessary attention to the rural's Indigenous or local knowledge (Merrewij, 1998). It is also explained that attention to this knowledge needs a complete recognition of rural people and their knowledge that through assembling of this knowledge we can find a correct way to reach a sustainable development and we should know that the movement toward sustainable development is not possible without correct using of Indigenous knowledge. Many development experts believe that the Sustainability of this concept is at the studying of this knowledge and in becoming popular in development. Indeed, Indigenous knowledge with its holist features had known the relation between nature's components better and had smoothed the way to Sustainability of development (Gigler, 2003).

We can summarize the usage of Indigenous knowledge in development as fallow:

1- Protection and maintenance of natural sources. Indigenous methods in management of natural sources are suitable pattern for managing natural sources in sustainable development.
2- The success of sustainable development plans is depended to rural people's communion at designing, schematization, performance and assessment. Use of Indigenous knowledge is necessary for rural people's communion.
3- Indigenous and modern knowledge should be combined because according to our needs and vulnerability of remained natural sources, none of them are able to remove our needs a lonely.
4- For recognizing development needs, trouble shooting problems should be polestar from rural people's view and recognizing problems and making efficient relation with rural people are possible through Indigenous knowledge.
5- In industrial countries, Indigenous methods are forgotten completely because of using modern knowledge in production process. As Indigenous methods are the most suitable way for achieving sustainable development goals so, many efforts were done to make this knowledge alive.

As a result not only we shouldn't forget the Indigenous knowledge but also we should use of this knowledge in developmental plans. Using Indigenous knowledge in developmental projects will help to have sustainable development in villages. So developing and not developing that were using of western development patterns for many year, should use of their Indigenous and local knowledge which is the result of many years experience and by helping

these plans they can reach to a sustainable development (Brouwer, 1998).

Sustainable agriculture
Sustainable agriculture is kind of agriculture that is toward human's interests and has more efficiency of using resources, and also is in balance with environment. This definition is in harmony with changing social and politic factors at agriculture development .and also it referred to kind of agriculture that is enable to produce enough foods without destroying world sources or polluting environment. It is also kind of agriculture that is follow with social values, agriculture family's welfare and supplying needed foods.
Generally sustainable agriculture is every kind of production system which follows theses goals:
More complete mixing of natural processes such as food cycles, nitrogen fixation, and relation of pests and natural disasters with agriculture productions processes.
Decreasing use of that non-farming, outside and non-renewable inputs in order to reduce damage to environment or less damage to farmers and consumer's health.
More fair access to interests and productions opportunities and progress in order to access to forms of agriculture that is fairer, and also increasing self reliance between farmers and villagers (Chambers, 2000).
Using more potential biologic and genetic aptitude of plant and animal species.
Using more local knowledge including innovative approaches that scholars didn't understand it completely or farmers didn't accept it extensively.
Combined agriculture would prepare this opportunity for common systems to apply needed reforms without creating inclusive changes in it toward organic systems. Therefore, aforementioned systems are considered as medium between common intensive agriculture and organic agriculture methods.
Two principles have especial importance at sustainable agriculture that is:
at early 1980's, with the emergence of new concepts, renewable agriculture and sustainable agriculture evolved and indeed it was based on "ecological interplay affect". now, this concept forms alter indigenous agriculture philosophy.
Sustainable agriculture presented from 1987 at global scale. In this principle, "agricultural interplay affects with society" is presented. Three issues are important about sustainability: first is enough income especially between poor people. Second is increasing access opportunity to food and its consumption. This means that more food should be prepared through increasing production and improving marketing. Third issue

contains protecting and improving natural resources (Louise, 2000).

Conclusion:
Indigenous knowledge has been manifested at sustainable process and improving extension programs at industrial countries of world, very well. Indigenous knowledge related to agriculture, medicine, food and architecture has been widely used At European countries, USA, Canada, Australia, by new names.
At one research as a name of "analyzing position of indigenous knowledge at sustainable rural development" that was done by Buzarjomhore (2005) it was signified that although there are some differences between indigenous and formal knowledge, but they should not be compared, because they are complementary of each other and it is possible to gain successes by synthesizing them that is impossible lonely. Base on new paradigms of rural development in order to solve rural problems, we should first refer to indigenous solutions and if it was working, then we should reinforce it; if not we should test and use outside solutions. Findings of one research done by Emadi and Amiri (2004), as "Synthesizing indigenous knowledge and formal knowledge as necessity for accessing to sustainable rural development", has shown that dominated belief among educated groups toward Indigenous s and their knowledge is precondition of every interaction, synthesis and relation. Creating revolution in formal education systems in order to attending empirical knowledge area is considered as one of main necessity of this synthesis that is outcome of years of researches. Researchers attention to "exploiter's accumulated experimental and historical wisdom" is one of other necessities of this revolution by using cooperative, qualitative and filed methods. Also, applying mutual extension ways and creating revolution at communication system between governmental, education-extension centers and farmers and rural people so that they be interacting, was considered as precondition and necessities. At researches as "indigenous knowledge at development process" done by Karimi (2003) , findings show that indigenous knowledge is principal factor and main source at the field of research of sustainable development, decreasing poverty , enabling local men and attracting their participation at activities and rural development programs, developing and producing appropriate technology, self-reliance of rural societies and country.

Socio-economic analysis of foreign immigrants in South East Iran

Mortaza tavakoli

PhD, Faculty Member; Department of Geography, University of Zabol, zabol, Iran
tavakoli@uoz.ac.ir or tavakoly52@gmail.com

Abstract: Beginning of immigration refer to age of times that human lives on the earth. The first human for keep from damage and problem's choosing immigrant as a solution. In between international immigrant with notice to it effect's in era and destination is the most important. Analytic Situation of Pakistani immigrant to Iran is the main goal of this research. The all of society that use in this research is N=1350 person from Pakistani immigration that lives in Konarak and Chabahar that the 219 person with simple Random Sampling method chosen and for analytic this data and information use from Excel and Spss 16 software's. The results show the main reason of immigrant Pakistani to these two cities is finding job and suitable work. Two stimulant consist of economic and other reason such local convenience, better life, more security has direct effect on other behavioral this reason has most important in between other reason.
[Tavakoli mortaza. Socio-economic analysis of foreign immigrants in south east Iran. Journal of American Science 2011;7(5):242-250]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: International immigrant's, Pakistani immigrants, Southern East of Iran.

1. Introduction

The history of immigration refer is to age of human in the earth. For first human immigration chosen as the suitable method to critical with problems rake of feed, security is some of dials that first human choose immigration. In Throughout history, the type of immigration with notice to environment and age is different. From beginning of 17-century social thinkers tries that can in between different event's social and economic, finding the reason of immigration (Jamshidian, 2002).

In a few past decades with notice globalization in international, volume of immigrant has increase. In 1960 total of international immigration alone consist of 76 million people that figure in 2000 reached to 175 million people. As a result, the growth of population between 1960 and 2000 (percentage2.9) is most than growth of total world population (percentage2.5) (Iom, 2005). In the entire world, special in after of the world war II, immigrants as an effect event chosen and was different sciences and theorists about the causes and factors which discussion began (tahrkhani, 2002).

Immigration is one of four dials change of population in world and with notice to its nature condition long effect has short effect in different periods that cause parity or impurity in structure, number of population has, and with notice to this, dial countries divide to sending immigration. Accepting immigration and countries without effective immigration event. Thus phenomena such as attitudes change and turmoil in the interaction, the release of individual family supervision, increase unskilled work force, create problem's in planning process of housing, health, study and welfare services

and other problem's cease to landlady government and nation look to them as the reason of problem's and censed to name them unsuitable immigrants. Cultural critical between native and immigrant people cense to insecurity immigrants and between native has provide the field of many social slope (zareh shah abadi, 2002). Immigration event is the most notice event in third and developing countries (National Youth Organization, 2002).

Basic and rapidly change in human social, attractive cities, welfare and increase the need of today human cense created new type of immigrant. Following this, a new perspective in immigrant in this standpoint, immigrant is affected by social change and needs. This landscape immigration's is a dial for indefeasible equilibriums so be in social in important. With past of time and spread over industry, high immigrant to cities increase to level of destructive environment of cities and increase the unemployment. That from field of negative image of this event form is the minds new theory point on destructive role of immigration. Industry growth rapidly and expansion communication and transport in international space cause local and regional looking effected by social event's and globalization. National border other cannot stop as an element for solubility, so spread type of international immigrants (Jamshidiha, 2002). Immigrant has many reasons that some of them consist of repulsion and some of them effected by attraction elements that. This dials has too in international. With notice to create economic gaps international level, the most important dials for immigration's is economically. Immigrant's for job is a special type for immigration, this type of immigration in world level is foreign event that

immigration of worker's from east southern of Asia to neighbor countries is such. Immigration of Pakistan people to neighbored countries and special to Iran is a kind of international immigration's that in resent years has growth way. In Iran, the good region for Pakistani worker who come's to Iran for work is east southern of Iran that Chabahar and Konarak is then. In this field to analytics situation of worker's in southern part of Iran with notice job and business attention to reason of immigration:

What is the main reason for immigrant is Pakistani to Chabahar and Kanarak?

What is the relationship between individual characteristics and professional status of immigrants and their job in Iran?

Studies and reviews relation with immigrant is a long time consist of research fields, in this way research and studies about this subject consist of below title:

Ghazi (1994) indexes success in job is job goals, job pleasure, job security, accessible to entertainment and lateral activities, job satisfaction, welfare equipment, good human relation, suitable equity are important dials (hemati and Jamali, 2007).

Shahnoshi et al (2000) has reviews social - economic dials about Afghan worker in Khorasan field. result this research shows that be Afghanian worker's in this region cause to immigrants of farmer families but prepare the field of immigration families that don't have enough land for agricultural activates, in total effect of Afghanian workers on Khorasan agricultural activates was negative.

Zareh shah abadi (2002) has a research with title of role Iraq immigrant and social damage in Yazad. In this research sample social chosen with sudden method and analytic with Spss software with notice to this results Iraq immigrant in increase of swindler and addictive to drug, behavioral damage, steeled, involvement has a direct damage but increase of knowledge and age and see don't each effect.

Jamshidian and Babai (2002) Factors Affecting Afghan refugee return, relying on residents Golshahr Mashhad city using the theory of absorption and excretion of Everett Lee has done. for this research to provide policies against refugees in Iran are Afghans.

Karimi moghari (2004) with use from regression formula analytic the effective of Afghan immigrants an earning workers business in Iran. Results show Afghan workers in rich province such Tehran, Esfahan, Khorasan and … busy to work that demand for work is high.

Sajad pour (2005) study a practical framework in international immigrant management in Iran. In this research, we have four main subject immigrant and development, easy of immigrant legal of immigration and forces immigration analytic. Also in

this research main organization that effect an immigrant i.e. government's, international organization's, international immigrant management and Trans many of human are notice able.

Immigration is one of the elements of change population and with that native addition that long-term changes and has short-term effects in much aspect consist of on population numbers and structure dimensions, economic, social, political etc and cause imparity in population structure (Jahani, 2006). Immigrant in total mains have the main home town and settlement in other part for temporary and always but immigrant is main movement of population is leave their country of main home to another longer place without come back to their home town (Javan, 2004). In other definitions, immigration is a shape of geography movement that tare between to region people from region with bad economical and social condition immigrant to other place, higher wages and better economic and social conditions, into (Mohtamedi, 2005). Change of population analytic in demographic study, that has many kinds, but in this research, we chose two kind of this:

Inner immigrations: all movement of population inside of a country border is this, from city to city, rural to city and rural to rural (tagavi, 1990).

Foreign immigrants: immigrant of people from one country to another country is this that one of them is stray and political immigrant's that occur in visual condition. Inner immigrant name's also that people self-action to immigration and unapplicant immigrant take in a large scale and they settlement in camp (jamshidiha, 2002).

2. Elements of immigrant

In landscape of immigrant, two theories of "functionalism" and "dependence" are most important theory in immigrant. In side this two theory, systemically theory of immigrant has proponent too and letter's pull and push theory accept from people. The first theory about immigrant presentation from Raven Eshtain English economist in 1855. He designs observation as "immigration law" that in it distance dials, pull and push factor, interaction dials and place and space visual settlement. Durkheim increases of population are most important reason for immigrant and believes that the from seventeenth century immigrant start formal i.e. a time that population increase and work divide in social presentation in formal (Therkhani, 2001).

Functionalism theory to emphasize performance and consequences of the phenomenon of immigration. According to this view, when a social system does not meet the needs of activists, the

probability that they meet the immigration needs to throw many hands

Immigration dependence theory (or contrast vision), the phenomenon of migration in the context of global capitalism and the development of concepts undeveloping be considered. From this perspective, migration is a side effect of unequal development and the other factor in the development and deepening inequality in society. Supporters of this theory, the solution to the issue of immigration in the context of overall development strategy examined. Until the unequal status between urban and rural, rich and poor and backward countries should not follow from the developed or reduced to minimize the migration is not possible.

Pull and push theory that according to Herbel study in the first a 1930-decade start immigrant cause from two elements: Push forces are some element is that because a person left the hometown and are element is that cause Tedious.

Pull forces are some element's that cause person attraction to another are. In this field Ores Lee theory has more standard that mention four element that is effective in immigrant: element of offspring region, element of destination region, element of intervention cause and problems and personal elements in immigration are noticeable.

Extensive immigrants cause from ware or natural challenge such certain, the earthquake and governments national local problems. Immigrant in public condition, search a place with work and live. Economical cause and try to believe is most important reason for immigration and search of people such: (Green and Green, 1993), (Altonji and Card, 1991), (Winstein, 2002), (Dunlevy and Saba, 1992).

Fawst et al, which four factors theoretically decisions are effective for immigration: (1) Ecological pressures, (2) surly element, (3) economical element and (4) mind theory (jalalyan and Muhammadi Yeganeh, 2007).

Economic perspective, migration mechanism for redistributing the workforce considers. Classical economists Adam Smith, including immigrant workers as well as the economic law of supply and demand described (Zanjani, 2001). The other important theory in immigration is international theory of immigration. From that features is wide look to immigration cause from control and political control, formal control. Apposite this theory this kind and don't attention to other, Dial send with notice to this event in economical condition and our dissuasion is according to this theory (jamshidiha, 2002).

Due to the expansion of population in Asia and sensible differences in income level, livelihood type of political events in various countries and its

continent recent decades, immigrants to center of regional and international. These countries of the region immigrants have not the same situation. Some countries far from major migration streams and some other major immigration centers are located. The high number of immigrants in south-central Asia with notice to put India, Pakistan and Iran are in this pout of world. India is second century in accepting immigration with 7 and 8 thousand in 1990, Iran and Pakistan from accept Afghan immigrant one important countries (Zanjani, 2001).

3. International immigrations

One of immigration with very important in international immigration. With notice to this point, that has a small different between international immigration and foreign immigrant: international immigration has taken between to undepended country. But foreign immigrant has take in international depend countries that one of their country not depend. Foreign immigrant's by effected today happen in a high scale some element's such education, communication, internal immigrant go up the hope to live has many effect in international immigration. That has many kind that consist of: (1) immigration for work, (2) for away elite brain drain, (3) political immigrants the developing and south countries are send immigration and develop and industry play attention immigration (National teenager organization, 2001).

Notice to international immigration has important from this aspect fore send immigration has economical, political and social several effect. Immigration in this shape has three general elements: first immigration, the country is main place to immigrants and tired good place (janshidiha and Anbari, 2004). Immigration and transport has many reasons in each region so without any program for advance of population cense to unsuccessful in social, economical, and cultural planning. Some of effect of immigration an legal from Pakistani, Afghani and Iraq, use suitable from equipment and condense of population in a region in some part's such Chabahar and Konarak is cause from without planning international immigration (Ashofteh tehrani, 2002).

Effect international immigration for special age and sexual change in economical of sending immigrant's country sleep effect of these factors is the internal migrations. The effects of Asia and Africa, where immigrants comprise more men are intensified (Mahdavi, 2003).

Iran in terms of immigrants resettled will be divided into two groups: The first groups of refugees form. During the past two decades, Iran is one of the main destinations mainly Afghan and Iraqi refugees have been. Iran between 1993 and 2003 hosted the

first or second largest number of refugees worldwide has purported. According to the Iranian government, only 308,000 refugees in 2002 were returned to their country. The second groups of Iranian immigrants in the workforce also comprise two categories. The first group includes immigrants who as a skilled work force in Iran and the second group include immigrants who labor as unskilled, low-level tasks have been allocated to (UNHCR, 2004).

Access to better financial and economic situation, the main factors had been migrated to the Pakistani.

Between personal and professional characteristics of immigrants and their employment, status has a positive relation.

Iran country in the northern hemisphere with an area of 1,648,195 million km between latitude 25 degrees 40 minutes North 44 degrees 63 minutes east and southwest Asia is located. Country's population, according to last census in 2006 against 70 million 472 thousand and 846 person and is based on the results of 48 million 245 thousand and 75 person from the population in cities and 22 million 227 thousand and 771 person live in villages. The country north of Armenia, Azerbaijan and Turkmenistan, the three former Soviet republics and the Caspian Sea, east of Afghanistan and Pakistan, with Turkey and Iraq from the west and south, the Persian Gulf and Oman Sea is a neighbor. 252 mm average rainfall country meters and under the condition that 179 mm (71%) directly due to the high evaporation potential in the country (1500-2000 mm) is evaporation. Height above sea level in different regions of the country - 40 to 5670 meters, which makes changes influence on diversity and climate change are areas (Gytashnasy Comprehensive Atlas, 2006 - 2007).

4. Chabahar and konarak

Chabahar Township of the southern provinces of Sistan and Baluchistan is. The city with the location 60 degrees 37 minutes' east longitudes and 25 degrees 17 minutes north latitude and within 756 kilometers south of Zahedan, Tehran and in the 2406 km asphalted route Zahedan - Konarak is located. This township has a number of city 5 centers and 3 Section, 11 villages and 592 inhabitants, is a rural. Chabahar has a desert climate is hot and dry. Average annual rainfall in the city 114.2 mm and average temperature in 2009 from +40.8 till +9.8 degrees change. According to latest census conducted in 2006 against the city with a population of 214.017 persons (Hossini and Jamali, 2007).

Konarak township with 11.567 km and is the central city of Konarak. Total population in 2006 is equal to 68.065 persons. Appellation in the city over language that remains is that this place was many

trees along anthem that is why this small town became famous Konarak port. Konarak a climate is hot and humid. The air at the height of summer due to monsoon winds "Monsoon" is mild (Hossini and Jamali, 2007).

Table 1: Population change cities studied (the person) during a 50-year period from 1956 to 2006

	1966	1976	1986	1991	1996	2006
Chabahar	2828	5922	20544	30038	34618	71070
Konarak	2506	5069	10076[1]	10965	14941	28685

5. Material and Methods

In this paper, survey research methods and descriptive - analytic. The statistical population of all research Pakistani immigrants living in the cities that comprise Konarak and Chabahar sample size using formula Cochrane 219 were selected. These methods were selected by simple random sampling. The main tool of this study is a questionnaire. For this purpose, after understanding the factors affecting migration phenomenon, with a field study techniques required information was collected in Excel and Spss software and data processing were done, then using different indices and statistical models, the results obtained In the descriptive tables and graphs (frequency, percentage and cumulative frequency) and analysis of data from the Pearson correlation coefficient was used.

6. Results

So says population society of this research in all of Pakistani immigrants that live in Chabahar and Konarak sample chose from Random Sampling method and questions that consist of information about marital status, age, sexual, education, employment status, family member, immigration reason, live place mind long time that immigrants and question ask them about job and earning that it's result is below:

The results of this table shows that from sexual visual 96.35 percent of this immigrant are man and only 3.65 percent of them are women.

Table 2: distribution of respondents by gender in the cities of Chabahar and Konarak

Sex	frequency	Percent	Cumulative percent
Man	211	96.35	96.35
Woman	8	3.65	100
Total	219	100	196.35

[1]. Population of Konarak city in <u>1365</u> is without the population of military units.

That not boss of family. However, can say the most of Pakistani immigrant's in this two city are man and look for work with unsuitable skills. have undo main between sexual visual and aspect of Pakistani work force in Iran is small and they say come to Iran for work and send their earning for their family in Pakistan.

Table 3: diffusion of answer according to their educational in Chabahar and Konarak

Educational	Frequency	Percent	Cumulative percent
Illiterate	28	12.79	12.79
Elementary	90	41.10	53.89
Guidance	101	46.12	100.01
Total	219	100	166.69

Pakistani immigrants living in cities Konarak and Chabahar in Sistan and Baluchistan Sunni (100 percent sample) and the existence of other religions and ethnic groups among the refugees is very scarce. Terms of the housing situation, around 85/8 percent respondents have leased housing. In contrast, only about 14.2 percent of the rest of them live in homes Maliki. Immigrants often live in urban fabric and to the end of tenancy may go neighborhood to neighborhood.

Fig 1: Iran's geographic Location and the cities studied

Over 72.7 percent of married respondents and about 27.3 percent of the rest were single. Half of immigrants (50%) of respondents have declared that his wife is Iranian and 22.7 percent of wives were Iranian, the rest immigrants 27.3 percent to the question "Will your wife is an Iranian?" Have not

responded. Pakistani immigrants in sex ratio is unbalanced because of the difference in migration between the sexes is that Pakistani immigrants to the country of Iran constitute more men.

From total answer's 12.79 percent illiterate, elementary with 41.10 percent and guidance period with 46.12 percent with 101 person frequency and all of this immigrant's. Accept their degree from Lahore and Karachi cities.

Considering that the number of literate people and school and a college education among the respondents is low. With notice to less the of immigrant's with advance and high education is main problem in develop current. Many of this immigrants work in low work with low wage diffusion of answers with age in Chabahar and Konarak.

According to figure No. 2, 10.50 percent in the age category 15-19 years, 21.92 percent in the age category 20-24 years, 6.39 percent in the age category 25-29 years, 18.72 percent in the age category 30-34 years, 11.87 percent in the age group 35-39 years and 30.59 percent more in the age category 40 years are.

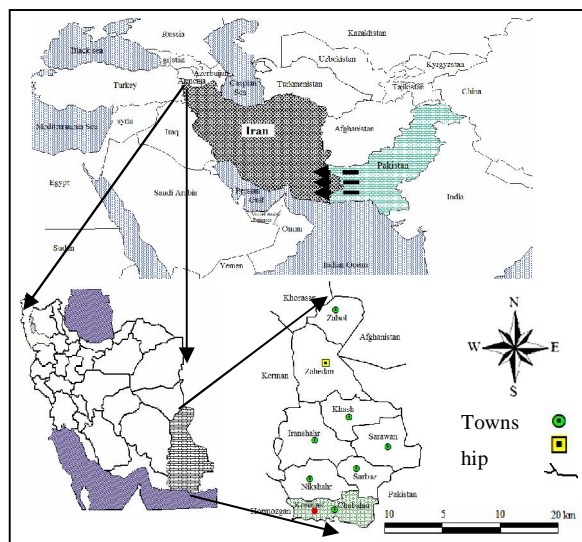
Data's of this chart show that many of person that answer to questions and migrants living in cities and middle-aged people off at an early age and are ineffective. Therefore, attention to their views is very important.


Fig 2: diffusion of answer according to their gender in Chabahar and Konarak

From total answer's 23.29 percent of those younger than 5 years, 27.40 percent between 5-10 years, 17.35 percent between 10-15 years, 16.44 percent between 15-20 years and 15.53 percent of people in more than 20 years have been living in Iran.
In these boys, 5-10 year is of live with 60 frequencies in Chabahar and Konarak and result is that number of Pakistani immigrant in Iran has an increase process and this need to a punctual programming.

With notice to languages is an element for communication between people. Figure 4 Total

numbers of immigrant's familiar language shows, according to this Figure of all the respondents of this research are familiar with Urdu. Of these 99 cases only in Urdu, the number 78 with Urdu and Persian, the number of 10 with Urdu and English languages and 32 people with all three languages Urdu, Persian and English were familiar. So with the 45.21 percent with Urdu, 35.62 percent Urdu and Persian are, Urdu and English is 4.57 percent and 14.61 percent speaking with 3 languages.

Fig 3: Age diffusion of answer's according to period of live in this two cities
Fig 4: knowing of Pakistani immigrant with foreign languages
Show almost reason of immigration consist of:
Immigrant's for work with high lavish with 171 person,
Pilgrimage with 12 person,
Tourism with 10 person,
Visit the family with 17 person,
In addition, etc with nine people.

Nearly 80 percent of answer person in says reason that them immigration to Iran un satisfaction economical in their country, two dials in immigration of Pakistani to Iran are important: get job and security and they point to this different between Chabahar and Konarak with they country and Stated

that security, comfort living, income and better position in the desirable expression of their country have the same agents hands and make them migrate to Iran.

Figure 6 shows the equipment that Pakistani immigrant's have 4.57 percent with 10 lavish have car, 44.57 percent with 98 person lavish has motor's transport element and 4.57 percent with 10 lavish has self settlement and 46.12 percent of them don't have any of this equipment and any of immigrant don't have land.

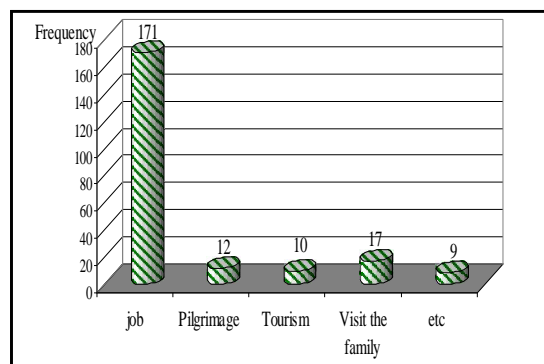
Fig 5: Causes and factors affecting migration to the Pakistani in these two cities


Fig 6: the owned facilities and Equipment Pakistani immigrant in Iran
As you will see more facilities, owned immigrants possess equipment that can quickly exchange and possession sale and it requires no registration document, or if the property was abandoned in an emergency, is not high price and are less damaged.
Table 4 is that all the active population is employed in the cities of immigrants is studied.
With notice to the findings, more subjects and 93.61 percent employed and approximately 6.39 percent of the subjects of this research have introduced its unemployed.

Job distribution of immigrants on the 26.94 percent of respondents with the highest frequency Cosmetics has jobs. Abacus (with 10.05 percent), mechanics (with 24.13 percent), masonry buildings (with 6.39 percent), fishing (with 4.11 percent), carpentry (with 3.65 percent), unskilled labor (with 4.57 percent), Engine building (with 9.13 percent), Shopkeeper, do (with 5.48 percent), and student job Assistant with 5.03 percent, with wire Rule 39.6 percent, and repair work with 5.02 percent next business had been expressed by the respondents. As you can see in the table with the Cosmetics jobs as the most Frequency first job was between immigrants. Notice to that these jobs among local people as low value job is considered and the requirement does not do much.

Situation of immigrant's show person depend on which of job grope and has which kind of production relation and what were can earning his money and this between women and man immigrants with notice to native of their works are different notice to high immigrant's and low education season to low production. 97 percent of immigrants are main. In other words, the existence of circumstances disparate between immigrants in most areas, the amount of jobs there. Distribution of immigrants in cities studied of this research function facilities and employment opportunities, fieldwork and job skills immigrants and local social base and their lives are.

Table 4: Job diffusion of Pakistani immigrants in Chabahar and Konarak cities

Job status	Frequency	Percent	Cumulative Percent
Engine building	20	9.13	9.13
Cosmetics	59	26.94	36.07
Sartorial	22	10.05	46.12
Mechanics	29	13.24	59.36
masonry	14	6.39	65.75
Serviceman	11	5.02	70.77
Fishing	9	4.11	74.88
Carpenter	8	3.65	78.53
Worker	10	4.57	83.1
Shopkeeper	12	5.48	88.58
Assistant	11	5.03	93.61
Unemployed	14	6.39	100
Total	219	100%	805.9

Looks immigration between people have a Positive relation with un satisfaction from live, if in hometown of person not maybe of accept their needs immigration is a natural work. Analytic of sample society of this research point to this fact and show 90 percent of Pakistani immigrants with notice from their live conditions immigrant to Iran. From immigration need to enough fields in together countries does not notice to this cease field the immigration. One of positive element on immigration in Pakistani to Iran is economical bases. This main marrow's of economical and finance condition cease people immigrants for this purports notice to

economical dial's as undependable shifty and stimulus as depend shifty are analytic first assumption: has a positive relation between finance condition and immigrants. First hypothesis: relationship between access to financial and economic components and motivation to migrate there.

Notice to table 5 components and indicators to find work and job of fit (R=0.639, P= 0.059), Don't have suitable settlement in home town (R= 0.487, P=0.05), Weak of finance ability (R=0.446, P=0.05), Love to work in Iranian job (R= 0.521, P=0.05), Increase the rights of immigrants and job rewards than before migration (R=0.706, P=0.000), Information of immigration about job (R= 0.425, P = 0.049), Increase of earning between age of immigration (R= 1.000, P = 0.001), Earning with job of immigrants (R =0.491, P= 0.045), Period of live in Iranian (R= 0.679, P= 0.045), Earning of immigrant with notice to their job skills (R= 0.491, P = 0.05) with regard to test the significance level smaller than the error rate are allowed 95 percent confidence accepted hypothesis test based on Pearson correlation test can say that this variables have positive correlation with Iran are the Pakistani immigration.

Table 5: result of assumption on effect the most important elements relate to immigration of Pakistani to Iran.

Components	Correlation Coefficient (R)	Permissible error rate
Find suitable job	0.639	0.05
Don't have suitable settlement in home town	0.487	0.05
Weak of finance ability	0.446	0.05
Weak of security good job	0.639	0.01
job security than in immigrants before immigration	0.674	0.01
Love to work in Iranian job	0.521	0.05
Have job security high before immigrant	0.752	0.01
increase the rights of immigrants and job rewards than before migration	0.706	0.05
Access to job purposes Iran	0.518	0.05
Increase of finance position	0.639	0.01
Information of immigration about job	0.425	0.05
Increase of ability and job skills	0.617	0.01
Increase of earning between age of immigration	1.000	0.05
Earning with job of immigrants	0.491	0.05
Period of live in Iranian	0.679	0.01
Earning of immigrant with notice to their job skills	0.491	0.05

According to the refugees, what economic and financial situation in connection with their jobs and income, more facilities available in the destination they are given motivation and attitude to immigration is more of Iran.

Table 6: correlation analytic of immigrant's characteristics with their job variable

Independent variables	Correlation Coefficient (R)	significant
Job look	0.311	0.01
Job goals	0.596	0.01
Job satisfaction	0.277	0.05
Sheet of support from immigrations	0.169	0.128
Sheet of job ability of immigrants	0.442	0.01
Sheet of corporation immigrants with organization	0.513	0.01

Also, find suitable job (R=0.639, P=0.000), Job security than in immigrants before immigration (R=0.674, P=0.000), Have job security high before immigrant (R = 0.752, P = 0.000), Increase of finance position (R = 0.639, P=0.000), Increase of ability and job skills (R=0.617, P=0.000), Period of live in Iranian (R=0.679, P=0.000) So, with 95 percent confidence accept our assumption and according to test of Pearson correlation can say that these variables have positive relation. Indeed with to above dials and cumulate correlation rate of job security in the most important dials in immigration of Pakistani to Iran as incontinence of suitable economic condition in of spring and don't have suitable settlement, not suitable habitant and etc element are in next dials. Second hypothesis: between individual characteristics of immigrant and their economical application have a positive relation.

Analytic this table shows the sheet of job ability with correlation rate has a positive relation this mean with increase job skills of immigration accept this price, findings show between variable of Correlation with organization's and job shifty application has a positive relation. So the second assumption supports. Correlation analysis of individual characteristics and professional variables on job performance is shown in table 6. According to the results obtained between Sheet of job ability of immigrants (R=0.442, P=0.000) with the dependent variable performance and occupational status and a significant positive relationship was found. This means any size the ability of immigrants to use more professional job performance, they will increase. Research findings showed that between the independent variable with Sheet of corporation immigrants with organization (R=0.513, P=0.000) and variables related to job performance is positive and significant. Similarly, Job look and Job goals with (R=0.311) and (R=596) in level 0.01 and 0.000 significant relationship exists. Other variable such as job satisfaction with 0.277 at 0.042 positive and significant relationships exists. So many researchers as important features in the physical and mental stress have increased job performance, which include: Ahmadi (2001) The

relationship between career motivation with job performance, Ghosh (2000), Pour safari (1999) and Rezaei (2001) Relationship between job satisfaction and job performance have been confirmed.

7. Discussion
International immigration is one of main season for economical depends between developed countries and developing countries in 21 century. In the first, this century estimate 175 million people near 3% of world population consist of immigrations people and most point to below dials: Most of Pakistani immigrants in Iran are man and a few of them are women and this cause to weak condition. Many of them have guidance educational with high lavish and has high age above 39 year's old and many of them in recent 3.60 years come to Iran and many of them speaking to Urdu, after Urdu, after English and a few number of them can only speaking English for their needs and many of Pakistani immigrants says their situation with before of immigration to Iran is different from economically dimension and 27 of them says economically situation of them don't change between before immigration of less of them says (5%) them economical situation after immigration to Iran get institution.

Clinical value of transforming growth factor beta as a marker of Fibrosis in adolescents with Chronic Liver Diseases

Elham Abdel Ghaffar, Bahaa El-Din Hassanin, Mona EL-Tokhy*

Pediatric & Clinical Pathology* Depart., Faculty of Medicine, Benha University

Abstract: Background: Hepatic fibrosis is the final common path of liver injury in most chronic liver diseases and can lead to cirrhosis, which is responsible for the majority of clinical complications. Our aim is to asses the clinical value of serum Transforming growth factor (TGF) as a fibrogenesis marker in adolescents with chronic Liver Diseases**. Methods:** We measured serum levels of TGF- in 25 adolescents with chronic liver disease and 25 healthy controls, and determined their relationship to frequently used liver function tests and liver biopsy findings. **Results:** Serum Transforming growth factor was significantly higher in patients than in controls as ($P < 0.001$). Significant positive correlation between TGF and TSB as r is 0.4682 and p is < 0.05. High significant positive correlation between TGF and (stage, grade of liver fibrosis, PT and duration of illness)as p is $< 0.001$and r is 0.9409, 0.7447, 0.5293 and 0.5952 respectively. Highly significant negative correlation with prothrombin concentration (PC) and serum albumin level as p is < 0.01 and r is -0.6460 and -0.5371 respectively. Sensitivity of TGF in diagnosis of fibrosis was 65% , specificity 94% and area under curve (AUC) was 0.812.The cut-off value of TGF used to discriminate significant fibrosis was 22.6 ng/ml and it was a dependant predictor factor for diagnosis of fibrosis with positive predictive value 75.5% and negative predictive value 90.4 %. **Conclusions:** TGF- had the ability to discriminate patients with significant fibrosis. and may be useful in reducing but not replacing the need for liver biopsy.

Introduction:

Chronic liver diseases (CLDs) are defined as the continuity of clinical and biochemical evidence of hepatic dysfunction for longer than six months *(1).*.Hepatitis B and C (HBV, HCV) are, and will remain for some time, major health problems in Egypt. Both infections can lead to an acute or silent course of liver disease **(2).** Hepatic fibrosis is the final common path of liver injury in most chronic liver diseases and can lead to cirrhosis, which is responsible for the majority of clinical complications. Fibrosis is characterized by excess deposition of extra-cellular matrix (ECM) components including different collagens and non-collagenous proteins such as laminin, fibronectin, undulin, and so on (3). The key cellular mediator of fibrosis is the hepatic stellate cells (HSCs) which when activated serve as the primary collagen-producing cell. Hepatic stellate cells (HSCs) are activated by a variety of mechanisms, including cytokines, chemokines and others (**4**). Transforming growth factor-beta (TGF-) is released by activated HSCs and is considered the key profibrogenic cytokine in liver disease, with participation in most critical events during liver fibrogenesis **(5).** Liver biopsy is essential in establishing the diagnosis, and in assessing the degree of fibrosis. Although liver biopsy has long been considered to be the gold standard of fibrosis assessment, the procedure is invasive, potentially associated with complications, and provides only a semi-quantitative assessment. Its repetition is required for following up the disease progression and monitoring treatment efficacy. This repetition is not easily accepted by patients especially in the pediatric population. Moreover, the diagnostic accuracy of liver biopsy in the staging of fibrosis is seriously affected by errors in sampling and inter-observer variation (**6) and (7**). These drawbacks justify an intensive search for non-invasive alternatives that are safe, inexpensive and reliable (**8**). Non-invasive diagnosis of liver fibrosis has been extensively evaluated in adult populations (**9), (10) & (11**). In contrast, in pediatric population, data are lacking and liver biopsy is still the only reliable tool for diagnosing the histological features (12). **Our aim is** to asses the clinical value of serum Transforming growth factor (TGF) as a fibrogenesis marker in adolescents with chronic Liver disease.

Subjects and Methods:

A mixed retrospective and prospective study was conducted from October 2009 to June 2010.Twenty five patients with chronic liver disease (group 1) were chosen from hepatology clinic of Benha university hospital (Kalyobia Governate)and the Liver Institute (Menofia Governate). Twenty five healthy children matched for age, sex, locality and socioeconomic state served as control (group 2).

Written consent was taken from parents before including their children in the study**.** Patients were included if their ages ranged from 10-16 years and with chronic liver disease. Patients with gastrointestinal bleeding (acute attack), chronic renal failure, hepatic encephalopathy were excluded from the study. All cases were subjected to: full history taking, complete clinical examination including ; Liver (surface, edge, consistency and span), spleen(surface, edge, consistency and size), presence or absence of ascites. Presence or absence of manifestation of liver cell failure (edema, bleeding tendency, jaundice and angiomas).Laboratory investigations including: complete blood count,fasting blood sugar, blood urea and creatinine, liver function tests including(ALT, AST, serum bilirubin (total and direct), serum albumin, prothrombin time and concentration. TGF was measured using DRG TGF ELISA kit. Ultrasonography-guided liver biopsy was done for chronic hepatitis patients. Liver biopsies were performed using true cut needle. Biopsy specimens were fixed in formalin and embedded in paraffin. Liver fibrosis and necroinflammatory activity were evaluated according to Ishak staging and grading score where histological activity index (HAI) ranged from 0 to 12, while fibrosis score ranged from F0 to F6 (**13).**

Results:

Demographic data among studied groups, including sex, residence and mean age (13.06±2.5) years in group 1 compared to (13.1±2.1) years in group 2 are shown in table (1).Chronic hepatitis C was the most common etiology of chronic liver disease among our cases (44%) followed by autoimmune hepatitis (24%),chronic hepatitis B (16%),glycogen storage disease (8%),congenital hepatic fibrosis and Alpha1 anti-trypsin deficiency (4%) each as shown in table (2). Table (3) shows clinical characteristics of studied cases. Table (4) shows laboratory data of studied groups and revealed highly significant difference between patients group and control group as regard serum transaminases level, albumin level ,total &direct billirubin, prothrombin time and concentration, also serum level of TGF was highly significantly elevated in group (1)than in group (2) as (P < 0.001). Grading of liver fibrosis revealed that; there were 8,9,5,2 and 1 patients in grade 2, 3, 4, 7and 8 respectively. Staging of liver fibrosis revealed that; there were 8, 7, 2, 5 and 3 patients in stage **1, 2** , **3**, **4** and **5** respectively. Figure (1) shows significant positive correlation between TGF and TSB as r is 0.4682 and p is < 0.05. High significant positive correlation between TGF and (stage, grade of liver fibrosis ,PT and duration of illness)as p is < 0.01 and r is 0.9409 , 0.7447, 0.5293 and 0.5952 respectively are shown in figures 2,3,4and 5. Highly significant negative correlation with PC and serum albumin level as p is < 0.01 and r is -0.6460 and -0.5371 respectively as shown in figures 6 and 7. Sensitivity of TGF was 65% , specificity 94% and area under curve (AUC) was 0.812 as shown in figure 8.The cut-off value of TGF used to discriminate significant fibrosis was 22.6 ng/ml and it was a dependant predictor factor for diagnosis of fibrosis with positive predictive value 75.5% and negative predictive value 90.4 %.

Discussion

In the normal liver, HSCs express very little TGF- , and hepatocytes essentially none. When injury strikes, inflammatory cells are drawn to the site of injury and HSCs undergo activation and becoming fibrogenic **(14)**,**(15)**.

The current study revealed that, serum level of TGF- was highly significantly elevated in patients with chronic liver disease than control. This significant elevation might reflect the fibrogenic process in the liver.

Luo et al.,2001(16) found a significant elevation of TGF- 1 in liver cirrhosis, yet its correlation with activity was moderate.In another Egyptian study done by **Abdel-Ghaffar et al.,2010 (17)** they found that; TGF- 1 was significantly increased in children with chronic liver disease than control. There are conflicting results in literature as to which TGF-beta level increase or remain unchanged in patients with chronic hepatitis.

Hong-Lei Weng et al., 2009(18), reported elevated TGF- 1 serum levels in patients with chronic hepatitis B virus (HBV)/hepatitis C virus (HCV) infections. On the other side **Liberek et al.,2009(19)** reported that ; in chronic hepatitis group of patients the plasma TGF-beta level did not differ from the control group and did not correlate with grading and staging of the liver tissue fibrosis. These contradictory results may be attributed to the heterogeneity of populations, races, diseases, and other confounding factors. Our results showed that,TGF- correlated positively with PT, TSB, stage and grade of liver fibrosis and negatively with PC and serum albumin levels. Our results are in agreement with **Flisiak and Prokopowicz**, **2000(20)** as they found a correlation between elevated TGF- and impairment of some synthetic liver functions, and *Filiask et al., (2002)*(21)who reported that, TGF correlated significantly positively with liver fibrosis. Also in accordance with our results, **Iagoda et al. , 2006(22)** studied correlations between growth factors and histological changes in the liver in 48 patients with chronic viral hepatitis and hepatic cirrhosis ,they showed that the blood level of transforming growth factor-beta1 (TGF-beta1) increases according to increase in histological activity and the degree of hepatic fibrosis and that there is a positive correlation between TGF-beta1 and the degree of hepatic inflammation and fibrosis. The stimulatory effect of TGF-beta on collagen synthesis by fat-storing cells is observed *in vitro* at a concentration of 10 ng/ml **(20)**. In our study, the level of circulating TGF-beta was two fold increase and a level more than 22.6 ng/ml had a sensitivity of 65% and specificity of 94% in identifying significant fibrosis. In the study of **Abdel-Ghaffar et al.,2010(17)** they found that, TGF- 1 more than 54.8 ng/ml had a sensitivity of 78.6% and specificity of 71.4% in identifying significant fibrosis. The difference in the results between our study and other studies could be explained by the difference in the mean age of the cases and accordingly the aetiology of chronic liver disease. **Hong-Lei Weng ,2009**(18) reported that,TGF- 1/Smad2 signaling in liver fibrogenesis is not a generalized feature and detected in an etiology-dependent manner.

In conclusion, TGF- may be used to predict significant fibrosis and/or cirrhosis in children with chronic hepatitis B & C and other causes of chronic liver disease. That is to say, non-invasive markers will likely reduce but not replace the need for liver biopsy, which may be useful in monitoring of disease development and treatment effectiveness and might be an inseparable part of assessment of chronic hepatopathies.

Abstract: One of the issues which hinder the execution of strategies in organizations is that it remains in a general level of actions and orientations. In response to this problem, the strategy map attempts to illustrate the organization strategies in terms of cause-effect relations and show how these strategies can change into measurable objectives and specified operations which must be followed by organizational units and also employees. By translating its strategy into the logical structure of the strategy map, Sahand Khodro Company created a common, tangible reference point for all its employees and personnel. In this study, we have translated the strategy of Sahand Khodro Company into operational objectives and evaluators from four aspects of the strategy map. By codifying the strategy map, Sahand Khodro Company was able to achieve greater profitability and better response in relation to all the beneficiaries involving customers, employees, director and owner of the company and the society.

Introduction

With the emergence of post-industrial era, the organizational environment has been dynamic, full of changes, and complexity has been the predominant issue in organizations. Changes have been so intense that predicting functions have lost their validity and new, unexpected challenges have emerged. Markets have become intensively competitive; learning faster and earlier than other rivals, has provided advantages in competition and, consequently, organizations have focused on science, knowledge and information. Nowadays, many organizations are mainly concerned about codification and implementation of strategies which ensure their success and survival in ever-changing, complex environmental circumstances. The strategy map provides a means for organizations to codify and execute strategies in different aspects of the organization and manage their strategic performance [1]. This is a framework for performance evaluation which uses a series of financial and non-financial scales to take a deep look at the performance of the organization. One of the issues which hinder the execution of strategies in organizations is that it remains in a general level of actions and orientations. In response to this problem, the strategy map attempts to illustrate the organization strategies in terms of cause-effect relations and show how these strategies can change into measurable objectives and specified operations which must be followed by organizational units and also employees [2]. The strategy map is very useful for all the organizations which suffer from the unclear relations between their codified strategies and executive, everyday operations [3]. The strategy map not only allows for the establishment of this kind of relation and picturing the strategy, but also is a means to test the logic and effectuality of codified strategies and to supplement them, if necessary.

A Look at the Auto-parts Manufacturing Industry and Sahand Khodro Company

Today, the automotive industry has a great role in the economy of countries all around the world. Likewise, the automotive industry of Iran has an important role in the production and employment status of the country. Automobile manufacturing companies submit the production of required parts for assembling the automobiles to auto-parts manufacturing companies in order to reduce their production expenses and increase the quality of their products. Therefore, the auto-parts manufacturing industry has always been known as the supplement of the automotive industry. Auto-parts manufacturing companies are very smaller than automobile manufacturing companies in scale but

are greater in number and provide more employment compared to automobile manufacturing companies. Auto-parts manufacturing companies shall choose appropriate strategies regarding their actual and future situation and circumstances. Appropriate strategies help their survival and development in the competitive field of auto-parts manufacturing industry. Sahand Khodro Company of Tabriz is an auto-parts manufacturing company which produces parts for Pride, Peugeot and also tractors. This company is geographically situated in the south-east of Tabriz, in the industrial site of Shahid Rajaee. Sahand Khodro Company is a small company in size, acts as a workshop and has a staff of 24 people. The strategy map has been used to codify and implement the strategy of Sahand Khodro Company. The strategy map is a highly effective method in codifying and implementing appropriate strategies in various organizations with different scales. The necessary information for the codification and implementation of the Sahand Khodro Company strategy was obtained by studying the general conditions and characteristics of the Iranian Auto-parts Manufacturing industry and its active companies; and also through interviews with executive director, production manager, quality manager and the employees of this company. It is hoped that by codifying and implementing an appropriate strategy through codifying the strategy map, Sahand Khodro Company could turn into a primary and successful company in the auto-parts manufacturing industry of the country and serve the Islamic community of Iran.

Mission Statement of Sahand Khodro Company

Sahand Khodro Company's organizational belief is based on satisfying its customers by providing their needs and considers the satisfaction of its customers as the key to the company's success. Also, the company regards its personnel and man force as its greatest capital and intends to make them effective, capable and enthusiastic by increasing their authorities and capabilities through related education and providing their welfare. Sahand Khodro Company will try to improve the quality of its auto parts and reduce the production costs and the final price of its products, and thus increase its productivity. In addition to maximizing its development and profitability, the company pays special attention to social, moral and religious issues and values of the society and a clean environment, so to gain credit and reputation among people and fulfill its duty and responsibility towards the society. Sahand Khodro Company intends to turn into a creative, innovative organization in order to become a vanguard company in the internal competitive market in the near future, and in the long

run, gain a better position in the auto-parts manufacturing industry of Asia and the world.

The Strategy of Sahand Khodro Company of Tabriz

The Strategy of Sahand Khodro Company is:

60% increase in the net profit in a course of two years.

This strategy is based on the two following principles:

1. Reducing the final price and improving productivity based on the value chain of the company,
2. Producing a higher amount of products (actual – new)

In order to implement the chosen strategy of Sahand Khodro Company, the strategy map has been applied. If the implementation of the strategy using this method proves successful, the profit margin of the company will increase in both of the above principles and Sahand Khodro Company will become a strategy-based organization. In order for Sahand Khodro Company to become a strategy-based organization, the strategy shall be translated into operational terms.

Codification of the Strategy Map of Sahand Khodro Company of Tabriz

To implement its strategy, Sahand Khodro Company should translate the strategy into phrases which are clearly understandable by all of its employees. Thus, Sahand Khodro Company of Tabriz should provide a framework for the conscious and continuous analysis and transmission of the strategy. The new framework is a logical and exhaustive structure for the analysis of the strategy which is known as the strategy map. The strategy map provides the design base of the balanced assessment method which is considered the corner stone of a new system of strategic management. The strategy map provides a means to analyze the process of value formation through the use of invisible assets, from the point of view of the company owner. The strategy maps establish the assessment and evaluation technology for management in knowledge-based economy. By translating its strategy into the logical structure of the strategy map, Sahand Khodro Company creates a common, tangible reference point for all its employees and personnel. Here, we have translated the strategy of Sahand Khodro Company into operational objectives and evaluators from four aspects of the strategy map.

The Financial Aspect

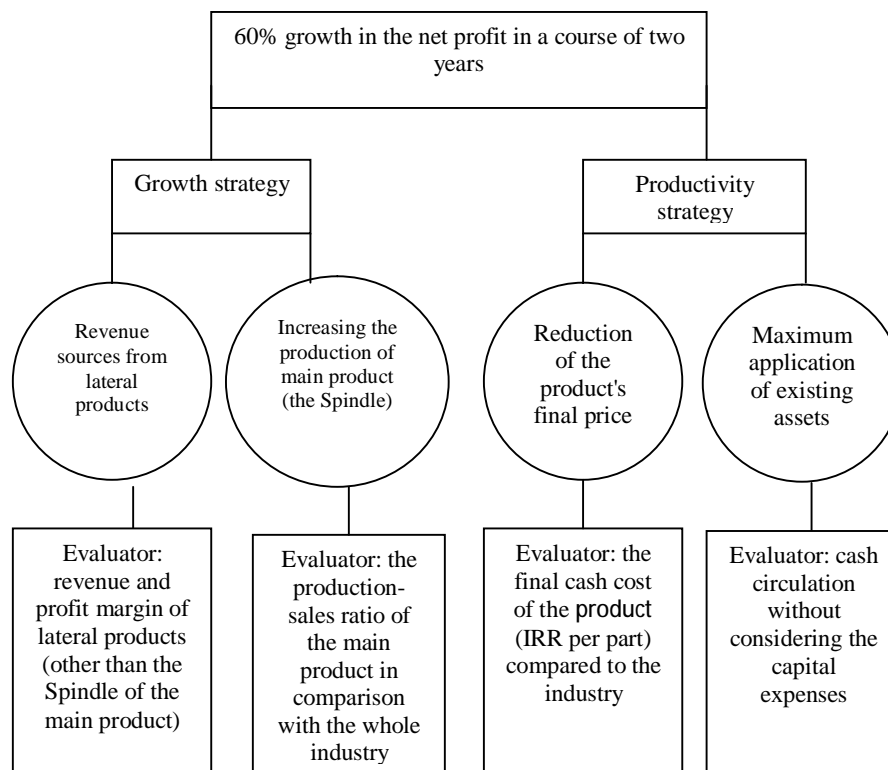
Gaining acceptable financial outcomes in economic companies and organizations is extremely necessary for their survival and development; therefore, financial evaluators are an integral part of the codification of the strategy map in profit-making organizations [3, 4, and 5]. Sahand Khodro Company started its strategy map by defining its high financial

targets i.e. 60% increase in the net profit in a course of two years. The director of Sahand Khodro Company was aware of the fact that increasing the profit in such level, considering the long history of auto-parts manufacturing industry and the existence of numerous, big competitors and also the large number of new and small rivals was truly a difficult task. Sahand Khodro Company decided to improve its net profit through two financial purports: productivity and growth. The productivity purport was consisted of two elements:

1. Reducing the final cost,
2. Increasing the application of assets

The reduction of the final cost could be evaluated through a comparison between the company's cash operational costs and the average of the related industry. The productivity of assets enabled Sahand Khodro Company in achieving a higher level of activity in accordance with its strategy without increasing the levels of its assets. To achieve this goal, Sahand Khodro Company can use the cash circulation evaluator, without considering capital expenses, in order to indicate the benefits related to cash making resulted from the existing assets plus the profit resulting from the reduction of the commodity supply.

The financial growth aspect of Sahand Khodro Company involves two different components. First, is the growth in the rate of the production operations with the aim of increasing the sales of its main product i.e. the Spindle (In Persian: Meel-Mahak). In addition to the mere growth in the production operations, Sahand Khodro intends to increase the sales rate of its main product compared to other rival producing companies. Thus, it uses the production - sales ratio evaluator in comparison with the whole industry. The second component of growth indicates the opportunity and possibility of the company in producing and selling products to its customers, other than the gearshift rod. For example, parts like spacing washer, differential case pin, etc. Sahand Khodro Company determined a financial growth target for developing revenue sources from these lateral products which is assessed by the evaluator of revenues from products other than the gearshift rod and their profit margin. Therefore, the financial aspect involved objectives and evaluators for both strategies of growth and productivity. The strategy map of the financial aspect of Sahand Khodro Company of Tabriz is shown below:

The Strategy Map: The Financial Aspect


The Customer Aspect
The customer aspect enables organizations to evaluate and improve the main evaluation criteria of the

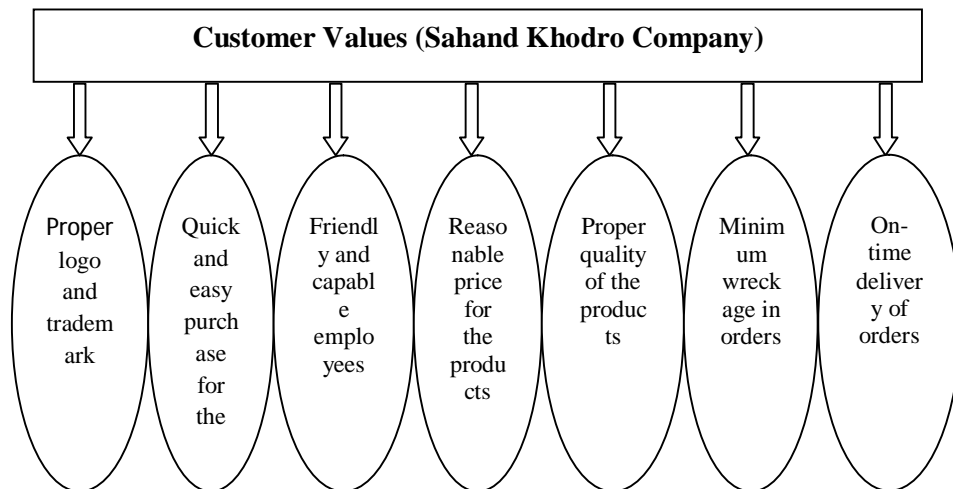
customers' status such as satisfaction, loyalty, keeping and maintenance, getting new customers, etc [6]. Sahand Khodro Company should try to secure the

consent of customers who are generally sensitive to both price and quality by reducing the final cost throughout the value chain, including the gearshift rod, and also by increasing the quality of its products and reducing the wastage. Thus, for the customer aspect, Sahand Khodro Company selected the market share evaluator for all of its products. However, the important point is that Sahand Khodro Company cannot solely rely on the market share evaluator in its customer aspect. The company needs to define values which should be considered in attracting and keeping the customers and building good relations with them in the target market. These values are as follows:

1. On-time delivery of orders
2. Proper documentations regarding products and customers

3. Friendly and capable employees
4. An internet website for the company
5. The possibility of a quick and easy purchase for the customers
6. Reputation and credit of the company

In this situation, Sahand Khodro Company will have a series of simple objectives and evaluators for assessing the customers' attitudes. One of these evaluators is related to the market share and the other is a summary of the customers' desired values (the company's rank given by customers) and is expected to motivate and lead to acceptable results. The strategy map of the customer aspect of Sahand Khodro Company of Tabriz is given below:

The Strategy Map: The Customer Aspect


The Aspect of Internal Business Procedures

The internal procedures create and present the acceptable values to customers. The performance of internal procedures is an effective factor in improving the subsets in the financial and customer aspect of the codification of the strategy map [5, 7, and 8]. In the internal procedures, Sahand Khodro Company has described numerous objectives and evaluators for the part-production operations and presenting them to the customers. These evaluators have an emphasis on low final cost; proper and stable quality; short stop-time for equipments; very few dangerous and health-impairing events; safety and the environment. Since increasing the final price of the company's products was not possible, Sahand Khodro Company decided to increase its profit by stabilizing the prices and reducing their total costs. Sahand Khodro Company also intends to

increase its financial and revenue sources by increasing the variety of its products. Quality evaluators such as observing the technical characteristics and on-time exposition of products supported some of the customers' desired values but most of them were related to the operational prominence in production and distribution operations. Significant objectives relating environmental, health and safety factors used evaluators such as the number of safety events, work environment satisfaction of employees and the number of the workers' holidays. On the other hand, some benefits resulting from the improvement of environmental, health and safety performance were effective in lowering the final cost and increasing the productivity. The strategy map of the aspect of the internal procedures of Sahand Khodro Company is demonstrated below:

The Strategy Map: The Aspect of Internal Procedures

Being a good citizen:	**Achieving operational prominence:**	**Customer management:**	**Creating privileges:**
* Improvement in environmental, health, and safety conditions - work environment satisfaction of employees - Safety events - Number of holidays	* Reducing the final cost of products - The final cost of activity compared to rivals * On-time production and in accordance with characteristics - Complete and on-time delivery of orders - Proper quality of the produced parts * Improving the management of assets - level of assets - the rate of inadequate assets * Improving the performance of production machinery - The rate of unexpected anticipations	* Customer satisfaction - Quality of products - On-time delivery * Increasing the customers - The number of new customers and their orders	* Producing new and various products - Profitability rate of new products - Number of orders for new products

The Aspect of Learning and Growth

The most fundamental objectives involve those which are categorized as the aspect of learning and growth, such as: skill and creativity of employees, organizational culture, team-work, etc. This aspect is the final source of creating constant values [7, 9]. In codifying the strategy map in Sahand Khodro Company, three groups of strategic objectives were determined in the aspect of learning and growth:

1. Critical abilities and skills
    *   Helping and encouraging employees in gaining wider knowledge about the production business and auto-parts sale
    *   Creating skill levels and capabilities that are essential for mission execution.
    *   Developing the necessary skills in order to improve the integral thought of employees about business and education.
2. Access to strategic information
    *   Developing necessary strategic information for executing the strategies
3. Organizational empathy
    *   Promoting a realization about the strategy of the organization, through creating an environment in which capable and motivated employees are working to materialize the mission statement.

Evaluators supporting these three targets were the most difficult ones that had to be determined. Ideally, Sahand Khodro Company wanted to determine the personal skills and information which one should have in order to improve the performance of internal procedure and transmission of the customers' desired values. The strategy map and the evaluators of the aspect of learning and growth of Sahand Khodro Company are shown below:

The Strategy Map: The Aspect of Learning and Growth

The aspect of learning and growth: a ready and motivated work-force		
* organizational capital and proper work environment	* information technology and resources	* development of human resources
Evaluators: - Proper organizational culture - Smart and intuitive leadership - Team-work among employees - Organizational unison (employees and directors)	Evaluators: - Improvement of information processing - Directors and employees' proper access to information	Evaluators: - Training employees - Increasing the capabilities of employees - Creating self-control

By presenting all the objectives and evaluators in one map and establishing a relation among them, the strategy map of Sahand Khodro Company is formed which clearly expresses how the company achieves its strategic objectives.

Conclusion

Sahand Khodro Company created a common reference point for its employees by translating its strategy into a logical structure of a strategy map. By connecting traditional processes like the service compensation system and dedicating resources to the execution of the codified strategy map explaining the strategy, Sahand Khodro Company created a strategic management system in the company. The strategy map explained the strategy and at the same time, the new management system connected all the organization components to the specified criteria in the strategy map. In a course of 6 months after the execution of the strategy map in Sahand Khodro Company, the following results were obtained:

1. The production rate of the main product showed a 14% growth compared to the same period in the previous year and the final cost of the product was reduced by economization in the production scale.
2. According to the facilities and machinery of the company, a new product was added to its productions and the production rate of two lateral products was increased.
3. All orders were delivered to the customers on time and the quality of all the sent goods were confirmed by customers.
4. The rate of the produced parts not in accordance with the characteristics (wastage) showed 40% decrease compared to the same period last year and thus, the wastage costs of the company decreased.
5. The safety events in the company showed 50% decrease and the number of employees' holidays showed 30% decrease compared to the same period in the previous year.
6. Creativities and intuitions of employees in their everyday tasks were supported in a way that out of 16 suggestions, 12 cases were confirmed by the director of the company.
7. Three training courses were held for employees in applying the strategy map, increasing crucial capabilities and skills, using strategic information, and creating an empathy atmosphere and team work.
8. An atmosphere and culture of competition in achieving the determined criteria in the strategy map was created for employees in the organization and the personnel tried their best in order for the realization of the strategy.

Prediction of Traditional Climatic Changes Effect on Pomegranate Trees Under Desert Condition in EL-Maghara, Egypt

Seidhom, S.H. and Abd-El-Rahman, G.

Water Requirements and Meteorology Unit, Chemistry and Soil Physics Department, Desert Research Center, El-Matareya, Cairo, Egypt.

Abstract: The main aim of this study is to combat and forecasting climate changes, with some soil managements in El-Maghara Research Station at North Sinai, Egypt, on pomegranate trees. The applied treatments were irrigation intervals and soil mulching with drip irrigation in the desert sandy soils and its impact on the water use efficiency and saving of irrigation water. A field experiment was carried out through split plot design during the three seasons 2008, 2009 and 2010 with pomegranate trees have 9 years age, planted at distances 3.6 X 3.6 meters (324 tree/fed). Experiments included 72 test unit consists of three irrigation intervals (2, 4 and 6 days) and three soil mulching practices under the trees (control without mulch, bitumen mulch and olive pomace mulch) and four replicates each have two trees, as the amount of irrigation water was calculated according to Penman - Monteith equation for data the last 10 years of the meteorological data of the region. The results were analyzed statistically, which were as follows: (1) There is a detected local climatic change for the main meteorological data of the site compared either with 10 or 30 years recorded data. These changes are partially caused by the global climatic change in one hand and to the local Oasis effect in the site in the other hand. These changes play a positive role in enhancing the yield of pomegranate trees referring to the horticulture references. (2) A significant increase of the values of pomegranate fruit yield, crop water use efficiency, water economy, water saving, total revenue and total profit by increasing of air temperature and humidity of the atmosphere and increasing the irrigation period to 6 days. Olive pomace mulch under the trees, gave a higher yield than bitumen mulch, and without mulch. (3) Significant decrease values of water consumptive use, crop coefficient of pomegranate, irrigation water use efficiency coefficient and environmental stress coefficients by increasing the irrigation period to be 6 days. Olive pomace mulching under the trees gave a higher yield than bitumen mulch and then without mulch. (4) The highest for the application of economic olive pomace mulch under irrigation with a period of 6 days. In all cases, the applied treatments get higher investment ratios (IR) than the traditional one (2.25 LE/IL). The study recommends with using drip irrigation every 6 days by the amount of irrigation water calculated according to Penman-Monteith equation without addition leaching requirements, with plants residues mulch such as olive pomace under the trees, which gave the highest return of one pound investment with ~ 3.07 LE., taking into account the vulnerability of the study area to the phenomenon of the Continental and Oasis effect, under conditions similar to the study area.

1- Introduction

Climatic change is nowadays one of the highly negotiable issues, which are not likely to be achieved soon (IPCC, 2007). Mark and Piet Rietveld (2009) stated that the climate change is almost invariably considered an issue of global interest, and therefore, also judgments about mitigation and adaptation costs to be made now, differ widely. Supit *et al.,* (2010) stated that the recent changes in the simulated potential crop yield and biomass production caused by changes in the temperature, and global radiation patterns are examined, using the Crop Growth Monitoring System. Peter *et al.,* (2005) stated that the oasis self-supporting mechanisms due to oasis breeze circulation are proposed and simulated numerically.

Excessive evaporation from the oasis makes the oasis surface colder than the surrounding desert surface.

Pomegranate trees (*Punica granatum. L*) are widely grown in the warmest area of the Mediterranean basin and Southern Asia. This tree species is well adapted to arid soils, where long periods of soil water deficit are usually present during the dry season. For sustainable water use agriculture, crop-specific and water-saving irrigation techniques that do not negatively affect crop productivity must be developed. Worldwide, successful attempts have been documented regarding the use of water regimes and mulching techniques to improve water use efficiency in various tree crop species. Thus conserving water is an important aspect for agricultural expansion, particularly in arid and

semiarid regions where the water deficit and high temperature are the main limiting factors for plant growth and productivity. Sheets *et al.,* (2008) reported that the pomegranates are native to be grown in ancient Egypt and can be grown in tropical to warm temperate climates. Bakeer (2009) concluded that anti-transpirants of kaolin at 6 % with olive pomace mulching within trees by the regulated deficit irrigation 75 % of crop evapotranspiration showed an increase in water use efficiency to improve vegetative growth, leaf nutrient content, blooming & fruiting, fruit set and yield. While it decreased fruit split, and fruit physical and chemical properties as well as economic revenue of pomegranate trees grown in El-Maghara, Egypt.

Allen *et al*. (1998) stated that mulches are effective in reducing ET of crop and crop coefficient values decrease by an average of 10 – 30 % due to the 50 – 80 % reduction in soil evaporation, but crop growth rates and yield were increased using mulches. Seidhom and Evon (2006) found that a significant increase of fruit yield, water consumptive use, irrigation water use efficiency coefficient, crop coefficient, environmental stress coefficient, water use efficiency, water economy and investment ratio by using black plastic mulch under olive trees followed by gravel mulch, with wider irrigation interval of 6 days, at El-Maghara, Egypt.

Lawand and Patil (1994) and Chopade *et al.,* (2001) observed that the pomegranate fruit yield/tree was greatest at an irrigation water (IW)/cumulative pan evaporation (CPE) of 0.8 with a constant depth of 50 mm. Abou-Aziz *et al.,* (1995) and Afria *et al.,* (1998) recorded that when soil reached 60 or 40% of field capacity, the irrigation regime resulted in the highest pomegranate fruit numbers and yields (36.8 and 69.2 kg/tree, respectively, averaged over both years). Prasad *et al.,* (2003) stated that drip irrigation at 8 liters h^{-1} day^{-1} for 3 h increased the pomegranate yield from 17.7 kg $plant^{-1}$ under the control to 28.2 kg $plant^{-1}$. Narendra and Shallendra (2007) reported that the highest yield of pomegranate is (48.46 kg/tree). Shallendra and Narendra (2005) found that 8 liters of water per hour through trickle irrigation gave the highest number of fruits per plant, fruit weight, fruit length, fruit diameter, total soluble solids content, sugar content, pomegranate yield and water use efficiency and the lowest acidity.

Farshi, (2001) found that irrigation water use efficiency (IWUE) in drip irrigation was better than for surface irrigation and WUE of pomegranate increased from 2.1 kg/m^3 for surface irrigation, to 9.2 kg/m^3 for drip irrigation. Irrigation water savings of 58% were achieved for drip irrigation. Singandhupe *et al.,* (2003) concluded that irrigation at 100% pan evaporation resulted in 18.1% higher pomegranate

fruit yield. El-Kassas, *et al., (*1992) and Gupta *et al.,* (1999) observed that mulching produced the highest pomegranate fruit yields (72.6, 71.9 and 68.2 kg/tree, respectively). Singh *et al.,* (2003) found that mulching reduced fruit cracking of pomegranate, with dried grass or farmyard manure being the most effective and increasing yield. Hasan *et al.,* (2002) stated that the total water consumption and water use efficiency were highest under the highest soil moisture regime with black polythene mulch.

This work is an attempt to clarify the effect of climatic changes on pomegranate trees under irrigation regimes and soil management conditions through mulching treatments and on improving water use efficiency, water economy and productivity of pomegranate grown in sandy soils.

2- Materials and Methods

This investigation was carried out during the three successive seasons of 2008, 2009 and 2010 to study the effect of climatic changes on yield and water use of pomegranate trees at El-Maghara area under some irrigation intervals (IF): (2, 4 and 6 days) and soil management (SM) conditions through mulching treatments viz: Control Without Mulch (CWM), petroleum as Bitumen Emulsion Mulch (BEM) and plant residues as Olive Pomace Mulch (OPM).

El-Maghara Experimental Station, of the Desert Research Center located in North Sinai Governorate, Egypt (latitude 30.35 N, longitude 33.20 E and 200 meter above sea level). The used climatic data of El-Maghara area were collected from the meteorological station in this station, to calculate reference evapotranspiration (ETo) using Penman–Monteith equation by using CROPWAT, software version 5.7 (Smith, 1992). Maximum and minimum air temperature, wind speed, relative humidity, sun shine hours, total rain and reference evapotranspiration are presented in (Table 1).

Seventy two healthy "Manfalouty" pomegranate trees (Punica granatum. L) about 9 years old nearly moderate vigor and productivity planted in sandy soil (mechanical and chemical analyses are shown in Tables 2a,b) were determined according to Richards (1954). Water of an artesian well was pumped from a depth of 288 m in El-Maghara area of Sinai and used for irrigation by the drip irrigation system.

The quality of tested irrigation water used in this study is presented in (Table, 3). Saline ground water (about 2800 to 3200 ppm) was used for irrigation viz drip system. The analysis of irrigation water belongs to high salinity, medium sodium, i.e., C4S2 water class (Richards, 1954). It is also evident that water quality of such a source shows a pronounced

variation throughout the year being of higher salinity   in summer than in winter.

Table (1). Measured climatic data of EL–Maghara region during the period of ten years from 1998-2007.

Elements	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	Avg.

S.A.R = Sodium adsorption ratio, R.S.C. = Residual sodium carbon,   T.D.S. = Total dissolved solids,   epm.= equivalent per million

Irrigation treatments were applied from 1st February and continued until September 20th, then stopped until harvest date October 5th, after that completed irrigation until the end of October for three seasons and were programmed according to irrigation intervals proposed during the afternoon based on calculation of water requirements for irrigation water applied, based on climatic data obtained from the meteorological station of El-Maghara average ten years (1998-2007) Table (1).

In the winter (beginning of February), a mulch practice was done by using different materials, such as olive pomace (Table 4a), bitumen emulsion (Table 4b) and control with bare soil (no-mulching). The soil around pomegranate trees was removed by hand hoeing to the depth of about 15 cm in the beginning of February, then adding olive pomace from olive portion of pulp. While, bitumen emulsion was applied on the soil surface around the trunk of pomegranate trees in a circle of 1.5 m half diameter.

Table (4a). Chemical analysis of olive pomace.

Organic Mater (%)	C/N Ratio (%)	Moisture (%)	N (%)	P (%)	K (%)	Ca (%)
40.0	11.32	22.6	3.0	0.08	0.47	0.47

Table (4b). Physical and Chemical Properties of Bitumen Emulsion

Chemical name(s):	Cationic: KSS60 + 65;
	Anionic: SS60; Feltec 60/3 + 60/5 KRS60, 65 + 70; KMS 60 + 65; FS60 + 65
pH:	2 to 2.4 - Anionic - Basic nature Cationic - Acid nature
Boiling point/range:	100°C (Contains 40% water)
Melting point/range:	Liquid at ambient temperature
Explosive properties:	Potentially low
Density at 20°C, kg/	1,0 gm/cm3 at 25°C
Solubility - water:	Highly soluble
Solubility - solvents:	Soluble
Viscosity	@ 40°C, mm2/s: Base bitumen - 2000 AMU
Protonated amine	70 wt.%
Ammonium salt	30 wt.%

All trees received the recommended doses of organic manure in winter, 15-20 m^3/fed (25 kg/tree) and mineral fertilization of (NPK): 100-200 kg/fed ammonium nitrate in two doses in March and May after the fruit eased, 75 to 100 kg/fed calcium superphosphate and from 50 to 75 kg/fed potassium sulfate in March), respectively.

The amount of irrigation water was calculated without addition leaching requirements using the equation of Doorenbos and Pruitt (1984) and Kaller and Bliesner (1990):

Diw = ((ETo X Kc X Cr X No. T.) / Ea) - Pe.
　　　Where:

Diw = Applied irrigation water (liter/tree/day)
ETo = Potential evapotranspiration (mm / day)
Kc = Crop coefficient from FAO56.
Cr = Canopy cover represented by the shadow area 1.5 m half diameter under trees at mid-day which in average = 7.07 m2.
No. T. = No. of trees/fed = 324 tree.
Ea = Irrigation system efficiency (%) = 85 % for drip irrigation.
Pe = Effective rainfall (mm) = 0.30 rainfall.
The amounts of applied irrigation water are shown in Table (5).

Table (5). Irrigation water applied to pomegranate trees grown in El-Maghara area.

Items	Feb.	Mar.	Apr.	Ma.	Jun.	Jul.	Aug.	Sep.	Oct.	Avg.

WR: Water requirements, IR: Irrigation requirements, ETo: Potential evapotranspiration, Emitters discharge 20 L/h

Soil moisture was measured with both tensiometer and gravimetric method at depths of 0 - 30, 30 - 60 and 60 - 90 cm. The values of soil moisture content which gravimetrically determined were employed for calculating the crop water consumptive use using Doorenbos and Pruitt (1984) equation as follows:

ETa = ($M._2$ % - $M._1$ %) x d_b x D x 1000　mm
Where:
ETa = Actual evapotranspiration (mm).

$M.2$ = Moisture content after irrigation (%).
$M.1$ = Moisture content before irrigation (%).
db = Bulk density of soil (g / cm3)
D = Active root depth (m).

Crop water use efficiency (WUE) was calculated by dividing the crop yield by the amount of seasonal evapotranspirations according to Giriappa, (1983). Water economy was calculated by dividing the crop yield by the amount of water added as kg/m3 according to Talha et al. (1980). Crop coefficient was

calculated by dividing the actual evapotranspiration (ETa) by potential evapotranspiration (ETo) according to Yaron et al. (1973). Environmental stress coefficient (Ks) was calculated by dividing the actual evapotranspiration (ETa) by maximum crop evapotranspiration (ETc calculated from ETo avg. 10 years and Kc FAO) according to Allen et al. (1998). Irrigation water use efficiency coefficient (IWUE) was calculated by dividing actual evapotranspiration (ETa) by the applied irrigation water (Diw) as reported by Norman et al., (1998). At the end of the experiments, pomegranate yield was recorded. Moreover, in the three seasons, the fruit of each treated trees were harvested on 5th October, then fruits were counted and weighed in kg. Data were statistically analyzed using Snedecor and Cochran (1989). Investment Ratio (IR) = (total revenue, LE / total cost, LE) according to Rana et al. (1996).

3- RESULTS AND DISCUSSION

3.1. Detection of Climatic Changes:

EL–Maghara region, about 90 Km south El-Arish city, North Sinai Governorate, Egypt, with altitude of about 200 meters above sea level, latitude $30^{o}35`$ N. and longitude $33^{o}20`$ E. Olive, guava, pomegranate trees and some vegeTables, medicinal and aromatic plants are grown in the area.

The climatic change is nowadays one of the highest negotiable issues through either scientific reports or multimedia. Meanwhile, there is no unique vision about this issue as some of the scientists believe that changes going toward increasing global temperature, while others referring that to the traditional meteorological cycle of cooling and heating. However, the majority of negotiations is dealing with the required precautions in the face to the worming phenomenon up to the studied simulation models.

Therefore, meteorological data were collected for a period of 30 years (1961-1990) as well as meteorological data of the recent period of 10 years (1998-2007) of the studied area in order to detect the occurrence of changes in the different climatic elements.

Meteorological data for about 30 years (1961-1990) of EL–Maghara region (Table 6a) was collected from the Climatic Atlas of Egypt (1996) and compared with measured climatic data of EL–Maghara region during the ten years period from 1998-2007 (Table 1).

Table (6a). Meteorological data for about 30 years (1961-1990) of EL–Maghara region.

Elements avg. 30 years	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	Avg.

To detect the variations in meteorological elements among the three sets of collected data; i.e. 30 years (Table 6$_a$), 10 years (Table 1) and the last 3 years (Table 6$_b$), the last Table showed these comparisons. From the Table it can conclude to the following:

1. Remarkable increase in average maximum temperature values when comparing the three years values of 2008, 2009 and 2010 with corresponding ones of both average 10 and 30 years bases which could be contributed to the enhance in growth parameters (Supit *et al.,* 2010).
2. Remarkable decrease in average minimum temperature values for the three years of 2008, 2009 and 2010 only when compared with 30 years, while fluctuated on 10 years base. This is clearly reflected on achieving the needed chilling hour's requirements which help in breaking the dormancy phase (actually ranged between 250 and 400 hours) (Sheets et al., 2008) compared with the reference one which is between 100-200 hours.
3. The net result of 1 and 2 is wider temperature range of fluctuation for the last years 2008-2010 which reflect partial continental phenomena (Stefan et al., 2007).

4. The relative humidity values become higher when compare the last 3 years 2008-2010 with 30 years data; while lower when compare with 10 years values (Peter et al., 2005).
5. Generally, the wind speed values of the last 3 years 2008-2010 tend to be lower than both 10 and 30 years values.
6. Generally, the rainfall of the last 3 years 2008-2010 give lower values on both bases of 10 and 30 years values (IPCC, 2007).
7. The net conclusion of all elements on reference evapotranspiration (ETo) values for the last 3 years 2008-2010 give contradictory trends being lower than average 30 years (may be due to higher relative humidity values), while higher than the 10 years values (may be due to lower relative humidity values) (IPCC, 2007).
8. The last two columns in Table (6c) define the "Oasis effect" for the experimental site through the following:
a- Definite increase in average maximum temperature values (IPCC, 2007).
b- Definite decrease in average minimum temperature values, therefore, definite wide temperature range (IPCC, 2007).

c- Sensible increase in average relative humidity values (IPCC, 2007).
d- Clear decrease in average rainfall values (IPCC, 2007).
e- Clear decrease in potential evapotranspiration (ETo) (IPCC, 2007).

From all these observations it can conclude to sensible climate variations for the site which should be faced by proper irrigation application which is the main target of this research. Not worthy to mention that the studied area is a typical site for the "Oasis effect" criteria as the cultivated site is surrounded by mountainous heights which cause heat convection to the cultivated core of the area. So, blowing of the wind loaded with high temperature in the waves caused a rise in the values of evapotranspiration at the edges of the region and cold the core of the cultivated areas (Sheets et al., 2008) and (Peter et al., 2005). Furthermore increasing the values of relative humidity and reducing the values of evapotranspiration within the studied region (Supit et al., 2010). Peter et al., (2005) and Stefan et al., (2007) they found that altitude and surrounding by mountains have a large effect on crop evapotranspiration. Therefore, as they conclude, resolution of land use data and digital elevation models would be needed to reliable model irrigation

water requirements for larger regions or the entire country of Oman.
On global base, there are climate changes slightly each year, which can forecast an increase in the average air temperature by about 3 degrees Celsius during the next hundred years, which need several efforts to mitigate and adapt to projected climate change. (IPCC, 2007) pointed out to the global climatic change, and further changes are expected regardless of the efforts to reduce global emissions of atmospheric CO2 which increased from an industrial concentration of 280 to 379 ppm in 2005 (IPCC, 2007).

The product of these variations reflects a definite decrease in both potential and actual evapotranspiration mean values (ETo & ETa) for the site under the pomegranate trees.

9. From the horticulture point of view, the pomegranate trees enhance production with wider temperature ranges which is clearly noticed in Table (6c). Furthermore, it needs sufficient chilling hours through winter season (October – March) which also detected from recorded meteorological data as shown in Table (6b) as previously mentioned in point 2.

Interrelation among both potential and actual evapotranspiration, crop production and water use efficiency:

Table (6$_d$) Data of average potential evapotranspiration, actual evapotranspiration, pomegranate yield and water use efficiency for the studied three years (2008-2010).

Growing seasons	2008	2009	2010	Average
Potential Evapotranspiration ETo (m³/fed)	2887.04	2833.41	2894.46	2871.64
Actual Evapotranspiration ETa (m³/fed)	1870.46	1911.52	1966.12	1916.03
Fruit Yield (kg/fed)	6227.28	7019.68	7855.35	7034.10
Water Use Efficiency (kg/m³)	3.36	3.70	4.02	3.69

The data in Table (6$_d$) indicate the following:
  a- Fluctuation of ETo average data over the studied years from 2008-2010.
    Which discussed before, an enhancing the growth of pomegranate trees.
  c- The general results, despite the effect of treatments, in gradual significant increase in pomegranate production over the three years. However the cumulative increase in trees production through 2008 to 2010 reaches about 23%.
3.2. Actual Evapotranspiration (ETa):
  EL–Maghara area affected by the phenomenon of what is known "Oasis effect" as it surrounded by mountains and dry desert areas as mentioned before.
  Data presented in Table (7) show a significant decrease in actual evapotranspiration (water

  b- Successive increase in ETa average values indicating definite effect of climate changes,

consumptive use) with increasing irrigation intervals, but exhibit a highly significant decrease in water consumptive use under olive pomace mulch (OPM) for pomegranate trees. The data also show significant interaction between the applied 6 days irrigation interval and olive pomace mulch (OPM) treatment. Water consumptive use of pomegranate increased by progress of the trees age. Table (7) gives the daily actual evapotranspiration values (liter/tree/day) as detected by field measurements throughout the growth three seasons.

Table (7). Actual evapotranspiration (liter/tree/day) of pomegranate grown in El-Maghara region.

(IF): irrigation intervals, (SM): soil management, (CWM): Control Without Mulch, (BEM): Bitumen Emulsion Mulch, (OPM): Olive Pomace Mulch. a, b, c, letters indicated to significant differences between treatments.

Comparing the values of water consumption under olive pomace mulch and bitumen emulsion mulch shows the following:

i- Dark color of bitumen emulsion mulch enhance heat reservation under trees canopy, so providing sufficient energy to processes and conditions related to plant growth. These include movement and uptake of soil water and nutrients, chemical and biological reactions, microbial activities, root growth …..etc.

ii- Evaporation has been highly retarded under olive pomace mulch than that under bitumen emulsion layer as the former can catch moisture than the latter.

iii- It is also noticed that the control plots suffered from weed growth which consume some of the added water, so the residual for trees decreased than planned amount, thereby plant growth appreciably decreased.

Similar results were obtained by Hasan *et al.,* (2002) who found that the total water consumption and water use efficiency were highest under the highest soil moisture regime with black polythene mulch. Seidhom and Evon (2006) found that, mulching significantly reduce evaporation losses.

3.3. Fruit Pomegranate Yield:

Supit et al., (2010) found that the recent changes in the simulated potential crop yield and biomass production were caused by changes in the temperature and examined global radiation patterns, using the Crop Growth Monitoring System.

It is quite evident from Table (8) that the tree yield increased significantly with increasing irrigation intervals. The higher value of tree yield was achieved by irrigated trees at 6 days, followed by 4 days. While, the interval 2 days recorded the lowest values of tree yield. The results go in line with those

reported by Abou-Aziz et al., (1995), Afria et al., (1998) and Sheets et al., (2008) witch noticed that when soil reached 60 or 40% of field capacity, irrigation regime were resulted in the highest pomegranate fruit numbers and yields.

Table (8). Fruit yield of pomegranate crop grown in El-Maghara region.

(CWM): Control Without Mulch, (BEM): Bitumen Emulsion Mulch, (OPM): Olive Pomace Mulch. a, b, c significant differences

In relation to the specific effect of soil management the olive pomace mulched trees showed to be most effective treatments in tree yield, followed by bitumen mulched trees as compared with unmulched trees (control) (Table 8). The same results were obtained by Patra et al., (2004) who found that all the mulching treatments resulted in higher yield per hectare compared to the control. The same trend obtained by that Singh et al., (2003), Seidhom and Evon (2006) and Bakeer (2009).

Considering, the interaction effect of irrigation intervals and soil management on yield, data in Table (8) indicate that irrigated at 6 days with olive pomace mulching trees recorded the highest values of tree yield during the three seasons. However, irrigated at 2 days with non-mulching within trees gave the least values in this concern. However, pomegranate fruit yield increased by progress of the trees age.

From Table (8) it is clearly noticed the following:

Irrespective to mulching treatments clearly yield increases upon increasing irrigation intervals. These findings may be explained by the effect of expanding irrigation period on enhancing root elongation, while mulching to accelerate this result which in turn reflected on yield of trees. These findings are mainly due to stimulation of concurrent flow of water and heat and partial aeration, which increase the yield. On the other hand, data show that variation in yield due to alternate bearing, and yield improved. These results are in agreement with findings of Singh et al., (2003), Seidhom and Evon (2006) and Bakeer (2009).

3.4. Water Use Efficiency of Pomegranate Crop (W.U.E.):

Data presented in Table (9) reveal that the influence of increasing irrigation intervals on WUE is significant differences. Whereas a mulch treatment significantly increases upon applying mulching treatments compared to the control (irrigation interval at 2 days without mulch). The highest value of WUE is associated with irrigation interval at 6 days by using olive pomace mulch were reached 5.55, 5.59 and 5.65 (kg/m3) followed by using olive pomace mulch irrigated at 4 days were reached 4.04, 4.52 and 4.64 (kg/m3) for the three seasons, respectively. WUE of pomegranate increased by progress of the trees age.

Peter et al., (2005) and Supit et al., (2010) they found two mechanisms to reduce heat and moisture exchange between the oasis and the surrounding desert: (1) the updraft over the desert reduces low-level hot, dry air flowing from the desert into the oasis; and (2) the downdraft increases the atmospheric static stability that reduces the oasis evaporation, and thus increasing WUE. However, olive pomace mulches may be associated with pronounced increases in soil temperature. So, it is suggested that this result activate both water and nutrient consumptions by root of trees which affect the crop yield. Also, may due to stimulation of concurrent flow of water and heat and partial aeration, which increase the yield. Similar results were obtained by Hasan et al., (2002) Seidhom and Evon (2006) and Bakeer (2009).

Table (9). Water use efficiency and water economy of pomegranate crop grown in El-Maghara region.

3.5. Water Economy of Pomegranate Crop (W.E.):

Data in Table (9) reveal that the same trend of water use efficiency is observed in water economy of pomegranate which increased by increasing irrigation intervals. However, for mulch treatments significant increase compared to the control (irrigation interval at 2 days without mulch). The highest value of W.E. is associated with irrigation interval at 6 days by using olive pomace mulch were reached 4.14, 4.31 and 4.49 (kg/m^3) followed by using olive pomace mulch irrigated at 4 days were reached 3.09, 3.53 and 3.74 (kg/m^3) for the three seasons, respectively. W.E. values of Pomegranate increased by progress of the trees age.

These findings may be due to saving the stored soil moisture and also to high yields, thereby high water economy values. Similar results were obtained by Hasan *et al.,* (2002) Seidhom and Evon (2006) and Bakeer (2009).

3.6. Irrigation Water Use Efficiency Coefficient (IWUE):

Many indices to assess water use performance have been used and are summarized by Purcell and Currey (2003). These indices describe the conversion of available water resources into crop yield at different stages of plant growth and thus quantify the proportion of productive water use to unproductive losses. In this study irrigation water use efficiency coefficient is computed as the ratio of actual water demand and the applied amount of irrigation water (Norman *et al.,* 1998). Irrigation water use efficiency coefficient (IWUE) of pomegranate trees decreased by increasing intervals between successive irrigation and mulching (Table, 9). Amounts of applied water will be decreased to raise the irrigation water use efficiency (IWUE), which could be considered as water saving parameter as show in Table (9).

Table (9). Irrigation water use efficiency coefficient (IWUE) of pomegranate crop grown in El-Maghara region during the three seasons.

Growing seasons	FEB.	MAR.	APR.	MAY	JUN.	JUL.	AGU.	SEP.	OCT.	Irrigation water use
Average 2008	0.74	0.69	0.73	0.82	0.82	0.82	0.82	0.82	0.75	0.78
Average 2009	0.76	0.73	0.74	0.84	0.83	0.83	0.84	0.83	0.76	0.80
Average 2010	0.77	0.83	0.78	0.85	0.85	0.85	0.85	0.85	0.78	0.82
Annual average	0.76	0.75	0.75	0.84	0.83	0.83	0.84	0.83	0.76	0.80

Regarding the irrigation water use efficiency coefficient (IWUE), Table (9) shows that the obtained values ranged between 0.63 and 0.86 with an average of 0.78 for 1st. year, 0.68 and 0.88 with an average of 0.80 for 2nd. year and 0.73 and 0.91 with an average of 0.82 for 3rd. year. These findings confirm the success of 6 days interval of irrigation than other two treatments due to low irrigation use efficiency. It is worthy to note that the efficiency of drip irrigation was assumed to have 85 % (Doorenbos and Pruitt, 1984), so adopting expanded irrigation intervals with some mulching surface application is

advised to these conditions. Similar findings were stated by Farshi (2001), Stefan *et al.,* (2007) and Bakeer (2009).

3.7. Pomegranate Crop Coefficient (Kc):

Data presented in Table (11) reveal that the influence of irrigation intervals on crop coefficient of pomegranate plant progressively increasing was not significant. However, significant decrease resulted by using mulch of olive pomace and bitumen compared to the control (irrigation interval at 2 days without mulch).

Table (11). Pomegranate crop coefficient (Kc) under El-Maghara conditions during the three seasons.

Growing seasons	FEB.	MAR.	APR.	MAY	JUN.	JUL.	AGU.	SEP.	OCT.	Kc Season
Average 2008	0.42	0.43	0.52	0.69	0.73	0.73	0.70	0.69	0.60	0.61
Average 2009	0.40	0.47	0.53	0.68	0.79	0.78	0.74	0.70	0.66	0.64
Average 2010	0.35	0.40	0.57	0.72	0.82	0.77	0.73	0.78	0.67	0.65
Annual average	0.39	0.43	0.54	0.70	0.78	0.76	0.72	0.72	0.65	0.63

Adjusting crop coefficient in suitable environmental conditions, which could be considered as a water saving parameter. These findings may be the decrease actual evapotranspiration due to keeping soil moisture content under mulch and thus decrease crop coefficient. Similar findings were stated by Allen *et al.*, (1998) and Seidhom and Evon (2006).

3.8. Environmental Stress Coefficient (Ks):

When cultivating crops in fields, the real crop evapotranspiration may deviate from, ETc due to non – optimal conditions such as the presence of pests and diseases, soil salinity, low soil fertility, water shortage or water logging. This may result in reducing the evapotranspiration rate below, Etc. Therefore, under soil water limiting conditions, Ks < 1, and where there is no soil water stress, Ks = 1.

Likewise, the same trend of a crop coefficients of pomegranate was observed for the environmental stress coefficient which, progressively increased by increasing irrigation intervals with non significant differences and significant decrease with using mulch of bitumen and olive pomace compared to the control (irrigation interval at 2 days without mulch), Table (12).

To increase water saving and decrease water loss, we must modify the calculated irrigation water amounts to formula by multiplying with the stress coefficients Ks, IWUE and Kc or by adjusting Kc for all kinds of other stresses and environmental constraints on crop evapotranspiration, then become as;

$D_{iw} = ((ET_o \times Kc \times Ks \times IWUE \times Cr \times No. T.) /Ea) + R.$

Table (12). Environmental stress coefficient (Ks) of pomegranate crop grown in El-Maghara region during the three seasons.

Growing seasons	FEB.	MAR.	APR.	MAY	JUN.	JUL.	AGU.	SEP.	OCT.	Ks Season
Average 2008	0.87	0.81	0.86	0.96	0.96	0.96	0.97	0.96	0.88	0.92
Average 2009	0.89	0.86	0.87	0.99	0.98	0.98	0.99	0.98	0.90	0.94
Average 2010	0.91	0.98	0.92	1.00	1.00	1.00	1.01	1.00	0.92	0.97
Annual average	0.89	0.88	0.88	0.99	0.98	0.98	0.99	0.98	0.90	0.94

This may be interpreted that due to decreasing actual evapotranspiration, decreased crop coefficient (Kc), thus decreased (Ks) and (IWUE) which could be considered as water saving parameters and suiTable environmental conditions. Similar findings were reported by Allen et al., (1998) and Seidhom and Evon (2006).

3.9. Economical Assessment:

The values of investment ratio (IR) are illustrated in Table (13). Table (13) calculate the investment rate for the applied treatments in the experiment as a rate for investing one pound as it is calculated as following: IR = total revenue / total cost, LE. However, the modified IR values calculated depend on the modified irrigation water referring to actual evapotranspiration data. Table (13) arranges the resulted IR values for all treatments in ascending order with guidance of the national IR value which is about 2.25 for this area.

From Table (13) it can be concluded the following:

1- Mulching with olive pomace gives the high values especially under 6 day's irrigation interval (3.07).
2- Bitumen emulsion mulch under 6 days irrigation interval give higher IR values regarding to olive pomace mulch under 4 and 2 days irrigation intervals respectively.
3- All treatments give higher IR values than the national one with increasing trend by increasing irrigation interval being 6 > 4 > 2 days.

These findings give a group of options which could be adapted with different conditions in the site. Similar findings were stated by Seidhom and Evon (2006) and Bakeer (2009).

Table (13). Inputs, outputs items and investment ratio (IR) of pomegranate yield grown in El-Maghara region.

(CWM): Control Without Mulch, (BEM): Bitumen Emulsion Mulch, (OPM): Olive Pomace Mulch. 0.40 LE/m3 irrigation water

4- Conclusion

From the above mentioned discussion it can be conclude to the following:

1. There is a detected local climatic change for the main meteorological data of the site compared either with 10 or 30 years recorded data. These changes are partially caused by the global climatic change in one hand and to the local Oasis effect in the site in the other hand. These changes play a positive role in enhancing the yield of pomegranate trees referring to the horticulture references.

2. Enlarging the irrigation intervals from 2 to 6 days cause a gradual increase in such yield as it seems to enhance root elongation, so the shoot growth as well.

3. Saving irrigation water could be enhanced by using olive pomace mulch more than that achieved by bitumen emulsion mulch, while both were higher than that of unmulched trees.

4. In all cases, the applied treatment get higher investment ratios (IR) than the traditional one (2.25 LE/IL), but mulching with olive pomace engaged with 6 days irrigation interval give the highest IR value among all the tested interactions.

Deterioration and Diffusion Studies of Radioactive Wastes from the Concrete   Matrix by Dynamic Method

A. El- Dakroury

Hot lab. Center and waste management
Atomic Energy Authority, P.O. 13759 Cairo Egypt
Aishaw95@yahoo.com

Abstract: In designing radioactive waste repositories, it is necessary to predetermine the degree of cement performance change due to leaching degradation. Cement is a porous material and consists of solid phases in contact and in equilibrium with a pore water solution. The progress of degradation can be expressed in terms of water exchange cycles or speed of diffusion of ions in the pore solution. Cementitious materials are fundamentally unstable in water and will change properties with time. High pH conditions of aqueous solutions in a radioactive waste repository can be brought about by dissolution of cementitious materials. In order to clarify the mechanisms involved in maintaining this high pH for long time, the dissolution phenomena of cement hydrate was investigated. In the present research, leaching tests on powdered cement hydrates were conducted by changing the ratio of mass of leaching water to mass of cement hydrate Ordinary Portland cement hydrate was contacted with pour water and placed in a sealed bottle. After a predetermined period, the solid was separated from the solution. Calcium hydroxide is one of the main reaction products resulting from the hydration of Portland cement with water. It is also one of the more soluble phases found in hydrated cement systems. Study's the influence of calcium hydroxide dissolution and its effect under the dynamic leaching system .From the results of XRD analysis on the solid phase and the calcium concentration in the aqueous phase, it was confirmed that Ca $(OH)_2$ was preferentially dissolved when the liquid/solid ratio was 30 to 35 %, and that C–S–H gel as well as Ca $(OH)_2$ were dissolved when the liquid/solid ratio was 45% or larger. The crystalline phases were identified using X-ray diffraction . The leaching of ^{137}Cs was carried out according to the ANSI/ ANS -16.1.

Keywords: deterioration ; diffusion ;solubility; cement hydrate; C–S–H gel;

Introduction

Concrete structures such as reservoirs, tanks, dams, water- supply pipes are attacked by soft water for a long time and which may result in concrete degradation as well as environmental problems. Similarly, radioactive waste facilities are designed to be placed underground 100m to 1,000m, where are underwater, and those are needed high durability for a long period over 1,000 years. Cement is considered to be an important component in low level waste (LLW) disposal systems. However, the long-term evolutions of its mechanical strength and its ability to confine radio nuclides have not yet been clarified, which has resulted in uncertainties in long-term repository performance assessment. Cement hydrates will be altered by dissolution of their minerals on contacts with groundwater: this is considered to be a major factor in changing various properties of cement hydrates. The chemical characteristics of pore water (pH, Eh, concentration of nuclides, etc.) dominated by dissolution of cement minerals are considered to influence surrounding environments such as the waste form, bentonite and rock.

Therefore, investigation of cement dissolution behavior is very important in assessing the long-term performance of the repository. The behavior of cement dissolution has been studied by many researchers. [1-4] have modeled the cement dissolution behavior and calculated the long-term evolution of its composition in the aqueous phase .[5,6] studied hydrated cement and suggested that it dissolves by competitive reactions (leaching from the surface and diffusion inside), and that the phase and the structure of the hydrated minerals will change with the progress of dissolution.

Accordingly, in assessing the long-term performance of a cement barrier, it will be necessary to define the long-term alteration behavior of the cement hydrates. Recognizing the importance of clarifying change in cement hydrates associated with the progress of dissolution in the evaluation of solubility and chemical durability and in modeling cement alteration, dissolution tests of hydrated cement have been conducted. [7-9] X-ray powder diffraction (XRD) has been used to analyze the structure of inorganic minerals. However, as the crystallinity of hydrated calcium silicate gel (XCaO–YSiO$_2$– ZH$_2$O: hereafter C–S–H gel), a primary mineral of hydrated cement, is low, it was difficult to analyze the structure by XRD. While the change in structure due to dissolution is not clear, structural changes in C–S–H gel could affect the physical properties of cement hydrates. In order to assess the long-term barrier performance of cement

hydrates, analysis of the structure of C–S–H gel is a key issue.

Portland Cement is composed of four principal phases: alite (C₃S: 3CaO·SiO₂), belite (C₂S: 2CaO·SiO₂), a ferrite phase (C₄AF: 4CaO·Al₂O₃·Fe₂O₃) and an aluminate phase (C₃A: 3CaO·Al₂O₃). The calcium silicate phase (alite and belite) accounts for 65 to 70 wt%. The hydration of the calcium silicate phase produces C–S–H gel and portlandite (Ca (OH)₂). C–S–H gel and Ca (OH) ₂ were the main products of the hydration of the Portland cement. However, as the crystallinity of hydrated C–S–H gel is low, it was difficult to analyze the structure by XRD.

The objective of this study was to know how the cement changes both its chemical and physical properties over time and how it interacts with groundwater by used the dynamic leaching test. The concentrations of calcium and silica in the leachate were measured .The crystalline phases were identified using XRD . The leaching of 137-Cs was carried out according to the ANSI / ANS -16.1 [10]

Experimental procedure
1-**Materials**

Portland cement:

The tests were conducted using ordinary Portland cement which was kindly supplied from Suez Cement Co., Egypt, the measured Blain surface area was ~ 350 cm²/kg. The chemical composition of the cement was presented in table (1) The XRD of cement is presented in fig.1n general, the major factors causing deterioration of cementations materials are water, corrosive components contained in water, carbon dioxide in the atmosphere, and heat. In repository, the concrete should be considered to be exposed to ground water containing small quantities of corrosive components , therefore , are considered to be the tow major factors for degradation of hydrated cement . The reaction is very slow due to the low diffusivity of ions through the pores in hardened cement paste. The dynamic test is to acceleration calcium (Ca), silica (Si). Specimen preparation a mortar mix of ordinary Portland cement mixed with ¹³⁷Cs were prepared at a different three water – cement ratio 0.35 , 0.45 and 0.50 . These mortars were cast in cylinder molds (2.24cm in diameter, 5 cm in height) for leaching test and curing in lab., at ambient temperature for four weeks.
Fig 1 XR diffraction patterns of starting cement

Table (1) Chemical Composition of Materials (%)

Material	SiO₂	CaO	Al₂O₃	Fe₂O₃	MgO	K₂O,Na₂O	SO₃
PC	19.15	62.19	4.57	3.44	1.84	0.59	2.85

The apparatus and the experimental set-up for through-diffusion (leaching test)11

The whole apparatus in fig. 2 was constructed modularly and consists of transparent polystyrene allowing an easy check of the height of the solutions. The exterior measurements were about ($l \times w \times h$) $20 \times 15 \times 12$ cm. The larger cavity was the reservoir for the source concentration, its total volume being about 600 ml. With the help of a membrane pump a smaller part of the reservoir side (volume$\approx$ 50 - 55 ml) was continuously supplied with "fresh" solution from the larger part of the cavity. The pipes consist of PTFE, have a total length of about 1.0 m and an inner diameter of about 4 mm; the wetted parts of the pump are covered with PVDF, and the pump rate was about 15 - 20 ml/min, i.e. about 50 % of the maximum performance. The surplus of solution flows off an overflow back to the lower lying reservoir part of the cell. With such an arrangement a constant solution head was guaranteed. Due to the great amount of traced solution of the reservoir side the concentration on this side was kept nearly constant over a longer time span. Below the measurement cell there was a magnetic stirrer continuously mixing the solution in the measurement cell with the help of a small (Teflon covered) magnet. The temperature measured in the source solution changed in the interval of 25 - 35 °C 2, depending on the season. At the beginning of the experiments sorption of the tracer occurred at the walls of the diffusion cell and onto inner surfaces of pipes and pump. Therefore, daily and, later on, weekly checks of the reservoir concentration were performed by taking out 1 or 2 ml samples. Necessary corrections were made with the help of pre-calculated higher concentrated tracer solutions. The height of the liquid in the measurement cell had always to be at the same level as that of the reservoir side to avoid an additional driving force for diffusion due to a pressure gradient. The controlling and re-adjustment of this level after the sampling was done 'just by eye.

Table (2) Geometrical of the apparatus

quantity	symbol	unit	value
Volume of measurement cell	V	$0.1^6 m^3$	52.0 ± 0.6
Volume of the tank side	V_0	$0.1^6 m^3$	600 ± 35

When compared to the steady-state values for the diffusive flux, which was at least more than an order of magnitude larger it is evident that such additional fluxes can play a definite role only in the very early part of the tracer breakthrough curve. The volume of the measurement cell was determined to be 52.0 ml with an uncertainty of about 0.6 ml (0.6 % relative error).An ideal boundary condition at the low concentration side would had been an exact zero concentration condition which only was fulfilled at the very beginning of the experiments. For practical reasons in maximum a concentration of 1 % of that of the reservoir concentration side was accepted resulting in daily sampling, hence replacing of the whole liquid volume of the measurement side. However, in the (near) steady-state phase the concentration could periodically exceed this 1 % level of C_0, yet only in the two days absence of the experimentalists during the weekends. After the weekends the maximum concentration in the measurement cell could be a few percent, but it was always well below 5 % of C_0."

C_t   = concentration released from the specimen during the *n* th leaching interval.

Analysis of Leachants

All leachant analyses for ^{137}Cs were performed on a high purity germanium (HPGe) gamma spectroscopy system in accordance with specifications outlined in ANSI 42.14 - Calibration and Use of Germanium Spectrometers for the Measurement of Gamma-Ray Emission Rates of Radio- nuclides.[10] The 1.9 1 polyethylene leachate containers also served as counting containers so no special sample preparation was required. Count times of 600 sec and 6000 sec gave minimum detectable activities (MDAs) for Cs of 1.38 Bq and 0.44 Bq, respectively. Use of longer count times to achieve lower MDA values was not warranted since the MDA value obtained at 6000 sec was considered negligible compared with the original activity spiked into each cement specimen, A_p. Counting times were of sufficient length to ensure counting errors were consistently below 20%. Leachant analyses provided the activity of the selenium released from the specimen during the nth leaching interval (a_n.) [11] The leaching test was the a considerable amount of experimental data obtained from the samples, which maimed their dimensional integrity during leaching , indicate that internal bulk diffusion is the most likely rate – determining mechanism during the initial phases of the leaching process. Although additional mechanisms probably do occur to some degree, they are more likely to become rate determining only during later ages of leaching (19, 47 and 90). thus , the recommended data handling procedure of the standard is permissible , due to simplification of mass- transport theory (second Fick law at non- stationary stat) , for the purpose of clarifying and ranking solidified wastes , according to leachability . The solution of the mass- transport equations (second Fick law), for a specimen that be considered as a semi-infinity medium, permit the effective diffusion to be computed by:

$$D_e = \ [\ (C_n/C_o)\ /(\ t)_n\ ]^2\ [\ V/S]^2\ T \qquad (1)$$

$$T = [\ 1/2\ \ t_n^{1/2} + t_n^{1/2}\ ]^2 \qquad (2)$$

Where
De is diffusivity factor
C_n is the activity or concentration released from the specimen during the n th leaching interval ;
C_o is the total activity or concentration of a given ion at the beginning of the first leaching interval;
$(\ t\ )_n$ is the duration of the n th leaching interval seconds;
V is the volume of the specimen in cm^3 ;
S is the geometric surface area of the specimen in cm^2
interval for a semi-infinite medium .
Generally, this method to calculated "D_e " is valid up to 5 days of leaching time (abbreviated test) , where diffusion is the rate – detaining mechanism. At this point in the test , the T is the cumulative leaching time representing the " mean time " of the n th leaching specimen acts like a semi- infinite medium . from 5 days , the specimens , generally , acts like a finite medium, being the cumulative fraction leached higher than 20 % , and other methods to calculate " D" must be used . So, for example a graphical method or interpolation , from which the parameters "G" can be obtained , n this case

$$De = Gd^2 /\ (\ t)_n$$

Where
d is the diameter of the specimen in cm , ,
G is the dimensionless factor As far as the leachbility index "L" is concerned , it is a normalization factor , which is related to the specific material tested :

$$L = \log (\ \ /\ D_e)$$

Where ,   is a defined constant (1.0 cm^2 / s) . "L" also depends on the leaching condition and the leachant renewal schedule.
Leachbility studies, therefore, consider all these variables and the results are applicable only to cases where all these the same within certain error range tables 4, present cumulative fraction release (CFR) values for each formulation at leaching intervals as specified in the ANSI/ ANS 16.1 -2003.

Results and discussion

1. Composition of the Aqueous Phase

Depending on the formulation of the cement-based binder system, different crystalline phases will be present at different curing durations. This would also vary based on the disposal environment. These crystalline phases would incorporate contaminants into their matrix, generally on a preferential basis. Leaching involves the attack of water on the calcium hydroxide and calcium silicate hydrate (CSH) present in hydrated cements. Solid hydrates of cement paste are more persistent at pH above 12-13, but at a lower pH the hydration phases no longer remain stable and thus dissolve. The pore solution of a typical portland cement paste is highly alkaline, so that the leaching process starts by removing alkalis (Na+ and K+), followed by dissolution of portlandite (CH) and subsequently by the leaching of calcium from silicates. Aluminate phases are also affected; depending on the formulation of the cement-based binder system, different crystalline phases will be present at different curing durations the aqueous phase and the concentrations of Ca and Si are shown in Table 2 and the relation between the leaching period and the composition of the aqueous phase is shown in Fig. 2. The results show that the pH and the concentration of Ca increase as the leaching period is extended, which indicates that the aqueous phase and the solid phase approach equilibrium with the development of dissolution.

The leaching period for which the values become constant was about 4 weeks for samples with a small liquid/solid ratio, and 5 weeks for ones with larger liquid/solid ratio. The cumulative amounts of Ca and Si dissolved in the aqueous phase after 16 weeks of leaching are shown in Table 3. As the liquid/solid ratio becomes larger, the amount of dissolved Ca increases and the Ca/Si molar ratio of the solid become smaller. The change in the solid phase composition could have affected the dissolution rate, which is considered as a cause of this trend. The concentration of Si in the aqueous phase also converged. However, the concentration of Si in samples with large a liquid/solid ratio increased at first and then decreased, finally converging at a specific value. It is considered that a large amount of Ca in the surface layer of the sample dissolved at the large liquid/solid ratio, which temporarily reduced the Ca/Si molar ratio in the surface layer. As C–S–H gel with a low Ca/Si molar ratio in the surface layer temporarily maintains equilibrium with the aqueous phase, the dissolution rate of Si was increased The most important is a gel-like phase, designated C-S-H because it contains Ca, Si, and water (H_2O). This gel constitutes the principal binding phase. The gel phase is further restricted in composition because it largely excludes other chemical components of the paste from its crypto structure

However, after the solid phase as a whole comes into equilibrium with the aqueous phase, the solid phase becomes homogeneous, leading to an increase in Ca/Si molar ratio and a decrease in concentration of Si. The pH and Ca concentration become constant in about 4 weeks for the samples with a small liquid/solid ratio and 8 weeks for the ones with larger liquid/solid ratio. The Si concentrations were constant after 13 weeks, which was considered to indicate that the solid phase entered into equilibrium with the aqueous phase after 13 weeks of leaching.

2- Relation between the Ca/Si Molar Ratio in the Solid Phase

The relation between the Ca/Si molar ratio in the solid phase and the composition of the aqueous phase after 13 weeks of leaching is given in Fig. 3. The Ca/Si molar ratio was calculated from the amount of Ca and Si dissolved in the aqueous phase. The pH and Ca concentration decreased when the Ca/Si molar ratio of the solid was small. The difference in the aqueous phase is considered to be due to this variation .However, the Ca/Si molar ratio in the solid phase after dissolution tests was obtained by calculation. Therefore, it will be necessary to analyze the chemical composition of the solid phase to compare it with the composition of aqueous phase

Table 3 Cumulative amounts of Ca and Si dissolved in the aqueous phase after 12 weeks of leaching

W/C ratio	Ca/Si molar ratio of solid phase	Cumulative amount of element dissolved (mol)	
		Ca	Si
30%	3.04	2.07E-4	1.79E-7
35%	2.34	2.09E-3	2.24E-6
45%	1.98	3.43E-3	1.07E-5
50%	1.75	4.62E-3	2.32E-5
	1.01	5.00E-3	3.22E-4

3- Relation between Liquid/Solid Ratio and pH and Ca Concentration in the aqueous Phase

After 16 weeks of leaching is at equilibrium, the relation between liquid/solid ratio and pH and Ca concentration in the aqueous phase is shown in Fig. 4. The pH and Ca concentration are constant for liquid/solid ratios of 50% or less and decreases sharply for values of 30 lying between pH 10.5 and 12.5, is due to C-S-H dissolution. C-S-H dissolves incongruently from a C/S ratio, whereupon dissolution becomes congruent. The sudden drop in pH from pH 11.0 is due to exhaustion of the C-S-H phaseThe most important is a gel-like phase, designated C-S-H because it contains Ca, Si, and water (H20).The gel compositions is confined to a rather restricted range of compositions ranging in Ca:Si molar ratios between about 1.7. This indicates that the dissolution mechanism of the

solid phase to be dissolved had changed. A calculation using the amount of Ca(OH)2 obtained by thermal analysis and the solubility of Ca(OH)$_2$ indicates that the Ca(OH)$_2$ will saturate for a liquid/solid ratio of 30% or less, the concentration of Ca decreases with the increase in the liquid/solid ratio. This interpretation illustrates well the results shown in Fig. 4. Hence, the Ca(OH)$_2$ in OPC hydrate under the test conditions in this study is considered to reach equilibrium after 16 weeks of leaching.
Fig 4 Relation between liquid/solid ratio and pH and Ca concentration in the aqueous phase

Phase Development in Blended Cements

      For compares one from fig.1and fig 5, the solid phases present. The most important is a gel-like phase, designated C-S-H because it contains Ca, Si, and water (H$_2$0). This gel constitutes the principal binding phase. The range of gel compositions is confined to a rather restricted range of compositions ranging in Ca:Si molar ratios between about 1. The gel is not totally without structure: it gives a very diffuse x-ray pattern which resembles an ill-crystallized version of the natural mineral tobermorite. Hence, this cement substance is sometimes referred to as 'tobermorite gel.' The analogy is not, however, satisfactory from the standpoint of either composition or structure: crystalline tobermorite has a composition which is fixed, or nearly so, at the Ca$_5$Si$_6$ ratio, and it has distinctly better crystallinity and lower solubility than C-S-H gel. Hence, a distinction should be made. The gel phase is further restricted in composition because it largely excludes other chemical components of the paste from its cryptostructure. Alumina and some of the iron oxide in cement instead combine to form an aluminoferrite hydrate hydrogarnet) and sulphoaluminate. The nature of the sulphoaluminate depends on the ratio of SO_4^{-2} to AI ; high ratios favour ettringite, 3CaO. A1$_2$0$_3$. 3CaSO$_4$- 31- 32H$_2$0, while low ratios favour "monosulphate," a calcium aluminate hydrate capable of allowing substitution of 2OH$^-$ by SO_4^{--}. In practice, the Fe content of these phases is very low, and may be neglected in their formula. The total quantities of Al, Fe, and SO_4^{-2} in a Portland cement are generally low, so the amounts of these phases which can develop is small, perhaps 10-15% of the total volume of the solid paste components. However, the chemical balance of OPC is such that not all Ca can be combined into these phases. For example, typical modern Portland cements have Ca:Si ratios ~2.5, whereas the most Ca-rich C-S-H gel has a ratio of only ~ 1.7. Therefore, much of the chemical excess of Ca appears as Ca(OH)2, portlandite. The three main phases of a well-hydrated Portland cement thus comprise an aqueous phase coexisting with two solids, Ca(OH)$_2$ and C-S-H; the former is crystalline, while the latter is amorphous. The Aqueous Phase Even at low humidities, some capillary condensation of water occurs in cement pores and of course, many repository scenarios assume flooding, so an aqueous phase is always an important constituent of cement systems. Cement-equilibrated "water" has a high pH. It is in intimate contact with high surface area solids, a situation which favors equilibration and exchange. During the first few seconds of mixing, the mix water becomes strongly alkaline. It may also become supersaturated with respect to calcium during the first few minutes or hours of hydration; the solubility of Ca(OH)$_2$ is about 1.67 g/L at 20"C, but if a cement powder is shaken with water for a few minutes, Ca(OH)$_2$ solutions containing ---2.5 g/L are readily obtained. Such solutions are very labile; if filtered from cement and allowed to stand in a sealed container,

they precipitate spontaneously. Much of the matter thus precipitated is colloidal or nearly so. If, however, Portland cement is allowed to hydrate at normal w/c ratios and the pore fluid is expressed after 28 d, super saturation will have been relieved and the pore fluid attained a steady state, or nearly so. Two factors combine to lower drastically the Ca solubility in the pore fluid relative to its solubility in water. One factor is the discharge of super saturation, which lowers Ca solubility's towards the threshold set by $Ca(OH)_2$ solubility. The other, more important, factor arises as a consequence of the alkali content of the cement ,(14,15).

Analysis of leach ability waste

Among radioactive wastes arising during operation of nuclear power plants, the [137] Cs isotopes deserve attention from the point of view of immobilization due to its amount, half- life and high solubility. The conventional cementation technique is widespread for solidification of low and intermediate activity wastes [16] Cs mainly remains dissolved in the pore fluid of the cement matrix, from which it can readily migrate into the biosphere. Tables 5 and 6 present cumulative fraction release (CFR) values for each formulation at leaching intervals as specified in the ANSI/ANS 16.1 procedure. ANSI/ANS 16.1 defines cumulative fractional release as the sum of all fractions leached during all previous leaching intervals, plus the fraction leached during the last leaching interval (an $/A_0$) using the initial amount of the species of interest present in the specimen as unity. All CFR values were corrected for radioactive decay back to the beginning of the first leaching interval. Uncertainties associated with each CFR value are experimental errors at the 1.0 sigma value for triplicate specimens. It clear he cumulative fraction release was increase when the W/C ratios increase .The diffusivity of the Cs through OPC at different times decrease due to caesium binding capacity of a cement matrix is significantly dependent on the chemical composition of the cement used, as the various phases formed during hydration have different binding capacity.

Conclusions

In the repository environment, cements will undergo a variety of reactions. These reactions can be classified in two ways. Basically, either cement may be treated as a closed system with respect to transport of matter, or it may be treated as an open system; intermediate ossibilities exist. Obviously the subject is extremely complex, and much of the information required in order to make predictions is site-specific in open system scenarios. Nevertheless, breaking the problem into its constituent parts provides a logical framework within which the problems can be solved. Cements are attractive matrices for the immobilization of radioactive wastes; they are inexpensive, tolerant of wet materials, durable in the natural environment, and draw upon existing technology.

The specifications for cement are quite strict, and imply definite limits to chemical and mineralogical compositions, and hence to their performance Increasing the w/c ratio gives a more fluid mix (and also permits incorporating a higher proportion of liquid wastes) but the penalty to be paid is a rapid increase in the free, uncombined water content. This excess leads to a large increase in the total volume of larger pores (<0.1 μm), with corresponding increases in the permeability of the hardened product. If the role of cement is as a physical barrier, it must be formulated to a low w/c ratio; less rigorous restrictions may apply to grouts intended for space filling. Thus, in real situations, it may be necessary to compromise between fluidity, which implies higher w/c ratios, and impermeability, which implies the opposite.

The cement structures almost from the time of construction start to deteriorate in one form or another due to exposure to the environment (e.g., temperature, moisture, cyclic loadings, etc.). The rate of deterioration is dependent on the component's structural design, materials selection and quality of construction, curing, and aggressiveness of its environmental exposure

- The progress of degradation can be expressed in terms of water exchange cycles or speed of diffusion of ions in the pore solution. Cementitious materials are fundamentally unstable in water and change their properties with time.

1. Water is the single most important factor controlling the degradation processes of cement (i.e., the process of deterioration of cement with time is generally dependent on the transport of a fluid through concrete), little reduction in quantity of Ca^{++} by lowering W/C ratio inductee that.

2. The aqueous phase reached equilibrium after 16 weeks from leaching.

3. The cumulative Fraction Released (CFR) of ^{137}Cs data suggest the reducing the W/C ratio of a cement formulation plays a somewhat limited role in its ability to immobilization of wastes and the immobilization may involve chemical fixation by formation of crystalline or noncrystalline compounds and sorption .

   There are changes and some damage occurs in cement under the dynamic leaching test the XRD

4. The durability of cement based grouts under condition potentially found to be in nuclear waste repositories must studied

Serum Fetuin-A Levels in Type 2 Diabetes Patients with Early Diabetic Nephropathy: It's Relation to Diabetes Control

[1*]Ayman Ramadan, [1]Amira Shoukry, [1]Mabrouk I. Ismail and [2]Maher Borai

[1]Internal Medicine, [2]Clinical Pathology Departments, Faculty of Medicine, Zagazig University, Zagazig, Egypt
[*]aymedman@yahoo.co.uk

Abstract: Background and objective: Fetuin-A is a circulating calcium-regulatory glycoprotein that inhibits vascular calcification. In the present study, serum fetuin-A was studied as a novel risk factor for the development of diabetic nephropathy and the relation between its levels with the state of diabetes control. Patients and Methods: 50 patients with type 2 diabetes mellitus (T2DM) and early diabetic nephropathy, 25 patients of them have well controlled diabetes on treatment (the first group), the other 25 patients have uncontrolled diabetes (the second group), and another 25 healthy volunteers (control group)) were enrolled in this cross sectional study. Serum fetuin-A, Fasting plasma glucose (FP glucose), glycoselated hemoglobin A1c, lipid profile (total cholesterol,HDL and triglycerides), Serum creatinine, Glomerular filtration rate (GFR), Albumin excretion in urine were measured. Results: There was a significant reduction in Serum fetuin-A levels in controlled diabetic patients (314±66.8) and uncontrolled diabetic patients (252.4±55.6) compared to control group (478.6±74.4). A significant decrease was also detected in uncontrolled diabetic patients when compared to controlled diabetic patients (P<0.001). A strong inverse correlation was found between serum fetuin-A and each of F P glucose, glycoselated hemoglobin (HbA1c), serum creatinine, and urinary albumin excretion (r = -0.52, -0.55, -0.61, and -0.56 respectively; P < 0.001 for each). Whereas; GFR was significantly positively associated with serum fetuin-A levels (r = 0.53, P<0.001). Conclusion: The results of this study demonstrate that diabetic nephropathy, especially with uncontrolled diabetes, is linked to low serum fetuin-A levels which represents a novel risk factor for the development of vascular complications. This factor could be responsible for the development and progression of accelerated nephropathy especially with uncontrolled diabetes.

1. Introduction:

Various biomarkers have been studied for identification of type 2 diabetes patients at micro- and macrovascular risk. Most of these markers are inflammatory, metabolic or procoagulant molecules indicating an unfavorable metabolic and vascular status in patients with type 2 diabetes [1]. However, the different biomarkers show large variations in risk prediction depending on metabolic status and disease severity of the study groups [2,3]. Recently published data imply, that most novel biomarkers do not improve risk prediction when added to models based on conventional risk scores [4] Yet, associations of novel biomarkers such as fetuin-A with metabolic markers or complications do help to understand their role in the pathophysiology of vascular disease.

Fetuin-A, a circulating calcium-regulatory glycoprotein that inhibits vascular calcification, is predominantly synthesized in liver. It is secreted into the blood stream and deposited as a noncollagenous protein in mineralized bones and teeth. During fetal life, there is high serum concentration of fetuin-A. Its level declines following infection, acute or chronic inflammatory states and malignancy [5,6]. Low

serum fetuin-A levels have been reported in chronic renal disease and dialysis patients and is associated with inflammation and outcome [7,8]. Recent data have shown a relationship between vascular calcification and endothelial dysfunction in vascular disease [9]. Therefore, low serum fetuin-A level could be one of the contributing factors for the development of endothelial dysfunction in chronic renal disease patients.

So far, there is few data available for associations of fetuin-A with parameters of microvascular disease in diabetes. To clarify the relation between fetuin-A and microvascular complications in patients with type 2 diabetes and early diabetic nephropathy, we studied its associations with albuminuria and parameters of renal function. In addition, the state of diabetes control of these patients was assessed by quantification of the glycoselated hemoglobin A1c and its association with fetuin-A levels was assessed.

2. Methods
Study population and data collection

This study was carried out in Internal Medicine and Clinical Pathology departments, faculty of medicine, Zagazig University. This cross sectional study was conducted from January 2010 to January 2011.

This study included 50 patients with type 2 diabetes mellitus (T2DM) and early diabetic nephropathy who were recruited from the outpatient clinics of Endocrinology and Diabetes at Zagazig University Hospital and referred to the diabetes control for specialist treatment. The selection of patient groups was as follows:

25 patients were selected to have well controlled diabetes on treatment (First group): They were 13 males & 12 females, having a mean age of 53.76 ± 6.0 years, and a mean HbA1c of 6.2 ± 0.7.

25 patients were selected to have uncontrolled diabetes on treatment (second group): They were 13 males & 12females, having a mean age of 55 ± 6.2 years, and a mean HbA1c of 11 ± 2.1.

Another age and sex matched 25 healthy volunteers were chosen as a control group.

Inclusion criteria: patients with T2DM who had to have a documented history of albuminuria in at least two separate urine samples (urinary albumin > 20 mg/L as suggested by current German and international guidelines for the diagnosis of diabetic nephropathy) [10].

Exclusion criteria: We excluded patients with malignant neoplasms, severe infectious disease, severe congestive heart failure, type 1 diabetes and other renal disease by urinary sediments and medical records (macroscopic hematuria, abnormal sediment, urinary tract infection and past history of glomerulonephritis or nephro-ureterolithiasis).

All patients were submitted to full clinical assessment including history taking and through clinical examination including blood pressure measurements (systolic and diastolic) and assessment of body mass index (BMI). In all individuals, 24-h urine samples were collected and the albumin excretion rate in 24 hours is estimated. The study complied with the Declaration of Helsinki, and all subjects gave informed consent to participate in this study.

Clinical chemistry

Blood was drawn in a fasting state under sterilized conditions and stored at -80°C until analysis. The following investigations were done:

Fasting plasma glucose (FPglucose) was measured by a glucose oxidase method. Triglyceride (TG), total cholesterol, and high density lipoprotein cholesterol (HDL) levels were quantified by using ADVIA 1650 auto analyzer (Siemens Medical Solutions Diagnostic. USA). Glycoselated hemoglobin (Hb A1c) was estimated by ion exchange resin chromatography using Stanbio Glycohemoglobin.

Glomerular filtration rate is estimated from the Modification of Diet in Renal Disease (MDRD) formula [11] as follows: MDRD formula = 186 X [serum creatinine (mg/dl)]$^{-1.154}$ X [age]$^{-0.203}$ X [0.742 if patient is female] X [1.21 if patient is African-American], which is used for statistical evaluation of renal function.

Albumin excretion rate (AER) was assessed and performed in 24-h urinary collections. For collection of the urine sample, a 3-l plastic container was used, and the volume of urine was measured to the nearest 50 ml. Albumin levels were determined by turbidimetry (Siemens Healthcare Diagnostics, Eschborn, Germany). AER was expressed as milligrams per 24 h.

Serum fetuin-A was measured in duplicates by an ELISA (Epitope Diagnostics, Inc., San Diego, USA) The intra- and interassay variations were 5.3 and 7.1%, respectively.

Statistical analyses

Statistical analyses of the results were performed using SPSS software version 15.0 (statistical package for social science, SPSS inc. Chicago, USA). Continuous variables were expressed as means± standard deviation (SD). Comparison between two sets of patients was performed by independent t test, but more than two sets of patients were compared by one-way ANOVA. The Kruskal-Wallis (KW) test was applied to compare the values of HbA1c, F P glucose and Albumin in urine (non normal distributed variables) among the three groups of the study. Pearson correlation coefficient r was used to describe the association between serum fetuin-A and the variables of interest. P values <0.05 were considered statistically significant.

3. Results:

Clinical and laboratory characteristics of all patients with diabetes mellitus and healthy control subjects and comparison between all groups are given in Table 1.

There were no differences in age {P=0.6}, sex {P=0.94}, duration of diabetes {P=0.97}, body mass index (BMI) {P=0.2}, systolic blood pressure {P=0.06}, diastolic blood pressure {P=0.54}, and serum albumin {P=0.75} among all groups of the study. There was no differences in the percentage of diabetic patients on treatment by ACE or insulin therapy between the two groups of diabetes mellitus {P=0.77 and 0.67 respectively}.

Table 1: Demographic, Ciinical and laboratory characteristics of the studied groups.

**P is significant.   KW, The Kruskal-Wallis test.

* Significance is present between this group and the other two groups.

[+] Significance is present between controlled diabetics and control group.

BMI: Body mass index. HbA1c: Glycoselated hemoglobin. F P glucose: Fasting plasma glucose.

GFR: Glomerular filtration rate. HDL: high density lipoprotein.

Fasting plasma glucose levels were significantly higher in the uncontrolled diabetic group (127.3 ± 20.2) than in the controlled diabetic group (92.2± 12.82) and healthy control group (82.3 ±7.8) {p<0.001}, and also there was a significant increase in FP glucose in the controlled diabetic group as compared to healthy control group {p<0.001}.

Hemoglobin A1c (HbA1c) was significantly higher in the uncontrolled diabetic group (11.0 ± 2.1) than in the controlled diabetic group (6.2 ± 0.7) and healthy control group (5.4 ± 0.5) {p<0.001}, and also there was a significant increase in HbA1c in the controlled diabetic group as compared to healthy control group {p<0.001}.

Serum creatinine levels were significantly higher in both the uncontrolled diabetic group (0.95 ± 0.19) and controlled diabetic group (0.9 ± 0.18) than in the healthy control group (0.55 ± 0.12) {p<0.001},

there was no significant difference in Serum creatinine between the uncontrolled and controlled diabetic groups.

GFR levels were significantly lower in both the uncontrolled diabetic group (95.5±17.7) and controlled diabetic group (103.1±14.6) than in the healthy control group (126.4±14.6) {p<0.001}, there was no significant difference in GFR between the uncontrolled and controlled diabetic groups.

Albumin excretion in urine was significantly higher in the uncontrolled diabetic group (243±140.5) than in the controlled diabetic group (188.4±114) and healthy control group (6.7±3.1) {p<0.001}, and also there was a significant increase in urinary Albumin excretion in the controlled diabetic group as compared to healthy control group {p<0.001}.

Triglyceride and cholesterol levels were significantly higher in both the uncontrolled diabetic

group (157.2±49.4 and 205±47.1, respectively) and controlled diabetic group (160.2±43.7 and 194.5±42.3, respectively) than in the healthy control group (119.2±23.3 and 160.2±23.3, respectively) {p<0.001}, there were no significant difference in triglyceride or cholesterol levels between the uncontrolled and controlled diabetic groups.

HDL levels were significantly lower in both the uncontrolled diabetic group (42.7±8.1) and controlled diabetic group (45.9±7.0) than healthy control group

(52.5±9.7) {p<0.001}, there was no significant difference in HDL between the uncontrolled diabetic and controlled diabetic groups.

Serum fetuin-A levels were significantly lower in the uncontrolled diabetic group (252.4±55.6) and the controlled diabetic group (314±66.8) than in the healthy control group (478.6±74.4) {p<0.001}, and also there was a significant reduction in serum fetuin-A in uncontrolled diabetic group as compared to controlled diabetic group (p<0.001).

Table 2: Correlation between Serum fetuin and other Parameters of the study.

Parameter	Serum fetuin	
	r	P
Age	-0.09	> 0.05
Body mass index	0.001	> 0.05
Systolic blood pressure	-0.19	>0.05
Diastolic blood pressure	-0.03	>0.05
Duration of diabetes	0.02	>0.05
Glycoselated HbA1c	-0.55	<0.001*
Fasting plasma glucose	-0.52	<0.001*
Serum creatinine	-0.61	<0.001*
Serum albumin	0.06	>0.05
Triglycerides	-0.15	>0.05
Total cholesterol	-0.21	>0.05
high density lipoprotein	0.2	>0.05
Glomerular filtration rate	0.53	<0.001*
Albumin excretion in urine	-0.56	<0.001*

* Correlation is highly significant.

The overall mean serum level of fetuin-A was 348.36 ± 116.1 mg/L with a range of 170 to 620 mg/L. Correlation study revealed that each of HbA1c, FP glucose, serum creatinine and Albumin excretion were significantly and inversely associated with serum fetuin-A levels (r = -0.55, -0.52, -0.61, and -0.56 respectively; P < 0.001 for each), whereas; GFR was significantly positively associated with serum fetuin-A levels (r = 0.53, P<0.001). No other clinical or metabolic variable (as BMI, blood pressure, total cholesterol,HDL and triglyceride) was significantly correlated in these groups of diabetic patients with serum fetuin-A (P>0.05 in all, see table 2). The overall mean serum level of fetuin-A in male individuals was 347.5±126.5 mg/L, with no significant difference from that of female individuals (346.5 ± 107.6 mg/L, p = 0.97).

4. Discussion

The gene encoding fetuin-A is located on chromosome 3q27, the chromosomal region that was previously mapped as a type 2 diabetes and metabolic syndrome susceptibility locus (12). The aforementioned findings and the animal studies showing that fetuin-A induces insulin resistance (13-

16) resulted in the view that fetuin-A is an interesting candidate involved in the pathophysiology of type 2 diabetes. Genetic analyses revealing that single nucleotide polymorphisms in the fetuin-A gene were associated with type 2 diabetes in cross-sectional studies (17) further corroborated this hypothesis. However, the role of fetuin-A in the natural history of type 2 diabetes still remained obscure. Fetuin-A, besides the placenta, is exclusively secreted from the liver (18). Expression of fetuin-A and plasma levels of the protein were found to be increased when there is fat accumulation in the liver (19,20) and circulating fetuin-A is increased in the metabolic syndrome (21), the condition that strongly associates with fatty liver (22). Moreover, fetuin-A complexes with calcium and phosphorus in the circulation and prevents the precipitation of these minerals in serum [23,24]. Fetuin-A is regarded as marker for vascular inflammation and as one of the most potent negative regulators of vascular ossification - calcification [25,26]. In animals lacking the fetuin-A gene, the aorta was found to be spared of calcification and fibrosis, whereas peripheral vessels in the skin and kidney showed evidence of extensive calcification,

and the small artery involvement preceded the impairment of renal function [24,27].

In this study, we evaluated the associations of parameters of microvascular disease in patients with T2DM and early diabetic nephropathy as the degree of albumin excretion and renal function (GFR and serum creatinine) with fetuin-A.

This study demonstrates that lower fetuin-A levels seem to be associated with microvascular complications in patients with early diabetic nephropathy disease in type 2 diabetes as evidenced by the significant inverse association between fetuin-A concentrations and the degree of 24 h urinary albumin excretion and also, the significant positive association between fetuin-A concentrations and GFR.

Furthermore, we could show that there is a link between fetuin-A serum levels and state of diabetes control which was determined by inverse association between fetuin-A concentrations and HbA1c.

In addition, fetuin-A levels do not correlate with some clinical and metabolic parameters as BMI, blood pressure, total cholesterol, HDL and triglyceride in our type 2 diabetic patients with early diabetic nephropathy with or without hyperglycemia.

The data presented herein allows to speculate, that fetuin-A could play a role in the development of early microvascular disease (especially nephropathy) in type 2 diabetes, yet possible mechanisms remain unclear. In line with this hypothesis, Eraso et al. showed that circulating fetuin-A was lower in 38 subjects with type 2 diabetes and an ankle/brachial index (ABI)<0.9, compared with 700 diabetes controls [28]. Also Roos et al assessed ABI as a paramerter of microvascular disease and demonstrated that type 2 diabetic patients with an ABI<0.9 had lower fetuin-A levels than patients with an ABI 0.9-1.3 or >1.3 and that fetuin-A was significantly associated with ABI. Moreover, Roos et al. found that lower fetuin-A levels seem to be associated with prevalent macrovascular disease (as coronary artery disease, stroke and peripheral artery disease) in type 2 diabetes. But in contrast to our results, they showed also that fetuin-A serum levels are not associated with microvascular complications (24 h urinary albumin excretion) in patients with early diabetic nephropathy. In addition, they agree with us to some extent in that fetuin-A levels do not correlate with metabolic parameters in their type 2 diabetes patients with prevalent late complications [29].

Again, a recently published study in patients without diabetes and renal impairment demonstrated decreased fetuin-A serum levels in patients suffering from advanced three-vessel disease compared with those without stenosis [30]. These finding go in line with our assumption of reduced fetuin-A serum levels in patients with diabetic nephropathy.

Reviewing the existing data as well as the results obtained in this study, it may be assumed that fetuin-A levels are lower in type 2 diabetes patients with early diabetic nephropathy especially those with uncontrolled diabetes.

Our results are in contrast to findings in several cross-sectional studies which showed an association of high fetuin-A levels with impaired glucose tolerance, metabolic syndrome and an atherogenic lipid profile (high low-density lipoprotein, high triglyceride concentrations and low HDL concentrations) [31,32] and the positive association of Plasma fetuin-A levels with the risk of type 2 diabetes [33].

We recognize the limitations of the present study. Our approach is limited by the small samples size. Therefore, especially the data for associations with microvascular disease and renal function in type 2 diabetes will have to be reproduced in larger groups.

5. Conclusions

In this study, low plasma fetuin-A levels predict microvascular complications in type 2 diabetes with early diabetic nephropathy and also there are associations of fetuin-A with hyperglycemia in these patients.

Abstract: Gas turbines are very important nowadays for electric power generation specially that used in the **Combined Cycle Power Plants (CCPPs)**. For this electric power generation, the dynamics of the gas turbine and parameters estimation are very essential. In this article, a simple procedure is used for estimating the parameters of Rowen's model for HDGTs in dynamic studies for analysis purposes. The parameters of Rowen's model for a 265-MW HDGT are derived and several simulated tests using Matlab/Simulink are presented. The way of obtaining the parameters are based on simple physical laws. It explains briefly how to extract the parameters of the model using the operational and performance data. The obtained results via simulations using Matlab/Simulink are highly matched with the involved scientific articles that published in different literature. Furthermore, the obtained results verifies the operational results of the considered HDGT. However, the procedure here is applied on a practical HDGT. The same procedure could be applied for any scale (size) of gas turbines.

Keywords: Combined Cycle Power Plant (CCPP), Dynamic Simulation, Gas Turbine, Mathematical Modeling, Thermodynamic Process.

1. Introduction:

Gas turbines are one of the most important sources for electric power generation in countries with natural gas resources and are installed in several places in the world due to their special distinctiveness. The needs for a mathematical representation of gas turbines in dynamic studies guide to several publications in this area [1]-[6]. One of the most frequently used simplified models was presented early by Rowen [1] taking into account the load-frequency and temperature control as well as the turbine's thermodynamic responses as a linear function and inlet guide vane effects in a following separate work [2]. Several models with different degrees of simplification for the representation of gas turbines in dynamic studies were introduced. Among these models : the Detailed model (which is based on IEEE model) for **Combined Cycle Power Plants (CCPPs)** which has deeper sight into internal processes [5]. A recent review of these models is given in [8, 9]. Among those articles dealing with dynamic studies and gas turbine performance only some works have been done on the model and its parameter extraction for deeper analysis purposes [3, 4]. However, many of electrical engineers are keen in performing dynamic studies. Rowen [1] does not include parameter estimation and details of each block's physical behavior. Therefore, similar to a previous work [4], the objective in this article is to produce a broad approach for power engineers and students to describe how the parameters of the turbine model can be derived from simple operational and performance data which is available in general. It is also useful to know at least which quantities are required to derive the parameters of the model and which features affect the parameters. As a case study, Rowen's model parameters are approximated here for a 265 MW single shaft Heavy Duty Gas Turbine (HDGT) by using operational and performance data of the gas turbine. In general, the gas turbine model is more complicated than the steam turbine model and thus needs more features to be studied. In this article, a simple procedure which is adopted recently by [4] is used for estimating the parameters of Rowen's model for HDGTs in dynamic studies. *It should be noted that the study in [1] was applied on a gas turbine of rated 60 MW, while the procedure that adopted by [4] was applied on a gas turbine of rated 172 MW. However, the same procedure is applied in this article, but on a practical gas turbine of 265 MW.*

2. Case Study of 265 MW HDGT

A 265 MW simple cycle, single shaft Heavy Duty Gas Turbine (HDGT) and its available operational and performance data are presented and studied for deriving the parameters of the model. These parameters are used

in a further simulation studies. Table (1) shows nominal data of the selected HDGT for modeling. For land based engines, performance data are frequently quoted at the single point standard conditions. These standard conditions used by the gas turbine industry are:

- Ambient temperature (T_A) 15 °C / 59 °F.
- Ambient pressure (P_A) 1.013 bar / 14.7 psi.
- Relative humidity (Φ) 60%.

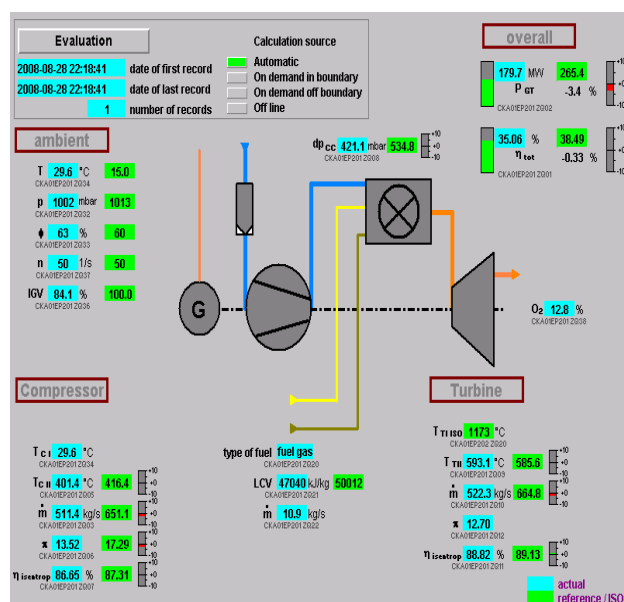
These conditions are established by the International Standards Organization (ISO) and frequently referred to as ISO conditions [1, 3, 4, 10]. For modeling purposes, a typical operating point is selected and illustrated in Figure (1). In advance, it is assumed that the considered model should be designated to represent the HDGT at rated load. It should be taking into account that in the following computations, the pressure loss in the entrance air filters and at the combustor is neglected. Also, IGVs are not modelled based on Rowen [1].


Figure (1): Plant Display Graphic of 265 MW HDGT[10]

2.1 Compressor and Turbine Efficiencies:

Using Table (1) and Figure (1), compressor and turbine efficiencies (η_C, η_T) parameters can be finally computed based on [3, 4] as follows:

$T_{2is(oc)}$ = 635.46 K = 362.46 °C
η_C = 0.895
$T_{3(oc)}$ = 1241.5 °C;
$T_{4is(oc)}$ = 792.9 K = 519.9 °C
η_T = 0.889

Where
(oc) Index stands for operating conditions of Figure (1).
(nc) Index stands for nominal conditions of Table (1).

Due to space limitations, only the final results are mentioned in this article, but for the detailed equations, one could refer to [3, 4]. It is inherently assumed constant compressor and turbine efficiencies in power output near nominal. It should be noted that the estimated efficiencies for the compressor and turbine are close to the actual results as illustrated in Figure (1).

2.2 Turbine Output Mechanical Power:

From now on, the turbine parameters are computed for nominal operation conditions (*nc*) according to Table (1). To extract the parameters of turbine output mechanical power block in [1], Figure (2) is depicted.

Table (1): Design Specifications of an Actual HDGT [10]

Parameter	Symbol	Unit	Value
Electrical power	P_{GT}	MW	265.4
Nominal frequency	F	Hz	50
Turbine speed	N	rpm	3000
Cycle efficiency (simple cycle)	η	%	38.49
Cycle efficiency (combined cycle)	$\eta_{combined}$	%	~ 58
Compressor type		17-stages axial	
Compressor pressure ratio	CPR	bar	17.29
Compressor inlet air mass flow	W_A	kg/sec	651.1
Combustor type		Annular	
Primary operating fuel		Natural gas	
Fuel mass flow	W_F	kg/sec	13.9
Lower heating value of fuel	LHV	kJ/kg	50012
Turbine type		4-stages axial	
Turbine diffuser exhaust mass flow	W_X	kg/sec	664.8
Turbine diffuser exhaust temperature	TET	°C	585.6
Figure (2): GT Output Mechanical Power Block of Rowen

Assume that, the considered HDGT is at nominal speed. In this point, the per unit (pu) output torque (***TRQ_D***) and mechanical power (***P_MG***) would be the same. Based on simple mathematical calculations in [4], *A* and *B* could

be obtained via applying the actual data from Table (1) and finally calculated as follows:

$$A = -0.117 \; ; \; B = 1.11699 \; ; \; m_{f(nc)} = 14.157 \, kg/sec$$

Where

A, B   Coefficients of developed (output) torque in Figure (2).

It should be noted that the estimated nominal fuel flow ($\dot{m}_{f(nc)}$) is very close to the actual one given in Table (1). The value of the speed sensitivity coefficient **C** in Figure (2) varies between 0.5 and 0.67 [4]. Here, **C** value assumed to be 0.5 (i.e., **C = 0.5**).

2.3 Turbine Exhaust Temperature:

Figure (3) represents the exhaust temperature (T_X) block in [1]. It should be noted that, nominal flows are needed to determine the parameters of this block (i.e., **D** and **E**). At nominal speed, the exhaust temperature parameter **D** could be finally computed as [3]: **D= 492.6 ˚C**
Based on discussion in [4] regarding temperature changes versus speed (**N**), the speed sensitivity coefficient **E** will vary in the range of 0.55 to 0.65 of rated exhaust temperature. Therefore, **E** is chosen to be **0.6T_R**. Hence:
E = 0.6T_R=351.36 ˚C
Figure (3): GT Exhaust Temperature Block of Rowen

However, temperature control in HDGTs requires measurement of the exhaust temperatures which may be composed of thermocouple and radiation shield [1]. Here, this study is only interested in the exhaust gas temperature out of the turbine (a convective source) to control the temperature and avoid excessive heating. Nevertheless, the radiation source, i.e., the turbine itself, will cause errors in the temperature measurement. The radiation shield is therefore used to overcome this problem, as illustrated in [3]. Temperature measurement device is the thermocouple which has a typical lag with a time constant based on its type and design. Time constant of thermocouple can be easily extracted from its time response documents. Figure (4) represents the exhaust temperature measurement block of Rowen [1]. To extract the parameters of the exhaust temperature measurement equipments, the same procedure and results of [4] have been adopted. The pertaining results are summarized in Table (2). More details are presented in [3, 4].

2.4 Fuel System:

Gas turbine fuel system is designed to provide energy input to the gas turbine in proportional to the product of command signal (V_{CE}) times the unit speed (**N**) as shown in Figure (5). Assuming linear response actuators and valves, the fuel flow will change directly with the output signal of the valve positioner. However, there is a lag associated with gas/oil flow in the pipes and fuel system manifold (T_{FS}). According to [11], this lag can be simply approximated.
Figure (4): GT Exhaust Temperature Measurement Block of Rowen [4]

Table (2): Exhaust Temperature Measurement Parameters of 265 MW HDGT

Parameter	Symbol	Unit	Value
Radiation shield parameter	G_{SH}	--	0.85
Radiation shield time	T_{SH}	sec	12.2
Thermocouple time	T_{TR}	sec	1.7

Using Tables (1) and (3), the fuel system time constant (T_{FS}) could be easily computed to be as [3]: **T_{FS}= 0.31 sec.** It should be noted that the approximation is inevitable when using Tables and graphs of thermodynamic properties [12], because not all the operating points are provided there.
Figure (5): Fuel System of Rowen's Model [1]

Table (3): Operational Data for NG System [10]

Parameter	Unit	Value
Fuel		Natural Gas
Fuel pressure	atm	26
Average temperature	K	293
NG piping approximate volume from the NG skid to the GT nozzles	m³	0.25 ~ (equivalent cylinder of length about 8 m and radius of 10 cm)

There is also a fuel demand signal limiter in the HDGT model. *maxF* is not reached in normal operation and may act as a backup to temperature control where any increase in turbine exhaust temperature will lead to activation of temperature control and decreasing fuel flow. *minF* is a negative value which shows the gas turbine ability of transient power absorption. Its value depends on minimum fuel flow required to maintain the flame in the combustor. A value of 1.5 pu is commonly used for *maxF* while *minF* value can be determined by operational data for the fuel system. From a dynamic standpoint, gas turbines have many differences from steam turbines. One of the more obvious differences is the need for a significant fraction of rated fuel support self-sustaining at no-load conditions. This fact that HDGTs need relatively high fuel consumption to operate even in no load conditions as reflected in Rowen's model. It is reflected by dividing the fuel demand signal into a constant part (K_{NL}) and the reducing gain multiplied by the demand signal (*1-K_{NL}*). For this reason, one of the economic driving forces to minimize operating time at full speed, no-load conditions. Data for no-load operation and minimum fuel flow rate to maintain combustor flame are given in Table (4) as well as Figure (6).

2.5 Time Delays and Compressor Discharge Lag:

The gas turbine behavior forces its dynamic model to have small delays and lag time constants, as shown in [3]. Actually, there is a small time delay between the fuel injection and heat release in the combustor which is called combustion reaction delay (E_{CR}).
Figure (6): Trend for Minimum Fuel Flow and No-Load Consumption [10]

In modern systems, it is on the order of some milliseconds. Hence, it is assumed that, there is a time of 5 msec between the fuel injection until burning in the combustor (i.e., E_{CR} = 5 msec). There is also a time delay between the fuel combustion and exhaust

temperature measuring system (E_{TD}). This delay is caused by exhaust system and turbine to transport the fluid to the measuring point. E_{TD} is in the order of milliseconds and depending mainly on the size of the HDGT and the average fluid speed. A relatively conservative value of 40 msec delay for air and combustion products transfer to the temperature measuring point is assumed (i.e., E_{TD} = 40 m sec). A relatively higher time lag exists in the compressor discharge path to the turbine inlet (T_{CD}). Considering the average temperature = 1100 K for Natural Gas, and using Table (1), and [3] as well as the thermodynamic properties of air [12], T_{CD} is approximated and could be calculated finally as: T_{CD} = 0.142 sec

Table (4): Operational Data for Minimum Fuel Flow and No-Load Consumption [10]

Parameter	Unit	Value
No load fuel flow	Kg/sec	~2.2
Minimum fuel flow to maintain combustor flame	Kg/sec	~1.4

2.6 Controllers Loops Parameters:

As shown in Figure (7), the values of the frequency-load and temperature control blocks are based on [1], for simulation purposes. All obtained values of the controllers parameters are in the range of the typical values which are usually used for HDGT dynamic models. It should be noted that some modifications are added from GT models in [5, 6] to the model in [4] to obtain the model that shown in Figure (7).

3. Model Simulation and Results of 265 MW Gas Turbine:

The derived and assumed parameters in previous section are used to simulate the behavior of 265MW HDGT. All parameters of the model presented in Figure (7) are reviewed, compared to [1, 4], and listed again in Table (5). The considered model has been simulated and tested under certain conditions as stated below.

3.1 Model performance at rated load:

The considered GT model is simulated under operating in nominal conditions (rated load) against three scenarios as follows:
- 0.1% speed step decrease.
- 0.3% speed step decrease.
- 20% load step increase.

The speed governor droop of 4% is assumed for the simulation, as illustrated in speed-load control block of Figure (7) and Table (5).The first scenario is presented

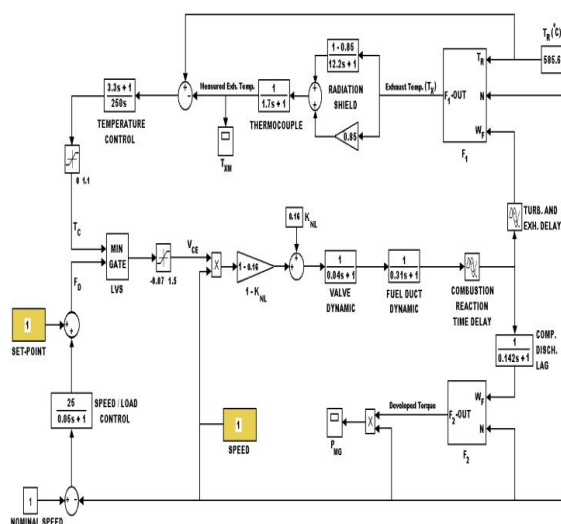
where the turbine speed downs by step of -0.1% during normal operation under nominal conditions. The behavior of the mechanical output power against -0.1% speed deviation is shown in Figure (8).


Figure (7): 265MW HDGT Model for Dynamic Studies

In steady state case, for 4% droop, the value of ~ 1.02 pu is observed for the output mechanical power. Figure (9) shows the exhaust temperature of the gas turbine which is measured by the thermocouple. Also, a final steady state value of near 596 $^{\circ}$C is observed for the measured exhaust temperature, where the temperature control is not activated yet. Figure (10) ensures this meaning where the output of the frequency-load controller (F_D) is all time lower than the output of the temperature controller (T_C). Therefore, the frequency-load controller output passes through the minimum gate and controls the fuel flow to the combustion chamber. However, in the second scenario, -0.3% step in turbine speed would cause the temperature control to be activated, as shown in Figure (13). Figure (11) shows the behavior of the mechanical output power against -0.3% turbine speed step, where a final value close to 1.066 pu is noted. Also, in Figure (11), the power output remains constant until temperature control activation in 60 sec roughly. The measured exhaust temperature increases in this period (~60 sec) until it reaches the value of around 616 $^{\circ}$C. At this time, temperature control activation have been occurred and forces the exhaust temperature to down to its rated value of 585.6 $^{\circ}$C and decreases the output power, as illustrated in Figure (12). The third scenario is presented where the turbine power set point increases by step of 20% during normal operation under nominal conditions.The behaviour of the turbine parameters is illustrated in Figures (14), (15), and (16).

Table (5): Extracted Parameters of HDGT

Parameter	Symbol	Unit	265 MW HDGT values [3]	Rowen Values [1]	172 MW GT Values [4]
Speed governor gain=1/droop	W	MW$_{pu}$ / N$_{pu}$	25	25	25
Speed governor lag time constant	Y	sec	0.05	0.05	0.05
Fuel demand signal upper limit	$maxF$	pu	1.5	1.5	1.5
Fuel demand signal lower limit	$minF$	pu	-0.07	-0.1	-0.13
No load fuel consumption	K_{NL}	pu	0.16	0.23	0.24
Fuel system external feedback loop gain	K_F	pu	0	0	0
Valve positioner time constant	b	sec	0.04	0.05	0.04
Fuel system transfer function coefficient	c	--	1	1	1
Fuel system time constant	T_{FS}	sec	0.31	0.4	0.26
Combustion reaction time delay	E_{CR}	sec	0.05	0.01	0.05
Turbine and exhaust delay	E_{TD}	sec	0.04	0.04	0.04
Compressor discharge volume time constant	T_{CD}	sec	0.142	0.2	0.16
Turbine rated exhaust temperature	T_R	$^{\circ}$C	585.6	510	522
Gas turbine torque block parameter	A	--	-0.117	-0.299	-0.158
Gas turbine torque block parameter	B	--	1.1169	1.3	1.158
Gas turbine torque block parameter	C	--	0.5	0.5	0.5
Gas turbine exhaust block parameter	D	$^{\circ}$C	492.6	390	413
Gas turbine exhaust block parameter	E	$^{\circ}$C	351.36	306	313
Radiation shield parameter	G_{SH}	--	0.85	0.8	0.85
Radiation shield time constant	T_{SH}	sec	12.2	15	12.2
Thermocouple time constant	T_{TR}	sec	1.7	2.5	1.7
Temperature controller parameter	G_{TC}	--	3.3	3.3	3.3
Temperature controller integration rate	T_T	$^{\circ}$C	250	250	250
Compressor efficiency	η_C	pu	0.895	--	0.86
Turbine efficiency	η_T	pu	0.899	--	0.89

The behaviour of the turbine parameters is illustrated in Figures (14), (15), and (16). These figures show that, the temperature control plays a vital role. Since it is override the speed/load control in case of overload. This is to protect the turbine against overheat. In other words, despite the set point is adjusted to a higher value than the permitted value, the temperature control takes over the responsibility to fix the positions of fuel valves and the turbine power accordingly to the permitted values.

Figure (15): T_{XM} against +20% Load Increase
Figure (16): Inputs of LVS against +20% Load Increase

3.2　Model Performance at Partial Load:

Since the considered model is designated to represent the HDGT at nominal point, the load set point is significantly more accurate at base (rated) load (i.e. set point = 1 pu), but less accurate at partial load. However, adjustments for the parameters *A*, and *B* of mechanical power block that shown in Figure (2) can enhance the accuracy of the set point at partial load. Values of *A* = -0.3 and *B* = 1.3 can be selected for this purpose. Behavior of the turbine output power (*P_{MG}*) has been

examined against -0.3% turbine speed deviation, when operating at the selected operating point (i.e. the turbine initially load by 0.67 pu roughly). After that, the temperature control loop is disabled and the simulations are repeated again. The results are represented in Figures (17) and (18). It can be seen that there is no difference between the curves with and without temperature control loop. This is expected, as the operating point is far away from the rated exhaust temperature limit as shown in Figure (18), due to the low power output of the gas turbine as shown in Figure (17). These results are highly matched with those given in [13]. Hence, the temperature control loop is not active and makes the presence of the temperature control superfluous. Under such conditions therefore, the temperature control loop can be neglected without any loss in model accuracy, because the output of the gas turbine is effectively determined by the governor only.
Figure (17): Partial Load of P_{MG} against -0.3% Turbine Speed Deviation
Figure (18): T_{XM} (^oC) against -0.3% Turbine Speed Deviation at Partial Load

This consequence had been proven in [13] as well. Now, it more obvious that, the temperature control loop is implemented in gas turbines to avoid a severe damage in the turbine due to overheat.

4.   Impact of Speed Droop on Gas Turbine Performance:
To illustrate the impact of the Governor with a speed droop characteristic on the gas turbine performance and hence the power system performance, the following

example is provided: Suppose two gas turbine units, as shown in Figure (19). Both units are rated at 265 MW (1 pu) and are initially loaded around the selected operating point 179.7 MW ($I_o \approx 0.66$ pu), as illustrated in Figure (1). Both units have governors with speed regulation; however, Unit 1 is set for 8% speed regulation and Unit 2 is adjusted for 3% speed regulation. It should be known that, the droop setting is adjustable from 2 to 10 percent [1]. To examine units response, -0.4% ($\Delta F = -0.004$ pu) frequency deviation is applied. Unbalance between generation and load will occur as a result of frequency deviation.
Figure (19): Two GTs with Different Speed Droop
(a) Unit 1 with Droop Setting 8%   (b) Unit 2 with Droop Setting 3%

To rebalance generation and load again, an additional power must be produced by the each unit. Depending on the governor droop setting, the unit governor will increase the output power to rematch generation and load. The steady-state frequency can be determined by considering the speed-load characteristic curves for the two units as shown in Figure (20). To calculate the additional power that has to be increased by each unit according to its governor speed droop setting, the following equation can be used [14]:

$$Percent\ droop\ (R\%)$$
$$= \frac{Percent\ speed\ or\ frequency\ change\ (\Delta F\%)}{Percent\ power\ output\ change\ (\Delta P\%)} * 100$$

In case of unit 1 with 8% droop setting, the governor will increase the output power from around 179 MW ($I_o \sim 0.66$ pu) to around 188 MW ($I_1 \sim 0.71$ pu). That is to say, unit 1 produces ~ 13 MW (ΔP_1) roughly as an additional output power due -0.4% (-0.2 Hz) frequency deviation. In case of unit 2 with 3% droop setting, the governor will increase the output power from around 179 MW ($I_o \sim 0.66$ pu) to around 209 MW ($I_2 \sim 0.79$ pu). That is to say, unit 2 produces ~ 35 MW (ΔP_2) as an additional output power due -0.4% (-0.2 Hz) frequency deviation. An important result could be obtained from these calculations; *a unit with a lower speed droop or regulation setting is more responsive to a change in system frequency.* This result is highly matching the results that are given in [15]. More details about the droop governor characteristics are given in [14].
Figure (20): Impact of Speed Droop on Gas Turbine Performance

5.   Conclusions:

 In this article, a simple procedure is used for estimating the parameters of Rowen's model for practical HDGTs. These parameters could be used in dynamic studies for many purposes. The parameters of Rowen model for a 265-MW HDGT is derived and several tests using simulation are presented. The way of obtaining the parameters are based on simple physical laws and explained to some extents to make it useful for who are involved in dynamic studies of HDGT. All the obtained results via simulations using Matlab/Simulink are highly matched with the involved scientific articles that published in different literatures. The same procedure could be applied for any scale (size) of gas turbines. However, it is noticeable that the obtained results are significantly depends on the selected operating conditions.

[*]dr_elmoselhy@hotmail.com

Abstract: Introduction: Pre-eclampsia (PE) represents a major cause of morbidity and mortality in mother, fetus and infant in many parts of the world. Objectives: The aim of this study was to investigate the role of behavioral, socio-demographic and clinical conditions as risk factors of PE among pregnant mothers and to define the impact of PE on health of the fetuses and neonates. Subjects and methods: A case-control, hospital based study design was used. All the cases and controls were interviewed and examined; clinically and laboratory. Results: Multiple gestations, rural residence, mothers married more than once, inter pregnancies' interval <3 years, primi-gravida, low social level and maternal age group 26-30 years were significant socio-demographic and personal risk factors (OR=9.79, 4.16, 4.0, 2.73, 2.16, 2.16 and 1.98, respectively). Further, much salty diet intake, no adequate fresh fruits/vegetables and much fat were significant dietary risk factors (OR=1.99, 1.85 and 1.83, respectively). Also; urinary tract infection, vaginal infection/ vaginosis, asymptomatic bacteriuria, polyhydraminos, diabetes and stress were significant medical and obstetric/gynecologic risk factors (OR=5.59, 4.41, 3.62, 3.59, 3.35 and 2.98, respectively). Fetal growth restriction, preterm labor, neonate birth weight <2.5 kg and neonate intensive care admission were more common in pre-eclamptic mothers compared to controls with statistically significant differences (P=0.00, 0.04, 0.03 and 0.02, respectively). The mean of 1- and 5-minute Apgar scores were significantly lower in newborns of pre-eclamptic mothers compared to controls (P=0.00 for each of them). Also, the mean Hb level was significantly lower in newborns of PE cases compared to controls (P=0.00). Recommendations: Improving ante-natal care for pregnant mothers in Egypt. Population based studies are needed in different areas in Egypt and on large numbers of mothers to understand the full epidemiology of pre-eclampsia.

1. Introduction

Pre-eclampsia (PE) is a major complication of pregnancy. It is pregnancy-specific condition, which usually occurs after 20 weeks of gestation and resolves with delivery (Roberts, 1998). It is determined clinically by identification of pregnancy induced hypertension, proteinuria or generalized edema or both. PE may be mild or severe (Cunningham et al., 2010). The prevalence of PE has not changed during the last century (Hauth and Cunningham, 1999). The prevalence is varying according to the difference in classifications, definitions and the fact that many estimates are hospital basis. However, the prevalence is commonly cited to be about 7.0 % of first pregnancies (Roberts, 1998). The prevalence of hypertension observed at deliveries is approximately 10.0% that diagnosed with pregnancy- induced or aggravated hypertension (Brown et al., 2000). In Egypt, the prevalence of PE is 10.7% in a community based study (Gadalla et al., 1986). While, in hospital based studies it ranged from 9.1% (Mahaba et al., 2001b) to 12.5% (El-Houseinie et al., 1994) of all deliveries.

Pre-eclampsia is a disease with worldwide significance to mothers and infants; it may have health hazards that increase maternal, fetal and infant morbidity and mortality **(**Roberts, 1998 and Roberts et al., 2003a)**.** Its greatest impact is in developing countries, where it accounts for 20.0-80.0% of the strikingly increased maternal mortality. While, in developed countries PE has a major effect on the fetus and neonate. Application of proper ante-natal care (ANC) and management has largely eliminated maternal mortality, frequently at the cost of preterm delivery. About 10.0% of PE cases occur at a stage of gestation where delivery exchanges a sick fetus in uterus for a sick premature infant in the nursery (Goldenberg and Rouse, 1998). Also, PE has associated with a higher risk for intra uterine growth restriction (IUGR), cerebral palsy (Report the Task Force ACOG/AAP, 2003) and persistent pulmonary hypertension of the newborn (Hernández-Díaz et al., 2007). Further, PE is a leading cause of perinatal mortality, 7.6% (Gaym, 2000). In developed countries perinatal mortality of infants of pre-eclamptic mothers is 5-fold greater than non pre-eclamptics. Further, about 15.0% of preterm births are indicated premature deliveries of PE (Goldenberg and Rouse, 1998). Moreover, PE can progress rapidly, putting both mother

and fetus at severe risk if no action is taken (Basso et al., 2006).

PE has been described as a "disease of theories" as the cause is not known. Some theories include rejection phenomenon (insufficient production of blocking antibodies), compromised placental perfusion, altered vascular reactivity, uterine muscle stretch (ischemia), dietary factors and genetic factors. None of these theories has been conclusively proved (Roberts & Cooper, 2001; Roberts & Lain, 2002 and Solmon & Seely, 2004).

Pregnancy induces increased venous capacitance, reduced systemic arterial resistance, and vasodilatation associated with a 50.0% increase in circulating blood volume (Marshall and Carpenter, 2007). PE is hypothesized to be a two-stage disorder with maternal-fetal interactions necessary to link the two stages (Roberts and Cooper, 2001). Reduced placental perfusion, secondary to abnormal implantation and subsequent reduced placental vascularization, is thought of as the first stage. The second stage; the maternal syndrome, develops in a subgroup of women with certain genetic, environmental, and/or behavioral risk factors (Roberts and Cooper, 2001) as a response to agents produced by the poorly perfused placenta (Roberts and Hubel, 1999). In a suitable maternal environment, endothelial dysfunction results (Roberts and Hubel, 1999) and initiates the coagulation cascade and ensuing multi-system sequelae (Surratt, 1993), stage 2 of PE (Bodnar et al., 2006).

Age, parity (Funai et al., 2005), low social status (MacGillivary, 1983), race, environmental factors (Cunningham et al., 2010), and genetic and familial predisposition influence the incidence of PE (Skjaerven et al., 2005). Also, increase inter-pregnancies space (Lie et al., 1998), multiple gestation (Sibai et al., 2000), nutrition deficiencies (Roberts et al., 2003b), obesity (Ros et al., 1998 and Roberts & Cooper, 2001), diabetes (Wolf et al., 2002 and Funai et al., 2005), infection and inflammatory processes (López-Jaramillo et al., 2001) and paternal factors (Li and Wi, 2000) are susceptible risk factors of pre-eclampsia.

Study Objectives
A- Ultimate objective:
Improve quality of the health of mother, fetus and infant in Egypt.
B- Immediate objectives:
1- To investigate the role of socio-demographic, behavioral and clinical conditions as risk factors of PE among pregnant mothers in Cairo, Egypt.
2- To determine the impact of PE on the health of the fetuses and neonates of the pregnant mothers in Cairo, Egypt.

2. Subjects and Methods
I- Study Questions:
Is there PE socio-demographic, behavioral and clinical risk factors? Is there PE health hazards on the fetuses and neonates?
II- Study Design:
A case-control, hospital based study design was used to investigate the current research problem.
III- Study Setting:
This study was conducted in the Obstetrics and Gynecology Department in Al-Hussein Hospital, Al-Azhar University.
IV- Study Sample:
According to sample size equation the sample was 86 cases, and to guard against sample size bias we increased the sample to be 100 PE cases. So, all the cases of PE attending the Obstetrics and Gynecology Department in Al-Hussein Hospital, Al-Azhar University were included in the study till sample reached the required number; 100. For each pre-eclamptic patient a healthy pregnant woman was chosen randomly. So, a control group of 100 healthy pregnant women was recruited.

All patients must be fulfilling the following inclusion criteria: 1) Age of patients up to 30 years, 2) Gestational age ≥33 weeks, 3) Have a definite specific diagnosis of PE. Also, all patients recruited in this study have fulfilled the following specific exclusion criteria: 1) Essential hypertension, 2) Pregnancy induced hypertension without proteinuria, 3) Intake of vitamins/antioxidants during the current pregnancy, 4) Blood diseases, 5) Kidney disease, 6) Liver disease, 7) Intrauterine fetal death, and 8) Ante-partum hemorrhage.

The controls enrolled in the study have fulfilled the following inclusion criteria: 1) Age up to 30 years, 2) Have no history of PE in the current or previous pregnancy, and 3) Gestational age ≥33 weeks. Also, the controls have fulfilled the same specific exclusion criteria used for the patients group.

V- Ethical Considerations:
The purpose of the study and procedures to be performed were explained to the cases and controls, an oral consent to participate in the study was taken accordingly. All patients were managed properly to control PE. All the cases and controls were delivered spontaneously in the normal vertex position or by Caesarian section according to the condition of each case.

VI- Study Tools and Methods:
1- Interview questionnaire:
It was used to collect data relevant to topic of the study. The patients and controls were submitted to an interview.

2- Diagnosis of PE: All patients must be fulfilling the following inclusion criteria: 1) Hypertension: Blood pressure (BP) ≥140/90 mmHg (Cunningham et al., 2010), 2) Proteinuria: Trace or more by dipstick method. Two random midstream urine specimens, collected ≥4 hours apart taken from each woman to avoid error due to false positive test, were used. The two results must be positive, so the diagnosis of proteinuria was significant (MacGillivary, 1983), and 3) Bilateral, pathological (≥+1) and not just dependant, lower limb edema. Edema is a common feature of pregnancy. But, edema of PE usually involves the face and hands, and persists (Cunningham et al., 2010).

3- Clinical examinations: Both general and local physical examinations were done for the cases and controls. Also, pelvi-abdominal ultra-sonography examination was done for both groups to estimate gestational age, to determine multiple fetuses, polyhydramnios and to detect fetal IUGR. Anthropometric measurements of mothers; height and weight were done. Weight (kg) was measured while women wear light outer garment and without shoes. Height (cm) was measured in standing position. Body mass index (BMI) was calculated as weight divided by height squared (kg/m²). BMI classifications considered obese subject to be ≥30 kg/m² (WHO, 2000).

All the neonates were evaluated clinically and their Apgar scores at 1- and 5-minutes were defined immediately after birth, low 5-minutes Apgar (activity, pulse, grimace, appearance and respiration) score was considered <4 (Casey et al., 2001). Also, weight (kg) by a special pediatric scale was done immediately at birth.

4- Laboratory investigations: Laboratory examinations were done for all cases and controls. Midstream urine samples were taken at time of interviewing the cases and controls for microscopic examination to detect cases of urinary tract infections that may be symptomatic or not. Also, umbilical vein blood samples were taken from all neonates of the cases and controls at birth to determine their hemoglobin (Hb) concentration level (g/dl) by using Drabkin's photometric method.

VII- Statistical Analysis:
Odds ratio (OR) with 95% confidence interval (CI) or exact confidence limits (ECL), t-student test, Yates corrected Chi-square (χ^2) and 2-tailed Fisher exact (FE) were used as tests of significance. The significance level for t, χ^2 and FE was accepted if the P-value <0.05.

3. Results
As regard socio-demographic risk factors of the PE cases and controls (table 1), low educational level (illiterates, and read and write) of the cases was significant risk factor (OR=1.51, 95% CI: 0.83-2.75). The house wives occupation and the unskilled workers are insignificant risk factors (OR=1.44, 95% CI: 0.79-2.60 and OR=1.16, 0.60-2.22). Collectively, 59.0% of the patients were belonged to lower social level and represented a significant risk factor (OR=2.16, 95% CI: 1.18-3.95). Further, rural residence represents a significant risk factor for PE (OR=4.16, 95% ECL: 1.52-13.16). On the other hand, middle social level and urban residence are significant protective factors.

With respect to personal risk factors of the PE cases and controls (table 2), the young (18-21 year) and old (26-30 year) age groups are significant risk factors (OR=2.01, 95.0% CI: 1.00-4.06 and OR=1.98, 95.0% CI: 1.04-3.76, respectively). Also, less than one year marriage-pregnancy interval is significant risk factor (OR=1.84, 95% CI: 1.01-3.35). At the same time, primigravida is significant risk factor (OR=2.16, 95% CI: 1.18-3.96). Regarding inter-pregnancy space, more than 3 years is significant risk factor (OR=2.73, 95% CI: 1.08-7.01). Also, multiple gestations represented a significant risk factor (OR=9.79, 95% ECL: 1.30-433.39). Further, history of prior PE/eclampsia and abortion in first trimester are insignificant risk factors (OR=2.85, 95% ECL: 0.66-14.12 and OR=1.25, 955 CI: 0.45-3.47, respectively). Also, positive maternal family history of PE is insignificant risk factor (OR=4.85, 95% ECL: 0.96-46.94). Regarding change in husbands, marriage more than once is significant risk factor (OR=4.0, 95% ECL: 1.01-22.88).

Regarding life-style and behavioral risk factors of the PE cases and controls (table 3), absence of ante-natal care is insignificant risk factor (OR=1.36, 95% CI: 0.73-2.53). Also, physical activity is insignificant risk factor (OR=1.34, 95% CI: 0.73-2.47). Further, smoking during pregnancy is insignificant protective factor (OR= 0.49, 95% ECL: 0.01-9.68). Regarding diet intake, no adequate intake of fresh fruits and vegetables (OR=1.85, 95% CI: 1.01-3.39), much intake of fats (OR=1.83, 95% CI: 1.01-3.34) and much intake of salty diet (OR=1.99, 95% CI: 1.02-3.91) are significant risk factors. On the other hand, much intake of sugar (OR=1.51, 95% CI: 0.80-2.86) and no adequate intake of proteins (OR=1.35, 95% CI: 0.73-2.50) are insignificant risk factors.

With respect to medical, gynecological and obstetric risk factors among the PE cases and controls (table 4), obesity (OR=2.02, 95% CI: 1.05-3.90), stress (OR=2.98, 95% ECL: 1.04-9.70), diabetes (OR=3.35, 95% ECL: 1.09-12.23), urinary tract infection (OR=3.59, 95.0% ECL: 1.05-15.58), polyhydraminos (OR=3.59, 95% ECL: 1.05-15.58), asymptomatic bacteriuria (OR=3.62, 95% ECL: 1.19-13.10) and vaginal infection/ bacterial vaginosis (OR=4.41, 95% ECL: 1.13-24.97) are significant risk factors.

As regard impacts of PE (table 5), 29.4% of the fetuses of pre-eclamptic women had IUGR compared to 5.9% of the controls (P=0.0002). At the same time, 8.0% of the cases had preterm labor compared to 1.0% of the controls (P=0.04). Moreover, 11.9% of the neonates were <2.5 kg at birth compared to 3.0% of the neonatal controls (P=0.03). Also, 12.8% of the neonates were admitted to neonatal intensive care units compared to 3.0% of the neonatal controls (P=0.02). Further, one (0.9%) of

the neonates died during the first week of life compared to none of the neonatal controls (P=1.00). Also, 1- and 5-minutes Apgar scores of the neonates of patients and controls were 4.62±1.37, 6.16±1.09 and 6.41±1.88, 8.89±1.32, respectively with a statistically significant difference (P=0.00 for each of them). Lastly, levels of hemoglobin of the neonates of patients and controls were 14.12±5.23 and 18.22±5.74 g/dl, respectively with a statistically significant difference (P=0.00).

Table (1): Distribution of pre-eclampsia (PE) cases and control group according to socio-demographic risk factors.

Socio-demographic risk factors	PE cases (n=100)		Control group (n=100)		OR (95% CI) OR (95% ECL)*

4. Discussion

PE results from the interaction between economic, psycho-social, nutritional, environmental and genetic factors (López-Jaramillo et al., 2001).

PE being more common in poor women long ago, numerous conflicting hypotheses were advanced (Roberts et al., 2003a). Further, there is a high rate of PE in developing countries (Caughey et al., 2005). Lower education level attainment reduces access to medical care for screening and is often associated with greater exposure to poor nutrition, physical inactivity, being overweight and other risk factors (Howard et al., 1992). In Egypt, 32.0% of the PE cases were illiterates compared to 26.0% of the controls, and 28.0% of the cases had up to secondary education compared to 34.0% of the controls, but the differences were insignificant (Mahaba et al., 2001a). Further, PE incidence was higher among manual workers (Baired, 1969). On the other hand, there was no significant difference between PE cases and controls regarding housewives and employees (P=1.0) (Ziaei et al., 2008). Also, In Egypt PE was found among 16.0% and 5.0% of rural and urban pregnant residents, respectively (Gadalla et al., 1986). Collectively, lower socioeconomic class is reported to have a higher incidence of PE. Poor ante-natal care, improper nutrition and increased incidence of concealed pregnancies are confounding factors. Also, the increased in the incidence of severe PE in very young girls may reflect the greater tendency to social neglect among this group. Further, reports on PE during war, famine and drought refer to the effects of war on the incidence of PE during the two major World Wars; higher incidence of PE/eclampsia was reported in Germany. Also, there is probably a difference in the incidence of PE among racial groups; its incidence in white races is 6.2%, while it is 8.5% in black race. This variation is mostly due to genetic factor that relates underlying chronic hypertension (MacGillivary, 1983). The differences between races may reflect the differences in genetic, nutritional, environmental and socioeconomic state.

There is a J-shaped curve for relationship between maternal age and the incidence of PE with a slightly increased pattern among young pregnant and a markedly increased incidence among the older ones, more than 35 years (MacGillivary, 1983 and Rosalia et al., 1998). So, advanced age is common risk factor for PE (Duckitt and Harrington, 2005). Also, the incidence of severe PE is more in pregnant teen aged girls. However, it remains uncertain whether this truly an increased in the incidence of severe PE in very young girls, or whether it is a reflection of the greater tendency to social neglect among them (MacGillivary, 1983). In young primigravida the increase incidence of PE may be due

to poor immune capacity at young age, while increased incidence with increasing age may probably reflect the increasing incidence of essential or latent essential hypertension (Davey, 1995). Further, women over 40 had a three-fold increased incidence of hypertension compared to control women aged 20-30 years (MacGillivary, 1983). On the other hand, some studies didn't found significant age difference between PE cases and controls (Caughey et al., 2005; Lou et al., 2008; Kolusari et al., 2008, and Ziaei et al., 2008).

At the same time, the length of sexual relation is inversely related to the incidence of PE, a sexual relationship of less than 4 months comparing to a sexual relationship of at least 12 months is associated with a 7-fold increased risk of development of PE (Wang, 2003). Also, PE is more common in women implanted with an oocyte fertilized with surgically obtained sperm rather than their partner's ejaculated sperm (Wang et al., 2002). These data suggest that the protective effect of semen exposure on the later development of PE is associated with exposure to sperm cells, or a factor closely linked with sperm in the ejaculate (Wang et al., 2002 and Wang, 2003). PE has been regarded as a disease of primigravidae, and it is suggested that a previous pregnancy is protective against the development of PE (Campbell and MacGillivary, 1985). Studies observed that the combination of primigravidity and age over 35 years leads to a much higher risk of developing PE (Campell et al., 1985). Also, our result is consistent with Mahaba et al. (2001a); they reported that 70.0% of their pre-eclamptic cases were primigravidae. Further, the risk of PE in a second pregnancy increases with maternal age, 1.3/5 years of increased age (Lie et al., 1998).

The risk of PE is increased in circumstances where formation of blocking antibodies to antigenic sites on the placenta might be impaired. This may arise where immunization by previous pregnancy is lacking as in first pregnancies (Cunningham et al., 2010). Major support for this hypothesis comes from studies that show the protective effect of sperm exposure (Dekker et al., 1998). Also, the risk of PE in a second pregnancy increases with interval between pregnancies, 1.5/5 years interval between first and second pregnancies (Lie et al., 1998 and Skjaerven et al., 2002). Also, PE is more frequent in multiple pregnancies (Sibai et al., 2000). Induced and spontaneous abortions are reported to be associated with decreased risks of PE (Eras et al., 2002). In details, prior abortion in the second trimester was found to be protective against PE, but prior first trimester abortion was risk factor (Campbell and MacGillivary, 1985). Also, about 1/3 of women who have had eclampsia in their first pregnancy developed PE in a later pregnancy; the prevalence of chronic

hypertension in these women with recurrent PE is high (Sibai et al., 1987).

Susceptibility to PE is highly heritable. Population based studies have shown a strong familial tendency to PE (Cooper et al., 1993). The single gene hypothesis fits with PE, but multi-factorial inheritance can't be excluded (Chesley and Cooper, 1986). Also, maternal predisposition to PE has been reported (Esplin et al., 2001; Nilsson et al., 2004 and Skjaerven et al., 2005). It seems reasonable to attribute patterns of familial predisposition to genetic inheritance. Daughters born after a pre-eclamptic pregnancy may carry their mothers' susceptibility genes, as well as genes from either parent that operate through the fetus (Lie et al., 1998 and Esplin et al., 2001). The proportion of preterm PE was 10.0% in the parents and 22.0% in the offspring. Women who were born after a pre-eclamptic pregnancy had more than twice the risk of having PE in their first pregnancy (OR=2.2, 95% CI: 2.0-2.4), and still had the same risk (OR=2.3, 95% CI: 1.8-2.9) of PE in their second birth compared to other women. Further, sisters who were not themselves born after a pregnancy complicated by PE were at increased risk of PE compared to women with no family history of PE (OR=2.0, 95% CI: 1.7-2.3). Also, women born after pre-eclamptic pregnancies were more likely to trigger severe PE in their own pregnancy (OR=3.0, 95% CI: 2.4-3.7) (Skjaerven et al., 2005). However, we cannot exclude potential confounding by other risk factors. But, a stronger familial association for clinically severe PE than for mild was found (Vatten et al., 2004). Further, maternal genes and fetal genes from either the mother or father may trigger PE. The maternal association is stronger than the fetal association. The familial association predicts more severe PE (Skjaerven et al., 2005). Also, change of partner between births has been associated with the risk of PE (Cnattingius et al., 1997 and Skjaerven et al., 2002). Major support for this hypothesis comes from epidemiological studies that show the impact of a change in partners, and the increased frequency of PE after donor insemination and oocyte donation (Dekker et al., 1998). Men who fathered a pre-eclamptic pregnancy were nearly twice as likely to father a pre-eclamptic pregnancy in a different woman, regardless of whether she had already had a pre-eclamptic pregnancy or not (Lie et al., 1998). Also, among women with two consecutive births; women without PE/eclampsia in the first birth, changing partners resulted in a 30.0% increase in the risk of PE/eclampsia in the subsequent pregnancy compared to those who didn't change partners. While, among women with PE/eclampsia in the first birth, changing partners resulted in a 30.0% reduction in the risk of PE/eclampsia in the subsequent pregnancy. The difference of changing paternity effect on PE/eclampsia risk between women with and without a history of PE/eclampsia was significant. These findings support the hypothesis that parental human leukocyte antigen sharing may play a role in the etiology of PE/eclampsia (Li and Wi, 2000).

Poor ante-natal care is risk factor for PE (MacGillivary, 1983). But, in this work poor ante-natal care is insignificant risk factor. PE is not a common cultural concept among most of the mothers in Egypt, more than half of our cases were belong to low social level. Also, physical inactivity might be risk factor for PE (Howard et al., 1992). Evidence suggests that physically active women are less likely to develop PE. Regular exercise resulted intracellular and extracellular conditions that should counteract the enhancement of oxidative stress, thus interfering with the process leading to endothelial dysfunction (Yeo and Davidge, 2001). On the other hand, bed-rest has been successfully used as effective method of treating hypertensive disorders of pregnancy. Also, there have been many reports that the incidence of PE is lower among smokers than among nonsmokers (Cnattingius et al., 1997 and Conde-Agudelo et al., 1999). So, smoking during pregnancy is protective (Conde-Agudelo et al., 1999). The incidence of PE in cigarette smokers is about 50.0% that in non-smokers. This is due to the presence of hypotensive agents as thiocyanate in tobacco (Darby and Wilson, 2002). However, this benefit is cancelled out by the substantial negative effect of smoking on fetal growth, risk for placental abruption, general health hazards and increases the incidence of fetal mortality (WHO, 1987 and Cnattingius et al., 1997). Marriage may serve as partial proxies for mothers' smoking, as married had a higher risk of PE (possibly reflecting a lower prevalence of smoking) than non married was negatively associated with PE (Basso et al., 2006).

Nutrition has long been hypothesized to have a role in the etiology of PE. The hypotheses have been diverse and often mutually exclusive (MacGillivary, 1983). There are several reports showing that metabolic- and mineral level changes are associated with abnormalities of pregnancy (Adam et al., 2001). The incidence of PE is more common in poor women. This suggested that nutrients might be involved in the disorder. But, in many studies PE is poorly defined and nutritional data are obtained on women with PE (Roberts et al., 2003a). It is now well understood that, while PE is clinically evident late in pregnancy, the causal exposure(s) and many of the pathophysiologic changes are present months earlier. Periconceptional exposures may be particularly relevant, as they may affect implantation and/or decidual vascular remodeling (stage 1 of PE) (Bodnar et al., 2006). It is

indicated that women with PE had a lower intake of energy, protein and fats than did controls. However, further interrogation indicated that these differences occurred after the woman became ill and were considered to be secondary to the disease rather than causal (Davies et al., 1976). Excess intake of protein, calories, sugar and sodium is associated with onset of PE (Lauro et al., 1997). High intake of polyunsaturated fatty acids, energy and sucrose is associated with increased risk of PE (Clausen et al., 2001). Diet in the past year was assessed at delivery in women with and without PE. It was found that intakes of vitamin C, fruits and vegetables below recommended values were associated with increased risk of PE (Zhang et al., 2002). However, periconceptional and prenatal intakes were not assessed separately in this study, so it is difficult to discern during which time period low vitamin C, fruit and vegetable intakes were most relevant for the development of PE (Bodnar et al., 2006). Also, certain nutrients found in multivitamins, such as vitamin C and vitamin E, have been given in form of supplement, starting in mid pregnancy and have been reported to reduce the risk of PE (Chappell et al., 2002; Roberts et al., 2003a and Bodnar et al., 2006). Energy intake was higher in women with PE and highest in early onset PE. The main difference between cases and controls was an increased intake of sucrose-containing soft drinks (Clausen et al., 2001). Other study found no difference in the energy intake between cases and controls (Morris et al., 2001). Although the belief that low protein intake is associated with an increased risk of PE (Brewer, 1976), none of the studies indicated reduced protein intake in women with or destined to develop PE. This is supported by trials of protein supplementation that did not reduce the incidence of PE (Herrera et al., 1998 and Crowther et al., 1999). Collectively, women with well-defined PE were examined with a crude food frequency questionnaire and no gross nutritional differences were found (Atkinson et al., 1998).

In the present study several medical disorders such as obesity, diabetes, urinary tract infections…etc were found to be risk factors for PE. There is general agreement that the incidence of PE is higher in obese women (Sibai et al., 1997; Ros et al., 1998; Roberts & Cooper, 2001 and Skjaerven et al., 2005). So, elevated BMI is risk factor for PE (Duckitt and Harrington, 2005). Women with a greater BMI in pregnancy are more likely to become hypertensive than those with a lower BMI (Pipkin, 2001). The increase in PE over time may reflect increases in BMI in recent years (Midthjell et al., 1999). Weight of the PE patients and controls was 81.0±13.9 and 69.0±14.0 kg, respectively with a statistically

significant difference (Mahaba et al., 2001a). Evidence suggests that the association with obesity may be limited to the relatively mild type of PE with term delivery (Odegard et al., 2000). Education may serve as partial proxies for obesity, because higher education, which may correlate with lower BMI, was negatively associated with PE (Basso et al., 2006). On the other hand, Lou et al. (2008) and Ziaei et al. (2008) didn't found significant BMI difference between PE cases and controls.

Diabetes is an important risk factor for PE (Ros et al., 1998; Roberts & Cooper, 2001 and Funai et al., 2005). In the present study we found that DM is risk factor for PE. PE has been frequently reported as a complication of gestational diabetes. But, the relationship between these two conditions is not well understood (Vambergue et al., 2002). Common risk factors, such as elevated BMI and advanced age have been noted for each of the two conditions (Duckitt and Harrington, 2005). Also, there might be underlying common pathophysiology; insulin resistance (Ostlund et al., 2004 and Scioscia et al., 2009), chronic inflammation (Borzychowski et al., 2006 and Scioscia et al., 2009) and endothelial dysfunction (Roberts and Gammill, 2006). Early insulin resistance is associated with late pregnancy PE (Wolf et al., 2002). There is a 5.0% increase in the incidence of PE in pregnant diabetics. Also, the increased incidence of PE could be partially explained by the poor control of the diabetes; and in some of the cases, there may have been underlying renal disease, rather than true PE (White, 1965).

A growing body of evidences link infections with PE (Sacks et al., 1998 and López-Jaramillo et al., 2001). Generalized inflammatory state is feature of PE. Maternal leukocytes and maternal endothelium are contributors (Raijmakers et al., 2004). The incidence of asymptomatic bacteriuria was higher in pregnant women with PE (19.0%) than in normal gravidas (3.0%-6.0%) (Hill et al., 1986). Also, the incidence of urinary tract infection in pre-eclamptic women was higher than in normal pregnant women (Hsu and Witter, 1995). Further, urinary tract infection was shown to be a strong risk factor for PE (OR=4.23, 95% CI: 1.05-5.09) (Abi-Said et al., 1995). During pregnancy, urinary tract infection was associated with nearly a 2-fold increased risk for PE. Further, primiparas who had a urinary tract infection were five times more likely to develop PE than those who did not have urinary tract infection during pregnancy (OR=5.3, 95% CI: 2.9-9.7) (Mittendorf et al., 1996). The role of infection in the pathogenesis of PE is particularly relevant in developing countries, where the high incidence of chronic sub-clinical infection may contribute to the high incidence of PE (López-Jaramillo et al., 2001). Further, pregnant women with

asymptomatic bacteriuria, and vaginal infections and bacterial vaginosis who were identified and treated had a 64.0% reduction in incidence of PE. This dramatic reduction was due to the early identification and principally treatment of asymptomatic infections. But, it is not possible to make a definitive statement that infection is the major risk factor for PE. It is proposed that chronic sub-clinical infections may increase maternal cytokines to levels high enough to affect vascular endothelial function in women with a predisposition to develop PE (Herrera et al., 2001).

Depression and anxiety in early pregnancy are associated with the risk for PE (Kurki et al., 2000). In the present study maternal strain might be a cause of PE. This was in accordance with MacGillivary (1983). PE is a state of sympathetic over activity, which reverts to normal after delivery. The increase in peripheral vascular resistance blood pressure (BP) in PE is mediated, partially, by a substantial increase in sympathetic vasoconstrictor activity (Roberts, 1998). High levels of stress can lead to a temporary but dramatic increase in BP (Tobe et al., 2005 and Mohammed, 2009). Further, if the subject try to relax by eating more or drinking alcohol, you may only fuel, problems with high BP (Tobe et al., 2005). If stress itself is a risk factor, it could be because chronic stress exposes to unhealthy, persistently elevated levels of stress hormones like adrenaline and cortisol (Murray and Pizzorno, 2006).

There might be an increased incidence of PE in polyhydramnios cases that may be due to the associated hyper-placentosis (Roberts, 1998 and Ros et al., 1998). There is a stimulation of nerve endings along smooth muscles of the wall of the uterus causing spasm of the renal artery. The subsequent renal ischemia led to proteinuria and activation of the rennin-angiotensin system thus leading to hypertension. Both hypertension and proteinuria result in edema of the different tissues (Hays and Smetter, 1986; Roberts, 1998 and Ros et al., 1998).

There are reports showing that metabolic- and mineral level changes associated with abnormalities of fetal growth (Adam et al., 2001). But, the major cause of fetal compromise in PE is reduced uteroplacental perfusion (Lindheimer et al., 1999). The intervention that effectively reverses PE is delivery (Meis et al., 1998). PE is associated with a significant risk for pregnancy unfavorable outcome including preterm birth, low birth weight and perinatal deaths (Nosseir et al., 1990 and El-Houseinie et al., 1994). Preterm delivery substantially increases the risk of neonatal death (Kramer et al., 2000). Collectively, the pregnancy unfavorable outcome may lead to the observed lower 1- and 5-minutes Apgar scores and level of Hb in the neonates of PE cases compared to controls' neonates. The

association of PE with fetal IUGR is well known especially in pregnancies with early onset disease (El-Houseinie et al., 1994 and Xiong et al., 2000). Abnormal placenta is clearly involved in the genesis of both PE and fetal IUGR (Cross, 1996). It has been proposed that product(s) of the fetal-placental unit enter circulation and then initiate the maternal pathophysiologic changes of PE (Roberts et al., 1990). However, there is evidence that both feto-placental and maternal factors interact in manifesting endothelial cell dysfunction and its clinical manifestations (Taylor and Roberts, 1999). Preterm labor may occur spontaneously in cases of PE and eclampsia. However, it is more likely to be due to artificial induction (Ferris, 1990). Hypertensive pregnant patients have 3-4 times more preterm deliveries than did the normotensive women (Lin et al., 1982 and El-Houseinie et al., 1994). PE is a primary and important indication for preterm delivery in, especially, developed (Goldenberg and Rouse, 1998) and in developing (El-Houseinie et al., 1994; Kolusari et al., 2008 and Ziaei et al., 2008) countries, a trend encouraged in part by the increasing ability to manage extremely preterm infant in highly equipped neonatal intensive care units (Friedman et al., 1999). As expected infants of PE women were delivered earlier and, therefore, there was significant difference in birth weight of the neonates of PE patients compared to controls (2.26±0.91 vs. 3.22±0.41 Kg, P<0.001) (Kolusari et al., 2008). So, there is a significant increase in number of neonatal admission to intensive care units among the neonates of the PE group as a result of more preterm deliveries and a more prevalence of low birth weight babies (Ananth et al., 2005). Delivery exchanges a sick fetus for a sick premature infant (Goldenberg and Rouse, 1998). However, medically indicated preterm delivery may help prevent stillbirth (Ananth et al., 2005). But, the infant might then pay a high compensatory price in postnatal increased risk. Such risk could persist well beyond the neonatal period but be difficult to detect on a population level because of the overall declining trend in infant mortality (Basso et al., 2006). Also, PE is associated with 5-fold increase in perinatal mortality (Hauth and Cunningham, 1999). A large proportion of the perinatal mortality is consequently due to iatrogenic prematurity. Up to 15.0% of preterm births are a result of PE (Meis et al., 1998). Among pre-eclamptic pregnancies, inductions before 37 weeks increased from 8.0% in 1967-1978 to 20.0% in 1991-2003. During this 35 year, the risk of stillbirth decreased from 4.2 to 1.3 in PE compared to normal pregnancies. Also, the risk of neonatal death after pre-eclamptic pregnancy remained relatively stable, 1.7 vs. 2.0. Later infant and childhood mortality also showed little change. Fetal survival in pre-eclamptic

pregnancies has vastly improved over the past 35 years, presumably because of more aggressive management. However, the relative risk of neonatal death following a pre-eclamptic pregnancy has not changed over time. So, PE still carries a 2-fold increased risk of neonatal death (Basso et al., 2006). A review of clinical trials of delayed versus immediate delivery in fact suggested better outcomes with delayed delivery in well-selected patients (Friedman et al., 1999). So, when PE occurs early in pregnancy, even a few more days in uterus may be a key to a new born survival (Friedman et al., 1999 and Sibai, 2003). Also, as there is a paradoxical effect of smoking in pre-eclamptic women; smoking increases the rates of perinatal mortality, abruptio placentae and IUGR (Cnattingius et al., 1997). Further, PE is associated with a higher risk for cerebral palsy of the newborn (Report the Task Force ACOG/AAP, 2003), and it is associated with a higher risk for persistent pulmonary hypertension of the newborn (Hernández-Díaz et al., 2007). Also, 1- and 5-minutes Apgar scores of the neonates of PE patients were significantly lower than controls (Kolusari et al., 2008 and Ziaei et al., 2008).

Conclusions and Recommendations

PE risk factors can be manipulated, so primary preventive strategies are important. Good ante-natal care, screening, early detection and interventions for PE should be strengthened by all health team members. Also, limited information of health team members about maternal dietary intake as well as trace elements content of food consumed by this vulnerable group of population limited their ability to assess diet intake of the micro- and macro-nutrients and risk of PE. Further, early detection demands careful ante-natal care at appropriate intervals, especially in women predisposed to PE. Major risk factors are primipara, family history of PE, multiple fetuses, diabetes, urinary tract infection, low social level and obesity. Also, fetal IUGR, preterm labor, low birth weight and neonate intensive care admission were more common in PE. A program of bio-psycho-social risk assessment must be developed and added to standard ante-natal care. This allows identifying pregnant women at risk for PE, helps to define nutritional supplementation interventions to prevent PE, and to screen and treat asymptomatic urinary tract and cervical infections, thus reducing maternal and perinatal morbidity and mortality. We recommend improving ante-natal care, health education and conducting more population based studies on large number of pregnant women to understand the epidemiology of PE and its impacts on mother and her fetus and infant in Egypt.

Amniotic Fluid Selenium And Maternal Biochemical Findings Among Pre-Eclamptic Women In Cairo, Egypt

Essam A. El-Moselhy; Hesham H. Amin* And Hani M. Abd El-Aal**

Departments of Community Medicine, Clinical Pathology* and Obstetric & Gynecology**, Faculty of Medicine, Al-Azhar University. dr_elmoselhy@hotmail.com

ABSTRACT: Introduction: Pre-eclampsia (PE) is a multi-factorial and a multi-system disease. Selenium (Se) may be one of the disease causes. **Objectives**: The aim of this study was to find out the mean level of amniotic fluid selenium and the biochemical profile among the pre-eclamptic mothers and controls in Cairo, Egypt. **Subjects and methods**: A case-control, hospital based study design was used. All the cases and controls were examined laboratory. **Results**: The mean amniotic fluid Se level was lower among pre-eclamptic cases; total, mild and severe compared to controls with a statistically significant differences (P=0.00, 0.00 and 0.00, respectively). Further, the difference was statistically significant between mild and severe cases (P=0.00). Also, the mean hemoglobin level, mean hematocrit percent and mean platelet count were lower among pre-eclamptic cases compared to controls with statistically significant differences (P=0.00 for each of them). While; the mean lipid profile (except SHDL-cholesterol), mean liver enzymes levels, mean blood urea level, mean fasting blood glucose level and indicators of infections and/or inflammatory processes, mean total leucocytic count and mean C-reactive protein level were higher among pre-eclamptic mothers compared to controls with statistically significant differences (P=0.00 for each of them). On the other hand, the mean serum createnine level was higher among pre-eclamptic cases compared to controls with a statistically insignificant difference. Further, these differences were also present between the mild and severe PE cases. Lastly, the most important significantly correlated factors of severe PE were low amniotic fluid Se, high total leukocytic count, high fasting blood glucose and C-reactive protein levels (P=0.01, 0.02, 0.02, 0.03, respectively). **Recommendations**: Early ante-natal care, including health education, and treatment of pre-eclamptic women are recommended. Se supplementation may be a way to prevent PE. Population based studies are needed in different areas in Egypt on large number of pregnant women to determine their biochemical profile and to find out other possible trace element deficiencies that might be risk factors for PE.

INTRODUCTION

Pre-eclampsia (PE) is an inflammatory state characterized by maternal endothelial dysfunction and leukocyte activation (**Raijmakers et al., 2004a**). It is pregnancy-specific condition and it is major complication of pregnancy (**Roberts, 1998a**). PE has a multi-systemic nature (**Roberts, 2000** and **Roberts et al., 2003**). Also, PE can progress rapidly; putting mother at severe risk if there is no good management (**Basso et al., 2006**).

In spite of importance of PE, its etiology is unknown (**López-Jaramillo, 2000**). The proposed "2-stage model" (**Roberts and Cooper, 2001)** in which reduced placental perfusion leads to release of vasoactive factors and occurrence of the maternal syndrome; is likely to provide a simplified, yet largely accurate, description of the origin of severe early-onset disease, but may be less relevant for later-onset milder disease (**Redman and Sargent, 2000**). The proposed role of the placenta in the pathology of PE is also strongly supported by the rapid resolution of symptoms after delivery. Although there is clearly a focal role for placental dysfunction in PE, a number of theories are proposed to explain how this may be associated with the maternal syndrome (**Hubel, 1999** and **Levine et al., 2004)**.

PE is much more than hypertension and proteinuria. Increased attention to the multi-systemic nature of PE, activation of coagulation and increased sensitivity to pressor agents has expanded understanding of it (**Roberts, 2000** and **Roberts et al., 2003**). A basic feature of PE pathophysiology is reduced perfusion of virtually all organs, which is due to vasoconstriction, microthrombi formation and reduced circulating plasma volume. The vasoconstriction is secondary to an increased sensitivity of the vasculature to pressor agent. Activation of the coagulation cascade produces microthrombi. The reduced plasma volume, reflecting an endothelial leak with fluid loss from the intravascular compartment, further compromises perfusion. These abnormalities precede clinically evident disease by weeks to months and have led to the suggestion that a primary target in PE is the vascular endothelium (**Roberts et al., 1990** and **Roberts, 1998b)**.

PE is a complex disorder caused by a series of genetic, nutritional and environmental factors that lead to the creation of an imbalance between the free radicals; nitric oxide (NO), superoxide (O_2^-) and peroxynitrate in the vascular endothelium (**López-Jaramillo, 2000**). The placenta appears to be the principal source of free radical synthesis. Deleterious effects of free radicals include initiation of lipid peroxidation, oxidative damage of biomolecules, and cellular dysfunction. It is proposed that these may initiate maternal vascular endothelial dysfunction and leukocyte activation, recognized features of PE (**Raijmakers et al., 2004a**).

A pivotal role of enhanced placental superoxide generation leading to oxidative stress (OS) is increasingly recognized (**Hubel, 1999** and **Raijmakers et al., 2004b**). Placental OS has been shown to be a key feature in the pathogenesis of PE. OS is an imbalance between the cellular generation of reactive oxygen species and the capacity of antioxidants to prevent oxidative damage. The expression and activity of important antioxidant proteins are decreased in placental tissues from pre-eclamptic women, resulting in an imbalance between prooxidants and antioxidants leading to OS. Two of these antioxidant proteins are glutathione peroxidase (GSH-Px) and thioredoxin reductase enzymes that have selenocysteine within their active site and are selenium (Se)-dependent for activity (**Walsh, 1998; Hubel, 1999** and **Redman & Sargent, 2000**). In a suitable maternal environment, OS and subsequent endothelial activation and injury result (**Roberts and Hubel, 1999**). This endothelial dysfunction initiates the coagulation cascade and ensuing multi-system sequelae (**Surratt, 1993**).

The trace element Se level lowers during pregnancy. Further, lower Se concentration and GSH-Px activity have been noticed in pregnant women compared to pre-pregnancy status (**Sibai et al., 2000**) and non pregnant women (**Ferrer et al., 1999**). Se is capable of limiting adverse endothelial effects. Se removes the products of attack by reactive oxygen species (hydro-peroxides and oxidized lipoproteins), which can break down to further reactive free radicals and cytotoxic agents (**Rayman, 2000**).

Considered risk factors of PE are nutrition deficiencies (**Roberts et al., 2003**), obesity (**Roberts and Cooper, 2001**), diabetes (**Funai et al., 2005**) and genitourinary infection and inflammatory processes (**López-Jaramillo et al., 2001**).

STUDY OBJECTIVES

1- To find out the mean levels of amniotic fluid selenium among the pre-eclamptic mothers in Cairo, Egypt.

2- To determine the biochemical profile of the pre-eclamptic mothers in Cairo, Egypt.

SUBJECTS AND METHODS

I- Study Questions: Is there amniotic fluid selenium deficiency in the pre-eclamptic women? Is there a biochemical profile disturbance in the pre-eclamptic women? Is there correlation between amniotic fluid Se and biochemical markers, and severity of PE?

II- Study Design: A case-control, hospital based design was used to investigate the current research problem.

III- Study Setting: This study was conducted in the Obstetric and Gynecology Department, Al-Hussein Hospital, Al-Azhar University.

IV- Study Sample: According to sample size equation the sample was 86 cases, and to guard against sample size bias we increased the sample to be 100 PE cases. So, all the cases of PE attending the Obstetric and Gynecology Department, Al-Hussein Hospital, Al-Azhar University were included in the study tell sample reached the required number; 100. For each pre-eclamptic patient a healthy pregnant woman was chosen randomly. So, a control group of 100 healthy pregnant women was recruited.

All the PE patients must be fulfilling the following inclusion criteria: 1) Age of patients up to 30 years, 2) Gestational age 33 weeks, 3) Have a definite specific diagnosis of PE. Also, all patients recruited in this study have fulfilled the following specific exclusion criteria: 1) Essential hypertension, 2) Pregnancy induced hypertension without proteinuria, 3) Intake of vitamins/antioxidants during the current pregnancy, 4) Blood diseases, 5) Kidney disease, 6) Liver disease, 7) Intrauterine fetal death, and 8) Ante-partum hemorrhage.

The controls enrolled in the study have fulfilled the following inclusion criteria: 1) Age up to 30 years, 2) Have no history of PE in the current or previous pregnancy, and 3) Gestational age 33 weeks. Also, the controls have fulfilled the same specific exclusion criteria used for the patients group.

V- Ethical Consideration: The purpose of the study and procedures to be performed were explained to the cases and controls, an oral consent to participate in the study was taken accordingly. All patients were managed properly to control PE. All the cases and controls were delivered spontaneously in the normal vertex position or by Caesarian section according to the condition of each case.

VI- Study Tools and Methods:

1- Diagnosis of PE: All patients must be fulfilling the following inclusion criteria: 1) Hypertension: Blood pressure (BP) 140/90 mmHg, 2) Proteinuria: Trace or more by dipstick method, and 3) Bilateral lower limb edema: +1.

Pregnancy-induced hypertension is defined as BP 140/90 mmHg (mild PE) and BP 160/110 mmHg (severe PE) (**National Education program Working Group on High Blood Pressure, 2000**). Proteinuria, trace to +1 (mild PE) and +2 (severe PE). Two random midstream urine specimens, collected 4 hours apart taken from each woman to avoid error due to false positive tests, were used for detection of proteinuria. The two results must be positive, so the diagnosis of proteinuria was significant (**MacGillivary, 1983**). Edema is a common feature of pregnancy, but edema of PE is pathological (+1) and not just dependant; it usually involves the face, hands and persists even after arising (**Cunningham et al., 2010**).

2- Laboratory investigations: Laboratory examinations were done in all cases and controls. Fasting venous blood samples, 10 ml, were taken for lab examinations. These examinations were complete blood count (CBC), renal function tests; serum (S) urea and S. creatinine, total S. cholesterol, S. triglycerides (TG), S. high and low-density lipoprotein cholesterol (SHDL-& SLDL-cholesterol), and liver enzymes; alanine amino-transferase (ALT) and aspartate amino-transferase (AST).

CBC was estimated by ABX MICROS, MEDONIC MING 60 cell counter. C-reactive protein (CRP, mg/L) was determined quantitatively using slide agglutination test. Total S. cholesterol (mg/dl) was determined by an enzymatic technique according to **Richmond (1973)**. While, S. TG (mg/dl) was determined according to **Esders and Michrina (1979)**. SLDL-cholesterol (mg/dl) was precipitated by the addition of phosphotungestic acid in presence of magnesium ions. The supernatant obtained contains HDL, from which cholesterol was determined enzymatically according to **Steele et al. (1976)**. LDL-cholesterol was calculated according to the Friedwald's equation (**Friedwald et al., 1972**). Transaminases activity was measured by continuous monitoring method (**Bergmeyer et al., 1978**). Creatinine was measured by Jaffe method (**Spencer, 1986**), while, urea was measured by enzymatic method (**Titez, 2004**). Fasting blood glucose was measured by glucose oxidase method (**Gochman and Schmitz, 1972**).

A sample of 2 cc amniotic fluid was taken from each woman at time of the delivery to determine Se level (μg/L) by flameless atomic absorption spectro-photometer model 460-graphete 2000 according to **Thompson and Allen (1988)**. We decided to determine Se level in maternal amniotic fluid not in serum or plasma as the levels of Se in maternal serum and plasma might be decreased, partly, because increase blood volume and therefore increase hemodilution during pregnancy (**Rayman, 2002**). On the other hand, level of Se in amniotic fluid suggests a real level of maternal Se during pregnancy. This might

be because Se deposition in placenta and fetal tissues (**Mistry et al., 2008**).

VII- Statistical Analysis: Unpaired t student test and correlation co-efficient were used as tests of significance. The significance level was accepted if the P-value <0.05.

RESULTS

As regard the results of amniotic fluid examinations among the PE cases and control group (**table 1**), mean value levels of amniotic fluid Se in total PE cases and controls were 9.11±0.93 and 11.71±1.63 μg/L, respectively with a statistically significant difference (P=0.000). Also, mean value levels of amniotic fluid Se in mild PE cases and controls were 10.64±1.45 and 11.71±1.63 μg/L, respectively with a statistically significant difference (P=0.000). Lastly, mean value levels of amniotic fluid Se in severe PE cases and controls were 6.98±0.79 and 11.71±1.63 μg/L, respectively with a statistically significant difference (P= 0.000).

Regarding the results of amniotic fluid examinations among the PE cases according to severity (**table 2**), mean value levels of amniotic fluid Se in mild and severe PE cases were 10.64±1.45 and 6.98±0.79 μg/L, respectively with a statistically significant difference (P=0.000).

As respect the results of laboratory examinations among the PE cases and control group (**table 3**), mean and standard deviation values of hemoglobin and percent of hematocrit values of the patients and controls were 9.72±0.64, 11.05±0.59 g/dl and 29.11±2.41, 34.25±1.43%, respectively with statistically significant differences (P=0.000 for each of them). Also, mean and standard deviation value level of fasting blood glucose of the patients and controls were 137.31±46.18 and 92.27±26.15 mg/dl, respectively with a statistically significant difference (P= 0.000). Regarding mean platelet count of the patients and controls, they were 172.22±29.98 and 231.91±31.22 thousand/cmm, respectively with a statistically significant difference (P=0.000). As respect lab results indicating infection, mean and standard deviation leucocytic count and C-reactive protein values of the patients and controls were 12.80±3.47, 8.72±2.36 thousand/cmm and 9.53±2.82, 6.01±1.29 mg/L; respectively with statistically significant differences (P=0.000 for each of them). Regarding lab results of lipid profile, mean and standard deviation values of total serum triglyceride, cholesterol and HDL-& LDL-cholesterol of the patients and controls were 258.82±86.11, 182.17±62.37 mg/dl; 246.57±56.92, 189.58±53.29 mg/dl; 41.27±9.16, 49.86±7.65 mg/dl and 167.96±49.38, 129.29±34.13 mg/dl, respectively, with statistically significant differences (P=0.000 for each of them). As respect lab

results of renal function tests, mean and standard deviation values of S. urea of the patients and controls were 32.52±2.85 and 23.41±3.88 mg/dl, respectively with a statistically significant difference (P=0.000). While, mean and standard deviation values of S. creatinine was 0.85±0.27 mg/dl for patients and 0.81±0.16 mg/dl for controls with a statistically insignificant difference (P=0.2). Regarding lab results of liver enzymes, mean and standard deviation value levels of ALT and AST of the patients and controls were 38.20±11.32, 27.90±6.12 and 33.75±8.53, 24.87±4.81 U/L, respectively with statistically significant differences (P=0.000 for each of them).

As regard the biochemical results of laboratory examinations among the mild and severe PE cases **(table 4)**, mean and standard deviation value levels of hemoglobin and mean percent of hematocrit values of the mild and severe PE patients were 10.18±0.68, 9.29±0.56 g/dl and 32.01±1.11, 27.19±2.01%, respectively with statistically significant differences (P=0.000 for each of them). Also, mean and standard deviation value level of fasting blood glucose of the mild and severe PE patients were 131.21±19.05 and 161.11±26.71 mg/dl, respectively with a statistically significant difference (P=0.000). As regard platelet count values of the mild and severe PE patients, they were 191.23±31.22 and 156.21±21.18 thousand/cmm, respectively with a statistically significant difference (P=0.000). As respect lab results indicating infection, mean and standard deviation leucocytic count and C-reactive protein mean values of the mild and severe PE patients were 8.12±2.03, 13.96±3.52 thousand/cmm and 8.21±1.02, 11.24±2.12 mg/L; respectively with statistically significant differences (P=0.000 for each of them). As regard lab results of lipid profile, mean and standard deviation values of total serum triglyceride, cholesterol and HDL-& LDL-cholesterol of the mild and severe PE patients were 214.37±42.11, 288.52±97.81 mg/dl; 218.81±31.91, 266.82±67.24 mg/dl; 45.86±9.50, 36.65±6.86 mg/dl and 149.25±46.32, 192.87±53.80 mg/dl, respectively, with statistically significant differences (P=0.000 for each of them). Respecting lab results of renal function tests, mean and standard deviation values of S. urea of the mild and severe PE patients were 27.81±2.24 and 36.82±3.15 mg/dl, respectively with a statistically significant difference (P=0.000). While, mean and standard deviation values of S. creatinine was 0.83±0.26 mg/dl for mild PE patients and 0.89±0.29 mg/dl for severe PE with a statistically insignificant difference (P=0.3). Regarding lab results of liver enzymes, mean and standard deviation value levels of ALT and AST of the mild and severe PE patients were 35.50±8.21, 41.90±10.12 and 29.74±5.14, 38.54±8.93 U/L, respectively with

statistically significant differences (P=0.002 and P=000, respectively).

Respecting the correlation co-efficient of severe PE cases according to significant findings of the laboratory examinations of maternal serum and amniotic fluid **(table 5)**, mean low levels of amniotic fluid Se and mean high levels of leukocytic count, fasting blood glucose, C-reactive protein, SLDL-cholesterol, total S. TG, total S. cholesterol and ALT were significantly correlated with severe PE.

DISCUSSION

PE syndrome is recognized to be a multi-system disease of the pregnant mother **(Roberts et al., 2003)**. It results from the interaction between economic, psychosocial, nutritional, environmental and genetic factors **(López-Jaramillo, 2000)**. Further, PE is associated with an imbalance of increased lipid peroxides and decreased antioxidants **(Ziaei et al., 2006)**.

The trace element Se has a biological role as catalysts for endogenous antioxidant enzymes. Also, Se for glutathione peroxide enzymes is component of numerous metalloenzymes and cofactors for super dismutase enzyme **(Mahomed et al., 2000)**. An increased incidence of pregnancy-induced hypertension in selenium-deficient regions was reported **(Lu, 1990)**. Selenium depletion leads to loss of glutathione peroxidase (GSH-Px) and thioredoxin reductase activity, although no one has examined the placental expression of these proteins during PE and related this to Se status **(Vanderlelie et al., 2004)**. The suggested importance of the deficiencies of trace elements in PE relates to the fact that they are present in superoxide dismisses (copper, Selenium and zinc) and GSH-Px (Se). Also, messenger RNA expression for copper-zinc-superoxide dismisses and glutathione peroxidase is lower in pre-eclamptic placenta **(Rayman et al., 1996; Wang & Walsh, 1996; Mahomed et al., 2000** and **Rayman, 2000)**. Biomarker information on Se is conflicting. Whole blood and plasma levels of selenium are lower in pregnant compared to non-pregnant women **(Ferrer et al., 1999; Mihailovic et al., 2000** and **Atmar et al., 2005)** and decrease more as gestation proceeds **(Zachara et al., 1993** and **Sibai et al., 2000)**. Further, erythrocyte **(Zachara et al., 199**3); hair **(Guvenc et al., 1995)** and amniotic fluid **(Mihailovic et al., 2000** and **Rayman, 2000)** levels of Se are lower in pregnant compared to non-pregnant women. The decreased levels of Se in maternal serum and plasma might be, partly, because increase blood volume and therefore increase hemodilution during pregnancy **(Rayman, 2002)**. However, the decreased levels of Se in erythrocyte and amniotic fluid suggest a real decrease in maternal Se during pregnancy and this might be because Se deposition in placenta and fetal

tissues. Also, there was significant reductions in serum selenium concentrations and plasma GSH-Px activity in pregnancy per se compared to non pregnant controls. Moreover, these levels were further decreased in the pre-eclamptic mothers and babies compared to normal pregnancies. OS associated with PE may be a consequence of reduced antioxidant defense pathways specifically involving GSH-Pxs, perhaps linked to reduce Se availability. Reduced GSH-Pxs could be associated with increased generation of toxic lipid peroxides contributing to the endothelial dysfunction and hypertension of PE **(Mistry et al., 2008)**. In a study on 32 pre-eclamptic women and 28 healthy pregnant women, serum level of Se was measured by atomic absorption spectrometry. The study found the mean serum Se concentration in PE is 60.68±6.42 mg/dl and in healthy pregnant is 87.50±10.96 mg/dl. The difference between both groups was statistically significant (P<0.01) **(Atmar et al., 2005)**. Se concentrations in maternal and umbilical cord blood, and amniotic fluid were determined in normotensive and hypertensive women in relation to their smoking status. In the group of normotensive and hypertensive women, significantly lower Se concentrations in blood of smokers were observed than in nonsmokers. Umbilical cord blood Se concentrations in both normotensive and hypertensive smokers were significantly lower than in nonsmokers as well. In the group of normotensive women, significant differences in Se concentrations in amniotic fluid were observed between smokers and nonsmokers **(Kosanovic et al., 2010)**. Further, toe nail Se concentrations in pre-eclamptic women were significantly lower than in their matched normal controls **(Rayman et al., 2003)**. Measuring Se status by using the toe nail clippings was decided to overcome the difficulty experienced in previous studies of the PE process influencing tissue concentration of Se concerning increased plasma volume in normal pregnancy and smaller or non existent in blood volume in pre-eclamptic patients. In Egypt, decreased levels of Se have been observed in patients with PE **(Mekkay et al., 2007)**. Also, third trimester amniotic fluid Se level associated with PE was lower compared to normal pregnancy **(Dawson et al., 1999)**. So, Se supplementation could be used to lower the high incidence of PE **(Lu, 1990)**. Further, as 15.0% of these studied pre-eclamptic group are diabetics and we reported that diabetes is risk factor for PE **(El-Moselhy et al., 2011)**, so Se blood level is lower in gestational diabetic women **(Tan et al., 2001)**. On the other hand, increased levels of plasma Se have been observed in patients with PE compared to controls **(Mahomed et al., 1998)**. Also, median maternal leucocytic Se was 15.0% higher among pre-eclamptic women compared to normal pregnant **(Mahomed et al., 2000)**. Further, the increased levels of Se were

15.0% **(Ratman et al., 1996)** and 18.0% **(Gromadzinska et al., 1998)** among PE cases compared to their normal pregnant controls. At the same time, there was no observed significant difference as regard Se levels between pre-eclamptic women and normal pregnant controls **(Rayman et al., 1996)**. The differences in tissues and analytical techniques used to measure maternal Se status are possible explanation for why available studies concerning maternal Se status and the risk of PE are not combatable. Moreover, differences in population characteristics such as age, race, ethnicity, as well as country and region of residence may account for some of the variation in results across studies. Also, the potential limitation of some studies (as our study) must be considered as the retrospective design of the study that was unable to determine whether the observed alterations in Se concentration preceded PE or whether the alteration attributed to PE **(Mahomed et al., 1998** and **Mahomed et al., 2000)**.

The increase prevalence of anemia among the pre-eclamptic women might be attributing to their disease and low intake of nutrients **(Davies et al., 1976)**. Also, hemoglobin serves to transport nitric oxide, as S-nitrose cysteine, from the lungs to the peripheral circulation, where it can be released. Glutathione peroxidase (GSH-Px), besides being an important antioxidant, is known to catalyze the release of nitric oxide (NO) from smaller carrier molecules, and may play a role in the distribution of NO throughout the body **(Funai et al., 2002)**. So, an imbalance between the free radicals NO, superoxide (O_2^-) and peroxynitrate in the vascular endothelium occurs **(López-Jarmillo, 2000)**. Also, selenium (Se) depletion leads to loss of GSH-Px activity, although no one has examined the placental expression of this protein during PE and related this to Se status **(Vanderlelie et al., 2004)**.

PE has been frequently reported as a complication of gestational diabetes **(Vambergue et al., 2002)**. Also, diabetes is an important risk factor for PE **(Roberts & Cooper, 2001; Funai et al., 2005** and **El-Moselhy et al., 2011)**. Diabetes mellitus among PE cases and control group was 15.0% and 5.0%, respectively (OR=3.35, 95% ECL: 1.09-12.23) **(El-Moselhy et al., 2011)**. But, the relationship between these two conditions is not well understood **(Vambergue et al., 2002)**. In PE, there is exacerbation of physiological changes associated with pregnancy such as insulin resistance, altered immune responses and inflammatory pathway activation. These exaggerated responses seen in PE are reminiscent of metabolic syndrome, and also are evident in gestational diabetes **(Scioscia et al., 2009)**. So, studies suggest that insulin resistance **(Ostlund et al., 2004)**, chronic inflammation **(Borzychowski et al., 2006)** and

endothelial dysfunction (**Solomon & Seely, 2001** and **Roberts & Gammill, 2006)** are underlying pathophysiology. Also, common risk factors, such as elevated body mass index and advanced age have been noted for each of the two conditions (**Duckitt and Harrington, 2005)**. Increased insulin resistance, a characteristic of gestational diabetes, has also been associated with the development of PE (**Kaaja & Greer, 2005** and **Parretti et al., 2006)**. Inositol phosphoglycan P-type (P-IPG) in PE has been extensively investigated and increased production has been demonstrated. This molecule acts as a second messenger of insulin, enhances the metabolic effects of insulin and is associated with insulin resistance (**Scioscia et al., 2009)**. Also, abnormal endothelial function with impaired flow mediated dilatation (**Dadelszen et al., 2007)** and inflammatory cytokine release as C-reactive protein and E-selectin are reported in PE and diabetes (**Aydin et al., 2004)**. Further; the post 50 gm challenge glucose value at 24-28 weeks of gestation, in a case-control study of pregnant women with new-onset hypertension in late pregnancy and normotensive controls, was significantly higher among those developed hypertension (**Solomon et al., 1994)**. Further, hyper-insulinemia may play a role in over activity of the sympathetic nervous system associated with obesity. In rats, insulin, like leptin, causes sympatho-activation to different tissues including the kidney (**Rahmouni et al., 2004)**. So, our results as regard high levels of fasting blood glucose of the patients compared to controls were expected and accepted.

In PE there is marked increase in platelet aggregation and decrease of platelet count that may occur early in pregnancy. The cause of this coagulation problem in PE is either due to disturbance of the balance between the platelet aggregation effects of the thromboxane A2 and the inhibitory effect of prostacyclin (**lewis et al,, 1981)**, or formation of soluble immune complexes that become deposited in the walls of blood vessels, thus enhancing platelet aggregation and intravascular thrombosis (**Burrows et al., 1987)**. Also, the risk factors for PE include thrombophilias (**Roberts and Cooper, 2001)**.

A growing body of evidence links infection and inflammatory processes with PE were reported (**López-Jaramillo et al., 2001)**. PE is an inflammatory state characterized by leukocyte activation (**Raijmakers et al., 2004a)**. It is associated with a greater inflammatory response than observed in normal pregnancy (**Sacks et al., 1998)**. Pre-eclamptic women had higher leukocytic count and increased total number of neutrophils compared to normal pregnant group. Also, pregnant women, who have a high risk for PE and chronic sub-clinical infection, have increased levels of CRP during the third trimester (**Teran et al.,**

2001). These results provide further evidence of enhanced inflammation in PE. Endothelial cell dysfunction is part of more widespread intravascular inflammatory response causing clinical PE (**Sacks et al., 1998)**. Also, placental lipid peroxidation product, tumor necrosis factor (TNF) and syncytiotrophoblast membrane fragments are blood borne agents causing endothelial cell dysfunction (**Redman et al., 1999)**. Further, malondialdehyde and 4-hydroxynonenal are stable production products that enter maternal circulation causing widespread endothelial dysfunction (**Esterbauer, 1993)**. Lipid peroxidation predisposes to shedding of syncytiotrophoblast membrane into maternal circulation and leads to decrease fluidity of syncytiotrophoblast membrane (**Morris et al., 1996)** and may have a profound adverse effect on vascular endothelium (**Smarson et al., 1993** and **Cockell et al., 1997)**. Also, shedding apoptotic debris from syncytial surface is more intense in PE than in normal pregnancy and acts as inflammatory stimulus for PE (**Redman and Sargent, 2003)**. Further, increased circulating TGs, free fatty acids, small dense LDL act as proinflammatory stimulus for PE (**Redman et al., 1999)**. Mean plasma TGs and free fatty acids concentrations undergo near doubling in pre-eclamptic women relative to normal pregnant (**Lorentzen et al., 1995** and **Hubel et al., 1996)**. Fasting serum TGs correlates with serum malondialdehyde in pre-eclamptic women (**Hubel et al., 1996)**. Amplification of injurious effects of placental TNF by increased maternal free fatty acids is then possible. Free fatty acids are highly inflammatory (**Toborek et al., 1996)**. Further, activation of maternal neutrophils during their transit through the placenta could provide a pathway for transfer of oxidative disturbances into the maternal circulation in PE (**Butterworth et al., 1991)**. Also, pre-eclamptic women had higher incidence of asymptomatic bacteriuria than in normal pregnant women, 19.0% vs. 3.0-6.0% (**Hill et al., 1986)**. Further, the incidence of urinary tract infections in pre-eclamptic women was higher than in normotensive pregnant women (**López-Jaramillo et al., 2001)**. In Egypt, there was significant risk of asymptomatic bacteruria, urinary tract infection, and vaginal infection and bacterial vaginosis among pre-eclamptic cases (ORs=3.62, 95% ECL: 1.19-13.10; 3.59, 95.0% ECL: 1.05-15.58 and 4.41, 95% ECL: 1.13-24.97, respectively) (**El-Moselhy et al., 2011)**. On the other hand, in women with PE, it cannot be determined whether the increase in CRP and proinflammatory cytokines was a cause or a consequence of PE (**Teran et al., 2001)**. Also, it is not possible to make a definitive statement that infection is a major risk factor for PE. However, it is proposed that chronic sub-clinical infections may increase maternal cytokines to levels high enough to affect vascular endothelial

function in individuals with a predisposition to subsequent development of PE (**Herrera et al., 2001**). So, the role that infection and inflammation may play in the imbalance of free radicals that leads to PE needs to be studied as it may involve a fundamental change in the prevention and treatment of PE (**López-Jaramillo et al., 2001**).

High intake of polyunsaturated fatty acids is associated with increased risk of PE (**Clausen et al., 2001**). Pregnancy induced hypertension is characterized by high TG and low HDL2-cholesterol levels. Alterations in HDL profiles may contribute to endothelial dysfunction in PE (**Von Versen-Hoeynck and Powers, 2007**). About one-third of pre-eclamptic women develop plasma TG values above 400 mg/dl (**Hubel et al., 1996**) greater than normal pregnancy (**Knopp et al., 1992**). Further, the risk factors for PE include obesity and diabetes (**Roberts & Cooper, 2001** and **El-Moselhy et al., 2011**). These factors are also risk factors for atherosclerosis. Also, other similarities exist between PE and atherosclerosis. In both of them, endothelial cells are important targets and the dyslipidemia predisposing to atherosclerosis occurs in pre-eclamptic pregnancies (**Hubel and Roberts, 1999**). Hyper triglyceridemia shifts the spectrum of LDL subclasses toward proportional increases in smaller, denser, more atherogenic LDL particles (**Krauss, 1997**). Small dense LDL particles more readily infiltrate into arterial tissue (the presumed site of LDL oxidation) and exhibit enhanced adhesiveness to artery internal proteoglycans (**Anber et al., 1996**). Further, smaller denser LDL particles are intrinsically more susceptible to oxidation (**Chait et al., 1993**). Small dense LDLs show greater capacity to provoke changes

in vascular cells in culture consistent with vasoconstrective effects in vivo (**Weisser et al., 1993**). Acute atherosis of decidual arterioles is characterized by fibrinoid necrosis of the vessel wall, disruption of the endothelium, aggregates of platelets and accumulation of lipid-laden macrophages, a true atherosclerosis-like change (**Sheppard and Bonnar, 1981**). Women with PE have reversible increases of serum TGs and LDL-cholesterol and reduced HDL-cholesterol. Importantly, small dense serum LDLs are, also, increased in women with PE compared to controls having normal pregnancies (**Hubel et al., 1989** and **Hubel et al., 1998**).

PE syndrome is now recognized to be a multi-system disease (**Roberts, 2000** and **Roberts et al., 2003**). PE variably may affect the brain, lungs, kidney and liver (**Raijmakers et al., 2004a**). So, the lab results of high liver enzymes and renal function tests are expected and accepted. The difference in lab results of ALT in mild (28.6 ± 7.6 U/L) and severe (55.5 ± 10.4 U/L) PE was statistically significant ($P < 0.001$). Also, the difference in lab results of AST in mild (26.5 ± 6.9 U/L) and severe (57.2 ± 11.8 U/L) PE was statistically significant ($P < 0.001$) (**Ziaei et al., 2008**). Further, when patient have liver dysfunction, thrombocytopenia and hemolysis, they are classified as having HELLP syndrome (i.e., hemolysis, elevated liver enzymes, low platelets) (**Curtin and Weinstein, 1999**).

The potential limitations of this study, which must be considered is the retrospective design of the study that was unable to determine whether the observed alteration in amniotic fluid trace element selenium concentration preceded PE or whether alteration attributed to PE.

Table (1): Means and standard deviations of pre-eclampsia (PE) cases and control group according to the laboratory results of amniotic fluid selenium.

Amniotic fluid selenium	Laboratory results of maternal amniotic fluid selenium M±SD		t-value	P-value
	PE cases (n=100)	Controls (n=100)		
Selenium (µg/L):				
Total cases (n=100)	9.11 ± 0.93	11.71 ± 1.63	-13.855	0.000
Mild PE cases (n=67)	10.64 ± 1.45	11.71 ± 1.63	-4.905	0.000
Severe PE cases (n=33)	6.98 ± 0.79	11.71 ± 1.63	-26.113	0.000

Tot. S. triglycerides	7.107	0.04
Tot. S. cholesterol	6.303	0.04
ALT	9.004	0.04

CONCLUSIONS AND RECOMMENDATIONS

In this study pre-eclamptic patients had lower mean amniotic fluid Se, higher mean levels of fasting blood glucose, low platelet mean count**,** higher mean total leukocytic count, increased mean levels of CRP, increased mean serum TGs and LDL-cholesterol and reduced mean HDL-cholesterol, higher mean liver enzymes (ALT and AST)**,** and higher mean renal function tests compared to pregnant controls. Further, these differences were also present between the mild and severe PE cases. Also, the most important significantly correlated factors for severe PE were low amniotic fluid Se, high total leukocytic count, and high fasting blood glucose and CRP levels. The best way to prevent PE in an effective manner is the establishment of an adequate prenatal control system, whose procedures should contain an adequate Se supplementation. In addition, adequate prenatal care would allow physicians to diagnose and promptly treat symptomatic and asymptomatic urinary and vaginal infections. Finally, the role that infection and inflammation may play in the imbalance of free radicals that leads to pre-eclampsia needs to be studied in depth because it may involve a fundamental change in the prevention and treatment of PE. Also, we recommend studying the role of other nutrient trace elements and vitamins in the occurrence of PE in Egypt.

Abstract: Background: Mercaptopurine is one of the most important drugs used in cancer treatment. Its elimination depends mainly on the enzyme Thiopurine S-methyl Transferase (TPMT). A number of known genetic polymorphisms can affect the activity of this enzyme. **Aim of the work**: to study the pattern of TPMT polymorphisms in a cohort of Egyptian patients with ALL and its impact on response to therapy and toxicity. **Patients and methods**: the study included 52 low-risk pediatric ALL patients treated by PNCI XIII LR Protocol. TPMT genotype was done for common mutations using polymerase chain reaction-based assays. Clinical follow-up, documentation of events, and 6-MP dose reductions were performed throughout the maintenance phase in a double blinded fashion. **Results:** TPMT genotyping showed that 40 patients (76.9%) have the wild type and 12 (23.1%) have the mutant type, two (3.85 %) of which were homozygous for G238C and ten were heterozygous (19.25%). TPMT mutant patients, especially homozygous, were at greater risk of 6-MP toxic effects and needed more frequent dose reductions. Mean duration of missed therapy was 50.250 weeks for the mutant patients vs. 25.825 weeks for wild-type patients **(P < 0.001)**. **Conclusion:** TPMT heterozygous and homozygous patients require lower doses of 6-MP.These results justify performing TPMT genotyping before initiating 6-MP therapy in all children with ALL to minimize consequent toxicity through dose modifications.

Introduction

Antimetabolites are one of the most chemotherapeutic agents used in cancer therapy. They are structural analogues of important cofactors or intermediates in the DNA and RNA biosynthetics. Antimetabolites inhibit synthesis of nucleic acids and their building units or are incorporated into the DNA or RNA, resulting in impaired synthesis. Antimetabolites like methotrexate, mercaptopurine and fluorouracil are folate, purine and pyrimidine analogues respectively. They are used in the treatment of childhood cancers *(1).*

Mercaptopurine and thioguanine are thiopurines. They are thiol-substituted derivatives of the naturally occurring purine bases hypoxanthine and guanine, respectively. Mercaptopurine has been used in the treatment of ALL for five decades, mainly during maintenance therapy. 6-Mercaptopurine is administered orally at a dose of 75 to 100 mg/m^2 per day with upward or downward dose adjustments based on the degree of myelosuppression during maintenance therapy. One of the most important factors in the outcome of pediatric ALL is to ensure that patients are receiving their maximum tolerated dose of mercaptopurine *(2)*.When the actual dose of mercaptopurine received increased by 22% as a result of more aggressive prescribing guidelines, the relapse-free survival improved by 18% **(3)**. High-dose intravenous infusions of mercaptopurine (1,000 mg/m^2 over 6 to 24 hours) have also been used to overcome the pharmacokinetic limitations of oral dosing **(4)**.

Thiopurines are very useful drugs, but they have a relatively narrow therapeutic index, with life-threatening myelosuppression as a major toxic effect. They are prodrugs that must be converted intracellularly to thioguanine nucleotides to exert a cytotoxic action. These drugs are metabolized, in part, by the cytoplasmic enzyme Thiopurine S-methyltransferase (TPMT) *(6)*.

The level of TPMT activity in human tissues is controlled by a common genetic polymorphism. Individuals who inherit a deficiency in this enzyme exhibit profound intolerance to thiopurine medications, including mercaptopurine and thioguanine *(7)*. TPMT-deficient patients treated with usual doses of these medications, develop profound hematopoietic toxicity

that precludes the administration of other chemotherapy and can be fatal; so reduction of doses by 10-15 folds should be done to prevent the occurrence of such toxicity *(8)*. One in 300 inherit two mutant TPMT alleles and are TPMT deficient, and about 5%-10% are heterozygotes at the TPMT gene locus and have intermediate enzyme activity *(2)*. The rare TPMT-deficient individual probably accounts for most of the thiopurine-intolerant patients who were previously considered to have 'idiosyncratic' toxic effects. TPMT heterozygotes constitute approximately 10% of the patients who receive these medications. If these heterozygotes have intermediate intolerance to thiopurines, due to their intermediate level of TPMT enzyme activity, this would provide a reasonable rationale for routinely assessing TPMT genotype in all patients before starting thiopurine therapy. (7, 9-13). However, another report did not approved these rationale (14)

TPMT exhibits genetic polymorphism in all large ethnic groups studied to date, including Caucasians, Africans, African- Americans, and Asians (15).

Patients and Methods

In this study we studied TPMT polymorphisms in a cohort of 52 newly diagnosed low risk pediatric acute lymphoblastic leukemia (ALL) patients. We aimed to investigate the prevalence of the polymorphic allele and its possible impact on 6-MP tolerability. ALL patients were treated at the NCI, Cairo University, Egypt in the period from June 2005 to October 2008

The study was approved by the IRB of the National Cancer institute, Cairo University. A signed consent from patient's parent had been taken to be enrolled in the study. Diagnosis was performed according to standard clinical, morphological, cytochemical, and immunophenotypic criteria. The recruited patients comprised 36 male and 16 female with an age range of 1-9 years with a median of 5 years.

Inclusion Criteria (Low Risk Criteria)
- Age= 1-9 years (inclusive) at diagnosis
- Total Leukocyte Count (TLC) < 50,000/mm^3 at diagnosis
- B-cell progenitor immunophenotype
- No t(1;19), t(9;22), or MLL gene rearrangement by cytogenetics
- CNS status 1 or 2 (WBC < 5/mm^3 in CSF)
- Day 15 (mid-induction) bone marrow aspirate (BMA) shows 5% blasts.

Exclusion Criteria:
- Patients with impaired liver or kidney function.

Treatment Protocol

Patients were enrolled into the **ALL LR PNCI XIII/2002** Treatment Protocol. In brief, remission induction therapy consisted of prednisone, vincristine,

L-asparaginase, doxorubicin, etoposide, cytarabine, and triple intrathecal injections (methotrexate, hydrocortisone, and cytarabine) given over a 4-week period. Two weeks later, patients started consolidation therapy which was a 14-day phase that consisted of high-dose methotrexate at a dose of 2 g/m^2 over a 2-hour infusion period given weekly for 2 doses with leucovorin rescue, in addition to 6-mercaptopurine at a dose of 75 mg/m^2 given daily by the oral route for the whole duration of the phase (14 days). Maintenance phase was then started and continued for 120 weeks. It consisted of weekly methotrexate at a dose of 40 mg/m^2 given intravenously or intramuscularly, with 6-mercaptopurine at a dose of 75 mg/m^2 given daily by the oral route for the whole duration of the week. Every 4th week, methotrexate and 6-mercaptopurine were substituted by a pulse of vincristine given intravenously at a dose of 1.5 mg/m^2 (with a maximum dose of 2 mg/m^2) and dexamethasone given orally for the whole week at a dose of 8 mg/m^2/day in 3 divided doses. Every 8 weeks during the 1st year only, methotrexate was substituted by high-dose methotrexate like that given in the consolidation phase and a triple intrathecal injection was added. Furthermore, a re-induction window was executed at weeks 16 to 19 and consisted of prednisone, vincristine, L-asparaginase, and doxorubicin. Complete blood counts were obtained weekly. Chemotherapy was given every week, provided that the absolute neutrophil count was 0.3x10^9/L, platelet count was 50x10^9/L, and that the patient did not exhibit other complications, such as severe mucositis, infection, or hepatotoxicity.

Study Structure

This study was conducted on a double-blind basis. Once the diagnosis of low-risk ALL was established, blood samples for TPMT genotyping were withdrawn and processed (using serial numbers) without knowing the specific genotype of each patient. Clinical follow-up, documentation of events, and 6-MP dose reductions were performed throughout the maintenance phase, and the resultant data were correlated with the specific TPMT genotypes after ending treatment.

I. **Genotyping**

Genotyping for TPMT G460A and A719G mutations was performed by PCR-RFLP method (9). TPMT G238C mutation was performed by ARMS (9), in which we used a common primer plus one primer for wild type and another for mutant type in a separate PCR reaction. Absence of these alleles was considered as TMPT wild type.

1. **Detection of G238C**

Genomic DNA, 400 ng, was amplified under the conditions previously described (9). The final volume for all PCR assays was 25 micro

L. Through use of 1 µg genomic DNA (Qiagen)) as a template, PCR was done with primers (table 1) in buffer D (Invitrogen, San Diego, California). The buffer contained Tris hydrochloride (pH 8.5), 60 mmol/L; ammonium sulfate, 15 mmol/L; and magnesium chloride, 3.5 mmol/L. The concentration of each oligonucleotide was 0.1 OU/mL (about 0.5 µmol/L), and 0.2 µL Taq polymerase (Qiagen) was used. With a Biometra T3 thermocycler (Germany), amplification was done for 30 cycles consisting of denaturation at 94 °C for 1 minute, annealing at 55 °C for 2 minutes, and extension at 72 °C for 1 minute. A final extension step at 72 °C for 7 minutes was done. A DNA fragment was amplified with P2M and P2C primers when C238 (mutant) was present, whereas a DNA fragment was amplified with P2W and P2C primers when G238 (wild-type) was present **(Table 1 and Fig 1)**.

2. **Detection of G460A**
PCR was performed in conditions similar to that of G238C except for buffer J (Invitrogen) which contained Tris hydrochloride [pH 9.5], 60 mmol/L; ammonium sulfate, 15 mmol/L; and magnesium chloride, 2.0 mmol/L) instead of buffer D (9). MwoI digestion of amplified wild-type DNA yields fragments of 267 and 98 base pairs, whereas DNA containing the G460A mutation is not digested and yields an uncleaved fragment of 365 base pairs **(Table 1 and Fig 2)**.

1. **Detection of A719G**
To detect the A719G mutation, a PCR assay using primers P719R and P719F was performed under the same conditions as those used for the G460A mutation (9), except that we used buffer N (Invitrogen) instead of buffer D, The A719G mutation introduces an AccI restriction site in the amplified fragment and yields fragments of 207 and 86 base pairs. Wild-type DNA yields an uncleaved fragment of 293 base pairs **(Table 1 and Fig 3)**.

II-Clinical Follow-up

1. Evaluation of the Toxic Effects of 6-MP
For each weak therapy withheld due to toxicity caused by 6-MP, the main cause was documented (neutropenia or hepatotoxicity) and the week marked as a missed one for treatment. Neutropenia was defined as an ANC (Absolute Neutrophil Count) < 0.3 x 10^9 cells/L. Episodes of fever and neutropenia necessitating antibiotic treatment - on outpatient or inpatient basis - were also considered toxic effects of treatment. Hepatotoxicity was defined as 5-fold serum ALT (Alanine Transaminase) elevation or serum direct (conjugated) Bilirubin 2.0 mg/dL in a previously healthy patient not suffering from any of the known hepatitis virus infections, which dropped back to normal values when treatment was withheld.

2. Dose Modification for 6-MP
Patients missing 25% (30 weeks) of treatment, as documented by missed treatment weeks, had 6-MP dose reduced preliminarily by 30% (75 50 mg/m^2/day). This dose reduction was reviewed every 4 weeks by means of evaluation of the main toxic effects of treatment.

Statistical Analysis

SPSS (Statistical Package for Social Sciences) software version 12.0 was used for data analysis. Mean and standard deviation were estimates of quantitative data. Non-parametric t test compared means of 2 independent groups and ANOVA was used for comparing more than 2 groups with Scheffe Test for post-hoc pairwise comparisons. Chi-Square/Fischer Exact were tests of proportion independence. ROC (Receiver Operator Characteristic) curve analysis was used to set up different levels of neutropenia, hepatotoxicity, and missed treatment durations to categorize 6-MP phenotypes into first, 'Wild' (normal) and 'Mutant' (heterozygous and homozygous) and then, 'Heterozygous Mutant' and 'Homozygous Mutant'. Accordingly, sensitivity and specificity were used to assess the validity of previous measures as diagnostic elements of abnormalities. Significant P value was set at 0.05.

Results

Toxic Effects of 6-MP

The toxic effects of 6-MP among the study group including neutropenia, hepatotoxicity and missed treatment weeks are demonstrated in (table 2).

Dose Reduction for 6-MP

Of the 52 studied patients, 12 (23.1%) required 6-MP dose reduction by 30% (70% of the original dose was given), due to missing 25% (30 weeks) of the duration of maintenance treatment. The other 40 patients (76.9%) required no dose reduction.

TPMT Genotype

The results of TPMT genotyping showed that 40 patients (76.9%) have the wild type (normal, no enzyme defect) and 12 patients (23.1%) have the mutant type. Out of the 12 mutant patients, three (5.77%) showed genotype TPMT *1/TPMT *2 (heterozygous mutant G238C), two (3.85%) showed genotype TPMT *2/TPMT *2 (homozygous mutant G238C), two (3.85%) showed genotype TPMT

*1/TPMT *3A (heterozygous mutant G460A and A719G), four (7.69%) showed genotype TPMT *1/TPMT *3B (heterozygous mutant G460A), and one patient (1.92%) showed genotype TPMT *3B/TPMT *3B (homozygous mutant G460A) (**Fig. 4**).

Clinical impact of TPMT Polymorphisms

1. **Neutropenia**

   Wild TPMT group (40) showed duration of 13.075 ± 4.0344 weeks vs. duration of 24.5 ± 7.5257 weeks for the mutant group (12) (**p value < 0.001**). Neutropenia duration of 14.5 weeks was a cut-off point between wild and mutant genotypes (**Fig. 5**).

   Comparing heterozygous group versus Homozygous group, the heterozygous group (9) showed duration of 21.667 ± 5.4314 weeks vs. duration of 33.0 ± 7.0 weeks for the homozygous group (3) (**p value = 0.002**). Neutropenia duration of 27.5 weeks was a cut-off point between heterozygous and homozygous genotypes (**Fig. 7**).

2. **Hepatotoxicity**

   Wild TPMT group (40) showed duration of 8.925 ± 3.5184 weeks vs. duration of 21.250 ± 6.5661 weeks for the mutant group (12) (**p value < 0.001**). Hepatotoxicity duration of 13.0 weeks was a cut-off point between wild and mutant genotypes (**Fig. 5**).

   Comparing heterozygous group versus homozygous group, the heterozygous group (9) showed duration of 18.222 ± 3.0732 weeks vs. duration of 30.333 ± 5.8595 weeks for the homozygous group (3) (**p value < 0.001**). Hepatotoxicity duration of 24.5 weeks was a cut-off point between heterozygous and homozygous genotypes (**Fig. 7**).

3. **Missed Treatment Weeks**

   Wild TPMT group (40) showed duration of 25.825 ± 6.1306 weeks vs. duration of 50.250 ± 14.5797 weeks for the mutant group (12) (**p value < 0.001**). Missed treatment duration of 31.5 weeks was a cut-off point between wild and mutant genotypes (**Fig. 5**). Comparing heterozygous group versus Homozygous group, the heterozygous group (9) showed duration of 44.222 ± 8.7433 weeks vs. duration of 68.333 ± 14.4684 weeks for the homozygous group (3) (**p value < 0.001**). Missed treatment duration of 56.0 weeks was a cut-off point between heterozygous and homozygous genotypes (**Fig. 7**).

On constructing a ROC curve for the toxicities among wild group versus mutant group, area under the curve (AUC) for neutropenia was 0.930 at a cut-off point of 14.5 weeks. For hepatotoxicity, AUC was 0.970 at a cut-off point of 13.0 weeks. AUC for missed treatment was 0.973 at a cut-off point of 31.5 weeks (**Fig. 6**). However the ROC curve for the toxicities among heterozygous group versus homozygous group area under the curve (AUC) for neutropenia was 0.926 at a cut-off point of 27.5 weeks. For hepatotoxicity, AUC was 1.000 at a cut-off point of 24.5 weeks. AUC for missed treatment was 0.963 at a cut-off point of 56.0 weeks (**Fig. 8**)

Discussion

The antimetabolite 6-MP has been used in the treatment of ALL for five decades, primarily for the maintenance of remission. *TPMT* genetic polymorphism has been investigated intensively over the past decade.

The drug is metabolized by *TPMT* enzyme; its activity is affected by *TPMT* gene polymorphisms. Individuals who inherit a deficiency in this enzyme exhibit profound intolerance to 6-MP. There are currently 11 variant alleles associated with low TPMT activity in humans (**10**). Out of these, TPMT *2, *3A, *3B, and *3C mutations account for more than 95% of the deficiency (11).

Of the 52 patients included in this study, 12 (23.1%) required 6-MP dose reduction by 30% (70% of the original dose was given) due to major toxicities. The other 40 patients (76.9%) required no dose reduction. This correlated perfectly with *TPMT* genotyping, when it turned out that those 12 patients requiring dose reduction were all TPMT mutants.

In this study *TPMT*2 and *3B allele were each encountered in 5 (9.6%) patients. This is much higher than that reported by other studies (table 5). On the contrary *TPMT*3C allele was not detected in any of our patients; this is in agreement with some previous studies (9,12,13,14), while most of the other studies reported a higher incidence of *TPMT*3C allele (table 3) .These differences in overall and specific frequencies could be attributed to ethnic variation or simply to statistical errors resulting from the relatively small sample size used in this study. In this study *TPMT*3A was encountered in 2 patients (3.8%) which is comparable to previous reports (9, 12, 14-16).

Clinical Impact of Wild vs. Mutant TPMT

The study proved a very strong clinical impact of *TPMT* genotype on 6-MP tolerance. The duration of neutropenia, hepatotoxicity and missed treatment weeks were significantly higher in patients harboring the mutant alleles (p <0.001). Duration of 14.5, 13 and 13 weeks was the discriminating cut off for the 3 parameters respectively.

A dose reduction of 30% (70% of the original dose given) was performed on 12 patients due to missing > 25% of the duration of maintenance treatment. Those 12 patients, as we mentioned before, turned out to be all *TPMT* mutants by genotyping.

In agreement with our results, the cumulative incidence of 6-mercaptopurine dose reductions for myelosuppression was highest among patients homozygous for TPMT deficiency (100% of patients), intermediate among heterozygous patients (35%), and lowest among wild-type patients (7%) (*P* < .001) indicating that *TPMT* polymorphism does have an impact on the optimal dose of 6MP. However hepatotoxicity was more not frequent in those with *TPMT* polymorphisms; in fact, hepatotoxicity even tended to be more frequent among those with higher TPMT activity (P. value .035)(17,18). In agreement with our results Mary et al., (19) reported a significant association between *TMPT* mutant type and the increased missed treatment weeks (P. value= 0.007). Also Pinkel (20) reported that hepatotoxicity was more frequent in TPMT deficient patients**.** On the contrary, Stanulla et al., (21) reported that hematopoietic toxicity did not differ between heterozygous, homozygous patients or those with wild type for *TPMT*.

In concordance with our results many other studies reported a significant association of 6-MP toxicity with ALL Patients having *TPMT* mutant alleles (2, 10, 22, and 23).

In contrast to our results Desire and his colleagues (24) reported that the presence of *TPMT* polymorphisms did not seem to completely explain the variation in 6-MP toxicity in 66 pediatric patients. They found that three of the 5 patients (60%) heterozygous for *TPMT**2 or *TPMT**3C polymorphisms and 12/61 patients (20%) with wild type *TPMT* genotype had more than 10% of reduction of 6-MP dose (P = 0.07).

Our study showed a clear difference in 6-MP tolerance between heterozygous and homozygous mutant patients with respect to duration of neutropenia, hepatotoxicity and missed treatment duration (P value= 0.002, < 0.001 and < 0.001) respectively.

These results underline the need for marked 6-MP dose reductions (5-10% of the original) in homozygous mutant TPMT patients. These patients have very low levels of TPMT and hence suffer severe toxicities complicating 6-MP administration.

Detection of the four most prevalent *TPMT* mutations (*2, *3A, *3B, and *3C) yielded greater than 95% concordance between *TPMT* genotype and phenotype in Caucasian population (26)*,* and one can anticipate that the molecular diagnosis of TPMT deficiency and heterozygosity will continue to improve as additional mutations are discovered and incorporated into automated high throughput methods (e.g., DNA arrays).

It is important to recognize that when full doses of 6-MP are prescribed to patients with undiagnosed *TPMT* homozygous or heterozygous mutations, this can compromise the ability to deliver all forms of acute lymphoblastic leukemia chemotherapy and thereby jeopardize the chance for cure. However, with the appropriate dose adjustment, these patients can be successfully treated with all components of acute lymphoblastic leukemia therapy including 6-MP (27).

In conclusion this study further emphasized that *TPMT* mutations are significant determinants of tolerance to acute lymphoblastic leukemia chemotherapy that contains 6-MP. Because this genetic polymorphism places at least 10% of the patients at risk for excessive toxicity and failed treatment results, we suggest that *TPMT* genotyping should be performed prior to therapy for all ALL patients to optimize their 6-MP therapy.

Table 1: Detection primer sequence, restriction enzyme, and amplification/digestion product size for each of the TPMT genetic polymorphisms

Genetic Polymorphism	Method of Detection	Primer Sequence	Restriction Enzyme	Size of Product
G238C	PCR-ARMS	**P2W** (5'-GTATGATTTTATGCAGGTTTG-3') **P2M** (5'-GTATGATTTTATGCAGGTTTC-3') **P2C** (5'-TAAATAGGAACCATCGGACAC-3')		
G460A	PCR-RFLP	**P460F** (5'-ATAACAGAGTGGGGAGGCTGC-3') **P460R** (5'-CTAGAACCCAGAAAAAGTATAG-3')	MwoI	**Mutant:** 267 bp + 98 bp **Wild:** 365 bp
A719G	PCR-RFLP	**P719R** (5'-TGTTGGGATTACAGGTGTGAGCCAC-3') **P719F** (5'-CAGGCTTTAGCATAATTTTCAATTCCTC-3')	AccI	**Mutant:** 207 bp + 86 bp **Wild:** 293 bp

Table 2: Durations (weeks) of the major toxic effects of 6-MP in the studied 52 low-risk Pediatric ALL cases.

Effect	Neutropenia	Hepatotoxicity	Missed Treatment
TPMT wild	13.075 ± 4.0344	8.925 ± 3.5184	25.825 ± 6.1306
TPMT mutant	24.5 ± 7.5257	21.250 ± 6.5661	50.250 ± 14.5797
Whole group	15.712 ± 6.9489	11.769 ± 6.8014	31.462 ± 13.5117
Range	7-41	3-37	15-85

Assessing of Adult Learning Principles

Abstract: Transfer of learning is the result of training and is simply the ability to use the information taught in your program but in new settings and contexts. As with reinforcement, both types of transfer: positive and negative should be used in the program approach. Positive transference, like positive reinforcement, occurs when the learner uses the skill learnt in your program. It is very important for any learner's orientation to the new skills they develop that they can practice in their own situations. Using knowledge from financial literacy training to work out the best way to use (or not use) credit in their lives is an important tool that many participants could use immediately. Participants can check how much credit debt they have, what interest they are paying and what alternatives there may be. Negative transference, again like negative reinforcement, occurs when the learners applying the skill do not do what they are told not to do. This also results in a positive (desired) outcome. This means it's important to find out what the participants in your program have been using their new skills for. Check to see if they are applying the techniques properly or whether they have misunderstood a key aspect of the program. Once wrong information is absorbed and used again and again it simply becomes another bad habit that could make financial decision-making worse instead of better.

Introduction:

Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education.

Much like strategies to curb epidemic, strategies to reduce illiteracy and raise the educational attainment of Kentucky's population must include both short-term efforts to face the immediate crises as well as long-term strategies to get at the underlying causes. Short-term crises include the imperative to keep helping welfare clients make the transition from welfare to work within the constraints of federal and state mandates and the need to train workers for immediate employer demands. Long-term prevention must address the underlying, persistent problems of the state's economic structure as well as the low awareness--if not appreciation--among segments of the population of the vital connection among education, employment, and improved standards of living.

The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population)

with a particular means (e.g., adult basic education) to achieve the goal.

Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act)1 defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills

necessary to exercise one's rights and responsibilities for citizenship. Different dimensions of literacy are often categorized by terms that cluster several dimensions of literacy important for different clients. Examples include workplace literacy (combining both basic academic skills and workplace skills), and family literacy (combining basic academic skills and other skills essential for successful parenting).

2. "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

3. "Literacy initiatives" often are defined in terms of the needs of a particular target group. These may be parents of young children, youth who have dropped out of high school without earning a high school diploma, welfare recipients, persons with limited English-speaking ability, incarcerated adults, or adults in the workforce.

4. Other literacy initiatives are defined in terms of a particular educational service, strategy, or means

Characteristics of adult education:
flexibility in time:
In the past, usually one of the obstacles in the way of learning and development of adult education was being inflexible and time courses were programs. But now most countries have to consider that the speed limit of time and learning ability and facilities must be adults. Flexibility in time means that not only should the time classes and programs for adults is appropriate, but necessary facilities should be provided for independent study.

Flexibility in the location:
One of the aspects of flexible space is that individuals can, regardless of their residence to the study and advancing their knowledge and skills pay. For example, adults in remote villages should like people who live in the city use of educational programs. After flexibility in other places is that the issue of specificity of location is not considered primarily educational.

Flexibility in age:
Educational opportunities for certain age should not use it for all regardless of their age, is possible. In fact, educational programs must use people of different ages to prepare.

Flexibility in admission:
No adult should not only be deprived of education because of the necessary conditions for admission in the class does. Of course this is not such a person without academic records to participate in university classes is accepted, Adoption order is that the adults in educational programs at different levels, according to the possibility of using the opportunity that is provided must be based on the experience and knowledge and their knowledge is.

To combine education and job responsibilities:
Adults should be able to work during that time engaged in training classes take them. In other words, their presence in the class should be considered part of their work. This means that low-literate or illiterate working people who are allowed to work an hour of your daily spending surpassed participation in educational programs.

Principles of Adult Learning:

1) PURPOSE
The Financial Literacy Foundation has prepared this document to provide education materials developers with information on the key principles of adult learning. It is a short summary of a very broad area of research and advice, prepared with the input of Adult Leaning Australia, the national peak body representing organisations and individuals in the adult learning field.

2) NEEDS, WANTS, CONCERNS AND ABILITIES OF YOUR LEARNERS
Assess the needs, wants, concerns and current abilities of the target learners. Each target group will have their own special needs and probably expect different outcomes from undertaking your training program. Common themes you can prepare for are:

Why are you here? - no-one readily admits to not knowing something fundamental that may impact on their life chances. Therefore program material, particularly that designed for adult learners should always treat aspects of why learners are in the training sensitively. Describe the outcomes expected from the training in positive, enhancing terms and not as redressing a weakness or failure on the part of the learner. For example, "Undertaking this program will improve (rather than redress a failing) the way you manage your money".

Tell me more - learners may well enter programs like this with poor past experiences of money matters or at least some trepidation about handling personal finances in the future. Recognise this in the program introduction but individual learners should never be required to expose any of their negative experiences in a group. It might seem a good 'ice-breaker' to ask a new group of learners to share what they expect from the program but resist going too far when asking learners to talk about past problems they may have had with finances. Firstly, they may be uncomfortable doing this in a group and secondly you could start the program in a sea of negative views about financial matters generally. A successful program introduction will focus on where the learners will go rather than dwell too much on where they may have been.

What do you know? - Gauge the likely capabilities of your target groups. Overestimating their current skills in dealing with money could mean the program misses fundamental principles and understandings. Underestimating existing knowledge is also not good as plodding through basic material most already are familiar with will bore participants and the full program content will not be assimilated.

What will I be able to do? – above all these target groups will want to be hands on and demonstrate to themselves and their peers that that can do something they could not before the training; and do it well. Let them know right at the beginning that they will be able to do things that will be of great benefit to them, not just know more.

Build on small successes – if a target group of learners has had limited positives in their life or work experiences its important to provide small and regular 'success' points in the program. Simply exposing the content and assuming everyone is assimilating it, putting it all together holistically and building up their skills is not enough. The beginning of the program should be designed so that a discrete piece of learning that the learners can use right away builds their confidence to move on. The program should be a series of steps where the learners confirm their progress and reinforce one new skill by relating it to another they can already confidently apply.

Testing! – many adults and people not regularly engaged in learning fear testing. Many may have had bad experiences of assessment in school and view the practice among peers as stressful. Make sure they understand that what they are in is a life skills program and no-one can 'fail' as such. In fact each can support others in things they do well that fellow learners may need help with so it's a cooperative not competitive environment that they are learning in. Build in some teamed exercises and assessments to avoid people feeling isolated in their learning and fearful of failure in front of the group.

Special needs. You need to consider learners with special needs and those who have English as their second language. Reasonable adjustment should be made depending on each individual learner's particular needs and abilities. Your program material should include advice to the trainer on how to determine the need to make adjustments which, depending on a learner's abilities may include:

- providing interpreters for people who are deaf;
- ensuring access, for example by conducting training and assessment in facilities which have ramps for people using wheelchairs and adjustable desks for people with physical disabilities;
- allowing for access of personal assistants or note takers;
- allowing additional time for assessments;
- allowing oral instead of written responses to questions;

- adaptive technology such as screen readers, speech synthesisers, computer software or hardware; and,
- assistance with managing stress and anxiety.

3) HOW DO ADULTS LEARN?
Your program needs to account for:
- Motivation of the learner;
- Reinforcement of the skills and knowledge being developed;
- Retention of key learning; and,
- Transference of what is learnt to new situations.

Motivation - Adults learn most effectively when they have an inner motivation to develop a new skill or gain new knowledge. They resist learning material if it is forced on them, or if the only reason given is that the material will, in some vague way, be "good for them to know." Adults need to know why they are being asked to learn something; and they definitely will want to know what the benefits will be before they begin learning. This means the best motivators for adult learners are explicit interest and self benefit. If they can be shown that the program will benefit them pragmatically and practically, they will learn better, and the benefits will be much longer lasting. Typical motivations include a desire for better handling of personal money matters, say in retirement, wanting a new or first job, promotion, job enrichment, a need to reinforce old skills in say, handling credit or learn new ones, a need to adapt to community changes such as on-line banking and so on. Remember the tone of the program should be motivating. Your program should employ methodologies so that your trainers establish a friendly, open atmosphere that shows the participants they will help them learn rather than present as 'experts' imparting knowledge. No-one engages well with a trainer/teacher who is just 'showing off' what they know. Financial services have a plethora of jargon and complicated ideas that can put many lay people off. Exposing this sort of terminology and explaining it in simple terms – or deciding whether some of it needs exposure at all – is paramount to keeping your learner's trust and interest.

Appropriate level of difficulty. The degree of difficulty of your financial literacy program should be set high enough to expose all the essential elements of the topic and challenge learners to succeed, but not so high that they become frustrated by information overload. Too much financial industry terminology strung together can be a complete turn off for people who may already struggle with the

fundamentals – is it really a necessary part of the skills they need?

So start with financial information and techniques that relate directly to the learner's own personal needs and wants. Personal budgeting is always useful and less complicated than say, comparing mortgage options. Don't make what could be a lesser used skill so important in the program it de-motivates the learners and loses their interest.

Motivational reward does not necessarily have to be in the monetary sphere; it can be simply a demonstration of social or workplace benefits to be realised from new financial management skills. Older participants could perhaps learn how to help their children with financial decisions. People could be shown how to utilise better financial planning in a club or society they belong to. Its about improving whole of life experiences not just direct monetary reward. The overall thrust of the program should be motivating and, like all good teaching and learning programs, course material should ensure other key adult learning elements are covered.

Reinforcement. As we know reinforcement is a very necessary part of any teaching/learning process. Through it, trainers encourage correct modes of behaviour and performance and discourage bad habits. Your program should use both reinforcement techniques throughout. Positive reinforcement is normally used when participants learn new skills. As implied, positive reinforcement is "good" and reinforces "good" (or positive) behaviour. Negative reinforcement is useful in trying to change bad habits or inappropriate modes of behaviour. The intention is extinction -- that is, the trainer uses negative reinforcement until the "bad" behaviour disappears or the learner understands why past practice is not beneficial to them. Examples could be ensuring participants always compare different rates of interest available to them before signing up for any new debt (a positive reinforcement) and not considering credit purchases that leave them with no income safety net for unforeseen circumstances (negative reinforcement).

Retention. Learners must retain what the program delivers to them in order to benefit from the learning. In order for participants to retain the information taught, they must see a meaning or purpose for that information. They must also understand and be able to interpret and apply the information in their own real life contexts. Understanding includes their ability to assign the correct degree of importance to the material and its application in the future. The amount of retention is always directly affected by the degree of original learning. In other words if the learners did

not learn the material well initially, they will not retain it well either. Retention by the participants is directly affected by their amount of practice during the learning. After the students demonstrate they can apply new financial skills, they should be urged to practice in their own time and for their own personal needs to retain and maintain the desired performance.

Transference. Transfer of learning is the result of training and is simply the ability to use the information taught in your program but in new settings and contexts. As with reinforcement, both types of transfer: positive and negative should be used in the program approach. Positive transference, like positive reinforcement, occurs when the learner uses the skill learnt in your program. It is very important for any learner's orientation to the new skills they develop that they can practice in their own situations. Using knowledge from financial literacy training to work out the best way to use (or not use) credit in their lives is an important tool that many participants could use immediately. Participants can check how much credit debt they have, what interest they are paying and what alternatives there may be. Negative transference, again like negative reinforcement, occurs when the learners applying the skill do not do what they are told not to do. This also results in a positive (desired) outcome. This means it's important to find out what the participants in your program have been using their new skills for. Check to see if they are applying the techniques properly or whether they have misunderstood a key aspect of the program. Once wrong information is absorbed and used again and again it simply becomes another bad habit that could make financial decision-making worse instead of better.

Transference is most likely to occur in the following situations:

• **Association**: participants can associate the new information with something that they already know. What skills have the learners already mastered that they can bring to bear on better financial planning for example? Perhaps they have a hobby where it is necessary to access information from written materials or the Internet and the same skills could be used to obtain and analyse better financial data to use in their budgeting.

• **Similarity**: the information is similar to material that participants already know; that is, it revisits a logical framework or pattern. Using calendars or electronic planners to plan future holidays, work shifts etc can be transferred to setting up a long-term budget planner for financial payments and income.

• **Critical attribute element**: the information learned contains elements that are extremely beneficial (critical) in personal life or in the workplace. Try to

reinforce the importance of aspects of the financial literacy program to the learner's own goals, whether these are in their home life, getting a job or improving their prospects in work they already have. People can even start their own small business ventures if they have the financial skills to work out the costs and benefits first.

4) DELIVERY STRATEGIES

Finally in developing your program consider that adults have different personal and social lives than young people in formal schooling or college. Unlike children and teenagers, adults have many responsibilities that they must balance against the demands of learning. Because of these responsibilities, adults may have barriers against participating in learning. These barriers could include lack of time, money, confidence, or interest, lack of information about opportunities to learn, scheduling problems, "red tape," and problems with child care and transportation. Try to consider these factors when scheduling the program. If it is to be delivered to people in a workplace it should fit around their work times and not require them to come back hours later well after they have completed a hard day's work. Week-ends might seem like good free time to learn but many adult learners are conditioned to week-ends being for family pursuits and are likely to be reluctant to give up hours away from this for financial training. Try to identify groups of learners for each program that can support each other in transport to where the program is delivered, assistance in minding young children and common interests outside of the formal learning. Groups seeking employment or those soon to retire are obvious examples of participants who will have similar interests and motivations and can help each other to access the training and learn collaboratively to use the new skills.

5) ENGAGEMENT OF THE LEARNER

Good program strategies encourage real learning, where the learner increasingly:
• takes responsibility and ownership of their learning;
• engages in experiential learning;
• partakes in cooperative learning; and,
• engages in reflective learning.
By requiring or encouraging your learners to take a more directive and active role in the program as it is delivered you are encouraging them to engage in the critical processes of:
• making meaning out of the new financial management knowledge they have;

• distilling principles from the program, which will aid their transference of financial skills to new contexts; and,
• practising their financial planning skills and mastering processes to improve their money management.
In your financial literacy program learner directed activities can also encourage greater levels of motivation. The learning is more purposeful, because they have a sense of ownership over what they achieve and identify themselves as the key beneficiaries of the outcomes. An abstract exercise in developing a savings plan for an imaginary person or family may appear to introduce the right principles but it may not resonate with the individuals you are training. Think of your target group. What are their savings goals?
What aspects of their income are available to saving and how can they work this out?
What form of saving is best for them in terms of achievable targets, regular contributions and limited risk?
Teachers and trainers often develop example exercises based on imaginary situations because, frankly, they appear to put everyone on the same testing level and it is easier to assess because there are a common set of 'right' answers. This is not the way to make financial literacy learning work for the target groups. They should be encouraged to work on individual situations entirely relevant to them. This may mean more effort on the part of the trainer in assisting with the work each person is doing and assessing outcomes but the result will be practical exercises that keep the learners involved and motivated.

6) ASSESSING PROGRESS AND OUTCOMES

Good assessment is a collaborative process involving the assessor, learners and others, where appropriate. Your assessment process should be transparent and allow for ongoing feedback from and to the learners. Remember these adult learners want to improve their skills in managing money and are not necessarily interested in formal recognition or being ranked against their peers in the group. Where possible, presenters should emphasise from the start that no-one is going to 'fail' the program. Even where students are seeking formal certification of their achievement, presenters can advise that there is no competition between the learners in the group or between an individual and the topic material – it's all achievable and everyone can make it work for them. Make sure they understand that they will all leave with better financial skills than they have at the beginning. If someone in the group is somehow

'better' or 'faster' at understanding superannuation than others that is their good fortune but makes no difference to the benefits everyone in the group gains from knowledge and skills in handling this important financial tool. Everyone will improve their life chances through participating in the program and outside of training for formal certification, assessment is to demonstrate this to them and no-one else.

If you want further Information on collaboration in the design of assessment materials and the role of learners in the assessment process this can be found in:

• Guide One – Training Package Assessment Materials Kit and Guide Five – Candidate's Kit in the Training Package Assessment Guides; and,

• Learning Circles Resource Manual for Facilitators and Learners (developed by Adult Learning Australia).

Conclusion:

Incentives aimed at providing content that audiences are produced primarily to attract different groups of adults interested in design, so that their participation in learning programs are encouraged. Motivational training materials for learners and have great importance even in support of successful applications over learners, planners and executors for educational programs is important.

Material often set different types of materials and educational content in books and pamphlets, books, training guides, trainers, equipment auxiliary audio, visual and material are included such that during actual teaching sessions, are used in the transmission and content but also to achieve the goals of making education programs are important.

Additional material for the next stage of learning often means to be expected when developing your learning skills Learners to increase awareness and enjoyment of reading and studying to operate.

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc.

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the assays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

Keywords: adult education, Adult Learning in agricultural education

Introduction:

adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones.

Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture.

Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

Successful adult education programs develop and utilize an Agricultural Education Program Advisory Committee to assess the informational needs of adults in the community. Agriculture teachers should utilize the expertise and communications link, which an effective advisory committee provides. Specifically, the advisory committee should be asked to provide advice regarding planning, conducting, and evaluating the adult education program in agriculture.

Adult education programs in agriculture should emphasize practical application of the information presented. Topics and information included in adult programs should be provided which fulfills needs of the local community. Providing information which cannot be applied to solve a local problem or address a local issue will generally be viewed as frivolous and over time will result in decreased interest (i.e. participation) in the adult education program.

The role of the agriculture teacher should be as a facilitator of the learning process. Most adults reject the traditional teacher-student relationship, which is necessary to maintain in secondary programs. Teachers should be encouraged to view themselves as partners with adult participants in the learning process. The democratic philosophy of shared responsibility for planning, conducting, and evaluating adult education programs distinguishes adult education from secondary education.

A local plan for adult education in agriculture should consist of two major components. Namely, a broad statement of philosophy, goals, and objectives of the local adult education program, and an annual calendar of program activities.

Adult education in agriculture is important for continued community prosperity, growth, and improvement.

The local Agricultural Education program has a responsibility to provide up-to-date information, training, and retraining for all adults interested in agriculture.

The goals of the Adult Education Program are:

1. To assist adults in establishing personal and business goals.

2. To enhance the self-confidence and decision making skills of adults in agriculture.

3. To develop agricultural leaders.

4. To maintain the local agricultural knowledge and technology base.

5. To improve the home, living, and business conditions of persons employed in agriculture.

6. To encourage adults to participate in cooperative efforts.

The objectives for the local Adult Education program are:

1. To increase the net farm income of local agricultural producers.

2. To improve the safety practices of adults employed in agriculture in the local community.

3. To educate the public about the significant role in agriculture in the local economy.

4. To encourage the use of practices that protect and conserve natural resources to maintain a good environment for everyone.

5. To assist local producers in the development of marketing plans that are tailored to their individual needs.

6. To assist local producers in developing strategies to make optimum use of agricultural support agencies (e.g. FSA, MO Department of Agriculture).

A comprehensive program of adult education in agriculture includes three major components: (a) organized instructional classes for adults, (b) a Young Farmers/Young Farm Wives Chapter, and (c) Farm Business Management Analysis (FBMA). State Agricultural Education Program standards implemented in 1992 indicate that a minimum of 20 clock hours of organized adult education classes be provided. Many local agriculture programs will far exceed this minimum standard. Salary reimbursement Procedures for "Full Time" and Short Term adult programs are.

Comparison of adult education in various countries:

in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings.

In developing countries and backward because the problems in primary education, lack of resources and facilities, poverty, social existence, economic and cultural concept of adult education is different. In such countries the concept of adult education, literacy education is.

Concept of adult education in revolutionary countries, is a combination of these two concepts.

Changes in these countries due to social, political and cultural revolution, resulting from, literacy and continuing education necessary to find because of the revolution, there is cultural poverty on the other hand the implementation of development plans and the need for skilled personnel are expert. General adult education system based on economic conditions - social and cultural community is different and each specific goals will follow. General objectives of adult education and literacy in two categories is divided into professional education.

Literacy goals include:
- Providing primary education in childhood that adults were deprived
- raising awareness for adults;
- knowledge bases and adults about their cultural heritage;
- increase confidence in adults.

Professional education goals include:
- Equipped with the necessary skills to adults living;
- providing the necessary manpower for the country's goals;
- achieving social equality and equity and eliminate the existing differences between different classes.

Principles of Adult Learning

1) PURPOSE

The Financial Literacy Foundation has prepared this document to provide education materials developers with information on the key principles of adult learning. It is a short summary of a very broad area of research and advice, prepared with the input of Adult Leaning Australia, the national peak body representing organisations and individuals in the adult learning field.

2) NEEDS, WANTS, CONCERNS AND ABILITIES OF YOUR LEARNERS

Assess the needs, wants, concerns and current abilities of the target learners. Each target group will have their own special needs and probably expect different outcomes from undertaking your training program. Common themes you can prepare for are:

Why are you here? - no-one readily admits to not knowing something fundamental that may impact on their life chances. Therefore program material, particularly that designed for adult learners should always treat aspects of why learners are in the

training sensitively. Describe the outcomes expected from the training in positive, enhancing terms and not as redressing a weakness or failure on the part of the learner. For example, "Undertaking this program will improve (rather than redress a failing) the way you manage your money".

Tell me more - learners may well enter programs like this with poor past experiences of money matters or at least some trepidation about handling personal finances in the future. Recognise this in the program introduction but individual learners should never be required to expose any of their negative experiences in a group. It might seem a good 'ice-breaker' to ask a new group of learners to share what they expect from the program but resist going too far when asking learners to talk about past problems they may have had with finances. Firstly, they may be uncomfortable doing this in a group and secondly you could start the program in a sea of negative views about financial matters generally. A successful program introduction will focus on where the learners will go rather than dwell too much on where they may have been.

What do you know? - Gauge the likely capabilities of your target groups. Overestimating their current skills in dealing with money could mean the program misses fundamental principles and understandings. Underestimating existing knowledge is also not good as plodding through basic material most already are familiar with will bore participants and the full program content will not be assimilated.

What will I be able to do? – above all these target groups will want to be hands on and demonstrate to themselves and their peers that that can do something they could not before the training; and do it well. Let them know right at the beginning that they will be able to do things that will be of great benefit to them, not just know more.

Build on small successes – if a target group of learners has had limited positives in their life or work experiences its important to provide small and regular 'success' points in the program. Simply exposing the content and assuming everyone is assimilating it, putting it all together holistically and building up their skills is not enough. The beginning of the program should be designed so that a discrete piece of learning that the learners can use right away builds their confidence to move on. The program should be a series of steps where the learners confirm their progress and reinforce one new skill by relating it to another they can already confidently apply.

Testing! – many adults and people not regularly engaged in learning fear testing. Many may have had bad experiences of assessment in school and view the practice among peers as stressful. Make sure they understand that what they are in is a life skills

program and no-one can 'fail' as such. In fact each can support others in things they do well that fellow learners may need help with so it's a cooperative not competitive environment that they are learning in. Build in some teamed exercises and assessments to avoid people feeling isolated in their learning and fearful of failure in front of the group.

Special needs. You need to consider learners with special needs and those who have English as their second language. Reasonable adjustment should be made depending on each individual learner's particular needs and abilities. Your program material should include advice to the trainer on how to determine the need to make adjustments which, depending on a learner's abilities may include:

- providing interpreters for people who are deaf;
- ensuring access, for example by conducting training and assessment in facilities which have ramps for people using wheelchairs and adjustable desks for people with physical disabilities;
- allowing for access of personal assistants or note takers;
- allowing additional time for assessments;
- allowing oral instead of written responses to questions;
- adaptive technology such as screen readers, speech synthesisers, computer software or hardware; and,
- assistance with managing stress and anxiety.

3) HOW DO ADULTS LEARN?
Your program needs to account for:
• Motivation of the learner;
• Reinforcement of the skills and knowledge being developed;
• Retention of key learning; and,
• Transference of what is learnt to new situations.

Motivation - Adults learn most effectively when they have an inner motivation to develop a new skill or gain new knowledge. They resist learning material if it is forced on them, or if the only reason given is that the material will, in some vague way, be "good for them to know." Adults need to know why they are being asked to learn something; and they definitely will want to know what the benefits will be before they begin learning. This means the best motivators for adult learners are explicit interest and self benefit. If they can be shown that the program will benefit

them pragmatically and practically, they will learn better, and the benefits will be much longer lasting. Typical motivations include a desire for better handling of personal money matters, say in retirement, wanting a new or first job, promotion, job enrichment, a need to reinforce old skills in say, handling credit or learn new ones, a need to adapt to community changes such as on-line banking and so on. Remember the tone of the program should be motivating. Your program should employ methodologies so that your trainers establish a friendly, open atmosphere that shows the participants they will help them learn rather than present as 'experts' imparting knowledge. No-one engages well with a trainer/teacher who is just 'showing off' what they know. Financial services have a plethora of jargon and complicated ideas that can put many lay people off. Exposing this sort of terminology and explaining it in simple terms – or deciding whether some of it needs exposure at all – is paramount to keeping your learner's trust and interest.

Appropriate level of difficulty. The degree of difficulty of your financial literacy program should be set high enough to expose all the essential elements of the topic and challenge learners to succeed, but not so high that they become frustrated by information overload. Too much financial industry terminology strung together can be a complete turn off for people who may already struggle with the fundamentals – is it really a necessary part of the skills they need?

So start with financial information and techniques that relate directly to the learner's own personal needs and wants. Personal budgeting is always useful and less complicated than say, comparing mortgage options. Don't make what could be a lesser used skill so important in the program it de-motivates the learners and loses their interest.

Motivational reward does not necessarily have to be in the monetary sphere; it can be simply a demonstration of social or workplace benefits to be realised from new financial management skills. Older participants could perhaps learn how to help their children with financial decisions. People could be shown how to utilise better financial planning in a club or society they belong to. Its about improving whole of life experiences not just direct monetary reward. The overall thrust of the program should be motivating and, like all good teaching and learning programs, course material should ensure other key adult learning elements are covered.

Reinforcement. As we know reinforcement is a very necessary part of any teaching/learning process. Through it, trainers encourage correct modes of

behaviour and performance and discourage bad habits. Your program should use both reinforcement techniques throughout. Positive reinforcement is normally used when participants learn new skills. As implied, positive reinforcement is "good" and reinforces "good" (or positive) behaviour. Negative reinforcement is useful in trying to change bad habits or inappropriate modes of behaviour. The intention is extinction -- that is, the trainer uses negative reinforcement until the "bad" behaviour disappears or the learner understands why past practice is not beneficial to them. Examples could be ensuring participants always compare different rates of interest available to them before signing up for any new debt (a positive reinforcement) and not considering credit purchases that leave them with no income safety net for unforeseen circumstances (negative reinforcement).

Retention. Learners must retain what the program delivers to them in order to benefit from the learning. In order for participants to retain the information taught, they must see a meaning or purpose for that information. They must also understand and be able to interpret and apply the information in their own real life contexts. Understanding includes their ability to assign the correct degree of importance to the material and its application in the future. The amount of retention is always directly affected by the degree of original learning. In other words if the learners did not learn the material well initially, they will not retain it well either. Retention by the participants is directly affected by their amount of practice during the learning. After the students demonstrate they can apply new financial skills, they should be urged to practice in their own time and for their own personal needs to retain and maintain the desired performance.

Transference. Transfer of learning is the result of training and is simply the ability to use the information taught in your program but in new settings and contexts. As with reinforcement, both types of transfer: positive and negative should be used in the program approach. Positive transference, like positive reinforcement, occurs when the learner uses the skill learnt in your program. It is very important for any learner's orientation to the new skills they develop that they can practice in their own situations. Using knowledge from financial literacy training to work out the best way to use (or not use) credit in their lives is an important tool that many participants could use immediately. Participants can check how much credit debt they have, what interest they are paying and what alternatives there may be. Negative transference, again like negative reinforcement, occurs when the learners applying the

skill do not do what they are told not to do. This also results in a positive (desired) outcome. This means it's important to find out what the participants in your program have been using their new skills for. Check to see if they are applying the techniques properly or whether they have misunderstood a key aspect of the program. Once wrong information is absorbed and used again and again it simply becomes another bad habit that could make financial decision-making worse instead of better.

Transference is most likely to occur in the following situations:

• **Association**: participants can associate the new information with something that they already know. What skills have the learners already mastered that they can bring to bear on better financial planning for example? Perhaps they have a hobby where it is necessary to access information from written materials or the Internet and the same skills could be used to obtain and analyse better financial data to use in their budgeting.

• **Similarity**: the information is similar to material that participants already know; that is, it revisits a logical framework or pattern. Using calendars or electronic planners to plan future holidays, work shifts etc can be transferred to setting up a long-term budget planner for financial payments and income.

• **Critical attribute element**: the information learned contains elements that are extremely beneficial (critical) in personal life or in the workplace. Try to reinforce the importance of aspects of the financial literacy program to the learner's own goals, whether these are in their home life, getting a job or improving their prospects in work they already have. People can even start their own small business ventures if they have the financial skills to work out the costs and benefits first.

4) DELIVERY STRATEGIES

Finally in developing your program consider that adults have different personal and social lives than young people in formal schooling or college. Unlike children and teenagers, adults have many responsibilities that they must balance against the demands of learning. Because of these responsibilities, adults may have barriers against participating in learning. These barriers could include lack of time, money, confidence, or interest, lack of information about opportunities to learn, scheduling problems, "red tape," and problems with child care and transportation. Try to consider these factors when scheduling the program. If it is to be delivered to people in a workplace it should fit around their work times and not require them to come back hours later well after they have completed a hard day's work.

Week-ends might seem like good free time to learn but many adult learners are conditioned to week-ends being for family pursuits and are likely to be reluctant to give up hours away from this for financial training. Try to identify groups of learners for each program that can support each other in transport to where the program is delivered, assistance in minding young children and common interests outside of the formal learning. Groups seeking employment or those soon to retire are obvious examples of participants who will have similar interests and motivations and can help each other to access the training and learn collaboratively to use the new skills.

5) ENGAGEMENT OF THE LEARNER

Good program strategies encourage real learning, where the learner increasingly:

• takes responsibility and ownership of their learning;
• engages in experiential learning;
• partakes in cooperative learning; and,
• engages in reflective learning.

By requiring or encouraging your learners to take a more directive and active role in the program as it is delivered you are encouraging them to engage in the critical processes of:

• making meaning out of the new financial management knowledge they have;
• distilling principles from the program, which will aid their transference of financial skills to new contexts; and,
• practising their financial planning skills and mastering processes to improve their money management.

In your financial literacy program learner directed activities can also encourage greater levels of motivation. The learning is more purposeful, because they have a sense of ownership over what they achieve and identify themselves as the key beneficiaries of the outcomes. An abstract exercise in developing a savings plan for an imaginary person or family may appear to introduce the right principles but it may not resonate with the individuals you are training. Think of your target group. What are their savings goals?

What aspects of their income are available to saving and how can they work this out?

What form of saving is best for them in terms of achievable targets, regular contributions and limited risk?

Teachers and trainers often develop example exercises based on imaginary situations because, frankly, they appear to put everyone on the same testing level and it is easier to assess because there are a common set of 'right' answers. This is not the way to make financial literacy learning work for the

target groups. They should be encouraged to work on individual situations entirely relevant to them. This may mean more effort on the part of the trainer in assisting with the work each person is doing and assessing outcomes but the result will be practical exercises that keep the learners involved and motivated.

6) ASSESSING PROGRESS AND OUTCOMES

Good assessment is a collaborative process involving the assessor, learners and others, where appropriate. Your assessment process should be transparent and allow for ongoing feedback from and to the learners. Remember these adult learners want to improve their skills in managing money and are not necessarily interested in formal recognition or being ranked against their peers in the group. Where possible, presenters should emphasise from the start that no-one is going to 'fail' the program. Even where students are seeking formal certification of their achievement, presenters can advise that there is no competition between the learners in the group or between an individual and the topic material – it's all achievable and everyone can make it work for them. Make sure they understand that they will all leave with better financial skills than they have at the beginning. If someone in the group is somehow 'better' or 'faster' at understanding superannuation than others that is their good fortune but makes no difference to the benefits everyone in the group gains from knowledge and skills in handling this important financial tool. Everyone will improve their life chances through participating in the program and outside of training for formal certification, assessment is to demonstrate this to them and no-one else.

If you want further Information on collaboration in the design of assessment materials and the role of learners in the assessment process this can be found in:
• Guide One – Training Package Assessment Materials Kit and Guide Five – Candidate's Kit in the Training Package Assessment Guides; and,
• Learning Circles Resource Manual for Facilitators and Learners (developed by Adult Learning Australia).

Conclusion:

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc.

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- - Preparation for adults to learn how much he depends on previous learning. Knowledge that has accumulated because of an ability to absorb new information more person is. Past educational experience features a diverse group of adult learners, the starting point of any activity on the diversity training is emphasized.

2- intrinsic motivation, learning a deeper and make them sustainable. When the need is met directly by the learning itself, what is learned, but is complementary learning. Creating a training activity in adult learning needs, learning ensures stable

3- Positive reinforcement (reward) learning to reinforce the negative (punishment) is more effective. Many adults because of negative experiences at the beginning of schooling, are weak and afraid. Feeling of success in adult learning for continuous learning and adult participation is essential.

4- To maximize learning, information must be provided an organized manner. Entries can be simple or complex can be arranged around related concepts are organized. Starting point for organizing content knowledge for adults and adults is linked to past experiences

5- Learning, especially regarding skills development, will be added frequently.

Development Partnership in Practice: The Sawah Technology

[1]Oladele O. I and [2]Wakatsuki T

[1]Department of Agricultural Economics and Extension, North-West University, Mafikeng Campus, South Africa, oladele20002001@yahoo.com,[2]Faculty of Agriculture, Kinki University Nara Japan wakatuki@nara.kindai.ac.jp

Abstract: This paper examines the process of technology development and dissemination with respect to sawah rice production. The term sawah refers to man-made environment for rice production that includes levelling and bunding of rice fields with inlet and outlet connecting irrigation and drainage. It has been hypothesized that sawah rice production technology holds the ace to the expected green revolution in West Africa as a yields of 5t/ha have been obtained. The process of sawah rice technology development and dissemination is exploring strategic synergy and partnership among Japanese institutions, research institutes, Ministry of agriculture, extension agencies, farmers groups, Millennium Village and Universities in Nigeria and Ghana which can be described as an emerging innovation system for rice production in West Africa. The partnership was empirically ascertained in terms of involvement, kind of involvement and intensity of involvement of the various stakeholders in the areas of joint problem identification (JPI), joint priority setting and planning (JPSP), collaborative professional activities (CPA), joint On- farm Adaptive Research (OFAR), dissemination of knowledge (DK), joint demonstration trials (JDTR), joint field days (JFD), joint seminar and workshop (JSW), evaluation survey (ES), and evaluation meeting (EM). A structure questionnaire was used to elicit information from a list activities identified among the stakeholders. Data collected were subjected to percentage distribution and one way analysis of variance to determine differences in the involvement of each of the actors. The results show varying degrees of involvement, types of involvement and different levels of intensity. While Japanese institutes are very prominent in funding and training, scientists and farmers are prominent in problem identification and joint demonstration trials. The implications of the results are discussed and pragmatic suggestions made for a proactive revamping of the process of technology development and dissemination for rice production in West Africa.

Keywords: Development, Partnership, Sawah Technology, Rice

1.   Introduction

Over decades, rice has occupied a prominent position as a strategic crop for food security and economic development of nations of the world. FAO (2006) classified the crop as the most important food depended upon by over 50 percent of the world population for about 80% of their food need. Due to the growing importance of the crop and the increasing challenges of attainment of food security, it has been estimated that annual rice production needs to increase from 586 million metric tons in 2001 to meet the projected global demand of about 756 million metric tonnes by 2030 (Kueneman 2006). Recent global trend in the rice industry however shows that there is a growing import demand for the commodity in Africa, as evidenced from pressure on world supply and the steady increase in the world price of the commodity in the last five years (FAO, 2006). In the West Africa sub region, Nigeria has witnessed a well established growing demand for rice as propelled by rising per caput consumption and consequently the insufficient domestic production had to be complemented with enormous import both in quantity and value at various

times (Erenstein et al., 2004; Daramola, 2005). The enormous importation has however been considered by various regimes as an avoidable drain on the country's foreign exchange earnings in view of the abundant natural endowments for expanded production in Nigeria.

In the past, the growth recorded in domestic rice production was due to area expansion. However, recent strategies through research system sought to increase production through increased productivity through intensification based on the development and dissemination of improved rice varieties and other modern inputs as a composite package to rice farmers. Oyekanmi et al., (2008) and Nwite et al., (2008) reported that from research stations (based on their on-station and on-farm trials showed that the adoption of the technologies and improved management practices lead to substantial yield increases in rice production. This invariably underscores the significant role that technology stands to play in attaining the much needed growth in the rice sub sector.

1.1 Development partnerships

'Partnerships' are of central importance to development practice in the 21st Century. The concept has become generally accepted as being fundamental for the success of poverty 'elimination'. It is used to refer to a wide range of different kinds of relationship, often with insufficiently rigorous assessment being applied either to its meaning or to its substance. Beneficial development practice should involve different groups of people and institutions is (Mercer et al, 2003; Slater and Bell, 2002). Two main ways in which the term 'partnership' is used in development practice are: the relationship between donors and recipient governments (usually global partnerships); and tri-sector initiatives combining the private sector with government and civil society (often partnerships at a national or regional scale). In addition, the term partnership is sometimes used to refer to activity focused projects that draw on the expertise of various stakeholders, invariably at a local or national scale. In some instances, all three usages coalesce, but failing satisfactorily to distinguish between the interests behind each of these approaches to partnership can lead to confusion and can also have damaging effects on the ability of poor people to enhance their lives (UNESCO, 2005).

1.2 Agricultural Technology System

Agricultural technology system (ATS) is defined by Kaimowitz et al (1991) as consisting of all the individuals, groups, organisations and institutions engaged in developing and delivering new or existing technology Ellis, (1992) described ATS as a national agricultural research system (NARS) - this includes many organisations, public and private, that are involved in generating various forms of agricultural technology. Swanson et al (1988) described the following indicators in analysing ATS.

Public policy: This guides the direction of agricultural development by establishing a course of action and goals at national level. Priorities are set; a resource allocated and rules are elaborated which create the environment for technological progress. Under this are the following indicators: - Government financial commitment to agriculture - Investment in research and extension - Availability and utilization of agricultural credit - Pricing policy - Farmers participation in technology system.

Technology development: The indicators under this section measure factors that affect the performance of the research subsystem, these are: - Access to external knowledge and technology - Human resources for agricultural research Resource allocation to research salaries and programme - Resource allocation to commodity focussed research

Technology transfer: This provides information on various resources and activities with knowledge transfer from researchers to farmers through extensionists. This considers the following: - Access to and availability of internal technology - Personnel administration and supervision - Time allotted to technology transfer - Resource allocation between extension salaries and programmes - Technology dissemination - Personnel resources for extension.

Technology utilization: This is concerned with the primary objectives towards which the entire technology system has been aimed. It focuses on: - Availability of technology - Access to technology - Technology adoption Kaimowitz and Merril-Sands (1989), explaining the institutional agricultural technology system posited that links between research and technology transfer have both functional and institutional meaning. Thus, the links between them may be discussed from two points of view, they may be seen as functional links, which relates to the institution and personnel were identified to be influencing research technology transfer namely:

Political factors: consider the historical legacy, current political and social structure and external pressure in terms of national policy, foreign donor and private sectors.

Technical factors: measure the farmer input and targeting; environmental diversity, communication channels and infrastructure, level of pre-existing knowledge about the environment, the dispersion and accessibility of the farming population.

Organisational factors: examine the interdependence between components and compatibility of management style, size consideration, different staff orientation and functional or market based organisations.

1.3 Agricultural Knowledge Information System (AKIS)

Rolings (1991) analyzed Agricultural Knowledge Information System (AKIS) and identified four basic processes in which all participants in an AKIS are engaged. These basic processes are:

Generation - This is often attributed only to research, yet public agricultural research is not more than 100 years old in most countries. Farmers have, however,

managed to develop their agriculture for thousands of years. Knowledge generation appears to be more effective when carried out in-groups than when attempted individually.

Transformation - This is perhaps the most crucial process-taking place in the AKIS. The essence of an AKIS is that knowledge generated in one part of the system is turned into information for use in another part of the system. The following transformations take place: i)   From information on local farming systems to research problem; ii)   From research findings   to   tentative   solutions   to   problems technologies;   From research problems to research findings; From technologies to prototype recommendations for testing in farmers field. v) From recommendation to observation of farmers' behaviour; From technical recommendation to information affecting service;   behaviour;   From adapted recommendations to information disseminating by extension; and viii)   From extension information to farmer knowledge.

Integration - This is carried out by all participants in an AKIS. The review articles produced by scientific disciplines to pull together research results are obvious examples.   Leaders of multi-disciplinary research teams are engaged in a continuous effort to integrate research results produced by different disciplines.

Storage and retrieval - These processes would seem to be typically the taste of specialized libraries but most researchers, extension workers and farmers store and retrieve information.

Rolings (1991), therefore stated that the analysis of AKIS must be examined against the back drop of: 1. Policy environment which formulates the laws, incentives that influence agricultural performance; Structural conditions, such as markets inputs the resource base,   infrastructure and the structure of farming; Political and bureaucratic structure through which interest groups   influence the system; and 4.

External sector comprising of the donor agencies, international agricultural research centers (IARCs) and/or commercial farms. The analysis could cover the comparison of major components, linkage mechanisms, management decisions, and actual and formal systems. Also identifying institutional and functional gap and investigating how actors see them as playing complementary roles.

1.4 Cycle of Partnership Formation

Various authors studying partnerships in development scenarios have made clear that partnership building occurs in several phases. Partnerships begin when a common interest arises and end when the proposed results are achieved or when the partners decide to terminate the partnership. Nevertheless, the process is iterative: some phases overlap, new problems and ways of operating the partnership arise, and processes that were already completed must be begun again (Hartwich et al 2007).

Phase 1: Identifying the Common Interest: The point of departure is usually a technical problem or a technological or market opportunity that can be resolved or addressed by research. The problem or opportunity may have already been identified by the public and private actors based on previous relationships or through a formal process of identifying a common interest. The common interest changes each time a new member enters the partnership or an old one departs. Therefore, it is often useful to develop a strategic vision that will allow the partnership to orient itself when it must adapt to changes in the socioeconomic context (Bovaird, 2004).

Phase 2: Negotiating the Partnership Contract
In this phase, the potential partners begin to develop the partnership's activities and discuss the expected costs versus the possible benefits. The goals of the partnership are reviewed, as are the interests and capacities of the potential partners. The main subjects of negotiation at this phase are: financing, distribution of benefits and intellectual property, structure or organizational design of the partnership and specific partnership activities (Crawford, 2003)
.

Phase 3: Operation
In this phase, the proposed activities of the partnership are put into practice. Some strategies that can improve the operation of partnerships include: confidence building,   transparency,   understanding   different cultures and strategic vision (Hartwich et al 2007).

Phase 4: Monitoring and Evaluation
The evaluation of a partnership can have different purposes, such as justifying the use of funds, understanding whether the expected results have been or are being generated and how efficiently they are being realized, and identifying the strengths and

weaknesses of the partnership in areas related to administration, management, leadership, and the synergetic effect produced (Bovaird, 2004).

Phase 5: Termination or Continuation
After evaluating the partnership and examining whether the expected results have been achieved, the partners must choose whether to continue or terminate the partnership (Hartwich et al 2007).

2.   Materials and Methods

A qualitative approach was used in this study and the participant observation and in-depth interviews were conducted to collect data for the study. The study population involves the participating researchers and farmers in Nigeria and Ghana. A purposive sampling

technique was used due to the fact that the number of participating scientist is limited and that of farmers has been increasing very season. The checklist for the interviews was based on the list of 21 activities that were developed from literature on partnership and linkages in agricultural technology development. The ranking of the partnership activities were collated and presented in table formats

3.   Results

Table 1 presents the results of the ranking of the comparative analysis of partnership activities used among major stakeholders in sawah technology development process, while Table 2 presents the analysis of variance comparing involvement in partnership activities by major stakeholders in sawah technology development

Table 1: Partnership activities among major stakeholders in Sawah rice technology development

4.   Discussion

Table 1 covers linkage activities between these three components. Japanese Institutions and researchers were very prominent in 18 out of the 21 listed activities. These are joint problem identification, joint programming, joint technology publication, collaborative professional activities, joint research contracts, joint research activities, exchange of resources, joint financial resources, dissemination of knowledge, joint publication, joint reports, joint demonstration trials, joint seminar and workshop, cross training, evaluation survey, evaluation meeting, evaluation field visits and evaluation reports. This may be because of the high involvement of the Japanese Institutions and researchers in all the stages of the technology development process. It is also noteworthy that the funds for the technology development process were granted by Japanese Institutions and researchers.

Scientists in Ghana and Nigeria Institutions were only prominent in 9 out of the 21 listed activities. These activities are joint technology publication, joint research activities, staff rotation, and dissemination of knowledge, joint publication, joint reports, joint demonstration trials, joint field days and joint audio-visual materials. The institutional mandate of the participating research scientists from in Ghana and Nigeria may be responsible for this trend of involvement in the partnership development activities. The high participation of Scientists in Ghana and Nigeria Institutions in partnership activities implies that when development is the focus and mandate related, resources are likely to be utilized effectively in carrying out these functions.

Farmers in Ghana and Nigeria were only prominent in 3 out of the 21 development activities. These are dissemination of knowledge, joint demonstration trials and joint field days. The acquisition of knowledge associated with these activities could be responsible for their prominence. Their non-involvement in the other activities underscores the lack of complete or partial linkage existing between researchers, extension agents and farmers. While it is a known fact that majority of farmers are illiterate, It has been established that they are sources of vital information (local) that will enhance the development, acceptability and utilization of technologies.

In Table 2, the result showed that there is a significant difference in the involvement of Japanese Institutions and researchers, Scientists in Ghana and Nigeria Institutions and Farmers in Ghana and Nigeria in the partnership activities in the sawah technology development process (F = 16.87, p < 0.05). The pattern of involvement as revealed by the mean involvement score shows that Japanese Institutions and researchers were more involved than Scientists in Ghana and Nigeria Institutions which also participated more in the partnership activities in the sawah technology development process than Farmers in Ghana and Nigeria. However the degree of involvement has enhanced the successful development and dissemination of sawah technology and there is need for the sustainability of the partnership activities.

The paper has shown clearly that partnership activities were critical in the development and dissemination of the sawah technology in West Africa. It has also highlighted the varying degrees of involvement in partnership activities by the three major stakeholders in the technology development process. The varying degree of involvement in the partnership activities enhanced the successful development and dissemination of sawah technology and there is need for the sustainability of the partnership activities.

Abstract: Electrodepsion of nickel from solutions containing nickel sulfate, boric acid, ammonium sulfate and sodium gluconate on copper substrate has been investigated. The study dealt with the influence of bath composition, current density, pH and temperature on cathodic current efficiency as well as the effect of urea, aniline sulfate and chloramine B as additives on the corrosion behavior using Potetiodynamic polarization curve and morphology of the deposited nickel using scanning electron microscopy (SEM). The optimum conditions for producing nickel deposits from the free additives baths were: 0.2 mol/l $NiSO_4.6H_2O$, 0.2 mol/l sodium gluconate, boric acid 0.4 mol/l, ammonium sulfate 0.4 mol/l, pH 8,current density of 2.5 A/dm^2 and at 25 ^{0}C. The same conditions were used in the presence of additives, under these conditions the cathodic current efficiency was 96.5% which decreased sharply with increasing temperature. These coatings have high corrosion resistance in comparison with Cu-substrate. However the surface morphology of the deposits varies from spherical grain to columnar in the absence and presence of additives, respectively.

1. Introduction:

Electrochemical nickel plating is a widely used process. Applications comprise functional coatings, for example, for corrosion protection, increase of wear resistance and decorative coatings such as bright Ni mostly in combination with chromium. Many electrolyte formulations are based on the classical composition proposed by Watts, which yields dull Ni deposits. To obtain decorative deposits with a mirror-like surface finish special additive formulations have been developed, which contain organic substances like surfactants, brighteners and levelers. The current efficiency is nearly 100% over a wide range of current densities [WEHNER et al., 2003].

The majority of metal electrodeposition processes are carried out from baths containing complexing agents such as sulfamates, tartrates, Citrates, glycinates and gluconates have been used. These complexing agents are non-toxic, easily obtained and their degradation products offer easier treatment [Rashwan et al., 2003]. A survey of literature shows that gluconate electrolytes were used to electroplate metals such as nickel [Abd El Meguid. E. A et al., 1999], copper [Abd El Rehim et al., 2000], tin [Abd El Rehim et al., 2000] and zinc [Rashwan et al., 2000]. Organic additives have been found to affect the electrothrowing power of nickel from sulfate, chloride and Watts's bath. High purity nickel was produced by electroplating from sulfate and chloride solutions in the presence of high concentration of boric acid as a buffer [Lupi et al., 2006].The effect of acetone on the current efficiency, morphology and particle size of the deposited nickel from an ammonical sulfate bath have been studied [Borikar et al., 2006].The morphology of the nickel deposited with a high concentration of organic additive TBAC (tri benzyl ammonium chloride) have been reported and the average particle size of the deposited powder decreased with the concentration of acetone. More recently, performed of nickel electrodeposition at a constant current density to determine the optimum concentration of chloride and an organic additive used for industrial nickel electroplating were studied [Malevich et al., 2008]. Selenious oxide and certain dyes have been used in conjunction with naphthalene sulfonic acids in nickel baths for improving the brightness and leveling of the nickel deposits. While saccharin, p-toluene sulfonamide, sodium m-benzene disulfonate, o-sulfo benzaldehyde have been used as stress reducers in Watts or sulfamate bath to obtain the desired hardness without tensile stress [Lowenheim, 1974]. Certain anionic wetting agents are used in nickel baths to

prevent bubbles of hydrogen from adhering to the cathode and causing pits in the deposit. Sulfates of normal primary alcohols containing 8–18 carbon atoms at concentrations of 0.1–0.5 g/l were the first successful wetting agents used commercially in bright electrodeposited nickel baths. However, sodium lauryl sulfate (SLS) free from lauryl alcohol is the most extensively used wetting agent of this class for ductile dull nickel plating. Sodium lauryl sulfate and sodium lauryl ethoxy sulfonates, otherwise called or known as anionic surfactants have been widely used commercially in the electroplating of nickel [Shinochiro et al., 1979].The objective of the present study is to obtain nickel deposits from alkaline-gluconate bath, in order to determine the dependence of coating characteristics on several electroplating variables and the effects of urea, analinium sulfate and chloralamine B in it is structure and corrosion resistance.

2. Materials and Method:

Two solutions baths listed in two tables (1) and (2) used were freshly prepared from analar chemicals and doubly distilled water. Copper sheet cathode and pure nickel sheet anode both of dimensions 2X2 cm^2 were used. The copper sheet cathodes were mechanically polished with different grade emery papers and then immersed in pickling solution (300ml H_2SO_4+100ml HNO_3+5ml HCl+595ml doubly distilled water) for 1min, washed with distilled water, rinsed with acetone, dried and finely weighted. The pH was measured using Microprocessor pH/mV/^{0}C Meter (Model CP 5943-45USA) and adjusted by NaOH 20% addition, the temperature was controlled by using hot plate-magnetic stirrer (Philip Harris Ltd). Direct current was supplied by a d.c power supply unit (GP-4303D). Cathodic current efficiency (CCE) of the deposits were calculated as Q_{Ni}/Q_{tot} X 100,where Q_{Ni} is the real charge estimated from the quantity of deposited nickel and Q_{tot} is the theoretical charge calculated from Faraday's Law. The surface of the as-deposited nickel on copper substrates was morphologically inspected using scanning electron microscopy (SEM). (JEOL-5410 attached to an EDX unit). The electrochemical experiments were performed using A VOLTA LAB 40 (Model PGZ301) with the aid of commercial software (Volta Master 4 version 7.08). A saturated calomel electrode (SCE) and a platinized platinum black were used as the reference and auxiliary electrodes, respectively with different deposited plates as the working electrode and the electrochemical cell was filled by 3.5% NaCl. Volta Master 4 calculates and displays the corrosion rate, Corr. in μm/year: this rate is calculated from the i cor the corrosion current density found, the D density and the M atomic mass

and V valence entered in the Tafel dialogue box. The calculation is performed as follows:

Corrosion μm/year=   (i cor. (A/cm²) x M (g)) / (D (g/cm³) x V) X3270   with: 3270 = 0.01 x [1 year (in seconds) / 96497.8] and 96497.8 = 1 Faraday in Coulombs.

3. Results and Discussion:

3.1. Cathodic Current Efficiency (CCE):

The effect of pH on cathodic current efficiency, CCE, of nickel deposition from baths containing 0.2 mol/l $NiSO_4.6H_2O$ and 0.2 mol/l $C_6H_{11}NaO_7$ with 0.4 mol/l boric acid and 0.4 mol/l ammonium sulfate at 25 ^{0}C and current density of 2.5 A/dm^2 is illustrated in Figure (1).It's clear from the plot of Figure(1) that the CCE of nickel is very low at low pH values of (3-4) and abruptly increases at pH of 5 attaining steady state in the pH range 5-7 (CCE=70%). At a pH of 8 the CCE is a maxima value of about 97%.The increase in the CCE of nickel deposition with increasing the pH value is due to the increase in hydrogen overpotential. Moreover, the strong hydrogen evolution in acidic solution may inhibit the diffusion of Ni(II) species to cathodic diffusion layer possibly to concurrent hydrogen adsorption and bubbles formation [Ying and Ng, 1988, Abd El Rehim et al., 1997]. In these gluconate solutions, it has been suggested that the gluconate ion is attached to Ni (II) ion by coordination through the carboxyl group and one of the adjacent hydroxyl groups [Joyce and Pickering, 1965]. Therefore, nickel may be obtained by electroreduction of either the complexed or uncomplexed ions with simultaneous hydrogen evolution as aside reaction and nickel may exists as [Ni $C_6H_{11}O_7$]$^+$ complex (K_f =74.43) [Kouba A , 1975]. The influence of temperature on cathodic current during nickel electrodeposition in pH 8 was examined and the results are shown in Figure (2). An increase in temperature from 25 ^{0}C to 50 ^{0}C decreased the cathodic current efficiency and this can be explaining by the enhancement of rate of hydrogen evolution which suppressed the metal deposition [Ying and Ng, 1988]. One of the most important operating conditions in electroplating process is the current density, as shown in Figure (3). Increasing the current density to 2.5 A/dm^2 increased the efficiency and after that decreased sharply and this is also due to hydrogen evolution at high current densities. It is found that the efficiency of nickel plating increases with increasing plating time from 10 to 20 min Figure (4). With further increase in plating time the efficiency decreased and the increasing of the efficiency with plating time may be attributed to the fact that hydrogen evolution takes place simultaneously with nickel deposition. Hydrogen evolution decreases with increasing plating time as a

result of increasing pH in the vicinity of the cathode surface [ABD EL REHIM et al., 2002].

From Figure (5). Cathodic current efficiency of Nickel electrodeposition increased with increasing gluconte concentration up to 0.2 mol/l and then decreased with increasing gluconate content in the bath. These results are expected due to the inhibiting effect of gluconate ions [Abd El Meguid et al., 2003].The data of Figure (6). Show that the cathodic current is increased with increasing Ni(II) ion up to 0.2 mol/l and then slightly decreases which may be due to that increase in nickel content tends to oppose its depletion in the cathodic diffusion layer [Abd El-Halim and Fawzy, 1993]. The effect of urea, analinium sulfate and chloramine B as additives in nickel electroplating from alkaline gluconate was shown in Figure (7). The cathodic current of nickel electrodeposition is decreased as the additive content in the bath is increased and this can be explained by the fact that larger aliphatic or aromatic compounds with positively charged amine groups generally blocked the active side in cathodic substrate at high concentration and it may cause pitting corrosion at higher or lower concentration [Hackerman and Snaveley, 1984].

3.2. Potetiodynamic Polarization Curves:

Linear polarization technique was carried out by subjecting the working electrode to a potential range of 205 mV below and above corrosion potential (Ecorr) at a scan rate of 5 mV/sec, corrosion rate were evaluated from the polarization curves by Tafel extrapolation with the aid of commercial software (Volta Master 4 version 7.08). The results in Figure (8). and table (3) Show the corrosion behavior of the deposited plates with nickel gluconate layer and nickel gluconate plated with addition of urea, aniline sulfate and chloramine B and from the data one could say that nickel gluconate layer alone and with additives was decreased the corrosion rate of cu-substrate in order

Aniline sulfate> urea> Ni-Gluconate> chloramine B> cu-substrate

With protection efficiency of:

96.15%> 95.12%> 91.21%> 83%, respectively

Organic additives protect the entire surface of a corroding metal when present in sufficient concentration both anodic and cathodic reactions are suppressed in the presence of organic additives, the film formed protect the metal surface through a hydrophobic film and the film formed provides a barrier to the dissolution of the metal [Hackerman and Snaveley, 1984] and the reason that aniline sulfate and urea showed greatest protection efficiency can be explain by the fact that larger aliphatic or aromatic compounds with positively charged amine groups generally form active portions in organic cationic

inhibitors [Hackerman and Snaveley, 1984, Pierre R, 1999].

3.3. Surface Morphology of The deposits:

The surface morphology of the as-deposited nickel on Cu-substrate was examined by scanning electron microscopy. Figure (9 a, b, c, d) shows the morphological details of some nickel deposits obtained from the optimum bath conditions for nickel gluconate deposited alone and with aniline sulfate, urea, chloramine B as additives. The deposits are generally adherent, bright and smooth and cover all substrate surface and the obtained deposits from the optimum free additives solutions is essentially differ from those which obtained in the presence of additives; as it is compact fine spherical grain shape which reflect in the presence of additives to compact fine columnar shape as in the presence of aniline sulfate and urea and mixture of spherical grain to predominately columnar shape in the presence of chloramine B, this transition from spherical to columnar reflect the presence of microcrackes in the deposits as result of highly stress. The stress could be due to the blocking sites which found by the action of additives .The result of EDX Figure.10. Indicate that the Ni% is high (97.5-98%) in these baths.

4. Conclusion

This work studied electrodeposition of nickel in alkaline gluconate baths with and without of aniline sulfate, urea and chloramine B as additives and the influence of these additives in the corrosion behavior of cu-substrate. It is found that the optimum operating condition for producing nickel deposits from the free additives bath are: 0.2 mol/l $NiSO_4.6H_2O$, 0.2 mol/l sodium gluconate, pH 8, current density of 2.5 A/dm^2 and at 25^{0}C. And the same condition was used in the

presence of additives, under these conditions the cathodic current efficiency is 96.4% which decreases sharply with increasing temperature. These coatings have high corrosion resistance in comparison with cu-substrate. However the surface morphology of the deposits varies from spherical grain to columnar in the absence and presence of additives, respectively.

Empowerment: An Approach for Development in Rural Areas of Iran

Fatemeh Allahdadi

Dept. of Organizational and Industrial Psychology,
Islamic Azad University, Marvdasht Branch, Marvdasht, Iran
fatemeharef@gmail.com

Abstract: The main objective of this study provides a strategy for rural development. Empowerment of rural areas has emerged as an important issue in recent times. The economic empowerment of rural is being regarded these days as a sine-quo-non of progress for a country; hence, the issue of empowerment of rural areas is of paramount importance to community developers, social scientists and social reformers. Empowerment can enable the local people to participate in the economic, political and social sustainable development of the rural communities. The findings of this investigation can assist rural developers in the implementation of rural development strategies based on rural empowerment.
[Fatemeh Allahdadi, **Rural Empowerment: An Approach for Development in Rural Areas of Iran**. Journal of American Science 2011;7(5):378-381]. (ISSN: 1545-1003). http://www.americanscience.org.

Keywords: empowerment, rural development, Iran

Introduction

Empowerment means people and communities, especially those frequently marginalized, having the capability to participate effectively in social, economic and political spheres (Helling, Serrano, & Warren, 2005). The term 'empowerment' is a contested concept which connotes different meanings depending on different perspectives of looking at it (Asnarulkhadi & Aref, 2009). The World Bank has suggested that empowerment should be a key aspect of all social programs (World Bank, 2001). The empowerment of rural means for them to have the necessary ability to undertake a number of tasks either individually or in groups, so that they have further access to society resources. Empowerment is recognized as an essential strategy to strengthen the well-being of individuals, and communities, (Aref, 2010). In other word empowerment is an abiding process which takes place with specific intent so enabling them to have further control over community resources (Rezaei, 2007).

Numerous studies emphasized on empowerment as means for community development. (Aref & Ma'rof, 2009; Aref et al., 2009; Gillman, 1996; Gore, 1992; Humphries, 1994; Lennie, 2002; Peters & Marshall, 1991). Empowerment is the expansion of the capabilities of the poor people to: participate in, influence and control the institutions that affect their lives. Elements of empowerment is the rights, resources and support to: Information, participation, and organizational capacity (Hamyaran, 2006). This literature suggests that rural researchers need to adopt a more critical approach to the concept about the processes they claim have facilitated empowerment. This requires the development of useful models of empowerment and effective methods for empowerment (Anderson, 1996).

Rural empowerment

Rural development is closely linked to development of the local economy. Improving local food security, household income, and the quality of livelihood options as well as encouraging growth in the number, scale, and profitability of both formal and informal sector businesses are important aspects of local development (Helling et al., 2005). In addition to its contribution to household welfare, growth in production and commerce provides the base for local resource mobilization to finance the provision of public services. Economic growth also contributes to the capital stock for investment in local development, including human capital from investment in the education and health of farmers, workers, and entrepreneurs and social capital from the strengthening of relationships among financial institutions, suppliers of inputs, producers, and purchasers of goods and services in the marketplace (Helling et al., 2005).

Rural Empowering are a challenge. Empowering in rural area can help to meet these challenges. Empowering not only enhance national productivity, employment but also help to develop economic independence, personal and social capabilities among rural women. Following are some of the social capabilities, which were developed as result of taking up empowerment among rural areas.
• Improved standard of living
• Self confidence and enhance awareness
• Sense of achievement
• Increased social interaction
• Engaged in political activities
• Improvement in leadership qualities

• Involvement in solving problems

• Decision making capacity (Sathiabama, 2010).

The major types of empowerment can be summarized into four groups (Lennie, 2002).

*Social empowerment***:** Access to new knowledge, Developing new skills, abilities, confidence and competence, obtaining the friendship and support of other women, participating in various activities with other women.

*Organizational empowermen**t:*** New knowledge and awareness about new benefits of technology for rural development through rural tourism development or development of agriculture cooperatives.

Political empowerment: Influencing other government policies and decisions that affect on rural communities, changing town-based people's beliefs, networking with people in government and industry and other women to discuss issues affecting rural women and rural communities.

Psychological empowerment: An increase in self-confidence and self-esteem, Greater motivation, inspiration, to develop new skills and knowledge, to keep pushing for better services for rural people

The local development paradigm is comprised of three main activities:

-Empowerment through capacity building

-Provision of Services to the community

-Local Governance (Hamyaran, 2006).

Three alternative approaches to local development; decentralized sectoral, local government, and community support approaches (Figure 1), emphasize many of the same principles: empowerment of the poor and other marginalized groups, responsiveness to beneficiary demand, autonomy of local institutions associated with greater downward accountability, and enhancement of local capacities.
Figure 1: Integrating Approaches for rural development. Source (Helling et al., 2005)

A sustainable local human, social and economic development can be achieved through community empowerment and local governance reform that will in turn enhance the efficiency of public service provision and encourage private sector growth (Figure1). A favorable national policy and institutional environment, an enhanced capacity of all local protagonists and institutions, along with adequate transfer of resources are the exterior catalysts necessary for local development to fall on track and to take its course as smoothly as possible (Hamyaran, 2006; Helling et al., 2005).
Figure 2: A Conceptual Framework for Rural Development. Source: (Helling et al., 2005)

Empowerment in Rural Areas of Iran

Empowerment is the starting point for local development. Empowerment is the process of enhancing the real possibility that an individual or a group can make and express choices, and transform their choices into desired actions and outcomes (World Bank, 2004). Individuals, households, and communities need both opportunity and capability in order to be truly empowered (Helling et al., 2005). The empowerment in rural area of Iran, as in many other countries, may be divided into two categories. First, there are those which arise in the context of daily human interactions within the societal arena for the fulfillment of common needs, fending of natural disasters, or responding to traditions and religious beliefs. The second is the result of conscience personal decision making and the desire to partake in activities outside one's immediate circle, specifically those which have communal ramifications. Institutionalization of communal participatory activities in the form of unions, forums, councils, societies, and voluntary groups fall within this category. Poverty and societal necessities have been

factors contributing to people rallying around and organizing themselves into groups in Iran, in order to better confront such maladies and inefficiencies. Historically, Iran has repeatedly fallen victim to devastating invasions by foreign armies. Internal tribal and regional conflicts have also been the cause of persistent instabilities, jeopardizing lives and livelihood. Maintaining security for one's immediate and extended family has thus been another driving factor towards people conglomerating into groups. The most basic form of group activity has been coordination for irrigation, cultivation, and production. Lack of mechanized means of production, particularly within the agricultural sector, which required focused manual labor within certain periods of time in the course of the year, necessitated cooperation and partnership. The thought of establishing community organizations in Iran dates back to the Constitutional Revolution (1906) where it found expression as part of an addendum to the first constitution of the country with regards to the right of establishment of provincial councils. Even though due to the overall declining state of events at that juncture in time such councils did not achieve permanence, they nevertheless became a forum for the voicing of people's opinions with regards to matters of their concern and an official venue for their political and social cooperation. The topic of people's empowerment is addressed and elaborated in the constitution of Iran:

-With specific reference to guidelines stated within the Quran, the Rural Islamic Councils have been described as "pillars of decision making and administration in the affairs of the country".

-For efficient planning and implementation of programs in production, industrial and agricultural establishments, councils should be elected which include representatives from workers, farmers, other employees and managers; and in educational, administrative, service establishments similar councils should be formed.

-Strengthening of people's participation had been the professed qualitative goal of the first two development plans that were promulgated and implemented by the Islamic Republic of Iran (1983-1987 and 1995-1999). The following were among its salient guidelines:

-Increased legal support for people's participation with emphasis on attracting private investment.

-Encouraging increased participation of women in social, cultural, educational and economic affairs while safeguarding family values.

-Establishment of Islamic provincial, township, municipal, and village councils with the supervisory power over every cultural, reconstructive, executive and economic affairs within their area of their jurisdiction (Hamyaran, 2006; Helling et al., 2005).

Conclusion

Empowerment increases people's capabilities to make and express choices and to transform those choices into desired actions and outcomes. People's capabilities to participate effectively in local development are determined not only by individual resource endowments, but also by social capital that provides the basis for collective action (Helling et al., 2005). The result of this study is suitable for the rural development for take control of the management of rural areas Because with the empowerment of rural areas, the elimination of gender discrimination and the creation of a balance of power between men and women, will not only be beneficial to women, but society as a whole shall benefit politically, economically and culturally. The results of this review suggested a range of strategies that could enhance rural empowerment.

Abstract: "Noise" or "unwanted sound" is one of the major sources of discomfort to the workers which affects human both psychologically and physically. The present investigation was conducted in Iran during the period from September to November 2010. The noise pollution caused by tractor and load were measured in open field with no obstruction and at the driver ear and by stander in accordance with NIOSHA standards. A ITM 399 (without cab) and Valtra T170 (with cab closed and open) and mold board plow and disk plow were used. Unloaded tractor noise was also measured. The data analyzed for different engine speed and gears. Results showed that the Sound Pressure Level (SPL) in the driver ear for the tractor without cab in all cases were more than NIOSH allowable 85 dB(A) criteria for eight hour of operation. The SPL of the tractor with open windows cab was also higher than the standards but lower than the tractor without cab. It was concluded that the driver should either stay on driving for less than 2 hours with tractors without cabin or open window cabin or the only best way, tractors should be equipped with factory made cabins. Even with the latter type of tractors, drivers should avoid opening the window very often for say checking the operation of the machinery behind the tractor or in case the air conditioner malfunctions.

Keyword: sound level, noise measurements, tractors, cabin, driver's ear

1. Introduction

Noise or unwanted sound is one of the major sources of discomfort to the workers which affects human both psychologically and physically. It has caused hearing problems to many drivers in the world. Noise is measured in two ways for OECD tests (Anonymous, 2010): at the operator's ear and from a bystander position, and is measured in decibels [db(A)]. But to the human ear, a noise that sounds twice (or half) as loud is actually measured at 10 dB(A). So when comparing noise figures, remember that it takes a reduction of 10 dB(A) before the human ear will perceive the noise as being half as loud. Sound measurement is made on the test track in two locations- at the driver's ear and in a location representing "bystander noise." The tests at the driver's ear are performed in several gears and under a number of conditions; but only the maximum level is reported. The "bystander sound" test is performed with the microphone located at 7.5 m from the centerline of the tractor which is accelerating from a lower speed to full speed in its top gear. The OECD procedure differs. The SAE/ASABE procedure measures sound in only one gear under different load conditions, whereas the OECD procedure measures sound in different gears

between High Idle and Rated Engine speed (Larsen, 2002). Sound levels are recorded using the "A" scale in the sound-level meter and are expressed in terms of decibels (A) or dB(A). The A scale is a filter that responds like a human ear. A 3-dB(A) increase in sound level doubles the sound-pressure level. Therefore, for every 5-dB(A) increase in sound level, the permissible exposure time is cut in half. In other words, at 95 dB(A), the allowable exposure time is only four hours. It is not uncommon to have tractor sound-level reaching 95 dB(A) (Grisso et al., 2007). Tractor driver farmer had more often high frequency hearing loss when compared to non tractor driver farmer. The noise levels observed on tractors in different operations were in the range of 90–110 dB (A) (Kumar et al., 2005). Sound levels that cause hearing loss begin at about 85 dB(A). Hearing loss occurs more quickly with louder noise. OSHA standards consider sound measured at 85 decibels or higher as damaging to the eardrum and therefore a risk to hearing (Anonymous, 2004). It is stated (Anonymous, 2010) that 30 percent of Sweden's farmers suffer from hearing loss. Similar results to those from Sweden were found in a study conducted by University of Iowa in the United States, indicating that

American farm workers are faced with the same noise problems in their daily work. An investigation by Dewangan et al (2005) for determination of SPL on 18.7 and 26.1 kW tractors and 4.6 and 6.7 kW hand tractors during field operations with various implements, revealed that both tractors produced the noise of 92 dB(A) in the working zone of operator. The SPL of the hand tractor was about 2 dB(A) higher than that of the tractor. The SPL during field operations at operator ear level increased with increase in engine speed and forward speed. Celen and Arm (2003) found that the maximum SLP of 97.1 dB(A) was in exhaust pipe and the minimum of 79.7 dB(A) at the bystander ear. An increase of 3 dBA was measured for engine speed changes from 1000 to 2000 rpm. Durgut and Celen (2004) measured an 96.6 db(A) at the drivers ear but a minimum of 67.7 dB(A) for the surrounding. They also found a 6 dB(A) difference when engine speed changed from 1000 to 2000 rpm. According to Aybek et al (2010), statistical analysis showed that type of operation, type of cabins, and operation x cabin interactions were statistically significant at (P < 0.01). The use of original cabins had a greater effect in decreasing average sound pressures and resulted in more efficient noise insulation, especially at higher center frequencies compared to field installed cabins. Sound pressure levels at 4000 Hz center frequency was reduced 2-13 dB and 4-18 dB by using a field-installed cabin and an original cabin, respectively. It was concluded that depending on the cabin types used, the operators could usually work from 4 to 6 h a day without suffering from noise induced inconveniences while 2–3 h is permissible for plowing and forage harvesting on tractors without cabins. In reference Anonymous (2009) it is stated that No Member State may refuse to grant EC (European Council) type-approval or national type-approval of any type of tractor on grounds relating to the driver-perceived noise level if that level is within the following limits: 90 dB(A) in accordance with Annex I, or 86 dB(A) in accordance with Annex II. Individual tasks which exceeded 85 dB(A) TWA-8 (NIOSH) identified by researchers were Tilling/plowing, Planting, or other farm activities (Milz, 2006). Equation (1) is given for

safe exposure time to noise, $t = \dfrac{8}{2^{\frac{SPL-85}{3}}}$ (1)

(Anonymous, 1996) where t= hours of exposure per day.

An experiment in Croatia by Goglia et al (2005) showed that by ISO 4872, 6393 and 362 standards, the noise level did not exceed the limit values. However, the noise level at the operator's position at full load and at nominal load exceeded the limits. Noise levels of 155 tractors on 36 farms were studied (Holt et al., 2006). The range of noise levels at the driver's ear level with radios off and windows closed (if so equipped) was from 78 to 103 dB. Seventy-five percent of tractors without cabs had noise levels in excess of 90 dB, compared to only 18% of tractors with cabs. The use of a radio adds an average of 3.1 dB of noise. When some cab windows are open and the radio is on, an average of 4.2 dB is added to the cab noise. A specially selected group of 45 farm tractor drivers were examined in order to estimate the degree of occupational hearing loss (Solecki, 2010). The drivers, aged 21-50 years, were employed on multi production farms. The study showed that the operators under study had statistically worse hearing within the range of high frequencies (3-6 kHz), especially those aged over 30 years. A study was carried out when a fabricated cab was added to an agricultural tractor (Abd-el-Tawwab et al., 2000). The fabricated cab was selected after a comprehensive series of experimental tests carried out on a variety of cab constructions. The results were discussed from the view point of obtaining the influence of the tractor driving parameters (road speed, gear-shift, engine speed and tractive effort) on the noise measured inside the tractor cab and over the frequency range up to 2000 Hz. In April, however, the occurrence of high total exposure values was due to intensive field activities (plowing, harrowing, sowing), and prolonged exposure to this factor (Aybek et al., 2010). In the seasons of the year analyzed, high equivalent exposure values were observed within the range: 5.53-6.61 Pa^2 h (some Polished standards). Mean value for this parameter for the whole year reached the value of 4.27 Pa^2 h (standard exceeded 4.3 times). This value is equivalent to a mean exposure level equal to 91.3 dB.

3. Material and Methods

Two types of tractor a 2-wheel drive MF399 with 62 kW PTO power without cabin and a Valtra T170, 184 kW power with closed window and open window cabin were tested. No load and loaded with moldboard plow and disk were tested for noise level at different gears and engine speed. The gears were 1 low, 2 low and 3 low and the speeds were set at 1500, 1750, 2000 and 2200 rpm. The measurements were taken at the driver ear and at a distance 7.5m from centre axis of tractor. A sound meter of type Lutron SL4013 equipped with capacitance microphone was used. The OECD testing standards were observed. The test course was a plot of 100 m long by 40m wide in open field. Each experiment data was recorded with 9 replicates. Data was analyzed based on factorial experiment with MSTAT-C software.

4. Results

Data was collected between the high idle and the rated speed according to OECD standards (Kumar et al., 2010) and in two ways as recommended by OECD (Abd-el-Tawwab et al., 2000). Statistical analysis of the results are show in tables 1-4 and the corresponding graphs in figures 1-6. A summary of results for the range of noise level is given in table 5. The maximum SPL reached 94.5 dB(A) in accordance with Grisso et al (2007) but less than the 96.6 dB(A) in Durgut and Celen (2004) and much lower than the maximum 110 dB(A) as measured in (Kumar et al., 2010). The SPL as shown in the figures does increase with engine and forward speed as mentioned in Dwangan et al (2005) with the exceptions in figures 2 and 4 for the second low gear. Holt et al (2006) gives a range of 78-103 dB(A) for closed window cabin while the experimental results showed a much smaller range of 74.3-77.9 dB(A). Durgut and Celen (2004) indicates a range of 76.5-91.9 at 2000 rpm engine speed without mentioning the type of tractor (with or without cab), the driving gear or loading in comparison with experimental 75.5-93.4 dB(A) for the same engine speed. The 93.4 dB(A) is for loaded and without cabin

tractor. Goglia et al (2007) also indicates that the sound level exceeded the limits at full load but without mentioning the gear, engine speed, cabin and weather loaded or not. Neither it mentions how much the exceeded value was. In this experiment the maximum loaded SPL was 93.5 dB(A) for disking at gear 3 low. The graphs of Fig. 2, 4 and 6 show an ascending trend of noise level with increasing engine speed. Noise level for closed window cabin is way much below the 85 dB(A) permissible level for 8 hours of work. For tractors without cabin and the open window cabin both; the level surpassed the 85 dB(A) but in all cases the noise level on tractor without cabin is higher than the one with open window cabin. Loaded tractors had higher noise level than unloaded one. The disk loaded tractors at all cases had higher noise level than the plough loaded. This could be because of the higher speed of disking. The graphs of Fig. 1, 3 and 5 shows the noise level in 3 low gears. It is apparent that noise level with some exception at gear 2 low, raises with increasing speed. The loaded tractors with one exception have higher noise level.

	loaded	89.1-94.5	74.2-78.6	84-92.7
	Permissible Exposure time (h)	3-0.9	97-35	10-1.4

4. Discussion

It may be concluded that drivers should always work with lowest engine speed and the lowest gear but; this is contradictory because tractors in this case, would not produce enough power to do the job. The alternatives are either stay on driving for less than 2 hours with tractors without cabin or open window cabin, the driver wears some kind of ear protection or the only best, is that tractors should be equipped with factory made cabins. Even with the latter type of tractors, drivers should avoid opening the window very often for say checking the operation of the machinery behind the tractor or in case the air conditioner malfunctions. Calculated permissible time in hours using equation (1) is also shown in table 5.

Abstract: Learners must retain what the program delivers to them in order to benefit from the learning. In order for participants to retain the information taught, they must see a meaning or purpose for that information. They must also understand and be able to interpret and apply the information in their own real life contexts. Understanding includes their ability to assign the correct degree of importance to the material and its application in the future. The amount of retention is always directly affected by the degree of original learning. In other words if the learners did not learn the material well initially, they will not retain it well either. Retention by the participants is directly affected by their amount of practice during the learning. After the students demonstrate they can apply new financial skills, they should be urged to practice in their own time and for their own personal needs to retain and maintain the desired performance.

Introduction:

The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act)1 defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills necessary to exercise one's rights and responsibilities for citizenship. Different dimensions of literacy are often categorized by terms that cluster several dimensions of literacy important for different clients. Examples include workplace literacy (combining both basic academic skills and workplace skills), and family literacy (combining basic academic skills and other skills essential for successful parenting).

2. "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

3. "Literacy initiatives" often are defined in terms of the needs of a particular target group. These may be parents of young children, youth who have dropped out of high school without earning a high school diploma, welfare recipients, persons with limited English-speaking ability, incarcerated adults, or adults in the workforce.

4. Other literacy initiatives are defined in terms of a particular educational service, strategy, or means to address a target population's literacy problems. "Adult basic education" and "family literacy" are examples. These initiatives are often defined in terms of a particular configuration of services for the target population (e.g., assessment and information and counseling services).

5. The term "lifelong learning" is often associated with "literacy." Lifelong learning is a means to the goal of maintaining necessary levels of literacy throughout one's lifetime. The goal of lifelong learning has implications for both individual adult's learning behavior as well as education policy and the design of the education system.

Goal six of the National Education Goals illustrates a broadly stated goal that incorporates expectations about both adult literacy and the kinds of policies and

services that should be in place to improve literacy. Goal six, "Adult Literacy and Lifelong Learning," states that, "By the year 2000, every adult will be literate and possess the knowledge and skills necessary to compete in a global economy and exercise the rights and responsibilities of citizenship."

Definition of Andragogy

term andragogy (the teaching of adults as opposed to pedagogy, the teaching of children) and questions whether it should relate more to a type of learner rather than the age of the learner. The blogger is Gwen. She describes her blog as "a reflection on the educational process by teachers working to transform their work into a more learner-centered, evidence-based, andragogical affair. Gwen suggests that the transition in a student from needing to be spoon-fed learning to a more independent state of seeking sometimes happens as early as middle school, while some adults in graduate school are still asking, "Is this on the test?" The question is an excellent one and Gwen does a great job of putting it forth. In her examination of the word and its meaning, she puts responsibility on both the student and the teacher. The word andragogy then becomes a fluid term referring to that developmental point at which an individual student becomes able and interested in accepting responsibility for his or her own learning. The teacher's responsibility is to recognize when that has happened and respond accordingly, getting out of the student's way and providing the support needed for their individual pursuit.

Andragogy: an emerging technology for adult learning:
Most of what we know about learning from the studies of learning in children and animals obtained more things about the training we know through experience educating children under conditions of compulsion (compulsive) obtained in relation to theories and more With Teaching - learning process obtained based on a definition of education as a process of transition culture.
Pedagogy from the Greek word "paid" means child and "agogos" meaning derived so conducting pedagogy means specifically include art and science of educating children. A problem that exists in the history of this phrase that the "children" omitted from the definition. In the minds of many people and even the dictionary "pedagogy" as the art and science training is defined even in the books written about adult education, you can specifically related to "Adult Education in pedagogy" without any explanation

clearly defined audience and can see the words. In addition, the main reason why adult education does not impact significantly on our civilization Since only the adult teachers know that how to teach adults if they were children.
Another problem is that with a pedagogy based on the old concept of an objective education that knowledge transfer is considered if the head Alfred White explains that the past generation as the training process of transferring what was known and the process was defined Because the transmission of culture change and culture, much larger main longer-term life and long-term process, individuals were. Under these conditions, something that a young person learns all the time in his life for him will remain valid. But the emphasis is on white head that "the specified period (the major cultural change) shorter than human life, and this basis should be training for people faced with new conditions to prepare."
In the early twentieth century the specified period, cultural changes (such as inputs or passive mass of new knowledge, technological innovation, alternative building professionals, social mobility and change in politics and economy, and required several generations to .....) found. with regard to the Cultural Revolution that occurred several. Under these new conditions in the knowledge that a person twenty years has earned or acquired in forty years when he will be old and obsolete and skills in his twenties had acquired during his thirty years, and discarding the useless was.
So what defines education as the transfer of other known right now but it should not be defined as a process of life at all to figure out what is not known. Skilled or professional adult educators know that they can not for a long time, like children teach adults. Most adult learners are volunteers who simply update their educational experiences do not. Therefore, adult education gradually separated from the traditional pedagogy and the separation along with the fear which was hosted by the standards violations occur. Adult educators to judge a logical theory about adult behavior as "adults" are still there and the lack of and no way to treat it. Theoreticians of Adult Education in Europe (Especially Germany and Yugoslavia) and the U.S. for a specific theory of adult education, and quickly developed a theory of this new technology for adult education was Conclusion. This new technology was a new name "Aandragogy" based on the Greek word "aner" means (human). So Andragogy art and science of learning to help adults. But more than semantic Andragogy to help adult learning. It means helping individuals to learn, so it is a concept for teaching children and young people and is also a process for the mature adult is getting.

Some Andragogy assumptions and its technological concepts:

Includes four main Andragogy assume that it has a different pedagogy. The assumptions are:

1)self concept: movement one of its personality by personality dependent guidance

2) reservoir of experience as a source for learning which he used

3)individual readiness for learning, which increases individual autonomy to develop activities and social roles

4) when he saw the changes based on learning of the subject matter central to the core of each of the above assumptions can be described briefly

Self - concept:

Children in conditions of complete dependence on the world are entering their every need (except biological functions) should be provided by someone else.'s First baby picture of himself as a separate personality dependent personality towards her when actually takes his life by itself be managed. At home, at play, at church, school and society expects of her adolescence and adulthood goes to impose his will. This concept to encourage the adult environment is dependent**.** In fact, the definition of community as an individual child is learning his job all the time and this is a passive role, one receives the inforHere, the child self is formed and he sees himself that the necessary capacity for decision making for own decisions in his first test takes a small and does not exceed the adult world, but gradually increased and the range of decisions than he is the concept of children in their own way of guidance is movingmation and shall save and teachers that children decide what information should be**.** Here, the child self is formed and he sees himself that the necessary capacity for decision making for own decisions in his first test takes a small and does not exceed the adult world, but gradually increased and the range of decisions than he is the concept of children in their own way of guidance is moving And during youth needs to take responsibility for important and meaningful to maintain living increases. But trends of his life until the last possible moment concept of their child who is dependent on the personality keeps. The culture of backwardness in the education of children in kindergarten and elementary school years, been considered so teachers, students in the planning process and are involved in learning activities and as a child but he goes up the educational ladder and more and more responsibility their education assumes And this with the help of parents, teachers and curriculum planners occur. But when his person was defined as adults for certain

things as emotional self-concept occurs naturally his own role in society and sees itself as a mature person as a producer or acts subject sees, Now his duty as a server, a couple (husband or wife), a parent (father or mother), and a citizen ...... Will look. After an adult look at his new position and look at other than his educational responsibilities and the concept acquires its own character driven And he will be able to take his own decisions and outcomes to manage them. In fact, the point is that when he himself fully understands his guidance a deep need for understanding and respect for others by your character to feel his guidance And that's why the adult needs to be treated with respect and be seen as a unique individual. Therefore, situations that they feel they can be treated like children, or avoid, avoid, resist, and said they hate. Adult learning and the conditions under which incompatible and incongruous with the concept of their own (as autonomous individuals) is take away (saying what to do and what not to do**.** In the case of adults to recall some of the classroom as a place that is wrong with their behavior and this spirit is so strong that a major obstacle for adult education activities is placed. So if adults were able to learn systemic absorption of the educational environment, we should be teaching awards and is worthy of adult.

On the other hand, when adults first exposed to a learning environment where they are treated with respect and in a two-way interaction with the teachers are responsible for the learning of them is given at the beginning and usually some kind of shock no organization comes into existence as adults for self-guidance they are not prepared to a familiar process for learning need. If you could adapt this knowledge and learning environment we provide for her sense of exhilaration and freedom she is experiencing and then enters into a deep learning and to reach results that the starting point is the time for him and for her teacher**.**

Technological concepts:

Several concepts for Andragogy technology and differences in their concept of children and adults are given.

1)learning environment: a basic concept as a social space that the adult learns that there are recommendations in relation to that physical environment should be such that

- adults can feel comfortable in it.
- Training equipment should be comfortable in adult sizes.
- Meeting rooms should be arranged without the formalities.

- Sounds and audio devices must be light - the visual is limited.

Most important is mental atmosphere and should be a convention that any adult sense of acceptance, respect and supports. When that kind of interaction between teacher and adult atmosphere is produced and the person in a friendly and informal atmosphere that is placed and when the name is known and the value is put to him as a unique personality considered felt to be "adult" shows more tendency So in traditional schools, formal atmosphere for adult learners is somewhat annoying. Therefore, the signs of child Andragogy for adult learners and they are considering are removed.

Service companies, churches, businesses and places of living environments are probably more for the education of adults are in contact and where they are most comfortable Rooms after row of chairs are arranged with the grouping of children for adult chairs were not suitable and should be such that convention participants sit in groups of small circular or round tables that should be appropriate for adults. Some adults say that Blackboard is a trace of their childhood are therefore to increase the popularity of adult education use of paper based newspapers on Tuesday is good. Teacher behavior probably more than any other factor on learning is effective teacher different ways of attitude and approach to students affects. Teacher who makes time to recognize individual students with their calls (especially first name) This shows that a teacher really has the students and participating in discussions respects and really listen What gives, he says. Adulthood atmosphere beyond theory classes and can be extended to all situations in addition to the creation of a suitable location for the design of appropriate training such as decor, architecture, methods, and leadership style and human ratios

Needs diagnosis:
the traditional activities that the teacher tells students what they need as well as what he needs to learn to impose his will. Of course, an adult will learn what others want him to learn if their power is strong and remember the penalty for failure to have followed his. More to learn but he sees things that need to be motivated to learn so Andragogy on adult learners to engage in self-diagnostic process for learning needs to be emphasized. Generally this process involves three stages:
1 - Build a model of competence or unique characteristics to achieve ideal performance model. Has a comprehensive quality of a good observer, good public speaker, and deserve a good parent and competencies that need to be good. In the model

phase convention in which the values and expectations of teachers, the school and the community goes with what is pervasive in mind are mixed together.

Conclusion:
Beyond the issues relating directly to DAEL(Department of Adult Education and Literacy), the task force heard a number of concerns about the Commonwealth's overall approach to adult literacy.

- Lack of coherent statewide leadership and coordination among multiple complementary initiatives aimed at the same problem.
- Lack of continuity in state leadership. Cited in particular was the difficulty sustaining a high level commitment to the issue long enough to make a difference because of changes in priorities of the state's political leaders. A high level of turnover in the leadership of the Department of Adult Education and Literacy has also contributed to the instability.
- Tendency to think of adult education as a separate categorical program rather than a strategy that cuts across the mission and responsibility of multiple Commonwealth programs and initiatives (e.g., early childhood education, welfare reform, economic development, and corrections).
- Multiple uncoordinated categorical federal initiatives that tend to drive (and fragment) policy for an overall state effort that is largely funded by Kentucky.
- A tendency to commingle and confuse different functions. The most important distinction is between functions focused on the needs of clients (adult learners, employers, communities, regions, and the Commonwealth as a whole) and functions associated with the operations and performance of providers. It is important that each of these functions receive attention, yet the tendency is for one (e.g., overseeing a network of providers) to drive out attention to overall system strategy.
- Inadequate coordination of services to meet the needs of individual adults, communities, employers, and regions is hindered by:

- Vertical financing and regulatory relationships between separate federal and state programs and local providers and administrative units. These vertical relationships can hinder the horizontal coordination

of services for individual adult learners, communities, and employers.

- Turf wars among providers, local politics, and long-standing conflicts among neighboring counties.

- Inadequate links with and leverage of other public and private initiatives and investments to reach the target population. Major sources of help include employers, postsecondary education, and workforce development.
- Lack of a state financing policy and strategy for provider performance incentives and collaboration, and tax and other employer incentives for leverage of non-state resources.
- Lack of programmatic and administrative flexibility to meet the rapidly changing needs of adult learners, employers, regional economies, and communities.

When the issue is examined from a county-by-county perspective, a significant mismatch is found between the availability of services and the target population. The problem is partially one of resources. Yet an even more serious problem is the lack of local leadership and coordination of available resources—both public and private. A deliberate strategy is needed to focus state priorities on the target population at the lowest literacy levels (Levels I and II) and in the counties with largest percentages of adults at these levels. Unless Kentucky can narrow the disparities within the state, the Commonwealth will be unable to narrow the disparities in per capita income and other critical indicators between Kentucky and its competitor states.

Lateral Tarsal strip technique for correction of lower eyelid Ectropion.

Mohamed A. Marzouk* , Ayman A. Shouman , Ehab S.Elzakzouk and M.Tarek A.Elnaggar

Research Institute of Ophthalmology – Giza – Egypt.
*marrzouk@hotmail.com

Abstract: Purpose: To evaluate lateral tarsal strip technique as a simple procedure that can be used in the presence of lateral canthal tendon laxity or malposition. The technique was used in this study on cases of involutional , paralytic, and cicatricial ectropion .The surgical outcome from different types of ectropion was compared and evaluated. **Patients and methods:** This retrospective study reviewed records of 30 patients (41 lids) who had undergone lateral tarsal strip from January-2008 to June-2010. All records were examined to determine the indications, management, outcome, postoperative complications and success rate. **Results:** A total of 17 males and 13 females made up the study groups. The mean age of the cohort was 59.15 +\- 6.2 yrs (range 4- 65 years).The average follow up period was 24 weeks .The patients were divided into 3 groups:Group A: 10 patients with bilateral involutional ectropion (20 lids). Group B: 10 patients with unilateral paralytic ectropion (10 lids). Group C: 10 patients with cicatricial ectropion 9 unilateral and 1 bilateral (11 lids). Most common presenting feature was persistent tearing, which was seen in all patients, others included lid laxity, lagophthalmos and unacceptable cosmesis. Thirty-five lids obtained satisfactory correction of eyelid ectropion with a simple lateral tarsal strip surgical procedure, while six lids required additional intra operative ancillary procedures to correct the remaining skin laxity, scleral show and residual ectropion. Common ancillary procedures used were excision of skin and muscle strip, lateral tarsorraphy and scar revision in severe cicatricial ectropion. Good aesthetic and functional results were achieved in 85% of cases.**Conclusions**: Lateral tarsal strip is a simple technique, which can be used in different types of eye lid ectropion. The technique is directed at correcting the anatomical defect, preserving the natural anatomy and maintaining the integrity of tear passage and outflow, rendering excellent cosmetic and functional results. The ancillary procedures used in our study are suggestive of a very specific role for lateral tarsal strip as a sole treatment in correcting various types of eyelid ectropion.

1. Introduction

The lateral tarsal (LTS) strip is a simple procedure that can be used in the presence of lateral canthal tendon laxity or malposition. Most cases of laxity and non-cicatricial ectropion are caused by lateral or medial canthal tendon laxity or elongation. The eyelid shortening procedure generally involves removal of the mid tarsal portion of eyelid, which may cause notching, damaging tear passage or tear outflow structures and results in displacement of lacrimal punctum without addressing the cause of the defect. (1)The lateral tarsal strip technique is directed at correction of the anatomical defect, preserving the natural anatomy and maintaining the integrity of tear passage and outflow.

Involutional ectropion is the most common form of lower lid ectropion in which turning out of the lower eyelid causes tearing, conjunctival exposure, redness, and photophobia. Rarely, untreated ectropion may result in a corneal ulcer. The main factor giving rise to involutional ectropion is the progressive degeneration of elastic and fibrous tissues within the lid occurring with increased age.

This causes an imbalance between the usual forces acting on the lower eyelid, and the resulting eyelid laxity, both horizontal (tarsal plate and orbicularis) and vertical (lower eyelid retractors and orbital septum), allows the punctual eversion to occur first, then medial portion of the lid will turn outwards, finally the entire lid will turn causing frank ectropion.

Medical treatment with lubricants offer only temporary relief of symptoms (2,3,4); surgery remains the mainstay for permanent treatment. (5-11) Different operations have been described that address the pathophysiologic factors with apparently acceptable surgical outcomes. (11-27) So many operations have been described that it raises the question of whether surgical correction is ever 100% curative. It is generally accepted that, for the best results, surgery should address both horizontal and vertical laxity. (9,10,17,18,19,20,21,24,26,28-33)

Follow-up is particularly difficult in the group of elderly patients because they may be too unwell to report for follow-up, they may move, or

they may die. Often, the clinical follow-up is too short to establish the long-term results. (11)

There is a need for involutional malposition to be corrected with minimal surgical intervention and morbidity, producing an effective, sustained result. (34,35,36)

Patients with keratitis from paralytic ectropion pose a functional and aesthetic oculoplastic challenge. There is dysfunction with upper and lower eyelid retraction as well as horizontal laxity resulting in lower eyelid ectropion or sag, lagophthalmos, and a significant risk of exposure keratopathy. (37,38,39,40) This is greatest when there is coexistent corneal anesthesia and a greatly reduced vertical palpebral aperture that is needed to reduce the lagophthalmos.

The aims of rehabilitative eyelid surgery are multiple: to reduce the vertical palpebral aperture and not to shorten the horizontal palpebral aperture unduly and to improve eyelid closure, ocular surface lubrication, and the aesthetic appearance of the patient.

This technique is also useful in mild to moderate cicatricial lid ectropion as a single-step surgical procedure or even in severe cicatricial ectropion with ancillary procedures to remove the traction, being very important for reconstructing the normal position, anatomical structure and lid function. (41)

The approaches for accessing the inferior orbital rim and orbital floor are transconjunctival, subciliary, subtarsal, and subpalpebral to manage orbital trauma and lower lid blepharoplasty, all these methods have advantages and disadvantages, and the choice is usually a matter of personal preference. Regardless of the approach, malposition of the lower eyelid is a common long term complication. (42, 43, 44, 45) The malposition may include retraction of the lower eyelid to show the sclera inferiorly, or frank ectropion. (42, 43) The result is cosmetically unacceptable and may be associated with tearing, irritation, and other symptoms of exposure keratitis. Factors that contribute to such malposition include horizontal laxity of the lower eyelid, and scarring of the skin and middle lamella (orbital septum). To correct this malposition, we disinsert the lower eyelid, and use a lateral tarsal strip to tighten and replace the lateral canthus. This provides horizontal and vertical support to the lower eyelid. The tarsal strip technique is relatively simple, and can correct the malposition after operations for trauma. (46,47,48)

The aim of this study is to evaluate the surgical outcome of LTS technique in different types of lower eyelid ectropion .

2. Patients and Methods

This retrospective study reviewed records of 30 patients, 17 males and 13 females, with lower eyelid ectropion , 11 bilateral and 19 unilateral cases, with a total of 41 lids, who had undergone lateral tarsal strip from January-2008 to June-2010. All records were examined to determine the indication, management, outcome, postoperative complications and success rate. They all received an informed consent for the procedure. Thirty-five lids were corrected with a simple LTS surgical procedure, while six lids required an additional intra operative ancillary procedures to correct the remaining skin laxity, scleral show and residual ectropion.(Table 1)

Patients were divided into 3 groups :

Group A: 10 patients with bilateral involutional ectropion, 9 were corrected with a simple LTS surgical procedure and 1 required additional skin and muscle excision (20 lids).

Group B: 10 patients with unilateral acquired 7th nerve palsy , 9 were corrected with a simple LTS surgical procedure and 1 required additional lateral tarsorraphy (10 lids). All patients had marked facial palsy present for more than 1 year with lagophthalmos and keratitis.

Group C: 10 patients with cicatricial ectropion ,9 unilateral and 1 bilateral (11 lids).

From these 8 patients with postoperative mild cicatricial ectropion after blepharoplasty, complaining of unacceptable look, tearing, redness and photophobia due to mild lower eyelid ectropion , were managed by simple LTS.While 2 patients (3 lids) with severe traumatic cicatricial ectropion, were managed by total reconstruction of lower eyelid with scar revision in addition to LTS . (Table 1)

Methods

The preoperative assessment of each patient was recorded on a standard Performa. Details of any previous surgery was taken, lateral tarsal strip technique efficacy was assessed by abolition of lower eyelid with thumb which compresses the orbital fat, shortens and elevates the lid laterally giving a good idea about the outcome of the surgical technique. (Fig.1) The following tests and measurements were also included:

1- Lid Distraction Test: The lower eyelid is grasped centrally and pulled away from the globe as far as possible without causing discomfort and the maximum separation of the lower lid margin from the lower limbus is measured in the primary position.

2- Snap-Back Test: The lower eyelid is pulled down away from the globe, and then suddenly released; normally the lid return into normal position due to elasticity a second after release, if any delay

found it is calculated and the test is considered positive indicating horizontal lower eyelid laxity, stop watch was used to calculate the time.

3- Margin-reflex distance: Distance between lower eyelid margin and corneal reflex in the primary position.

4- Capsulopalpepral Fascia Disinsertion signs:

-Higher resting position of lower eyelid.
-Incomplete lower eyelid movement with down gaze.
-Pink horizontal band along lower fornix.
-Deep lower fornix.
-Absent lower eyelid crease

5- Rose Bengal staining Test: Kerato-conjunctival staining due to exposure.

Table 1: Base Line Characteristic

Table 2: Surgical Procedures.

Clinical Diagnosis	No. Patient.	Surgical procedure
• **Involutional Ectropion:**	9 patients 18lids 1 patients 2 lids	**LTS** **LTS + Skin Muscle Excision**
• **Paralytic Ectropion (7th N palsy):**	9 patients 9 lids 1 patients 1 lid	**LTS** **LTS + LT**
• **Post.oper. Cicatricial Ectropion:**	8 patients 8 lids	**LTS**
• **Traumatic Cicatricial Ectropion:**	2 patients 3 lids	**LTS+ Scar revision**

LTS: Lateral Tarsal Strip   **LT**:Lateral Tarsorraphy.   **Scar Revision**: Scar Excision + Rotational flaps.
Skin Muscle Excision: Removal of a horizontal skin and muscle strip along the whole width of the lower lids 3 – 4 mm from the lower lid margin.

Nine patients with involutional ectropion (18 lids) where operated with lateral tarsal strip as the only procedure to treat the lid pathology, one patients with bilateral involutional ectropion (2 lids) needed removal of a horizontal skin and muscle strip along the whole width of the lower eyelid , 3 – 4 mm from the lower lid margin to prevent over riding of the preseptal part of the orbicularis muscle over the pretarsal part, in this patient the lower lid was taught and puffy, the wound was closed by 6-0 prolene and the residual scar was cosmetically acceptable and augmented the lateral tarsal strip effect. (Fig. 2 a, b)

Ten patients with 7th nerve palsy were operated with LTS, (Fig. 3 a, b) in one case we performed lateral tarsorraphy (LT) to decrease the vertical inter-palpebral distance. (Fig. 4 a, b) The LTS perfectly aligned the lower lid malposition. In two patients with severe traumatic cicatricial ectropion, scar revision and rotational flaps were done, though the main surgical procedure to reattach the lower lid in its normal position was LTS, revision of the scar and flaps were done to eliminate traction and for cosmetic reasons, but still not enough alone to reconstruct lower lid malposition. (Fig. 5, 6)

In eight patients with mild post operative lower lid ectropion, LTS was perfectly the only surgical procedure. (Fig.7). All the operations in this study were performed by one senior surgeon, Marzouk MA. (Table 2)

(Fig. 7 a): Patient with right lower lid ectropion due to lower lid blepharoplasty.

(Fig. 7 b): Same patient after simple lateral tarsal strip.

Surgical Methods

Surgery was performed under local anesthesia in 28 patients and under general anesthesia in 2 patients, one 4 years old kid not fit for local anesthesia and one patient with severe lid deformity which needs extended surgical procedures. Local anesthesia included tetracaine eye drops in the conjunctival sac and subcutaneous infiltration of the lower eyelid with 1:1 volume of lidocaine 2% with 1:200.000 epinephrine and bupivacaine 0.5%. The lateral canthus was also infiltrated down to the periosteum along with the lateral third of the upper eyelid.

A lateral canthotomy and inferior cantholysis were initially performed. A "tarsal strip" is fashioned from the lateral lower eyelid by stripping the superior mucocutaneous junction tissue, debriding conjunctival epithelium posteriorly, excising the anterior lamella, and making a linear incision inferiorly to create a "tendon" of tarsal plate. The length of the fashioned tendon is determined by assessing the desired tension required to tighten the lower eyelid. The tarsal strip is attached to the internal lateral orbital rim with a double-armed 5-0 polyglactin suture by creating a slip knot at the tendon and passing the 2 suture ends through the internal orbital portion of the lateral orbital rim periosteum. (49) The aim is to slightly overcorrect the height of the eyelid by placing the suture slightly more superiorly than the lateral canthal angle while maintaining a posterior vector of tension. Just before tying this suture, lateral canthal reformation is achieved with a single buried 6-0 polyglactin suture. Deep buried 6-0 polyglactin suture is used to close the lateral canthal orbicularis muscle followed by skin closure with interrupted 7-0 polyglactin suture. (50)
Figure (8): Diagram showing lateral tarsal strip procedure .(51)

Antibiotic ointment was instilled in the inferior conjunctival fornix and suture sites, and a double eye pad was used for a firm dressing for 24 hours. Patients were asked to instill tobramycine eye drops 4 times per day for 3 weeks. Patients were asked to take care not to pull on their lower lid when instilling the drops because it could increase the risk of dehiscence. The first postoperative review in the outpatient clinic was 1 week after surgery. Patients were then reviewed again at 4, 8, 12, and 24 weeks postoperatively.

All patients were followed up for a minimum of 6 months to ensure that the late failures can be detected. Successful surgery was defined as resolution of lid malposition.

3. Results:

A total of 30 patients, 17 males and 13 females, made up the study groups. The mean age of the cohort was 59.15 +\- 6.2 yrs (range 4- 65 years). The average follow up was 24 weeks. The patients were divided into 3 groups :

Group A: 10 patients with bilateral involutional ectropion (20 lids).

Group B: 10 patients with unilateral paralytic ectropion (10 lids).

Group C: 10 patients with cicatricial ectropion 9 unilateral and 1 bilateral (11 lids).

Most common presenting feature was persistent tearing, which was seen in all patients, others included lid laxity, lagophthalmos and unacceptable cosmesis. Thirty-five lids obtained satisfactory correction of eyelid ectropion with a simple LTS surgical procedure, while six lids required an additional intraoperative ancillary procedures to correct the remaining skin laxity, scleral show and residual ectropion. Common ancillary procedures were excision of skin and muscle strip, lateral tarsorraphy and scar revision in severe cicatricial ectropion.

N.B: We excluded the 2 patients with severe cicatricial ectropion (3lids) from the statistical calculations as they gave us abnormal measurements due to fibrosis.

The preoperative tests and measurements were taken and statistically analyzed as follow:

-Lid Distraction test ranged from 14 to 15 mm with a mean of 14.4+\-0.48 mm in group A, and from 14 to 16 mm with a mean of 14.8+\-0.49 mm in group B and from 11 to 13 mm with a mean of 12.2+\-0.39 mm in group C.

-Snap-Back test was positive in all patients as the lids did not snap back except ,after blinking in group A , after forced eye closure in group B, and after multiple blinking in group C.

-Margin reflex distance ranged from 4.0 to 4.5 mm with a mean of 4.25+\-0.25mm in all groups.

-Capsulopalpebral fascia dehiscence signs: A higher resting position of the lower eyelid, inability of the lower lid to follow movement of the globe in down gaze and a deep lower fornix were noticed in all groups.

-Rose Bengal staining test was positive in all groups.

-Six months after surgical correction:

a- Lid Distraction test ranged from 9 to 10 mm with a mean of 9.4 +\- 0.49 mm. The test results were highly significant $p<0.05$ compared to preoperative calculation in all groups.

b- Snap-Back test ranged from 3 to 5 sec. with a mean of 3.8 +\-0.94 sec. The test results were significant compared to preoperative calculation in all groups.

c- Margin reflex distance ranged from 4.5 to 5.5 mm with a mean of 4.95+\-0.36mm. The test results were significant compared to preoperative calculation in all groups.

d- Rose Bengal staining decreased in all groups, indicating good functional results.

Functional and cosmetic success was achieved in 28 patients. No major complications were noted except for pain and tenderness over lateral canthal region, which was short lasting (1week).

4. Discussion

Disorders that alter the delicate anatomy of eyelid margin can have serious effect on comfort and vision. The lower eyelid is analogous to tennis net. The net remains erect and straight because of its horizontal support at the net poles. If the horizontal support slackens, the net sags and is free to flop in to one court or the other depending on the wind. Management of such relaxation aims at restoration of the near-normal horizontal eyelid tone by horizontal lid tightening. Anderson and Gordy originally described the lateral tarsal procedure in 1979. The lateral tarsal strip procedure was found to be particularly useful for lower lid paralytic ectropion, involutional entropion or ectropion, lateral canthal tendon laxity or malposition, iatrogenic phimosis associated with recurrent entropion or ectropion after traditional lid shortening procedures and in elevating the lateral canthus and effectively deepening the fornix while tightening lax eyelids in surgically anophthalmic socket. (1)

In this study we divided 30 patients in to 3 groups according to the etiology of the lower eyelid ectropion, group A: involutional, group B: paralytic and group C: cicatricial.

We used a battery of simple clinical tests to evaluate lower eyelid ectropion in all cases.

The Lid Distraction test changed from 12-14mm before LTS, to 9-10mm, 6 months after LTS, this was highly significant. The Snap-Back test is difficult to quantitate (4). However by using a stop watch we found the test to be reliable and easy to perform. Snap-Back test before LTS in group A was on blinking, and in group B was on forced eye closure, and in group C was on multiple blinking, 6 months after LTS Snap-Back test changed to 3-5 sec. which was significant. Margin reflex distance changed from 4.0-4.5 mm before LTS, to 4.5-5.5 mm, 6 months after LTS, which was also significant. All our cases had extensive Rose-Bengal cojunctival and corneal staining which showed marked improvement in the degree of staining after LTS procedure.

The Snap-Back test reflects the lid elasticity, the Lid Distraction test reflects the overall relaxation and the Rose-Bengal staining reflects the objective ocular surface morbidity. This makes Rose-Bengal testing an important step in the preoperative evaluation of patients with border line lower eyelid laxity which when correlated with subjective complaints could be useful in decision making for surgery and in the evaluation of postoperative results. In our study one patient with involutional ectropion (2 lids) underwent excision of muscle and skin strip along with lateral tarsal strip as an ancillary procedure; one patient with facial palsy (1 lid) needed lateral tarsorraphy. Tarsal strips are an excellent adjunct to skin grafts in cases of cicatricial ectropion. Two patients (3 lids) in our series underwent full thickness rotational skin graft along with lateral tarsal strip.Lateral tarsal strip is relatively simple procedure and complications are rare. The most common complaint of patient is tenderness and mucus discharge at lateral canthal region, which were noted in all our patients during postoperative period. Other rare complications like pyogenic granuloma formation, suture abscess and wound dehiscence were not seen in our series. The patient undergoing lateral tarsal strip should be cautioned not to excessively rub or stretch the tight eyelid in immediate postoperative period and we routinely advise our patients for the same. LTS is a simple technique, which can be used in correcting various eyelid disorders, and renders excellent cosmetic and functional results. The multiple ancillary procedures used in our study are suggestive of a very specific role for lateral tarsal strip as a sole treatment in correcting various types of eyelid ectropion. (1)

Abstract: Thinking dispositions are characterological in nature, and like many human character traits, they develop in response to immersion in a particular cultural milieu. The cultural milieu that best teaches thinking dispositions is a culture of thinking environment that reinforces good thinking in a variety of explicit ways. The effective program for teaching thinking dispositions, therefore, should create a culture of thinking in the educational system. Critical thinking is a desirable outcome; so to develop and practice critical thinking; educators need to re-consider course content and curricular strategies used to develop critical thinking. The study aimed to determine nursing students' preferences of educational strategies and their critical thinking dispositions. This study was conducted at the Faculty of Nursing, University of Alexandria. The subjects of this study consisted of (50%) of the total number of students of each academic level comprising 630 students. The students' total score of critical thinking dispositions had significant relation with nine preferred educational strategies out of twenty four. They strongly preferred the following educational strategies: role play, demonstration, portfolio computer assisted instruction/e- learning and panel discussion. While they moderately preferred the following educational strategies: interactive lecture, case study, questioning and nursing round. Finally, they never preferred written assignment. Based on the finding of this study annual assessment of students' CTDs using the CCTDI is carried to select educational strategies that reinforce the positive dispositions and change the negative and ambivalent ones towards the positive inclination.
[Eman El-Sayed Taha, Zinat Ibrahim El Hawashy, Shadia Abou Donia, and Doaa Demerdash. Preferred Educational Strategies and Critical Thinking Dispositions among Nursing Students. Journal of American Science 2011;7(5):406-416]. (ISSN: 1545-1003). http://www.americanscience.org.

Key words: Critical thinking dispositions, students' preferences, educational strategies

1. Introduction:

Critical thinking dispositions are the affective components of critical thinking. These dispositions are coupled with cognitive skills as essential components of ideal critical thinker. Critical thinking disposition is consistent willingness, motivation, inclination and drive to be engaged in critical thinking while reflecting on significant issues, making decision and solving problems. The Delphi project concluded that critical thinking (CT) as "Purposeful, self-regulatory judgment which results in interpretation, analysis, evaluation and inference as well as explanation of the evidential conceptual, methodological, and contextual considerations upon which that judgment was based. The Delphi study reports that CT includes the dimensions of skills and dispositions. Accordingly, The ideal critical thinker is, habitually inquisitive, well-informed, honest in facing personal biases, prudent in making judgments, willing to consider, clear about issues, orderly in complex matters diligent in seeking relevant information, reasonable in selection of criteria, focused in inquiry and persistent in seeking results which are as precise as the subject and the circumstances of inquiry permit". (Chenoweth,1998; Giancarlo &Facione ,2001)

The concepts of CT and CTDs become a catchphrase among nurse educators today and increasingly important in nursing because it shapes goals in nursing education as well as practice. These concepts are considered as indicators in higher education, the Commission of Collegiate Nursing Education (CCNE) strongly indicated that the development of CT and CTDs should be the top curricular priority in baccalaureate nursing programs. (Rannoevacho ,2000 ; Cauig,2001)

The Joint Commission of Accreditation of Health Care Organizational Standards (JCAHO, 1994) reported that critical thinking is accompanied with quality improvement. Enhancing patient care is a trade mark of the nursing profession and. Surveyors from JCAHO envision that nurses do more than documentary passive observations. Nurses need to take action based on patients' conditions in such a way that management of care involves all facets; exemplify reasoned considerations, constructive thinking and incorporate a particular disposition that leads to favorable outcomes. The process of critical thinking will enhance the ability of nurses to identify clinical indicators, assess their significance and discuss areas for improvement. Both CTDs and continuous quality improvement are seen as never ending processes and outcomes. Hence, a harmonious

relationship exists between the importance of CTDs and how to promote it through a conducive learning environment and the use of educational strategies and the effective quality improvement initiatives. (Bandman & Bandman , 1995; Facione et. al, 1994 ; Alfaro,2004)

There are three sets of factors that may affect students' dispositions toward critical thinking; characteristics of teachers, characteristics of learners and the educational strategies that both teachers and learners apply. Critical thinking is a desirable educational outcome; so to develop and practice CT; educators need to re-consider course content and curricular strategies used to develop CT. (Lee et. al, 2000; Girot, 2000; Seymour et.al 2003; Kawashima & Petrini , 2004)

Gilmartin(2001) ; Banning(2004)stated that critical thinking is a salient feature of the facilitative methods of teaching and learning. Nurse educators who teach nursing need to be familiar with and encourage the use of facilitative methods of teaching and learning, in particular creative educational strategies and the adoption of these teaching and learning approaches can encourage the use of process oriented teaching methods . This will add to the creation of a teaching and learning programme that reduces the dichotomy between professional knowledge and university knowledge.

Caroll (2007) suggested a set of criteria for assessing how well an instructional approach might be expected to teach thinking dispositions. Their view is based on the idea that thinking dispositions are learned through a process of enculturation, rather than direct transmission. Thinking dispositions are characterological in nature, and like many human character traits, they develop in response to immersion in a particular cultural milieu. The cultural milieu that best teaches thinking dispositions is a culture of thinking environment that reinforces good thinking in a variety of explicit ways. The effective program for teaching thinking dispositions, therefore, should create a culture of thinking in the educational system. Such a culture will have the following four elements.

1. It should provide models of good reasoning behavior and providing opportunities for teacher to model reasoning so, students are provided with exemplars of what thinking dispositions look like in practice.
2. The program should provide direct explanations about the purpose, concepts and educational strategies that promote CTDs.
3. A program for teaching CTDs should provide plenty of opportunities for active, reflective and collaborative learning experiences.

4. Lastly, the program should provide plenty of opportunities for formal and informal feedback around thinking dispositions through teacher feedback, peer feedback and self feedback students should learn about the strengths and weakness of their reasoning behavior. Feedback is one of the most powerful ways a culture teaches and expresses its values.

Stewart and Dempsy (2005) identified, benchmarks and guiding principles for best practices that promote CTDs; encourage contact between students and faculty, develop reciprocity and cooperation among students, uses active and reflective learning techniques, give prompt feedback , emphasize time on task, communicate expectations and learning outcomes, respect diverse talents and ways of learning. Moreover, Stewart and Dempsy (2005) identified students' independent learning and self autonomy as the most important guiding principles for promoting CTDs, they identified independent learning as a process in which individuals take the initiative, with or without the help of others, in diagnosing their learning needs, formulating learning goals, identifying human and material resources for learning, choosing and implementing appropriate learning strategies, and evaluating learning outcomes'. They added that educator's role as a facilitator of the learning process is very important.

So, this study aimed to determine the relationship between critical thinking dispositions of the nursing students and preferred educational strategies.

2. Material and Methods
Materials
Research design:
This research is a descriptive correlational design.

Setting:
 This study was conducted at the Faculty of Nursing, University of Alexandria.

Subjects:
The subjects of this study consisted of 50% of the total number of students of each academic level comprising 630 students. First year, n=161; Second year, n=135; Third year; n=144; Forth year, n=190. Subjects were selected using the systematic random sampling method

Tools:
Tool I: California Critical Thinking Disposition Inventory (CCTDI):

The California Critical Thinking Disposition Inventory (CCTDI) (*Facione & Facione, 1992*) was used to determine students' critical thinking dispositions or habits of the mind. The CCTDI is a 75 items likert format tool , each subscale assesses one of the seven dispositions of critical thinking, namely; truth seeking (12 items), open-mindedness (12 items), analyticity (11 items), systematicity (11 items), self confidence (9 items), inquisitiveness (10 items), and cognitive maturity (10 items).

Scoring system:

For each of the seven subscales a student's score on the CCTDI may range from a minimum of 10 points to a maximum of 60 points. Scores are interpreted utilizing the following guidelines. A score of 40 points or higher indicates a positive inclination or affirmation of the characteristic; a score of 30 or less indicates opposition, disinclination toward the same characteristic. A score in the range of 31-39 points indicates ambivalence toward the characteristic.

An overall score on the CCTDI can be computed by summing the seven subscale scores. Overall CCTDI scores may range from a minimum of 70 points to a maximum of 420 points. Similar interpretative guidelines are used when looking at overall CCTDI scores: a total score of 280 points or higher indicates a positive overall disposition toward critical thinking, whereas a total score of 210 or lower indicates the negative disposition towards critical thinking. A score in the range of 211-279 indicates ambivalence toward critical thinking.

Each of the 75 items includes a forced choice six point likert scale ranging from strongly agree (1) to strongly disagree (6). A reversed scoring is allotted to negative statements.

Tool II: Preferred Educational Strategies Questionnaire Schedule (PESQS):

This tool was constructed by the researchers after reviewing the related literature *Gardner (2004) ; Lierman (2004)* to determine the degree of preference of each strategy by every study subject. It constitutes a list of 24 educational strategies in a likert format and a simple description of each strategy. Each of the 24 educational strategies includes a forced choice 4- point likert scale that are categorized and coded as follows; always preferred (4), often preferred (3), sometimes preferred (2) and not preferred (1).

Method

- Permission to conduct the study was obtained from the dean of the Faculty of Nursing; Alexandria University and the head of each

scientific department after explaining the purpose of the study.

- California Critical Thinking Disposition Inventory (tool I) was translated into Arabic and adopted to suit the Egyptian culture by the researcher.

- Preferred Educational Strategies Questionnaire Schedule (PESQS) (tool II) was developed by the researcher after extensive review of related literature. This tool used to determine the degree of preference of each strategy by the nursing students, this part of the tool was developed in the form of structured statements that describe simply each strategy. Students were asked to tick their responses in the likert format to determine the extent of preference of each educational strategy.

- Tool I and II was submitted to a jury composed of 6 experts in the field of nursing from the faculty of nursing staff members. They were asked to judge completeness and accuracy of the content of the tools.

- Reliability of the tool I and II were tested for their internal consistency using Cronbach Alpha reliability test. The coefficient values were 0.869 and 0.726, respectively.

- Subjects were selected using the systematic random sampling method by selecting the fourth name from random lists that were previously prepared by the students' affairs department.

- Pilot study was conducted by the researcher to test the clarity and applicability of the tools on 80 students (20 students from each academic level). Tools were reconstructed and put in its final form.

- The researchers explained the purpose of the study, and then assured them that their responses would be kept confidential. Student's consent to respond to the questionnaire was obtained.

- Data was collected by the researcher, using the questionnaire method over a period of 3 months from the beginning of April to the end of June 2008.

Statistical analysis:

- Data was coded and computerized and statistical analysis was conducted using SPSS version 12.
- Descriptive statistics were done using numbers, percentages, arithmetic means and standard deviations.

- Analytical statistics were done using:
1. ANOVA was used to determine:-

- Significance of differences of nursing students' critical thinking dispositions in relation to their academic level.
- Significance of differences of nursing students' critical thinking dispositions in relation to their last educational experience.
- Significance of differences of the preferred educational strategies among the nursing students of the four academic levels.
- Relationship between critical thinking dispositions and preferred educational strategies among the nursing students.
- The selected level of significance was p 0.05.

2. Cronbach Alpha reliability test; to test the internal consistency of tool I and II.

3. Results

Table (1): illustrates personal and academic characteristics of the nursing students; it can be noticed that nearly one third of the students (30.1%) were in the forth year, about one quarter (25.6%) were in the first year, while less than one quarter (22.9%) and (21.4%) were in the third and second year respectively. The majority of the students (78.1%) were females, while males constituted 21.9%.

Figure (1): shows that nursing students regardless of their academic level showed ambivalent disposition toward the total score of critical thinking dispositions and all critical thinking dispositions subscales (CTDs) except for the inquisitiveness disposition which had the positive level (42.49±6.557).

Moreover, the highest mean score was among students of the four academic levels (N=630) in the inquisitiveness disposition followed by the analycity disposition (42.49±6.557, 39.61±5.379), respectively. Meanwhile, they got the lowest mean scores in the truth seeking and open mindedness dispositions (32.20±5.968, 35.28±5.068), respectively. Also, findings indicated also, that students of the first year got ambivalent level regarding all CTDs except for analycity and inquistiveness dispositions which were in the positive level (40.19±7.25, 40.88±6.55) respectively.

Results indicated the following in relation to the CTDs of the students according to their academic levels; regarding truth seeking and open mindedness subscales; it can be noticed that the highest mean scores were among the first year students (33.34±5.56 and 37.12±5.77) respectively and the differences were statistically significant (F= 6.90 and 15.57) respectively.

Concerning Analyticity, Systematicity, Self confidence, Inquisitiveness, Cognitive maturity subscales and the Total score of critical thinking dispositions; it can be noticed that the highest mean scores were among the forth year students (40.42±5.63, 38.33±5.46, 39.86±5.72, 44.47±6.78, 37.19±6.88, 268.23±25.81) respectively and the differences were statistically significant (F= 8.86, 9.36, 7.91, 15.26, 14.86, 22.90) respectively and P=0.000 for all values.

Figure (2): Presents ranking of the mean percent scores of the total nursing students' preference for each educational strategy as follows: pre clinical conference ($\overline{X}$ %85.5%), nursing round ($\overline{X}$ %= 83.25%), post clinical conference ($\overline{X}$ %= 81.25%), mentoring ($\overline{X}$ %=76.75%), problem based learning ($\overline{X}$ %=76.5%), demonstration ($\overline{X}$ %=74.75%), computer assisted instruction/e-learning($\overline{X}$ %73.5), learning contract($\overline{X}$ %=71.5), questioning($\overline{X}$ %=67.75) case study($\overline{X}$ %67), role play($\overline{X}$ %=67), interactive lecture($\overline{X}$ %=66), seminar($\overline{X}$ %=65.75), debate($\overline{X}$ %=65), panel discussion($\overline{X}$ %=65), portfolio($\overline{X}$ %=63.5), cooperative learning($\overline{X}$ %=62.5), role modeling($\overline{X}$ %=62.5), written assignments ($\overline{X}$ %=61.25), brain storming($\overline{X}$ %=60.75), concept map($\overline{X}$ %=59.75), reflective journal($\overline{X}$ %=59.25), project based learning ($\overline{X}$ %=57.25) and traditional lecture ($\overline{X}$ %=56.25).

Figure (3) illustrates presents mean total scores of CTDS of the nursing students as they significantly relate to the preferred educational strategies. The students' total score of critical thinking dispositions had significant relation with nine preferred educational strategies out of twenty four. They strongly preferred the following educational strategies: role play, demonstration, portfolio computer assisted instruction/e- learning and panel discussion. While they moderately preferred the following educational strategies: interactive lecture, case study, questioning and nursing round. Finally, they never preferred written assignment. F value ranged between 4.36 and 14.55 and p value ranged between 0.00 and 0.01. On the other hand, There was no statistical significant relationship between the students' total score of critical thinking dispositions and their preference to written assignment

Table1: Personal and Academic Characteristics of the Nursing Students

Characteristics of Nursing Students	N N = 630	%
Academic level		
First year	161	25.6

4. Discussion

Nurse educators have the challenge of providing students with an education that prepares them for the future marketplace. Critical thinking is a valued educational outcome. Therefore, nurse educators agree that critical thinking is an integral component and essential competency for the professional nurse in today's ever changing health care environment.

Gardner (2004) identified that the education of good critical thinkers includes the fostering of critical thinking dispositions (CTDs), these dispositions are described as the consistent internal motivation to problem solving and decision making by using thinking.

The results revealed that the nursing students mean scores were high in analyticity and inquisitiveness, compared to truth seeking and open mindedness; these findings are consistent with (Mc Carthy ,2001; El Hessewi,2003). These indicate that the nursing students have the disposition of being alert to potentially problematic situations, anticipating possible results or consequences, prizing the application of reasons and the use of evidence if

the problem in hand turns out to be challenge or difficult.

Interestingly, the results showed also, that the nursing students mean scores were positive in inquisitiveness, which refers to the person's intellectual curiosity and desire for learning. The inquisitive person is eager to learn more, he/she is one who wants to know how things work and values learning even if the immediate pay off are not directly evident. These results were supported by Redding ,1999) who considered up-to-date knowledge as an important component of critical thinking .The nursing students curiosity to broaden their knowledge base become a must when evidence based practice based on standards is applied. Another reason that motivates the nursing students to look for knowledge and to strengthen their scientific base is their intense need to improve their image in the health care field as the knowledge base provides the students with sense of empowerment.

Regarding the CTDs of the nursing students in relation to their academic level; as, regards truth seeking which is the courageous desire for the best

knowledge even if such knowledge fails to support or determine one's preconceptions, beliefs or self interest. The mean score of this dispositional characteristic was the highest among the fourth year students. This finding is consistent with the finding of (Lee et al. ,2006) in their study to examine critical thinking disposition in baccalaureate nursing students.

Findings of this study was supported by those of (McCarthy et al.,1999; Bartlett & Cox ,2000, Tiwari et al. ,2003; Profetts-McGrowth ,2005;Shin et al. ,2006), these findings revealed that seniors got the significantly highest mean of the overall CCTDI. In contrast, findings of (El Hessewi, 2003 ; Brunt. 2005; Ward ,2006), where the senior level students got the lowest mean of total score of CTDs.

In relation to, the relationship between critical thinking dispositions (CTDs) and preferred educational strategies among the nursing students; numerous components of critical thinking (CT) are involved in the development of valued educational strategies. Educational strategies that promote CTDs are never simple and require careful planning. They entail highly complex performances of observation and analysis, reading and interpretation, question and answer, conjecture and refutation, proposal and response, problem and hypothesis, query and evidence, individual retention and deliberation…these educational strategies command student vigilance which in turn causes learners to feel highly visible in the educational environment and students become active, reflective, interactive and independent. Learners also are accountable not only to teachers but also to their peers in their responses, arguments, commentaries and presentation, they are also accountable to themselves through their self reflection. (Shulman, 2005)

As for the interactive lecture; findings revealed that there were significant relationships between the nursing students' total score of CTDs and the nursing students' preference of the interactive lecture. (Oerman ,2000), clarified that the interactive approach during the lecturing method encourages students' CTDs, he explained that, during the interactive lecture a combination of educational methods are used according to the nature of the topic being introduced; discussion, questioning, short case analysis, concept map, story based discussion, and book end approach.

As regards role play, case study and demonstration, as a simulation educational strategies; the results showed that there were significant relationship between the total score of CTDs. (Welthew (2004), identified role play, case study and demonstration as the most important types of simulation used to educate nursing students. (Linden

(2008) in her study of "the effect of clinical simulation and traditional teaching versus traditional teaching alone on critical thinking of nursing students" explained that simulation meets the standards for interactive, student – centered learning that stimulates CTDs. Moreover this strategy has been prescribed in nursing education as part of the education redesign.

Moreover, (Amerson ,2005; Samuel ,2006) explained that during interactive lectures, students are required to actively engage in the learning process, a great opportunity is allowed for students to discuss with each others and to explore alternate perspectives and examine different decisions to arrive at reasoned judgments. So, possessing open mindedness is a command for these interactions and collaborations.

The results revealed that there were significant relationships between the total score of CTDs, and their preference of the questioning strategy. On this track of usefulness of the questioning technique , Webber et al. (2002) stated that, nursing education builds on information from courses with proven methods that espouse learning (such as questioning and other interactive techniques which encourage the adult learner). Memorizing facts is not critical thinking, however, taking information into a global perspective by analyzing and evaluating the data, gives insight as to the nature of the problem/ question that will then evoke a solution / answer.

The results showed that there were significant relationship between the nursing students' total score of CTDs and their preference of portfolio. These results are supported by Grant et al. (2007) who stated that portfolio enable students to gather evidence of learning via a series of tasks and the information documented arises from learner's learning experience, such students follow the reasons and evidences are truth seekers. Furthermore, Driessen & Vermunt (2003) ,clarified that the component tasks of the portfolio should be organized to meet intended learning outcomes. Students tend to use their systematic thinking in order to accomplish their tasks in the required manner. Through portfolio, the future developmental needs can be identified and organized. Tiwari et al. (2003) ; Ghallab (2008) opinions supports the relationship between analyticity and open-mindedness and portfolio. The work controlled in the portfolio provides material for the student to review their learning. It also, provides full picture on how students analyze, produce, and create. In addition, students interact on intellectual emotional and social levels with others, they listen to each other, ask their peers about their opinions in their work. Another benefit for the portfolio is raising students self confidence because it measures students progress in their accumulated work.

As for computer assisted instruction (CAI)/e- learning; the results presented significant relationships between the nursing students' open-mindedness and analyticity and their preference of this strategy. Meyer (2003) ; Ahmed (2008)stated that" as faculty members struggle to determine how to use new technologies in education appropriately; they must grapple with understanding the advantages of online or computer assisted activities. Curtis & Lawson (2001) found evidence from the literature on successful collaborative learning in online discussions. They reported in their study that, students experienced greater cognitive and explanatory learning.

The results presented that there were significant relationships between the nursing students' total score of CTDs and their preference of nursing round. These results are reasonable, Elliot and Waldock (2008) in their study "round: an approach to nursing development" reported that successful round should constitute of three basic constituents; engagement, team building and knowledge appreciation.

Furthermore, Morsy (2004) stated that nursing round demands students to possess analyticity in order to analyze the patient condition and systematicity in order to organize the communication or intervention according to the purpose of the round.

Finally, there was no statistically significant relationship between total score of CTDs and written assignment. That results explained by Fazarro et.al (2009) that the written assignments in enthusiastic design in the clinical nursing experience must considered as nursing students spend prolonged hours in the practical sits practicing psychomotor skills and attending lecture classes and participating in seminars and clinical conferences, so after completing the schools day they becomes very exhausted.

From that context CTDs is a desired educational outcome; so to develop and practice CT, educators need to reconsider educational strategies that had significant relationship with the students CTDs and are in accordance with their preferences. Nurse educators need to be familiar with and encourage the use of facilitative methods of teaching and learning that not only prepare the nursing students with the substantive knowledge necessary for competent practice but also, create an environment in which students learn to think critically, practice reflectively, learn independently, work effectively in groups and access and use new information to support their practice that will in turn decrease the dichotomy between professional knowledge and university knowledge. However, such a shift in what has been traditionally revered in nursing education creates tensions and challenges such as: students' resistance to new methods, classroom straights and role confusion, here the role of faculty arises to overcome these difficulties. In this respect the Faculty of Nursing – Alexandria University considered promoting students CT as one of the most important strategic objectives to be a unique privilege for joining the Faculty.

5. Conclusion and Recommendations

The following are the conclusions derived from findings of the present study:
The CTDs of the nursing students as arranged in descending orders are: inquisitiveness, analyticity, self confidence, systematicity, cognitive maturity, open mindedness and truth seeking.

The nursing students' total score of critical thinking dispositions had significant relation with nine of the preferred educational strategies out of the twenty four; the students strongly preferred the following educational strategies: role play, portfolio, computer assisted instruction/e- learning , panel discussion. While they moderately preferred the following educational strategies: interactive lecture, questioning case study and nursing round. Finally, they never preferred written assignment.

Based on the findings of the present study, it is recommended that; annual assessment of students' CTDs using the CCTDI is carried to select educational strategies that reinforce the positive dispositions and change the negative and ambivalent ones towards the positive inclination. Also, longitudinal study that evaluates students' critical thinking dispositions throughout the four years of the nursing program to determine the developmental process of CTDs.

Effects of strengthening adult education in agricultural development

[1] Ali Badragheh, [2] Mohammad Abedi

[1, 2] Department of Agricultural Extension and Education, Varamin Branch, Islamic Azad University, Varamin, Iran
*Corresponding author: abedi114@yahoo.com

Abstract: adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones. Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture. Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

Introduction:

Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Kentucky's capacity to raise the state's per capita income, improve the quality of life of its population, and develop a competitive economy, depends fundamentally on the state's ability to increase the population's educational level. Progress is needed across all of Kentucky, not just some of Kentucky. The social, economic, and political costs of growing disparities between the haves and have-nots are unacceptable. To maintain its current standing relative to competitor states, Kentucky must make progress. Extraordinary progress will be necessary for Kentucky to improve its competitive position relative to neighboring states and the most progressive states in the nation. To be successful, the Commonwealth's strategies must energize and gain the commitment of all the state's political, education, business, and civic leaders. No strategy will succeed unless it engages leaders in each community and county to identify needs and develop programs and services appropriate to the community's unique circumstances. The most serious challenge will be to motivate low-skilled, under-educated adults within the working age population to seek further education. Simply expanding the number of providers and programs will not necessarily increase demand from the populations and communities where the needs are greatest. Deepseated social, economic and cultural barriers—many dating back generations—lead people to undervalue education. In addition, in many counties it is difficult for people to see a direct relationship between better education and better-paying jobs. Either there are no jobs available or many existing employers do little to emphasize the connection between better education and the possibilities for getting a job, keeping a job, or earning a higher wage. For many, getting more education and earning a high school diploma or a college degree has little positive meaning. only the negative consequences are obvious: getting more education often means leaving one's family and community for jobs and opportunities for advancement somewhere else. The future of Kentucky depends on uplifting the quality of life and economy of all of Kentucky. The social and economic costs of neglect of large parts of the state will drag down the rest of the state and seriously hinder its capacity to compete in the global economy. Much like strategies to curb epidemic, strategies to reduce illiteracy and raise the educational attainment of Kentucky's population must include both short-

term efforts to face the immediate crises as well as long-term strategies to get at the underlying causes. Short-term crises include the imperative to keep helping welfare clients make the transition from welfare to work within the constraints of federal and state mandates and the need to train workers for immediate employer demands. Long-term prevention must address the underlying, persistent problems of the state's economic structure as well as the low awareness--if not appreciation--among segments of the population of the vital connection among education, employment, and improved standards of living.

Adult characteristics:
to understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.
Operating speed:
slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due to weakness and increased awareness of natural forces and their skills.
Consciousness:
 no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability (which varies with the speed of learning) is not relevant.
Health:
 what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.
Background of knowledge - skills and beliefs of adults:
adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

Ways to Strengthen Adult Education

1- Create a culture that supports adult study
1. Communicate that learning is intrinsic to faith development. Lift up ongoing study, including adult education, as an essential function of any Christian community.
2. Reinforce the expectation of study participation from the pulpit and with new members.
3. Make Bible study a part of other church activities such as committee meetings and mission activities.
4. Use scripture meaningfully in worship. Don't assume your worshippers know the context of the passages read. Use sermons as an opportunity to teach the Bible.

2- Offer a variety of formats, schedules, and approaches
5. Experiment with a variety of times -- Sunday morning classes, weeknight groups, retreats, oneday events, and breakfast-hour or noon-time classes – depending on lifestyles in your congregation.
6. Consider scheduling some classes or small groups in homes or other community locations. Christian education doesn't happen only in church buildings.
7. Start new studies and groups often. Despite their best intentions, ongoing groups have a tendency to become cliquish. Newcomers are far more likely to feel comfortable joining something new.
8. Have as your goal a Bible study program that exposes church members to the entire biblical witness over time.
9. Recognize different learning styles among individuals and age groups. Older folks tend to be most comfortable with traditional classroom structures. Boomers are inclined to question authority and enjoy discussion. Younger persons are more accustomed to media and technology and prefer a fast-paced, informal style.
10. Make use of a variety of different approaches, including lectionary-based studies, topical studies, character studies, etc.
11. Incorporate different learning strategies, such as role playing, dramatization, guided meditation, even memorization.
12. Churches too small for a large number of groups can vary their approach by rotating different studies and curricula with groups.
13. Don't teach "about" the Bible in a way that doesn't allow people to encounter the texts for themselves. Encourage individual reading or make it part of the group's time together.
14. Encourage active, discussion-based learning. Break into small conversation groups frequently.
15. Allow for diversity in perspectives.

16. Encourage the use of a variety of different biblical translations. Those less experienced in Bible study may find it helpful to read from a paraphrase.

3- Meet people where they are

17. Acknowledge biblical illiteracy among many adult church-goers – even the well-educated – and strive for methods that straddle this paradox.

18. Recognize that some beginners will be turned off by "homework." Use videos, in-class readings, dramatizations, or audio tapes as alternative ways of getting everyone "on the same page" and ready for discussion, all the while encouraging the habit of daily scripture reading.

19. Provide short-term classes for those who won't commit to a long-term study or ongoing class, but make these short-term learning experiences "stepping stones" toward greater involvement.

20. Conduct "taster" classes for those who want to try out the experience before they commit to it. Select topics that will appeal to those new to Bible study.

21. Break an ongoing class into shorter, defined segments, each with a clearly identified focus. With each new segment, take the opportunity to publicize the topic and invite newcomers.

22. Teach stewardship of time to counteract "busyness." Just as with financial stewardship, persons need to be encouraged to make Christian education a priority. Encourage "first fruits" commitments of time.

23. Be clear about expectations with regard to attendance, participation, and preparation.

4- Promote participation effectively

24. Link group study topics to sermon series and encourage participation from the pulpit.

25. Emphasize study during Lent. Select a topic or curriculum for church-wide study during this period and encourage all to take part. Tie the topic into preaching and worship.

26. Lift up study leaders and participants. Celebrate every time a new group starts or completes a study program. Use the newsletter, a photo board, or a dedication service in worship.

27. Ask class members to write a newsletter article or testify about the significance of their learning experiences.

28. Remember that personal invitations are usually the most effective way of getting someone involved in any activity.

29. Capitalize on the current popularity of book clubs and films by creating opportunities for those who enjoy these activities. Check out "Reel Time" from Cokesbury.

5- Foster strong leadership

30. Recruit leaders as the first step toward forming groups. Groups will often form around a gifted leader.

31. Stress the group leader's role as facilitator, rather than teacher. Setting up one person as "the expert" creates a poor group dynamic and discourages new people from stepping into leadership. Thinking of group leaders as facilitators allows Scripture and the Holy Spirit to do the teaching.

32. Expect your pastor to model the importance of ongoing adult education by leading and participating in study, but don't reinforce the notion that only the ordained can lead study groups.

33. Take advantage of the leader training opportunities provided in conjunction with many popular study curricula.

34. Provide orientation and ongoing support for group leaders.

35. Train leaders in group process so they can keep their groups on track, being sensitive to the need to keep more outspoken participants in check and draw out the more reserved using phrases like, "Let's hear from some of the others," or "You look like you have something to say."

36. Emphasize the importance of leader preparation, especially mapping out discussion questions in advance.

37. Encourage team leadership. Experienced leaders should invite a newer person to pair with them in leading groups to develop the less experienced leader.

38. Rotate the leadership responsibility within a group so that all participants get experience leading sessions.

39. Know that Sunday School classes and small groups are one of the best places to develop lay leaders and lay relationships that strengthen the church.

6- Use resources effectively

40. Stay abreast of new resources, including those available from other denominations or traditions and the secular press.

41. Don't be afraid to introduce ideas and resources from a variety of theological perspectives. Trust the discernment abilities of individuals and the group.

42. Use workbook-style studies creatively. Nothing is more boring than a lesson read straight out of a leader's manual. Find ways to make pre-packaged lesson plans come alive.

43. Use videos to bring expert perspectives to bear and to get everyone "on the same page" for discussion. But avoid class sessions that are no more than viewing a video, or participants will soon

wonder why they shouldn't stay home and watch their own TV.

44. Create a resource center with reference materials, maps, and other items to support your leaders and participants.

45. Don't allow your church library to become a museum. Update the collection. Offer books and resources linked to sermon topics and congregational study themes.

46. Consider a book sales kiosk and stock it with things you'd like your congregants to be reading. Many busy people would rather buy a book than worry about due dates and library fines.

7- Stress spiritual formation

47. Remember, the goal is formation, not information. Every class should be deliberate in helping members accept God's grace, grow in faith, deepen their relationship to the Christian community, and answer Christ's call to discipleship.

48. Include prayer as part of every study session and encourage group members to pray for one another daily.

49. Encourage a covenantal relationship within study groups.

50. Nurture a sense of Christian community and connectedness within groups. A Sunday School class or small group can be a "home" for individuals within a larger church.

Conclusion:

Adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones.

Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture.

Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

Successful adult education programs develop and utilize an Agricultural Education Program Advisory Committee to assess the informational needs of adults in the community. Agriculture teachers should utilize the expertise and communications link, which an effective advisory committee provides. Specifically, the advisory committee should be asked to provide advice regarding planning, conducting, and evaluating the adult education program in agriculture. Adult education programs in agriculture should emphasize practical application of the information presented. Topics and information included in adult programs should be provided which fulfills needs of the local community. Providing information which cannot be applied to solve a local problem or address a local issue will generally be viewed as frivolous and over time will result in decreased interest (i.e. participation) in the adult education program.

The role of the agriculture teacher should be as a facilitator of the learning process. Most adults reject the traditional teacher-student relationship, which is necessary to maintain in secondary programs. Teachers should be encouraged to view themselves as partners with adult participants in the learning process. The democratic philosophy of shared responsibility for planning, conducting, and evaluating adult education programs distinguishes adult education from secondary education.

A local plan for adult education in agriculture should consist of two major components. Namely, a broad statement of philosophy, goals, and objectives of the local adult education program, and an annual calendar of program activities.

Adult education in agriculture is important for continued community prosperity, growth, and improvement.

The local Agricultural Education program has a responsibility to provide up-to-date information, training, and retraining for all adults interested in agriculture.

The goals of the Adult Education Program are:

1. To assist adults in establishing personal and business goals.

2. To enhance the self-confidence and decision making skills of adults in agriculture.

3. To develop agricultural leaders.

4. To maintain the local agricultural knowledge and technology base.

5. To improve the home, living, and business conditions of persons employed in agriculture.

6. To encourage adults to participate in cooperative efforts.

The objectives for the local Adult Education program are:

1. To increase the net farm income of local agricultural producers.

2. To improve the safety practices of adults employed in agriculture in the local community.

3. To educate the public about the significant role in agriculture in the local economy.

4. To encourage the use of practices that protect and conserve natural resources to maintain a good environment for everyone.

5. To assist local producers in the development of marketing plans that are tailored to their individual needs.

6. To assist local producers in developing strategies to make optimum use of agricultural support agencies (e.g. FSA, MO Department of Agriculture).

A comprehensive program of adult education in agriculture includes three major components: (a) organized instructional classes for adults, (b) a Young Farmers/Young Farm Wives Chapter, and (c) Farm Business Management Analysis (FBMA). State Agricultural Education Program standards implemented in 1992 indicate that a minimum of 20 clock hours of organized adult education classes be provided. Many local agriculture programs will far exceed this minimum standard. Salary reimbursement Procedures for "Full Time" and Short Term adult programs are.

Evaluation of Canopy Cover of Street Trees in Urban Forests Using by Satellite Data

Seyed Armin Hashemi[1]

[1.]Department of Forestry, Lahijan Branch, Islamic Azad University, Iran.
hashemi@iau-lahijan.ac.ir

Abstract: Information on structure of city forest such as species composition and canopy cover density is a prerequisite for planning, design and management of vegetation in cities in local and regional scale. For this purpose in present study, different inventory methods Including 100% inventory by using 20meters transects and aerial images (1:8000 scale) and spot satellite image were compared for evaluating canopy cover surface of street trees with 1 kilometer length is Sep2009 , to develop an optimum and suitable method to evaluate canopy cover of these trees. In 100% inventory considered as the basis for comparing with various methods, canopy surface of these trees was calculated in each 15m transect. Results of paired –T test indicated that results of 100% inventory and aerial photos ($p = 0.52$, $t = 0.809$, $df = 23$) and satellite image ($p = 0.48$, $t = 0.847$, $df = 23$) don't differ significantly. Regression results indicated that using aerial images ($R^2 = 0.92$) and spot images ($R^2 = 0.89$) is relevant to evaluate street trees canopy cover.
[Seyed Armin Hashemi, Department of Forestry, Lahijan Branch ,Islamic Azad University, Lahijan, Iran. Journal of American Science 2011;7(5):423-426]. (ISSN: 1545-1003). http://www.americanscience.org.

Key words: canopy cover, street trees, inventory, aerial photograph, spot images.

1. Introduction

City forests are considered among important elements and components of civil ecosystems. Since trees are considered as most important index of civil landscape (Gary and Geff,2005) , it's necessary as first step for landscape sustainable development to recognize and record information about civil trees , so that based on collected data analysis , planning needed to maintain and develop landscape being performed. (konijnendijk etal., 2005 , white, 2002).Information on structure and function of civil forests is necessary to increase advantages and decrease costs of management related to civil forests (wood , et al., 1999). Information helping better management of civil forests are including canopy cover surface , tree and shrub coverage percent , percentage of coverage afforested in the city, percent of land various covers , tree and bush species available in the city and required data in single – tree surface including species , mean diameter at breast height , cutting. Surface, tree height, canopy height, canopy width, fresh and dried foliage rate . While it seems that most civil foresters are managing a valuable capital but they aren't aware of their wealth and the number of trees in what area they are managing and they don't know there what species of trees in what extent in the city. In some cases will cause negligence in optimum management of these resources (ward & Johnson, 2007). To take inventory of street trees modern complex methods such as

100% inventory, using aerial photos. Satellite images, computerized techniques or simpler methods like. Evaluation from inside the car and other different sampling can be used. However, using inventory techniques in different conditions is dependent on the goal of inventory method, and the method used must be evaluated in respect of accuracy and spent cost. Several studies have been performed on inventory method from urban forests. Indian Inventory Institute used two stage methods to define coverage of tree outside of the forest.

By using obtained results suggested random classification method for inventory method from trees outside of the forest. studied various techniques to define optimum method to evaluate canopy cover of street trees by using GIS technique (Geographic Information system) and results indicated that 100% inventory method or sampling in GIS medium may be suitable with low time and cost spent to evaluate street trees(wood et al., 1999).

Currently , with development of remote sensing data with high local resolution power most problems of urban planning and management have been solved. Many studies have been performed by using aerial photos and satellite data such as spot in evaluating canopy coverage of urban forests (Coillie et al , 2007 , zhang et al., 2007 , Jensen & Hardin , 2005 , Goetz et al. , 2003 , Freeman & Buck , 2003).

In present study, function of aerial photos and spot images was studied to provide street trees canopy cover map and its results were compared to 100%

inventory method in respect of accuracy and spent cost. This study aims to compare accuracy and costs of evaluating street trees canopy cover on aerial photos and spot satellite images to 100% inventory method and developing a suitable inventory method to evaluate street trees canopy surface. So that it could be possible to develop an optimum and suitable technique for evaluating street trees canopy cover and management of these valuable resources.

2. Material and Methods

The Study area is located in district of Rasht with 49º 36´27" - 49º 36´ 39" E Longitudes and 37º15´ 47" - 37º 15´ 44" N altitude including street trees of both sides of street .It has been studied in Sep 2009.

Trees of this region are planted with 3 ± 1.1 average spaces from each other. These trees are in more unsuitable conditions due to construction and light shortage and most of them are dried or drying. Canopies are in unusual conditions due to their closeness to each other and they become ellipsoid most trees canopy have been inclined toward the street.

Different inventory method techniques used to evaluate canopy area and their methods are including:

Inventory method:

In studies performing to compare various inventory method techniques, firstly studied community is inventory method by 100% inventory and those techniques will be evaluated through comparing obtained results of various sampling methods and their actual rates (100% inventory method). In present study also 100% inventory method technical has been used as a basis to compare various methods to evaluate canopy cover area.

Firstly after square turn, street length divided to 20 m bands. Total number of bands taken in both sides of the street was 25 transects that according to length of transects; it has been measured 500 m totally.

In this method large and small length of tree canopies were measured by tape – measure. Equation 1 was used to evaluate canopy area. To obtain total area of transect canopy, canopy area of transect canopy, canopy of trees located in each transect was summed. Finally, mean, standard deviation and total area of canopy were calculated.

$A = (D_1 /2) \times (D_2 /2) \times 3.1415$ (1)

A = tree canopy area (m^2)

$D_1 =$ Small diameter of tree canopy (m)

$D_2 =$ Large diameter of tree canopy (m)

Aerial photographs:

Aerial photographs taken in last aerial photograph method from Rasht in 2009 with 1:8000 scale by Army forces geographical information organization were used to obtain canopy cover in each transect . Firstly these aerial photographs were geometric corrected using 1 : 2000 maps in software ERDAS IMAGINE 8.4 with 0.4 RMse.

Then limit of studied region was mapped on them and implemented on studied limit by using ArcGIS 9.2 software. Amount of canopy surface was defined in each transect by using ArcGis9.2 through digitalization of tree's canopy cover surface. Mean and standard deviation of total area in aerial photographs were calculated after measurement of total surface of transects and its transformation to 11.5, SPSS medium (Table 1).

Spot image

In this technical, raw photographs of spot satellite purchased by municipality geographic information center were used. Spot detail takes photographs (multi spectrum) with 4 bands (green, red , near infrared and mid infrared) with 10 meters resolution power and panchromatic with 2.5 meter resolution power (Dial et al., 2003) . Spot photograph has been under geometric correction through image by image technique with aerial photograph in ERDAS IMAGEINE software medium with 0.2 RMSe. (Goetz et al., 2003). ArcGIS software was used to define transects and tree canopy surface size in photographs. Then by digitalization of tree's canopy cover surface, canopy cover rate in each transect was calculated in GIS medium (Breisgau , 2003 and Dwyer & Miller , 1999).

Obtained measurements were transformed to 11.5 SPSS medium. Then mean and standard deviation of total area of transects were evaluated. And also paired t – test and regression relations were calculated. It is worth mentioning that when implementing each method, time and cost of each utilized method were recorded.

3 Results:

Results including total area , mean , standard deviation , standard error , standard error percentage and total cost spent in each method are given in table 1.

Data normality was studied using kolmogrov – Smironov test so that data was normal. Paired t – test were used to compare obtained areas from land 100% inventory method, aerial photos and satellite images. Results of paired t-test between 100% inventory method and aerial photos (p = 0.52 , t = 0.809 , df = 23) and satellite image (p = 0.48 , t = 0.847 , df = 23) indicated that obtained data don't differ significantly

from 100% inventory method so that figures represent this fact (Figure 1and 2) . Results of regression analysis indicated that aerial photos and Spot images respectively with 92% and 89 clearing coefficient indicate that it is possible to evaluate canopy cover surface of street trees with high accuracy using dada utilized in present study (Table 2).

Table 1. results obtained through various methods.

Inventory methods	100% inventory method	Aerial photograph	Spot image	Aerial images difference to land reality	satellite image different to land reality
Total area	4145.34	4093.45	3870.16	52.9	275.17
Average area of transect	140.78	142.65	137.1	2.1	3.6
Standard deviation (m^2)	15.3	12.36	11.40	2.94	3.9

Table 2. prediction model , regression coefficient , significance late.

Technique	X Model	R^2	Significance rate
Aerial photo	Y=1.065x-12.02	0.92	0.001
Satellite images	Y=0.788x+19.78	0.89	0.002

y = canopy cover area in 100% inventory method
x = canopy cover area in aerial photos and satellite images.

Results of costing indicated that method of evaluating canopy cover area of street trees from satellite images spends lowest cost rate so that cost spent for 100% inventory method is respectively 6.5 and 34 times higher than costs spent to evaluate canopy cover surface in aerial photos and spot satellite images. While costs spent to evaluate street trees canopy cover in aerial photos is approximately 5 times higher than costs of spot images.
Function in evaluating street trees canopy cover. Thus these two technique were studied in respect of spent cost and time to find suitable method in respect of spent cost.
Figure.1 Relationship between canopies covers area estimate in aerial photos and 100% inventory .
Figure.2 Relationship between canopies covers area estimate in satellite image and 100% inventory

4. Discussions

According to performed calculations , street trees canopy cover evaluate method by using Spot images spent lowest cost rate and had acceptable accuracy. Thus inventory taking from street trees may be used in wide range of big cities. According to this fact, method with lowest spent cost and highest accuracy is optimum technique. Therefore, consistent to results, evaluate of street trees canopy cover evaluation from aerial photos and Ikonos satellite images has highest accuracy (Akbari et al.,2003)
Aerial photos with lower spent cost and time obtain better results compared to 100% inventory technique and can be suitable.
And they may be suitable alternative for territorial inventory technique to calculate canopy cover (Goodwiny , 1996). But it must be noticed that powerful processing systems are required to interpret

aerial photos in wide level in big cities, and corrections required before interpretations in wide level are time – consuming and expensive. Nowadays, according to rapid changes of land uses in urban areas, updated information on street trees canopy cover is needed to be aware on its changes in short – term. Aerial photos with consuming great cost and labor are provided in 10 years periods in Iran. Then according to the fact that satellite images are taken in short – term periods and show changes of land surface , they may be used as suitable tool to supervise changes in street trees canopy surface. While using satellite images with high resolution power such as IKONOS and Quick bird provide us the possibility to utilize them in management of urban forests with lower time and cost consumption compared to aerial photos taken in longer period.

Based on results of present study it could be recommended that it is rational to use aerial images to evaluate tree's canopy cover in small surfaces with high accuracy.

Anionic Schiff Base Amphiphiles: Synthesis, Surface, Biocidal and Antitumor Activities

Nihal O. Shaker; *Fatma H. Abd El-Salam; Bahyia M.El-Sadek; Eman M. Kandeel and Sharbat A. Baker

Chemistry Department, Faculty of Science (girl's branch), Al-Azhar University, Nasr City, Cairo, Egypt, B.O. 11754
*prof_drfatma@yahoo.com

Abstract: A series of anionic surfactants containing schiff base group was synthesized and their chemical structures were confirmed using elemental analyses, FTIR, ^{1}H-NMR, and mass spectroscopy. The surface activities of these amphiphiles were determined based on the data of surface tension. Thermodynamics of adsorption and micellization processes of these surfactants in their solutions were also calculated. It was found that these compounds have tendency towards adsorption at the interface and also micelle formation at lower concentrations.Also, these schiff bases amphiphiles have been evaluated for their biocidal activity against bacterial and fungi species and their antitumor activity against three human tumor cells such as HEPG$_2$ (liver), HCF$_7$ (breast) and HCT116 (colon).

Keywords: Schiff base amphiphiles; surface activity, biocidal activity; antitumor activity; potent action.

1. Introduction:

Schiff bases are one of the important classes of organic compounds which have many interesting properties and extensive applications in medicinal, agricultural, pharmaceutical fields and material science (Cerchiaro *et al. 2005,* Vancoa *et al.* 2004, Marcell *et al.*2009, Nabel and Mohamed 2008). Schiff bases are characterized by the –N=CH– (imine) group which is important in elucidating the mechanism of transamination and racemisation reactions in biological systems (Lau *et al.* 1999 and Shawal *et al.*1985). Due to the great flexibility and diverse structural aspects, a wide range of Schiff bases have been synthesized. Now days, there is a large number of research on Schiff base amphiphiles have already been published. The most ones were used as corrosion inhibitors and crude oil spill dispersants (Aiad et *al.*2009, Negm *et al.*2008, Hegazy 2009, Negm *et al.*2009, Nabel *et al.* 2008 ,Atta *et al.*2008, Atta *et al.*2008 and El-Saeed *et al.*2008

Schiff bases are considered good bases for synthesis of several antibacterial compounds due to their easily preparing procedures and their ability to attach to several functional groups on their chemical skeleton. The schiff bases were essentially appeared antibacterial influence against most of bacterial strain, and their resistance routes against different types of bacteria is based on using efficient biocides. These biocides are either cationic, ionic compounds or metal complexes. A literature survey showed that Schiff bases and their metal complexes have biological application including antibacterial (Abdallah *et al*.2009, Nabel *et al.*2008, Nabel *et al.* 2010, Nair *et al*.2006, Raman *et a*l.2003 and Mohamed 2006), antifungal and antitumor activities (Karthlkeyan *et al.*2006 , Gaballa *et al.*2007 , Sinha *et al.*2008 , Weber *et al.*1988 and Baihalli *et al.*2008).

Our study aimed to synthesis some Schiff base surfactants from condensation of three amines with 2-alkoxy benzaldehyde having hydrocarbon chain length ranged from C$_{12}$ to C$_{18.}$ .The prepared compounds were tested for being surface, biocidal and antitumor activities.

The synthetic route, chemical structures and abbreviations of these surfactants are shown in scheme 1.

2. Experimental:

All chemicals used in the present study were of Analar or highest purity grade from BDH, Aldrich and Merck companies and used as received without further purification. FTIR spectra were recorded on a Perkin–Elmer 1420 spectrometer and a biorad FT57 (KBr).A brucker model DRX-300 NMR spectrometer with TMS as an internal standard for ^{1}H-NMR spectra was used. Mass spectra were recorded on a Joel JMS-AX 500 (ET and FAB) $^+$. The elemental analyses of the synthesized materials were performed using a vario Elementar instrument for elemental analysis.

2.1. Synthesis of Alkyl Chloride:

Alkyl chlorides were synthesized according to a method reported elsewhere (Weil *et al.*1960).

2.2. Synthesis of 2-Alkoxy Benzaldehyde (AB):

Salicylaldehyde (20 mmol) was dissolved in methanol (30 ml) containing potassium hydroxide (23 mmol) and the reaction mixture was refluxed under nitrogen atmosphere for 2h. A methanol solution containing (30 mmol) of alkyl chloride was added drop wise to this mixture and refluxed for 20 h under nitrogen atmosphere, scheme 1. The solution was concentrated to dryness to give 2-alkoxy benzaldehyde, AB as red brown viscous oil. The crude product was washed by a mixture of light petroleum; ethyl acetate: chloroform (30: 1: 5 v/v/v)

afford AB-12, AB-16 and AB-18 as very viscous liquid (65-80%), Table 1. IR spectrum (AB-12): 721-756 cm^{-1} (Ar-nucleus), 1161 (C–O–C), 1732 (C=O), 2857 and 2923 cm^{-1} (CH$_2$ and CH$_3$ of fatty chain). ^{1}H-NMR (CDCl$_3$, MHz): 0.85 (t, 3H, CH$_3$); 1.04-1.43 (m, 22H, (CH$_2$)$_{11}$); 3.4-3.6 (t, 2H, OCH$_2$); 6.41-7.53 (m, 4H, Ar) and 8.26 (s, 1H, CHO). FAB- MS (m/z): 290 (M$^+$, 57%).
Scheme 1: Synthetic Route of Schiff Base Amphiphiles.

2.3. Synthesis of Schiff Bases Amphiphiles:

Different alkoxy schiff bases were synthesized by the condensation reaction of amines, namely: glycine, anthranilic and sulfanilic acids with 2-alkoxy benzaldehyde. An amine (3.6 mmol) was stirred with an alcoholic potassium hydroxide solution (17 ml, 3.6 mmol). To this solution, 2-alkoxybenzaldehyde (3.6 mmol) was added drop wise and the reaction mixture was refluxed with continuous stirring for 6hr. Then, the reaction mixture was left to overnight and acidified with dilute

hydrochloric acid. The pure schiff base was extracted ethyl acetate and washed several times with water, then dried over anhydrous sodium sulfate to afford the desired Schiff base amphiphiles which were denoted as SBA-12, SBA-16, SBA-18, SBC-12, SBC-16, SBC-18, SBS-12 ,SBS-16 and SBS-18; Scheme 1 and Table 1.

Micro elemental analysis of the synthesized Schiff bases showed their purity (Table 1). IR spectra of SBA-12 showed absorption band at 617-754 cm^{-1} for benzene nucleus and appearance of a strong band

Table 1: Physico-chemical Properties of the Synthesized Compounds:

at 1651 cm^{-1}determines the formation of an azomethene (HC=N–). A broad absorption band of C=O appeared at 3425cm^{-1} and at 1701 cm^{-1} for C–O. ^{1}HNMR (CDCl$_3$) for SBA-12: δ 0.88 (t, 3H, CH$_3$); 1.26 (m, 22H, (CH$_2$)$_{11}$); 6.59 (d, 4H, Ar); 4.8 (t, 2H, OCH$_2$); 4.17 (s, 2H, NCH$_2$); 9.8 (s, 1H, CH=N) and δ 10.5 (s, 1H, COOH). EI/FAB$^+$ (m/z):343(M$^+$–4, 69.6%).

IR spectra of SBC-12 showed a complete disappearance of the absorption band at 1732 cm^{-1} corresponding to the carbonyl group and the appearance of a new band at 1635cm^{-1} corresponding to C=N group. Bands at 1716, 2869 and 2925cm^{-1} corresponding to C=O of COOH, CH$_2$ and CH$_3$, respectively. A broad absorption band at 3440 cm^{-1} for COOH and 621-756cm^{-1} corresponding to a benzene nucleus appeared in all of the synthesized compounds indicating the presence of all functional groups expected in the synthesized compounds. ^{1}HNMR (CDCl$_3$) for SBC-18 showed the following signals relative to TMS as an internal standard at 0.85 (t, 3H, CH$_3$); 1.12 (m, 22H, (CH$_2$)$_{11}$); 1.5-1.8 (t, 2H, CH$_2$); 3.1-3.5 (m. 2H, OCH$_2$CH$_2$); 3.6-3.7 (t, 2H, OCH$_2$); 7.0-7.2 (m, 8H, 2Ar nucleus), 8.4 (s, 1H,

CH=N) and δ 10.6 (s, 1H, COOH). The mass spectra showed parent ion peak at m/z (493; M$^+$–4, 20.2%).

IR spectra of SBS-12 showed a stretching vibration at 1600 cm^{-1} for HC=N and appearance of absorption band for SO$_3$H and C–O–C at 1207,1110cm^{-1}, respectively, plus all chaired band appeared either in SBA-12 or SBC-12. The chemical shifts of the different types of protons in ^{1}HNMR spectra of SBS-12 showed δ 0.88 (t, 3H, CH$_3$); 1.24 (m, 22H, (CH$_2$)$_{11}$); 7.1-7.5 (m, 8H, 2Ar); 8.2 (s, 1H, CH=N); 3.6 (t, 2H, OCH$_2$) and δ 4.3 (s, 1H, SO$_3$H). Mass spectra of SBS-12 showed molecular ion peak at 444 (M$^+$–1, 2.04%).

2.4. Surface Tension Measurements:

Surface tension measurements were done at 25°C ± 0.2 using a Due Nouy platinum ring method with Kruss K7 tensiometer. The values which remained constant for a period of 30 min. were taken as the surface tension of the solution. The critical micelle concentration (cmc) and the surface tension at the cmc were determined as the values of the break point of surface tension vs. concentration plots.

2.5. Biocidal Activity:

Biocidal activity of the synthesized schiff base surfactants was measured at the fermentation biotechnology and applied microbiology center (FBAM, Al-Azhar University) using inhibition zone technique in dimethyl formamide as a solvent. The studied microorganisms were identified for each strain as gram negative bacteria: *pseudomonas fluorescen (597), pseudomonas phaseolicola (GSPB 2828)*, gram positive bacteria: *Staphylococcus aurens* (ATCC 25923), *Staphylococcus pyogenes (*ATCC 19615) and fungi: *Fusarium oxysporum* and *Aspergillus fumigatus.*The antibiotic chloramphenicol was used as standard references broad antibiotic, cephalothin and cycloheximide were used as standard gram negative bacteria and antifungal references respectively.

2.6. Antitumor Activity:

The antitumor activity for the compounds under investigation was carried out at pharmacology unit, National Center Institute, Cairo, University.

The choice of Elhrlich ascites carcinoma (EAC) as a model system of mice cell tumor and it is a suitable tool for studying the biological behavior of malignant tumor and drug action within cells (Homburger 1981).

3. Results and Discussion:
3.1. The Surface Properties:

Fig. (1) Represents the variation for the surface tension vs. log. concentration of the synthesized schiff base amphiphiles at 25°C. The profile showed sharp break points corresponding to the critical micelle concentration values of the different surfactants. The critical micelle concentration (cmc) values of the synthesized amphiphiles are gradually decreased by increasing the length of the alkyl chains attached to the synthesized molecules (Table 2) which referred to increase of the hydrophobicity as a result of increasing the methylene groups (Oda *et al.*1997, Nagarajan, and Ruckern 2000). On the other hand, the hydrophilic substituent's have a considerable role in their cmc values. Derivatives which contain sulfonate groups (SBS) have a higher depression in cmc values than those containing carboxylate groups (SBA, SBC).

From surface tension lowering ability γ_{cmc} in Table 2, it can be seen that γ_{cmc} of schiff base amphiphiles increases with increasing hydrophobic chain length. This explained the increases of hydrophobicity of surfactants and compounds with dodecyl group in the alkyl chain for all series that showed the maximum surface tension lowering ability.

Table 2: Surface Properties of the Synthesized Schiff Base Amphiphiles at 25°C:

Compound	cmc x 10^{-3} mol/l	γ_{cmc} mN\m	π_{cmc} mN\m	PC_{20}	cmc/C_{20}	Γ_{max}. Mol/cm^2	A_{min} x 10^2 nm^2	-ΔG_{mic} KJ/mol	-ΔG_{mic}/ CH$_2$	-ΔG_{ads} KJ/mol	-ΔG_{ads}/ CH$_2$
SBA-12	7.88	30.5	41.5	2.91	6.41	1.25	132.8	12.01		12.34	
SBA-16	7.41	34.0	38.0	2.99	6.62	1.42	116.9	12.16	0.19	12.43	0.17
SBA-18	5.62	36.0	36.0	3.32	9.32	1.60	103.8	12.84		13.07	
SBC-12	6.92	27.5	44.5	2.85	4.91	1.13	147.5	12.33		12.73	
SBC-16	5.50	30.0	42.0	2.95	4.92	1.14	143.6	12.89	0.17	13.25	0.16
SBC-18	4.68	31.5	40.5	3.05	5. 25	1.17	141.3	13.29		13.64	
SBS-12	6.61	37.5	34.5	2.83	4.47	1.20	138.3	12.44		12.73	
SBS-16	5.25	39.0	33.0	3.05	5.89	1.38	120.3	13.01	0.15	13.25	0.13
SBS-18	4.65	40.0	32.0	3.15	6.56	1.52	109.2	13.31		13.52	

Effectiveness (π_{cmc}) of the synthesized surfactants is the difference between the surface tension of distilled water and that at the cmc values, while the efficiency (PC_{20}) is the negative logarithm of surfactant concentration, which provides a 20 mN/m reduction in surface tension.

The effectiveness (π_{cmc}) values showed gradual decrease by increasing the hydrophobic chain length indicating the increasing of accumulated surfactant molecules at the interface. The maximum accumulation was indicated by the lowest surface tension depression at the critical micelle

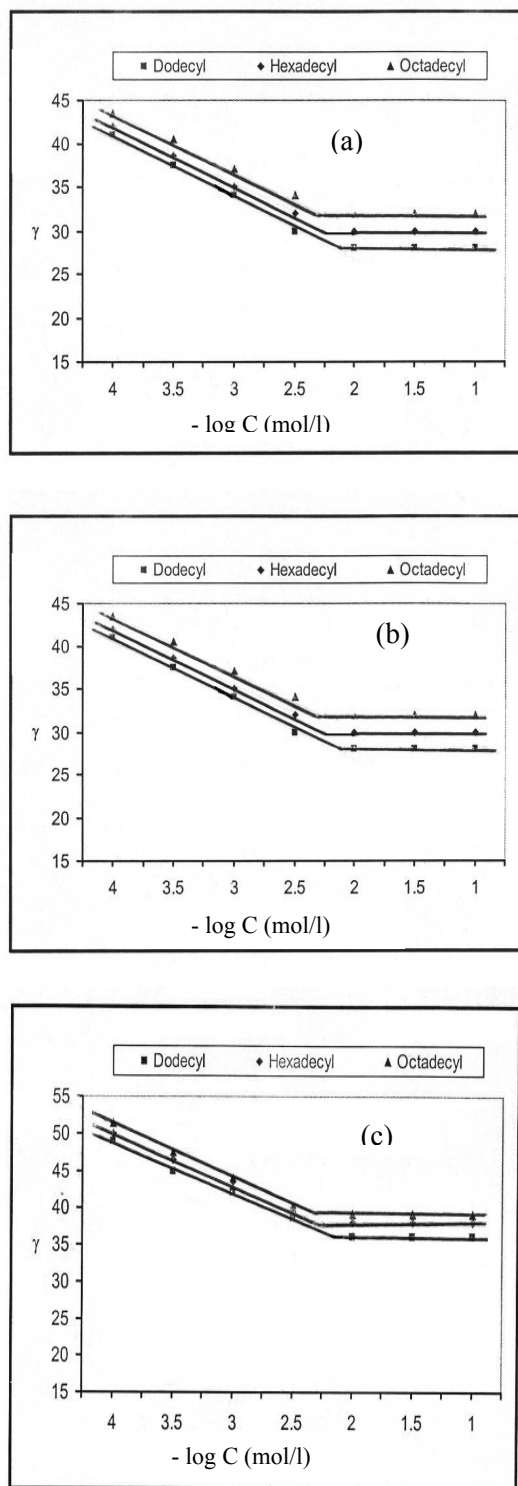
concentration and was recorded for SBC-12 at 44.5 mN/m. The efficiency values (PC_{20}) of the targeted surfactants (Table 2) showed their good tendency to modify the surface activity of their solutions at considerably low concentrations. Increasing the hydrophobic chain length of the studied amphiphiles results a decrease in the surface tension of the surfactant solution indicating the high tendency of the longer hydrophobic molecules to adsorb at the interface. The lowest PC_{20} value was observed to SBS-12.


Fig .1 : Variation of Surface Tension (γ) against Concentration of the Synthesized Schiff Base Amphiphiles at 25°C (a) SBA , (b) SBC and (c) SBS

The cmc/C_{20} ratio is an index of adsorption onto the water/air interface relative to micellization in the bulk surfactant concentration. The cmc/C_{20} ratios of schiff base amphiphiles were listed in Table 2. It is obvious that the cmc/C_{20} ratios increase with the increase of hydrophobic alkyl chain length. This result suggests that SB with long hydrocarbon chains adsorb at the air/water interface in preference to forming micelles, whereas SB with short hydrocarbon chains do not adsorb efficiently at the interface.

It can be also found that the cmc/C_{20} values of schiff bases SBA are higher than those of SBC and SBS; the difference of the hydrophobic benzene ring may be the main reason.

Values of the minimum surface areas occupied by schiff base amphiphiles at the interface (A_{min}) were calculated according to the equation:

$$A_{min} = \frac{10^{16}}{N\Gamma_{max}}$$

Where Γ_{max} and N are the maximum surface excess and Avogadro's number respectively.

Increasing the maximum surface excess values indicates the increasing of adsorbed molecules at the interface, hence the area available for each molecule will decrease .That causes the compacting of surfactant molecules at the interface to form denser layer.

From Table 2, it can be seen that A_{min} values of SBC and SBS are larger than those of SBA and A_{min} is greatly influenced by the hydrophobic alkyl chain length. Increasing the hydrophobic alkyl chain length increases A_{min} values at the interface. It is well known that phenyl is a rigid group, so the hydrophobic groups of SBC and SBS pack rather loosely than those of SBA. Also, increasing the maximum surface excess (the accumulation of surfactant molecules at the air/water interface, Γ_{max}) indicates the surfactant/water repulsion in the bulk of the solution which pumps the surfactant to the air/water interface. Longer hydrophobic alkyl chain lengths showed longer Γ_{max} values and derivatives which contain phenyl ring have a lower Γ_{max}; SBC, SBS than those of SBA. That can be referred to the change of the hydrophobicity of the molecules under consideration by the type of substituents.

The thermodynamic characteristics of the synthesized anionic schiff base amphiphiles were studied using the calculated values of adsorption and micellization free energies ΔG_{ads}, ΔG_{mic}. These data were calculated using the thermodynamic equations (Azzam et al.2004) Table 2. The free energy changes of micellization and adsorption showed negative sign indicating the spontaneously of the two processes at

25°C. Also, ΔG_{mic} and ΔG_{ads} decreased slightly by increasing the hydrophobic chain lengths.

The maximum depression in ΔG_{mic} and ΔG_{ads} was observed for SBS-18 derivative at -13.31and -13.52KJ/mole, respectively.

The calculated increment $\Delta G_{mic}/CH_2$ and $\Delta G_{ads}/CH_2$ i.e., the change in ΔG_{mic} and ΔG_{ads} per one methylene group in alkyl substituted R was 0.15 and 0.13 KJ/mol which was lower indicates that the tendency of adsorption of SBS molecules from the bulk to the air/water interface is stronger than those of SBA and SBC molecules.

3.2. Evaluation of the Synthesized Surfactants as Antibacterial and Antifungal Agents:

Frequently, for numerous applications, it is highly desirable to develop the so-called functional surfactants, i.e., surface active compounds which show evidence of additional benefits. In this context the antimicrobial properties of surface active compounds are highly for applications in the cosmetic field, in consumer products, in cleaning liquids for medical instruments, as well as for the stabilization of industrial emulsions against deterioration by bacteria and fungi (Marcelo *et al*.2008 and Viscardi *et al*.2000)

Hence, the above synthesized schiff base surfactants were tested regarding their activities against a series of bacteria (Gram positive: *Staphylococcus aureus* ATTC 25923, *Staphylococcus pyogenes* ATCC 19315; Gram negative: *Pseudomonas fluorescen* S97, *Pseudomonas phaseolicola* GSPB 2828 and fungi: *Fusarium oxysparum, Aspergillus fumigatus.* The data of biological activity of the reported compounds at 1 and 2 mg/ml are given in Table (3 & 4). The results showed that our surfactants are in general capable of inhibiting the growth of bacteria and fungi to a moderate extent. Also, it is clear from Tables 3, 4 that the biological activities of the synthesized surfactants against the tested microorganism increase by increasing their doses. The highest activity was observed at 2 mg/ml. On the other hand, the most effective factor is the carbon chain length; it was found that, as the carbon chain length (hydrophobic part) increases, the compound efficiency also increases. That can be related to their ability of adsorption at the interface. Increasing the absorbability increases their action on the cell membrane. The absorption of schiff base molecules on the cell membrane decreases its permeability which disturbs the biological process in these cells leading to their death. So, C_{16} and C_{18} derivatives showed a higher effective biocidal action upon tested bacteria and fungi. Also, the presence of benzene ring slightly decreases its effect.

Table 3: Antimicrobial Activity of the Synthesized of the Schiff Base Amphiphiles:

3.3. Antitumor Activity:

In vitro, anticancer cytotoxin activity of synthesized schiff base amphiphiles was investigated using EAC at different concentrations (25, 50 and 100%); Table 5. The tumouricidal effects of the compounds under investigation were tested on the survival of cultured EAC cells, the antitumor activity of the targeted compounds was expressed as a percentage of non viable cells (% NVC) calculated as follows:

$$NVC\% = \frac{number\ of\ NVC}{Total\ number\ of\ cells}\ X\ 100$$

From Table 5, it is clear that the cytotoxic effects of these compounds were dose dependent, i.e. by increasing the concentration on these compounds in the culture media; the percentage of non-viable cells (EAC) is increased. Also from data of Table 5 one observes that upon testing the schiff base compounds which contains more than one benzene ring, the antitumor activity dramatically increases from 0% of non-viable EAC cells at 25 mg/ml to 95% of these cells at 100 mg/ml and also NVC% increases by increasing the chain length of the hydrophobic radical.

To achieve the maximum therapeutic damage of tumor cells using the minimum concentration of drugs, the tumor cells lines used in this study for SBA-12 which causes the death of 95% of EAC cell are liver carcinoma (HEPG$_2$), breast carcinoma (MCF 7) and colon carcinoma (HCT 116); Table 6 and Fig. 2.The 50% growth inhibitory concentration (IC $_{50}$) values for SBC-12 at different concentration ranged from 1 to 10 mg/ml is recorded. Data showed that SBC-12 was found to exhibit high activity in vitro system on the tumor cell lines

investigated and the highest cytotoxic effect on FEPG2, HCT116 and MCF7, respectively.

Finally, in our research, we found that SBC-12 surfactant affects tumor tissue at very low concentrations at values lower than their cmc values which means that there is a strong relationship between very small values of cmc of this compound and its ability to reach IC$_{50}$ values under very low concentration. This is due to the fact that increasing the concentration of schiff base surfactants causes an increase in the adsorption process on cells membranes till the cmc is reached; after this adsorption slowly decreases and then stops due to the formation of micelles, which prevent mobility and suppresses antitumor activity.

4. Conclusion:

A series of anionic surfactants containing schiff base group have been synthesized and their chemical structures were confirmed using elemental analyses, FTIR, ^{1}H-NMR, and mass spectroscopy. Their surface activities were determined based on the data of surface tension. It was found that critical micelle concentration (cmc) values of these amphiphiles were gradually decreased by increasing the length of the alkyl chains attached to the synthesized molecules which referred to increase the hydrophobicity as the result of increasing the methylene groups. Thermodynamics of adsorption and micellization processes of these surfactants in their solutions were also calculated. Results were indicated that these compounds have tendency towards adsorption at the interface and also micelle formation at lower concentrations. Biocidal activity of prepared amphiphiles was investigated against bacterial and fungi species which showed that our surfactants are in general capable of inhibiting the growth of bacteria and fungi to a moderate extent. Also, it is clear that the biological activities of the synthesized surfactants against the tested microorganism increase by increasing their doses. Antitumor activity of these surfactants was evaluated against three human tumor cells such as HEPG$_2$ (liver), HCF$_7$ (breast) and HCT116 (colon). The cytotoxic effects of these compounds were dose dependent, i.e. by increasing the concentration on these compounds in the culture media; the percentage of non-viable cells (EAC) was increased. Also, data showed that SBC-12 was found to exhibit high activity in vitro system on the tumor cell lines investigated and the highest cytotoxic effect on FEPG2, HCT116 and MCF7, respectively

The study of relation between biodiversity indices of woody species and growing stock in natural forest stands

Seyed Armin Hashemi [1]

[1.] Department of Forestry, Lahijan Branch, Islamic Azad University, Lahijan, Iran.
hashemi@iau-lahijan.ac.ir

Abstract: In order to determine the relationship between diversity indices of woody species and growing stock per hectare in natural beech (*Fugus orientalis Lipsky*) Forests, Twenty sites specially at middle elevations were studied including three plots per each site . The dimension of each plot was 50×100 meters. The method of surveying was selective sampling. Results indicated there are positive linear regression between the biodiversity indices and growing stock per hectare. The best equation were obtained from the relationship between Brillouin index and growing stock per hectare(r =0.95).

1. Introduction

Biodiversity has so wide meaning and consists of genetic diversity up to ecosystems diversity. Species diversity is known equal to biodiversity that is limited to diversity in local or regional surface (Krebs, 1998). Diversity of organisms, measurement of diversity and examination of some hypothesis about reasons of diversity are some cases that have been favored by ecologists for a long time (Barnes *et al*., 1998). Researchers have applied different indices in order to measurement of diversity (Krebs, 1998).Understanding of necessity of species diversity that has happened recently has caused to concentrate on the quality of measurement of biodiversity in plants and animals a lot (Ehrlich and Wilson, 1991).

The some research used quantitative models (nonlinear matrix) with ecological criterion of diversity index of Shannon – Winer , minimum number of trees in each age class and section level of trees and some other criteria in order to manage combined forests of oak , pine and spruce(Bazzaz ,1987). In most studies about biodiversity, Alpha and Beta diversities have been considered (Pitkanen, 1998). Alpha diversity has been species diversity in a region (Whittaker, 1972) and Beta diversity mentions to the amount of changes of species in environmental gradient length (Whittaker, 1972; Wilson and Shmida, 1984). The first index of heterogeneity has been applied by Simpson in the year 1949 for the first time (Whittaker, 1972) and many copies of this index have been developed up to now. Another index that has wide application in studies is shannon index (Vujnovic *et al*., 2002).in order to estimate the diversity of vegetative covering of forestry projects of Boreal used the diversity index and by using different variables such as the number of needle – leaf and wide – leaf species , determining fires , the fertility of growing places , topography , average diameter of trees , the number of floors of canopy , the type of soil , drainage and artificial life renewal , presented a classification including 14 classes of biodiversity in forestry projects(Itkanen ,1997).Studied the impact of beneath woody floor and the age of stand on relative diversity and frequency bryophytes , lichens and fungi in trampling pine stands (*Popolus tremuloides*) in combined forests of Boreal in Alberta and showed that the availability of combined stands of aged pine and fallen woods in different steps of demolition are important for preserving the total of bryophytes , lichens , and fungi(Crites,2000) .Some studied the relations of biodiversity and surface in been forests of Denmark in a case study . The diversity of forest species showed negative relation with surface (Harris ,1984). The purpose of this research is that the relation between diversity indices with growing stock in hectare in natural stands would be studied, So that we can estimate ideal growing stock in other areas by studying these indices in each step of stand. In order to this, forests in Guilan province that have considerable natural stands were selected for study. In this research, the aim of biodiversity is the diversity of species and the diversity of species is dependent on the number of species (as richness) and also the ratio of the number of individuals within each species (as frequency or monotonousness) in a specified level or a group of creatures. In each community with two way , the quantity of biodiversities determined that in first method , the calculation of the quantity of diversity , the rare species in a community is very important which is calculate able by dependent methods of Shannon– Winer and Brillouin index. In this study, the relation

between these indices with growing stock of trees in hectare between these indices with growing stock of

2. Materials and Methods

This study has been done in twenty growing places of basin 21 from dividing the auriferous basins of north forests of country in natural beech stands.
In the studied region most rainfall is in autumn. The mean annual rainfall in plainly region in the station of the climatology of Rasht (100 meters ASL) is 1258 mm and mean annual temperature in the station is 15.6º C.

The most soils of study area have been placed on maternal igneous rocks (Alkaline and acidic) and be seen on the maternal Andesitic and Basalt rocks with more spreading. The type of the soils of this region is acidic brown. The acidity of these soils is 4.5 to 5.5.

For studying of the relation between the diversity indices with growing stock in forest stands of beech, first natural stands which not to be interfered as for as possible , were identified and reflected on the map. Then, with primary studies in each identified region, three pieces of 0.5 hectare which were intact and with least interference were measured as selective sampling. Twenty sites especially at middle elevations were studied including 3 plots per each site. The dimension of each plot was 50 ×100 meter. Statistics within each piece as hundred percent was done for measuring the characteristics of the type of species, the diameter equivalent to tree slope. The situation of studied regions was also identified from the slop and altitude from sea level. After obtaining desired characteristics, first diversity indices using related formula were calculated and growing stock using local volume table was estimated. Then the relation between diversity indices with growing stock in hectare by regression calculation, were analyzed.
The amounts of diversity indices are calculated with following formula.
Equal (1) – The index of Simpson:

$$1 - D = 1 - \sum_{i=1}^{s} Pi^2 \qquad (1)$$

In this equal, 1-D is the diversity index of Simpson and P is the proportion of the individuals in each species in the piece of sample.

Equal (2) – the function of Shannon – Wiener

$$H^/ = -\sum_{i=1}^{s} p_i \ln (p_i) \qquad (2)$$

In this formulation, H is Shannon – Wiener's function and its unit is Bits / individual and S is the number of species.

trees in hectare was studied.

Equal (3) – Brillouin index H = 1/N log

$$Ni / n_1 . n_2 . n_3 \qquad (3)$$

In this formulation, H is Brillouin index, N is total number of stands (individuals) in sample, N_1 is the number of related stand and N_2 is the number of stands related to second species.

3. Results

In this research , the amounts of biodiversity (using Simpson's index , Shannon – Wiener's function and Brillouin index) and the estimation of growing stock in hectare in studied growing places were calculated and the relationship between the indices of diversity and growing stock was studied (Table 1)
Amounts of indices of diversity and the amounts of growing stock in hectare to estimate growing stock in hectare, local volume table have been used. The amounts of diversity and growing stock indices in hectare in studied regions have been presented in table 1.In table 1 is seen that in regions where growing stock of trees is high , diversity indices is also higher and in regions with low growing stock , the amounts of diversity indices is less than other regions. Since this subject should be studied from statistical point of view, the relationship between diversity and growing stock indices of trees by regression calculation were studied.

Regression relationship between diversity indices and growing stock in hectare
The relationship between different indices of biodiversities of trees in studied regions (including Simpsons' index, N2 Hill, Shannon – Wiener's function , and Brillouin index) and growing stock in hectare have been presented in figures 1-4.
The figures 1-4 show that:
- There is the relation of Y=495.1X + 298.3 with correlation coefficient of 0.83 (r = 0.83) between Simpson's index and growing stack. In this relation , X is the amount of Simpson's index and Y is growing stock in hectare (Figure1.)
- There is a relationship between N2 Hill and growing stock in hectare with the relation of Y = 176 X +240.2 with correlation coefficient of 0.83 (r = 0.80) . In this relation X is the amount of N2 Hill's index (Figure2.).
- Shannon – Wiener's function and growing stock in hectare have the relation of Y = 540.5X + 270.7 and (r = 0.85) in that X is the amount of Shannon – Wiener's function(Figure 3.).

- It was observed a relation of Y = 560 X + 290.1 and r = 0.95 between Brillouin index with growing stock in hectare (Figure4).

Therefore the hypothesis of Zero is rejected and there is meaningful relationship between diversity and growing stock indices in hectare in the level of 0.05.

Table 1. The amount of biodiversity indices and amount and rate of growing stock in hectare in studied region.

Discussion

The study of obtained results from the relation between biodiversity indices and growing stock in hectare in the studied growing places show that there is meaningful relationship between these biodiversities indices of trees and the factor of growing stock in hectare at the level of 0.05. Beech have more than 70% of the number of trees in this region .According to this study, maximum correlation coefficient is related to the relation of growing stock of trees with Brillouin index (r = 0.95) and minimum of that has been obtained in the relation between obtained in the relation between N2 Hill and the factor of growing stock in hectare (r = 0.80) . As a result Brillouin index function is more suitable for study of the relation of biodiversity with growing stock in forests of studied regions. Obtained relationship shows positive and linear correlation, it means that in regions that biodiversity shows high rates; growing stocks in hectare are also higher. This subject shows that growing places which have higher biodiversity generally have high stability and fertility and from growing stock of trees in hectare perspective also have better condition. According to the result of this study, we can obtain the amount of growing stock of trees in hectare with high accuracy by determining biodiversity criterion (the amount of Shannon – Winer's function) in studied regions.

It seems that we can obtain a relationship in a wider area which according to biodiversity criterion , can estimate growing stock of trees in hectare with acceptable of growing stock in each region or obtaining models that are considered biodiversity factor as one of basic variables of that model.

Also, according to obtained results from this study, it seems that we can obtain a relationship between biodiversity indices with other factors of forest stands in this region with other studies. Also , It seem that we can understand relatively ecological ability and potential of growing places by comparing the factor of biodiversity in different regions , or obtain relations which be a base for ideal planning in forest units. In this study, other factors like slope orientation, altitude, and some characteristic of soil also have been studied.

From the result of the study of these factors can understand that generally by increasing the altitude in studied region , mean growing stock in hectare will be decreased and mean biodiversity indices in hectare also become low(Whittaker. R.H., 1972).

In this study, growing stock in hectare in different growing places with changing slope , depth and the moisture of soil show that growing stock in growing places.

North Slope and deep soil and high moisture compared with other growing places. In these conditions, ideal growth of trees has caused that trees reach stock of trees in hectare. On the other hand , the diversity of trees with high percent combination in these growing places have caused the increase of biodiversity indices.

Sub – diversity of species in a growing place with percentage of low number has little impact on the increase of biodiversity indices.

It's necessary to state that this research has been done in beech community and done researches have shown that in natural beech stands , in addition to altitude and aspect , factors like low depth of soil , being high the sand of the soil and being rocky and stony of growing sites also have negative impact on volume (Hashemi,2010). The result of research in studied regions showed that biodiversity indices of tree species have direct relationship with growing stock.

Of course in studied pure stands, some negative factors in growing beech like low depth of soil, being high in the sand of soil and being stony were observed. Since some growing place factors may intensify or neutralize or weaken the impact of other factors, so if we can compare the similar stand of natural and intact forest from the perspective of growing place conditions but by different biodiversity to each other, therefore judgment about optimum point of diversity will be possible.

Abstract: The present study was carried out to determine the type of gene action, genetic parameters of yield and other quantitative traits by crossing eight diverse maize inbred lines in partial diallel fashion. Seeds of F_1 population along with their parents were evaluated in year 2010 in Shoushtar City (Khuzestan province in Iran) using a randomized complete block design with three replications. Genotypes planted at two dates, 6 July (to coincide heat stress with pollination time and grain filling period) and 27 July (as normal planting). Estimation gene effects and some of genetic parameters and graphic plot drawing to Hayman – Jinks method revealed statistics a and b significant for all traits in two conditions. Considering the average dominance degree and Hayman graphical plot, dominant effects for hektolitr weight trait under heat stress condition and for grain yield under normal condition, over dominance as well as partial dominance for other traits, were revealed.

Key words: Maize; heat stress; genetic parameters; grafic plot

1.Introduction

Under heat stress, maize plant shows stunted growth, wilting top firing, tassel blast, silking delay and desiccation, pollen abortion and poor seed set which eventually can result in yield losses. Heat stress is 2nd major abiotic problem after drought that reduces grain yield more than 15 percent (Akbar et al, 2008). In southern part of Iran, especially in Khuzestan, heat stress is one of the most important abiotic stress in maize growing area. Therefore breeders need to develop such maize genotypes which may sustain period of heat stress stress without lowering their yield potential.

Betran et al. (2003) reported gene action for yield, ear diameter, number of grain in row, grain depth and 1000 grain weight is over dominance but for number of grain rows is partial dominance.

Barati et al. (2003) showed that gene action for yield, number of grain in row and 1000 grain weight is over dominance but for number of grain rows is partial dominance.

Srdic et al. (2007) found that dominant gene effects were more significant in maize grain yield and number of grains per row while additive gene effects were more important for grain row number and 1000 grain weight. The mode of inheritance of grain row number was partial dominance, while over dominance was of greater importance for grain yield, number of grains per row and 1000 grain weight.

Wattoo et al. (2002) revealed that the yield potential like number of days taken to tasselling, number of days taken to silking, plant height, number of ears per plant, number of grain rows per ear, number of grains per row, 100 grain weight and grain yield per plant were controlled by over dominance type of gene action.

Irshad-Ul-Haq et al. (2010) revealed that non-additive genetic effects were more pronounced in the inheritance of plant height, days to 50% tasseling, days to 50% silking, ear height and grain yield per plant. The graphic analysis showed that all the characters were under the genetic control of over dominance type of gene action. Also for grain yield the parents NYP-8 and NCQPM-2 were close to the point of origin and had an excess of dominant genes whereas FR-37 being farthest from the origin was carrying maximum number of recessive alleles.

Hussain et al. (2009) reported that plant height, leaf area, grain yield, per plant and harvest index, under normal and water stress conditions indicated additive gene action with partial dominance. Also over dominance type of gene action was recorded for grains per row and 100 grain weight. Heritability estimates ranged from moderate to high (54-85%) for various traits.

Rezaei *et al*. (2005) reported that high broadsence heritability estimates (0.85 to 0.95) were observed for most traits, the estimates for narrowsence heritability were relatively low, the

lowest values belonging to number of grain row and grain yield (0.23 and 0.38) respectively.

Heritability degrees varied from low to moderate for grain yield (Kalla et al, 2001; Singh et al, 2002).

The study of diallel analysis of the genetic traits would certainly be a valuable aid in selection and breeding for better maize hybrids and synthetics under heat stress condition. The information derived may be helpful to develop selection criterion and selection of most promising inbred lines for further future breeding programs.

2. Materials and methods
